

**Natural vegetation of the Carolinas:
Classification and description of
plant communities of the Francis Marion National Forest and vicinity**

A report prepared for the Ecosystem Enhancement Program, North Carolina Department of Environment and Natural Resources in partial fulfillments of contract D07042.

By M. Forbes Boyle, Robert K. Peet, Thomas R. Wentworth, and Michael P. Schafale

Carolina Vegetation Survey
Curriculum in Ecology, CB#3275
University of North Carolina
Chapel Hill, NC 27599-3275

Version 1. October 5, 2007

INTRODUCTION

The Francis Marion National Forest (FMNF) is located along the Atlantic Coast in Berkeley and Charleston Counties, South Carolina. The National Forest is bounded on the north and east by the Santee River. The Santee Coastal Reserve Wildlife Management Area is located to the east of the National Forest, where the Santee River empties into the Atlantic Ocean. To the south and east of the FMNF is Cape Romain National Wildlife Refuge. The Cooper River forms an approximate western boundary to the National Forest.

The geomorphology of the FMNF is a combination of upland sandy ridges, dominated by a diversity of fire-maintained longleaf pine and xeric oak woodlands, and large expanses of inter-ridge swamp forests. Salt and freshwater riverine environments also exist within the property, as well as salt water marshes along the southeastern border. Limestone sinks and clay-based Carolina bays can be found on upland depressions throughout the area. Low-lying maritime forests, dominated by *Quercus virginiana*, *Juniperus virginiana* var. *silicicola*, and *Pinus elliottii*, are located along the coastal fringe of the eastern portion of the FMNF.

In the fall of 1989, Hurricane Hugo passed over the FMNF and left a broad swath of fallen and misshapen trees. The tidal surge caused by the storm shifted estuarine patterns and influenced floodplain forests dynamics. Today, most of the disturbed forests within the FMNF damaged by Hurricane Hugo have been replanted in longleaf pine; a few areas have undergone natural seral transitions.

The Carolina Vegetation Survey conducted an initial inventory of natural communities within the FMNF and surrounding areas in May 2005. The high community diversity found within this area of the Carolinas lends itself to a wide ranging floristic survey, whereby increasing current understanding of Outer Coastal Plain vegetation patterns throughout the Carolinas. The objectives of the study were to define and characterize the southern edge of variation in Coastal Plain vegetation to be expected in North Carolina. Furthermore, the data captured from these plots will enable us to refine the community classification within the broader region. The goal of this report is to determine a classification structure based on the synthesis of vegetation data obtained from the May 2005 plots, and to use the resulting information to develop restoration targets for disturbed ecosystems within North Carolina.

STUDY AREA AND FIELD METHODS

During May 2005, a total of 54 vegetation plots were established in and around the FMNF in Berkeley, Charleston, and Georgetown Counties, South Carolina (Figure 1). Focus locations within the FMNF included Wambaw Creek Wilderness, Hellhole Bay Wilderness, Ocean Bay, Battery Historic (Cedar Hill), and Big Dam Swamp. Other locations outside of the National Forest included the Santee Coastal – Washo Reserve, Cape Romain – Cape Islands, and the Quarterman Branch Reserve.

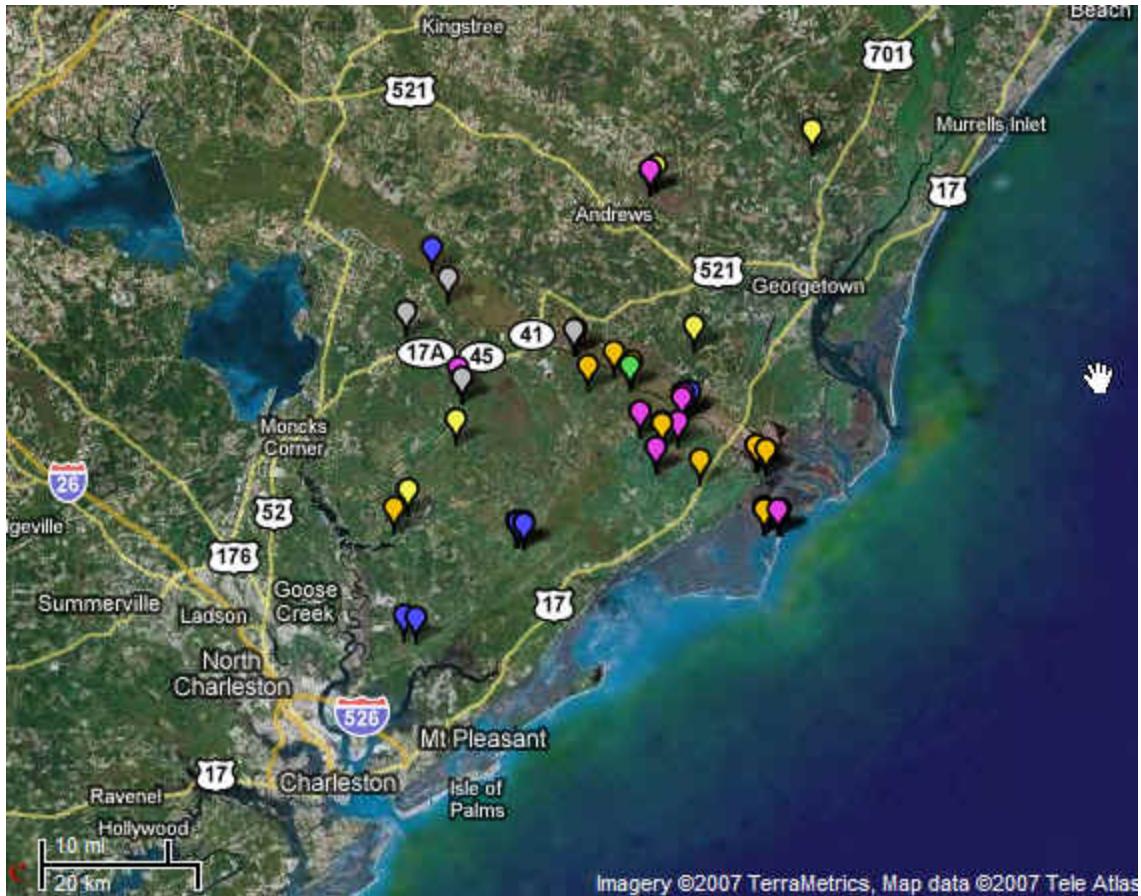

FIGURE 1. Pulse 2005a sample region and established plots: (Map courtesy of VegBank:
http://vegbank.org/vegbank/views/map_userplots.jsp?latlongfile=http://www.bio.unc.edu/faculty/peet/lab/CVS/maps/63-points.csv)

Target natural communities included brownwater and blackwater alluvial hardwood forests, upland hardwood forests, blackwater river cypress and gum swamps, pocosins, bay forests, depression wetlands, small stream systems, freshwater and brackish marshes, coastal dunes and grasslands, maritime forests, and longleaf pine savannas.

