Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Backcountry

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Antelope Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health, watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health

(USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as Backcountry. Backcountry includes areas of the national forest that are generally undeveloped with few roads. Most of the national forest's remote recreation and administrative facilities are found in this zone. The level of human use and infrastructure is generally low to moderate. The zone is managed for motorized public access on designated roads and trails. Although this zone generally allows a broad range of uses, the management intent is to retain the natural character inherent in this zone and limit the level and type of development (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am on weekdays or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar

to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are

assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Backcountry land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. However, Grass Mountain is not identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: State Route 138

Distance (Miles): 9.25

Disaster Route: San Francisquito Canyon Road

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Antelope Valley Frwy

Distance (Miles): 9.25

Nearest Major Arterial: Elizabeth Lake Rd

Distance (Miles): 1.96

Access to the Project Site Provided Via: Grass Mountain Fire Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Antelope Valley Recycling and Disposal Facility

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: GRM

Site Name: Green Mountain

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of utility pole and overhead power line. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This small site is located within the Coastal Zone in Topanga State Park along Temescal Ridge Trail Road, in the Santa Monica Mountains just inside the coastal zone. The site includes a small one-story building enclosed by chain link fence, utility poles, and tall, slender lattice tower of unknown height. The Temescal Ridge Trail begins in the subdivision south of the site and leads directly to and past it. The site's location is identified on local trail maps as Green Peak, a 1,966-foot summit on Temescal Ridge Trail. Following the trail farther leads to Temescal Peak (hikespeak.com 2014). The Temescal Lookout is approximately 0.5 mile north at roughly the same elevation, and is identified in the park's general management plan as a vantage point (CA State Parks 2011). Primary sensitive viewers include hikers on the "heavily traveled" Temescal Ridge Trail, which "begins with a 1,000-foot ascent that gives way to panoramic ocean-and-city views, then descends into a sycamore-shaded canyon to a seasonal waterfall" (trails.com 2014).

Visual Sensitivity: High

On federally administered public lands: No, but within boundary of Santa Monica Mountains NRA

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: Yes, Brentwood/Pacific Palisades Community Plan

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: Yes

If yes, enter recreation area name: Topanga State Park

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new facilities would be located within a site that includes existing towers that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing towers, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings are impacted by the presence of an existing site and tower. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 2680

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site GRM. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site GRM or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?**Construction Impact:** Significant Impact Reduced to Less than Significant with Mitigation Incorporated**Operational Impact:** Less than Significant**Discussion:**

Emissions from the construction of proposed site GRM would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site GRM will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site GRM would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site GRM or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site GRM, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site GRM, which is 817 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher for CO and No_x, lower for PM₁₀ and PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site GRM and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site GRM in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site GRM and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly

trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

monarch butterfly (*Danaus plexippus*; ESA-Pet); two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1); white-veined monardella (*Monardella hypoleuca* ssp *hypoleuca*; 1B.3)

Sensitive Communities Recorded within 1 Mile:

Southern Sycamore Alder Riparian Woodland; Braunton's milk-vetch Critical Habitat (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1)

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); monarch butterfly (*Danaus plexippus*; ESA-Pet); Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1); white-veined monardella (*Monardella hypoleuca* ssp *hypoleuca*; 1B.3)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

Santa Monica Mountains National Recreation Area (NPS); Topanga State Park (California Department of Parks and Recreation); SEA - Santa Monica Mountains (Temescal-Rustic-Sullivan Canyons); CRA - Santa Monica Mountains; SCAG Zoning - Open Space and Recreation; Natural Landscape Block - Topanga Canyon/Santa Monica Mountains

Local Policy or Ordinance for Biological Resources:

Topanga State Park General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

California buckwheat scrub [*Eriogonum fasciculatum* Shrubland Alliance]; Alliance - *Eriogonum fasciculatum*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site GRM is located on a hill top with several unpaved roadways leading up the slope and circling the existing facilities at the project site. Potentially suitable habitat (and a potential reintroduction site) for California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) has been reported by Santa Monica Mountains National Recreation Area to occur within 1 mile of Site GRM at an unspecified location within Topanga State Park. Though the project site is located in mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been

reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. Primary habitat for Braunton's milk-vetch (*Astragalus brauntonii*; FE, 1B.1) is carbonate outcrops on ridgetops; populations most prevalent after a fire. Road edges and other sources of disturbance such as fire provide potential habitat for Braunton's milk-vetch; suitable habitat may be present within the project area, though the species was not observed during the fall habitat assessment survey. About 1 to 1.5 miles of the access road passes through designated critical habitat. Habitat for white-veined monardella (*Monardella hypoleuca* ssp. *Hypoleuca*; CNPS 1B.3) occurs within the project area although this shrubby species was not observed during the fall habitat assessment survey. Monarch butterflies (*Danaus plexippus*; ESA-Pet) have been observed in the area. Butterflies tend to "hilltop" and seek high points on the landscape and so may spend more time near the project site during migration. Roost trees were not observed in the project area. The site does not contain stream or aquatic habitat for two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC). Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) in the project area. Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. To protect dispersing California red-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Conduct spring botanical surveys for Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1) and white-veined monardella (*Monardella hypoleuca* ssp. *Hypoleuca*; 1B.3); if present mark the areas requiring special protection. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Mitigation required: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The Southern Sycamore Alder Riparian Woodland is within 500 feet of the project site. Site GRM may be hydrologically connected to stream habitats that include California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) potentially suitable habitat. Site GRM is 800 feet from designated critical habitat for Braunton's milkvetch (*Astragalus brauntonii*; FE, 1B.1); the access road passes through about 1 mile of critical habitat.

Mitigation Measure(s):

Limit impacts to native vegetation at Project site and along access road. Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM

24 Special Status Plants Surveys and Instructions

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes the following two wetland feature types as indicated by the National Wetland Inventory (USFWS 2014): 1) Freshwater Forested/Shrub Wetland; and 2) Riverine. However, these wetland types are restricted to ephemeral drainages. Adverse impacts to these wetlands may occur due to sedimentation as a result of runoff from the construction. However, construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from storm water runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Topanga Canyon/Santa Monica Mountains Natural Landscape Block which overlaps the ranges of approximately 275 amphibian, reptile, mammal and bird species. Additionally the site is located across both the proposed Santa Monica Mountains (Temescal-Rustic-Sullivan Canyons) Significant Ecological Area and the Santa Monica Mountains Coastal Resource Area, which are identified as important regional habitat linkage in the Los Angeles General Plan. Linkages in this SEA and CRA connect open spaces together that may be fragmented due to rural development and connect to habitats in Ventura County. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. Additionally, due to the nature of the project, impacts to wildlife movement would be minimal to none. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement which primarily takes place on the local ridgelines and canyons..

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project may conflict with goals and guidelines described in the Topanga State Park General Plan that protect sensitive plant and wildlife species and reduce exotic plant species. Proposed development would be consistent with current site usage; there would be no change in the nature of the on-site impacts. Conflicts could occur as sensitive species protected by the Topanga State Park General Plan could be impacted (see discussion under Impact BIO-1, BIO-2, and BIO-3). These conflicts would result in significant impacts.

Mitigation Measure(s):

Incorporation of mitigation measures identified at Impact BIO-1 and Impact BIO-2 would preclude impacts to sensitive species and habitats, thereby avoiding conflict or reducing conflict with the Topanga State Park General Plan to a less than significant level. Mitigation Required: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 22 Monarch Butterfly Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in October 2014. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Santa Susana, which has a moderate potential for significant vertebrate fossils. No localities are recorded within the proposed site; however, this formation has produced fossil specimens of eagle ray, primitive shark, dogfish shark, bonito shark, lemon shark, and the holotype of the chimaeroid *Ischyodus zinsmeisteri* in the Santa Monica Mountains region. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Santa Susana Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Paleocene marine rocks, unit 1 (Central and Southern California)

Stability: Moderate pending geotechnical analysis

Soil Type: Urban land-Rock outcrop-Millsholm Association

Erosion Potential: Low

Expansive Soil: Low to Moderate Potential

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require

additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The Millsholm series consists of shallow, well drained soils that formed in material weathered from sandstone, mudstone and shale often with clay content up to 30%. Moderate to steep slopes surround the proposed flat building site. Grading, excavation, and other construction activities associated with the implementation of the proposed project could cause erosion due to exposed soils. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell

with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site GRM and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site GRM was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site GRM. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site GRM would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site GRM, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site GRM would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: Yes

If yes, which department?: California Department of Parks and Recreation

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: City of Los Angeles, Pacific Palisades Subarea

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Los Angeles

General Plan Designation: Open Space

Zoning: Open Space

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

None identified

Comprehensive Plan or General Plan Local Agency: Los Angeles

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: Brentwood - Pacific Palisades

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing telecommunications structure and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified. No conflict with the Topanga State Park General Plan was identified.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Los Angeles

Applicable Noise Ordinance: Municipal Code, Chapter IV Public Welfare

Noise Level Threshold: N/A; no construction from 9 pm to 7 am on weekdays, weekends and holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range

from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 dBA daytime criterion but would exceed FTA threshold 80 dBA nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would

not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: City of Los Angeles, Pacific Palisades Subarea

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: Yes

If yes, Plan or Designation Area: Topanga State Park

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: Yes

Other Recreational Area Names: Topanga State Park

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: State Route 27

Distance (Miles): 2.4

Disaster Route: Pacific Coast Highway

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Interstate 405

Distance (Miles): 2.4

Nearest Major Arterial: Sunset Blvd

Distance (Miles): 2.31

Access to the Project Site Provided Via: Temescal Ridge Trail

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: CITY OF LOS ANGELES

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does not meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: H-17A

Site Name: H-17A

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Surrounding area west of site

Aesthetics

Setting

Visual Description:

Site H-17A is located on a ridge top along Rattlesnake Ridge Trail in Hellman Park in a low density suburban area. The site includes a large, white water tower and two lattice towers of varying unknown heights. Microwave dishes are attached to one tower. The site is on a semi-circular concrete pad enclosed by a chain link fence. Two medium sized trees are located at the site's outer boundary; otherwise, vegetation is limited to grasses and low shrubs. Topography slopes away from the ridge to the north and south. The site would be visible from Rattlesnake Ridge Trail and Hellman Park Trail to the southeast, as well as from Sycamore Canyon Open Space to the north. Sycamore Canyon provides "exceptional hiking into beautiful riparian habitat." Many large, old California sycamores and coast live oaks, as well as arroyo and black willows, line the canyon (SMMC 2014).

Visual Sensitivity: Medium

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: Yes

If yes, enter recreation area name: Hellman Park; adjacent to Sycamore Canyon Open Space

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed new facilities would be located within a site that includes existing towers that already create a visual intrusion onto the landscape. The new facilities would not be located in an area defined as a scenic vista. The addition of proposed equipment with existing structures would concentrate the impacts. The existing towers would attenuate the noticeability of new structures, thereby minimizing visual impacts. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no impacts to scenic vistas would occur.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Operational impacts would result from installation of the new tower and equipment, which would be uncharacteristic of the visual character if no structures were already present. However, the new facilities would be located within a site that includes existing towers that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change or noticeably or unfavorably contrast with the existing visual character or quality due to the presence of the existing towers, which would attenuate the noticeability of new structures. In addition, co-locating the new tower and equipment with existing structures would concentrate the impacts so that a small area is altered, thereby minimizing impacts to visual character and quality. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to visual character or quality would occur. Construction impacts would be related to construction of the new tower and equipment. Construction would occur over an approximate 6-week period and involve a variety of equipment, including 4-wheel drive trucks making daily trips to and from the site. Transportation to and from the site would create dust that would temporarily affect the visual character of the area. These construction activities would result in minor temporary visual impacts that would occur on weekdays when visitation to the Rattlesnake Ridge Trail, Hellman Park Trail, and Sycamore Canyon Open Space would be low. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required..

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 925

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site H-17A. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site H-17A or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site H-17A would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site H-17A will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site H-17A would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site H-17A or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site H-17A, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site H-17A, which is 925 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 11 are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site H-17A and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site H-17A in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site H-17A and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly

trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Yes

Wildlife Corridor or Nursery Site:

Puente Hills Significant Ecological Area (Sycamore & Turnbull Canyons); SCAG Zoning - Local Parks and Recreation;

Local Policy or Ordinance for Biological Resources:

City of Whittier General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Laurel sumac scrub [*Malosma laurina* Shrubland Alliance]; Association-*Malosma laurina*-*Artemisia californica* and non-native herbaceous stand (scrub).

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site H-17A is located on a hilltop in the Puente Hills at a former Nike Missile site. The southwestern portion of the project area contains coastal sage scrub vegetation; the eastern portion contains non-native grassland, with scattered elderberry (*Sambucus mexicana*) and walnut (*Juglans californica*) in the draws and north-facing slopes. The site does not contain riparian streambank nesting habitat for bank swallow (*Riparia riparia*; CA-T). An observation was made in 1894 from stream bank in "Whittier." The burrowing owl (*Athene cunicularia*; CDFW-SSC) is often found in highly disturbed areas. A 2010 observation has been recorded in the CNDDDB along Skyline/Fire

Ridge Road about 0.2 mile west of the project site, within the fire breaks along the ridgeline. Similar and contiguous habitat is found within the study area. Coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) may occur on-site and individuals could be killed by project activities. The study area and surrounding lands are within designated critical habitat for the coastal California gnatcatcher (*Poliioptila californica californica*; ESA-T, CDFW-SSC). The project site is mapped to include patches of coastal sage scrub vegetation, including California sagebrush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), prickly-pear cactus (*Opuntia littoralis*), and lemonade bush (*Rhus integrifolia*). These and other habitat components constitute primary constituent elements of critical habitat for this species. The access road to the project site traverses a slope that supports moderate to high quality gnatcatcher habitat. Extensive coastal sage scrub habitat is found on surrounding hillsides. Protocol surveys for the gnatcatcher were conducted in 2014 where the access road traverses high quality habitat and no birds were detected. Construction activities could result in the loss of approximately 2.6 acres of designated gnatcatcher critical habitat, reducing nesting and foraging habitat availability at the project site. The amount of vegetation that may be removed could constitute the area utilized by a breeding pair (breeding ranges are estimated between 2 and 14 acres). If vegetation removal would occur during the breeding season, there is a possibility that a gnatcatcher nest could be lost. Habitat loss can increase fragmentation of patches already separated by roads, and possibly increase exposure to predation. Temporary disturbance due to construction activities (e.g., construction vehicle access, concrete cutting, trenching, and other sources of loud noises and activities) during the breeding season could disrupt birds nesting near the site or along the access road. The CDFG has established a 500-foot protection zone around active nests of special status species of birds. Temporary disturbance outside of the breeding season, including continued operations at the site, may briefly disrupt dispersal or foraging activities of the non-migratory gnatcatcher, though it may be expected that the reaction of the birds would be within their normal behavior patterns. The least Bell's vireo (*Vireo bellii pusillus*; ESA-E, CA-E) is restricted to stands of dense riparian or riparian scrub vegetation. The site does not contain aquatic/riparian habitat suitable of least Bell's vireo or western spadefoot (*Spea hammondi*; CDFW-SSC). Numerous vireo occurrences have been recorded within about 2 miles where there is dense, mature riparian habitat. At the bottom of Sycamore Canyon and Dark Canyon, intermittent streams, more than 1,000 feet north of the project site, there appears to be patches of possibly suitable habitat. South of the project site intermittent drainages appear too steep and provide limited riparian vegetation, if any, to support vireos. No project activities would impact these areas. The undisturbed vegetation contains potential habitat for intermediate mariposa-lily (*Calochortus weedii* var. *intermedius*; CNPS 1B.2), which grows in grasslands and openings in chaparral and coastal sage scrub. No distinctive mariposa lily fruiting stalks were observed during the fall survey. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of coast horned lizard and coastal California gnatcatchers (*Poliioptila californica californica*; ESA-T, CDFW-SSC) in the project area, and the importance of maintaining coastal sage scrub vegetation. Minimize disturbance to natural vegetation; especially coastal sage scrub vegetation (e.g., California sagebrush [*Artemisia californica*], sage [*Salvia* spp], and Laurel sumac [*Malosma laurina*], and California buckwheat [*Eriogonum fasciculatum*]). Prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. No construction activities during the gnatcatcher breeding season. Stay on existing roads. Manage trenches so as not to trap wildlife. Conduct protocol surveys for the gnatcatcher; if nesting is present within the project area limit construction activities to the non-breeding season. Conduct spring botanical surveys for intermediate mariposa-lily (*Calochortus weedii* var. *intermedius*; 1B.2); if present mark the areas requiring special protection. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Mitigation required: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 13

Coastal California Gnatcatcher Breeding Season Restrictions • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The study area and surrounding lands are within designated critical habitat for the coastal California gnatcatcher (*Polioptila californica californica*; ESA-T, CDFW-SCC). The project site is mapped to include patches of coastal sage scrub vegetation, including California sagebrush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), prickly-pear cactus (*Opuntia littoralis*), and lemonade bush (*Rhus integrifolia*). These and other habitat components constitute primary constituent elements of critical habitat for this species. Construction activities could result in the loss of components of designated gnatcatcher critical habitat, reducing nesting and foraging habitat availability at the project site. Habitat loss can increase fragmentation of patches already separated by roads, and possibly increase exposure to predation. There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

Protect native vegetation. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection of Habitat • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes the following two wetland feature types as indicated by the National Wetland Inventory (USFWS 2014): 1) Freshwater Forested/Shrub Wetland; and 2) Riverine. However, these wetland types are restricted to ephemeral drainages. Adverse impacts to these wetlands may occur due to sedimentation as a result of runoff from the construction. However, construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from storm water runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is located within the Puente Hills (Sycamore & Turnbull Canyons) Significant Ecological Area, which is identified as an important regional habitat linkage in the Los Angeles General Plan. This SEA has been found to support significant wildlife movement as well as residential habitat, and serves as a linkage between the Puente Hills and Chino Hills. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. Additionally, due to the nature of the project, impacts to wildlife movement would be minimal to none. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities could remove vegetation and therefore could result in conflict with the City of Whittier General Plan. Site H-17A includes an existing tower facility and road, but also includes disturbed native scrub vegetation. The use of the site is a communications facility and most of the buildable (flat) portion of the site is developed. Ground disturbance associated with proposed construction at the site would not exceed 5,000 square feet, and substantive removal of native vegetation is not expected. As a result, any construction impacts to biological resources protected by the City of Whittier General Plan at Site H-17A would be minor. The proposed new structure increases the probability of a bird strike hazard, even if other towers are present. Temporary disturbance of vegetation increases the chances of permanently spreading nonnative weed species into unaffected areas. Maintenance of the sites is expected to occur approximately once a month, this increase in road use could result in mortality for some wildlife. These impacts may occur to a few individual animals, however, without impacts at a landscape level. In addition, the Project site development would be within, or involve a slight expansion of, existing facilities, and so would not change the character or magnitude of existing impacts. Due to the potential for protected species in nearby areas, operations of the proposed project could have a significant impact on biological resources protected by the City of Whittier General Plan (as well as other applicable protections which are in force and discussed under Impact 1). However, because the Authority is exercising intergovernmental immunity, the plan is not applicable and no conflict with the City of Whittier General Plan exists.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Miocene Sycamore Canyon Formation, which has a high potential for significant vertebrate fossils. No localities are recorded within the proposed site; however, this formation has produced numerous fossil specimens in the San Gabriel Valley region, including a fossil whale skeleton. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Sycamore Canyon Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: Low to Moderate based on designation within Landslide Zone and proximity to Fault Line

Soil Type: Soper-Fontana-Calleguas-Balcom-Anaheim Association

Erosion Potential: Moderate based on designation within Landslide Zone

Expansive Soil: Low to Moderate Potential

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line (Whittier Fault) was identified approximately 1/3 mile southeast of the property (EDR, 2014), but is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and

Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is comprised of well-drained, gravelly sandy clay loam that has a rapid runoff characteristics with moderately slow permeability. This condition increases erosion hazards in areas of sloping terrain; however, the proposed building site is on relatively flat grade. Grading, excavation, and other construction activities associated with the implementation of the proposed project could cause erosion due to exposed soils. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site H-17A and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site H-17A was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site H-17A. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site H-17A would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site H-17A, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site H-17A would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: Presbyterian Intercommunity Hospital

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain:

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Whittier

General Plan Designation: Park

Zoning: Hillside Residential

What is the zoning height restriction, if any?:

Maximum building height (30 feet), or 70 feet with conditional use permit

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Whittier

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such plans, policies, and regulations are not applicable to the project. Nevertheless, in the exercise of its discretion and in the interest in working cooperatively with local jurisdictions, local land-use plans, policies, and regulations are referenced, described, and addressed in recognition that such plans, policies, and regulations reflect the local community's policy decisions with respect to appropriate uses of land in the area. Consideration of these plans, policies and regulations, therefore, assists in determining whether the proposed project may conflict with nearby land uses, which could affect the analysis of whether the proposed project would result in potentially significant environmental impacts.

