IEVADS

Šajā *Latvijas Veģetācijas* izdevumā ir apkopoti dati par četrus Latvijas rajonus (Tukums, Valka, Valmiera, Ventspils) parku un dendroloģisko stādījumu kokaugu sugu sastāvu, tā noslēdzot publikāciju sēriju par 20. gs. beigu posma (1972 - 2000 g.) parku un dendroloģisko stādījumu dendrofloras inventarizācijas rezultātiem. Inventarizācijas materiāli publicēti divos periodos (1. att.). No 1985. gada līdz 1991. gadam inventarizācijas materiāli par 11 rajoniem publicēti Latvijas zinātniski tehniskās informācijas institūta *Ekspresinformācijas* sērijā, kā arī šī institūta žurnālā *Mežsaimniecība un Mežrūpniecība*, bet no 2003. gada līdz 2007. gadam periodiskajā izdevumā *Latvijas Veģetācija* publicēti materiāli par 15 rajoniem. Atsevišķā izdevumā 1988. gadā apkopoti dendrofloras materiāli par Rīgu.

TUKUMA RAJONA DENDROLOĢISKO STĀDĪJUMU KOKI UN KRŪMI

Nacionālais botāniskais dārzs, Dendrofloras laboratorija, Miera iela 1, LV-2169
e-pasts: dendroflora@nbd.apollo.lv

Darbā apkopotas ziņas par dendroloģiskajiem stādījumiem Tukuma rajona 263 objektos. Pētījumi veikti no 1977. līdz 2000. gadam. Konstatēti 71 vietējie un 802 introducētie koku un krūmu taksoni. Minētas to atrašanās vietas, kokiem doti izmēri.

Raksturvārdi: vietējās sugas, svešzemju sugas, koki un krūmi.

IEVADS

Tukuma rajonā koki un krūmi inventarizēti pilsētu un lauku parkos, dendrārijos, stādījumos pie mājām un mežniecībās, stādaudzētavās, kā arī atsevišķās privātās kolekcijās (1.att.). Apzināti arī savvaļas dižkoki, it īpaši te augošie ozoli.