Vegetation was sampled following the North Carolina Vegetation Survey protocol described in Peet et al. (1998) and data collected conformed to established and proposed federal standards (see: Jennings et al. 2007, and Federal Geographic Data Committee 2007) <http://www.fgdc.gov/standards/projects/FGDC-standards-projects/vegetation/index.html>). Plots were subjectively located to best capture the composition of the target plant community. Each plot contained from 1 to 10 100 m² modules, the number reflecting the area of visually homogeneous vegetation available to sample. Species presence was recorded across a logarithmic sequence of subplot sizes including 0.01, 0.1, 1, 10, 100, and, where sufficient modules were sampled, 400 and 1000 m². Species cover was recorded individually for up to 4 intensively sampled modules (those containing the nested subplots), and overall cover for the plot was also recorded for species not found in intensively sampled modules. Soil samples were collected and sent to Brookside Laboratories for analysis. Soil

nutrients were extracted by the Mehlich III technique. Mean soil nutrient and texture values are summarized by community in Appendix 1. Tree stems were recorded for each plot by diameter.

VEGETATION CLASSIFICATION

Plots were classified to association following the US National Vegetation Classification (NVC) standard (Grossman et al. 1998, Jennings et al. 2006) and the Carolina Vegetation Survey's "Vegetation of the Carolinas" project (<http://cvs.bio.unc.edu/vegetation.htm>). The 'association' is defined as a group of plots having similar species composition, structure, and habitat. Plot assignment was accomplished through a qualitative assessment of vegetation composition, landscape position, hydrologic regime, and soil characteristics. The associations were grouped into higher categories following the classification hierarchy developed by the "Vegetation of the Carolinas" project and include the Formation (e.g., Coastal Plain lowland evergreen forests and shrublands) and Ecological Group (e.g., White cedar forests) levels. The lowest, finest level of the classification scheme used was the NVC association.

Where possible, plots were assigned to an NVC association, identified by association name and unique CEGL identifier. Also, a degree of fit was applied to the classification scheme based on the plot's correspondence with its assigned association. The 5-level scale of fit we employ conforms to that the standards employed by the VegBank archive and the proposed US Federal standards (see Jennings et al. 2007): Excellent, Good, Fair, Poor (similar but wrong), and Bad (unambiguously wrong). In some cases it was necessary to assign a plot to more than one community because of its intermediate character. In 39 of the 54 cases (see Appendix 2), the fit was either fair or poor, suggesting a need for numerous revisions of the NVC to better represent the vegetation of this part of South Carolina.

For each community type to which we assigned plots, we provide a brief summary. We also provide hotlinks (with the CEGL codes) to the formal descriptions of these types in the National Vegetation Classification. Where the fit is weak or poor, we briefly explain the problem. Composition is shown in detail in Appendix 3 where the prevalent species (most frequent species with the number equal to the average number of species per 100 m² plot) are listed by constancy among plots, and mean percent cover where present. Average cover class was calculated using the geometric mean of the true cover range for each cover class. Vegetation that was novel or failed to fit well in established associations of the National Vegetation Classification are summarized in Appendix 2. Botanical nomenclature follows Weakley (2006).

Our classification yielded assignments to 36 high-order community associations, from 23 Ecological Groups and 14 Formations. A community characterization is presented for each association below. Names are based on the naming system used in the U.S. National Vegetation Classification (NatureServe 2007). Names reflect species with high constancy and high cover; a “-” separates species within the same vertical strata, while a “/” separates species of different strata.

ASSOCIATIONS

I. Coastal Plain mixed mesic forests

A. Mesotrophic mesic forests

1) *Quercus alba* - *Carya glabra* / Mixed Herbs Coastal Plain Forest (CEGL007226)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.685135

NVC Fit = Fair

Plots = 063-09-0925

This mesic forest of the Atlantic and Gulf Coastal Plain has a canopy dominated by *Quercus alba*, *Pinus taeda*, and *Liquidambar styraciflua*. Other canopy and subcanopy associates include *Hamamelis virginiana* var. *virginiana*, *Cercis canadensis* var. *canadensis*, *Quercus nigra*, *Quercus stellata*, and *Quercus michauxii*. The high density of *Rhus copallina* var. *copallina* in the subcanopy is a result of significant canopy disturbance by Hurricane Hugo in October 1989. The shrub stratum is moderately dense, and includes such species as *Vaccinium elliottii*, *Arundinaria tecta*, *Aesculus pavia* var. *pavia*, *Crataegus flava*, *Gaylussacia frondosa*, and *Callicarpa americana*. Species richness across all strata is high in this plot (118). Species in the herbaceous stratum found throughout the plot include *Melica mutica*, *Amphicarpaea bracteata* var. *bracteata*, *Agrimonia pubescens*, *Coreopsis auriculata*, *Smallanthus uvedalia*, *Phlox carolina* ssp. *carolina*, *Chasmanthium sessiliflorum* var. *sessiliflorum*, and *Scleria oligantha*. The NVC recognizes *Carya glabra* as an important canopy codominant in this community type; however, this species, nor any *Carya* spp., was located on this plot. Furthermore, the NVC explains that this community type lacks dry-site oaks like *Quercus stellata*. This species was found throughout the plot.

2) *Quercus hemisphaerica* - *Magnolia grandiflora* - *Carya* (*glabra*, *pallida*) / *Vaccinium arboreum* / *Chasmanthium sessiliflorum* Forest (CEGL004788)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.683553

NVC Fit = Poor to Fair

Plots = 063-02-0926, 063-03-0925, 063-04-0936,
063-04-0938, 063-04-0939, 063-07-0929,
063-09-0932

This upland mesic forest is found in the south Atlantic Coastal Plain along slopes of rivers and small streams. The NVC recognizes that this community has a differential tree stratum, with no one species dominating. They acknowledge that *Quercus hemisphaerica* is the only true constant canopy species in this community type. The plots found on the FMNF, however, contain a minor amount of this species. Instead, *Pinus taeda* and *Liquidambar styraciflua* are the only canopy species with high constancy across these plots. Other important diagnostic canopy species include *Quercus nigra*, *Quercus alba*, and *Carya alba*. The subcanopy/shrub stratum is dominated by *Cornus florida*, *Aesculus pavia* var. *pavia*, and *Symplocos tinctoria*. Constant herbs include *Chasmanthium sessiliflorum* var. *sessiliflorum*,

Mitchella repens, and *Dichanthelium commutatum* var. *commutatum*, *Elephantopus carolinianus*, *Scleria oligantha*, and *Oxalis dillenii*.

