Belize Tropical Forest Studies

A Study commissioned by Machaca Hill Lodge, Toledo District, Belize

Introduction

The Machaca Hill Lodge is located on the shores of the Rio Grande near the town of Punta Gorda in the Toledo District. During July 2006, Jim Scott, Manager of the Lodge expressed interest in a rapid ecological survey of the property. This survey was carried out in the latter half of August of the same year. The study focused on vegetation and ecosystems. Aspects such as ornithology and geology will be addressed in separate studies.

Acknowledgements

The team acknowledges the support of Jim Scott, manager of the Machaca Hill Lodge as well as the entire staff of the lodge which made our work at the property most agreeable.

Methodology

The purpose of the study was to gather information on the property on ecological – ecosystem level. For practical purposes this translates to a study of the flora of the area. Since little time was available for the study, only one field visit could be made (August 18-21, 2006) during which forays were made into the various habitats on the property. No formal transects were prepared but rather trails were chosen that allowed the most efficient access to the various habitats. Locations were established using GPS coordination.

Maps including a topographic map (Map 1) and a 2006 Landsat tm Satellite Image in false color (Map 2) were consulted to establish the different habitats from a remote sensing perspective.

As much as possible, plants were identified in the field. Pictures were taken when required and in some cases specimens were collected for identification at a later stage.

Although the **flora** of the Machaca Hill Lodge was the main focus of the study, other biodiversity aspects were gathered on an opportunistic basis.