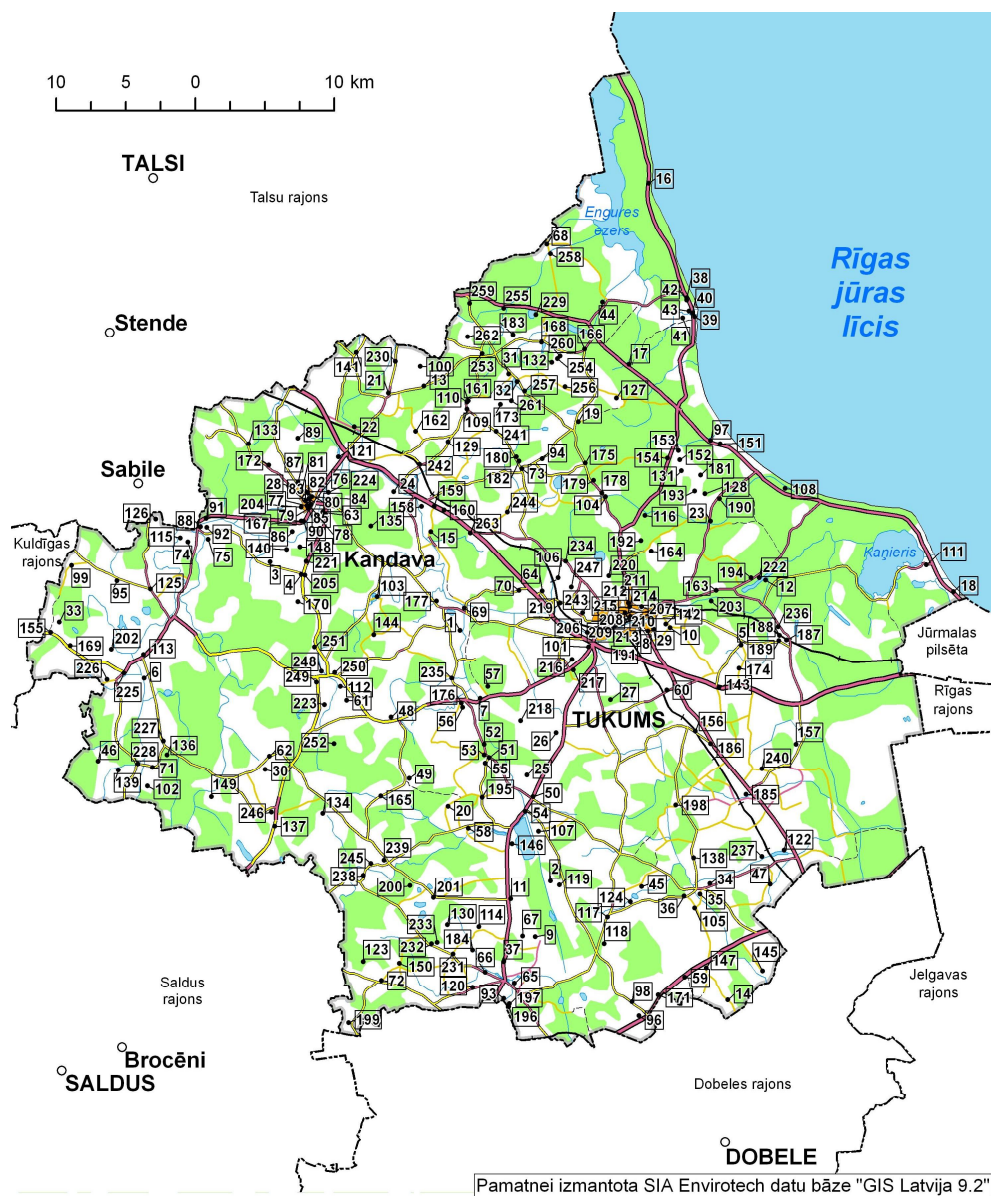

Plašāka rajona dendrofloras izpēte R. Cinovska vadībā uzsākta 1977. g. Stādījumi apzināti arī turpmākajos gados, pie kam vērtīgākie laikā no 1991.-1993. g. pildot Kultūras ministrijas pasūtījumu, inventarizēti atkārtoti. Apkopotas ziņas par 263 dendroloģiskajos stādījumos konstatētajiem 873 taksoniem, t. sk. 71 vietējo un 802 introducētiem.

Tukuma rajons introducēto koku un krūmu taksonu skaita ziņā ir viens no bagātākajiem Latvijā. Te ir vairāk kā 20 veco parku, kuros koki ir sasnieguši lielus izmērus.

Vāgnera dendrārijā aug tādi retumi, kā *Picea rubens*, *Acer rubrum*, *Betula papyrifera* var. *subcordata*, *Betula pendula* 'Fastigiata', *Fagus sylvatica* 'Laciniata', *Fagus sylvatica* 'Pendula', *Malus mandshurica*, *Quercus benderi*, *Quercus coccinea*, *Quercus petraea*, *Tilia tomentosa*, *Ulmus x hollandica* 'Vegeta' u.c.

Taksonu skaita ziņā visbagātākais ir Igora Medņa izveidotais Lāčupes dendrārijs, taču tur stādījumi ir vēl jauni un ne visi saglabājušies.

Starp retāk audzētiem kokiem jāmin *Abies mayriana*, *Fagus sylvatica* 'Purpurea Tricolor' un *Ulmus procera* 'Purpurea', kas aug Tukuma "Lauksargos"; *Pinus ponderosa* var. *scopulorum* Bērzmuižā; *Aesculus x hybrida* Veclaukos; *Carya laciniata* un *Corylus colurna* Pūrē; *Juglans mandshurica* Raudā un Vānē; *Phellodendron amurense* Variēbā; *Malus floribunda* un *Phellodendron sachalinense* Rūmenē; *Populus simonii* Aizupē, Mariņmuižā, Šlokenbekā un Tukuma centra apstādījumos; *Tilia x moltkei* 'Spectabilis' Kandavas "Remesos" u.c.

Fig.1. Dendrological objects in Tukums District (numbers of the map correspond with the numbers in the list of dendrological objects).

Lielas Veimutpriedes aug Aizdirē, Durbē, Strutelē, Veclaukos un Zemītē, bet lielākā Kanādas tsuga Valdeķos. Rajona parkos atrodama tikai Latvijas rietumdaļai raksturīgā kalnu kļava un tās šķirnes un parastais dižskābardis un tā šķirnes.

Inventarizācija dendroloģiskajos stādījumos veikta pēc vienotas Raimonda Cinovska izstrādātas metodes (R. Cinovskis u.c. 1986. *Latvijas dendroloģiskās vērtības*. Rīga, "Zinātne").

Uzskaitīti vietējie un introducētie koku un krūmu taksoni (sugas, pasugas, varietātes, formas, šķirnes). Minētas atradnes, dots koku skaits un daļai koku (introducētās sugas un dižkoki) arī izmēri: koka augstums, stumbra caurmērs (1,3 m augstumā) un apkārtmērs (ja stumbra caurmērs lielāks par 1 m).

Lietoti šādi saīsinājumi (alfabētiskā secībā): a. – aleja; apst. – apstādījumi; atv. – atvases; bij. – bijušais; cv. – šķirne; d – stumbra caurmērs krūšaugstumā (cm); $d_{0,9}$ – stumbra caurmērs citā (šai gadījumā 0,9 m) augstumā; d_{max} – resnākā koka stumbra caurmērs (cm) koku grupā; dzīvž. – dzīvžogs; fragm. – fragments; h – koka augstums (m); h_{max} – augstākā koka augstums (m) koku grupā; kv. – meža kvartāls; l. t. – lauku teritorija; m. – māja; m.m. – mācītājmāja (mācītājmuiža); n – koku skaits ir liels (vairāk par 50), bet precīzi nav zināms; p – stumbra apkārtmērs (cm); $p_{1,8}$ – stumbra apkārtmērs citā (šai gadījumā 1,8 m) augstumā; p. – parks; pag. – pagasts.