B. Calcareous Forests

1) *Carya cordiformis* - *Quercus pagoda* - *Quercus shumardii* - *Carya myristiciformis* / *Sabal minor* - *Cornus asperifolia* Forest (CEGL007316)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.689950

NVC Fit = Fair

Plots = 063-02-0934

This community is typically found over a limestone substrate and usually experiences seasonal ponding of water. Soil drainage is poor throughout this community. The canopy and subcanopy of this plot are composed of a diversity of species and include *Acer floridanum*, *Nyssa biflora*, *Carpinus caroliniana* var. *caroliniana*, *Fraxinus caroliniana*, *Cornus asperifolia*, *Ilex opaca* var. *opaca*, and *Magnolia grandiflora*. This plot lacks the calcareous canopy species that are used to discriminate this community in the NVC. These species include *Carya myristiciformis*, *Carya cordiformis*, *Quercus pagoda*, and *Quercus shumardii*. The herbaceous stratum of this plot is composed of a dense cover of *Dryopteris ludoviciana*, a rare wood-fern typically found along black-water rivers. Other herbaceous species found more typical of swamp forest include *Boehmeria cylindrica*, *Persicaria virginiana*, and *Rhynchospora miliacea*.

2) *Quercus pagoda* - *Carya cordiformis* / *Chasmanthium sessiliflorum* - *Verbesina virginica* Forest
(CEGL004092)

NVC Fit = Good

Plots = 063-04-0942

This mesic, calcareous forest is found along the Coastal Plain of South Carolina. Species diversity is high in this plot, which is located along a small ridge between the Santee River and Echaw Creek in northern Berkeley County, SC. Constant canopy species include *Carya cordiformis*, *Quercus nigra*, and *Quercus hemisphaerica*. The shrub stratum is dominated by *Callicarpa americana*, *Cornus asperifolia*, *Sideroxylon lycioides*, and *Symplocos tinctoria*. Common herbs found in this plot include *Asplenium platyneuron*, *Chasmanthium sessiliflorum* var. *sessiliflorum*, *Dichanthelium commutatum* var. *commutatum*, *Galium circaeans* var. *circaeans*, *Mitchella repens*, *Oxalis dillenii*, *Phryma leptostachya* var. *leptostachya*, and *Sanicula canadensis* var. *floridana*.

II. Coastal Plain fire-maintained woodlands

A. Dry-Mesic Pine-Oak Woodlands

1) *Pinus palustris* / *Quercus laevis* - *Quercus geminata* / *Vaccinium tenellum* / *Aristida stricta* Woodland (CEGL003589)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.688575

NVC Fit = Fair

Plots = 063-02-0929

This xeric pine-oak dominated woodland occurs on the Outer Coastal Plain of North and South Carolina. The open canopy is dominated by *Pinus palustris*. The low shrub stratum is dominated by low-stature scrub oaks--*Quercus margareta* and *Quercus virginiana*. Herbs found in this plot include *Pteridium aquilinum*, *Tephrosia virginiana*, and *Andropogon* sp. This plot does not fit completely with the above-listed NVC Association because of the lack of *Aristida stricta*.

III. Coastal Plain brownwater river forests

A. Levee and Floodplain Forests

1) Liquidambar styraciflua - Quercus (laurifolia, nigra) - (Pinus taeda) / Arundinaria gigantea / Carex abscondita Forest (CEGL007732)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.683508

NVC Fit = Good

Plots = 063-04-0935

This floodplain forest is found along the Santee River in northern Berkeley County, SC. This community experiences temporary flooding during certain times of the year, but the water level is usually much lower during the growing season. Dominant canopy species include *Liquidambar styraciflua*, *Fraxinus pennsylvanica*, and *Quercus laurifolia*. The subcanopy is composed of *Carpinus caroliniana* var. *caroliniana*, *Ilex opaca* var. *opaca*, *Ulmus americana* var. *americana*, and *Celtis occidentalis*. The shrub stratum is composed of *Arundinaria gigantea*.

Herbaceous diversity is high in this plot, and includes *Carex louisianica*, *Chasmanthium latifolium*, *Dichanthelium dichotomum*, *Mitchella repens*, and *Toxicodendron radicans* var. *radicans*.

B. Brown-water Swamp Forests

1) Quercus lyrata - Quercus laurifolia - Taxodium distichum / Saururus cernuus Forest (CEGL004735)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.689572

NVC Fit = Fair

Plots = 063-04-0934

This plot occurred as on a very low ridge within a backswamp along the Santee River. Canopy dominants include a mixture of bottomland hardwoods and gum – cypress species. These include *Platanus occidentalis* var. *occidentalis*, *Quercus lyrata*, *Quercus laurifolia*, *Taxodium distichum*, *Fraxinus pennsylvanica*, *Ulmus americana* var. *americana*, and *Celtis occidentalis*. The herb stratum is composed

of *Carex intumescens* var. *intumescens*, *Carex crus-corvi*, *Boehmeria cylindrica*, *Dichanthelium yadkinense*, and *Woodwardia areolata*. This plot and association (CEGL004735) are typical of the hardwood bottoms adjacent to *Taxodium-Nyssa* aquatic backswamps (CEGL007431). Nonetheless, 4735 is a rather broad and poorly defined community type within NVC and requires further characterization of its range of variation. Flooding on this plot is largely regulated by dams along the river.

2) *Taxodium distichum* – *Nyssa aquatica* / *Fraxinus caroliniana* Forest (CEGL007431)
http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.686827

NVC Fit = Good

Plots = 063-02-0932, 063-04-0941, 063-07-0926

This backswamp community of high-quality brownwater rivers of the Atlantic Coastal Plain is typically composed of a canopy of *Taxodium distichum*, *Nyssa aquatica*, *Fraxinus caroliniana*, and *Acer rubrum*. This community type is semipermanently flooded, and species found in the herbaceous stratum include *Saururus cernuus*, *Justicia ovata* var. *ovata*, and *Onoclea sensibilis* var. *sensibilis*. Overall, the herbs are sparse in this community type. Soils in this community type are usually saturated due to river flooding.

NVC Fit = Poor

Plots = 063-08-0928

This plot differs from the other plots and the NVC described association due to the high density of *Carpinus caroliniana* var. *caroliniana* in the subcanopy. The canopy dominants are similar to those in the other plots. An abundance of *Aronia arbutifolia* and *Alnus serrulata* is also found on this plot.

IV. Coastal Plain blackwater river forests

A. Black-water Swamp Forests

1) *Nyssa aquatica* - *Nyssa biflora* Forest (CEGL007429)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.684509

NVC Fit = Fair

Plots = 063-08-0929

This blackwater swamp forest is dominated by a short canopy (< 12 meters) of *Nyssa aquatica*, *Taxodium distichum*, and *Fraxinus caroliniana*. Other minor canopy and subcanopy associates include *Acer rubrum*, *Betula nigra*, *Quercus laurifolia*, and *Alnus serrulata*. This community occurs within

intermittently flooded alluvial sites along blackwater rivers in the Atlantic and Gulf Coastal Plain. Herbaceous species richness can be high in this community type. Species found on these plots include *Carex gigantea*, *Orontium aquaticum*, *Hymenocallis crassifolia*, *Proserpinaca palustris* var. *palustris*, *Saururus cernuus*, and *Woodwardia areolata*. The presence of species typifying brown-water river systems sets this plot apart from the NVC described association.

