Abstract / Rezumat

First contribution to the study of lepidopteran fauna (Insecta: Lepidoptera) from Stânca, Iași (Romania)

With this papers the authors present a first contribution to the knowledge of lepidopteran fauna (Insecta: Lepidoptera) from Stânca, Comarna, Iași County. All data from Stânca, Comarna, Iași County were gathered mostly in 2014. The locality is situated in North-East of Romania near Prut River, at cca 20 km South-East of Iași city, in the Moldavian Plain and is part of Continental biogeographical region. In this first year of study a number of 342 species of Lepidoptera were recorded. The following species have been recorded for the first time in the region of Moldova: *Ancylolomia tentaculella* (Hübner, 1796), *Chrysodeixis chalcites* (Esper, 1789), *Cucullia xeranthemi* Boisduval, 1840, *Cucullia gnaphalii* (Hübner, 1813), *Cucullia dracunculi* (Hübner, 1813) and *Mythimna congrua* (Hübner, 1817).

Key words: Lepidoptera, new records, distribution, faunistic, Romania.

Prima contribuție la studiul faunei de lepidoptere (Insecta: Lepidoptera) din zona localității Stânca (jud. Iași) (România)

Prin această lucrare autorii prezintă pentru prima oară o contribuție asupra faunei de lepidoptere (Insecta: Lepidoptera) din zona localității Stânca (comuna Comarna, județul Iași). Datele din zona localității Stânca au fost colectate mai ales în 2014. Localitatea este situată în NE-ul României lângă Râul Prut, la ccca 20 km SE de localitatea Iași, în Câmpia Moldovei și este parte a bioregiunii continentale. În acest prim an de studiu au fost găsite 342 specii de fluturi. Următoarele specii au fost colectate pentru prima oară în regiunea Moldova: *Ancylolomia tentaculella* (Hübner, 1796), *Chrysodeixis chalcites* (Esper, 1789), *Cucullia xeranthemi* Boisduval, 1840, *Cucullia gnaphalii* (Hübner, 1813), *Cucullia dracunculi* (Hübner, 1813) și *Mythimna congrua* (Hübner, 1817).

Cuvinte cheie: Lepidoptera, date noi, distribuție, faunistică, România.

Introduction

Fauna of Moldova region is relatively poorly known, with the exception of the

northern part of the region where new researches are done continuously (Székely, 1992; Corduneanu 2014; Corduneanu & all, 2007; Corduneanu & all, 2011, 2012, 2013,

2015), almost everything else is known today is from specimens stored in Alexei Alexinschi collection (Nemeş & Dănilă, 1970; Nemeş & Voicu, 1971 and Nemeş & Voicu, 1973).

Stânca locality is situated in the middle of the region near the Prut River (at cca 20 km South-East from Iaşi city) in the continental bioregion. The researched area is a mosaic of different habitats: wet areas (most of them man made and with water only in the spring), steppe like area (grazed or not), shrubs, patches of forests with a very high diversity (mainly from plantations). The altitude is in average of cca 80 m, with a maximum of cca 130 m and a minimum of cca 25 m. The terrain is very rough with a lot of forms of erosion and small depression that fill with water in the spring and contribute to the biological diversity of the region. The climate in the area is characterized by almost continuous winds all year long mostly from south-west or north-east that contribute to a dry climate, precipitation almost only in spring and autumn and with summers that are very hot and dry.

Material and methods

Lepidoptera species were observed, photographed and/or collected from October 2013 to October 2014.

Lepidoptera species were collected using active methods: in day time using an entomological net on transects and at night were attracted with the help of mercury lamp at light sheet 160W lamp. Also passive methods were used; self collecting traps for night flying species, for this being used a trap with a tube of 12W UV (ultraviolet light). Specimens were photographed in studio with various lenses appropriate for the specimen size and with two studio flashes. The killing of collected specimens was done with vapours of ethyl acetate in a glass jar (Rakosy, 2013) and, for some species that cannot be reliably identified based exclusively on wing morphology, a genitalia was prepared. The process for genitalia preparation had few steps: maceration (at cold or boiling) in 10% potassium hydroxide, followed by cleaning and examination under a stereomicroscope and finally storage in tubes with glycerine for future reference (Clarke, 1941; Robinson, 1976). Material collected is stored in authors

collections but also in several others collections: Carol Bere (Cluj-Napoca, Romania), Marius Aurelian (Buzau, Romania), Viorel Ungureanu (Buzau, Romania), Yasunori Kishida (Japan), Jean Haxaire (France) and Jorma Pets (Estonia).

Main collecting spot for Stânca is at the following coordinates: 47.0698°N and 27.8038°E, at an altitude of 50 m.