Based on the zoning ordinances for this site, the maximum allowable height of structures in this area is 70 feet.

Exceptions to the ordinance may be allowed, ordinarily with a conditional use permit. However, per the doctrine of intergovernmental immunity, the permit requirement is not applicable to the project. Because the Authority is exercising intergovernmental immunity, the City of Whittier General Plan is not applicable and no conflict with the plan exists.

The proposed facilities at this site may be inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and the policy to protect areas that have significant natural resources. However, no physical impact would occur as a result of an inconsistency between the proposed project and the policy, and this is not considered a significant impact. As discussed in Sections 3.5 (geologic and soil hazards), Section 3.7 (fire hazards), Section 3.3 (biological effects), as well as in a site-by-site assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than significant.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Whittier

Applicable Noise Ordinance: Title 8 Health and Safety, Chapter 8.32 Noise Control

Noise Level Threshold: N/A, permitted construction during daytime hours

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: Presbyterian Intercommunity Hospital

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range

from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would

not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is located within the vicinity (approximately 1.5 miles) of a private airstrip (Presbyterian Intercommunity Hospital), but outside of the airstrip area where most noise is generated. Conservatively assuming a 65 CNEL at proposed Project sites such as H-17A, this combined baseline noise level in combination with the estimated construction noise level for this site would be below the 90-Db threshold where adverse community reaction could occur. Therefore, construction of this site would not expose people, workers or residents, to excessive noise levels.

After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: Yes

Other Recreational Area Names: Hellman Park

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: State Route 72

Distance (Miles): 1.4

Disaster Route: Workman Mills Road

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No

Nearest Highway/Freeway: Interstate 605

Distance (Miles): 1.4

Nearest Major Arterial: Beverly Blvd

Distance (Miles): 0.65

Access to the Project Site Provided Via: Tank Fire E. Road or Ridge Fire Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Savage Canyon Landfill

Adequate Disposal Capacity: No

Site Served by or has Available Access to Domestic Water System: CITY OF WHITTIER

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: H-69B

Site Name: H-69B

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Aesthetics

Setting

Visual Description:

This site is located in the Santa Monica Mountains National Recreation Area west of the intersection of Saddle Peak Road and Swenson Drive on at the intersection of two ridgelines. Los Angeles County designates one of these ridgelines as “significant” and the other as “proposed significant.” H-69B is also adjacent to a scenic route (Saddle Peak Road) as designed under the Santa Monica Mountains Coastal Program Land Use Plan. The access road to the site also provides access to two estate houses, although the site itself is not visible. The existing site consists of a large barren area occupying approximately 12,500 square feet, with no existing structures.

Visual Sensitivity: High

On federally administered public lands: No, but within boundary of Santa Monica Mountains NRA

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: Yes, Santa Monica Mountains Local Coastal Plan

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Saddle Peak Road

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: Yes

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Significant and Unavoidable Impact

Discussion:

The proposed new facilities would be located in an area with no existing structures. The new facilities would intrude upon views of the Pacific Ocean from vantage points to the north, including the significant ridgeline upon which the site would be located. Ongoing and recurring maintenance activities would be barely visible and infrequent. Because no structures currently exist on the site, and because the site is located on a designated significant ridgeline and is adjacent to a scenic route within a national recreation area, a substantial adverse effect to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

Unavoidable impact. A measure evaluated to address the significant visual impacts included painting the new structures to blend with their visual setting. This measure was determined infeasible because FAA guidelines specify paint colors to be used on structures for aviation safety purposes and painting the new structures to blend with surroundings would not reduce their visual impact to less than significant levels.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Very little vegetation exists on the site, and no rock outcroppings, historic buildings, or other scenic resources are present. No damage to vegetation or other elements considered scenic resources would occur during construction

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Significant and Unavoidable Impact

Discussion:

The existing visual character and quality of the site is low due to the size of the barren, disturbed area. However, the height of the new tower would contrast and be incompatible with the visual character of the surrounding landscape, which consists primarily of vegetated forests. Although some development, such as estate houses, exists, development is fairly sparse. The result would be a degradation of the visual character surrounding the site. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

Unavoidable impact. A measure evaluated to address the significant visual impacts included painting the new structures to blend with their visual setting. This measure was determined infeasible because FAA guidelines specify paint colors to be used on structures for aviation safety purposes, and painting the new structures to blend with surroundings would not reduce their visual impact to less than significant levels.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 171

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site H-69B. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site H-69B or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site H-69B would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site H-69B will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site H-69B would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site H-69B or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site H-69B, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site H-69B, which is 171 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds for CO, Nox, lower for PM₁₀, PM 2.5 but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site H-69B and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site H-69B in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site H-69B and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

American peregrine falcon (*Falco peregrinus anatum*; CDFG-FP); California mountain kingsnake (San Diego population; *Lampropeltis zonata pulchra*; CDFW-SSC); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); monarch butterfly (*Danaus plexippus*; ESA-Pet); two-striped garter snake (*Thamnophis hammondi*; CDGF-SSC); western pond turtle (*Emys marmorata*; CDFG-SSC)

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

American peregrine falcon - foraging (*Falco peregrinus anatum*; CDFG-FP); California mountain kingsnake (San Diego population; *Lampropeltis zonata pulchra*; CDFW-SSC); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); monarch butterfly (*Danaus plexippus*; ESA-Pet); Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

Santa Monica Mountains National Recreation Area (NPS); SEA/CRA - Santa Monica Mountains; SCAG Zoning - Wildlife Preserves and Sanctuaries (Malibu Coastal Zone)

Local Policy or Ordinance for Biological Resources:

Santa Monica Mountains Local Coastal Program Land Use Plan and Local Implementation Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Big pod ceanothus chaparral [*Ceanothus megacarpus* Shrubland Alliance]; Association-Ceanothus megacarpus-*Adenostoma fasciculatum*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site H-69B is located adjacent to a paved road on a hilltop in the San Gabriel Mountains. The site is used as a helicopter landing pad and has been largely leveled and cleared of vegetation, with patches of chaparral on steep slopes. Dense chaparral shrubs are on steep north-facing slopes within the project area. Vegetation includes chamise, big-berry manzanita, laurel sumac, bush buckwheat, purple sage, and chaparral currant. A private

residence and vineyard is within the project area, and other residences are scattered throughout the vicinity. American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP) may pass by the site while foraging, but the project area does not provide steep cliff habitat required for nesting. California mountain kingsnake (San Diego population; *Lampropeltis zonata pulchra*; CDFW-SSC) is not expected to occur within the project area due to removal of vegetation and proximity to paved road, though the species may occur along drainage channels in the project area. Coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) may occur in the project area and individuals could be killed by project activities. Potentially suitable habitat (and a potential reintroduction site) for California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) has been reported by Santa Monica National Recreation Area to occur within 1 mile of Site H-69B at an unspecified location within Cold Creek Nature Preserve. Though the project site is located in steep mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. Monarch butterfly (*Danaus plexippus*; ESA-Pet) may pass through the area on migration, though tall trees that may serve as potential roosts within the project area are associated with private property. No aquatic habitats are present in the project area suitable for two-striped garter snake (*Thamnophis hammondi*; CDGF-SSC) or western pond turtle (*Emys marmorata*; CDGF-SSC). Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1) is perennial species that was not observed during botanical survey. However, the project area includes chaparral and disturbed soils. There is a potential that this species could emerge, especially after a fire. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) and California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) in the project area. Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. To protect dispersing California red-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Preconstruction surveys would verify if Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1) is present; protect as necessary. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 22 Monarch Butterfly Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site. Site H-69B may be hydrologically connected to stream habitats that include California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) potentially suitable habitat.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Freshwater Forested/Shrub wetland feature types as indicated by the National Wetland Inventory (USFWS 2014). However, this wetland type is restricted to ephemeral drainages. However, construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from storm water runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the proposed Santa Monica Mountains Coastal Resource Area, which is identified as an important regional habitat linkage in the Los Angeles General Plan. Linkages in this CRA connect open spaces together that may be fragmented due to rural development and connect to habitats in Ventura County. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. Additionally, due to the nature of the project, impacts to wildlife movement would be minimal to none. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Most of Site H-69B is comprised of H3 habitat, but Significant Ecological Resource Areas (SERAs) identified at the site include some H2 habitat in the northern portion of the site. The study area for Site H-69B includes H1 habitat and H1 Quiet Zone. Protection of SERAs identified in the land use plan (LUP) includes prohibition or other strict regulation of proposed site development. Policies contained within Goal CO-2 of the LUP offer protection of SERAs as a priority over other development standards in the Local Implementation Plan. Construction and operations impacts to resources at the site are described in Impact BIO 1, Impact BIO 2, and Impact BIO 3. Existing site conditions include disturbed areas that are not considered SERAs, and therefore not subject to SERA restrictions. Because construction activity would potentially affect SERA(s), and construction and operations activities could impact migratory birds and other special-status species, a potential for conflict exists with LUP policies CO-40, CO-41, CO-42, and CO-44. This conflict would constitute a significant impact.

Mitigation Measure(s):

The mitigation measures identified in Impact BIO 1 and Impact BIO 2, coupled with application of LU MM 3 (requiring the Authority obtain a coastal development permit) would reduce impacts to less than significant.

Mitigation Required: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 22 Monarch Butterfly Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Significant and Unavoidable Impact

Indirect / Visual Impact: Significant and Unavoidable Impact

Discussion:

There are no previously recorded historical resources within the direct or indirect APEs for this project location. However, during field surveys, prehistoric archaeological sites and features were newly identified that would meet the criteria for historical resources under the CEQA Guidelines. Given the mountainous location and the distribution of the cultural material and features, this project location would also qualify as an archaeological or ethnographic landscape. The condition and status of this project area were confirmed by a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian during field survey. Project activities at the H-69B project location include attachment of whip antennas and microwave dishes on a proposed 180-foot lattice tower and construction of a new equipment shelter, backup generator, and fuel tank. Construction of these structures would cause a substantial adverse change in the significance of the newly identified historical resource within the APE. Archaeological monitors would be present for all ground disturbing activities; however, given the location and extent of the identified resources, impacts could not be avoided and would remain significant. In addition, construction of a 180-foot steel tower and the associated antennas and infrastructure features would be visually out of character for this landscape. Standard approaches to mitigation for towers (painting/camouflage), particularly for towers of this height would not be effective and would not reduce the visual impacts to less than significant levels. In addition, the painting of tall telecommunications towers is controlled by FAA Advisory Circulars 47 CFR § 17.21-17.58 to prevent aviation hazards; therefore, painting would not be a feasible mitigation at this project site. Based on this information, direct and visual impacts at this project location would be

significant and unavoidable and implementation of mitigation measures would not reduce impacts to less than significant levels.

Mitigation Measure(s):

CUL MMs 1, 3, and 4 would be implemented at this project site. Archaeological monitors would be present for all ground disturbing activities; however, given the location and extent of the identified resources, impacts at this project site could not be avoided. Construction of a 180-foot steel tower and the associated antennas and infrastructure features would be visually out of character at this project site and would intrude on the significance of the landscape. Because of FAA requirements for the painting of tall communications towers, CUL MM 5 would not be applicable to this project site and there is no feasible mitigation to reduce visual impacts to less than significant levels.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Significant and Unavoidable Impact

Indirect / Visual Impact: Significant and Unavoidable Impact

Discussion:

There are no previously recorded historical resources within the direct or indirect APEs for this project location. However, during field surveys, prehistoric archaeological sites and features were newly identified that would meet the criteria for historical resources under the CEQA Guidelines. Given the mountainous location and the distribution of the cultural material and features, this project location may also qualify as an archaeological or ethnographic landscape. The condition and status of this project area were confirmed by a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian during field survey. Project activities at the H-69B project location include attachment of whip antennas and microwave dishes on a proposed 180-foot lattice tower and construction of a new equipment shelter, backup generator, and fuel tank. Construction of these structures would cause a substantial adverse change in the significance of the newly identified historical resource within the APE. Archaeological monitors would be present for all ground disturbing activities; however, given the location and extent of the resources, impacts at this project site could not be avoided. In addition, construction of a 180-foot steel tower and the associated antennas and infrastructure features would be visually out of character for this landscape. Standard approaches to mitigation for towers (painting/camouflage), particularly for towers of this height would not be effective and would not reduce the impacts to less than significant levels. In addition, the painting of tall telecommunications towers is controlled by FAA Advisory Circulars 47 CFR § 17.21-17.58 to prevent aviation hazards; therefore, painting would not be a feasible mitigation at this project site. Based on this information, impacts at this project location would be significant and unavoidable and implementation of mitigation measures would not reduce impacts to less than significant levels.

Mitigation Measure(s):

CUL MMs 1, 3, and 4 would be implemented at this project site. Archaeological monitors would be present for all ground disturbing activities; however, given the location and extent of the identified resources, impacts could not be avoided and would remain significant.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Miocene Topanga Formation, which has a high potential for significant vertebrate fossils. No localities are recorded within the proposed site; however, significant vertebrate fossil localities have been recorded from this formation in the Santa Monica Mountains region. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Topanga Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: Significant and Unavoidable Impact

Indirect / Visual Impact: Significant and Unavoidable Impact

Discussion:

No human remains have been identified within APE; however, given the nature of the resources newly identified at this project location, the potential for human remains is moderate to high. Given the mountainous location and distribution of the cultural material and features, and the potential for human remains, impacts at this project location would be significant and unavoidable.

Mitigation Measure(s):

CUL MMs 1, 3, and 4 would be implemented at this project site. Archaeological monitors would be present for all ground disturbing activities. However, based on the distribution of the cultural material and features, and the potential for human remains, impacts at this project location would be significant and unavoidable and mitigation measures would not reduce impacts to less than significant levels.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: Significant and Unavoidable Impact

Indirect / Visual Impact: Significant and Unavoidable Impact

Discussion:

The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within the APE. However, during the field survey of this project location, Tribal cultural resources as defined by California Assembly Bill 52 were identified within the APE. In addition, the introduction of a 180-foot lattice tower and its associated antennas and infrastructure features would be out of character and would cause a substantial adverse visual effect on the landscape and impacts at this project location would be significant and unavoidable.

Mitigation Measure(s):

CUL MMs 1, 3, and 4 would be implemented at this project site. Archaeological monitors would be present for all ground disturbing activities. However, based on the distribution of the cultural material and features, impacts at this project location would be significant and unavoidable and mitigation measures would not reduce impacts to less than significant levels.

Geology and Soils

Setting

Surface Geology: Tertiary intrusive rocks (hypabyssal), unit 5 (Southern California Basin)

Stability: Moderate pending geotechnical analysis

Soil Type: Urban land-Rock outcrop-Millsholm Association

Erosion Potential: Low

Expansive Soil: Low to Moderate Potential

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The Millsholm series consists of shallow, well drained soils that formed in material weathered from sandstone, mudstone and shale often with clay content up to 30%. Moderate to steep slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site H-69B and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site H-69B was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site H-69B. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site H-69B would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site H-69B, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site H-69B would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: LA County Fire Department Camp 8 Heliport less than 1.5 miles from Project Site

Applicable Emergency Response or Emergency Evacuation Plan: yes

Wildland Fire Risk: yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage

Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: N/A

Located in a State Fire Hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' Fire Severity zone

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: Santa Monica Mountains Coastal Zone

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Mountain Lands (RL20)

Zoning: Light Agriculture

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Monica Mountains Coastal Zone

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site H-69B is proposed within 500 feet of Saddle Peak Road, a designated Scenic Route within the Santa Monica Mountains Coastal Zone. The Santa Monica Mountains Land Use Plan, a component of the Santa Monica Mountains Local Coastal Program, was issued in August 2014 and allows for telecommunication facilities within several land use categories, including open space, rural lands, rural residential, rural villages, residential, commercial, commercial recreation – limited intensity, and public and semi-public facilities (County of Los Angeles, Department of Regional Planning 2014). Land Use Plan Policy CO-147 limits maximum allowable height to 18 feet above existing or finished grade, whichever is lower, along (within 200 feet of) Scenic Routes. Land Use Plan Policy CO-152 indicates wireless telecommunication facilities along Scenic Routes should be co-located where feasible and made to blend into the landscape. The proposal is to establish a 180-foot-tall tower at a previously

disturbed site with some existing development, but not developed specifically as a telecommunications site.

In addition, Site H-69B is along an adopted Significant Ridgeline within the Santa Monica Mountains Coastal Zone. Per the Local Implementation Plan adopted in 2014, new development is prohibited along Significant Ridgelines. The highest point of a structure must be located at least 50 vertical feet and 50 horizontal feet from a Significant Ridgeline. Construction of the proposed project facilities at this site (to establish a 180-foot-tall tower) would result in a conflict with the Santa Monica Mountains Land Use Plan because the proposed project exceeds the identified height limitations.