B. Black-water Fringing Hardwood Forests

1) *Taxodium distichum* – *Fraxinus pennsylvanica* – *Quercus laurifolia* / *Acer rubrum* / *Saururus cernuus* Forest (CEGL007719)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.687855

NVC Fit = Fair

Plots = 063-09-0930

This Atlantic and Gulf Coastal Plain swamp –hardwood forest transition occurs in sloughs and other alluvial flats with a large percentage of silt in the soil. The canopy of this community type is composed of *Taxodium distichum*, *Nyssa biflora*, *Quercus laurifolia*, and *Acer rubrum* var. *rubrum*. Subcanopy species found in these plots include *Ulmus americana*, *Ilex verticillata*, *Fraxinus caroliniana*, and *Carpinus caroliniana* var. *caroliniana*. The shrub stratum in these plots is rather sparse, while herb species diversity is moderately high. Vines such as *Bignonia capreolata*, *Toxicodendron radicans* var. *radicans* and *Smilax laurifolia* are abundant in this plot. The herbaceous stratum was diverse on this plot. Species include *Hypoxis wrightii*, *Woodwardia areolata*, *Justicia ovata* var. *ovata*, and *Osmunda regalis* var. *spectabilis*. This community type requires further investigation based on its composition in response to variable inundation frequencies throughout its range.

C. Small Stream Forests

1) *Quercus phellos* - *Quercus laurifolia* - *Nyssa biflora* - *Liquidambar styraciflua* / *Arundinaria gigantea* ssp. *tecta* - *Sabal minor* Forest (CEGL007846)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.685578

NVC Fit = Poor

Plots = 063-08-0935, 063-08-0936

This small stream forest of the Outer Coastal Plain of South Carolina has a variable canopy. Canopy species on these plots include *Quercus laurifolia*, *Acer drummondii*, and *Taxodium distichum*. The NVC does not recognize cypress occurring in these community types. The shrub stratum is dominated by *Arundinaria tecta* in this community type, while the herbaceous stratum is dominated by *Chasmanthium laxum*. Other species found on these plots include *Carex howei*, *Carex intumescens* var. *intumescens*, *Hypericum hypericoides*, *Mitchella repens*, and *Osmunda regalis* var. *spectabilis*.

V. Coastal Plain lowland deciduous forests

A. Coastal Plain Nonriverine Swamp Forests

- 1) *Taxodium ascendens* / (*Nyssa biflora*) / *Leucothoe racemosa* - *Lyonia lucida* - *Morella cerifera* Depression Forest (CEGL007420)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.683580

NVC Fit = Fair

Plots = 063-02-0930

This community type occurs in wet, peaty depressions throughout the entire southeastern Coastal Plain. The canopy is codominated by *Taxodium ascendens* and *Nyssa biflora*. The shrub stratum is extremely dense and composed of pocosin-like vegetation. Species include *Persea palustris*, *Lyonia lucida*, *Magnolia virginiana* var. *virginiana*, *Ilex glabra*, and *Morella caroliniensis*. The herb stratum is very sparse, but includes *Woodwardia areolata* and *Onoclea sensibilis* var. *sensibilis*. This community will require further investigation due to its extensive described range in the southeastern Outer Coastal Plain.

- 2) *Quercus laurifolia* - *Nyssa biflora* / *Clethra alnifolia* - *Leucothoe axillaris* Forest (CEGL007447)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.685596

NVC Fit = Fair

Plots = 063-09-0926

This plot was located on the south end of Jericho Swamp within the FMNF. According to the NVC, this community type is found along wet sloughs, or broad flats with a high water table. Flooding in these areas is usually intermittent throughout the year. The canopy here is dominated by *Quercus laurifolia*, *Nyssa biflora*, *Acer rubrum*, and *Fraxinus caroliniana*. The dense shrub stratum is composed of *Arundinaria tecta*, *Morella cerifera*, *Magnolia virginiana* var. *virginiana*, *Persea palustris*, and *Itea virginica*. Vines are also abundant on this plot. They include *Smilax laurifolia*, *Berchemia scandens*, and *Parthenocissus quinquefolia*. The herbaceous stratum is diverse and includes *Scirpus lineatus*, *Rhynchospora miliacea*, *Triadenum walteri*, *Sabal minor*, and *Carex folliculata*. The high species diversity of canopy and subcanopy species in this plot sets it apart from the NVC described association.

VI. Coastal Plain lowland evergreen forests and shrublands

A. Bay Forests

- 1) Magnolia virginiana - Persea palustris / Lyonia lucida Forest (CEGL007049)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.688884

NVC Fit = Good

Plots = 063-07-0928

This community type occurs on saturated, peaty wetlands of the Outer Coastal Plain. This low forest has a canopy less than 10 meters tall, and includes *Magnolia virginiana*, *Persea palustris*, *Clethra alnifolia*, and *Cyrilla racemiflora*. Other low shrubs include *Vaccinium formosum*, *Vaccinium fuscatum*, and *Ilex coriacea*. The herbaceous stratum is composed of *Thelypteris palustris* var. *pubescens*, *Woodwardia virginica*, *Xyris platylepis*, *Rhynchospora microcephala*, and *Ludwigia pilosa*.

B. Pocosins

- 1) Pinus serotina / Zenobia pulverulenta - Cyrilla racemiflora - Lyonia lucida Wooded Shrubland (CEGL004458)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.684717

NVC Fit = Fair

Plots = 063-07-0927

This typical high pocosin of the Atlantic Coastal Plain is composed of a very dense shrub stratum, up to 5 meters tall. Typical shrub species include *Lyonia lucida*, *Ilex coriacea*, *Persea palustris*, and *Clethra alnifolia*. An open canopy of *Pinus serotina* is also characteristic of this community type. Unlike the described NVC association, this plot also has a fairly rich herbaceous layer. Species include *Woodwardia virginica*, *Eupatorium pilosum*, *Hypericum hypericoides*, *Osmunda cinnamomea* var. *cinnamomea*, and *Xyris ambigua*.

- 2) Ilex glabra - Lyonia lucida - Zenobia pulverulenta Shrubland (CEGL003944)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.688893

NVC Fit = Fair to Good

Plots = 063-02-0928, 063-08-0930

This community type is found on peat domes of the Outer and Middle Coastal Plain of the Carolinas. The vegetation is described as a low pocosin, and soils are unproductive. The dense shrub stratum is dominated by *Lyonia lucida*, *Zenobia pulverulenta*, *Ilex coriacea*, and *Persea palustris*. Where fire has been taken out of these communities, species richness values remain low due to the high density of woody shrub biomass. Plot 063-08-0930 experienced significant fire disturbance three years prior to sampling. This explains the disparity of herbaceous species diversity values between these two plots (burned versus unburned). Herbaceous species found on plot 063-08-0930 include *Saccharum giganteum*, *Scirpus cyperinus*, *Erechtites hieracifoila*, *Typha latifolia*, *Woodwardia virginica*, *Rhynchospora fascicularis*, and *Xyris iridifolia*.

