

# Dip:

A plunge dip is a construction that allows to completely immerse livestock in a liquid that contains a parasiticide. Plunge dips are either fixed and made of concrete (typical for cattle and sheep) or portable (usually metallic, mainly for sheep and seldom for pigs).

## spot-ons:

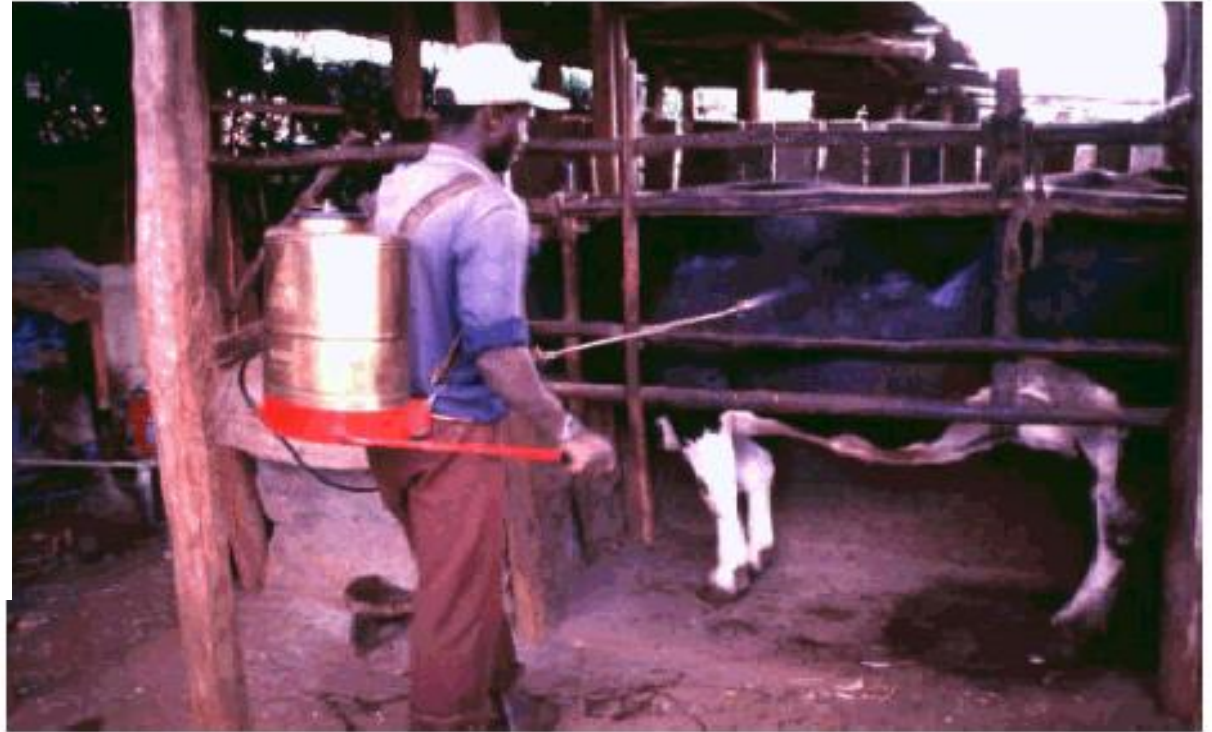

A few ready-to-use liquid formulations for livestock are neither poured nor sprayed along the back of the animal, but applied in a few spots. These spot-ons are much more popular for dogs and cats, popularly known also as **pipettes**, **squeeze-ons** or **drop-ons**.

# Steps of spot-ons in dogs and cats

# Spray:

## Hand-spraying:

Hand spraying is an effective method of tick control for a few animals who do not justify the expense of a [spray race](#) or [plunge dip](#) eg on small-scale commercial dairy farms.

## **Spray Race (Spray dipping):**

The cattle spray race is a gentler method of dipping and more suitable for dairy cows, as there is less chance of injury.

## Insecticidal dusting powder:

It is designed to control insects on the skin and in the hair of dogs and cats, as well as for disinfestation of their bedding, baskets, kennels and other places of permanent residence.

-Application onto the animal's skin and hair is easy and does not induce any resistance.

## **Insecticidal shampoos:**

- **They** are designed to control insects on the skin and fur of an animal. In view of how they actually work, they are effective on application only.
- The biologically active substance in their composition acts while applied onto the skin.