The final determination of consistency would be made by the agency responsible for issuing a Local Coastal Permit. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan, and plan inconsistency is not considered a significant impact.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am on weekdays or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: 115 feet

Ambient Noise Level: 55 dBA

Sensitive Noise Receiver 1: Single Family Residential Dwellings

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

Hourly average construction noise levels are anticipated to be approximately 89 dBA. The predicted noise levels represent the demolition phase which is anticipated to be the loudest construction phase. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site. However, in some instances, it may be necessary for construction activities to take place outside of these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The affected jurisdiction has not established a construction noise level threshold. Therefore, construction noise levels at the proposed Project site would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable" community noise equivalent level (CNEL) developed by the California Department of Health Services was referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. Noise levels from both sources would be below the 60 dBA "normally acceptable" level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers within this distance to the site; therefore, groundborne vibrational noise impacts would be less than significant.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B-3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance to the Project site; therefore, impacts from groundborne vibration from construction would be less than significant.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design; therefore, impacts due to excessive groundborne vibration or groundborne noise from Project operation would be less than significant.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, the estimated noise level at 115 feet from proposed sites would be 76 dBA and not exceed the 90 dBA daytime or 80 dBA nighttime criterion; therefore, construction impacts would be less than significant.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds; therefore, impacts from operational noise would be less than significant.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except

for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: Santa Monica Mountains Local Coastal Program, Land Use Plan

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: S Topanga Canyon Blvd

Distance (Miles): 1.48

Disaster Route: State Route 27

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No

Nearest Highway/Freeway: State Route 27

Distance (Miles): 1.68

Nearest Major Arterial: Mulholland Hwy

Distance (Miles): 2.57

Access to the Project Site Provided Via: Extension off of Saddle Peak Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: L A COUNTY WATERWORKS DIST #29

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: JOP

Site Name: Josephine Peak

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of two (2) up to 85kW diesel generators each with up to 1,500 gallon belly tanks. Propose installation of two solar arrays up to 1500 square feet total. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 10,000 square feet

Permanent disturbance area: Up to 8,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Surrounding area west of site

Aesthetics

Setting

Visual Description:

This site is approximately 1.0 mile north of the Angeles Crest Scenic Byway. This isolated hilltop site is located in Angeles National Forest on top of Josephine Peak off Josephine Peak Road near the intersection of Angeles Forest Highway and Angeles Crest Highway, a National Forest Scenic Byway, which traverses the base of the peak to the southeast. Steep topography blocks views of this site from both roads, with the exception of the southwestern side. West of the intersection, the scenic byway climbs some hills, from which the top of Josephine Peak would be intermittently visible. Some small solar panels and towers currently exist on the site. A dirt access road encircles the top of the peak, which has little vegetation and appears previously disturbed. Below the dirt access road, trees are more dense to the north of the peak, with some scattered vegetation on the south side of the peak. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Back Country, Motor Vehicle Use Restricted. The site is also a USFS Designated Communication Site, which allows for such use on national forests except when identified as not suitable because of law, national or regional policy, or the revised forest plan (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Back Country (Motorized Use Restricted)

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: State Route 2; Angeles Crest Scenic Byway

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Significant and Unavoidable Impact

Discussion:

The proposed new facilities would be located in an area with no existing tall structures. Given the height of Josephine Peak in relation to the surrounding forest, the new structure would intrude upon scenic vistas in the area. Ongoing and recurring maintenance activities would be barely visible and infrequent. However, because the new lattice tower would introduce a new vertical intrusion onto the landscape, a substantial adverse effect to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

Unavoidable impact. A measure evaluated to address the significant visual impacts included painting the new structures to blend with their visual setting. This measure was determined infeasible because FAA guidelines specify paint colors to be used on structures for aviation safety purposes, and painting the new structures to blend with surroundings would not reduce their visual impact to less than significant levels.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Very little vegetation exists on site. No rock outcroppings, historic buildings, or other scenic resources exist in the area. No damage to vegetation or other elements that would be considered scenic resources would occur during construction.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Significant and Unavoidable Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. The new tower and shelter would contrast and be incompatible with the visual character of the landscape, which consists primarily of vegetated forests. The new tower would introduce a new vertical intrusion onto the landscape where other vertical structures do not currently exist resulting in a substantial adverse impact. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

Unavoidable impact. A measure evaluated to address the significant visual impacts included painting the new structures to blend with their visual setting. This measure was determined infeasible because FAA guidelines specify paint colors to be used on structures for aviation safety purposes, and painting the new structures to blend with surroundings would not reduce their visual impact to less than significant levels.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow

from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Federal government building

Distance to Sensitive Receptor: 5523

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site JOP. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site JOP or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site JOP would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site JOP will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site JOP would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site JOP or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site JOP, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site JOP, which is 5,523 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 8 are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site JOP and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site JOP in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site JOP and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition,

the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

Coast Range newt (*Taricha torosa*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

Greata's aster (*Symphyotrichum greatae*; 1B.3)

Sensitive Communities Recorded within 1 Mile:

Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP); arroyo toad (*Anaxyrus californicus*; ESA-E, ESA-CH, CDFW-SSC); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E); Greata's aster (*Symphyotrichum greatae*; 1B.3)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

US Forest Service - Angeles National Forest; SCAG Zoning - Wildlife Preserves and Sanctuaries; Natural Landscape Block - Pleasant View Ridge;

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Canyon live oak chaparral [*Quercus chrysolepis* Shrubland Alliance]; Association- *Quercus chrysolepis*-*Eriogonum fasciculatum*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site JOP is located on a mountain top in the San Gabriel Mountains with sparse chaparral on south-facing slopes and dense Canyon Live Oak forest in the shaded canyons. The bedrock is primarily very old metamorphics and the vegetation is recovering from a recent burn. The vegetation includes bush buckwheat (*Eriogonum fasciculatum*), Our Lord's candle (*Yucca whipplei*), poodle plant (*Turricula parryi*), canyon live oak (*Quercus chrysolepis*), sulfur buckwheat (*Eriogonum umbellatum*), bricklebush (*Brickellia californica*), ceanothus, blackberry, and prickly phlox (*Leptodactylon* sp). American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP) may pass through the study area while foraging, but the study area does not provide steep cliff habitat required for nesting (suitable nesting habitat may be present within one mile). The study areas considered to be outside the current range of the

California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), but as the condor population increases it is expected to expand geographically. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. No aquatic, wetland, or aquatic habitats occur within the vicinity of the JOP study area. However, designated critical habitat for the arroyo toad (*Anaxyrus californicus*; ESA-E, ESA-CH, CDFW-SSC) is in Big Tujunga Canyon, a little more than 1 mile to the north. Though the project site is located in mountain terrain and no aquatic/riparian habitat occurs in the study area, arroyo toads may disperse overland for distances of more than 1.5 miles during rainy periods. Southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) is known to occur in Mill Creek/Big Tujunga Creek, and in Seco Arroyo, just less than 2 miles to the north and south of Site LACFCP09, respectively. Potentially suitable habitat (and a potential reintroduction site) for California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) has been reported by the Angeles National Forest to occur within 2 miles of Site JOP in Big Tujunga Canyon. Though the project site is located in mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. Aquatic/riparian habitat for Coast Range newt (*Taricha torosa*; CDFW-SSC) does not occur in the project area. Potential habitat for Greata's aster (*Symphyotrichum greatae*; 1B.3) occurs within the survey area but the vegetation is too dense to survey. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

To address future use of the area by condors all trash and construction debris (especially small items such as nuts and washers) will be removed from the site; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of arroyo toad (*Anaxyrus californicus*; ESA-E, ESA-CH, CDFW-SSC), southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E), California red-legged frog (*Rana draytonii*; ESA-T, ESA-CH, CDFW-SSC), and Greata's aster (*Symphyotrichum greatae*; 1B.3). Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. To protect dispersing frogs and toads, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measurable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Mark the areas requiring special protection for Greata's aster (*Symphyotrichum greatae*; 1B.3). Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Southern coast live oak riparian forest and woodland is within 500 feet of the project site JOP. Site JOP is hydrologically connected to stream habitats that include southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) and California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) occupied and potentially suitable habitat.

Mitigation Measure(s):

Recommended Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Pleasant View Ridge Natural Landscape Block which overlaps the ranges of approximately 257 amphibian, reptile, mammal and bird species. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual

species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. The only other recorded cultural resource at this project location (not a historical resource) is P-19-002248H, which consists of the remains of the 1938-era Josephine Peak Lookout tower that was destroyed during the Mill wildfire in 1975 and retains essentially no integrity. LMR activities at this project location include attachment of whip and microwave antennas mounted on a proposed 70-foot monopole and construction of a new equipment shelter and fuel tank mounted on a concrete pad. This project location is heavily disturbed from the previous construction of a road and the former lookout station. The conditions and status of cultural resources at this project location was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Based on the nature of Resource No. P-19-186535 and the absence of other historical resources, impacts from project activities at this project site would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. The only other recorded cultural resource at this project location (not a historical resource) is P-19-002248H, which consists of the remains of the 1938-era Josephine Peak Lookout tower that was destroyed during the Mill wildfire in 1975 and retains essentially no integrity. LMR activities at this project location include attachment of whip and microwave antennas mounted on a proposed 70-foot monopole and construction of a new equipment shelter and fuel tank mounted on a concrete pad. This project location is heavily disturbed from the previous construction of a road and the former lookout station. The conditions and status of cultural resources at this project location was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Based on the nature of Resource No. P-19-186535 and the absence of other historical resources, impacts from project activities at this project site would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Precambrian rocks, undivided, unit 2 (Mojave Desert and Transverse Ranges)

Stability: Moderate pending geotechnical analysis

Soil Type: Pismo-Etsel family-Cieneba-Caperton Association

Erosion Potential: Low to Moderate

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The potential erosive properties of this soil type would be confirmed during geotechnical investigation and the results must be considered as part of the overall site design. The proposed building site is relatively flat, though moderate to steep slopes surround the site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site JOP and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site JOP was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site JOP. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site JOP would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site JOP, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site JOP would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Backcountry Motorized Use Restricted

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Antelope Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health,

watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as Backcountry (Motorized Use Restricted), which includes areas of the national forest that are generally undeveloped with few roads. Few facilities are found in this zone, but some may occur in remote locations. Motorized use is restricted to administrative purposes only; this includes Forest Service, other agency, or tribal government needs, as well as access needed to private land or authorized special-uses. Although this zone allows a range of low intensity land uses, the management intent is to retain the natural character of the zone and limit the level and type of development (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. The motorized use restriction may entail additional access challenges as use of the administrative roads requires special-use authorization. Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am on weekdays or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar

to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

Some local jurisdictions have established thresholds above which construction vibration becomes perceivable by sensitive receiver locations. If vibration from construction exceeds a specified threshold in a jurisdiction with a vibration ordinance that is applicable to the Authority, this would be a significant impact. If vibration from construction exceeds a specified threshold in a jurisdiction with a vibration ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines

for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Backcountry Motorized Use Restricted land use desig

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. Josephine Peak is not identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Angeles Forest Hwy

Distance (Miles): 0.86

Disaster Route: State Route 2

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No

Nearest Highway/Freeway: Foothill Frwy

Distance (Miles): 0.86

Nearest Major Arterial: Big Tujunga Canyon Rd

Distance (Miles): 0.87

Access to the Project Site Provided Via: Josephine Peak Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Scholl Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: JPK

Site Name: Johnstone Peak - 1

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Address: Angeles National Forest

City: San Dimas

State: CA

Zip: 91741

Latitude: 34.1603256346

Surrounding area west of site

Aesthetics

Setting

Visual Description:

This isolated site is located in Angeles National Forest on Lodi Lateral Mountain Way near its intersection with Johnstone Peak Truck Trail. The site consists of a utility pole, two lattice towers (the tallest one painted red and white), transformer, equipment compound, and two one-story equipment shelters. The site is on an isolated ridge top in a cleared area surrounded by chaparral vegetation and little development. The JPK2 site, with an existing lattice tower, is approximately 300 feet to the west. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Experimental Forest, which is generally closed to the public except by permit. The site is also a USFS Designated Communication Site, which allows for such use on national forests except when identified as not suitable because of law, national or regional policy, or the revised forest plan (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Experimental Forest

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new facilities would be located within a site that includes existing towers that already create a visual intrusion onto the landscape. Locating the new tower and equipment with existing structures would concentrate the impacts. The existing towers would attenuate the noticeability of new structures, thereby minimizing visual impacts. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. The existing visual character and quality of the site and its surroundings are impacted by the presence of an existing site and large lattice tower, as well as the nearby presence of the JPK2 site and its tower. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site and the adjacent JPK2 site. In addition, the site is located on a USFS Designated Communication Site, which generally allows for such use within the area's landscape. Therefore, there would be no change to the designated scenic attractiveness rating. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare

that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 7505

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site JPK. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site JPK or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site JPK would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site JPK will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site JPK would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site JPK or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site JPK, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site JPK, which is 7,505 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 10 are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site JPK and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site JPK in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site JPK and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger

public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

Coast Range newt (*Taricha torosa*; CDFW-SSC); two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

Greata's aster (*Symphyotrichum greatae*; 1B.3); round-leaved filaree (*California macrophylla*; 1B.1); many-stemmed dudleya (*Dudleya multicaulis*; CA-1B.2)

Sensitive Communities Recorded within 1 Mile:

Southern Coast Live Oak Riparian Forest; Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

round-leaved filaree (*California macrophylla*; 1B.1)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

US Forest Service - Angeles National Forest; SEA - San Dimas Canyon/San Antonio Canyon; SCAG Zoning - Open Space and Recreation; Essential Connectivity Area - Sugarloaf Mountain/Keller Peak - San Gabriel/Cucamonga; Natural Landscape Block - San Dimas

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Chamise chaparral [*Adenostoma fasciculatum* Shrubland Alliance]; Association - *Adenostoma fasciculatum*-*Eriogonum fasciculatum*

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site JPK is located on a mountain top in the San Gabriel Mountains and contains chamise chaparral on the south-facing slopes and oak woodland and forest on the north-facing slopes. The study areas considered to be outside the current range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), but as the condor population increases it is expected to expand geographically. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. The project area does not contain habitat wet enough to sustain Greata's aster (*Symphyotrichum greatae*; 1B.3). The site contains moderate quality habitat for round-leaved filaree (*California macrophylla*; 1B.1), though it was not detected in

surveys conducted 8/14/2014. Aquatic/riparian habitat for Coast Range newt (*Taricha torosa*; CDFW-SSC) and two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC) does not occur in the project area. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

To address future use of the area by condors all trash and construction debris (especially small items such as nuts and washers) will be removed from the site; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Conduct spring botanical surveys for round-leaved filaree (*California macrophylla*; 1B.1); if present mark the areas requiring special protection. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 18 Nesting Bird Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project area includes the following two wetland feature types as indicated by the National Wetland Inventory (USFWS 2014): 1) Freshwater Forested/Shrub Wetland; and 2) Riverine. However, these wetland types are restricted to ephemeral drainages. Construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated San Dimas Natural Landscape Block which overlaps the ranges of approximately 272 amphibian, reptile, mammal and bird species. It is also located within the Essential Habitat Connectivity Area Sugarloaf Mountain/Keller Peak - San Gabriel/Cucamonga that connects San Gabriel Mountains from Pleasant View Ridge eastward through Table Mountain to San Bernardino Mountains. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The SEA notes the specific habitat for thread-leaf brodiaea in the vicinity. The woodland and riparian habitat within the SEA specifically are used by special status wildlife species during part of their life cycle. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

Recommended mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

Yes

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

Project locations JPK and JPK2 are overlapping sites with slightly different, but immediately adjacent construction footprints. There are two historical resources within the direct and indirect areas of potential effects (APEs). The first of these is Resource No. P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. The second historical resource is Resource No. P-19-187829, which is eligible for inclusion in the National Register of Historic Places as the San Dimas Experimental Forest Historic District. This resource encompasses 17,161 acres of buildings, structures, sites, and landscapes that date to between 1933-1952. Included among the contributing landscape elements are the major topographical features found on the forest, because without this particular topography of streams and canyons forming isolated watersheds, Resource No. P-19-187829 would not have been selected as a location for an experimental forest. The Experimental Forest is the only such forest in Southern California, and believed to be the most significant within the U.S. Forest system. Both the direct and indirect APEs are completely encompassed by both P-19-186535 and P-19-187829. There are no other historical resources within the direct or indirect APEs. The LMR activities at this project location include attachment of whip and microwave antennas mounted on a proposed 180-foot lattice tower and construction of a new equipment shelter and fuel tank mounted on a concrete pad, all enclosed by a chain-link fence. The condition and status of cultural resources at this project location were

confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Given the enormous size and scale of Resource Nos. P-19-186535 and P-19-187829 and the lack of any resource-associated features; the small footprint of the project site; and the absence of other historical resources, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

Project locations JPK and JPK2 are overlapping sites with slightly different, but immediately adjacent construction footprints. There are two historical resources within the direct and indirect areas of potential effects (APEs). The first of these is Resource No. P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. The second historical resource is Resource No. P-19-187829, which is eligible for inclusion in the National Register of Historic Places as the San Dimas Experimental Forest Historic District. This resource encompasses 17,161 acres of buildings, structures, sites, and landscapes that date to between 1933-1952. Included among the contributing landscape elements are the major topographical features found on the forest, because without this particular topography of streams and canyons forming isolated watersheds, Resource No. P-19-187829 would not have been selected as a location for an experimental forest. The Experimental Forest is the only such forest in Southern California, and believed to be the most significant within the U.S. Forest system. Both the direct and indirect APEs are completely encompassed by both P-19-186535 and P-19-187829. There are three additional recorded resources within this project location's indirect APE. The first is P-19-002054, the Johnstone Peak Lookout tower, which is situated approximately 350 feet northeast of the direct APE, has been determined to be not eligible for inclusion in the National Register of Historic Places, and has been converted internally and externally into a communications-related site that includes the building, structures, and a lattice towers, all surrounded by a chain-link fence. The second and third sites are FS-05015200153, a prehistoric archaeological site consisting of five lithic artifacts situated in the southeastern-most quadrant of the indirect APE and P-19-187815, a segment of the Sycamore Flat Motorway (Forest Road 1N15), which crosses the southwestern-most boundary of the indirect APE; neither of these recorded resources are historical resources. The LMR activities at this project location include attachment of whip and microwave antennas mounted on a proposed 180-foot lattice tower and construction of a new equipment shelter and fuel tank mounted on a concrete pad, all enclosed by a chain-link fence. This project location is heavily disturbed from the previous construction of an existing communications facility (including a lattice tower). The conditions and status of cultural resources at this project location was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Given the enormous size and scale of Resource Nos. P-19-186535 and P-19-187829 and the lack of any uniquely definable resource-associated features; the small footprint of the project site; and the absence of other historical resources, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) at this project site. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Mesozoic granitic rocks, unit 3 (Sierra Nevada, Death Valley area, Northern Mojave Desert and Transverse Ranges)

Stability: Low to Moderate based on designation within Landslide Zone and proximity to Fault Line

Soil Type: Sobrante-Exchequer-Cieneba Association

Erosion Potential: Low to Moderate

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line was identified approximately 1/8 mile south of the property (EDR, 2014), but is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and

Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is comprised of well-drained, gravelly silt loam that has a rapid runoff characteristics with moderately permeability. This condition increases erosion hazards in areas of sloping terrain; however, the proposed building site is on relatively flat grade. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site JPK and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site JPK was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site JPK. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site JPK would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site JPK, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site JPK would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: San Dimas

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Experimental Forest

Zoning: Watershed

What is the zoning height restriction, if any?:

12 feet; 30 feet if designed as public art

City or county permit requirements for communication facilities, if any:

City of San Dimas prohibits monopolies in Watershed zone, but City authority would not apply to Forest Service land; Forest Service requires Special Use Authorization

Comprehensive Plan or General Plan Local Agency: San Dimas

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such plans, policies, and regulations are not applicable to the project. Nevertheless, in the exercise of its discretion and in the interest in working cooperatively with local jurisdictions, local land-use plans, policies, and regulations are referenced, described, and addressed in recognition that such plans, policies, and regulations reflect the local community's policy decisions with respect to appropriate uses of land in the area. Consideration of these plans, policies and regulations, therefore, assists in determining whether the proposed project may conflict with nearby land uses, which could affect the analysis of whether the proposed project would result in potentially significant environmental impacts.

Based on the zoning ordinances for telecommunication facilities, the maximum allowable height of structures is 12 feet or 30 feet if designed as public art. Exceptions to the ordinance may be allowed, ordinarily with a conditional use permit. However, per the doctrine of intergovernmental immunity, the permit requirement is not applicable to the project. In addition, city policy is to preserve existing ridgelines to preserve views and viewsheds of the foothills and the proposed structure would be on a ridgeline within the foothills north of the city. Because the Authority is exercising intergovernmental immunity, the City of San Dimas General Plan is not applicable and no conflict with the plan exists.

Furthermore, while the site is within the city planning boundary and zoning designation exists, the site is within Angeles National Forest where federal land use jurisdiction takes precedence.

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health, watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as Experimental Forest. The Experimental Forest zone serves as a research and demonstration area, and is generally closed to the public except by permit. Access is controlled. The San Dimas Experimental Forest (SDEF) is a protected field laboratory for studies of hydrology, fire, and other topics relating to the ecology of chaparral and related ecosystems. It has been closed to the general public, except under special written permit. Uses within the SDEF include a communications site that was authorized by special-use authorization (USFS, Pacific Southwest Region 2005b).

Communications sites may be permitted within the SDEF, but would require special-use authorization. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. No land use plan incompatibility impacts are anticipated because of the communications site designation, but new development will still require a permitting process prior to construction.

Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: San Dimas

Applicable Noise Ordinance: Title 8 Health and Safety, Chapter 8.36 Noise Ordinance

Noise Level Threshold: N/A; no construction from 8 pm to 7 am or any time on Sundays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range

from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would

not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Experimental Forest land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. Johnstone Peak is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Foothill Frwy

Distance (Miles): 2.77

Disaster Route: Route 66

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: Approximately 4.7 miles from Brackett Field Airport

Nearest Highway/Freeway: Foothill Frwy

Distance (Miles): 2.71

Nearest Major Arterial: Amelia Ave

Distance (Miles): 2.05

Access to the Project Site Provided Via: Lodi Lateral Mtwy

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None Required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles

bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None Required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site JPK is more than 20,000 feet from an identified airport or heliport. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered (in this case, proposed whip and microwave antennas mounted on a proposed 180-foot-tall lattice tower with up to a 15-foot lightning rod), the TOWAIR tool indicates that the antenna structure is a "pass slope determination," which indicates the structure would not interfere with takeoff and landing operations, and does not require Federal Aviation Administration (FAA) notification based on the structure height and distance from runways. No impacts to aviation flight safety are anticipated.