VII. Coastal Plain ponds and marshes

A. Pond Cypress Depression Forests

- 1) *Taxodium ascendens* / *Ilex myrtifolia* Depression Forest (CEGL007418)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.688856

NVC Fit = Good

Plots = 063-09-0931

This depression forest has a closed canopy dominated by *Taxodium ascendens*, and a lesser amount of *Nyssa biflora* and *Acer rubrum*. The shrub stratum is composed of *Ilex myrtifolia*, *Lyonia lucida*, *Magnolia virginiana*, and *Litsea aestivalis*. Herbs include *Carex striata*, *Panicum verrucosum*, *Saccharum brevibarbe* var. *contortum*, *Woodwardia virginica*, *Rhynchospora microcephala*, and *Carex glaucescens*.

B. Freshwater Marshes

- 1) *Saccharum* spp. - *Panicum verrucosum* - (*Rhexia* spp., *Sabatia angularis*) Herbaceous Vegetation (CEGL004752)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.687896

NVC Fit = Fair

Plots = 063-07-0930

According to the NVC, this upland depression community is geomorphologically and floristically distinct from bays and limesinks. Currently, this community has been described for the Coastal Plain of southern Georgia, and acknowledged as potentially occurring on the FMNF. This plot floristically fits the described community type, except for the occurrence of *Liquidambar styraciflua* saplings invading from a clearcut area outside the plot. Otherwise, discriminant herbaceous species found on the plot include *Saccharum baldwinii*, *Sabatia campanulata*, *Rhynchospora fascicularis*, *Rhynchospora microcephala*, and *Hypericum denticulatum*.

- 2) *Eleocharis baldwinii* - *Hydrocotyle* (*ranunculoides*, *umbellata*) Herbaceous Vegetation (CEGL007893)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.687504

NVC Fit = Fair

Plots = 063-04-0926, 063-04-0927

These plots are located below the boardwalk at the Washo Reserve in the Santee Coastal WMA. Both plots are characterized by a dense cover of both floating and rooted herbaceous vegetation. The herb stratum is characterized by a dense cover of *Hydrocotyle ranunculoides*, while *Lemna minor* is the dominant floating species. Water covers close to 100% of the ground on both of these plots. The plots are being encroached upon by woody species (*Nyssa biflora* and *Taxodium distichum*) from adjacent freshwater swamp communities. The NVC recognizes association 7893 from the Deltaic Plain in southern Louisiana. The plots in the FMNF share dominance by *Hydrocotyle* sp. and geomorphologic characteristics with the described community type. However these plots lack codominance of *Eleocharis baldwinii*, which is a discriminant species in this Louisiana community.

VIII. Coastal Plain seepage and streamhead wetlands

A. Streamhead Pond Pine Woodlands

- 1) *Pinus serotina* - (*Liriodendron tulipifera*) / *Lyonia lucida* - *Clethra alnifolia* - *Ilex glabra*
Woodland (CEGL004435)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.685104

NVC Fit = Poor to Fair

Plots = 063-02-0933, 063-08-0931

This community type occurs along streams within the Sandhills of both North and South Carolina. Neither of these plots fit well with the NVC described community association, 4435. They consistently exhibit an open canopy of *Pinus serotina* and a moderately dense shrub stratum of *Clethra alnifolia* and *Lyonia lucida*. However, plot 63-08-0931 contains *Taxodium ascendens* and *Liquidambar styraciflua* in the canopy. Also, the herbaceous stratum is highly diverse, further separating the plot from the NVC community type. Species found in this plot include *Dichanthelium lucidum*, *Eupatorium capillifolium*, *Carex alboluteascens*, *Rhynchospora microcarpa*, *Rhynchospora cephalantha*, *Woodwardia virginica*, *Carex glaucescens*, and *Sparganium americanum*.

IX. Maritime subxeric forests and shrublands

A. Maritime Oak Forests

- 1) Juniperus virginiana var. silicicola - (Quercus virginiana, Sabal palmetto) Forest (CEGL007813)
http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.686269

NVC Fit = Poor

Plots = 063-04-0933

This community occurs on marsh islands along the Atlantic Coast of the Carolinas and Georgia.

The canopy can be relatively open, or closed, and is dominated by *Juniperus virginiana* var. *silicicola*. In this plot, *Morella cerifera* and *Ilex vomitoria* are canopy codominants. The NVC recognizes only *Quercus virginiana*, *Sabal palmetto*, and *Celtis laevigata* as canopy codominants. The herbaceous stratum is diverse in this plot, and includes *Chloris pectinata*, *Cyperus filicinus*, *Dichanthelium aciculare*, *Uniola paniculata*, and *Spartina patens* var. *monogyna*.

- 2) Quercus virginiana - Quercus hemisphaerica - Pinus taeda - Quercus falcata / Ilex vomitoria Forest (CEGL007026)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.687020

NVC Fit = Fair

Plots = 063-08-0927

This maritime upland community of the Atlantic Coast differs from other such forests by being protected from constant salt spray. The canopy and shrub stratum in these areas is generally more diverse than their sea salt influenced counterparts. The canopy of this plot is comprised of *Pinus taeda*, *Juniperus virginiana*, and *Quercus virginiana*. The well-developed shrub stratum includes *Ilex vomitoria*, *Smilax bona-nox*, *Smilax auriculata*, *Morella cerifera*, and younger individuals of the canopy species. This plot lacks *Quercus*

hemisphaerica, *Quercus falcata*, and *Carya glabra*. The NVC recognizes these species as canopy codominants. Furthermore, this plot is distinguished from the NVC association by its lack of *Persea palustris* in the understory.

- 3) *Quercus virginiana*-*Pinus taeda* /*Ilex vomitoria* / *Chasmanthium sessiliflorum* Woodland
(proposed)

NVC Fit = n/a

Plots = 063-02-0927

This maritime oak forest community is currently not recognized by the NVC. The plot occurs between Wambaw and Chicken Creek within the FMNF in northeastern Berkeley County, SC. The canopy of this plot is dominated by a mixed canopy of *Quercus virginiana*, *Quercus hemisphaerica*, *Pinus taeda*, *Quercus nigra*, and *Carya glabra* var. *megacarpa*. The subcanopy and shrub stratum are well-developed and comprised of *Ilex opaca* var. *opaca*, *Cornus florida*, *Morella cerifera*, *Vaccinium elliottii*, *Liquidambar styraciflua*, *Smilax glauca*, and *Toxicodendron radicans* var. *radicans*. The herbaceous diversity is also high within this plot, and includes *Chasmanthium sessiliflorum* var. *sessiliflorum*, *Galium uniflorum*, *Elephantopus tomentosus*, and *Desmodium glabellum*.

