THE ARIZONA DEPARTMENT OF MINES AND MINERAL RESOURCES

The objective of the Department is to promote the development of Arizona's mineral resources. This is accomplished through technical research, field investigations, compilation of information into a mineral occurrence data base and disseminating information through publications, personal contacts and seminars.

The Department's mining engineers and geologists assist mining and exploration companies, prospectors and others interested in Arizona's minerals with mineral processing, mineral land acquisition, exploration, mine development, financing, government regulations and marketing.

The Department is a service agency and does not regulate, tax, or require any type of registration. The agency provides assistance that is tailored to meet the differing needs of the public. The following is a partial list of services which the Department offers:

- Maintain a site specific data base of unpublished reports and maps which includes 5,000 mine files and indexes of 10,000 computerized Arizona
- Maintain an information bank and library of mineral and mining information including a mine map library (hard copy and microfilm), government publications, periodicals, and unpublished master and doctorate theses.
- Gather and disseminate information on commodities and markets.
- Suggest target areas for possible exploration activity.
- Suggest prospects and individual properties for study and acquisition.
- Assist individuals and companies in their dealings with State regulatory agencies to facilitate their mining and exploration activity.
- Produce publications in the form of mineral reports, annual directories, technical reports, annual mineral industry surveys and information circulars. These include Laws and Regulations Governing Mineral Rights in Arizona, Directory of Active Mines in Arizona, Manual for Determination of Status and Ownership of Arizona Mineral and Water Rights, and others. A current listing of the Department publications is available upon request.

Specific statistics may vary slightly from table to table due to differences in source data.

INTRODUCTION

The Arizona Department of Mines and Mineral Resources presents herein a report covering activity in Arizona's copper industry in the calendar year 1990. A brief review of operational highlights reported by the major developers and producers in the State, market and price developments that affected copper production, and discussions of Arizona severance taxes on metalliferous minerals are included.

The contained statistical tables include various production, employment, inventory, import/export, prices, costs, and ore reserve numbers for 1990. Production of recoverable copper is given for individual mines and by company. Figures showing the importance of copper in the mining industry are provided, as are data on the by-products of copper mining; gold, silver, and molybdenum. In addition, historical compilations are included for leach copper, average grade of ore produced, percent copper recovered, open pit mine stripping ratios, and employment and earnings. Additional compilations indicating refined copper inventories in and out of the United States and average copper prices by month from 1981 through 1990 are provided. Also included are tables showing designed mine capacity and copper reserves in Arizona plus average copper cash production costs for the United States, 1983-1988.

The Department maintains extensive reference libraries in its Phoenix and Tucson offices concerning the copper industry in Arizona. These repositories include information on individual mines and mining companies, United States Bureau of Mines and United States Geological Survey publications, other professional publications, periodicals, and earlier editions of this report. Additionally, experienced mining engineers are available for consultation, at no charge, on matters germane to the minerals industry. Office hours are 8 a.m. to 5 p.m. on all non-holiday weekdays in Phoenix and on Mondays and Tuesdays in Tucson.

ACKNOWLEDGEMENT

The author wishes to express his sincere appreciation to the management and staff of each of Arizona's mining companies for graciously devoting time and effort to provide information for this report. Michael Greeley of the U.S. Bureau of Mines, Dr. George Leaming of the Western Economic Analysis Center of Marana, Arizona, and the American Bureau of Metal Statistics, Inc. of Secaucus, New Jersey also provided vital information.

Thanks are also due to the Arizona Department of Economic Security, the Arizona Department of Revenue, and the staff of the Joint Legislative Budget Committee for providing statistics and data.

A special gratitude is felt toward the preceding authors for providing the format and sources of statistical information and to Leroy E. Kissinger, Director of the Department of Mines and Mineral Resources, for providing the opportunity to author this report.

COPPER PRODUCTION IN ARIZONA - 1990

Arizona's copper industry produced 1,087,287 tons of copper in 1990 (Table I). This is an increase of 8.2% above 1989, but is still 1.4% below the record production of 1981 (Table IX). Arizona's share of the United States total was up to 62.5% from 60.8%.

The gross value of non-fuel mineral production in Arizona in 1989 was down 3% from 1988 to \$3,060,218,000 (Table X) as copper prices declined. Copper production represents 86% of this total; the by-products of copper production (gold, silver and molybdenum) represent an additional 3.9% (Table IX). The total contribution of the copper mines was therefore 89.9% of the gross value.

Copper was produced by 5 companies from 15 properties in 1990 and molybdenum was recovered as a co-product or by-product at 5 of these properties (Tables III & IV). Eight properties produced 98.8% of Arizona's copper and 3 produced 94.3% of the molybdenum. The Morenci-Metcalf mine of Phelps Dodge led in copper production with 30.9% of the total. The Sierrita-Esperanza complex produced 53.5% of the molybdenum.

More than 300,000 tons of copper representing 27.7% of the total was produced by leaching in 1990.

Solvent extraction-electrowinning produced almost 293,000 tons of cathode copper from these leach solutions. The remaining 7,800 tons were precipitated as cement copper (Table I).

Stripping of waste, including some leachable material, was accomplished at the 9 operating open pit mines during 1990. The weighted average of the stripping ratios - waste to ore - was 1.57 to 1 (Table VIII). This is comparable to the 1.46 to 1 in 1989 which probably indicates continued normal long range mine planning.

The weighted average grade - percent copper - of sulfide ores mined in 1990 was 0.58% copper (Table VI).

The estimated capacity to produce copper at each of Arizona's principal operations totals 1.173 million tons annually (Table XI). By this estimate the mines, concentrators, and leach facilities operated at 92.7% of capacity in 1990.

The copper reserve base in Arizona by company and property is estimated in Table XIII. The reserve base as defined in "Mineral Facts and Problems" 1985 Edition, Bureau of Mines Bulletin 675, page 3, includes those resources that are currently economic (reserves), marginally economic (marginal reserves), and some of those that are currently sub-economic (sub-economic reserves). The many technical, political, social, and economic variables render a listing of actual economic reserves inappropriate.

Figure 1. Producing Copper Properties - 1990

1990 OPERATIONS SUMMARY

Operating Properties	15
Operating Companies	5
Operating Smelters	3
Ore Mined (including some oxide)	213,168,000 tons
Ore Milled (sulfides)	168,460,000 tons
Waste/Overburden removed	
(includes some leach material)	296,177,000 tons
Average stripping ratio	1.57:1
Copper produced	1,087,287 tons - 62.5% of U.S.
From sulfide ores	786,607 tons - 72.3% of AZ
Average grade	0.58% copper
From leaching	300,678 tons - 27.7% of AZ
SX-EW	292,875 tons - 97.4% of leached
	26.9% of total
Precipitation	7,803 tons - 2.6% of leached
Molybdenum produced	29,344,000 pounds
Silver produced	4,069,000 troy ounces
Gold produced	44,000 troy ounces
Average employment	11,352
Average annual wage	\$36,243
Productivity (production workers)	121 lb. of copper per man-hour, 11.9 tons of ore per man-hour

STATUS AND PROGRESS

Although prices softened somewhat during the year, the increased efficiencies at Arizona's copper properties made 1990 another profitable year for the industry. The continued political and labor problems that plagued some of the foreign producers staved off the predicted glut of copper on the world market. Although world stocks of refined copper rose by 20% the U.S. stocks actually declined 22%. The outlook for the early nineties is for a deficiency of smelter capacity in spite of the increased SX-EW production.