Mitigation Measure(s):

None Required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None Required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Savage Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does not meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: JPK2

Site Name: Johnstone Peak - 2

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Surrounding area west of site

Aesthetics

Setting

Visual Description:

This site is in approximately 300 feet west of the JPK site in Angeles National Forest, and the same conditions apply. The site is on an isolated ridge top in a cleared area surrounded by chaparral vegetation and little development. The site consists of dirt ground with two very small shelters and lattice tower with attached microwave antennas, which are enclosed by a chain link fence. A shorter monopole with attached antennas is adjacent to a small shelter outside of this compound. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Experimental Forest, which is generally closed to the public except by permit. The site is also a USFS Designated Communication Site, which allows for such use on national forests except when identified as not suitable because of law, national or regional policy, or the revised forest plan (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Experimental Forest

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new facilities would be located within a site that includes an existing tower that already creates a visual intrusion onto the landscape. Locating the new tower and equipment with existing structures would concentrate the impacts. The existing towers would attenuate the noticeability of new structures, thereby minimizing visual impacts. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. The existing visual character and quality of the site and its surroundings are impacted by the presence of an existing site and large lattice tower, as well as the nearby presence of the JPK site and its two towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site and the adjacent JPK site. In addition, the site is located on a USFS Designated Communication Site, which generally allows for such use within the area's landscape. Therefore, there would be no change to the designated scenic attractiveness classification. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare

that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 7313

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site JPK2. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site JPK2 or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site JPK2 would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site JPK2 will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site JPK2 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site JPK2 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site JPK2, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site JPK2, which is 7,313 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 10 are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site JPK2 and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site JPK2 in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site JPK2 and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly

trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

Coast Range newt (*Taricha torosa*; CDFW-SSC); two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

Greata's aster (*Symphotrichum greatae*; 1B.3); round-leaved filaree (*California macrophylla*; 1B.1); many-stemmed dudleya (*Dudleya multicaulis*; CA-1B.2)

Sensitive Communities Recorded within 1 Mile:

Southern Coast Live Oak Riparian Forest; Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

round-leaved filaree (*California macrophylla*; 1B.1)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

US Forest Service - Angeles National Forest; SEA - San Dimas Canyon/San Antonio Canyon; SCAG Zoning - Open Space and Recreation; Essential Connectivity Area - Sugarloaf Mountain/Keller Peak - San Gabriel/Cucamonga; Natural Landscape Block - San Dimas

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Chamise chaparral [*Adenostoma fasciculatum* Shrubland Alliance]; Association - *Adenostoma fasciculatum*-*Eriogonum fasciculatum*

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site JPK2 is located on a mountain top in the San Gabriel Mountains and contains chamise chaparral on the south-facing slopes and oak woodland and forest on the north-facing slopes. The study areas considered to be outside the current range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), but as the condor population increases it is expected to expand geographically. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. The site does not contain habitat wet enough to sustain Greata's aster (*Symphotrichum greatae*; 1B.3). The site contains moderate quality habitat for round-leaved filaree (*California macrophylla*; 1B.1). Aquatic/riparian habitat for Coast Range

newt (*Taricha torosa*; CDFW-SSC) and two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC) does not occur in the project area. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

To address future use of the area by condors all trash and construction debris (especially small items such as nuts and washers) would be removed from the site; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Conduct spring botanical surveys for round-leaved filaree (*California macrophylla*; 1B.1); if present mark the areas requiring special protection. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 18 Nesting Bird Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Freshwater Forested/Shrub wetland feature type as indicated by the National Wetland Inventory (USFWS 2014). However, this wetland type is restricted to an ephemeral drainage. However, construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

Implementation of best management practices for control of erosion and sedimentation.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated San Dimas Natural Landscape Block which overlaps the ranges of approximately 272 amphibian, reptile, mammal and bird species. It is also located within the Essential Habitat Connectivity Area Sugarloaf Mountain/Keller Peak - San Gabriel/Cucamonga that connects San Gabriel Mountains from Pleasant View Ridge eastward through Table Mountain to San Bernardino Mountains. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

Recommended mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

Yes

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

Project locations JPK2 and JPK are overlapping sites with slightly different, but immediately adjacent construction footprints. There are two historical resources within the direct and indirect areas of potential effects (APEs). The first of these is Resource No. P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. The second historical resource is Resource No. P-19-187829, which is eligible for inclusion in the National Register of Historic Places as the San Dimas Experimental Forest Historic District. This resource encompasses 17,161 acres of buildings, structures, sites, and landscapes that date to between 1933-1952. Included among the contributing landscape elements are the major topographical features found on the forest, because without this particular topography of streams and canyons forming isolated watersheds, Resource No. P-19-187829 would not have been selected as a location for an experimental forest. The Experimental Forest is the only such forest in Southern California, and believed to be the most significant within the U.S. Forest system. Both the direct and indirect APEs are completely encompassed by both P-19-186535 and P-19-187829. There are no other historical resources within the direct or indirect APEs. The LMR activities at this project location include attachment of whip and microwave antennas mounted on a proposed 180-foot lattice tower and construction of a new equipment shelter and fuel tank mounted on a concrete pad, all enclosed by a chain-link fence. The condition and status of cultural resources at this project location were

confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Given the enormous size and scale of Resource Nos. P-19-186535 and P-19-187829 and the lack of any resource-associated features; the small footprint of the project site; and the absence of other historical resources, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

Project locations JPK2 and JPK are overlapping sites with slightly different, but immediately adjacent construction footprints. There are two historical resources within the direct and indirect areas of potential effects (APEs). The first of these is Resource No. P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. The second historical resource is Resource No. P-19-187829, which is eligible for inclusion in the National Register of Historic Places as the San Dimas Experimental Forest Historic District. This resource encompasses 17,161 acres of buildings, structures, sites, and landscapes that date to between 1933-1952. Included among the contributing landscape elements are the major topographical features found on the forest, because without this particular topography of streams and canyons forming isolated watersheds, Resource No. P-19-187829 would not have been selected as a location for an experimental forest. The Experimental Forest is the only such forest in Southern California, and believed to be the most significant within the U.S. Forest system. Both the direct and indirect APEs are completely encompassed by both P-19-186535 and P-19-187829. There are no other historical resources within the direct or indirect APEs. The LMR activities at this project location include attachment of whip and microwave antennas mounted on a proposed 180-foot lattice tower and construction of a new equipment shelter and fuel tank mounted on a concrete pad, all enclosed by a chain-link fence. The condition and status of cultural resources at this project location were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Given the enormous size and scale of Resource Nos. P-19-186535 and P-19-187829 and the lack of any uniquely definable resource-associated features; the small footprint of the project site; and the absence of other historical resources, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) at this project site. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Mesozoic granitic rocks, unit 3 (Sierra Nevada, Death Valley area, Northern Mojave Desert and Transverse Ranges)

Stability: Low to Moderate based on designation within Landslide Zone and proximity to Fault Line

Soil Type: Sobrante-Exchequer-Cieneba Association

Erosion Potential: Low to Moderate

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line was identified approximately 1/8 mile south of the property (EDR, 2014), but is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and

Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is comprised of well-drained, gravelly silt loam that has a rapid runoff characteristics with moderately permeability. This condition increases erosion hazards in areas of sloping terrain; however, the proposed building site is on relatively flat grade. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site JPK2 and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site JPK2 was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site JPK2. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site JPK2 would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site JPK2, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site JPK2 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: San Dimas

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Experimental Forest

Zoning: Watershed

What is the zoning height restriction, if any?:

12 feet; 30 feet if designed as public art

City or county permit requirements for communication facilities, if any:

City of San Dimas prohibits monopolies in Watershed zone, but City authority would not apply to Forest Service land; Forest Service requires Special Use Authorization

Comprehensive Plan or General Plan Local Agency: San Dimas

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such plans, policies, and regulations are not applicable to the project. Nevertheless, in the exercise of its discretion and in the interest in working cooperatively with local jurisdictions, local land-use plans, policies, and regulations are referenced, described, and addressed in recognition that such plans, policies, and regulations reflect the local community's policy decisions with respect to appropriate uses of land in the area. Consideration of these plans, policies and regulations, therefore, assists in determining whether the proposed project may conflict with nearby land uses, which could affect the analysis of whether the proposed project would result in potentially significant environmental impacts.

Based on the zoning ordinances for telecommunication facilities, the maximum allowable height of structures is 12 feet or 30 feet if designed as public art. Exceptions to the ordinance may be allowed, ordinarily with a conditional use permit. However, per the doctrine of intergovernmental immunity, the permit requirement is not applicable to the project. In addition, city policy is to preserve existing ridgelines to preserve views and viewsheds of the foothills and the proposed structure would be on a ridgeline within the foothills north of the city. Because the Authority is exercising intergovernmental immunity, the City of San Dimas General Plan is not applicable and no conflict with the plan exists.

Furthermore, while the site is within the city planning boundary and zoning designation exists, the site is within Angeles National Forest where federal land use jurisdiction takes precedence.

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health, watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as Experimental Forest. The Experimental Forest zone serves as a research and demonstration area, and is generally closed to the public except by permit. Access is controlled. The San Dimas Experimental Forest (SDEF) is a protected field laboratory for studies of hydrology, fire, and other topics relating to the ecology of chaparral and related ecosystems. It has been closed to the general public, except under special written permit. Uses within the SDEF include a communications site that was authorized by special-use authorization (USFS, Pacific Southwest Region 2005b).

Communications sites may be permitted within the SDEF, but would require special-use authorization. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. No land use plan incompatibility impacts are anticipated because of the communications site designation, but new development will still require a permitting process prior to construction.

Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: San Dimas

Applicable Noise Ordinance: Title 8 Health and Safety, Chapter 8.36 Noise Ordinance

Noise Level Threshold: N/A; no construction from 8 pm to 7 am or any time on Sundays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range

from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 dBA daytime criterion but would exceed FTA threshold 80 dBA nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would

not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Experimental Forest land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. Johnstone Peak is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Foothill Frwy

Distance (Miles): 2.76

Disaster Route: Route 66

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: Approximately 4.7 miles from Brackett Field Airport

Nearest Highway/Freeway: Route 66/Foothills Blvd

Distance (Miles): 2.76

Nearest Major Arterial: Amelia Avenue

Distance (Miles): 2.05

Access to the Project Site Provided Via: Lodi Lateral Mtwy

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None Required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles

bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None Required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site JPK2 is more than 20,000 feet from an identified airport or heliport. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered (in this case, proposed whip and microwave antennas mounted on a proposed 180-foot-tall lattice tower with up to a 15-foot lightning rod), the TOWAIR tool indicates that the antenna structure is a "pass slope determination," which indicates the structure would not interfere with takeoff and landing operations, and does not require Federal Aviation Administration (FAA) notification based on the structure height and distance from runways. No impacts to aviation flight safety are anticipated.

Mitigation Measure(s):

None Required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None Required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Savage Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: LACF072

Site Name: County FS 72

Site Discussion:

Propose installation of up to 20 whip and up to 5 microwave antennas on new monopole up to 70 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

- Temporary disturbance area (includes staging): Up to 5,000 square feet
- Permanent disturbance area: Up to 3,000 square feet
- Excavation: Up to 150 cubic yards removed
- Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide
- Proposed foundations include:
 - o Up to 8 foot diameter x 36 foot deep drilled caisson with concrete cap for monopole support; or up to 16 foot x 16 foot x 10 foot deep concrete mat foundation
 - o Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter
 - o Up to 200 square feet x 18 inch concrete slab for generator
- Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This site is Los Angeles County Fire Station 72 located on Decker Canyon Road (Highway 23), a paved two-lane road that is a Scenic Route as designated under the Santa Monica Mountains Coastal Program Land Use Plan. Decker Canyon Road traverses the nearby Santa Monica Mountains NRA generally north to south and connects to Mulholland Scenic Highway. The site consists of a single one-story fire station and flag pole. A broad, flat parking area and low-rise metal shelter are located across the highway. Views along the roadway corridor include telephone poles, chaparral vegetation, and occasional residences. Views are dominated by the road corridor, a distant, relatively flat mountain horizon, and telephone poles and lines. The setting is mostly semi-rural, with some estate homes scattered along the road. Primary sensitive viewers are travelers along Decker Road.

Visual Sensitivity: High

On federally administered public lands: No, but within boundary of Santa Monica Mountains NRA

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: Yes, Santa Monica Mountains Local Coastal Plan

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Decker Canyon Road

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new facilities would be constructed along the eastern boundary of the fire station property in an undeveloped moderately wooded area on a low hill. The height of the new monopole would be similar to the surrounding trees, and would also be elevated above Decker Canyon Road on a hill that is obscured from view by cut banks. The monopole would be of similar height as the telephone poles that line the road and the flagpole at the fire station. The undulating nature of Decker Canyon Road and its many curves and cut banks, as well as the presence of mature vegetation along the road, would obscure most views of the site. There would be no change to the road's scenic route designation. The site would not interfere with scenic vistas in SMMNRA given the stature of the new monopole and its location in the landscape. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some trees would be disturbed to accommodate the new facilities and construction staging area. Operation of the project would result in no removal of or damage to trees, rock outcroppings, or historic buildings that constitute scenic resources.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings are impacted by the presence of telephone poles and lines that parallel the road. The new monopole would be largely obscured by surrounding vegetation and topography. Therefore, the new facilities would be compatible with the visual character of the surrounding landscape. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 40

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site LACF072. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site LACF072 or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?**Construction Impact:** Significant Impact Reduced to Less than Significant with Mitigation Incorporated**Operational Impact:** Less than Significant**Discussion:**

Emissions from the construction of proposed site LACF072 would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site LACF072 will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site LACF072 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site LACF072 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site LACF072, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site LACF072, which is 40 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds for CO, No_x, lower for PM₁₀, PM 2.5 but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site LACF072 and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site LACF072 in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site LACF072 and all proposed Projects sites

would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site LACF072 is located in a suburban/rural setting on a hillside slope in the Santa Monica Mountains adjacent to a paved road in association with a fire station. The project site is within an existing fenced facility, landscaped with ornamental vegetation including several large non-native trees; no native habitats are present on site. The project area includes residences and corrals on neighboring properties. Less disturbed areas include chaparral vegetation with coast live oak (*Quercus agrifolia*) woodlands and patches with coastal sage scrub components, including scattered flattop buckwheat (*Eriogonum fasciculatum*), laurel sumac (*Malosma laurina*), California sagebrush (*Artemisia californica*), and mountain mahogany (*Cercocarpus* sp.). Monarch butterflies (*Danaus plexippus*; ESA-

Pet) may pass through the project area and suitable roost trees are present. Aquatic habitat for the western pond turtle (*Emys marmorata*; CDFW-SSC) does not occur within the project area. The project site has been highly modified from natural conditions, with no native habitats present. Though no occurrences of Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1) are recorded within 1 mile and the closest populations are northwest of the site in the Santa Monica Mountains, adjacent lands within the study area, primarily on the opposite side of SR-23, may provide habitat for Braunton's milk-vetch. Braunton's milk-vetch is a fire follower that also occurs in openings and disturbed areas in chaparral. This species could occur within the study area northeast of the site in what is considered poor quality habitat; the slopes are too steep to survey. Though no occurrences of Lyon's pentachaeta (*Pentachaeta lyonii*; ESA-E, CA-E, 1B.1) are recorded within 1 mile, adjacent lands within the study area, primarily on the opposite side of SR-23, may provide habitat for Lyon's pentachaeta. Designated critical habitat is located about 1.5 miles to the northeast. This species could occur within the study area; the slopes are too steep to survey. Marcescent dudleya (*Dudleya cymosa* ssp. *marcescens*; ESA-T, CA-R, CNPS-1B.2), Santa Monica dudleya (*Dudleya cymosa* ssp. *ovatifolia*; ESA-T, CNPS 1B.2), and Sonoran maidenhair fern (*Thelypteris puberula* var. *sonorensis*; 2B.2) were not observed on the 8/5/2014 habitat assessment survey, though potentially suitable habitat is present and require spring surveys. The steep slopes would likely preclude a thorough survey of the project area. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities.

Mitigation Measure(s):

Conduct spring botanical surveys for Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1), Lyon's pentachaeta (*Pentachaeta lyonii*; ESA-E, CA-E, 1B.1), marcescent dudleya (*Dudleya cymosa* ssp. *marcescens*; ESA-T, CA-R, CNPS-1B.2), Santa Monica dudleya (*Dudleya cymosa* ssp. *ovatifolia*; ESA-T, CNPS 1B.2), Sonoran maidenhair fern (*Thelypteris puberula* var. *sonorensis*; 2B.2); if present mark the areas requiring special protection. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Inspect trees for roosting monarch butterflies (*Danaus plexippus*; ESA-Pet). Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 22 Monarch Butterfly Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Sensitive Community -Southern coast live oak riparian forest and woodland is within study area.

Mitigation Measure(s):

Recommended Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Riverine wetland feature type as indicated by the National Wetland Inventory (USFWS 2014). However, this wetland type is restricted to ephemeral drainages. However, construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the proposed Santa Monica Mountains Coastal Resource Area, which is identified as an important regional habitat linkage in the Los Angeles General Plan. Linkages in this CRA connect open spaces together that may be fragmented due to rural development and connect to habitats in Ventura County. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. Additionally, due to the nature of the project, impacts to wildlife movement would be minimal to none. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Most of Site LACF072 is comprised of H3 habitat, but Significant Ecological Resource Areas (SERAs) identified at the southwestern side of the site include some H2 habitat. The northern portion of the study area for Site LACF072 (across Decker Canyon Road) and the southwestern edge of the study area include H2 habitat. Protection of SERAs identified in the land use plan (LUP) includes prohibition or other strict regulation of proposed site development. Policies contained within Goal CO-2 of the LUP offer protection of SERAs as a priority over other development standards in the Local Implementation Plan. Construction and operations impacts to resources at the site are described in Impact BIO 1 and Impact BIO 3. Existing site conditions include disturbed areas that are not considered SERAs, and therefore not subject to SERA restrictions. Because construction activity would potentially affect SERA(s), and construction and operations activities could impact migratory birds and other special-status species, a potential for conflict exists with LUP policies CO-40, CO-41, CO-42, and CO-44. This conflict would constitute a significant impact.