Šajā publikācijā dots rajonā inventarizēto stādījumu alfabētiskais rādītājs (tajā ir ziņas par stādījumu raksturu, vietējo un introducēto taksonu skaitu objektā (izcelti), inventarizācijas datumu) un taksonu saraksts.

Taksonu sarakstā aiz latīniskā nosaukuma ir latviskais nosaukums (sugām, pasugām un dažkārt arī šķirnēm). Pasvītrotie skaitļi ir kārtas numuri stādījumu alfabētiskajā rādītājā. Iekavās dots koku skaits, caurmērs (ja kokam ir vairāki stumbri, caurmērs rakstīts šādi: 15/17/50) un augstums, kā arī dažādas piezīmes.

Trees and Shrubs of the Dendrological Objects in Tukums District

Maija Bice, Dzintra Knape, Ināra Bondare, Dagnija Šmite

Summary

Keywords: indigenous species, exotic species, trees, shrubs, Tukums District.

The inventory of indigenous and exotic tree and shrub species in Tukums District was carried out in 1974 – 2000. In total, 263 dendrological objects were inventoried and 71 indigenous and 802 exotic tree and shrub taxa were registered.

VALKAS RAJONA DENDROLOĢISKO STĀDĪJUMU KOKI UN KRŪMI

Maija Bice, Dzintra Knape, Dagnija Šmite

Nacionālais botāniskais dārzs, Dendrofloras nodaļa, Miera iela 1, LV-2169
e-pasts: dendroflora@nbd.apollo.lv

Darbā apkopotas ziņas par dendroloģiskajiem stādījumiem 135 Valkas rajona objektos. Pētījumi veikti no 1972. līdz 2000. gadam. Konstatēti 53 vietējie un 318 introducētie koku un krūmu taksoni. Minētas to atrašanās vietas, kokiem doti izmēri.

Raksturvārdi: vietējās sugas, svešzemju sugas, koki un krūmi.

IEVADS

Valkas rajonā laikā no 1975. līdz 2000. g. dendroloģiskie stādījumi inventarizēti 135 objektos – pilsētu un lauku parkos un apstādījumos, kā arī Silvas dendrārijā (1.att.). Nozīmīgākie stādījumi inventarizēti atkārtoti, pildot Kultūras ministrijas pasūtījumu. Kopumā apzināti 372 taksoni, t. sk. 53 savvaļas un 318 introducēti.

Rajonā nav daudz parku, pie tam tie neizceļas ar sugu daudzveidību. Sugām bagātākie stādījumi ir Silvas dendrārijā, kā arī Smiltenes, Mēra, Aumeisteru un Paksmanes parkā.

Valkas rajona vecākajos stādījumos ir salīdzinoši daudz lielus izmērus sasniegušu skujkoku, kā *Abies balsamea*, *A. x phanerolepis*, *A. sibirica*, *Larix decidua*, *L. kaempferi*, *L. ledebourii*, *Pinus sibirica*, *P. strobus*, *Pseudotsuga menziesii*. *Larix x polonica* aug Ēveles mācītājmuiža, *Larix sibirica* Lugažu parkā, bet *Tsuga canadensis* Smiltenes slimnīcas parkā.