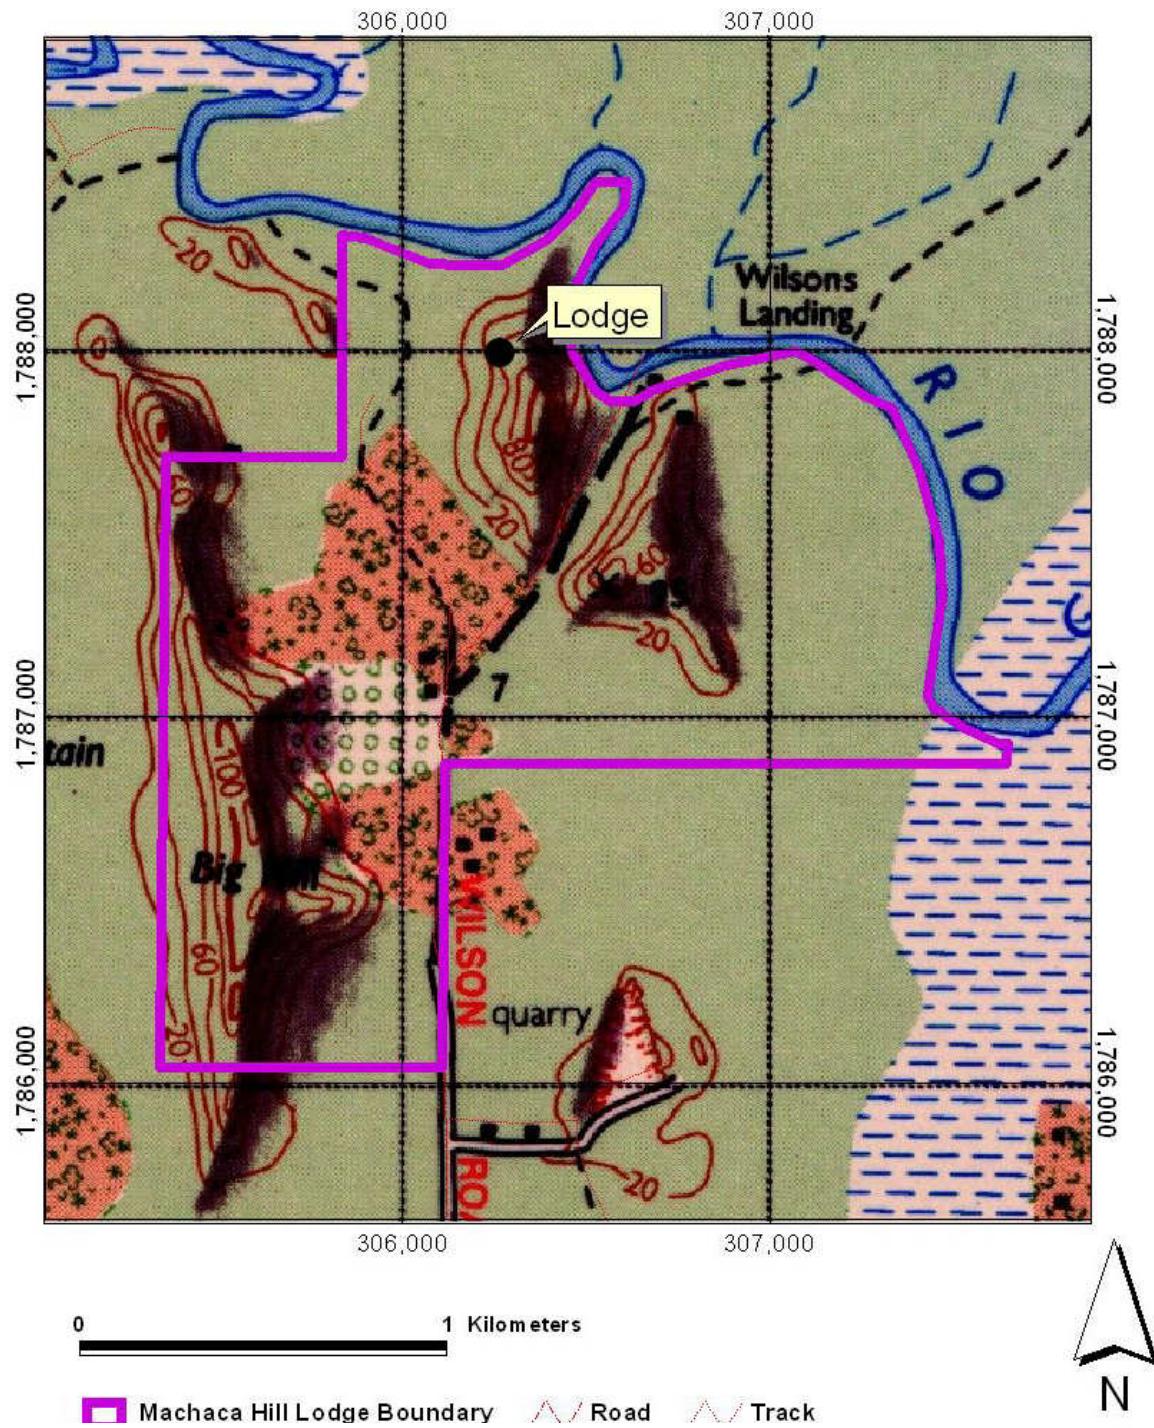

Birds were visually noted only when they were conspicuous or presented particularly interesting species in the experience of the consultants.

Butterflies were collected using a number of traps (6 fruit baited traps and one interception trap) set out throughout the property. In addition some specimens were caught with a hand net as well as visual observations were taken.