B. Mesic Maritime Hardwood Forests

- 1) *Quercus hemisphaerica* - *Pinus taeda* - (*Quercus nigra*) / *Osmanthus americanus* var. *americanus* / *Ilex glabra* Forest (CEGL007022)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.685138

NVC Fit = Fair

Plots = 063-07-0925

This community association occurs on islands within swamps of the Outer Coastal Plain of the Carolinas. The canopy of this plot is not well-developed (total cover < 15%), but contains community nominal species like *Quercus hemisphaerica*, *Pinus taeda*, and *Quercus nigra*. *Quercus virginiana* is also a characteristic component of the canopy in this plot. This species is not mentioned in the NVC description of association 7022. The shrub stratum of this plot is also distinct from the association. Important shrubs include *Ilex vomitoria*, *Persea palustris*, and *Vaccinium tenellum*. This plot is located within the Washo Reserve in the Santee Coastal WMA.

X. Maritime grasslands

A. Foredune Dry Grasslands

1) *Uniola paniculata* Herbaceous Vegetation (CEGL004038)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.686506

NVC Fit = Good

Plots = 063-04-0928

This is the typical foredune beach vegetation in the southern Atlantic Coast, outside the range of *Schizachyrium littorale*. The dominating grass is *Uniola paniculata*. Other species include *Hydrocotyle bonariensis*, *Iva imbricata*, *Oenothera fruticosa* var. *fruticosa*, and *Cakile edenula*.

2) *Uniola paniculata* - *Schizachyrium littorale* - *Panicum amarum* Herbaceous Vegetation

(CEGL004039)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.687366

NVC Fit = Fair

Plots = 063-08-0926

According to the NVC, this foredune community is dominated by *Uniola paniculata*, but also includes *Schizachyrium littorale* and *Panicum amarum* var. *amarum*. This plot lacks the former species, but includes other diagnostic species such as *Croton punctatus*, *Heterotheca subaxillaris*, and *Oenothera humifusa* var. *humifusa*. Other species found on this plot include *Yucca gloriosa*, *Eustachys petraea*, and *Galactia volubilis* var. *volubilis*.

B. Backdune and interdunal dry grasslands

- 1) *Spartina patens* - *Schoenoplectus pungens* - *Solidago sempervirens* Herbaceous Vegetation (CEGL004097)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.686121

NVC Fit = Good

Plots = 063-04-0929

This interdunal grassland community can be found throughout the mid and south Atlantic maritime strand of the eastern United States. The dominant grass species of this plot is *Spartina patens* var. *monogyna*. Other species include *Solidago sempervirens* var. *mexicana*, *Iva imbricata*, *Panicum amarum* var. *amarum*, and *Heterotheca subaxillaris*. This community represents a seral transition from interdunal wet grasslands and shrub uplands.

XI. Freshwater tidal woodlands

A. Tidal Hardwood Swamps

- 1) *Nyssa biflora* - *Nyssa aquatica* - *Taxodium distichum* / *Saururus cernuus* Forest (CEGL004696)
http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.688712

NVC Fit = Fair to Good

Plots = 063-04-0937, 063-08-0925,
063-08-0933, 063-08-0934

This tidal river swamp forest occurs from southern Virginia to South Carolina. These plots are all located along Santee River drainage of Berkeley and Georgetown Counties, SC, except 063-08-0933, which is located along Mill Branch in the Wambaw Creek National Wilderness. The canopy is codominated by *Taxodium distichum*, *Acer rubrum*, *Nyssa biflora*, and *Quercus laurifolia*. Subcanopy species include *Fraxinus caroliniana*, *Sabal minor*, *Liquidambar styraciflua*, and *Ulmus americana* var. *americana*. The shrub stratum is not very well developed in these plots, but includes *Morella cerifera*.

Constant herb species include *Saururus cernuus*, *Triadenum walteri*, *Osmunda regalis* var. *spectabilis*, *Persicaria punctata*, and *Arundinaria tecta*.

2) *Acer rubrum* - *Nyssa biflora* - (*Liquidambar styraciflua*, *Fraxinus* sp.) Maritime Swamp Forest
(CEGL004082)

NVC Fit = Fair

Plots = 063-09-0928

This maritime swamp forest occurs in basins of dune swells along the coast of the Carolinas. The plot occurs on the Quarterman Branch Reserve of the FMNF. Canopy vegetation includes a mixture of *Acer rubrum*, *Nyssa biflora*, and *Liquidambar styraciflua*. Also, the invasive, exotic *Triadeca sebifera* is found in the canopy of this plot. Although the NVC reports that this community type is low in herbaceous diversity, this plot is rich in herbaceous strata species. These include *Ludwigia palustris*, *Scirpus atrovirens*, *Galium tinctorium* var. *floridanum*, *Eleocharis microcarpa*, *Carex tribuloides* var. *tribuloides*, and *Pluchea camphorata*.

3) *Quercus laurifolia* - *Fraxinus pennsylvanica* - *Nyssa aquatica* / *Sabal minor* Tidal Forest

(CEGL007884)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.686897

NVC Fit = Good

Plots = 063-02-0931

This community occurs in tidal influenced brownwater river systems of the Gulf Coastal Plain. This plot is found along Mill Branch, in the Wambaw Creek National Wilderness of the FMNF. The canopy is dominated by *Acer rubrum*, *Nyssa biflora*, *Quercus laurifolia*, and *Liquidambar styraciflua*. The subcanopy is composed of *Ilex opaca* var. *opaca*, *Cornus foemina*, and *Ulmus rubra*, while the open shrub stratum is composed of *Morella caroliniensis*. The herbaceous stratum is diverse and includes *Carex intumescens* var. *intumescens*, *Fraxinus pennsylvanica*, *Sabal minor*, *Rubus trivialis*, *Hypoxis wrightii*, and *Mitchella repens*.

B. Tidal Cypress Swamps

1) *Taxodium distichum* Tidal Woodland [Placeholder] (CEGL003739)

NVC Fit = Fair

Plots = 063-04-0925

This community has yet to be defined by the NVC. It currently exists as a placeholder within the *Taxodium distichum* Tidal Woodland Alliance (II.B.2.N.f). This plot is located on a tidal swamp within the Washo Reserve of the Santee Coastal Wildlife Management Area. The canopy is dominated by *Taxodium distichum*, *Liquidambar styraciflua*, and *Nyssa biflora*. Minor canopy species include *Acer rubrum* var. *rubrum*, *Quercus virginiana*, and *Pinus*

taeda. The shrub stratum is composed of canopy species and *Morella cerifera*, *Triadeca sebifera*, *Cephalanthus occidentalis*, and *Fraxinus caroliniana*. The herbaceous stratum includes *Alternanthera philoxeroides*, *Dulichium arundinaceum*, *Hymenocallis crassifolia*, *Saccharum giganteum*, *Juncus effuses* ssp. *solutus*, and *Pontederia cordata* var. *cordata*. Standing water is usually found on this plot. Aquatic floating and submerged vegetation is found here. Species include *Lemna minor*, *Nymphoides cordata*, and *Potamogeton pulcher*.