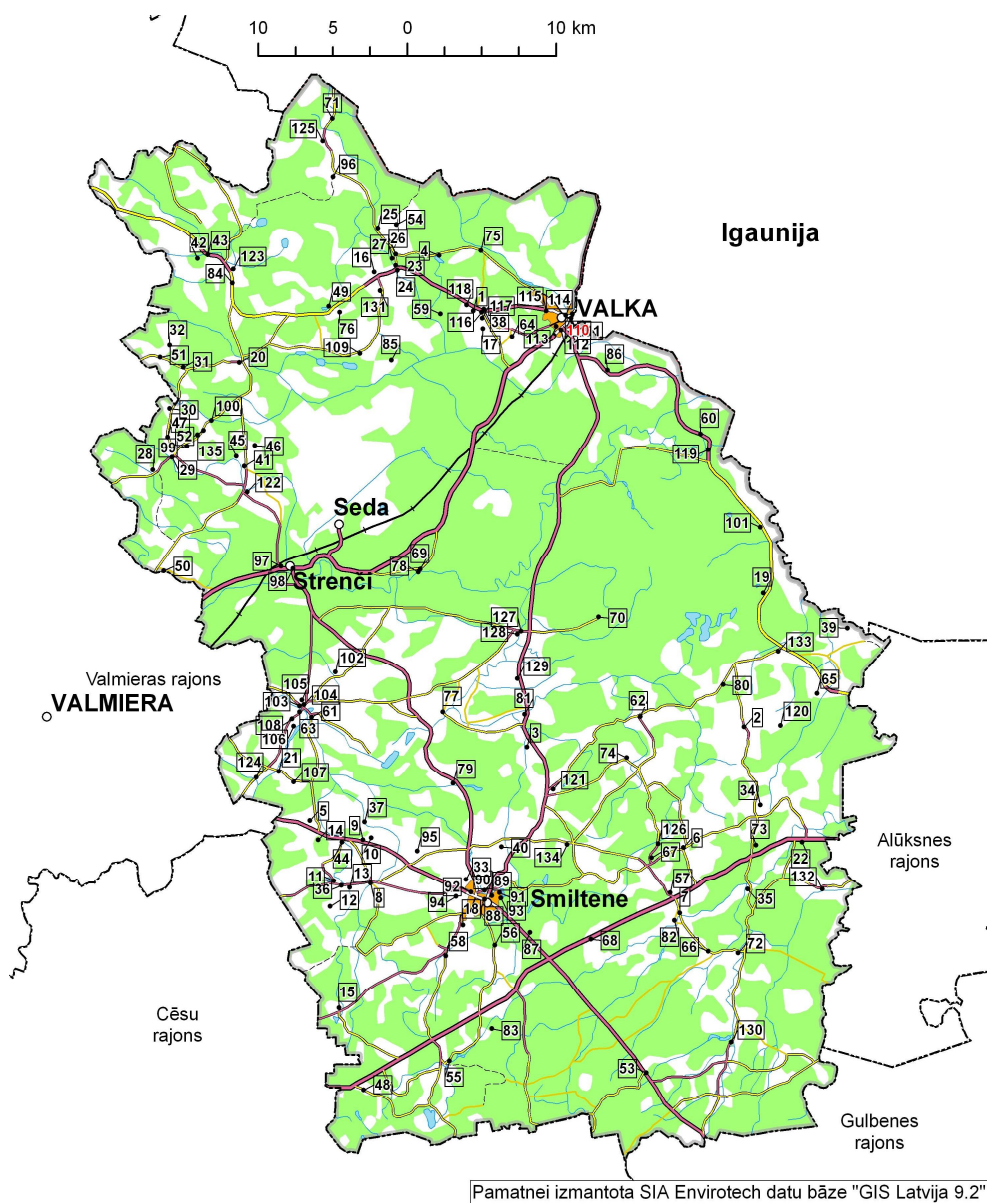

Rajonā maz stādīti citur tik bieži atrodamie kadiķi un pacipreses – viena savara aug tikai Valkā, centra apstādījumos.

Rajonā atrodamas tādas dekoratīvas un lēnaudzīgas papeļu sugas, kā *Populus laurifolia*, *P. simonii* (Aumeisteros) un *P. suaveolens*.

Smiltenes parkā aug liels skābardis, kā arī papīra bērzs un stepju goba. Aumeisteru parkā aug 2 Amerikas gobas, bet Mēra parkā stepju goba.

Inventarizācija dendroloģiskajos stādījumos veikta pēc Raimonda Cinovska izstrādātas metodes (R. Cinovskis u.c. 1986. *Latvijas dendroloģiskās vērtības*. Rīga, "Zinātne").

Uzskaitīti vietējie un introducētie koku un krūmu taksoni (sugas, pasugas, varietātes, formas, šķirnes). Minētas atradnes, dots koku skaits un daļai koku (introducētās sugas un dižkoki) arī izmēri: koka augstums, stumbra caurmērs (1,3 m augstumā) un apkārtmērs (ja stumbra caurmērs lielāks par 1 m).

1. att. Valkas rajona dendroloģiskie objekti (objektu numuri kartē atbilst to numuriem dendroloģisko objektu sarakstā).

Fig.1. Dendrological objects in Valka District (numbers of the map correspond with the numbers in the list of dendrological objects).

Lietoti šādi saīsinājumi (alfabētiskā secībā): - a. – aleja; apst. – apstādījumi; atv. – atvases; bij. – bijušais; cv. – šķirne; d – stumbra caurmērs krūšaugstumā (cm); $d_{0,7}$ – stumbra caurmērs citā (šai gadījumā 0,7 m) augstumā; d_{max} – resnākā koka stumbra caurmērs (cm) koku grupā; dzīvž. – dzīvžogs; fragm. – fragments; h – koka augstums (m); h_{max} – augstākā koka augstums (m) koku grupā; kv. – meža kvartāls; l. t. – lauku teritorija; m. – māja; m.m. – mācītājmāja (mācītājmuiža); n – koku skaits ir liels (vairāk par 50), bet precīzi nav zināms; p – stumbra apkārtmērs krūšaugstumā (cm); $p_{0,7}$ – stumbra apkārtmērs citā (šai gadījumā 0,7 m) augstumā; p. – parks; pag. – pagasts.