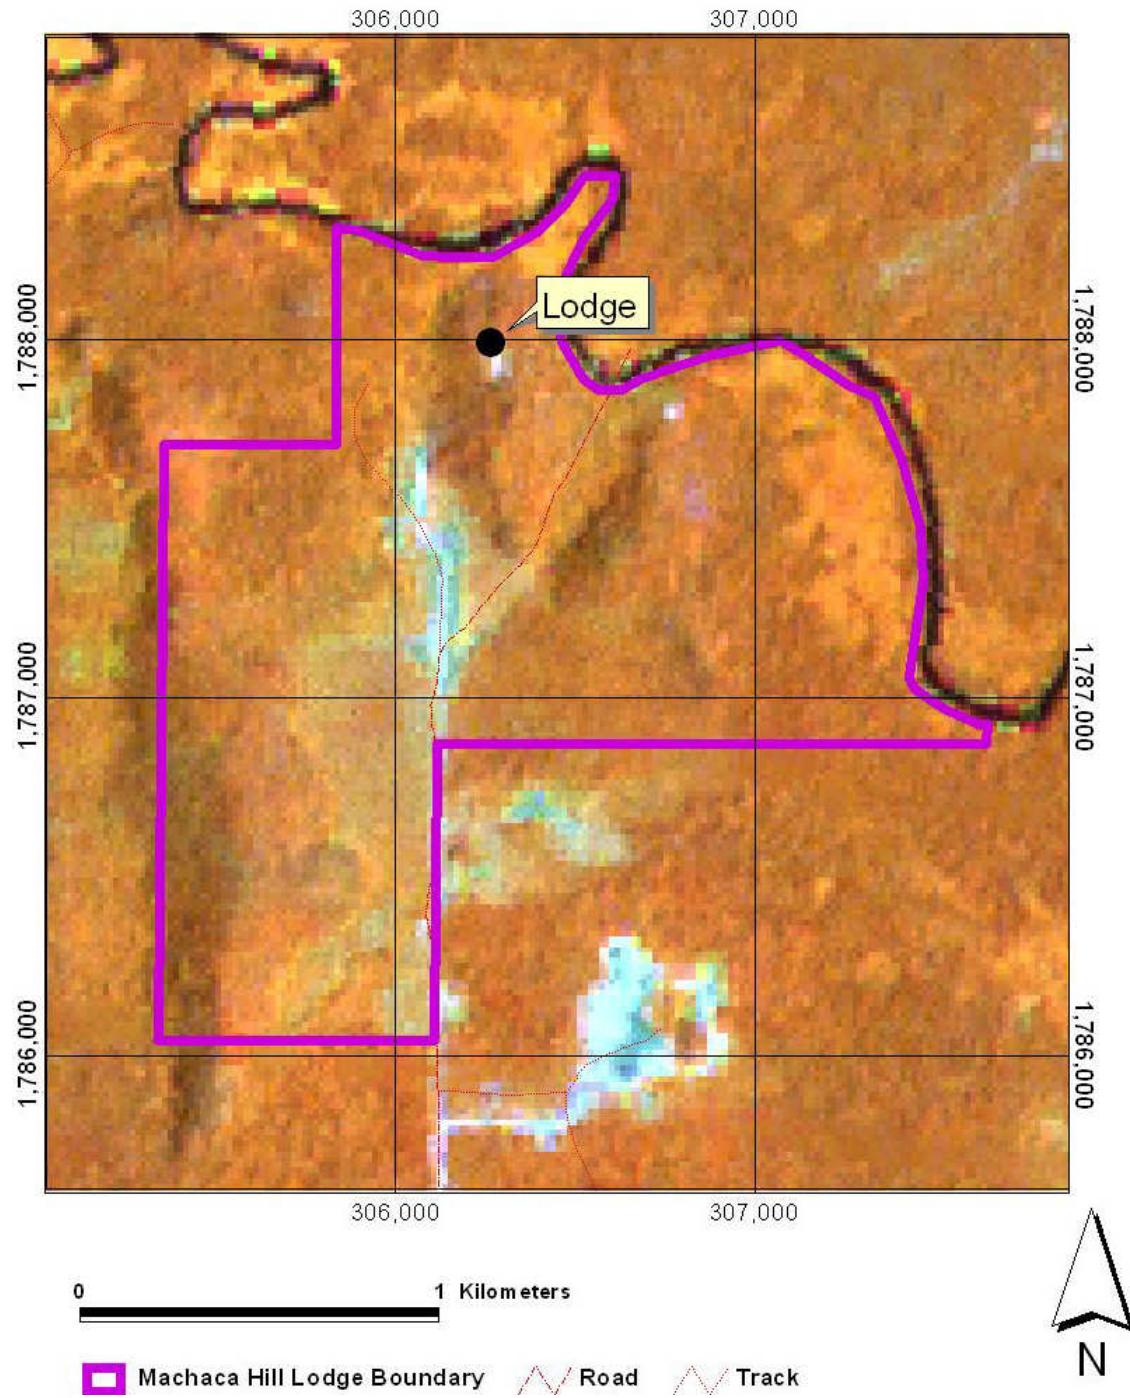

Stick insects were collected during two night-walks over the property.

Mammals, Reptiles and Amphibians data were collected opportunistically both during the day as well as during the night-walks over the property.

Map 1. Topographic map of Machaca Hill Lodge

Map 2.
2006 Landsat tm Satellite Image of the Machaca Hill Lodge terrain. Pixel size is 15 x 15 m.

Results

Much of the terrain shows heavy human impact. Most of the lowlands have been used for agricultural activities at some stage and the only less impacted ecosystems can be found in the more swampy areas along the river and on the hills. On top of this, the entire terrain was heavily impacted during Hurricane Iris in 2001 (Meerman, 2001).

