

Echinodermata Gr: spine skin

6500 spp all marine except for few estuarine, none freshwater

1) pentamerous radial symmetry (adults)

*larvae bilateral symmetrical

2) spines

3) endoskeleton

mesodermally-derived

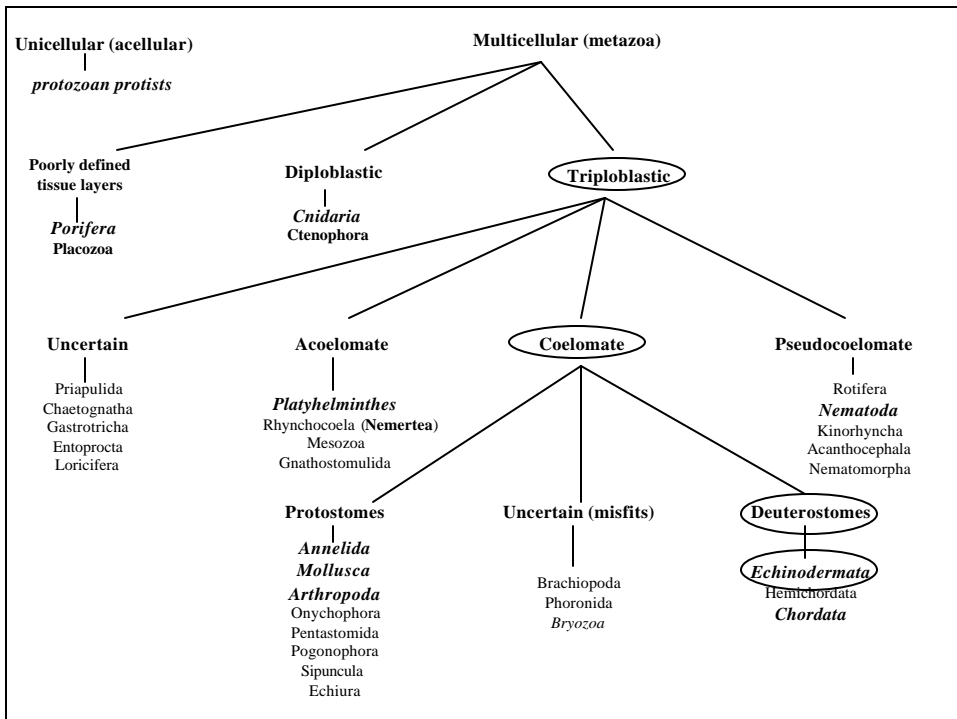

ossicles

calcareous plates

up to 95% CaCO_3 , up to 15% MgCO_3 , salts,
trace metals, small amount of organic materials

4) water vascular system (WVS)

5) tube feet (podia)

Chapter 14: Echinodermata

Classes:

- 1) Asteroidea (Gr: characterized by star-like)
1600 spp
- 2) Ophiuroidea (Gr: snake-tail-like)
2100 spp
- 3) Echinoidea (Gr: hedgehog-form)
1000 spp
- 4) Holothuroidea (Gr: sea cucumber-like)
1200 spp
- 5) Crinoidea (Gr: lily-like)
stalked – 100 spp
nonstalked, motile comatulid
(feather stars)- 600 spp

Asteroidea sea stars/starfish

arms not sharply marked off
from central star shaped disc

spines fixed

pedicellariae

ambulacral groove open

tube feet with suckers on oral side

anus/madrepore aboral

A

**B *Choriaster granulatus* scavenges
dead animals on shallow Pacific reefs**

C

**On the Great Barrier Reef, *Tosia queenslandensis*
browses encrusting organisms**

**D Crown-of-thorns star, *Acanthaster planci*
forages on corals**

Ophiuroidea brittle star/basket star

brittle star, *Ophiura lutkeni*

basket star, *Astrophyton muricatum*

arms separate from star shaped central disc

spines on arms

tube feet

without suckers

not used for locomotion

used for feeding

no pedicellariae

no anus

ambulacral groove closed & covered by ossicles

Figure 22.11

Echinoidea sea urchins, sea biscuits & sand dollars

globular/disc shape

endoskeletal ossicles fused

no arms

movable spines (ball & socket)

pedicellariae (3 jawed)

tube feet with suckers

ambulacral groove closed & covered by ossicles

Sea urchin, *Strongylocentrotus purpuratus*

B Sand dollar, *Encope micropora*

Figure 22.18

A Ten-lined pencil urchin, *Eucidaris metularia* from the Red Sea (retain ancestral characters from Paleozoic)