Šajā publikācijā dots rajonā inventarizēto stādījumu alfabētiskais rādītājs (tajā ir ziņas par stādījumu raksturu, vietējo un introducēto taksonu skaitu objektā (izcelti), inventarizācijas datumu) un taksonu saraksts.

Taksonu sarakstā aiz latīniskā nosaukuma ir latviskais nosaukums (sugām, pasugām un dažkārt arī šķirnēm). Pasvītrotie skaitļi ir kārtas numuri stādījumu alfabētiskajā rādītājā. Iekavās dots koku skaits, caurmērs (ja kokam ir vairāki stumbri, caurmērs rakstīts šādi: 20/35/40) un augstums, kā arī dažādas piezīmes.

Trees and Shrubs of the Dendrological Objects in Valka District

Maija Bice, Dzintra Knape, Dagnija Šmite

Summary

Keywords: indigenous species, exotic species, trees, shrubs, Valka District.

The inventory of indigenous and exotic tree and shrub species in Valka District was carried out in 1974 – 2000. In total, 135 dendrological objects were inventoried and 53 indigenous and 318 exotic tree and shrub taxa were registered.

VALMIERAS RAJONA DENDROLOĢISKO STĀDĪJUMU KOKI UN KRŪMI

Maija Bice, Dzintra Knape, Dagnija Šmite

Nacionālais botāniskais dārzs, Dendrofloras nodaļa, Miera iela 1, LV-2169
e-pasts: dendroflora@nbd.apollo.lv

Darbā apkopotas ziņas par dendroloģiskajiem stādījumiem 205 Valmieras rajona objektos. Pētījumi veikti no 1973. līdz 1996. gadam. Konstatēti 55 vietējie un 314 introducēti koku un krūmu taksoni. Minētas to atrašanās vietas, kokiem doti izmēri.

Raksturvārdi: vietējās sugas, svešzemju sugas, koki un krūmi.

IEVADS

Valmieras rajonā koki un krūmi inventarizēti pilsētu (Mazsalacas, Rūjienas, Valmieras) un lauku parkos un apstādījumos, kā arī stādījumos pie mežniecībām (1.att.). Apzināti arī te augošie dižkoki.

Plašāki pētījumi R. Cinovska vadībā veikti 1973. un 1983. gadā. Vērtīgākie stādījumi, pildot Kultūras ministrijas pasūtījumu, 1991. un 1994. gadā inventarizēti atkārtoti.

Apkopotas ziņas par 205 dendroloģiskajiem objektiem, kuros apzināti 369 taksoni, t. sk. 55 vietējie un 314 introducēti.