Particularly as a result of the Hurricane impact, much of the vegetation is now in a regeneration phase with abundant secondary growth. This secondary growth goes in phases. Shortly after the hurricane in 2001, the most noticeable secondary growth species was *Carica papaya* (wild Papaya). Only 5 years later, this species is now much more uncommon, but a number of other secondary shrubs and trees now dominate the scene. Most notably these are:

- *Schizolobium parahyba* (Quamwood)
- *Cecropia obtusifolia* (Trumpet Tree)
- *Cecropia peltata* (Trumpet Tree)
- *Ochroma pyramidalis* (Balsa)
- *Acalypha diversifolia*
- *Cestrum nocturnum* (Dama de Noche)
- *Trema micrantha* (Capulin)

Interestingly the above species can be found in all habitats on the property. Broadly speaking 4 main ecosystems were recognized (map 3):

1. Tropical Evergreen broad-leaved lowland hill forest on steep karstic terrain
2. Deciduous broad-leaved lowland riparian shrubland of the plains
3. Tropical Evergreen broad-leaved lowland forest on poor or sandy soils
4. Tropical Evergreen broad-leaved lowland swamp forest.

The first ecosystem: **Tropical Evergreen broad-leaved lowland hill forest on steep karstic terrain** is the best defined. It is restricted to the steep limestone hills that form such a distinctive feature of the property. Based on the limited amount of fieldwork conducted, this also appears to be the most bio-diverse. A total of 179 species was identified here (which is a very high number for such a short study)(Appendix 2 & 3). A description of this ecosystem based on Meerman & Sabido (2001) can be found in appendix 1.

Like the rest of the terrain, this ecosystem was heavily impacted during Hurricane Iris in 2001. Typically the western slopes were distinctly more damaged than the eastern slopes. Nevertheless, wherever you go there is a jumble of secondary growth and vines which make access problematic.

The vegetation of the hills was fairly typical becoming more distinct towards the ridges with distinct hilltop species such as *Deherainia smaragdina* and *Forchammeria trifoliata*.

The palm *Chamaedorea tepejilote* (Pacaya) and the palm-like Cyclanthaceae *Carludovica palmata* (Jippi Jappa) were common features along the slopes.

There were some surprises such as *Andira inermis*, *Pterocarpus officinalis* and *Lonchocarpus guatemalensis*. In the experience of the consultants these species are normally lowland species and often riverine in distribution. To find them on hill crests came somewhat as a surprise. Probably the environment in the Machaca Hill Lodge area is so permanently moist as to allow these typical wetness indicators on a well drained hill crest.

The second ecosystem that is reasonably well defined is the **Deciduous broad-leaved lowland riparian shrubland of the plains**. Again, see the description in appendix 1. In the case of the Machaca Hill Lodge, this ecosystem forms a belt along the Rio Grande. At places it is shrubby and herbaceous as in the type description for this ecosystem. However, stands of sizeable trees can be found here with *Cassia grandis* (Bokut), *Pterocarpus officinalis* (Kaway) and *Ficus insipida* (Amate). Smaller trees include *Grias cauliflora* (Bongo Wood), *Bactris major* (Pokenoboy) and *Zygia* sp. (Turtlebone). The biodiversity of this area was not as high as in the hills with only 45 species identified. It should be noted however that the herbaceous component of the ecosystem received very little attention.