The major companies continued to expand production at current properties as opposed to opening new properties, although Magma did reopen its namesake Magma Mine at Superior.

The smaller companies were less conservative. Arimetco shut down and sold Emerald Isle, but started production at Johnson camp and is conducting feasibility studies at the Van Dyke for an in-situ/SX-EW operation. Holcorp Gold plans to operate Emerald Isle with an SX-EW plant to be built by Arimetco as a part of the purchase deal. The Oracle Ridge property neared production and AZCO continued with studies and permitting at the Sanchez property.

OPEN PIT MINING

Open pit mining is the principal method of producing copper. Loading equipment ranges from front-end loaders to electric shovels and haulage is by off road trucks, sometimes in conjunction with conveyor belts.

In 1990, ten open pits were mined. Six produced principally sulfide and oxide ore, and two produced principally oxide ore.

UNDERGROUND MINING

San Manuel is the largest underground metal mine in the nation and utilizes the block caving method of mining. This method consists of undercutting a block of ore and allowing the ore to cave into draw points to be loaded onto trains for haulage to the shaft and hoisted to the surface.

Towards the end of the year, the original Magma Mine at Superior became the only other underground copper mine operated in 1990. Superior utilizes the undercut and fill method of ore extraction.

IN-SITU MINING

In-situ leaching of rubbleized copper bearing material remaining in mined out underground stopes has long been practiced in Arizona. At San Manuel, Magma is developing a more formalized program of leaching

mined out block caving stopes and is approaching production status. During the last few years all of the production from the Lakeshore property has been from a similar system developed by Noranda. Cyprus is continuing this project as well as tests of in-situ leaching of non-rubbleized or virgin ground.

The U.S. Bureau of Mines is partially funding tests of in-situ leaching of virgin ground in Arizona. Asarco is cooperating with the Bureau at the Santa Cruz property near Casa Grande. The Santa Cruz ore body is a deep seated acid soluble deposit which is owned by Asarco and Freeport McMoran on a 50-50 basis.

SOLVENT EXTRACTION

Traditionally the copper produced from leach solutions has been extracted by cementation process (precipitation from solution by the replacement of copper in solution by metallic iron). This has been a source of relatively cheap copper, but the cement copper produced must be smelted and refined along with the flotation concentrates.

During the 1960's, Ranchers Exploration and Development Corporation pioneered the use of solvent extraction-electrowinning to produce copper from its Bluebird property near Miami. The obvious advantage of this method is that cathode copper of salable quality can be produced directly from leach solutions. Smelting, with its pollution problems, and further refining are therefore not required.

During the relatively good years experienced by the industry after Rancher's introduction of solvent extraction-electrowinning, interest in the process grew gradually. The disastrous 80's prompted an accelerated interest in it, however. Twelve plants operated during 1990. Several expansions or new plants are planned and the cementation process is being phased out except as a subsidiary method.

CONCENTRATION

The overwhelming majority of copper mineralization in Arizona is of the sulfide type and is not amenable to leaching without extraordinary means. Inspiration has had success with its heap leach-ferric cure process on mixed oxide-sulfide ores and Kennecott pioneered the use of bacteria to convert sulfides to oxides in low grade dumps. However, as shown in Table I, about 75% of the copper was produced by the flotation method of concentration. In addition much of the leached copper produced is from dumps of "waste" that was stripped from open pit mines to provide access to sulfide ore. Another aspect of the flotation process that makes it

viable at some properties is the recovery of molybdenum by selective flotation. Molybdenum provides a significant portion of the revenues from some properties. Also, any precious metals in the ore follow the copper through the flotation process and smelting to the electrolytic refinery where they can be recovered from the anode slimes.

There are currently nine flotation concentrators in operation in Arizona. Asarco is operating 3 - 1 at Ray and 2 at Mission, Cyprus is operating 2 - Bagdad and Sierrita, Magma is operating 3 - San Manuel, Pinto Valley, and Superior, and Phelps Dodge 2 at Morenci-Metcalf.

Although efficiency is constantly being improved, the flotation process is not cheap. It requires crushing and grinding the ore, separation of the ore minerals from the gangue minerals in the flotation cells, smelting the concentrate, and refining the copper anodes from the smelter. The most significant development in flotation is the column flotation cell being installed in most concentrators.

SMELTING

Of the six smelters remaining in Arizona in 1989 only three operated. Asarco's Hayden smelter and Cyprus' smelter at Miami have been brought into compliance with air pollution constraints and Magma's smelter at San Manuel has been retrofitted with an Outokumpu flash furnace to bring it into compliance. The Ray smelter at Hayden that Asarco acquired from Kennecott met all significant environmental constraints when last operated in 1982. Phelps Dodge's smelters at Ajo and Morenci will require extensive retrofitting before they can be operated. Phelps Dodge is shipping concentrates to its Hidalgo smelter at Playas, New Mexico and to the Chino smelter at Hurley, New Mexico that was recently acquired from Kennecott. Excess concentrates are being sold.

As an alternative to smelting, Cyprus Casa Grande has reactivated the Roast-Leach-Electrowinning (RLE) plant built by Hecla at the Lakeshore property. In this process flotation concentrates are roasted to make them acid soluble and leached with sulfuric acid. Soluble cathode copper is extracted from the leach solution by electrowinning. Cyprus is upgrading the leach solutions in the solvent extraction plant before electrowinning. Acid is produced from the roaster gases and the process is essentially pollution free.

A portion of the concentrates from Sierrita are being processed at this plant.

PROGNOSTICATION

After looking at all of the trends, figures and statistics and reading the statements of the experts, I believe that I'll defer to Richard De J. Osborne in his comments at the Institute of Metal's Copper 90 conference held in Sweden. It seems to summarize the view of the people in the industry.

"Unlike the popular view, I see the copper industry as a growing business, supported by efficient, well-run producers and fabricators -- and an industry which is investing in the market development necessary to assure its own future. I do not subscribe to the view of the social planners that our industry is a sunset industry which should be set aside in their grand plan for the world's future."

ARIMETCO INCORPORATED

**Corporate Headquarters - 6245 E. Broadway,
Suite 350, Tucson, Arizona 85711
Phone (602) 745-8882**

Arimetco acquired the Emerald Isle and Johnson properties in Arizona and the Yerington property in Nevada during 1989.

At Johnson camp cathode production from previously mined ore heaps was started in 1990 upon the completion of the SX-EW plant.

The Emerald Isle operation was sold to Holcorp Gold Mines contingent upon Arimetco building an SX-EW plant at that property.

The Van Dyke property at Miami was purchased and feasibility studies for a modified in-situ leaching/SX-EW operation are being conducted.

Emerald Isle

**Kingman, AZ
Phone (602) 565-4554**

The Emerald Isle which consisted of in-situ leaching and a precipitation plant was shut down in the first quarter of 1990. It was subsequently sold to Holcorp gold Mines contingent on Arimetco building an 8,000 PPD SX-EW plant to replace the precipitation plant.