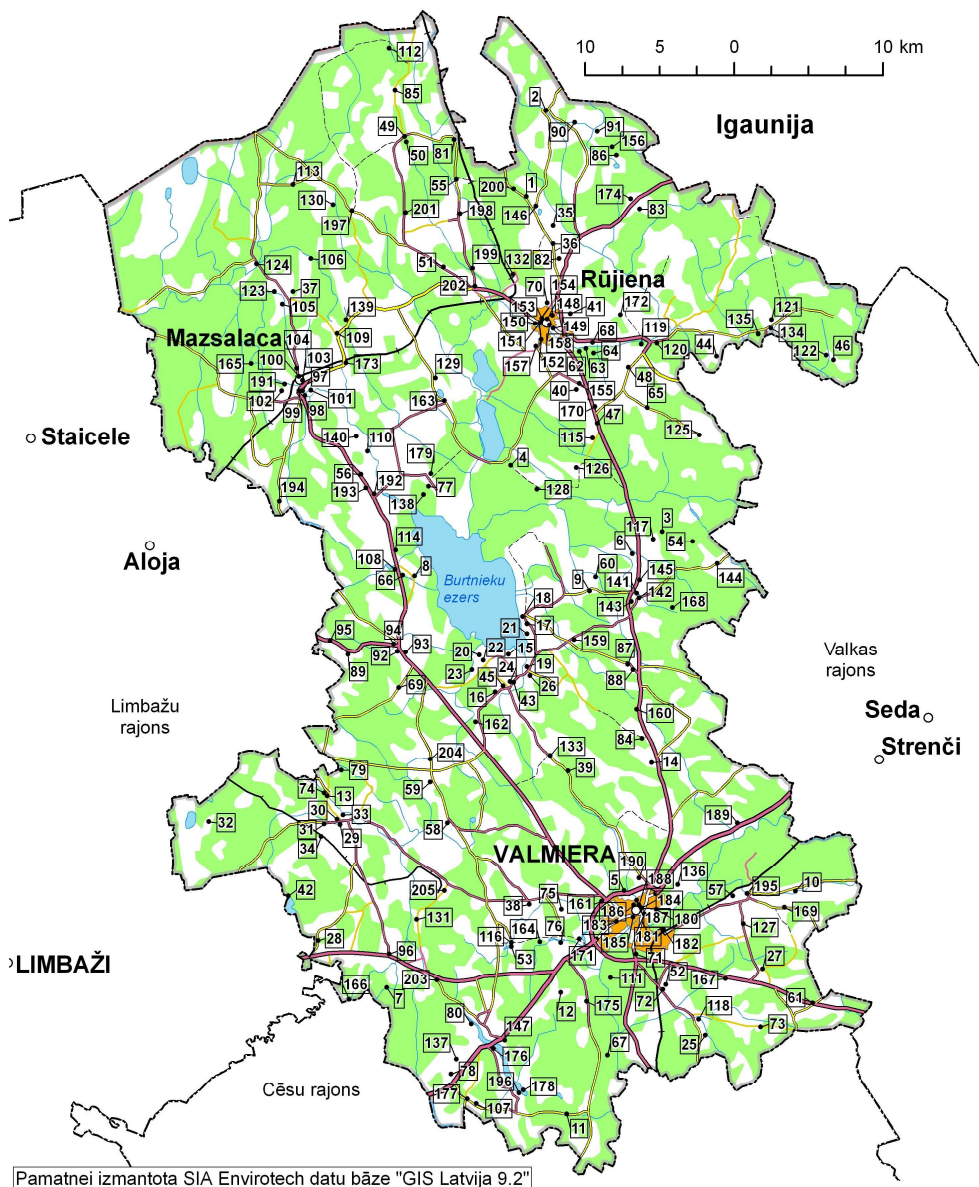

Rajonā apzināti lieli ozoli un liepas. Pie Burtnieku ezera (Jēkabkalnā un Mīlītē) atrasta Latvijā reti sastopamā Šerarda roze.

Ar introducentiem bagātākie ir Brenguļu “Čiekuržu” dendroloģiskie stādījumi, kā arī parki Endzelē, Burtniekos, Kocēnos, Valtenbergā, Naukšēnos un Vecatē.

Rajonā ir bagātīgi skujkoku stādījumi. Te daudz balzama, garzvīņu un Sibīrijas balteglu, kā arī Eiropas un Ledebūra lapegļu. Salīdzinoši bieži stādītas Polijas lapegle, Sibīrijas ciedrupriede un Veimutpriede.

Stādījumus Brenguļu “Čiekuržos” savās lauku mājās 20. gs. 20. gados uzsācis prof. A. Zāmelis. Vēlāk šie stādījumi papildināti. 1991. g. te konstatēti 55 svešzemju izcelsmes taksoni. No retāk stādītiem jāmin skujkoki – Gmelina un Sibīrijas lapegle, balzama un Sibīrijas baltegles hibrīds, Engelmaņa un Serbijas egle, asās egles šķirnes.

Burtnieku parkā aug *Betula papyrifera*, *B. pendula* ‘Crispa’, *Fraxinus pennsylvanica* ‘Aucubaefolia’, *Ulmus minor*, Rencēnmuižā – *Aesculus glabra*. Endzelē ir reti audzētas krustābeles - *Crataegus chlorosarca*, *C. maximowiczii*, *C. remotilobata* un *C. rivularis*, kā arī *Cydonia oblonga*.

Fig.1. Dendrological objects in Valmiera District (numbers of the map correspond with the numbers in the list of dendrological objects).

Lietoti šādi saīsinājumi (alfabētiskā secībā): a. – aleja; apst. – apstādījumi; atv. – atvases; bij. – bijušais; cv. – šķirne; d – stumbra caurmērs krūšaugstumā (cm); $d_{0,7}$ – stumbra caurmērs citā (šai gadījumā 0,7 m) augstumā; d_{vid} – vidējā koka stumbra caurmērs (cm) koku grupā; dzīvž. – dzīvžogs; fragm. – fragments; h – koka augstums (m); h_{vid} – vidējā koka augstums (m) koku grupā; kv. – meža kvartāls; lit. – liters; l. t. – lauku teritorija; m. apst. – māju apstādījumi; m.m. – mācītājmāja (mācītājmuiža); n – koku skaits, ja koku ir daudz (vairāk par 50), bet precīzs skaits nav zināms; p – stumbra apkārtmērs (cm); p. – parks; pag. – pagasts.

Šajā publikācijā dots rajonā inventarizēto stādījumu alfabētiskais rādītājs (tajā ir ziņas par stādījumu raksturu, vietējo un introducēto taksonu skaitu objektā (izcelti), inventarizācijas datumu) un taksonu saraksts.