Identification was done with several books (Rakosy, 1996 for Noctuidae; Rakosy, 2013 for Rhopalocera; Koch, 1991 Macrolepidoptera in general; Pyraloidea with Slamka, 2006, 2008 & 2010 and Geometridae with Hausmann, 2001, 2004, Hausmann & Viidalepp, 2012 and Mironov, 2003).

Presence or absence in the region was checked mainly with Rakosy & all, 2003 but also with new published works (Rakosy & Goia, 2006). Red List status was checked with Rakosy & all, 2003.

Taxonomic names and classification was the one used in FaunaEuropea website (Jong & all, 2014).

In this first contribution only species that belongs to Macrolepidoptera and few Microlepidoptera (Hepialidae, Peleopodidae, Limacodidae, Cossidae, Carposinidae and Pyraloidea) were recorded. Day flying species were only marginally observed, this being the reason that for now only few species are recorded. More specimens that belong to Microlepidoptera species are collected and determination is in work and will be the subject of future works.

Results and discussions

In the area of Stânca locality 342 species of Lepidoptera were observed, photographed and collected from October 2013 to October 2014 (see Table 1). Abbreviations (in “Observations/Red List” column) used in table are: C - collected, P - photographed, O - observed, * - rare species or known only from old data for the region, ** - new species for the region, ! - species of conservative interest, CR - critical endangered, EN - endangered, VU - vulnerable, NT - near threatened, DD - data deficient and LC - least concern.

The order of species and numbers are the ones used in Rakosy & all, 2003 with the exception of the species grouped in family

Erebidae. *Cilix asiatica* A. Bang-Haas, 1907 and *Acontia candelaria* (Hübner, 1831) are

without number as those were not yet known from Romania in 2003.

Table 1

Lepidoptera species collected in Stâncă locality area from October 2013 to October 2014

From the Stâncă area 6 species are new for Moldova region: *Ancylolomia tentaculella* (Hübner, 1796), *Chrysodeixis chalcites* (Esper, 1789), *Cucullia xeranthemi* Boisduval, 1840, *Cucullia gnaphalii* (Hübner, 1813), *Cucullia dracunculi* (Hübner, 1813) and *Mythimna congrua* (Hübner, 1817).

Also other 53 species are rare species for the region known only from old data, this being marked with * in the table.

In Stâncă area were found 4 species of Lepidoptera which are of conservative interest, Natura 2000 species: *Proserpinus proserpina* (Pallas, 1772), *Hyles hippophaes* (Esper, 1789), *Zerynthia polyxena* (Denis & Schiffermüller, 1775) and *Euplagia quadripunctaria* (Poda, 1761).

Below we will briefly discuss some taxons that we consider to be of special interest for the region.

Ancylolomia tentaculella (Hübner, 1796) (Crambidae) (fig.1)

This species is new for the region. Many specimens were observed in July and August 2014, 6 specimens being collected. In Romania the species is known with new data only from NW part, Maramures and Satu Mare regions (and old data from Banat, Oltenia and Dobrodja) (Rakosy & all, 2003; Slamka, 2008).

Chrysodeixis chalcites (Esper, 1789) (Noctuidae) (fig.2)

Another new species for the region, this is a subtropical migratory species widely distributed across Eurasia, Africa, Oceania and Australia, and is a resident species only in southern Europe. One fresh male specimen was photographed and collected in 15.X.2014 (leg. & coll. Manci C.).

The species was known only from Dobrodja (Rakosy & Neumann, 1990; Székely & all, 2011) and Muntenia (Székely

& Stanciu, 2002; Dincă, 2006) but is likely to be or become more spreaded, as it can become a pest of several cultivated plants (tomato, tobacco, pepper and other).

***Cucullia xeranthemi* Boisduval, 1840**
(Noctuidae) (fig.3)

This new species for the region is associated with places where *Aster linosyris* grow in steppe. Recent data are from Transylvania, Dobrodja and historical from Banat and Crisana (Rakosy, 1996; Rakosy & all, 2003). Between August and September 3 specimens arrived at light, one male was photographed and after that collected in 5.IX.2014 (leg. & coll. Manci C.).

It is listed as a vulnerable species in the Romanian fauna (Rakosy & all, 2003).

***Cucullia gnaphalii* (Hübner, 1813)**
(Noctuidae) (fig.4)

New for the region, it is a rare species in Romania, known in the recent years only from Transylvania and with historical data also from Banat (Rakosy & all, 2003). One specimen was photographed and collected in 1.VI.2014 (leg. & coll. Manci C.).

It is listed as a vulnerable species in the Romanian fauna (Rakosy & all, 2003).