Johnson

**Benson, AZ
Phone (602) 586-2241**

Construction of a 35,000 PPD SX-EW plant was completed and put in production in October, 1990. Initial production is from leaching existing heaps and mining of new ore will commence in 1991 with a fleet of 4 120 ton trucks.

ASARCO INCORPORATED

Corporate Headquarters - 180 Maiden Lane, New York, New York 10038 - Phone (212) 669-1000

In Arizona, Asarco operates copper mines at Sahuarita, Ray and Silver Bell and a copper smelter at Hayden. In Texas, they operate a copper smelter at El Paso and a copper refinery at Amarillo. They also hold major interests in MIM Holdings Limited, Mexico Desarrollo Industrial Minero, S.A. (MEDIMSA) and Southern Peru Copper Corp. (SPCC).

In June 1989 Asarco purchased 49.9% of a partnership formed by Montana Resources to own and operate the Continental Mine in Butte, Montana.

In addition to copper, Asarco mines and refines lead, zinc, gold and silver and produces coal, industrial minerals and chemical and manufactured products.

**Tucson Office - 1150 N. 7th Ave., P.O. Box 5747,
Tucson, Arizona 85703 - Phone (602) 792-3010**

The Tucson office houses the Southwest Mining Department, the Mining Department/Corporate Office, the Mineral Beneficiation Department, the Exploration Department, the Acid Sales Department, Safety Department, and Government of Affairs Office.

During 1990 Asarco's Arizona operation consisted of a major copper smelter at the Hayden Unit, major open pit mines at the Mission and Ray Units, and a dump leaching/cementation operation at the Silver Bell Unit. With the increased production at the Mission Complex, Asarco is able to produce 67% of the feed to its smelters.

Asarco continued its \$375 million program to become self-sufficient in concentrates to feed its smelters. The program includes a 42% increase in production at the Mission complex by utilizing the idle Cyprus Pima mill and a 58% increase in production at Ray by building a new mill at the mine site to supplement the production from the Ray mill at Hayden. Also included in the expansion is the resumption of mining and the construction of an SX-EW plant at Silver Bell.

The in-situ study at the Santa Cruz property in cooperation with the U.S. Bureau of Mines continued. Injection of saline solution to determine the hydrology of the deposit was accomplished and the results are being evaluated.

Asarco also holds major reserves at the Chilito north of Hayden, at Helvietia, east of the Mission Complex and at Sacaton East.

Hayden Unit

Box 98, Hayden, Arizona 85235 - Phone (602) 356-7804

The Hayden Unit consists of an INCO flash furnace smelter rated at 720,000 tons of charge per year for an estimated production of 175,000 tons of blister copper. An acid plant rated at 1,600 tons of sulfuric acid per day keeps sulfur dioxide emissions within air quality restraints.

By 1992, when Asarco's expanded and modernized copper facilities are operating at capacity their output will be enough to provide all the feed to its smelter.

Mission Unit

Box 111, Sahuarita, Arizona 85629 - Phone (602) 791-2920

The Mission Unit consists of the consolidation of the Mission, Eisenhower, San Xavier, and Pima open pit mines into one large open pit referred to as the Mission Complex. Also included is the smaller San Xavier North pit. The acquisition of the rest of the Eisenhower in April and of the Mineral Hill deposit adjacent to the Pima section of the open pit late in 1987 increased reserves and facilitates further efficiencies in pit design and mine planning.

Mining is conducted by electric shovels with truck haulage to the primary crusher and waste dumps. Some areas of the pit are back to final limits allowing some waste dumping in pit. The stripping ratio in 1990 was 2:87:1, waste to ore.

The addition of the refurbished Pima mill increased concentrator capacity to a total of 59,000 TPD.

Ray Unit

P.O. Box 9, Hayden, Arizona 85235 - Phone (602) 356-7811

The Ray Unit consists of an open pit mine, dump leach and heap leach operations, and a 40,000 ton per year SX-EW plant at Ray and a 26,000 ton per day concentrator at Hayden.

Mining is conducted by electric shovels supplemented by front-end loaders utilizing truck haulage. The production rate is 100,000 tons per day of which 26,000 tons are sulfide ore sent to the mill, and 10,000 tons are silicate ore that is crushed and sent to the leach heaps. The remainder is low grade sent to leach dumps or waste sent to waste dumps. The stripping ratio in 1990 was 1.90:1, waste to ore. The mine plans are predicated on the sulfide operation and therefore silicate ore is stockpiled when in excess and fed from the stockpile to the crushers when short.

Sulfide ore is hauled by truck to the primary crusher at Ray where it is crushed and transferred to trains for the 20 mile haul to the mill.

Silicate ore is hauled to the primary crusher then further reduced to minus 3/4 inch by secondary and tertiary crushers. It is then transported by conveyor where it is agglomerated with sulfuric acid while in transit to the heap leach area. Final haulage and placement on the heaps is by end-dump trucks.

Low grade muck is hauled to prepared leaching areas and non-mineral muck is hauled to waste dumps by

end dump trucks. All leach solution are now fed to the SX-EW plant.

Previously stockpiled native copper ore is being reclaimed and fed to the mill in small proportions as is smelter slag.

A \$12 million project was started in 1988 to maintain production capacity as the hardness of the ore increases as the pit deepens. In addition, \$130 million of the \$260 million expansion project will be spent at the Ray Unit. A 60,000 ton per day portable in-pit crusher and conveying system will replace the 30,000 ton per day primary crusher at the pit and a 20,000 ton per day concentrator will be built at the mine site. Concentrates will be hauled by rail to the smelter at Hayden. The project is scheduled for completion in 1992.

Silver Bell Unit

Marana, Arizona 85653 - Phone (602) 622-6551

The Silver Bell Unit consists of an open pit copper mine on stand by status. The dump leaching operation and precipitation plant are in operation. Reactivation of the mine and construction of an SX-EW plant is planned.

CYPRUS MINERALS COMPANY

Corporate Headquarters - 9100 E. Mineral Circle, P.O. Box 3299, Englewood, Colorado 80112 - Phone (303) 643-5000

Cyprus has continued to grow. In March 1988 it entered into a 15 year lease of the Twin Buttes property formerly operated by Anamax and in July 1988 they acquired the entire Inspiration property at Miami including the mines, concentrator (inactive), SX-EW plant, smelter, acid plant, electrolytic refinery, and rod plant. Cyprus was Arizona's second largest producer of copper in 1990 and continued to be the largest producer of molybdenum.

In 1990 Cyprus accomplished a 20% increase in capacity at its Bagdad mill by adding a fifth grinding line.

Production continued at the Sierrita and the leased Twin Buttes properties. Sulfide ore from Twin Buttes is conveyed by belt to the Sierrita Mill and the oxide ore is treated in the agitation leach/SX-EW plant built by Anamax at Twin Buttes.

At Cyprus Miami a project to make Cyprus independent of outside smelting was announced. An increase in capacity from 450,000 tons to 650,000 tons of concentrate per year is scheduled for completion in 1992 at the Miami Smelter.