Taksonu sarakstā aiz latīniskā nosaukuma ir latviskais nosaukums (sugām, pasugām un dažkārt arī šķirnēm). Pasvītrotie skaitļi ir kārtas numuri stādījumu alfabētiskajā rādītājā. Iekavās dots koku skaits, caurmērs (ja kokam ir vairāki stumbri, caurmērs rakstīts šādi; 19/25/30) un augstums, kā arī dažādas piezīmes.

Keywords: indigenous species, exotic species, trees, shrubs, Valmiera District.

The inventory of indigenous and exotic tree and shrub species in Valmiera District was carried out in 1974 – 1996. In total, 205 dendrological objects were inventoried and 55 indigenous and 314 exotic tree and shrub taxa were registered.

VENTSPILS RAJONA DENDROLOĢISKO STĀDĪJUMU KOKI UN KRŪMI

Maija Bice, Ināra Bondare, Dzintra Knape, Dagnija Šmite

Nacionālais botāniskais dārzs, Dendrofloras laboratorija, Miera iela 1, LV-2169
e-pasts: Dendroflora@nbd.apollo.lv

Darbā apkopotas ziņas par dendroloģiskajiem stādījumiem 271 Ventspils rajona objektā. Pētījumi veikti laikā no 1977. līdz 2000. gadam. Konstatēti 74 vietējie un 372 introducētie koku un krūmu taksoni. Minētas to atrašanās vietas, doti koku izmēri.

Raksturvārdi: vietējās sugas, svešzemju sugas, koki un krūmi.

IEVADS

Ventspilī un Ventspils rajonā laikā no 1976. līdz 2000. g. dendroloģiskie stādījumi inventarizēti 271 objektā – pilsētu un lauku parkos, stādījumos pie mājām, baznīcām, kapsētās u.c. (1.att.). Inventarizēti arī atsevišķi meža kvartāli.

Rajonā plašākie pētījumi R. Cinovska vadībā veikti 1977. un 1983. g., bet Ventspilī 1996., 1997., un 2000. g. (M. Bice, I. Bondare).

Rajonā ir tikai 16 lauku parki. Lielākā kokaugu daudzveidība ir Popes, Zūru, Tārgales, Leču, Vārves un Zīru parkā.

Ventspilī pavisam inventarizēti 170 objekti – arī Būšnieku ezera krasts un jūras piekraste, kas ir Ventspils mežniecības pārziņā.