Mitigation Measure(s):

The mitigation measures identified in Impact BIO 1, coupled with application of LU MM 3 (requiring the Authority obtain a coastal development permit) would reduce impacts to less than significant. Required mitigation measures:

- BIO MM 1 Mitigation Monitoring and Reporting Plan
- BIO MM 2 Worker Environmental Awareness Program
- BIO MM 3 Biological Compliance Reporting
- BIO MM 4 Site Sanitation
- BIO MM 5 Hazardous Materials

Management • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 22 Monarch Butterfly Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protectio

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Based on the absence of

historical resources (archaeological), there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Tertiary volcanic flow rocks, unit 8 (Southern California Basin)

Stability: Moderate pending geotechnical analysis

Soil Type: Rock outcrop-Lithic Xerorthents-Hambright-Gilroy Association

Erosion Potential: Low to Moderate

Expansive Soil: Low to Moderate

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: No

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of a fine-grained silt/clay material. This soil type exhibits a well-drained, medium to very rapid runoff with moderate permeability equating to moderate erosion resistance. Grading, excavation, and other construction activities associated with the implementation of the proposed project could cause erosion due to exposed soils. The potential erosive properties of this soil type would be confirmed during geotechnical investigation and the results must be considered as part of the overall site design. Site design and construction would be required to conform to the current California Building Code (CBC), local building codes, and existing General Plan policies to ensure the site and its elements would be designed to minimize soil erosion.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located in rolling hills near the top of a hill, with shallow bedrock, on a relatively flat area. The fire station is within a small complex of buildings and the monopole would be placed in previously developed area within a paved area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site LACF072 and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site LACF072 was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site LACF072. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site LACF072 would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site LACF072, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site LACF072 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: Los Angeles County Fire Heliport

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: Yes

If yes, please explain: Permitted UST located on-site

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: N/A

Located in a State Fire Hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Conejo-tierra Rejada Volcanic

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: Santa Monica Mountains Coastal Zone

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Public and Semi-Public Facilities

Zoning: Light Agriculture

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Monica Mountains Coastal Zone

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site LACF072 is proposed along Decker Road, a designated Scenic Route within the Santa Monica Mountains Coastal Zone. The Santa Monica Mountains Land Use Plan, a component of the Santa Monica Mountains Local Coastal Program, was issued in August 2014 and allows for telecommunication facilities within several land use categories, including open space, rural lands, rural residential, rural villages, residential, commercial, commercial recreation – limited intensity, and public and semi-public facilities (County of Los Angeles, Department of Regional Planning 2014). Land Use Plan Policy CO-147 limits maximum allowable height to 18 feet above existing or finished grade, whichever is lower, along Scenic Routes. Land Use Plan Policy CO-152 indicates wireless telecommunication facilities along Scenic Routes should be co-located where feasible and made to blend into the landscape. The proposal is to mount whip and microwave antennas on a proposed 70-foot-tall monopole at a site

with existing development, but not developed specifically as a telecommunications site. Construction of the proposed project facilities at this site would result in a significant conflict with the Santa Monica Mountains Land Use Plan. The proposed action is not in compliance with the adopted and certified Land Use Plan because the proposed project exceeds the identified height limitations.

The final determination of consistency would be made by the agency responsible for issuing a Local Coastal Permit. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan, and plan inconsistency is not considered a significant impact.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: 65 feet

Ambient Noise Level: 45 dBA

Sensitive Noise Receiver 1: Single Family Residential Dwellings

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

Hourly average construction noise levels are anticipated to be approximately 89 dBA. The predicted noise levels represent the demolition phase which is anticipated to be the loudest construction phase. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site. However, in some instances, it may be necessary for construction activities to take place outside of these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The affected jurisdiction has not established a construction noise level threshold. Therefore, construction noise levels at the proposed Project site would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable"

community noise equivalent level (CNEL) developed by the California Department of Health Services was referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. Noise levels from both sources would be below the 60 dBA “normally acceptable” level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at site LACF072. However, the county ordinance has not defined impacts for groundborne noise; therefore, the potential of the project to result in exposure of persons to or generation of excessive groundborne noise levels is less than significant.

The ordinance for unincorporated Los Angeles County requires that vibration levels during construction not exceed a motion velocity of 0.01 peak particle velocity (PPV) in in/sec over the range of 1 to 100 Hertz as specified in the local ordinance. Although levels in excess of 0.01 PPV are still well below the potential damage criteria set by the FTA, 0.12 PPV for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings, the ordinance prohibits construction activities in excess of this threshold. Vibration levels from construction equipment used for this Project would range from 0.003 PPV at 25 feet for a jackhammer to 0.089 PPV for a loaded truck such as the 3-ton flatbed. Applying the damage assessment methodology developed by FTA and described in Appendix B-3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold for unincorporated Los Angeles County is 97 feet.

Sensitive receivers (scattered residential dwellings) are located within 65 feet of Project site LACF072. Vibration from loaded trucks such as the 3-ton flatbed or dump trucks could be as high as 0.018 PPV depending on the geology, soil type and stiffness; therefore, impacts from construction of the Project could expose these sensitive receiver locations to excessive groundborne vibration and impacts of the proposed Project would be significant.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. Therefore, operational groundborne vibration or noise would be less than significant during operation of each Project site including LACF072.

At site LACF072, where construction vibration levels would exceed the unincorporated Los Angeles County

vibration ordinance threshold, NOI MM 1 would be required.

Mitigation Measure(s):

NOI MM 1

Prior to commencement of construction at site LACF072, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction vibration impacts. Such measures may include but are not limited to the following:

- Route heavily-loaded trucks away from residential streets, if possible, selecting streets with the fewest homes if no other alternatives are available.
- Operate earth moving equipment including excavators/mini excavators and dump trucks as far away from vibration-sensitive locations as possible.
- Phase demolition and earth-moving operations so as not to occur simultaneously. Total vibration could be significantly less when each vibration event occurs separately.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, the estimated noise level at 25 feet from proposed sites would be 81 dBA and not exceed the 90 dBA daytime criterion but would exceed the 80 dBA nighttime criterion; therefore, construction noise impacts for this Site would be significant.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds; therefore, impacts from operational noise would be less than significant.

Mitigation Measure(s):

NOI MM 2

Prior to commencement of construction at Seit LAC072 the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction noise impacts below the levels specified in FTA nighttime

threshold. Such measures may include but are not limited to the following:

- Use noise blankets or other muffling devices on equipment and quiet-use generators at noise-sensitive receivers.
- Use well-maintained equipment and have equipment inspected regularly.
- Operate construction equipment for periods of fewer than 15 consecutive minutes when possible.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This site is located within the vicinity (approximately 2 miles) of a private airstrip (Los Angeles County Fire Department Heliport), but outside of the airstrip area where most noise is generated. Conservatively assuming a 65 CNEL at proposed Project sites such as LACF072, this combined baseline noise level in combination with the estimated construction noise levels for all proposed Project sites would be below the 90-Db threshold where adverse community reaction could occur. Therefore, construction of this site would not expose people, workers or residents, to excessive noise levels.

After construction, this site will be unmanned during operation except for occupational maintenance, which would include landscaping maintenance, routine site inspections, and occasional equipment repairs. Conservatively assuming a 65 dBA CNEL at proposed Project sites located 0.25 miles from private airstrips, operation of this Project site, including the HVAC systems and emergency generators, would result in noise emissions below 60 dBA and would be considered “normally acceptable” for outdoor residential exposure. Therefore, operation of this Project site would not expose people residing or working in the Project area to excessive noise levels. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels. Impacts from operation of the Project would be less than significant.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: Santa Monica Mountains Local Coastal Program, Land Use Plan

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Decker Rd

Distance (Miles): 0

Disaster Route: State Route 23

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No

Nearest Highway/Freeway: State Route 23

Distance (Miles): 0

Nearest Major Arterial: Lechusa Rd

Distance (Miles): 0.16

Access to the Project Site Provided Via: Decker Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None Required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None Required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None Required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None Required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: LAS VIRGENES MUNI W DIST

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: LACFCP08

Site Name: LA County Fire Camp 8

Site Discussion:

Propose installation of up to 27 whip and up to 5 microwave antennas on new monopole up to 70 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 150 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 8 foot diameter x 36 foot deep drilled caisson with concrete cap for monopole support; or up to 16 foot x 16 foot x 10 foot deep concrete mat foundation.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This site is located in the Santa Monica Mountains National Recreation Area (NRA) southeast of the intersection of Rambla Pacifico Street and Los Flores Canyon Road behind a large Los Angeles County Fire Camp (Camp 8). Camp 8 is a “sprawling” compound that is a former Army nuclear missiles base and is now used by firefighters that operate helicopters from the site to combat wildland fires. There are numerous buildings on the grounds including a cafeteria, a common room, offices, dorm-style bedrooms and multiple helipads (Malibu Times 2015). The site is on a hilltop that appears to have been flattened to accommodate a large paved or concrete foundation or landing area comprising approximately 800 square feet. This area, and most of the Camp 8 facilities, is not visible from Rambla Pacifico Street. Telephone poles line both roads. Los Angeles County has designated a “public viewing area” on Rambla Pacifico Street just northwest of the intersection. Rambla Pacifico Street is a scenic route as designated under the Santa Monica Mountains Coastal Program Land Use Plan. The site is also located on a ridgeline designated by the county as “significant.” Residential subdivisions exist directly north and northeast of the site. Topography varies and vegetation consists of mostly low chaparral. Dominant views are the roadway, telephone poles and lines, and slightly undulating horizon line. Sensitive viewers are NRA visitors.

Visual Sensitivity: High

On federally administered public lands: Yes, National Park Service

If yes, enter applicable ratings: None

Within the California coastal zone boundary: Yes, Santa Monica Mountains Local Coastal Plan

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Rambla Pacifico Street

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: Yes

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new facilities would be located within a site that has already been highly disturbed. Despite this high degree of disturbance, the site is not easily visible from the scenic route or other readily accessible viewpoints due to highly varying topography, road curves, and the presence of trees and mature landscaping. The new facilities would not block or remove views given the degree to which the site is currently obscured by topography and vegetation. In addition, the relatively low height and narrow girth of the monopole would not be sufficient to cause a substantial impact on scenic vistas. Ongoing and recurring maintenance activities would be barely visible and infrequent. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Low vegetation exists at the site, with a few scattered trees at the perimeter of the site. No rock outcroppings, historic buildings, or other scenic resources exist in the area. No substantial damage to scenic resources would occur during construction.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site itself is low given the extent of the previous disturbance and current use as a helicopter launch area. Although the monopole and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. In addition, this large disturbed area and the majority of the Camp 8 facilities are not readily visible from area vantage points, and would therefore not affect the area's visual character or quality, or the significance of the ridgeline. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity traveling to and from the site.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Industrial building

Distance to Sensitive Receptor: 281

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site LACFCP08. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or

obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site LACFCP08 or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site LACFCP08 would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site LACFCP08 will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100

pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site LACFCP08 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor Nox would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, Nox emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site LACFCP08 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site LACFCP08, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site LACFCP08, which is 281 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds for CO, NO_x, lower for PM₁₀, PM 2.5 but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site LACFCP08 and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site LACFCP08 in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site LACFCP08 and all proposed Projects sites

would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); monarch butterfly (*Danaus plexippus*; ESA-Pet)

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

American peregrine falcon - foraging (*Falco peregrinus anatum*; CDFW-FP); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); monarch butterfly (*Danaus plexippus*; ESA-Pet); Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

Santa Monica National Recreation Area (NPS); SEA/CRA - Santa Monica Mountains; SCAG Zoning - Beach Parks (Malibu Coastal Zone); Los Angeles County Zoning - Open Space; Natural Landscape Block - Las Flores/Santa Monica Mountains

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Santa Monica Mountains National Recreation Area General Management Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Laurel sumac scrub [*Malosma laurina* Shrubland Alliance]; Association -

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site LACFCP08 is located on a broad hilltop in the Santa Monica Mountains, adjacent to a large complex of structures, paved areas, and ornamental vegetation. The surrounding slopes are coastal sage scrub/chaparral vegetation community. There is some native vegetation within the survey area. The vegetation is too dense and the slopes too steep and rocky to walk. The site is located on cut and fill slopes with mostly weedy annuals. The south-facing slopes contain coastal sage scrub and the north facing slopes contain chaparral. The dominant native shrubs are chamise (*Adenostoma fasciculata*), bush buckwheat (*Eriogonum fasciculatum*), redberry (*Rhamnus*

crocea), deerweed (*Acmispon glaber*), and laurel sumac (*Malosma laurina*). American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP) may pass by the site while foraging, but the project area does not provide steep cliff habitat required for nesting. Potentially suitable habitat (and a potential reintroduction site) for California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) has been reported by Santa Monica National Recreation Area to occur within 1 mile of Site LACFCP08 at an unspecified location within Cold Creek Nature Preserve. Though the project site is located in steep mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. Monarch butterflies (*Danaus plexippus*; ESA-Pet) may pass through the project area, though suitable roost trees are not present. Potentially suitable habitat for Branton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1) occurs in the study area in chaparral vegetation following fires. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) in the project area. Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. To protect dispersing California red-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Patches of native vegetation are within the mapped project footprint. Preconstruction surveys for Branton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1) would verify if present; protect as necessary. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site. Site LACFCP08 may be hydrologically connected to stream habitats that include California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) potentially suitable habitat.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project area includes one Riverine wetland feature type as indicated by the National Wetland Inventory (USFWS 2014). This wetland type is restricted to ephemeral drainages. Construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Las Flores/Santa Monica Mountains Natural Landscape Block which overlaps the ranges of approximately 302 amphibian, reptile, mammal and bird species. The site is also located within the proposed Santa Monica Mountains Coastal Resource Area, which is identified as an important regional habitat linkage in the Los Angeles General Plan. Linkages in this CRA connect open spaces together that may be fragmented due to rural development and connect to habitats in Ventura County. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the SMMNRA GMP would be made by the NPS. Construction activities could impact species and introduce non-native species, conflicting with SMMNRA GMP goals.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, National Park Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: Yes

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Significant and Unavoidable Impact

Indirect / Visual Impact: Significant and Unavoidable Impact

Discussion:

There are no previously recorded historical resources within the direct or indirect APEs at this project location. However, during field surveys previously unrecorded technical and administrative features of a Cold War-era Nike missile complex were identified within both the direct and indirect APEs that would meet the criteria for historical resources under the CEQA Guidelines. The complex, historically known as LA-78 (Malibu), is a Nike launch site and is one of two related elements associated with the Nike missile program at this general location. The second element (the LA-78 Integrated Fire Control [IFC]), is situated approximately 1.3 miles to the northwest. Both elements of the complex were among 16 Nike missile facilities constructed in a ring around the greater Los Angeles area to defend against Soviet long-range bomber aircraft. LA-78 was activated in 1963 and the entire Nike system was deactivated in 1974. Although this complex has not been formally evaluated for inclusion in the National Register of Historic Places (National Register) or California Register of Historical Resources (CRHR) there is a high probability that it would meet the eligibility criteria for inclusion in both. As a result, the Nike complex at LACFCP08 is treated as an eligible single resource consisting of multiple contiguous, interrelated, technical and administrative elements. Proposed LMR construction at the LACFCP08 project location includes the attachment of whip and microwave antennas on a proposed 70-foot monopole; construction of a new equipment shelter; and installation of a new back-up generator and fuel tank on a concrete pad. Construction of these proposed structures would adversely affect the newly identified resources at this project location directly and visually. The condition and status of this project location was confirmed through archival research and during a field survey

conducted by a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. LACFCP08 is treated as a potentially eligible historical resource and project activities would have a direct effect from ground disturbance and indirect (visual) adverse effect from erection of an out of character element into the Nike landscape. Given the magnitude of the project and the extent of the resources present at this project site, even with implementation of the required mitigation measures, impacts would not be reduced to less than significant levels; therefore, impacts would be unavoidable and significant.

Mitigation Measure(s):

With implementation of CUL MMs 2, 3, and 5 impacts would be minimized through archaeological monitoring for subsurface historical artifacts and through camouflage to disguise the proposed monopole; however, given the magnitude of the ground disturbance and the extent of the resources present at this project site, even with implementation of the required mitigation measures, impacts would be significant and would not be reduced to less than significant levels. Because LACFCP08 is on land owned and administered by the National Park Service, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Significant and Unavoidable Impact

Indirect / Visual Impact: Significant and Unavoidable Impact

Discussion:

There are no known historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); however, given the nature of this project site, there is a high probability that subsurface Cold War-era Nike missile site artifacts and features are present. Therefore, project activities would cause a significant and unavoidable impact and mitigation measures would not reduce those impacts to less than significant.

Mitigation Measure(s):

CUL MMs 2 and 3 would be implemented at this project site. Archaeological monitors would be present during all ground disturbing activities to minimize impacts; however, impacts would be significant and implementation of CUL MMs 2 and 3 would not reduce impacts to less than significant.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as low sensitivity artificial fill at the surface. However, these deposits overlie the Santa Susana, which has a moderate potential for significant vertebrate fossils. No localities are recorded within the proposed site; however this formation has produced fossil specimens of eagle ray, primitive shark, dogfish shark, bonito shark, lemon shark, and the holotype of the chimaeroid *Ischyodus zinsmeisteri* in the Santa Monica Mountains region. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Periodic paleontological spot checks are required during excavation into the artificial fill to determine if Santa Susana Formation is present. If present, monitoring would be conducted during excavation into paleontologically sensitive sediments to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Paleocene marine rocks, unit 1 (Central and Southern California)

Stability: Moderate pending geotechnical analysis

Soil Type: Urban land-Rock outcrop-Millsholm Association

Erosion Potential: Low

Expansive Soil: Low potential

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require

additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of well-drained, light clay loam with low to very high runoff and moderate permeability. Moderate slopes surround the flat site. Grading, excavation, and other construction activities associated with the implementation of the proposed project could cause erosion due to exposed soils. The potential erosive properties of this soil type would be confirmed during geotechnical investigation and the results must be considered as part of the overall site design.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical

analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site LACFCP08 and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site LACFCP08 was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site LACFCP08. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site LACFCP08 would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site LACFCP08, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site LACFCP08 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: NPS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: Santa Monica Mountains Coastal Zone

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space - Parks

Zoning: Light Agriculture

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Monica Mountains Coastal Zone

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site LACFCP08 is proposed along an adopted Significant Ridgeline within the Santa Monica Mountains Coastal Zone. The site is also within 1,100 feet of Las Flores Canyon Road, a designated Scenic Route. The Santa Monica Mountains Land Use Plan, a component of the Santa Monica Mountains Local Coastal Program, was issued in August 2014 and allows for telecommunication facilities within several land use categories, including open space, rural lands, rural residential, rural villages, residential, commercial, commercial recreation – limited intensity, and public and semi-public facilities (County of Los Angeles, Department of Regional Planning 2014). Per the Local Implementation Plan adopted in 2014, new development is prohibited on Significant Ridgelines. Structures must be located sufficiently below Significant Ridgelines so that the highest point of a structure is located at least 50 vertical feet and 50 horizontal feet from a Significant Ridgeline. The proposal is to mount whip and microwave

antennas on a proposed 70-foot-tall monopole at a site with existing development, but not developed specifically as a telecommunications site. This would result in a conflict with the Santa Monica Mountains Land Use Plan because the proposed project exceeds the identified height limitations and would be along a Significant Ridgeline where development is not allowed.

The final determination of consistency would be made by the agency responsible for issuing a Local Coastal Permit. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan, and plan inconsistency is not considered a significant impact.

Site LACFCP08 is also on National Park Service Land. In accordance with the Superintendent's Compendium of Designations, Closures, Permit Requirements, and Other Restrictions Imposed under Discretionary Authority (NPS 2014b), construction of a structure requires a permit from the Superintendent, but wireless communications site development or use are not otherwise specified for this unit of the NPS system. The Authority would apply for the permit and adhere to the terms and conditions.

The final determination of consistency for sites LACFCP08 and PWT would be made by NPS. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan, and this is not considered a significant impact.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This site is located within the vicinity (approximately 2 miles) of a private airstrip (Camp 8 Heliport), but outside of the airstrip area where most noise is generated. Conservatively assuming a 65 CNEL at proposed Project sites such as LACFCP08, this combined baseline noise level in combination with the estimated construction noise levels for all proposed Project sites would be below the 90-Dba threshold where adverse community reaction could occur. Therefore, construction of this site would not expose people, workers or residents, to excessive noise levels.