The refurbished Hecla lakeshore RLE (roast-leach-electrowin) plant at Cyprus Casa Grande is treating con-

centrates from other Cyprus properties. The pregnant solution is fed to the solvent extraction plant with the in-situ solution prior to electrowinning.

In addition to its copper-molybdenum properties, Cyprus operates Arizona's largest gold mine, the Copperstone north of Quartzsite.

Cyprus has grown on a worldwide basis as well as in Arizona. It operates the Thompson Creek molybdenum mine in Idaho and in July, 1988 it acquired the molybdenum mine at Tonopah, Nevada.

In March 1989, Cyprus acquired the Warrenton Refining Co. in Truesdale, Missouri, a producer of copper ingot and wire bar from scrap. In February of 1990 they acquired MCR Products Inc. in Chicago, Illinois from Magma, a producer of high quality copper rod.

In Australia Cyprus owns a share of and operates the Gidgee, Selwyn and Moline gold mines and has a share of the Sheahan-Grants gold mine. In New Zealand it is developing the Golden Cross Project.

In 1990 Cyprus produced coal from 8 mines in Colorado, Kentucky, Pennsylvania, Utah, West Virginia and Wyoming; talc in Montana, Vermont, Alabama, and Spain; and barite in Georgia. With the acquisition of Foote Mineral Company in April of 1988 it became the major producer of lithium from salt brines in the Silver Peak facility in Nevada and in northern Chile.

Cyprus acquired the Reserve Iron Operation in northern Michigan in 1989. These facilities were rehabilitated and commenced production in 1990.

Cyprus Bagdad

P.O. Box 245, Bagdad, Arizona 86321 - Phone (602) 633-2241

The Bagdad operation consists of an open pit copper-molybdenum mine, a 71,000 ton per day concentrator, a dump leach operation and an SX-EW plant.

Mining is conducted by electric shovels using truck haulage to the primary crusher and dumps. The stripping ratio in 1990 was 1.17 to 1, waste to ore.

The sulfide ore is transported from the primary crusher at the mine, a distance of 6,400 feet to the coarse ore stockpile at the concentrator, by conveyor belts. There it is crushed further, ground by autogenous and ball mills and copper and molybdenum concentrates are produced. Column cells are utilized in the molybdenum flotation circuit.

Dual process ore (sulfide ore with an unusually high oxide content) is placed in heaps and leached for 60 days before being sent to the concentrator.

Pregnant solutions from the leach dumps are collected behind dams and pumped to the SX-EW plant at approximately 1.8 grams of copper per liter. The barren

solutions are returned to the dumps after the copper has been extracted.

Cyprus Casa Grande

P.O. Box C-9, Casa Grande, Arizona 85222 - Phone (602) 623-1539

The Casa Grande operation consists of an in-situ leaching operation and an SX-EW plant. The block caved stopes in the oxide orebody are being leached and development of a leaching operation in virgin ground is underway using high pressure pumps to inject sulfuric acid solution into holes drilled from the old underground workings. Pregnant solutions are collected in sumps underground and pumped to the SX-EW plant.

The roasters and acid plant of the Roast-Leach-Electrowinning (RLE) plant built by Hecla have been refurbished and are treating concentrates from Sierrita. The pregnant solutions go to the SX-EW plant and the acid produced from the roaster gases is used for the leaching operations.

Cyprus Miami

P.O. Box 1559, Claypool, Arizona 85532 - Phone (602) 473-7150

The Cyprus Miami properties consist of three open pit copper mines formerly called Inspiration Mines, a 24,000 ton per day concentrator that is currently on standby status, a 450,000 ton per year electric furnace smelter, acid plant, SX-EW plant, electrolytic refinery and a 135,000 ton per year rod plant.

The ore is mined at the rate of 50,000 tons per day with electric shovels and hauled by truck to high grade, low grade and waste dumps. The stripping ratio in 1990 was 0.55:1 waste to ore. Soon after Cyprus acquired the property the construction of the second, nearly identical, solvent extraction train was completed that increased the capacity of the plant to 8,000 gallons per minute. The 25 cycle AC to DC motor-generators were replaced with modern rectifiers to increase the capacity and efficiency of the tank house. The cathodes from both the electrowinning and electrorefining sections are fed to the continuous cast rod plant to produce 5/16 inch copper rod on reels holding three and one-third miles of rod each.

Cyprus Mineral Park

P.O. Box 6249, Kingman, Arizona 86401 - Phone (602) 565-2226

The Mineral Park property consists of an open pit copper-molybdenum mine and a 15,000 ton per day concentrator that are both on stand-by status. The dump leaching operation and the precipitation plant are in operation and some in-pit leaching is also being conducted.

Cyprus Sierrita/Twin Buttes

P.O. Box 527, Green Valley, Arizona 85622 - Phone (602) 791-2950 & (602) 625-4800

The Cyprus Sierrita property consists of an open pit copper-molybdenum mine, a 100,000 ton per day concentrator, a ferromolybdenum plant, a rhenium plant, a dump leaching operation, and an SX-EW plant.

Mining is conducted using electric shovels and truck haulage to the crushers and dumps. The stripping ratio in 1990 was 0.79:1, waste to ore.

Production was started at the Twin Buttes mine in 1988 providing additional feed to the Sierrita Mill. The stripping ratio in 1990 was 4:38:1. Construction of a 6.8 mile conveyor to transport sulfide ore to the Sierrita concentrator was completed in 1989. Twin Buttes contributed about one third of the copper produced at the Sierrita concentrator in 1990. The SX-EW plant at Twin Buttes is fed with solutions from leaching tailings.

MAGMA COPPER COMPANY

Corporate Headquarters - P.O. Box M, San Manuel, Arizona 85631 - Phone (602)385-3100

In March 1987, after nearly 20 years as a wholly owned subsidiary of Newmont Mining Corporation, Magma once again became an independent corporation. As such it has continued implementing an extensive expansion and modernization program to meet all environmental constraints and to become competitive in the copper market. As part of this program the company housing in the town of San Manuel is being sold.

Magma's Arizona operations are divided into the San Manuel Division and the Pinto Valley Division which include the Pinto Valley Unit and the Miami Units, and the the original Magma Mine at Superior.

At San Manuel the development of the Kalamazoo ore body continued with some production in late 1990.

The recovery of solutions from the in-situ leaching was increased by changes in well to well leaching technology.

The smelter at San Manuel attained full design capacity production.

At Pinto Valley 14 haulage trucks were replaced with larger units to provide additional feed to the concentrator. Mill capacity was expanded in 1989.

Operational difficulties are being experienced by the No. 2 Tailings leaching project.

Production at the Superior underground mine was started with an expected production rate of 1500 tons of ore per day by the end of 1991.

The McCabe gold mine started production with concentrates being shipped to the San Manuel Smelter or treatment.

Magma also operates a 29 mile railroad from San Manuel and a 28 mile railroad from Superior. Both connect to the Santa Fe Southern Pacific system.

A wholly owned subsidiary, MCR Products, consisting of a rod plant rated at 140,000 tons per year, in Chicago, Ill. was sold to Cyprus in February, 1990.