B Slate-pencil urchin, *Heterocentrotus mammillatus*

C *Colobocentrotus atraus*

D *Diadema antillarum* from West Indies & Florida

E *Astropyga magnifica*

Holothuroidea

sea cucumbers

cucumber shaped (bilateral symmetrical)

endoskeletal ossicles dispersed

no arms

no spines

no pedicellariae

tube feet with suckers

ambulacral groove closed & covered by ossicles

ossicles

Crinoidea sea lilies/feather stars

aboral attachment stalk of dermal ossicles

no spines

five branching arms with side branches (pinnules)

no pedicellariae

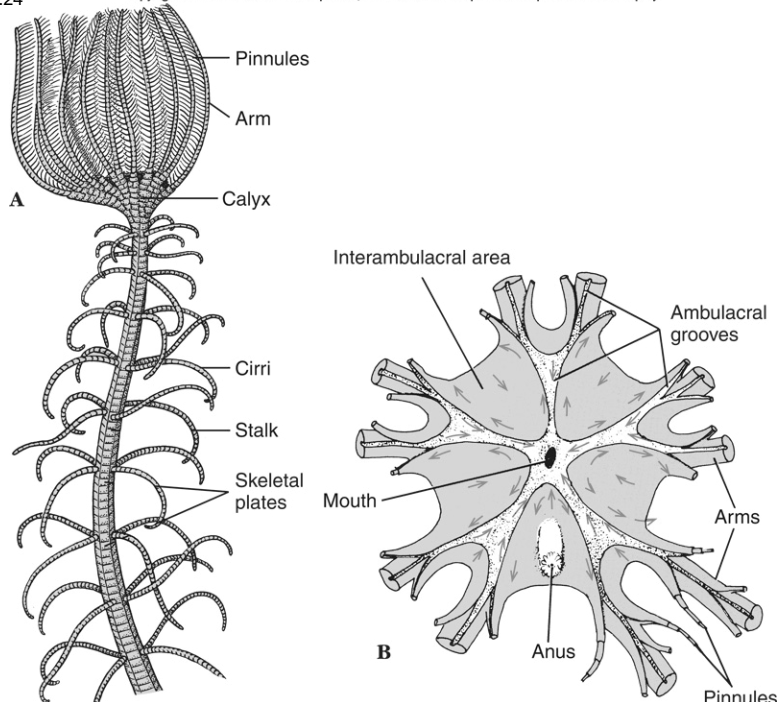

ciliated ambulacral groove on oral surface

tube feet tentacle-like on oral surface for food collecting

anus on oral surface

Figure 22.24

Class: Concentricycloidea
sea daisies: only 2 spp
1 cm diameter 1000 m deep New Zealand

Figure 22.28

Echinoderm Larvae

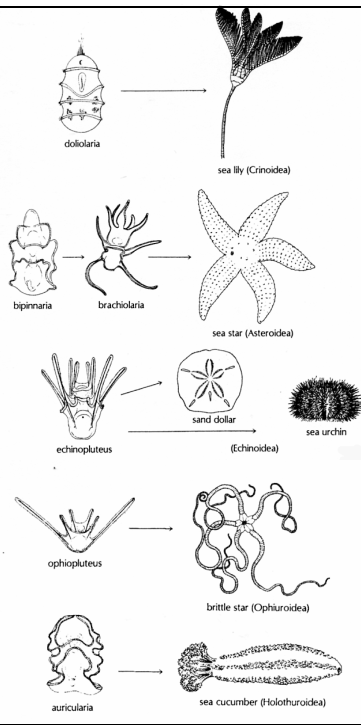

Figure 22.09 Copyright © The McGraw-Hill Companies, Inc. Permission required for reproduction or display.

Importance of Echinoderms

I. Developmental biology

sea urchin egg/sperm → elucidate the jelly membrane surrounding a recently fertilized egg

II. Ecology keystone species

Kelp Forest/Mussel bed Communities

Intermediate Disturbance Hypothesis

Disturbance ← sea stars/sea urchins