After construction, this site will be unmanned during operation except for occupational maintenance, which would include landscaping maintenance, routine site inspections, and occasional equipment repairs. Conservatively assuming a 65 dBA CNEL at proposed Project sites located 0.25 miles from private airstrips, operation of this Project site, including the HVAC systems and emergency generators, would result in noise emissions below 60 dBA and would be considered “normally acceptable” for outdoor residential exposure. Therefore, operation of this Project site would not expose people residing or working in the Project area to excessive noise levels. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels. Impacts from operation of the Project would be less than significant.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: Santa Monica Mountains Local Coastal Program, Land Use Plan

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: Yes

If yes, Plan or Designation Area: Located within National Park Service administered land in the Santa Monica Mountains National Recreation Area

National or California State Park: Yes

If yes, Plan or Designation Area: Santa Monica Mountains National Recreation Area

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: Yes

Other Recreational Area Names: Within Santa Monica Mountains National Recreation Area

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Pacific Coast Hwy

Distance (Miles): 1.41

Disaster Route: Pacific Coast Highway

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No

Nearest Highway/Freeway: Us Highway 101

Distance (Miles): 1.41

Nearest Major Arterial: Highway N-1

Distance (Miles): 2.67

Access to the Project Site Provided Via: extension off Rambia Pacifico Street

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None Required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None Required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None Required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None Required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: LAS VIRGENES MUNI W DIST

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: LACFCP09

Site Name: LA County Fire Camp 9

Site Discussion:

Propose installation of up to 27 whip and up to 5 microwave antennas on new monopole up to 70 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 150 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 8 foot diameter x 36 foot deep drilled caisson with concrete cap for monopole support; or up to 16 foot x 16 foot x 10 foot deep concrete mat foundation.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This site is located in Angeles National Forest at a Los Angeles County Fire Suppression Camp on a ridge top on the Santa Clarita Truck Trail, which is a narrow, shoulderless paved rural local road. This road does not provide access to designated recreation destinations. The camp consists of several one-story buildings and two helicopter landing pads, primarily surrounded by evergreen and deciduous trees. The site includes an existing lattice tower, and two additional towers can be seen farther west of the site on the approach from North Sand Canyon Road. Otherwise, this site is not visible from sensitive vantage points. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Back Country (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High/SAC B; Back Country

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing site includes a slender lattice tower of unknown height, which creates a visual intrusion onto the landscape. However, several tall evergreen trees absorb this impact. Locating the proposed new monopole and equipment adjacent to the existing structures and tall trees would concentrate the impacts. The existing tower and trees would attenuate the noticeability of new monopole, thereby minimizing visual impacts to scenic vistas. Minimal impacts would occur given the site's distance from viewpoints, and the relatively low height and small girth of the monopole. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. The new structures would be compatible with the existing site, which is a fire camp with associated facilities. The views of intermittent presence of helicopters also somewhat detract from the existing visual character and quality. The low height of the new monopole would result in minimal impacts to the surrounding visual character, resulting in no change to the site's scenic attractiveness rating. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Industrial building

Distance to Sensitive Receptor: 50

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site LACFCP09. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site LACFCP09 or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?**Construction Impact:** Significant Impact Reduced to Less than Significant with Mitigation Incorporated**Operational Impact:** Less than Significant**Discussion:**

Emissions from the construction of proposed site LACFCP09 would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site LACFCP09 will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site LACFCP09 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor Nox would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, Nox emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site LACFCP09 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site LACFCP09, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site LACFCP09, which is 50 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 13 are higher than the SCAQMD thresholds for CO, NO_x, lower for PM₁₀, PM 2.5 but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site LACFCPD09 and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site LACFCP09 in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site LACFCP09 and all proposed Projects sites

would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

None

Special Status Plants Recorded within 1 Mile:

Davidson's bush-mallow (*Malacothamnus davidsonii*; 1B.2)

Sensitive Communities Recorded within 1 Mile:

Southern Coast Live Oak Riparian Forest

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

California condor (*Gymnogyps californianus*; ESA-E, CA-E, CDFW-FP); southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); Davidson's bush-mallow (*Malacothamnus davidsonii* CNPS1B.2)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

US Forest Service - Angeles National Forest; SEA – Santa Clara River; SCAG Zoning - Wildlife Preserves and Sanctuaries; Essential Connectivity Area - Contract Point - Santa Susana Mountains; Natural Landscape Block - Contract Point

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Eastwood manzanita chaparral [*Arctostaphylos glandulosa* Shrubland Alliance]; Association - *Arctostaphylos glandulosa*-*Cercocarpus montanus*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site LACFCP09 is located on a mountain ridge in the San Gabriel Mountains with montane chaparral on the south-facing slopes and Big-cone douglas fir and yellow pine forest on the north-facing slopes. The site is long and narrow as dictated by the topography. The slopes are too steep to survey. A stand of Coulter pines (*Pinus coulteri*) have been planted on the east side. The study area is within the foraging range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), and potential nesting habitat may be found in steep mountainous terrain surrounding the study area. However, currently condors rarely visit this general area. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may

consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. Southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) is known to occur in Pacoima Wash, approximately 1.5 miles to the southeast of Site LACFCP09; this drainage is also considered as potentially suitable habitat (and a potential reintroduction site) for California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) by the Angeles National Forest. Though the project site is located in steep mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. Site LACFCP08 is not hydrologically connected to Pacoima Wash. Surveys for Davidson's bush-mallow (*Malacothamnus davidsonii* CNPS1B.2) were conducted in and around the accessible portion of the project area; adjacent slopes were too steep to conduct a botanical survey. Habitat in the project area is considered minimally suitable due to dense vegetation; no additional surveys are planned. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities.

Mitigation Measure(s):

A biological monitor will be present during construction and an environmental awareness program will be presented to all workers; all trash and construction debris (especially small items such as nuts and washers) will be removed from site each day; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) and California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) in the project area and along access roads. To protect dispersing southern mountain yellow-legged frogs and California red-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measurable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes the following two wetland feature types as indicated by the National Wetland Inventory (USFWS 2014): 1) Freshwater Forested/Shrub Wetland; and 2) Riverine. However, these wetland types are restricted to ephemeral drainages. Construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Contract Point Natural Landscape Block which overlaps the ranges of approximately 268 amphibian, reptile, mammal and bird species. It is also located within the Essential Habitat Connectivity Area Contract Point - Santa Susanna Mountains that connects the San Gabriel Mountains West and Santa Susanna Mountains Natural Landscape Block. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. This project is located within the Angeles National Forest and environmental documents would consider forest sensitive species. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

Recommended mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: Yes

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Significant and Unavoidable Impact

Indirect / Visual Impact: Significant and Unavoidable Impact

Discussion:

There are two historical resources within the direct and indirect areas of potential effects (APEs). The two resources are P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant. In addition, Forest Service Resource No. 05015500237 is within both the direct and indirect APEs at this project location. This resource consists of three separate loci of the Los Pinetos Nike Missile Site, which was constructed 1955-1956 and deactivated in 1968. The loci are the locations of the administrative area (barracks and support structures), the radar control facility, and the launch control facility. The direct APE is completely encompassed by one of the Nike missile loci and the remaining two are approximately 1,500 to the east and west. The complex of Nike facilities was formally evaluated in 1987 and determined eligible for inclusion in the National Register of Historic Places. LMR activities at this project location include the attachment of whip and microwave antennas on a proposed 70-foot monopole; construction of a new equipment shelter; and installation of a backup generator and fuel tank on a concrete pad. The construction of these proposed facilities would directly and adversely affect the identified resources within the direct APE and adversely affect the Nike missile landscape. The condition and status of

cultural resources at this project location were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Activities at this project site would have a direct effect from ground disturbance and indirect (visual) adverse effect from erection of an out of character element into the Nike landscape. Given the magnitude of the project and the extent of the resources present at this project site impacts would be significant and even with implementation of the required mitigation measures, impacts would not be reduced to less than significant levels; therefore, impacts would be unavoidable and significant.

Mitigation Measure(s):

None required for Resource No. P-19-186535. With implementation of CUL MMs 2, 3, and 5 for Forest Service Resource No. 05015500237, impacts would be minimized through archaeological monitoring for subsurface historical artifacts and through camouflage to disguise the proposed monopole; however, given the magnitude of the ground disturbance and the extent of the resources present at this project site, even with implementation of the required mitigation measures, impacts would not be reduced to less than significant levels. Because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Significant and Unavoidable Impact

Indirect / Visual Impact: Significant and Unavoidable Impact

Discussion:

There are two historical resources within the direct and indirect areas of potential effects (APEs). The two resources are P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant. In addition, Forest Service Resource No. 05015500237 is within both the direct and indirect APEs at this project location. This resource consists of three separate loci of the Los Pinetos Nike Missile Site, which was constructed 1955-1956 and deactivated in 1968. The loci are the locations of the administrative area (barracks and support structures), the radar control facility, and the launch control facility. The direct APE is completely encompassed by one of the Nike missile loci and the remaining two are approximately 1,500 to the east and west. The complex of Nike facilities was formally evaluated in 1987 and determined eligible for inclusion in the National Register of Historic Places. LMR activities at this project location include the attachment of whip and microwave antennas on a proposed 70-foot monopole; construction of a new equipment shelter; and installation of a backup generator and fuel tank on a concrete pad. The construction of these proposed facilities would directly and adversely affect the identified resources within the direct APE and adversely affect the Nike missile landscape. The condition and status of cultural resources at this project location were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Given the magnitude of the project and the extent of the resources present at this project site impacts would be significant and even with implementation of the required mitigation measures, impacts would not be reduced to less than significant levels; therefore, impacts would be unavoidable and significant.

Mitigation Measure(s):

None required for Resource No. P-19-186535. CUL MMs 2 and 3 would be implemented for Forest Service Resource No. 05015500237; however, given the magnitude of the ground disturbance and the extent of the resources present at this project site, even with implementation of the required mitigation measures, impacts would not be reduced to less than significant levels. Therefore, impacts at this Project site would be significant and unavoidable.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Mesozoic granitic rocks, unit 3 (Sierra Nevada, Death Valley area, Northern Mojave Desert and Transverse Ranges)

Stability: Moderate to high pending geotechnical analysis

Soil Type: Pismo-Etsel family-Cieneba-Caperton Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for

this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of a somewhat excessively drained gravelly sand material. This soil type exhibits a rapid runoff with rapid permeability. Moderate to steep slopes surround the flat site. Grading, excavation, and other construction activities associated with the implementation of the proposed project could cause erosion due to exposed soils. The potential erosive properties of this soil type would be confirmed during geotechnical investigation and the results must be considered as part of the overall site design. Site design and construction would be required to conform to the current California Building Code (CBC), local building codes, and existing General Plan policies to ensure the site and its elements would be designed to minimize soil erosion.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site LACFCP09 and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site LACFCP09 was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site LACFCP09. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site LACFCP09 would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site LACFCP09, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site LACFCP09 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Backcountry

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Clarita Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health, watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health

(USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as Backcountry. Backcountry includes areas of the national forest that are generally undeveloped with few roads. Most of the national forest's remote recreation and administrative facilities are found in this zone. The level of human use and infrastructure is generally low to moderate. The zone is managed for motorized public access on designated roads and trails. Although this zone generally allows a broad range of uses, the management intent is to retain the natural character inherent in this zone and limit the level and type of development (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Backcountry land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already developed and is not on land specifically designated for recreation, such as a campground or trailhead. Site LACFCP09, County CP 9, is not identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Foothill Frwy

Distance (Miles): 2.91

Disaster Route: Sand Canyon Road

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Foothill Frwy

Distance (Miles): 2.91

Nearest Major Arterial: Little Tujunga Canyon Rd

Distance (Miles): 1.13

Access to the Project Site Provided Via: Forest Route 3N17

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None Required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None Required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None Required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None Required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Sunshine Canyon City/County Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: LACFCP11

Site Name: County CP 11

Site Discussion:

Propose installation of up to 20 whip and up to 5 microwave antennas on new monopole up to 70 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Proposed construction of up to 200 foot long x 4 foot high retaining wall. Propose installation of up to 300 foot overhead electrical telecommunications line to existing utility pole. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 150 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 8 foot diameter x 36 foot deep drilled caisson with concrete cap for monopole support; or up to 16 foot x 16 foot x 10 foot deep concrete mat foundation.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Address: 8800 W Soledad Canyon Rd

City: Santa Clarita

State: CA

Zip: 91350

Latitude: 34.4378761646

Longitude: -118.288361344

Jurisdiction:

Landowner: US Government, United States Forest Service

Proposed LMR Facilities

Antenna Support Structure: New Monopole

Aesthetics

Setting

Visual Description:

This site is located in Angeles National Forest on a hilltop above Soledad Canyon Road, a paved 2-lane road paralleling a riparian area that provides access to recreational destinations such as campgrounds. A beige water tank approximately 20 feet tall currently exists on the site, set among low chaparral vegetation. A wide driveway accesses the site from the side of the hill opposite the road. A wide, cleared gravel area leads from the water tank to the helipad. The site is occasionally visible from westbound Soledad Canyon Road, but high cliffs block views for eastbound traffic. The high ridgeline, cut slope, and riparian corridor dominate the views. A heliport is located on the ridge adjacent to a water tank. Primary sensitive viewers are ANF visitors. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Developed Area (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Developed Area

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The hilltop at this site is lower than surrounding peaks and ridgelines. Both the new equipment shelter and monopole would be located in a previously cleared area beside the existing 20-foot tall water tank. The new facilities would be only intermittently visible from Soledad Canyon Road, where adjacent telephone poles present an existing human-made visual intrusion. The slender girth of the proposed monopole and its location on a lower hilltop beside the water tank would minimize impacts to scenic vistas. Both the new equipment shelter and monopole would be located in a previously cleared area beside the water tank. The water tank would block views of the shelter from the road. The facilities would be only intermittently visible from Soledad Canyon Road. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical, and this area is also identified as a Developed Area zone. In such areas, the level of human use and infrastructure is typically higher than in other zones. This zone includes a number of highly popular developed recreation facilities, and recreation and non-recreation special-uses facilities. This zone is the lowest designation for naturalness. The site is already impacted by the presence of the water tower and helicopters using the helipad. The new facilities would be compatible with the existing site and would not alter the area's visual character or quality, and there would be no change to the scenic attractiveness rating. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 2113

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Less than Significant

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site LACFCP11. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site LACFCP11 or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Less than Significant

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site LACFCP11 would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site LACFCP11 will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site LACFCP11 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor Nox would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, Nox emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site LACFCP11 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site LACFCP11, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site LACFCP11, which is 2,113 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 13 are higher than the SCAQMD thresholds except for PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site ZHQ and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site LACFCP11 in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site LACFCP11 and all proposed Projects sites

would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); Santa Ana sucker (*Catostomus santaanae*; ESA-T, CDFW-SSC); unarmored three-spined stickleback (*Gasterosteus aculeatus williamsoni*; ESA-E, CA-E)

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

Southern California Three-spined Stickleback Stream; Southern Cottonwood Willow Riparian Forest; Southern Riparian Scrub; Southern Sycamore Alder Riparian Woodland; arroyo toad critical habitat (*Anaxyrus californicus*; ESA-E, ESA-CH, CDFW-SSC)

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

California condor (*Gymnogyps californianus*; ESA-E, CA-E, CDFW-FP); southwestern willow flycatcher (*Empidonax traillii extimus*; ESA-E, CA-E); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); arroyo toad (*Anaxyrus californicus*; ESA-E, ESA-CH, CDFW-SSC); unarmored three-spined stickleback (*Gasterosteus aculeatus williamsoni*; ESA-E, CA-E);

Designated Critical Habitat Within 500 Feet:

arroyo toad (*Anaxyrus californicus*; ESA-E, ESA-CH, CDFW-SSC)

Riparian Habitat Within 500 Feet:

Yes

Indicators of Waters of the US Within 500 Feet:

No

Wildlife Corridor or Nursery Site:

US Forest Service - Angeles National Forest; SEA – Santa Clara River; SCAG Zoning - Wildlife Preserves and Sanctuaries; Essential Connectivity Area - San Gabriel Mountains West - San Francisquito

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Chamise chaparral [*Adenostoma fasciculatum* Shrubland Alliance]; Association - *Adenostoma fasciculatum*-*Ceanothus crassifolius*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site LACFCP11 is at a Los Angeles County detention center in association with an existing water tank and helipad located at the end of a ridgeline, above and adjacent to Soledad Canyon Road. The Santa Clara River is on the opposite side of Soledad Canyon Road; Maher Canyon drainage passes through the detention facility, crosses under Soledad Canyon Road, and joins the Santa Clara River; both drainages are ephemeral within the project

area. Primary vegetation surrounding the project site is chamise chaparral; within the Santa Clara river corridor and Maher Canyon drainage within the project area is mature riparian forest that includes coast live oak and California sycamore trees. Although riparian forest is within the project area it would not be impacted by project activities that are separated from the Santa Clara River by Soledad Canyon Road. The study area is within the foraging range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP). However, the project site is located among the lower hills rather than on the peaks of surrounding mountains or ridgelines where condors may be attracted to a potential perch site; and the site is within an extensive developed facility with frequent human activity. Condors may fly over the site and study area, but are not expected to approach the project site. Though the project site is on a ridgeline within chaparral vegetation community, the Santa Clara River, on the opposite side of Soledad Canyon Road, is included within the study area. Within the river corridor is mature riparian vegetation, though the stream is not perennial in this portion of the drainage. The river corridor has been highly impacted by heavy equipment, dumping or storage of construction materials, active railroad, and as a source of water for helicopter bucket dips from a maintained water storage tank. It is unknown if southwestern willow flycatchers currently utilize the riparian corridor near Site LACFCP11; there are past records of flycatchers nesting farther downstream. The habitat is less than ideal with the lack of permanent or semi-permanent water, and lack of large patches of dense riparian vegetation with complex vertical structure (though habitat quality may change year to year). Though due to a lack of sufficiently dense riparian vegetation flycatchers would not be expected to nest along Maher Canyon, an ephemeral drainage that passes through the detention facility, if birds are present along the Santa Clara River, they may forage or disperse within Maher Canyon. Temporary disturbance to nesting, foraging, or dispersing flycatchers, if present. No riparian vegetation would be impacted by project activities; there would be no loss of flycatcher habitat. Coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) may occur within the project area and individuals could be killed by project activities. Habitat for the two fish species, Santa Ana sucker (*Catostomus santaanae*; ESA-T, CDFW-SSC) and unarmored three-spined stickleback (*Gasterosteus aculeatus williamsoni*; ESA-E, CA-E), does not occur in the project area due to the ephemeral nature of the river system. Critical habitat for arroyo toad (*Anaxyrus californicus*; ESA-E, ESA-CH, CDFW-SSC) includes the Santa Clara River and the lower section of Maher Canyon, completely overlapping the project site. Primary constituent elements of critical habitat includes the stream and its hydrologic regime; channel, riparian and adjacent upland habitats; natural flooding regimes; and stream channel and adjacent upland habitats to allow for movements and dispersal. Most project-related activities are within previous development facilities, specifically excluded as critical habitat; however, project activities may impact native upland vegetation on the opposite side of Soledad Canyon Road from the Santa Clara River. No project activities would impact riparian habitats. Project-related construction activities and travel on access roads could impact dispersing toads, if present. The Santa Clara River in the vicinity of Site LACFCP11 is not perennial, though the unarmored three-spine stickleback (*Gasterosteus aculeatus williamsoni*; ESA-E, CA-E) may recolonize previously dry portions of the stream during wet periods. Based on records in the CNDDDB, stickleback presence in the river is more reliable about 1 mile downstream. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of arroyo toad (*Anaxyrus californicus*; ESA-E, ESA-CH, CDFW-SSC) and its critical habitat, and the coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC). Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Do not remove riparian trees. Stay on existing roads. To protect dispersing arroyo toads, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Though no aquatic, wetland, or riparian habitat would be removed due to project activities, the project site is in close proximity to the Santa Clara River. Application of standard best management practices for control of sedimentation and spills would protect aquatic habitats of the unarmored three-spined stickleback (*Gasterosteus aculeatus williamsoni*; ESA-E, CA-E). Preconstruction surveys for nesting birds (including southwestern willow flycatcher) will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will

be established to protect nesting birds and active bird nests. • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 15 Southwestern Willow Flycatcher Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Riparian and ephemeral stream habitats are found in association with the Santa Clara River and the tributary drainage in Maher Canyon within 500 feet of the project site and within designated critical habitat for arroyo toad (*Anaxyrus californicus*; ESA-E, ESA-CH, CDFW-SSC). Mature riparian forest includes coast live oak and California sycamore trees. Southern California Three-spined Stickleback Stream, Southern Cottonwood Willow Riparian Forest, Southern Riparian Scrub, and Southern Sycamore Alder Riparian Woodland were not observed in the project area.