San Manuel Division

P.O. Box M, San Manuel, Arizona 85631 - Phone (602) 385-3100

The San Manuel Division consists of a block-caving underground copper- molybdenum mine, a 62,000 ton per day concentrator, an open pit oxide copper mine, pad leach, in-situ leach, SX-EW plant, a 1,000,000 ton per year smelter with a 3000 ton per day acid plant and a 300,000 ton per year electrolytic refinery and a 180,000 ton per year rod plant.

After development of the grizzly and haulage levels, caving is initiated by undercutting the ore block. The caved ore is drawn through the grizzlies to the haulage level. Haulage to the production shafts is by 23 ton trolley locomotives pulling ten 15-17 ton ASEA cars or fifteen 12-13 ton rotary dump cars. After hoisting to the surface the ore is hauled by rail to the mill in 100 ton cars in groups of 35 to 40 pulled by 125 ton diesel-electric locomotives. Development of the Kalamazoo ore body continued and production was commenced in the third quarter of 1990.

The Outokumpu Flash Smelting Furnace, at a design capacity of 3000 tons of concentrate per day, is the largest single furnace smelter in the industry. An oxygen plant and modifications to the acid plant were a part of the modernization.

Mining at the open pit oxide mine is accomplished with front end loaders with truck haulage at the rate of 28,000 tons of ore and 65,000 tons of waste per day. Ore is placed on the polyethylene lined leach pads and some

of the waste is dumped in the subsidence area. Any sulfide ore that is encountered is hauled to a railroad siding and added to the feed going to the concentrator. Copper is recovered from the leach solutions at the SX-EW plant that uses the ISA process of plating the copper on stainless steel sheets rather than on copper starter sheets. The solutions from the in-situ leaching are also fed to this plant that was expanded to a capacity of 75,000 tons of copper per year.

Cathodes from the electrolytic refinery and the SX-EW plant are melted and cast into continuous rods at the rod plant.

Pinto Valley Division

P.O. Box 100, Miami, Arizona 85631 - Phone (602) 425-7611

The Pinto Valley Division consists of the Pinto Valley Unit and the Miami Unit. At the Pinto Valley Unit mining is accomplished with electric shovels and truck haulage to the 63,000 ton per day concentrator. A dump leaching and an 8000 tons per year SX-EW plant are also in operation. The concentrates and cathodes are shipped to San Manuel.

At Miami solutions from the in-situ leaching of the old Miami Copper block cave area are treated by SX-EW. Construction of the project to slurry and leach the Miami Copper Company tailings from #2 tailing dam was completed in 1989. This is a process to slurry the tailings by hydraulic mining, leach with sulfuric acid, thicken, extract the copper at the SX-EW plant, and pump the tailings to the mined out Cities Service pit at Sleeping Beauty. To accommodate the additional solution the solvent extraction plant at Miami was modified and the electrowinning tank house was expanded to a capacity of 6,000 tons per year of copper. The tailing thickeners at the old mill were rebuilt to separate the pregnant solution from the solids after leaching.

PHELPS DODGE CORPORATION

Corporate Headquarters - 2600 North Central Avenue, Phoenix, Arizona 85004- 3015 - Phone (602) 234-8100

Phelps Dodge Mining Company was formed in September, 1988 as one of two operating divisions of Phelps Dodge Corporation. It is the nation's largest copper producer and accounts for about one-third of the nation's copper production at its mines in southeastern Arizona and southwestern New Mexico. In conjunction with its Arizona operations, Phelps Dodge operates the Hidalgo Smelter near Playas, New Mexico, a 420,000 ton

per year refinery at El Paso Texas, a mine at Tyrone and the Chino Mine near Silver City, New Mexico in which it acquired a two-thirds interest from Kennecott at the end of 1986.

The Chino Mines Branch consists of an open pit copper mine, a 45,000 ton per day concentrator, a dump leach precipitation plant, a 500,000 ton per year INCO Flash smelter with an acid plant, and a 45,000 ton per year solvent extraction-electrowinning plant. The mine and concentrator are located at Santa Rita about 15 miles east of Silver City. The smelter is located about 9 miles south of the mine at Hurley.

The Hidalgo smelter near Playas, New Mexico is an Outokumpu flash furnace rated at 500,000 tons per year. During 1986 the oxygen enrichment plant from the Morenci smelter was installed to increase capacity and efficiency. The resulting increase in sulfur dioxide concentration of the gases improved the operation of the acid plant as well.

The development of an underground mine at the Dos Pobres property near Safford, Arizona was suspended in 1982, allowed to flood in August 1984, and remains inactive. In 1986 Phelps Dodge acquired the nearby Lone Star property from Kennecott.

At Copper Basin near Prescott, Phelps Dodge has continued to pursue a land trade with the Forest Service. This property is being considered as a possible replacement for the Tyrone operation that is scheduled to cease mining operations in the early 1990's.

In addition to its Arizona-New Mexico copper properties Phelps Dodge operates a fluorspar mine in South Africa through its wholly owned subsidiary Phelps Dodge Mining (Pty) Limited and two copper-gold mines in Chile through its wholly owned subsidiary Compania Minerao Ojos del Salado SA. It also has interests in Black Mountain Mining Development Company (Pty) Limited, which operates a major lead-silver-zinc-copper mine in South Africa, and Southern Peru Copper Corporation in Peru.

Phelps Dodge Industries, the other operating division of Phelps Dodge Corporation, produces carbon black through its wholly owned subsidiary Colombian Chemical Company, wheels and rims for heavy trucks through Accuride Corporation acquired in March, 1988, and Magnet Wire, etc. through Phelps Dodge Magnet Wire Company.

Morenci Branch

Morenci, Arizona 85540 - Phone (602) 865-4521

The Morenci Branch consists of the combined Morenci-Metcalf open pit copper mine, the 60,000 ton per day Morenci concentrator with a molybdenum circuit, the 40,000 ton per day Metcalf concentrator, and a dump leach - SX-EW operation. The 650,000 ton per year smelter with a 2400 ton per day acid plant remain inactive and will require extensive modifications to meet air quality restraints if ever reactivated. Sumitomo Mining Arizona, Inc. holds an undivided 15% interest in the Morenci branch excluding the inactive smelter.

Mining is conducted with electric shovels and truck haulage utilizing a computer controlled Modular Mining Truck Dispatching System for maximum efficiency. During 1989 the completion of the in pit crushing and conveying (IPCC) system eliminated rail haulage completely. The trucks are dumped into the two semi-mobile primary crushers in the pit and the crushed ore is conveyed to the coarse ore stockpile by conveyor belt. Each concentrator is fed by conveyors running under the stockpile. Both concentrators are standard flotation mills except that column flotation cells have been installed in the cleaner circuit of each.

All mined material other than ore is classified as leach material and is taken to one of several leach dumps. There are three widely spaced solvent extraction plants to upgrade the solutions before they are pumped to the centrally located tank house for electrowinning.

Phelps Dodge completed the relocation of 2.2 miles of U.S. Highway 666 at Morenci as part of the Northwest Extension project. This project includes the expansion of the SX-EW capacity by 90,000 tons per year to 170,000 tons.

The "discovery" of the Coronado ore body adjacent to the Northwest Extension was announced.

Additional in-put crushing capacity is being provided to facilitate re-entry into the Metcalf mine area. The loading and hauling equipment in the pit were upgraded.