***Cucullia dracunculi* (Hübner, 1813)**
(Noctuidae)

Another *Cucullia* species that is new for the region, known before from Banat (Neumann, 1997) and Dobrodja (Kovács & Kovács, 1997) (Rakosy & all, 2003).

A rare species in Romania known only from 4 specimens (3 from Banat and 1 from Dobrodja) this one being the fifth specimen known, collected in 26-31.VIII.2014 (leg. Manci C., coll. Sitar C.).

It is listed as a vulnerable species in the Romanian fauna (Rakosy & all, 2003).

***Mythimna congrua* (Hübner, 1817)**
(Noctuidae)

New for the region, the species is known recently Dobrodja (Rakosy, 1996) and with historical records from Transylvania and Oltenia (Rakosy & all, 2003). In the locality 2 specimens were collected in 1-8.IX.2014 (leg. Manci C., coll. Sitar C.).

It is listed as a vulnerable species in the Romanian fauna (Rakosy & all, 2003).

***Lemonia dumi* (Linnaeus, 1761)**
(Brahmaeidae) (fig.5)

A species that is rarely signalled now probably because of less field work in the period when the species flying. The species appears to be relatively common in the area, in a day on transect up to 10 males can be seen flying, being observed in September 2013 and September 2014. Few specimens were collected in second half of September 2014 stored in Coll. Bere, Sitar & Manci.

Only historical data are known from the region, it is listed as a endangered species in the Romanian fauna (Rakosy & all, 2003).

***Dolbina elegans* A. Bang-Haas, 1912**
(Sphingidae) (fig.6)

Appears to be a rare species in Moldova region (as it is in general) that was firstly signalled from Cric Forest, 1 male is collected in 19.VI.2007 (Corduneanu & all, 2011). Here 3 specimens were collected in the first part of august 2014 (stored in coll. Balan, Corduneanu and Haxaire).

These two localities are the most northern localities known for this species (Székely, 2011).

It is listed as a endangered species in the Romanian fauna (Rakosy & all, 2003).

***Proserpinus proserpina* (Pallas, 1772)**
(Sphingidae) (fig.7)

A relatively common species (2-3 each night) in second half of May.

It is listed as a vulnerable species in the Romanian fauna (Rakosy & all, 2003) and a species of conservative interest being a Natura 2000 species.

***Hyles hippophaes* (Esper, 1789)**
(Sphingidae) (fig.8)

Several specimens were observed in July 2014, one specimen being photographed and collected in 7.VII.2014 (leg. & coll. Manci C.). The species was described from material collected in south Moldova (Focșani) (Székely & Szabó, 1995) and later being again found near Tecuci, 2 specimens in Alexinschi collection (Nemes & Voicu, 1973). Later was to be relatively common in Dobrodja and sporadically in Muntenia (Székely & Szabó, 1995; Székely & all, 2011). It is listed as a vulnerable species in the Romanian fauna (Rakosy & all, 2003) and a species of conservative interest being a Natura 2000 species.

***Zerynthia polyxena* (Denis & Schiffermüller, 1775) (Papilionidae)**

It is listed as an endangered species in the Romanian fauna (Rakosy & all, 2003) and a species of conservative interest being a Natura 2000 species. In the area it is a relatively common species, in day being able to see more than 20 specimens flying. Larvas were found in a lot of places host plant *Aristolochia clematitis* being common here.

***Cilix asiatica* A. Bang-Haas, 1907**
(Drepanidae) (fig.9)

Signaled from Romania from Dobrodja (Székely & all, 2008) the species was already mentioned for the first time from Moldova region (Corduneanu & all, 2013, 2015) this being the second record of the species. The species here appear to be very common from May to September in 2(3) generation, being normal to have at least 10 specimens at light in a night (several hundreds of specimens being seen in 2014 and few tens being collected). We don't have enough data to know if it is about a recent strong dispersion of this species in Romanian fauna or if it was just overlooked.

***Acontia candefacta* (Hübner, 1831)**
(Noctuidae) (fig.10)

One specimen was collected in 1-8.IX.2014 (leg. Manci C., coll. Sitar C.). The species was already known from Moldova in 2013 when first specimens are found (Corduneanu & all, 2013, 2015).

This is a species of Nearctic origin being widely distributed in North America and has been intentionally introduced in southern Russia (the Krasnodar region) in the years 60 of the 20th century as a biological control measure against the *Ambrosia artemisiifolia*, an invasive plant, that is becoming more and more common and with pollen that is highly allergic (Székely & all, 2011). We expect that the species will become more and more common.