Mitigation Measure(s):

Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Riverine wetland feature. However, construction activities would be limited to the project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Contract Point Natural Landscape Block which overlaps the ranges of approximately 268 amphibian, reptile, mammal and bird species. It is also located within the Essential Habitat Connectivity Area San Gabriel Mountains West - San Francisquito that connects San Gabriel Mountains through

Soledad Canyon Northwest to Liebre/Sawmill Mountains. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

Recommended mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. The entire southern one-half of this project location (including a portion of the direct APE) is encompassed by this California Landmark. The condition and status of cultural resources at this project location were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant.

Mitigation Measure(s):

None required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant.

Mitigation Measure(s):

None required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Precambrian granitic rocks, unit 2, (San Gabriel Mountains Anorthosite)

Stability: Moderate to high pending geotechnical analysis

Soil Type: Pismo-Etsel family-Cieneba-Caperton Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line was identified approximately 1 mile north of the property (EDR, 2014), but is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes

specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of a somewhat excessively drained gravelly sand material. This soil type exhibits a rapid runoff with rapid permeability. Moderate to steep slopes surround the flat site. Grading, excavation, and other construction activities associated with the implementation of the proposed project could cause erosion due to exposed soils. The potential erosive properties of this soil type would be confirmed during geotechnical investigation and the results must be considered as part of the overall site design. Site design and construction would be required to conform to the current California Building Code (CBC), local building codes, and existing General Plan policies to ensure the site and its elements would be designed to minimize soil erosion.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site LACFCP11 and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site LACFCP11 was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site LACFCP11. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site LACFCP11 would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site LACFCP11, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site LACFCP11 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: Camp 11 Heliport

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: N/A

Located in a State Fire Hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Developed Area Interface

Zoning: Watershed, Heavy Agriculture

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Clarita Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health,

watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as in the Developed Area Interface. The Developed Area Interface zone includes areas adjacent to communities or concentrated use areas and developed sites with more scattered or isolated community infrastructure. The level of human use and infrastructure is typically higher than in other zones, and the level of development varies between areas that are highly developed to areas where no development has occurred. Although this zone may have a broad range of higher intensity uses, the management intent is to limit development to a slow increase of carefully designed facilities to help direct use into the most suitable areas and concentrating on improving facilities before developing new ones (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is located within the vicinity (approximately 2 miles) of a private airstrip (Camp 11 Heliport), but outside of the airstrip area where most noise is generated. Conservatively assuming a 65 CNEL at proposed Project sites such as LACFCP11, this combined baseline noise level in combination with the estimated construction noise levels for this proposed Project site would be below the 90-Dba threshold where adverse community reaction could occur. Therefore, construction of this site would not expose people, workers or residents, to excessive noise levels.

After construction, this site will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Developed Area Interface land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: Yes

Trail Name: Located within 0.25 miles of Santa Clara River Trail

Parks and other Recreational Areas: Yes

Other Recreational Area Names: Within Angeles National Forest

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site already supports a storage tank and is not on land specifically designated for recreation, such as a campground or trailhead. Site LACFCP11, County CP 11, is not identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Antelope Valley Frwy

Distance (Miles): 2.71

Disaster Route: Soledad Canyon Road

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: Approximately 300 feet from Camp 11 Heliport and approximately 4.6 miles from Agua Dulce Airport

Nearest Highway/Freeway: Antelope Valley Frwy

Distance (Miles): 2.71

Nearest Major Arterial: Soledad Canyon Rd

Distance (Miles): 0

Access to the Project Site Provided Via: extension off of Soledad Canyon Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site LACFCP11 is approximately 300 feet from Camp 11 Heliport and approximately 4.6 miles from Agua Dulce Airport. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered (in this case, proposed whip and microwave antennas mounted on a proposed 70-foot-tall monopole with up to a 15-foot lightning rod), the TOWAIR tool indicates that the antenna structure is a "pass slope determination," which indicates the structure would not interfere with takeoff and landing operations, and does not require Federal Aviation Administration (FAA) notification based on the structure height and distance from runways. No impacts to aviation flight safety are anticipated.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Antelope Valley Recycling and Disposal Facility

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: LARICSHQ

Site Name: LA-RICS Headquarters Building

Site Discussion:

Propose installation of up to 20 whip and up to 7 microwave antennas on roof top of existing building . Mount proposed 3-foot lightning rod to existing mounting platform which would not exceed 10% of the overall current structural height including appurtenances. Propose indoor equipment racks to be located in room in existing building.

Aesthetics

Setting

Visual Description:

This site is located within a fully developed urban area at the LA -RICS headquarters building within an office complex. The building is a two-story beige and white building. The area immediately surrounding the headquarters building consists of similarly-colored two-story office and commercial buildings and associated paved parking lots. Street lighting and building signage are located along the roads with the office park. A notable characteristic of the area is the mature commercial landscaping, including trees and shrubs, located adjacent to the office buildings and lining the streets. Most trees are taller than the office/commercial buildings and serve to partially screen views of the buildings both from inside the office complex itself and from adjacent commercial/industrial areas. A power substation is located immediately northeast of the headquarters building parking lot.

Visual Sensitivity: Low

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located in a suburban/industrial setting. The proposed new facilities would not be located in an area defined as a scenic vista.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed new facilities would not affect the existing visual character and quality, which is low, consisting primarily of adjacent commercial and industrial uses. The new facilities would be compatible in height to the telephone poles and palm trees that comprise the primary vertical elements in the area.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site is located in an urban area. The proposed Project facilities would be roof mounted or collocated and constructed of materials that do not produce glare. No additional lighting would be required. This would not result in a substantial new source of day or nighttime light or glare that would adversely affect nighttime views of the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Office Building

Distance to Sensitive Receptor: 65

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site LARICSHQ. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site LARICSHQ or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Emissions from the construction of proposed site LARICSHQ would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site LARICSHQ will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site LARICSHQ would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor Nox would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, Nox emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site LARICSHQ or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site LARICSHQ, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site LARICSHQ, which is 65 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 11 are higher than the SCAQMD threshold for CO and lower for NO_x, PM₁₀, PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site LARICSHQ and were not assessed further.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site LARICSHQ in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site LARICSHQ and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

American badger (*Taxidea taxus*; CDFW-SSC); bank swallow (*Riparia riparia*; CA-T); burrowing owl (*Athene cunicularia*; CDFW-SSC); southwestern willow flycatcher (*Empidonax traillii extimus*; ESA-E, CA-E); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

None

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

None

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:**Wildlife Corridor or Nursery Site:**

None

Local Policy or Ordinance for Biological Resources:

City of Monterey Park General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Ornamental

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site LARICSHQ is located within a completely urbanized area. No native habitats are present; no special status species would occur within the project area. Roof-top mount.

Mitigation Measure(s):

None required.

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Monterrey Park does not contain open space or natural vegetation according to the General Plan. Conservation issues are limited to recreation in parks.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The City of Monterey Park General Plan does not include policies to protect biological resources.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). The direct APE consists solely of the LA-RICS Headquarters building, which was built in 1986 and, based on archival research and field survey, is not a historical resource. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APE). The direct APE consists solely of the LA-RICS Headquarters building, which was built in 1986 and is surrounded by pavement. Based on archival research and field survey, there are no historical resources (archaeological) within

the 0.5 mile radius of the project site. Based on the absence of historical resources (archeological), there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as high sensitivity at the surface and subsurface for the Fernando Formation. However, these deposits overlie older alluvium, which has a moderate/unknown potential for significant vertebrate fossils. No localities are recorded within the proposed site. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Periodic paleontological spot checks are required during excavation into the artificial fill to determine if Fernando Formation is present. If present, monitoring would be conducted during excavation into paleontologically sensitive sediments to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted and a search of their sacred land file requested. A response from the NAHC indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Pliocene marine rocks

Stability: Low to moderate. Not located in a liquefaction zone or landslide area.

Soil Type: Urban land-Lithic Xerorthents-Hambright-Castaic Association

Erosion Potential: Low

Expansive Soil: Low

Alquist-Priolo Zone: No

Liquefaction Potential: Located 80 FT west of a liquefaction zone

Landslide Zone: No

Steep Slopes: No

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line was identified approximately 0.3 miles south of the property, but is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). Antennas would be located on the roof of the existing building, therefore a geotechnical study for new structures is not required. All structures in southern California are located within an area subject to seismic shaking. The UBC and CBC have specific design requirements to reduce or eliminate the effects of seismic shaking. Permitting processes are required to evaluate and mitigate other geologic hazards prior to issuance of a building permit. Existing structures were built in accordance with current UBC and CBC at the time of construction. Therefore, the effects of seismic shaking or other geologic hazards would be less

than significant.

Mitigation Measure(s):

None required.

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site has a mix of shallow, well drained stony loam to silty clay loam. This soil type exhibits a medium to very rapid runoff with moderately slow permeability, resulting in moderate erosion resistance. Moderate slopes surround the site. Grading, excavation, and other construction activities associated with the implementation of the proposed project could cause erosion due to exposed soils. Building permits require that standard BMPs for erosion control be put in place on all projects. There would be no ground disturbing activities associated with the operation of the LMR facility.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no impact on the project. The site is located in an urban area and antenna are to be located on the roof of existing building. No new structures would be built to support the antenna. Antennas would be located on the roof of the existing building, therefore a geotechnical study for new structures is not required. All structures in southern California are located within an area subject to seismic shaking. The UBC and CBC have specific design requirements to reduce or eliminate the effects of seismic shaking. Permitting processes are required to evaluate and mitigate other geologic hazards, such as land spreading prior to issuance of a building permit. Existing structures were built in accordance with current UBC and CBC at the time of construction. Therefore, the effects of seismic shaking or other geologic hazards would be no impact for construction and operational impacts.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site LARICSHQ and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site LARICSHQ was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site LARICSHQ. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site LARICSHQ would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site LARICSHQ, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site LARICSHQ would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: Yes, East Los Angeles Academy

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage

Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: Yes

If yes, please explain: LMR Site is within 1/4 mile of 2 permitted USTs and 1 open LUST

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: Yes

If yes, please explain: Blanchard Street Dump

Located in a Local Fire hazard Zone?: No

If yes, please explain: N/A

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

East Los Angeles Academy is located within 0.25 mile of the proposed Project site. Construction activities could include refueling of equipment on site, which would be done using the BMPs identified in Chapter 2. Operations could include transport to and refueling of the up to 1500 gallon diesel tank integrated into the generator proposed for the site. Use, transport, and disposal of hazardous materials and wastes are required to occur in compliance with federal, state, and local regulations.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The project site is not within a designated Fire Hazard Severity Zone.

Mitigation Measure(s):

None required.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Coastal Plain Of Los Angeles

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation would not be required at the site therefore dewatering would not be necessary. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting

process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Monterey Park and Unincorporated

General Plan Designation: Commercial

Zoning: Commercial and Services

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Wireless Telecommunications Facility Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: West San Gabriel Valley Planning Area and Metro Planning Area

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing building and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Monterey Park

Applicable Noise Ordinance: Title 9 Peace, Safety, and Morals, Chapter 9.53 Noise

Noise Level Threshold: N/A; no construction from 7 pm to 7 am on weekdays and 6pm to 9am on weekends and holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient

noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Interstate 710

Distance (Miles): 0.1

Disaster Route: Interstate 710

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: Approximately 4,000 feet from Los Angeles County Sheriff's Department Heliport; no airports within 5 miles

Nearest Highway/Freeway: Interstate 710

Distance (Miles): 0.2

Nearest Major Arterial: Cesar E Chavez Avenue

Distance (Miles): 0.4

Access to the Project Site Provided Via: Corporate Place

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In this urbanized area, this construction-related traffic would be less than one-quarter of a percent of the average daily traffic.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site LARICSHQ is located approximately 4,000 feet from Los Angeles County Sheriff's Department Heliport. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered for Site LARICSHQ, the TOWAIR tool indicates that the antenna structure meets the 6.10-meter (20-foot) rule criteria. This means that FAA notification is not required if the antenna structure is 6.10 meters (20 feet) or less in height, unless the antenna structure would increase the height of another antenna structure. The tallest proposed features are a 15-foot whip antenna so no impacts to aviation flight safety are anticipated.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day at each site, and typically would be less than 1 percent of average daily traffic on nearby streets. Construction-related activities may require lane narrowing at a driveway or detours in the parking lots of existing facilities. These actions could temporarily impair access on adjacent roadways, potentially creating traffic hazards and limiting emergency access, resulting in a significant impact. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

TRANS MM 1: The construction contractor shall maintain a minimum of one open lane of traffic at all site access roads during project construction. Use of standard construction traffic control practices such as flagmen, warning signs, and other measures shall be implemented as necessary to ensure that traffic flow remains uninterrupted at all times.

TRANS MM 2: Any temporary road or lane closures that may affect state highways shall be coordinated with Caltrans prior to commencement of construction at the site that will require the road or lane closures. If construction requires temporary road or lane closures on roads and streets managed by local entities, a traffic management plan shall be prepared and submitted to the relevant county and/or city public works department or other appropriate department for approval prior to commencement of construction at the site. Encroachment permits would be obtained where applicable.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Scholl Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: City of Monterey Park Water System

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Dewatering would not be required for building mount or collocation sites because groundwater is not expected at the shallow depths of excavation associated with this activity. Wastewater treatment plants in the project would not be affected during construction. During operations, the project would not result in the production of any wastewater that would require treatment.

Mitigation Measure(s):

None required.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: LEPS

Site Name: Lower Encinal Pump Station

Site Discussion:

Propose installation of up to 20 whip and up to 5 microwave antennas on new monopole up to 70 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 150 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 8 foot diameter x 36 foot deep drilled caisson with concrete cap for monopole support; or up to 16 foot x 16 foot x 10 foot deep concrete mat foundation.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This site is in the coastal zone approximately 0.5 mile from the coast in a low-density estate house neighborhood adjacent to and just north of Encinal Canyon Road. The site is adjacent to a water tank among very hilly topography consisting primarily of low shrub vegetation with scattered taller evergreens. Vegetative cover is chaparral and oak woodlands; patches of grasslands and pine exist. Telephone poles line nearby streets. The site is not currently visible from Encinal Canyon Road. Primary sensitive viewers are people traveling Encinal Canyon Road, which is designated as a Scenic Road by the City of Malibu, which defines scenic roads as existing public roads with views of the ocean and other scenic areas (City of Malibu 2002).

Visual Sensitivity: High

On federally administered public lands: No, but within boundary of Santa Monica Mountains NRA

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: Yes, City of Malibu Local Coastal Plan

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Encinal Canyon Road

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new facilities would be located adjacent to a water tank, which is not currently visible from Encinal Canyon Road. The top of the monopole would be visible from the road as it is likely taller than the water tank, but would be above the drivers' viewing angle when viewed from the south. As the road then travels directly east for nearly one mile and then north, the site would no longer be visible from the road. The new facilities would be visible from certain view points in the area, particularly those north of the site toward the ocean. The greatly varying topography would obscure some views of the site depending on the location. The relatively low height and narrow girth of the structure would make it difficult to see from more distant viewing locations, and the facilities would be below the viewing plane in many instances. Ongoing and recurring maintenance activities would be infrequent and would not substantially affect scenic vistas. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Very little vegetation exists on site, the majority of which has been previously cleared. No rock outcroppings, historic buildings, or other scenic resources exist in the area. The same construction activities described for scenic vistas, described above, would also apply. Minimal damage to vegetation or other elements that would be considered scenic resources would occur during construction.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings has already been degraded by grading and the presence of a water tower. The new monopole and associated equipment would be compatible with the existing site, and – to a lesser extent -- with the surrounding landscape, which is a low-density suburban area. Due to its relatively small stature, the monopole would blend into the surroundings. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 310

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site LEPS. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site LEPS or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site LEPS would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site LEPS will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site LEPS would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor Nox would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, Nox emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site LEPS or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site LEPS, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site LEPS, which is 310 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds for NO_x, CO, lower for PM₁₀, PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site LEPS and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site LEPS in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site LEPS and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

monarch butterfly (*Danaus plexippus*; ESA-Pet)

Special Status Plants Recorded within 1 Mile:

Santa Susana tarplant (*Deinandra minthornii*; CA-R, CNPS-1B.2); Sonoran maiden fern (*Thelypteris puberula* var. *sonorensis*; CNPS-2B.2)

Sensitive Communities Recorded within 1 Mile:

Southern Coast Live Oak Riparian Forest; groundfish (M&F-EFH)

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

coastal California gnatcatcher (*Polioptila californica californica*; ESA-T, CDFW-SCC); monarch butterfly (*Danaus plexippus*; ESA-Pet); Southern Coast Live Oak Riparian Forest; Santa Susana tarplant (*Deinandra minthornii*; CA-R, CNPS-1B.2); Sonoran maiden fern (*Thelypteris puberula* var. *sonorensis*; CNPS-2B.2)

Designated Critical Habitat Within 500 Feet:

Riparian Habitat Within 500 Feet:

Yes

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

Santa Monica Mountains National Recreation Area (NPS)

Local Policy or Ordinance for Biological Resources:

City of Malibu Local Coastal Program

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Laurel sumac scrub [*Malosma laurina* Shrubland Alliance]; Association - *Malosma laurina* shrubland(semi-dense)-*Eriogonum fasciculatum* shrubland (Sparse).

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site LEPS is located in the Santa Monica Mountains in association with an existing water tank in a fenced and paved compound that has been cut-back into the hillside resulting in an excavated disturbance zone of approximately 100 feet surrounding the water tank. Though coastal sage scrub vegetation is reestablishing in the disturbance zone, it appears the area is mowed as part of site maintenance. A few California walnut trees (*Juglans californica*) are adjacent to the project site. The surrounding vegetation within the project area is coastal sage scrub dominated by California sagebrush (*Artemisia californica*), purple sage (*Salvia leucophylla*), and California buckwheat (*Eriogonum fasciculatum*); on the opposite side of the paved Encinal Canyon Road is a shallow canyon with ephemeral drainage that supports riparian vegetation including California sycamore (*Platanus racemosa*),

coast live oak (*Quercus agrifolia*), and arroyo willow (*Salix lasiolepis*). The project area includes potential high quality habitat for coastal California gnatcatcher (*Polioptila californica californica*; ESA-T, CDFW-SCC) within a more expansive area of coastal sage scrub vegetation with a low degree of habitat fragmentation. Protocol surveys for the gnatcatcher were conducted in 2014 and no birds were detected. Though this general area of Los Angeles County is not known to support high numbers of breeding gnatcatchers, the coastal sage scrub community is high quality gnatcatcher habitat, and so birds could colonize the project area at any time. If birds are present they could be impacted by project activities. Essential fish habitat has been designated for groundfish (a guild of bottom dwelling marine fishes) along the coastline approximately 0.5-miles of the project site; no project activities would impact marine environments. Monarch butterflies (*Danaus plexippus*; ESA-Pet) may pass through the project area and use the tall trees as roost sites. Santa Susana tarplant (*Deinandra minthornii*), SR, 1B.2) is a perennial but was not observed during the habitat assessment survey conducted 8/5/2014; potential habitat is present within coastal sage scrub vegetation. Sonoran maiden fern (*Thelypteris puberula* var. *sonorensis*; 2B.2) is a perennial and was not observed during the habitat assessment survey conducted 8/5/2014; potential habitat may be found in the study area within Encinal Canyon. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) and coastal California gnatcatchers (*Polioptila californica californica*; ESA-T, CDFW-SSC) in the project area, and the importance of maintaining coastal sage scrub vegetation. Minimize disturbance to natural vegetation; especially coastal sage scrub vegetation (e.g., California sagebrush [*Artemisia californica*], sage [*Salvia* spp], and Laurel sumac [*Malosma laurina*], and California buckwheat [*Eriogonum fasciculatum*]). Conduct protocol surveys for the gnatcatcher; if nesting is present within the project area limit construction activities to the non-breeding season. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Manage trenches so as not to trap wildlife. Stay on existing roads. Conduct spring botanical surveys for Susana tarplant (*Deinandra minthornii*), SR, 1B.2) and Sonoran maiden fern (*Thelypteris puberula* var. *sonorensis*; 2B.2); if present mark the areas requiring special protection. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 14 Coastal California Gnatcatcher Protocol Surveys • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 22 Monarch Butterfly Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Southern Coast Live Oak Riparian Forest occurs within the project area in a shallow canyon along an ephemeral drainage on the opposite side of the paved Lower Encinal Road; no project related activities would impact riparian habitat.