An additional ball mill was installed at the Morenci concentrator and the flotation cells at the metcalf concentrator are being replaced by larger units to increase capacity.

Copper Queen Branch

Highway 92, Bisbee, Arizona 85603 - Phone (602) 432-3621

The Copper Queen facility consists of a dump leaching and precipitation operation at the mined out Lavender pit.

A drilling program on an area north of the Lavender pit was conducted in 1987 to define a possible ore body amenable to treatment by heap leaching and SX-EW.

New Cornelia Branch

Ajo, Arizona 85321 - Phone (602) 387-7451

The New Cornelia Branch consists of an open pit copper mine, a 30,000 ton per day concentrator with a molybdenum circuit and a 190,000 ton per year smelter with an acid plant. The mine has been inactive since August 1984 and the smelter was shut down in April 1985. There are no immediate plans to reactivate the operation but it is being considered as a replacement for the Tyrone operation if economic conditions are suitable in the early 1990's.

SEVERANCE TAX ON METALLIFEROUS MINERALS

Background

Laws of 1982, Chapter 230, repealed the tax on sales of metalliferous minerals and enacted a severance tax in its place. Under the provisions of the severance tax, metalliferous minerals were to be taxed at the time of production, not at the time of sale. All metalliferous minerals produced after 1982 were to be taxed on the greater of the following 2 values:

1. The "weighted mineral value" which is essentially the cost of extracting the minerals from the earth and delivering them to the site where they will be processed, or

2. A specified percentage of the old sales tax base.

The severance tax was to be levied on metalliferous minerals at a rate of 2 1/2 percent. Unless otherwise provided by law, the tax was to be administered in the same manner as the sales tax. As a result, severance tax payments were due on the first day of the second month following the month in which the tax accrued. From January 1, 1983 through June 30, 1983, 40 percent of the severance tax was to be distributed in the same manner as the transaction privilege tax (i.e. 25 percent to the cities, 33.6 percent to the counties and 41.4 percent to the state). In subsequent fiscal years, a progressively larger share of the severance tax was to be distributed in the same manner as the transaction privilege tax. The balance of severance tax collections, after making this distribution, was to be deposited each year in the state's general fund. (Effective from and after December 31, 1982.)

Laws of 1983, Chapter 4 changed the due date for payment of the Severance Tax to the twentieth day of the month following the month in which the tax accrues. Taxes were to be delinquent if not received by the Department of Revenue on the day preceding the last day of the month in which they were due. (Effective April 1, 1983). The law also changed the interest rate on delinquent tax payments to equal the rate established by Section 6621 of the Internal Revenue Code, compounded annually. (Effective February 11, 1983.)

Legal Citation

A.R.S. 42-1461 - 42-1466.

Paid by

Persons engaged in the business of extracting substances from the earth that become metalliferous minerals (A.R.S. 42-1461 - 42-1462.)

Exemptions

None.

Tax Base

The severance tax is levied on the "net severance base" of all metalliferous minerals produced after 1982 (42-1462). The "net severance base" is the greater of the following 2 values (42-1464, Laws of 1982, Chapter 230, Section 12):

1. The "weighted mineral value", or
2. A specified percentage of the old sales tax base (the gross value of production less out-of-state processing costs). This value will be referred to as the "Arizona value" after June 30, 1985.

The "weighted mineral value" is essentially the cost of extracting the minerals from the earth and delivering them to the site where they will be processed.

The "weighted mineral value" is determined using the following formula (42-1464):

$$\text{weighted mineral value} = \frac{\text{mining costs} \times \text{gross value of production}}{\text{total production costs}}$$

where:

mining costs represent the cost of extracting the minerals from the earth and delivering them to the site where they will be processed further (42-1461).

- total production costs include most of the major costs incurred in mining and processing minerals until the point of sale (42-1461).
- gross value of production is determined by multiplying the recoverable units of a metallic product by the per unit price of the product; the price per unit does not include the cost of manufacturing, fabricating or otherwise transforming a refined mineral product, when these activities occur prior to sale of the product (42-1461).

Although metalliferous minerals will no longer be taxed on the old sales tax base, the value of minerals produced after 1982 may not fall below a specified percentage of the old tax value (42-1464, Laws of 1982, Chapter 230, Section 12). The old tax value included not only the cost of extracting the minerals from the earth, but most of the major in-state costs of producing the minerals. This value was determined by multiplying the recoverable units of a metallic product by the per unit price and deducting the out-of-state processing costs from the result (42-1464; Laws of 1982, Chapter 230, Sec-

tion 12; 41-1461). The following table shows the minimum percentage of the old tax value that may be assigned to minerals for severance tax purposes (42-1464; Laws of 1982, Chapter 230, Section 12):

Period during which minerals are produced	Minimum value of minerals for purposes of determining the severance tax
Jan. 1, 1983 - June 30, 1983	100% of the old taxable sale value
July 1, 1983 - June 30, 1984	83 1/3% of the old taxable sale value
July 1, 1984 - June 30, 1985	66 2/3% of the old taxable sale value
July 1, 1985 and thereafter	50% of the old taxable sale value

Tax Rate

2.5% of the net severance base.

Due Date

Collections from the severance tax on metaliferous minerals are due on the twentieth day of the month following the month in which the tax accrues. Taxes are delinquent if they are not received by the Department of Revenue on the day preceding the last day of the month in which they are due. The due date may be extended by the Department of Revenue for good cause, but not beyond the first day of the third month following the regular due date (42-1465, 42-1322).

Collecting Agency

Department of Revenue. (42-1462, 42-101)

Dedication or Purpose

To aid in defraying the necessary and ordinary expenses of the state, cities, and counties to reduce or eliminate the annual tax levy on property for state, city and county purposes and to reduce the levy on property for public school education (Laws of 1982, Chapter 230, Section 17).

Yield

Fiscal Year	Net Collections
1989-90	\$543,461
1988-89	563,534
1987-88	557,476
1986-87	480,535
1985-86	376,947
1984-85	197,920
1983-84	102,305
1982-83	33,425

Source: Department of Revenue, Annual Reports.

Distribution

Each year, a portion of severance tax collections will be distributed in the same manner as the transaction privilege tax (i.e. 25 percent to the cities, 33.6 percent to the counties and 41.4 percent to the state). The portion of collections that is distributed in this manner will increase each fiscal year until 1986-87. The table below shows the amount of severance tax collections that will be distributed in the same manner as transaction privilege taxes during each fiscal year (42-1465, Laws of 1982, Chapter 230, Section 16).

Period during which collections are received	Portion of severance tax collections distributed in the same manner as the transaction privilege tax
January 1, 1983 - June 30, 1983	40%
July 1, 1983 - June 30, 1984	48%
July 1, 1984 - June 30, 1985	60%
July 1, 1985 and thereafter	80%

After making this distribution the balance of severance tax collections will be deposited each year in the state's general fund and is appropriated for public educational purposes (42-1465; Laws of 1982, Chapter 230, Section 16).

Prepared by the Staff of the Joint Legislative Budget Committee

PROPERTY TAX

The following has been excerpted from *Appraisal Manual for Mines and Natural Resources* by Donald E. Ross of the Arizona Department of Revenue which was effective as of January 1, 1988 and is revised annually.