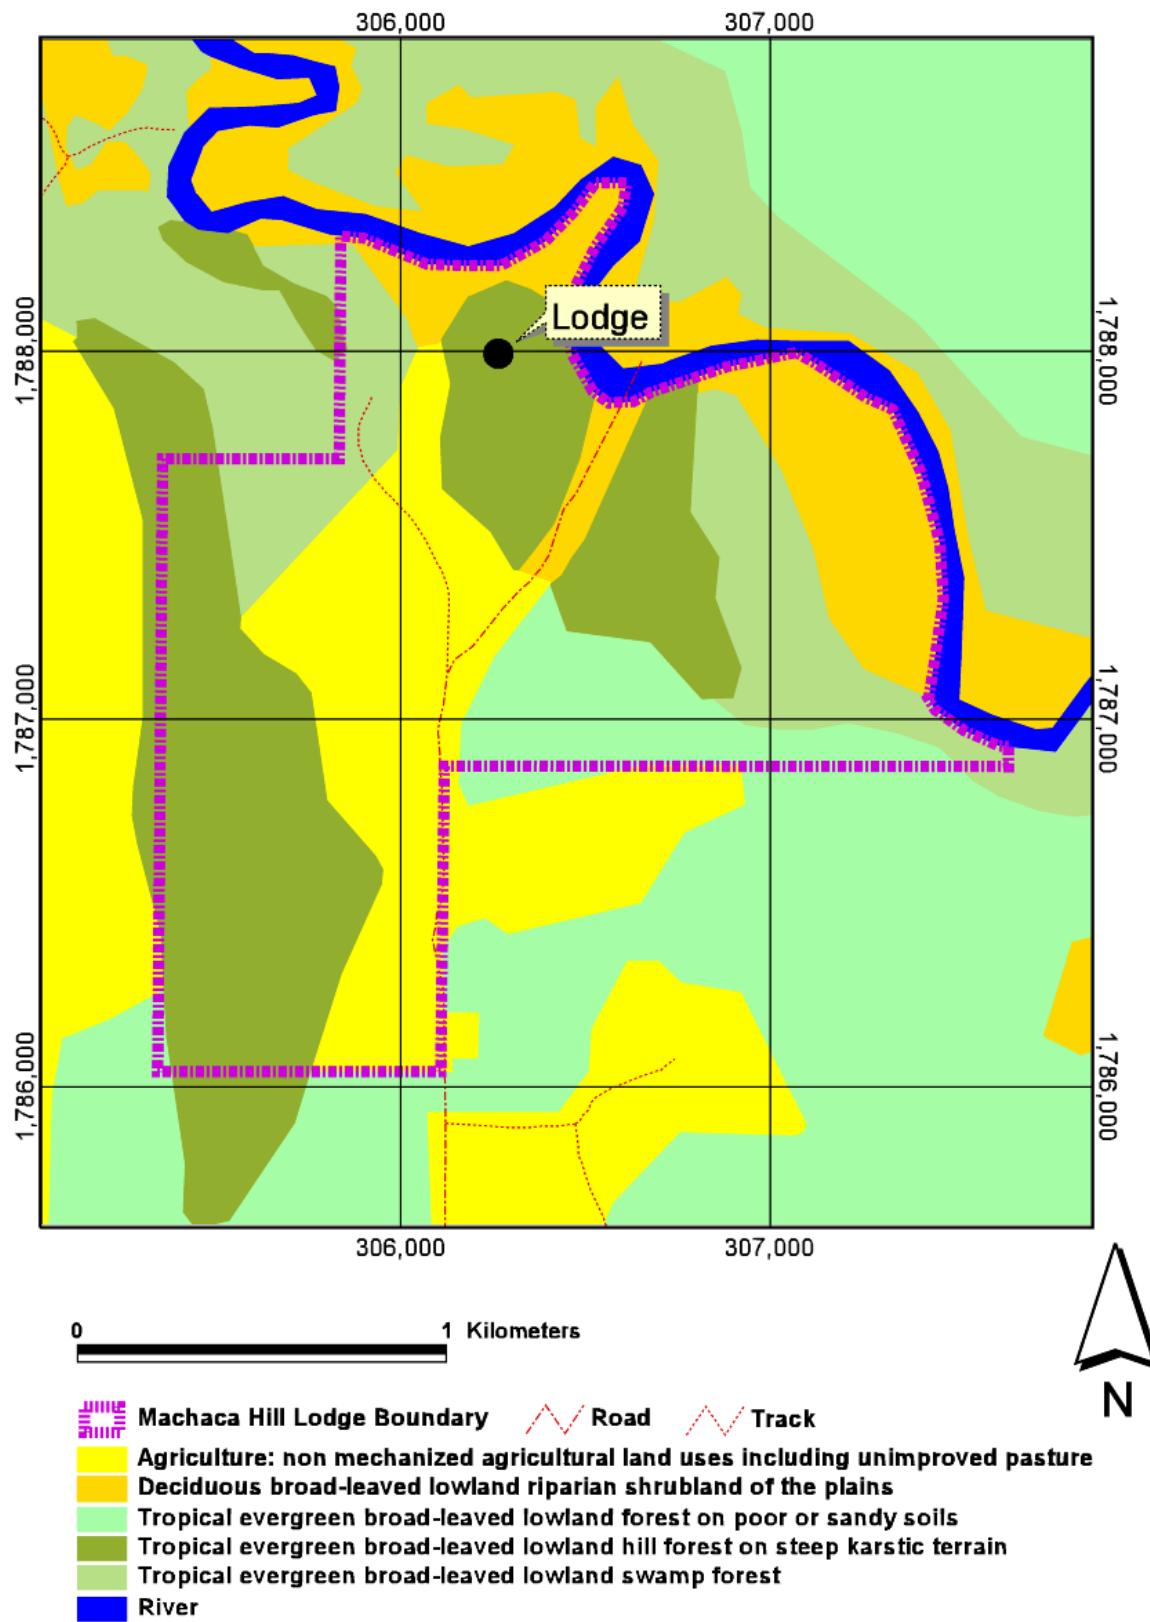

In general this is a very important ecosystem considering the environmental services it provides (shore protection).

The remaining ecosystems: “**Tropical Evergreen broad-leaved lowland forest on poor or sandy soils**” and “**Tropical Evergreen broad-leaved lowland swamp forest**” are less well defined. Actually there appears to be a very gradual cline from the riparian shrubland through “Tropical Evergreen broad-leaved lowland swamp forest” towards “Tropical Evergreen broad-leaved lowland forest on poor or sandy soils”. Both have suffered under past agricultural activities and little if anything of what was once was “Tropical Evergreen broad-leaved lowland forest on poor or sandy soils” remains. The effects of Hurricane Iris further diffused the distinction between these ecosystems.

Because of the difficulty in distinguishing between these “flatland” type ecosystems they have been lumped in the biodiversity listing in appendix 2.

The total biodiversity count of this lumped ecosystem is 96 species.

Map 3. Generalized Ecosystem Map of Machaca Hill Lodge.

Amphibians and Reptiles

A total of 6 amphibian and 4 reptilian species (Appendix 2 & 3), were noted. The Rio Grande is reportedly an important stronghold for the threatened *Dermatemys mawii* Turtle (Hickatee) but none were seen.

See picture of *Norops uniformis* to the left

Birds

A total of 13 species was entered into the database. Notable was a flock of 34 Swallow Tailed Kites that was seen circling over the lodge.

Also a pair of Golden-hooded Tanagers was observed in a Balsa

tree. (see picture above). Six species of hummingbird were observed on the hummingbird feeders at the lodge (see picture of Scaly-breasted Hummingbird above).

Mammals

Signs of 6 mammal species were noted. Black Howler Monkeys appear to be common on the property undoubtedly supported by the very large number of *Ficus* sp (Fig) trees that was noted. Encouraging were also very fresh Tapir tracks. This is a species that tends to have a difficult time near human habitation.

Butterflies

A total of 40 species was noted (Appendix 2 & 3). Unfortunately the various traps that were set out were strangely ineffective. Most notable were the common Morpho theseus (Brown Morpho) that were patrolling over the canopy of the hill forests. This species is uncommonly recorded.

Picture. Male Morpho theseus in flight

Stick Insects

An unusual component of Rapid Ecological Studies, but because of that quite interesting. A total of three species was collected. One species may be an as yet undescribed *Alienobostra* species (see picture to the left).

Appendix 1.

Ecosystem descriptions from Meerman & Sabido (2001): Belize Ecosystems Map.