- 2) *Taxodium ascendens* - *Nyssa biflora* / *Carex striata* - *Rhynchospora* (*careyana*, *cephalantha*, *microcephala*) Stringer Woodland (CEGL004089)

NVC Fit = Good

Plots = 063-04-0940

This woodland occurs on seasonally to semipermanently saturated depressional zones along the Outer Coastal Plain of South Carolina and Georgia. The canopy of this plot is dominated by *Taxodium ascendens*, *Nyssa biflora*, and *Acer rubrum* var. *rubrum*. The shrub stratum is relatively open, but includes *Morella cerifera*, *Cephalanthus occidentalis*, *Itea virginica*, and *Clethra acuminata*. The herbaceous stratum is dominated by a dense mat of *Carex striata*. Other herbs include *Dichanthelium ensifolium*, *Woodwardia virginica*, and *Woodwardia areolata*. This plot is located directly off of Collins Creek within the FMNF.

NVC Fit = Poor

Plots = 063-08-0937

This plot does not fit the NVC description of CEGL004089 due to its lack of *Taxodium ascendens* in the canopy. The canopy is dominated by *Nyssa biflora*, and the subcanopy is dominated by *Acer rubrum* and *Persea palustris*. The open shrub stratum is dominated by *Magnolia virginiana*, *Morella cerifera*, and *Gaylussacia frondosa*. The herbaceous stratum is dominated by a thick cover of *Carex striata*. Other herbs include *Woodwardia virginica*, *Andropogon virginicus*, and *Mitchella repens*.

XII. Shrubby tidal vegetation

A. Saline tidal shrublands

- 1) *Borrichia frutescens* / (*Spartina patens*, *Juncus roemerianus*) Shrubland (CEGL003924)
http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.687750

NVC Fit = Fair

Plots = 063-04-0930

This saline shrubland community is found between drier upland sites and salt marsh flats influenced by daily tide fluctuations. Characteristic species of this plot includes *Borrichia frutescens*, *Distichlis spicata*, and *Salicornia virginica*. Because of its topographic position, this community type does

not experience daily flooding like the *Spartina* marsh below. Rather, this plot incurs irregular or monthly flooding due to storm surge or strong tides.

XIII. Open salt and brackish tidal vegetation

A. Tidal Salt Marshes

- 1) *Spartina patens* - *Distichlis spicata* - *Juncus roemerianus* Herbaceous Vegetation
(CEGL004197)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.684204

NVC Fit = Poor

Plots = 063-04-0932

This salt marsh community occurs on higher topographic positions than adjacent, regularly flooded low salt marshes. *Spartina patens* var. *patens* is typically the dominant grass, with *Distichlis spicata* forming a minor codominant. This plot is dominated by *Distichlis spicata*, and *Spartina patens* is

completely absent. Other species found include *Spartina alterniflora* and *Salicornia virginica*. This plot is located on Murphy Island, within the Santee Coastal Wildlife Management Area.

2) *Spartina alterniflora* Carolinian Zone Herbaceous Vegetation (CEGL004191)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.683265

NVC Fit = Fair

Plots = 063-04-0931

This community represents regularly flooded tidal salt marshes from Cape Hatteras, NC to the Atlantic Coast of the Florida peninsula. This community experiences long exposure to high salinity water, and according to the NVC, can tolerate long submergence. The dominant tall grass found in this community type is *Spartina alterniflora*. Species diversity in this association is usually very low. This plot also includes *Salicornia virginica*.

XIV. Open fresh and oligohaline vegetation

A. Oligohaline Tidal Marshes

- 1) *Zizaniopsis miliacea* Tidal Herbaceous Vegetation (CEGL004705)

http://www.natureserve.org/explorer/servlet/NatureServe?searchCommunityUid=ELEMENT_GLOBAL.2.685256

NVC Fit = Fair to Good

Plots = 063-04-0943, 063-04-0944

These oligohaline marshes are constantly dominated by *Zizaniopsis miliacea*. The community experiences daily tidal flooding. Other species found throughout these plots includes *Typha domingensis*, *Utricularia* sp., *Azolla caroliniana*, and *Nymphoides aquatica*. None of these species, except for the nominal, match the species described as codominants by the NVC.

CONCLUSIONS AND FUTURE DIRECTIONS

The Francis Marion Pulse documented many poorly known or unknown vegetation types from this part of the state. New to the survey were rich upland hardwood forests from the Outer Coastal Plain of South Carolina, and fire-maintained woodlands over relatively rich silty soils. A large range of brown and blackwater riparian forests were sampled, as well as pocosin, depression pond, coastal marsh, and Coastal Fringe maritime and dune vegetation. Collected plots were assigned to 36 vegetation types. In some cases the plots site well into established types, but for the most part our plots deviate from the previous descriptions suggesting a need for substantial refinement of the NVC. In particular 39 plots only marginally fit within the classification, 9 plots seemed to fit not at all, and 1 plot could not be placed in any classification scheme. Appendix 2 provides a summary table for identified groups that do not fit well into the current NVC schema. As illustrated in the above descriptions, much work is needed to refine our understanding of Maritime and Coastal Plain communities of the Carolinas. Additional plots established in the eastern portion of both states will be needed to increase our understanding of these under-sampled communities. For now, however, these current plots will provide a framework for future classification projects undertaken throughout our broad study area.