The Natural Resource Unit of the Division of Property Valuation and Equalization is assigned the responsibility of valuing producing and nonproducing mines and oil, gas, and geothermal interests. Arizona Department of Revenue mine valuation regulations R15-4-201 through R15-4-206 are incorporated into this manual.

Arizona Revised Statutes (ARS Section 42-201.8) states:

"Producing mine or mining claim" means any mine or mining claim from which any coal, mineral or mineral substance, other than clay, sand, gravel, building stone or any mineral substance normally processed into artificial stone, has been extracted for commercial purposes at any time during a period of one year prior to the first Monday in January of the tax year."

A producing mine includes the land utilized for mining purposes together with structures and facilities necessary to sustain mining operations. It also includes equipment used directly in the process of extracting ores or minerals from the earth for commercial purposes, including equipment required to prepare the materials for extraction and the handling, loading or transportation of such extracted material to the surface. Mining includes underground, surface and open-pit operations for the extraction of ores and minerals.

If mining operations cease, real and personal property associated with a mining operation will continue to be valued by Centrally Valued Properties for a period of three years. The nonoperating mine will be retained in the legal class 1 for the first year after mining operations are terminated. The legal class designation used for the next two years will depend on the use of the property, which could be class 4 if the property remains idle.

Three years after mining operations have ceased, the valuation of the nonproducing mining property will be transferred from the Centrally Valued Properties' jurisdiction to the Locally Valued Properties' jurisdiction. From this point on, the county assessor is responsible for classifying and valuing the subject property. Such property will be classified according to its current use. If the real and/or personal property is idle at the expiration of the three-year period, it normally will be classified legal Class Four property.

The Natural Resource Unit of the Centrally Valued Properties Section of the Arizona Department of Revenue is responsible for determining annually the

value of all producing mines as of the first day of January of the tax year. Property within the context of a producing mine excludes manufacturing operations such as a rod plant. In summary, the value of taxable producing mine property for Arizona property tax purposes includes land, supplies inventories, ore reserves, construction work in progress, personal property and improvements.

Summary of Procedures

Producing mines are taxed on the basis of their assessed value multiplied by the local tax rate which produces the tax due. The assessment ratio for 1988 is 28% of the full cash value or market value. The full cash value is determined by the mineral property appraiser after correlating the three approaches to value, namely the income, cost and market approaches.

The income approach consists of discounting two different future income streams as developed by (1) the mining company and (2) by the Department utilizing a single rate factor. The Department has developed a method in which a five-year history, expressed as a profit margin, is combined with the future production schedule to produce a future income stream. The historical data are expressed on a production basis, not on a sales basis. This five-year margin method avoids the problems of predicting the future price of copper and other metals. It is supported in the literature and has been approved by the Arizona Supreme Court. The past is only a valid indicator of the performance level of a relatively stable operation and should not be used for new or dying mines. The historical data are averaged to flatten the effects of the peaks and it is generally accepted as standard for financial reporting, and the Securities and Exchange Commission reports.

Cost approach values are determined by computing the reproduction cost new less depreciation for the physical assets. Straight line depreciations is utilized along with appreciation or inflation factors as developed by the Department (Table I). Economic and functional obsolescence can be allowed for by the appraiser if warranted.

Comprehensive field notes are written for each mine annually. Contacts with the mining industry are maintained in order to keep abreast of development in technology and discount rates. Technical papers and literature are collected, indexed, and placed in the listing of references for each mine appraisal report. Detailed production statistics are maintained in order to analyze the historical performance for the mine.

PERCENT OF PRIMARY COPPER PRODUCED (11)	15.0	19.6	18.8	18.0	15.0	17.1	19.8	23.1	24.9	27.7

(1) Copper recovered by precipitation or by solvent extraction from material dump, heap, vat or in-situ leached.

(2) Arimetco acquired Johnson Camp from Cyprus in August, 1989.

(3) Operated by Kocide 1988-89. Acquired by Arimetco in 1990.

(4) Asarco purchased Ray Unit from Kennecott November 18, 1986.

(5) Operated by Ranchers, became part of Inspiration Area Mines July, 1984 and Cyprus Miami July, 1988.

(6) Noranda Lakeshore through 6/31/87; Now Cyprus Miami July, 1988.

(7) Sold by Inspiration to Cyprus July 1, 1988.

(8) Cyprus purchased Sierrita/Esperanza and Mineral Park from Duval April 1, 1986.

(9) Operated by ANAMAX. Acquired by Cyprus March, 1988.

(10) Open pit, heap leach, SX-EW start-up in spring of 1986. Some in-situ production.

(11) Leach copper compared to total copper produced as reported in this report, Table I.

TABLE VIII
STRIPPING RATIOS AT ARIZONA OPEN-PIT COPPER MINES (1
(Waste:Ore)

Continued

- (1 Leachable rock included with waste (except at solely leach operations).*
- (2 Mining was done by ASARCO, includes ANAMAX's share of ore.*
- (3 Combined as Mission Complex in 1985.*
- (4 Ray Unit acquired from Kennecott, November 18, 1986.*
- (5 Stripping of overburden ceased in January, 1981 but mining continued until July.*
- (6 Bluebird property acquired by Inspiration in 1984 and by Cyprus as part of Cyprus Miami July 1, 1988.*
- (7 Acquired from Inspiration July 1, 1988.*
- (8 Sierrita, Esperanza and Mineral Park acquired from Duval April 1, 1986.*
- (9 Acquired by Cyprus March, 1988*

Cyprus	Casa Grande	2,000 (e)
Phelps Dodge	Copper Queen	2,000 (e)
TOTAL		1,173,000

(1) *Figures generally represent a current estimate of the productive capacity of primary recoverable copper in concentrates, precipitates, and cathodes. Figures do not represent smelter or refinery capacity. The estimates are based on recent production figures and on capacities of concentrator and leach plant facilities. Other factors affecting actual production include, for example, grade of ore and recovery. Some capacities have been published by the reporting company. Capacities for shut down operations are historic and not necessarily immediately available.*

- (2) *Basis of capacity estimate*
- (a) *Recent production figures*
 - (b) *Design capacity & ore grade*
 - (c) *Company annual report or 10K*
 - (d) *Historic data*
 - (e) *Leaching only*

Source: American Bureau of Metal Statistics Inc.

(a) Includes Hecla's share of production from each mining property.

(b) Includes copper produced from purchased ores.

(c) The totals for these concerns are to a large extent duplications of the reports of other producers.

(d) Starting in 1988, Cyprus Miami Mining Corp.

(e) Magmont mine.

(f) Refined production.

(g) Copper content of mine production unless otherwise noted.

(h) Mine abandoned in 1979.

(i) Mine abandoned in 1981.

(j) Operated by ASARCO - Shows Hecla Mines share of 5%.

(k) Operated by ASARCO - Shows Hecla Mines share of 25%.

(l) Reported production of refined copper plus unrefined copper sales. Includes only Kennecott's share from jointly owned properties.

(n) Refined copper contained in concentrates produced & SX-EW production.