UNESCO Classification code	<u>I.A.1.a.(1).(a).K-s</u>
Name	Tropical evergreen broadleaf lowland forest over steep calcareous hills
Altitude	< 500 m.
Geology and soil	Found in steep terrain over calcareous rocks, often where there is more non-vegetated ground surface, particularly bare rock. Soils may be extremely organic due to the leaching of the mineral soil and the build-up of organic matter in the limestone cracks and fissures.
Water regime	Mostly well drained
Rainfall	Found in the 2500 - 4000 mm annual rainfall areas of southern Belize with a dry season from February through May.
Fire exposure	Fires can do tremendous damage to this ecosystem. The soil at the base of steep limestone hills is often quite fertile and sought after for slash and burn agriculture. Agricultural fires associated with this practice frequently escape and creep up the hills, commonly doing relatively minor damage at the lower elevations but completely destroying the tops of the hills. The vegetation of such hilltops is then replaced by vines such as <i>Bidens squarrosa</i> and <i>Calea</i> sp. or more commonly with the fern <i>Pteridium caudatum</i> .
Description	Altitude is less important than steepness and the vegetation cover is dictated by the seasonal droughtiness. But because of the high rainfall figures in southern Belize, deciduousness is not a conspicuous feature even on these steep hills. Normally the valleys between these steep hills have an ecosystem that should be termed IA1a(1)(a)K-r but the current mapping effort does not allow this type of detail. The canopy tends to reach 25-30 m. 
Frequent plant species	Distinctive species include: <i>Acalypha</i> sp., <i>Achimenes erecta</i> , <i>Alseis yucatenensis</i> , <i>Aphelandra scabra</i> , <i>Astronium graveolens</i> , <i>Bauhinia divaricata</i> , <i>Bernoullia flammea</i> , <i>Brosimum</i> spp., <i>Bursera simaruba</i> , <i>Ceiba aesculifolia</i> , <i>Clusia</i> sp., <i>Coccocloba acapulcensis</i> , <i>Cryosophila stauracantha</i> , <i>Dendropanax arboreus</i> , <i>Desmoncus orthacanthos</i> , <i>Drypetes brownii</i> , <i>Louteridium donnell-smithii</i> , <i>Manilkara zapota</i> , <i>Malmea depressa</i> , <i>Metopium brownei</i> , <i>Oreopanax obtusifolius</i> , <i>Pimenta dioica</i> , <i>Piper psilorrhachis</i> , <i>Piper</i> spp., <i>Plumeria rubra</i> , <i>Pouteria campechiana</i> , <i>Pouteria reticulata</i> , <i>Protium copal</i> , <i>Pseudobombax ellipticum</i> , <i>Sapindus saponaria</i> , <i>Sebastiania tuerckheimiana</i> , <i>Trichilia minutiflora</i> and <i>Vitex gaumeri</i> .

UNESCO Classification code	<u>I.A.1.a.(1).(b).P</u>
Name	Tropical evergreen broadleaf lowland forest over poor or sandy soils
Altitude	< 50 m.
Geology and soil	Corresponding to where they occur in lowland areas, soils are acidic and may be dull reddish-brown, brown or gray clays, often mottled and/or stony.
Water regime	Drainage varies. Often ill drained.
Rainfall	Found in the 2500 - 4000 mm annual rainfall areas of southern Belize with a dry season from February through May.
Fire exposure	Where fires have penetrated this system, small patches of scrubby “savanna” occur with associated species such as <i>Byrsonima crassifolia</i> and <i>Pinus caribaea</i> appearing. High rainfall figures in these areas prevent major expansion of these savannas but under a regime of recurring droughts and increased human pressure, these forests may well degenerate towards savanna.
Description	Generally dense forests with a broken canopy.
Frequent plant species	Distinctive species include <i>Acosmium panamense</i> , <i>Acocelorrhaphé wrightii</i> , <i>Aspidosperma cruenta</i> , <i>Attalea cohune</i> , <i>Bactris</i> sp., <i>Calophyllum brasiliense</i> , <i>Chrysobalanus icaco</i> , <i>Clidemia</i> spp., <i>Coccocypselum herbaceum</i> , <i>Dialium guianense</i> , <i>Dicranopteris</i> , <i>Erblichia odorata</i> , <i>Ficus</i> sp., <i>Guarea</i> sp., <i>Guettarda combsii</i> , <i>Licania hypoleuca</i> , <i>Licania platypus</i> , <i>Miconia</i> spp., <i>Mouriri exilis</i> , <i>Mouriri mytilloides</i> , <i>Pouteria mammosa</i> , <i>Psychotria poeppigiana</i> , <i>Pterocarpus rohrii</i> , <i>Scleria bracteata</i> , <i>Simarouba glauca</i> , <i>Spondias mombin</i> , <i>Symphonia globulifera</i> , <i>Terminalia amazonia</i> , <i>Tetracera volubilis</i> , <i>Tococca</i> sp., <i>Virola koschnyi</i> , <i>Vismia ferruginea</i> , <i>Vochysia hondurensis</i> and <i>Xylopia frutescens</i> .
References	Meerman 1999a, Wright et al. 1959: 8, 8a, 8b, 8c, Iremonger and Brokaw 1995: I.2.1.4. Picture: <i>Simarouba glauca</i> . Mountain Pine Ridge, Cayo district. J. Meerman