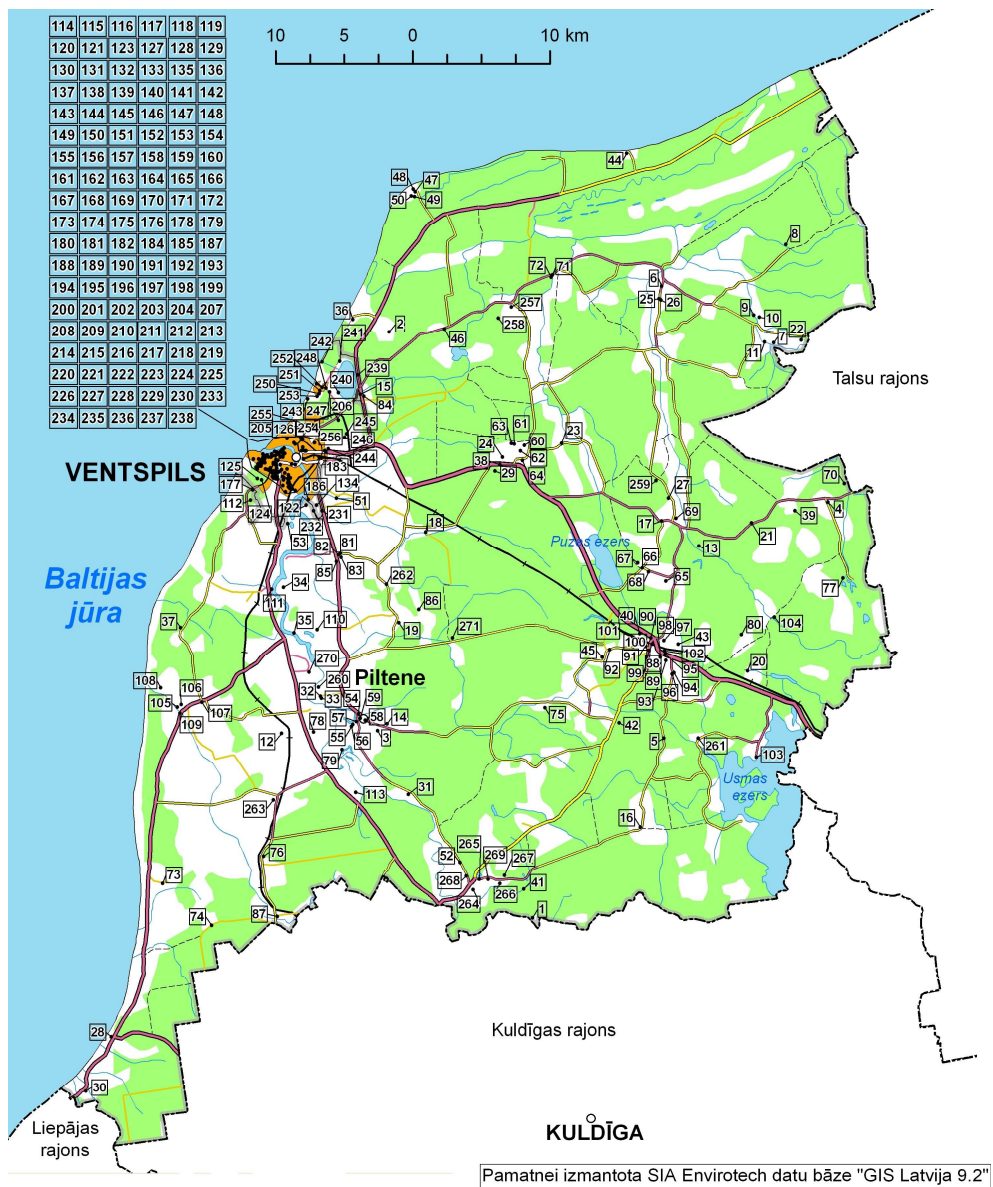

Ventspilī aug tādi dendroloģiski retumi, kā lielākā Latvijā *Tilia tomentosa* ‘Pendula’, *Ulmus glabra* ‘Pendula’, kas ir viens no četriem Latvijā apzinātajiem kokiem, *Quercus robur* ‘Strypemonde’ u.c. Te bieži stādīts un labi ražo *Juglans regia*. Gar ēku sienām stādītas efeju (*Hedera*) sugas un šķirnes.

Ventspils ziemeļdaļas zaļajā zonā Staļģenē, jūras piekrastē un pie Būšnieku ezera pārgājuši savvaļā *Sorbus intermedia* un *S. hybrida*. Abas sugas hibridizē ar parasto pīlādzi. Šie pīlādži aug arī ceļmalās un meža klajumos.

Te aug arī aizsargājamas krūmu sugas, kā Pallasas sausserdis, parastā purvmirte un ložņīgais kārklis.

Inventarizācija dendroloģiskajos stādījumos veikta pēc vienotas R. Cinovska izstrādātas metodes (R. Cinovskis u.c. 1986. *Latvijas dendroloģiskās vērtības*. Rīga, “Zinātne”).

Uzskaitīti vietējie un introducētie koku un krūmu taksoni (sugas, pasugas, varietātes, formas, šķirnes). Minētas atradnes, dots koku skaits un daļai koku (introducētās sugas un dižkoki) arī izmēri: koka augstums, stumbra caurmērs (1,3 m augstumā) un apkārtmērs (ja stumbra caurmērs lielāks par 1 m).

1. att. Ventspils rajona dendroloģiskie objekti (objektu numuri kartē atbilst to numuriem dendroloģisko objektu sarakstā).

Fig.1. Dendrological objects in Ventspils District (numbers of the map correspond with the numbers in the list of dendrological objects).

Lietoti šādi saīsinājumi (alfabētiskā secībā): a. – aleja; apst. – apstādījumi; atv. – atvases; bij. – bijušais; cv. – šķirne; d – stumbra caurmērs krūšaugstumā (cm); $d_{0,2}$ – stumbra caurmērs citā (šai gadījumā 0,2 m) augstumā; d_{max} – resnākā koks stumbra caurmērs (cm) koku grupā; dzīvž. – dzīvžogs; h – koka augstums (m); h_{max} – augstākā koka augstums (m) koku grupā; kv. – meža kvartāls; lit. – litrs; l. t. – lauku teritorija; m. apst. – māju apstādījumi; m.m. – mācītājmāja (mācītājmuiža); n – koku skaits, ja koku ir daudz (vairāk par 50), bet precīzs skaits nav zināms; p – stumbra apkārtmērs krūšaugstumā (cm); $p_{0,8}$ – stumbra apkārtmērs citā (šai gadījumā 0,8 m) augstumā; p. – parks; pag. – pagasts.

Šajā publikācijā dots rajonā inventarizēto stādījumu alfabētiskais rādītājs (tajā ir ziņas par stādījumu raksturu, vietējo un introducēto taksonu skaitu objektā (izcelti), inventarizācijas datumu) un taksonu saraksts.

Taksonu sarakstā aiz latīniskā nosaukuma ir latviskais nosaukums (sugām, pasugām un dažkārt arī šķirnēm). Pasvītrotie skaitļi ir kārtas numuri stādījumu alfabētiskajā rādītājā. Iekavās dots koku skaits, caurmērs (ja kokam ir vairāki stumbri, caurmērs rādīts šādi: 15/19/40) un augstums, kā arī dažādas piezīmes.
