

The Drought Devils collection features plants well adapted to California gardens and are classified as needing low to moderate amounts of supplemental summer water. This group primarily includes natives from California, the Mediterranean, and Australia - that thrive in the Bay Area's summer-dry climate.

Drought Devils are drought-tolerant once established assuming proper soil structure and standard seasonal precipitation. These plants will need regular water for about two dry seasons in order to develop strong stems and extensive root systems. By the third dry season, these plants should be able to thrive with low amounts of supplemental water, except for times of extreme hot weather or prolonged drought.