TABLE XVI
"COVERED EMPLOYMENT" AND WAGES IN ARIZONA COPPER MINING AND SMELTING

Year	Average No. Covered Employees (1)	Total Wages	Average Annual Wage	Average Weekly Wage	Tons Copper Ore
1983	13,864	395,266,852	28,510	548.29	135,301,652
1984	12,556	387,028,537	30,824	592.77	145,278,431
1985	11,155	349,311,047	31,314	602.19	174,218,218
1986	10,848	326,915,975	30,136	579.54	167,808,000
1987	10,340	299,297,407	28,946	556.65	166,113,000
1988	10,588	348,502,604	33,008	634.78	175,261,000
1989	11,111	383,199,684	34,488	663.23	196,684,000
1990	11,352	411,433,093	36,243	696.99	213,168,000

(1 "Covered Employment" by law includes all employees of employers of three or more persons. Prior to 1966 only a portion of the workers in smelting, refining and rod fabrication were included in this table.

TABLE XIX
(Cont'd)
EMPLOYMENT, EARNINGS, AND HOURS IN COPPER MINING
IN THE UNITED STATES AND ARIZONA (1

(1 Statistics do not reflect workers in copper smelting, refining and rod fabrication.

(2 These figures are estimates made by the Arizona Department of Economic Security, in cooperation with the U.S. Bureau of Labor Statistics, and they include all full-time and part-time wage and salary workers who are employed in copper mining in any part of the pay period which included the 12th of each month of the year.

(3 Estimates made by the U.S. Bureau of Labor Statistics, in cooperation with the 50 states, and based upon monthly samplings similar to those in (2 above, adjusted periodically to census bench mark.

(4 Estimates of production (non-supervisory) workers based upon samplings as in (2 above. Since 1975, figures have been calculated by the Arizona Department of Mines and Mineral Resources dividing the annual number of "All Employees in Arizona" by a factor of 1.26. This factor was derived by comparing the annual number of "All Employees-Arizona" with "Production Workers - Arizona" from 1970 to 1974.

(5 Earnings figures for a particular year is the product of "Average Hourly Earnings" and "Average Weekly Hours" for that year.

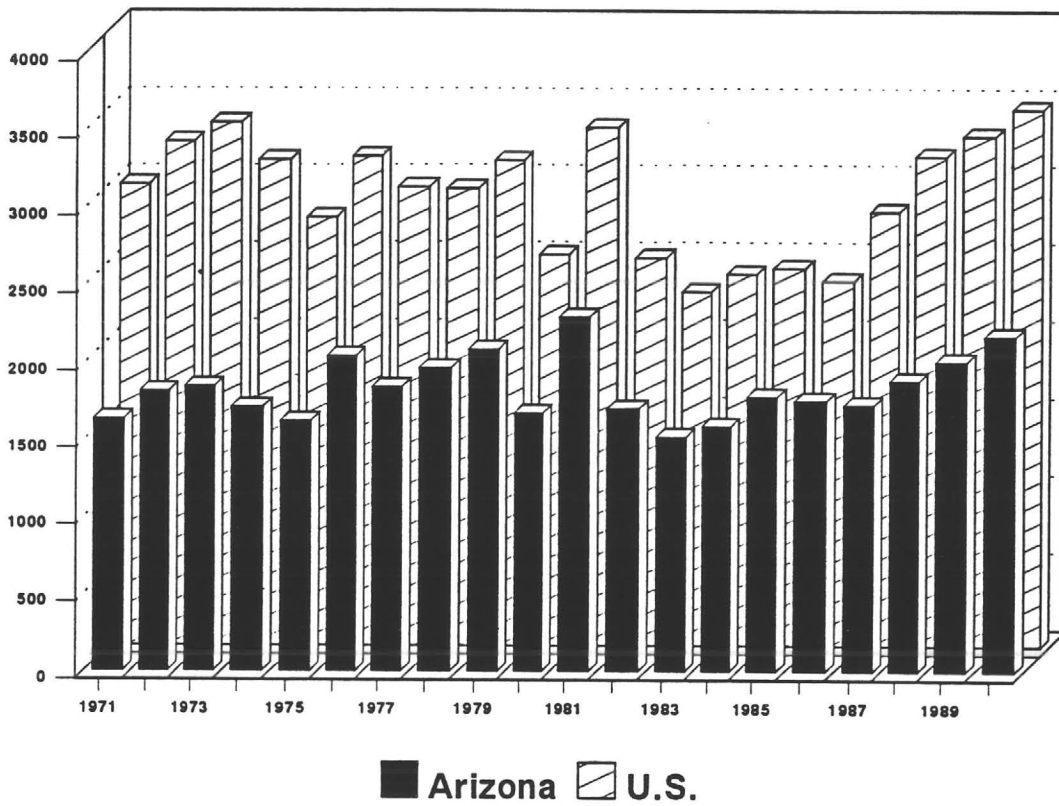

(6 Gross payroll aggregates, exclusive of irregular bonuses and other pay not earned in a sample pay period, are divided by gross man-hour aggregates of production and related workers for the period in order to determine average hourly earnings.

(7 "Average Weekly Earnings" times 52 weeks.

(8 Number of production workers times "Average Weekly Hours" times 52 weeks.

TABLE XXII
AVERAGE COPPER CASH PRODUCTION COSTS FOR THE UNITED STATES, 1983-1989 (1)
 (Cents Per Pound Of Copper)

PRODUCT COSTS	1983	1984	1985	1986	1987	1988	1989
Mine operating cost	22	20	23	23	19	18	17
Mill-Float operating cost (2)	24	23	20	21	28	28	27
Mill-Leach operating cost	7	7					
Smelt/Refine/Transportation	26	24	23	19	14	17	18
Taxes (3)	3	2	2	2	2	1	1
Total Cost	82	76	68	65	63	64	63
Byproduct Credits	(13)	(11)	(9)	(9)	(10)	(10)	(9)
Cash Cost (4)	69	65	59	56	53	54	54
Recovery of Capital				11	5	7	6
TOTAL				67	58	61	60

(1) Includes 18 mines, most of which were producing from 1983 to 1989.

(2) Includes copper recovered by leaching in 1985 et seq.

(3) Property, severance taxes, and royalties, if applicable.

(4) Includes all cash cost of production and credit for byproducts but excludes depreciation and profit.
 Costs are in actual dollars for each year shown.

TOTAL COPPER RESERVE BASE IN ARIZONA

Sulfide	6.2 Billion Tons at 0.64 Cu
Acid Soluble	3.0 Billion tons at 0.41 Cu
Mixed	2.7 Billion tons at 0.52 Cu
TOTAL	11.9 Billion tons at 0.55 or 65 million tons of copper

(1 Reserve Base - That part of an identified resource that meets specified minimum physical and chemical criteria related to current mining and production practices, including those for grade, quality, thickness, and depth. The reserve base is the in-place demonstrated (measured plus indicated) resource from which reserves are estimated. It may encompass those parts of the resources that have a reasonable potential for becoming economically available within planning horizons beyond those that assume proven technology and current economics. The reserve base includes those resources that are currently (reserves), marginally economic (marginal reserves), and some of those that are currently subeconomic (subeconomic resources).

"Mineral Facts and Problems" 1985 Edition, Bureau of Mines Bulletin 675, page 3.