UNESCO Classification code	<u>I.A.1.b.(1).K-s</u>
Name	Tropical evergreen broadleaf submontane forest over steep calcareous hills
Altitude	500-1000 m.
Geology and soil	Over calcareous rock.
Water regime	Mostly well drained
Rainfall	Found in the 2500 - 4000 mm annual rainfall areas of southern Belize with a dry season from February through May.
Fire exposure	Not resistant to fire but frequently exposed to fire from uncontrolled slash and burn cultivation activities. Effects most severe on hillcrests.
Description	This forest type is the medium altitude (> 500 m) version of type IA1a(1)(a)K-s. Since travel through this ecosystem is difficult, there is little information available of this forest type.
Frequent plant species	Rich in understory palms and ferns. It appears to be the habitat for the endemic <i>Zamia prasina</i> . 
References	Brokaw & Lloyd-Evans 1987, Iremonger & Sayre 1994, Wright et al. 1959: 2d, 2e; Iremonger and Brokaw 1995: I.2.3.2. Picture: <i>Zamia prasina</i> . Columbia River Forest Reserve. Toledo district. J.Meerman

UNESCO Classification code	I.A.1.g.(1).(a)
Name	<u>Tropical evergreen broadleaf lowland swamp forest: Seasonally waterlogged.</u>
Altitude	< 50 m.
Geology and soil	Mostly calcium poor
Water regime	Ill drained, often waterlogged for part of the year.
Rainfall	Found in the 2500 - 4000 mm annual rainfall areas of southern Belize with a dry season from February through May.
Fire exposure	Unknown
Description	<p>Swampy thickets of thin stemmed trees and shrubs without emergents in the high rainfall areas of southern Belize. Some hog-wallow micro-relief exists.</p> 
Frequent plant species	<p>Frequently encountered plants in these forests are <i>Acosmium panamense</i>, <i>Aspidosperma cruenta</i>, <i>Astrocaryum mexicanum</i>, <i>Attalea cohune</i>, <i>Bactris</i> spp., <i>Bucida buceras</i>, <i>Calyptanthes chytraculia</i>, <i>Clidemia</i> sp., <i>Coccoloba</i> sp., <i>Cryosophila stauracantha</i>, <i>Dalbergia cubilquitensis</i>, <i>Dalbergia stevensonii</i>, <i>Dialium guianense</i>, <i>Dracaena americana</i>, <i>Guettarda combsii</i>, <i>Heliconia vaginalis</i>, <i>Hirtella racemosa</i>, <i>Inga</i> sp., <i>Jacquinia paludicola</i>, <i>Miconia</i> sp., <i>Mouriri exilis</i>, <i>Mouriri myrtilloides</i>, <i>Pachira aquatica</i>, <i>Psychotria glomerulata</i>, <i>Psychotria poeppigiana</i>, <i>Scleria bracteata</i>, <i>Swietenia macrophylla</i>, <i>Symphonia globulifera</i>, <i>Terminalia amazonia</i>, <i>Virola koschnyi</i>, <i>Vismia ferruginea</i>, <i>Vitex kuylenii</i>, <i>Vochysia hondurensis</i> and <i>Xylopia frutescens</i>. On richer soils <i>Pterocarpus officinalis</i> is found; on poorer soils more Melastomataceae and <i>Acoelorrhaphe wrightii</i>. Where this ecosystem comes close to the coast, <i>Anacardium occidentale</i> and <i>Byrsonima crassifolia</i> can be found.</p> 
References	<p>Meerman 1999a, Wright et al. 1959: 14,14a, 14b, 14c; Iremonger and Brokaw 1995: I.1.1.1.2.1.</p> <p>Picture top: Punta Gorda, Toledo district. J. Meerman</p> <p>Bottom: <i>Heliconia vaginalis</i>. Stann Creek district. J. Meerman</p>

UNESCO Classification code	<u>III.B.1.b.(f).P</u>
Name	<u>Deciduous broadleaf lowland riparian shrubland of the plains</u>
Altitude	< 50 m.
Geology and soil	On alluvial deposits. Outcrops of calcareous rock occur, but generally the alluvial deposits are deep and there is no bedrock visible.
Water regime	Mostly well drained
Rainfall	NA
Fire exposure	Frequently exposed to human induced fires.
Description	Found along riversides where disturbance may be natural, such as the displacement by a river after flooding, or it may be anthropogenic as when land is cleared and left fallow.
Frequent plant species	Tall graminoids (reeds, rushes, and sedges) mix with shrubs, and many types of ruderal communities.