This species was firstly found in Dobrodja (Székely & all, 2011) and Dobrodja and Muntenia (Székely, 2011; Rakosy & Mihai, 2011).

***Amphipyra tetra* (Fabricius, 1787)**
(Noctuidae) (fig.11)

A new species for the region, one specimen was photographed in 26.VIII.2014. Appears to be a very rare species in Romania, known with new data only from Dobrodja and

it is listed as an endangered species in the Romanian fauna (Rakosy & all, 2003).

***Mycteroplus puniceago* (Boisduval, 1840)** (Noctuidae) (fig.12)

A rare species in Moldova and second record for the north part of Moldova (Corduneanu & all, 2011, 2015). First specimen and only one before this record date from 2010. A number of 5 specimens were collected at the end of summer - autumn (August, September), 2015.

It is listed as a vulnerable species in the Romanian fauna with recent data, except the one from Moldova, only from Dobrodja (Rakosy & all, 2003).

***Polyphaenis sericata* Esper, 1787**
(Noctuidae)

The species was known until recently (Corduneanu & all, 2015) only from old data in the region. Here two specimens were collected in 9.July.2014 and 26-31.August.2014 (leg. Manci C., coll. Sitar C.).

It is listed as a critical endangered species in the Romanian fauna (Rakosy & all, 2003).

***Cleoceris scoriatea* (Esper, 1789)**
(Noctuidae) (fig.13)

Known before with recent data only from Banat (Băile Herculane) and historical data from Crisana, Transylvania and South of Moldova (Gârboavele Forest) (Rakosy, 1996; Rakosy & all, 2003) it was found recently to be common in Dobrodja (Székely & all, 2011). Here the species looked to be a common one in september with nights having more than 10 specimens at light.

It is listed as an endangered species in the Romanian fauna (Rakosy & all, 2003).

***Calyptra thalictri* (Borkhausen, 1790)**
(Erebidae) (fig.14)

Until few years ago it was a species known from the region only with historical data, in the last years a massive influx of this species reached the north part of Moldova region, a maximum recorded was over 50 specimens at light in June 2012 (Corduneanu & all, 2011, 2015).

Here the species appeared only in isolated specimens, 3 specimens being collected in July 2014.

It is listed as a vulnerable species in the Romanian fauna (Rakosy & all, 2003).

Fig. 1. *Ancylolomia tentaculella* (Hübner, 1796)

Fig. 5. *Lemonia dumi* (Linnaeus, 1761)

Fig. 13. *Cleoceris scoriatea* (Esper, 1789)

Fig. 10. *Acontia candefacta* (Hübner, 1831)

Fig. 14. *Calyptra thalictri* (Borkhausen, 1790)

Fig. 11. *Amphipyra tetra* (Fabricius, 1787)

Fig. 15. *Eublemma amoena* (Hübner, 1803)

Fig. 12. *Myctero plus puniceago* (Boisduval, 1840)

Fig. 16. *Chelis maculosa* (Gerning, 1780)

***Eublemma amoena* (Hübner, 1803)**
(Erebidae) (fig.15)

A rare species in the region, one specimen was photographed and collected in 10.august.2014 (leg. & coll. Manci C.).

It is listed as a vulnerable species in the Romanian fauna (Rakosy & all, 2003).

***Chelis maculosa* (Gerning, 1780)**
(Erebidae) (fig.16)

A rare species in the region (Corduneanu & all, 2013, 2015), here appears to be a common species, in 2 generation, maybe the species is a rare one found because it is coming at light only very late at night. Nights with up to ten specimens are not rare in May-June and August.

It is listed as a vulnerable species in the Romanian fauna (Rakosy & all, 2003).

***Hyphoraia aulica* (Linnaeus, 1758)**
(Erebidae)

A species signalled sporadically from all the regions (Corduneanu & all, 2011) but rare in the region, one male was collected in May 2014.

It is listed as an endangered species in the Romanian fauna (Rakosy & all, 2003).

***Euplagia quadripunctaria* (Poda, 1761)** (Erebidae)

It is a common species almost everywhere in Romania, but it is a species of conservative interest being a Natura 2000 species.

Conclusions

From the 341 species recorded in the first year (October 2013 to October 2014) of survey some species are of more interest: 6 are new for the whole region, 50 are rare or known only from older data (one being knew in the region only before 1900) and 4 are important from conservative point of view, being Natura 2000 species.

We are sure that a continuously monitoring of Stâncă area will reveal a bigger number of species.

Acknowledgements

The authors want to express their thanks to Carol Bere, from Cluj-Napoca, who helped doing and checking some identification, Szekely Levente for his help with literature and discussions and to Laszlo

Rakosy for critical discussion and help with some identification.