Appendix 2: Association Groups with Fair or Poor Fit

CEGL	# of Plots	NVC FIT	Reason
<i>Quercus alba</i> - <i>Carya glabra</i> / Mixed Herbs Coastal Plain Forest (CEGL007226)	1	Fair	Vegetation composition is different; specifically, plot's lack of <i>Carya glabra</i> and presence of xeric oak species in the canopy
<i>Quercus hemisphaerica</i> - <i>Magnolia grandiflora</i> - <i>Carya (glabra, pallida)</i> / <i>Vaccinium arboreum</i> / <i>Chasmanthium sessiliflorum</i> Forest (CEGL004788)	7	Poor to Fair	Vegetation composition is different; specifically, plots' lack of <i>Quercus hemisphaerica</i>
<i>Carya cordiformis</i> - <i>Quercus pagoda</i> - <i>Quercus shumardii</i> - <i>Carya myristiciformis</i> / <i>Sabal minor</i> - <i>Cornus asperifolia</i> Forest (CEGL007316)	1	Fair	Vegetation composition is different; specifically, plot's lack of calcareous species in the canopy
<i>Pinus palustris</i> / <i>Quercus laevis</i> - <i>Quercus geminata</i> / <i>Vaccinium tenellum</i> / <i>Aristida stricta</i> Woodland (CEGL003589)	1	Fair	Vegetation composition is different; specifically, plot's lack of <i>Aristida stricta</i> in the herbaceous layer
<i>Quercus lyrata</i> - <i>Quercus laurifolia</i> - <i>Taxodium distichum</i> / <i>Saururus cernuus</i> Forest (CEGL004735)	1	Fair	Poor understanding of composition in response to differentiating hydrologic regimes; broadly defined association
<i>Taxodium distichum</i> – <i>Nyssa aquatica</i> / <i>Fraxinus caroliniana</i> Forest (CEGL007431)	1	Poor	Vegetation composition is different; specifically, dominance of <i>Carpinus caroliniana</i> in the understory
<i>Nyssa aquatica</i> - <i>Nyssa biflora</i> Forest (CEGL007429)	1	Fair	Vegetation composition is different; specifically, plot is codominated by brown-water river species
<i>Taxodium distichum</i> – <i>Fraxinus pennsylvanica</i> – <i>Quercus laurifolia</i> / <i>Acer rubrum</i> / <i>Saururus cernuus</i> Forest (CEGL007719)	1	Fair	Poor understanding of this community type within the NVC
<i>Quercus phellos</i> - <i>Quercus laurifolia</i> - <i>Nyssa biflora</i> - <i>Liquidambar styraciflua</i> / <i>Arundinaria gigantea</i> ssp. <i>tecta</i> - <i>Sabal minor</i> Forest (CEGL007846)	2	Poor	Vegetation composition is different; specifically, plot is codominated by <i>Taxodium distichum</i>
<i>Taxodium ascendens</i> / (<i>Nyssa biflora</i>) / <i>Leucothoe racemosa</i> - <i>Lyonia lucida</i> - <i>Morella cerifera</i> Depression Forest (CEGL007420)	1	Fair	Large range of this community requires further investigation of local floristic composition

CEGL	# of Plots	NVC FIT	Reason
<i>Quercus laurifolia</i> - <i>Nyssa biflora</i> / <i>Clethra alnifolia</i> - <i>Leucothoe axillaris</i> Forest (CEGL007447)	1	Fair	Vegetation composition is different; specifically, high species diversity in the canopy and subcanopy
<i>Pinus serotina</i> / <i>Zenobia pulverulenta</i> - <i>Cyrilla racemiflora</i> - <i>Lyonia lucida</i> Wooded Shrubland (CEGL004458)	1	Fair	Vegetation composition is different; specifically, high herbaceous diversity
<i>Ilex glabra</i> - <i>Lyonia lucida</i> - <i>Zenobia pulverulenta</i> Shrubland (CEGL003944)	1	Fair	Vegetation composition is different; specifically, high herbaceous diversity
<i>Saccharum</i> spp. - <i>Panicum verrucosum</i> - (<i>Rhexia</i> spp., <i>Sabatia angularis</i>) Herbaceous Vegetation (CEGL004752)	1	Fair	Vegetation composition is different; specifically, occurrence of <i>Liquidambar styraciflua</i> saplings
<i>Eleocharis baldwinii</i> - <i>Hydrocotyle (ranunculoides, umbellata)</i> Herbaceous Vegetation (CEGL007893)	2	Fair	Vegetation composition is different; specifically, plots' lack of <i>Eleocharis baldwinii</i> in the herbaceous layer
<i>Pinus serotina</i> - (<i>Liriodendron tulipifera</i>) / <i>Lyonia lucida</i> - <i>Clethra alnifolia</i> - <i>Ilex glabra</i> Woodland (CEGL004435)	2	Poor to Fair	Vegetation composition is different; specifically, high herbaceous diversity
<i>Juniperus virginiana</i> var. <i>silicicola</i> - (<i>Quercus virginiana</i> , <i>Sabal palmetto</i>) Forest (CEGL007813)	1	Poor	Vegetation composition is different; specifically, codominance of <i>Morella cerifera</i> and <i>Ilex vomitoria</i> in the canopy
<i>Quercus virginiana</i> - <i>Quercus hemisphaerica</i> - <i>Pinus taeda</i> - <i>Quercus falcata</i> / <i>Ilex vomitoria</i> Forest (CEGL007026)	1	Fair	Vegetation composition is different; specifically, plot lacks constant canopy species like <i>Quercus hemisphaerica</i>
<i>Quercus hemisphaerica</i> - <i>Pinus taeda</i> - (<i>Quercus nigra</i>) / <i>Osmanthus americanus</i> var. <i>americanus</i> / <i>Ilex glabra</i> Forest (CEGL007022)	1	Fair	Vegetation composition is different; specifically, dominance of <i>Quercus virginiana</i> in the canopy of this plot
<i>Uniola paniculata</i> - <i>Schizachyrium littorale</i> - <i>Panicum amarum</i> Herbaceous Vegetation (CEGL004039)	1	Fair	Vegetation composition is different; specifically, plot lacks <i>Schizachyrium littorale</i>
<i>Nyssa biflora</i> - <i>Nyssa aquatica</i> - <i>Taxodium distichum</i> / <i>Saururus cernuus</i> Forest (CEGL004696)	3	Fair	Poor understanding of this community type within the NVC
<i>Acer rubrum</i> - <i>Nyssa biflora</i> - (<i>Liquidambar styraciflua</i> , <i>Fraxinus</i> sp.) Maritime Swamp Forest (CEGL004082)	1	Fair	Vegetation composition is different; specifically, high herbaceous diversity

CEGL	# of Plots	NVC FIT	Reason
<i>Taxodium distichum</i> Tidal Woodland [Placeholder] (CEGL003739)	1	Fair	Currently, this association is not described by NVC
<i>Taxodium ascendens</i> - <i>Nyssa biflora</i> / <i>Carex striata</i> - <i>Rhynchospora (careyana, cephalantha, microcephala)</i> Stringer Woodland (CEGL004089)	1	Poor	Vegetation composition is different; specifically, the plot lacks <i>Taxodium ascendens</i> in the canopy
<i>Borrichia frutescens</i> / (<i>Spartina patens</i> , <i>Juncus roemerianus</i>) Shrubland (CEGL003924)	1	Fair	Vegetation composition is different;
<i>Spartina patens</i> - <i>Distichlis spicata</i> - <i>Juncus roemerianus</i> Herbaceous Vegetation (CEGL004197)	1	Poor	Vegetation composition is different; specifically, the plot lacks <i>Spartina patens</i>
<i>Spartina alterniflora</i> Carolinian Zone Herbaceous Vegetation (CEGL004191)	1	Fair	Geomorphologically different from described community type
<i>Zizaniopsis miliacea</i> Tidal Herbaceous Vegetation (CEGL004705)	1	Fair	Vegetation composition is different; specifically, high herbaceous diversity
