Certificates of analysis explained

All LoGiCal reference materials are accompanied by comprehensive certificates of analysis. These provide a full description of the material to which they relate, and summarise the analyses undertaken during the characterisation process. Our certificates of analysis are prepared in accordance with ISO Guide 31, which specifies the requirements for the description of reference materials and the contents of certificates and labels. Current examples of our certificates of analysis for all products in the LoGiCal range are openly available via the www.lgcstandards.com website on the relevant product pages.

Component	Concentration ("free base")	Uncertainty
see product name	1.000 mg/ml ²	U = 0.005 mg/ml ³

Uncertainty of the concentration is expressed as an expanded uncertainty in accordance with ISO 17025 and Guide 34 at the about 95 % level of confidence using a coverage factor of k = 2 and has been calculated by statistical analysis of our production system and incorporates uncertainty of the purity, material density and balance and weighing technique.
Concentration based on material weighings and material purity factor (assay of the neat material).

The solution's concentration and homogeneity are verified by independent method.

LGC certifies that this standard meets the specification stated in this certificate and warrants this product to meet the stated acceptance criteria through the retest date when stored unopened as recommended. Product should be used shortly after opening to avoid concentration changes due to evaporation. Warranty does not apply to ampoules stored after opening.

¹ Ampoules are overfilled to ensure a minimum 1 ml volume fill. We advise laboratories to use measured volumes of this standard solution before diluting to the desired concentration.
² The value is based on the results of analytical techniques, which calibration and verification was carried out with standards traceable to SI-units. The value is expressed on a "free base" basis.
The concentration with its uncertainty is valid in the range between 19 °C and 25 °C.
The identity is verified by data from international scientific literature.
Gravimetrically prepared using qualified balances calibrated annually by accredited calibration service. Calibration verification performed daily prior to use utilizing weights traceable to SI via other mass standards.
³ The uncertainty "U" is the expanded uncertainty estimated in accordance with the Guide to the Expression of Uncertainty in Measurement (GUM). It is corresponding to a level of confidence of about 95 %. Standard uncertainties are indicated with "u".

Long term storage
The minimum specified storage requirements and those under which real time stability testing is performed. NOTE 1

Uncertainty
The statistical parameter that is used to describe the possible fluctuation in concentration. NOTE 2

Concentration
Based on material weighings and purity factor (assay of the neat material). NOTE 4

NOTE 1: Long term storage

Unless otherwise stated, storing reference materials in pure organic solvent at temperatures below those specified is not detrimental. Some analytes may come out of solution at lower temperatures and so the reference material should be warmed to room temperature and mixed prior to use. Products in aqueous solvent should not be stored at temperatures below 0°C unless explicitly stated.

NOTE 2: Uncertainty

In accordance with the Guide to the Expression of Uncertainty in Measurement (GUM), our certificates of analysis list the expanded concentration uncertainty at the about 95 % level of confidence using a coverage

factor of $k = 2$. They incorporate uncertainty of the purity, material density and balance and weighing technique. Our concentration uncertainties are valid in the range between 19°C and 25°C.

NOTE 3: Expiry Date (Retest date)

We run “accelerated stability studies” backed up with additional stability testing at regular time points after initial production – “real time stability tests”. From the data obtained during these investigations, we determine the ideal long-term storage conditions of our reference materials. Additionally the stability of every lot is regularly investigated through a routine quality control testing program. These results can be used to reassign expiry dates and on occasion may lead to changes in the storage temperature.

NOTE 4: Concentration

The concentration is based on gravimetric material weighings – using weights traceable to SI units - and material purity factor (assay of the neat material). The concentration listed is ‘as is’ for neat materials or ‘free base/acid’ for salt forms, meaning no further correction is required.

Concentration ‘as is’
If the neat material is in salt form the concentration of the salt is also provided.

Verification of concentration
Depending on the analyte, the concentration is verified by an appropriate technique such as GCMS or HPLC.

Identity
We use a range of analytical techniques to confirm the identity of our reference substance (neat material); 1H-NMR, MS, IR, HPLC-DAD, GC.

Purity
Purity testing is performed by HPLC or GC, water content is evaluated by Coulometric Karl Fischer titration, and residual solvent by 1H-NMR.

Homogeneity is assured by validated procedures, including ampoulation, and is verified by HPLC.

Physical properties
Where other physical properties are known then we also use these as an identity check (e.g. melting point, appearance, and polarimetry).

Absolute methods
We use elemental analysis (carbon titration) and/or quantitative NMR in the characterisation of our reference materials.

Our certificates of analysis are typically 5-10 pages long depending on the presentation of the reference materials. The first pages, described above, summarise the analytical data that follows.