Mitigation Measure(s):

Recommended Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and

Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes the following two wetland feature types as indicated by the National Wetland Inventory (USFWS 2014): 1) Freshwater Forested/Shrub Wetland; and 2) Riverine. However, these wetland types are restricted to ephemeral drainages. Adverse impacts to these wetlands may occur due to sedimentation as a result of runoff from the construction. However, construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site LEPS does not contain Environmentally Sensitive Habitat Areas (ESHAs), and the site is bounded on three sides by paved roads. ESHA does exist in the southern and western portions of the study area at Site LEPS. The City of Malibu Local Coastal Program (LCP) Land Use Plan (LUP) includes ESHA designations and protections for designated ESHA. The City of Malibu General Plan Conservation Element provides specific conservation policies. These include avoidance of consumption of ecologically sensitive lands (including ESHAs [CON Policies 1.1.1 and 1.2.4]), prioritization of protection of ESHA over development (CON Policy 1.1.4), protection of plants and wildlife (CON Policy 1.1.5), prevention of spread of invasive plants (CON Policy 1.2.5), discouragement of use of herbicides (CON Policy 1.2.7), and control of surface runoff (CON Policy 1.3.11). Impacts from construction and operations are described in BIO Impact 1 and Bio Impact 3. Because a potential for significant impact associated with the resources protected by the LCP LUP exists, a conflict with the policies contained in the LCP LUP exists and this would constitute a significant impact.

Mitigation Measure(s):

The mitigation measures identified in Impact BIO 1 coupled with application of LU MM 3 (requiring the Authority

obtain a coastal development permit) would reduce impacts to less than significant. Required mitigation measures:

- BIO MM 1 Mitigation Monitoring and Reporting Plan
- BIO MM 2 Worker Environmental Awareness Program
- BIO MM 3 Biological Compliance Reporting
- BIO MM 4 Site Sanitation
- BIO MM 5 Hazardous Materials Management
- BIO MM 8 Biological Monitoring
- BIO MM 9 Protect Native Vegetation and Common Wildlife
- BIO MM 10 No Pets
- BIO MM 11 Site Access
- BIO MM 16 Snowy Plover Instructions
- BIO MM 18 Nesting Bird Instructions
- BIO MM 24 Prevent the Spread of Nonnative Vegetation

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: Yes

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

Yes

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct area of potential effects (APE). Within the indirect APE there are seven previously recorded prehistoric archaeological sites that have been heavily disturbed from road construction, agricultural activities, modern development, and unauthorized artifact collection. One of the sites (P-19-000384 - approximately 1,700 feet from the direct APE) may have at one time contained human bone; however, no bone or other human remains have been reported from the other six sites. The closest of the seven sites to the direct APE is approximately 700 feet away. LMR activities at this project location include the attachment of whip and microwave antennas on a proposed 70-foot monopole; construction of a new equipment shelter; and installation of a new backup generator and fuel tank on a concrete pad; none of which would have either a direct or visual effect on the archaeological sites within the indirect APE. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Given the distance of the identified resources from the project site, there would be no impacts on historical resources.

Mitigation Measure(s):

There would be no impacts at this project site; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct area of potential effects (APEs); however, there are seven unevaluated archaeological sites identified within the indirect APE all of which are situated between 700 and 2,600 feet from the direct APE and would not be either directly or indirectly affected by LMR construction. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Given the distance of the identified resources from the project site, there would be no impacts on historical resources.

Mitigation Measure(s):

There would be no impacts at this project site; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Miocene Topanga Formation, which has a high potential for significant vertebrate fossils. No localities are recorded within the proposed site; however, vertebrate fossil localities have been recorded from this formation in the vicinity. Recovered fossils include smelt and herring. With implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Topanga Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within the direct area of potential effects (APEs). Human bone has been identified in one of the seven identified unevaluated archaeological sites within the indirect APE; however, this site is approximately 1,700 feet from the direct APE and well beyond the LMR construction area. Project activities, therefore, would not disturb any human remains; therefore, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

There would be no impacts at this project site; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct area of potential effects (APEs). Tribal resources have been identified within the indirect APE (within the seven identified archaeological sites); however, the seven sites are each greater than 850 feet from the direct APE and well beyond the LMR construction area. Project activities, therefore, would not disturb Tribal resources. The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

There would be no impacts at this project site; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: Moderate pending geotechnical analysis

Soil Type: Sespe-Millsholm-Malibu-Lodo-Hambright Association

Erosion Potential: Moderate pending geotechnical analysis

Expansive Soil: Moderate potential

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: yes

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line was identified approximately 1/3 mile south of the property (EDR, 2014), but is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes

specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located in a deep cut pad adjacent to a water. All surface soils have been stripped away, and proposed location is on exposed bedrock, and compacted fill. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the local planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards natural and constructed drainage.

Mitigation Measure(s):

None Required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell

with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site LEPS and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site LEPS was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site LEPS. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site LEPS would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site LEPS, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site LEPS would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: Malibu Coastal Zone

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Malibu

General Plan Designation: Rural Residential

Zoning: Rural Residential

What is the zoning height restriction, if any?:

28 feet

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Malibu

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such plans, policies, and regulations are not applicable to the project. Nevertheless, in the exercise of its discretion and in the interest in working cooperatively with local jurisdictions, local land-use plans, policies, and regulations are referenced, described, and addressed in recognition that such plans, policies, and regulations reflect the local community's policy decisions with respect to appropriate uses of land in the area. Consideration of these plans, policies and regulations, therefore, assists in determining whether the proposed project may conflict with nearby land uses, which could affect the analysis of whether the proposed project would result in potentially significant environmental impacts.

Based on the zoning ordinances for this site, the maximum allowable height of structures in this area is 28 feet.

Exceptions to the ordinance may be allowed, ordinarily with a conditional use permit. However, per the doctrine of intergovernmental immunity, the permit requirement is not applicable to the project. Because the Authority is exercising intergovernmental immunity, the City of Malibu General Plan is not applicable and no conflict with the plan exists.

Site LEPS also is within the Malibu Coastal Zone and is located within 500 feet of Encinal Canyon Road, a Scenic Road, on a parcel that supports a storage tank within the City of Malibu Coastal Zone. The City of Malibu Coastal Zone Land Use Plan was certified by the California Coast Commission on September 13, 2002 and provides for communication facilities as a conditional use in all land use designations. Policies in the Land Use Plan include avoiding or minimizing impacts to Environmentally Sensitive Habitat Areas and scenic resources; avoiding facility visibility from public viewing areas; and co-locating facilities where feasible. Per Local Implementation Plan Policy 3.14.1, the general requirements for every wireless telecommunications facility and antenna include development standards specifying that the maximum height of ground or building-mounted antennae shall not exceed 28 feet. Per Land Use Plan Policy 6.5, new development shall be sited and designed to minimize adverse impacts on scenic areas visible from scenic roads to the maximum feasible extent. The proposal is to mount whip and microwave antennas on a proposed 70-foot-tall monopole at a site that currently does not include communications facilities.

Construction of the proposed project facilities at this site would result in a conflict with the City of Malibu Coastal Zone Land Use Plan because of exceeding the height requirements.

The final determination of consistency would be made by the agency responsible for issuing a Local Coastal Permit. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan, and plan inconsistency is not considered a significant impact.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Malibu

Applicable Noise Ordinance: Municipal Code, Title 8 Health and Safety, Chapter 8.24 Noise

Noise Level Threshold: N/A; no construction from 7 pm to 7 am on weekdays, before 8 a.m. or after 5 p.m. on Saturday, or any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: 280 feet

Ambient Noise Level: 45 dBA

Sensitive Noise Receiver 1: Scattered Residential Dwellings

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

Hourly average construction noise levels are anticipated to be approximately 89 dBA. The predicted noise levels represent the demolition phase which is anticipated to be the loudest construction phase. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site. However, in some instances, it may be necessary for construction activities to take place outside of these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The affected jurisdiction has not established a construction noise level threshold. Therefore, construction noise levels at the proposed Project site would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable"

community noise equivalent level (CNEL) developed by the California Department of Health Services was referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. Noise levels from both sources would be below the 60 dBA “normally acceptable” level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers within this distance to the site; therefore, groundborne vibrational noise impacts would be less than significant.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings or sensitive receivers within this distance to the site; therefore, impacts from groundborne vibration would be less than significant.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. Therefore, extremely sensitive (fragile) buildings and sensitive receivers would not be exposed to excessive groundborne vibration or groundborne noise from Project operation and impacts would be less than significant.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, the estimated noise level at 280 feet from proposed sites would be 68 dBA and not exceed the 90 dBA daytime or 80 dBA nighttime criterion; therefore, construction impacts would be less than significant.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds; therefore, impacts from operational noise would be less than significant.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working

in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: City of Malibu Local Coastal Program, Land Use Plan

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Pacific Coast Hwy

Distance (Miles): 2.71

Disaster Route: Encinal Canyon Road

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Pacific Coast Hwy

Distance (Miles): 0.32

Nearest Major Arterial: Encinal Canyon Rd

Distance (Miles): 0.08

Access to the Project Site Provided Via: Vista Del Ventada

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: L A COUNTY WATERWORKS DIST #29

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

•Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: LPC

Site Name: Loop Canyon

Site Discussion:

Propose installation of up to 20 whip and up to 5 microwave antennas on new monopole up to 70 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 150 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 8 foot diameter x 36 foot deep drilled caisson with concrete cap for monopole support; or up to 16 foot x 16 foot x 10 foot deep concrete mat foundation.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Address: Angeles National Forest – off Forest Route 3N17

Surrounding area west of site

Aesthetics

Setting

Visual Description:

This isolated site is located in Angeles National Forest adjacent to Santa Clara Truck Trail on an undeveloped ridgetop at an elevation that is higher than surrounding hills. The site includes a large cleared area with a rectangular building, triangular paved parking area, and two low, broad platforms approximately two to three stories tall. Antennas of various sizes and shapes stand upon the platforms. Another building and two lattice towers of unknown height are located approximately 200 feet northeast of the site on the approach road. This site is visible from the Santa Clara Truck Trail and other nearby trails that climb to the ridgeline, but most views are toward the ocean, away from the site. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Back Country. The site is also a USFS Designated Communication Site, which allows for such use on national forests except when identified as not suitable because of law, national or regional policy, or the revised forest plan (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Back Country

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present, particularly given the prominence of the unobstructed ridge top. However, the new facilities would be located within a site that includes existing structures that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing structures, which would attenuate the noticeability of new monopole. In addition, locating the new monopole and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area.

Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. The existing visual character and quality of the site and its surroundings has already been degraded by the presence of an existing site and structures of various size and configuration. Although the new monopole and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. No change to the designated scenic classification would occur. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare

that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Industrial building

Distance to Sensitive Receptor: 252

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site LPC. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site LPC or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site LPC would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site LPC will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site LPC would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site LPC or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site LPC, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site LPC, which is 252 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 13 are higher than the SCAQMD thresholds for NO_x, CO, lower for PM₁₀, PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site LPC and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site LPC in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site LPC and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

None

Special Status Plants Recorded within 1 Mile:

Davidson's bush-mallow (*Malacothamnus davidsonii*; 1B.2)

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Canyon live oak woodland [*Quercus chrysolepis* Shrubland Alliance]; Association - *Adenostoma fasciculatum* (Sparse)

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site LPC is located on a mountain ridge at 4,025 feet elevation in the San Gabriel Mountains within montane chaparral vegetation. Diagnostic woody vegetation includes interior live oak (*Quercus wislizenii*), squaw bush (*Rhus trilobata*), mountain mahogany (*Cercocarpus montanus*), deer vetch (*Acmispon glaber*), manzanita, chamise (*Adenostoma fasciculata*), and laurel sumac (*Malosma laurina*). The study area is within the foraging range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP). Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at construction sites. Several

communication towers and facilities are present at and near the project site and few if any anti-perch devices have been installed on these structures. Southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) is known to occur in Pacoima Wash, almost 2 miles to the southeast of Site LPC; this drainage is also considered as potentially suitable habitat (and a potential reintroduction site) for California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) by the Angeles National Forest. Though the project site is located in steep mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. Site LPC is not hydrologically connected to Pacoima Wash. Davidson's bush-mallow (*Malacothamnus davidsonii* 1B.2) was observed within the project area, adjacent to the project site. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities.

Mitigation Measure(s):

A biological monitor will be present during construction and an environmental awareness program will be presented to all workers; all trash and construction debris (especially small items such as nuts and washers) will be removed from site each day; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E), California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC), and Davidson's bush-mallow (*Malacothamnus davidsonii* 1B.2) in the project area and along access roads. To protect dispersing southern mountain yellow-legged frogs and California red-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Mark the areas requiring special protection for Davidson's bush-mallow. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site; however, Southern Coast Live Oak Riparian Forest was observed below the project site to the northwest at a distance of approximately 0.15-miles. Site LPC is hydrologically connected to stream habitats that include occupied habitat of the southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E), and potentially suitable habitat for the California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC).

Mitigation Measure(s):

Recommended Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes the following two wetland feature types as indicated by the National Wetland Inventory (USFWS 2014): 1) Freshwater Forested/Shrub Wetland; and 2) Riverine. However, these wetland types are restricted to ephemeral drainages. Adverse impacts to these wetlands may occur due to sedimentation as a result of runoff from the construction. However, construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Contract Point Natural Landscape Block which overlaps the ranges of approximately 268 amphibian, reptile, mammal and bird species. It is also located within the Essential Habitat Connectivity Area Contract Point - Santa Susanna Mountains that connects the Santa Susanna Mountains eastward to the San Gabriel Mountains through Contract Point. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

Recommended mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual

species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: Yes

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Significant and Unavoidable Impact

Indirect / Visual Impact: Significant and Unavoidable Impact

Discussion:

There are two historical resources within the direct and indirect areas of potential effects (APEs). The first of the two resources is P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant. The second identified historical resource (Forest Service Resource No. 05015500237) consists of two of three separate loci of the Los Pinetos Nike Missile Site, which was constructed 1955-1956 and deactivated in 1968. The loci are the locations of the administrative area (barracks and support structures) and the radar control facility; the third locus (the launch control facility) is situated just outside the southeast boundary of the indirect APE. The direct APE is completely encompassed by one of the Nike missile loci and the remaining two are approximately 1,650 to 2,900 feet to the east. The complex of Nike facilities was formally evaluated in 1987 and determined eligible for inclusion in the National Register of Historic Places. LMR activities at this project location include the attachment of whip and microwave antennas on a proposed 70-foot monopole; construction of a new equipment shelter; and installation of a backup generator and fuel tank on a concrete pad. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified

archaeologist and architectural historian in December 2014. The construction of the proposed facilities would directly and adversely affect the National Register-eligible Nike missile resources within the direct APE and adversely affect the Nike missile landscape within the indirect APE; therefore, impacts would be unavoidable and significant and even with implementation of the required mitigation measures, impacts would not be reduced to less than significant levels.

Mitigation Measure(s):

None required for Resource No. P-19-186535. With implementation of CUL MMs 2, 3, and 5, impacts on Forest Service Resource No. 05015500237 would be minimized through archaeological monitoring for subsurface historical artifacts and through camouflage to disguise the proposed monopole; however, given the magnitude of the ground disturbance and the extent of the resources present at this project site, impacts would be significant and even with implementation of the required mitigation measures, impacts would not be reduced to less than significant levels. Because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Significant and Unavoidable Impact

Indirect / Visual Impact: Significant and Unavoidable Impact

Discussion:

There are two historical resources within the direct and indirect areas of potential effects (APEs). The first of the two resources is P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any associated resource features at this proposed project site, impacts would be less than significant. The second identified historical resource (Forest Service Resource No. 05015500237) consists of two of three separate loci of the Los Pinetos Nike Missile Site, which was constructed 1955-1956 and deactivated in 1968. The loci are the locations of the administrative area (barracks and support structures) and the radar control facility; the third locus (the launch control facility) is situated just outside the southeast boundary of the indirect APE. The direct APE is completely encompassed by one of the Nike missile loci and the remaining two are approximately 1,650 to 2,900 feet to the east. The complex of Nike facilities was formally evaluated in 1987 and determined eligible for inclusion in the National Register of Historic Places. LMR activities at this project location include the attachment of whip and microwave antennas on a proposed 70-foot monopole; construction of a new equipment shelter; and installation of a backup generator and fuel tank on a concrete pad. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. The construction of the proposed facilities would directly and adversely affect the National Register-eligible Nike missile resources within the direct APE and adversely affect the Nike missile landscape within the indirect APE; therefore, impacts would be unavoidable and significant and even with implementation of the required mitigation measures, impacts would not be reduced to less than significant levels.

Mitigation Measure(s):

None required for Resource No. P-19-186535. With implementation of CUL MMs 2 and 3, impacts on Forest Service Resource No. 05015500237 would be minimized through archaeological monitoring for subsurface historical artifacts; however, given the magnitude of the ground disturbance and the extent of the resources present at this project site, impacts would be significant and even with implementation of the required mitigation measures, impacts would not be reduced to less than significant levels. Because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Mesozoic granitic rocks, unit 3 (Sierra Nevada, Death Valley area, Northern Mojave Desert and Transverse Ranges)

Stability: Moderate pending geotechnical analysis

Soil Type: Pismo-Etsel family-Cieneba-Caperton Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line (San Gabriel Fault) was identified approximately 3/4 of a mile northwest of the property (EDR, 2014), but is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the

Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of a somewhat excessively drained sandy to gravelly loam with moderately rapid to very rapid runoff and rapid permeability. Moderate to steep slopes surround the relatively flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site LPC and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site LPC was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site LPC. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site LPC would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site LPC, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site LPC would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: Pacoima Dam Helipad

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Backcountry

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Clarita Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health, watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health

(USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as Backcountry. Backcountry includes areas of the national forest that are generally undeveloped with few roads. Most of the national forest's remote recreation and administrative facilities are found in this zone. The level of human use and infrastructure is generally low to moderate. The zone is managed for motorized public access on designated roads and trails. Although this zone generally allows a broad range of uses, the management intent is to retain the natural character inherent in this zone and limit the level and type of development (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Backcountry land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. Loop Canyon is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Foothill Frwy

Distance (Miles): 1.01

Disaster Route: Sand Canyon Road

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Foothill Frwy

Distance (Miles): 2.71

Nearest Major Arterial: Little Tujunga Canyon Rd

Distance (Miles): 1.41

Access to the Project Site Provided Via: Extension off of Forest Route 3N17

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Sunshine Canyon City/County Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: MMC

Site Name: Mount McDill

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This site is on an undeveloped ridgetop east, and outside, of the Angeles National Forest Santa Clara District. One 100-foot high lattice tower and one 60-foot high lattice tower, both with several microwave dishes, are located within a small square concrete pad enclosed with chain link fence. Small, one-story high shelters and small equipment (e.g., generator and HVAC unit) are also on site. The surrounding landscape is an undeveloped rural area along a dirt Forest Service Road. Little vegetation exists, except for scattered trees north and northwest of the site. The remaining area is predominantly barren.

Visual Sensitivity: Low

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present, particularly given the prominence of the unobstructed ridge top. However, the new facilities would be located within a site that includes existing structures that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing structures, which would attenuate the noticeability of new tower. In addition, locating the new monopole and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings has already been degraded by the presence of an existing site and two lattice towers. Although the new tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required

Air Quality

Setting

Air Basin: Mojave Desert

Air Quality Management District: Antelope Valley

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM10 (unclassified)

State Nonattainment Status: O3, PM10, PM2.5 (unclassified)

Applicable Air Quality Management Plan(s):

AVAQMD 2004 Ozone Attainment Plan (State and Federal), AVAQMD Federal 8-Hour Ozone Attainment Plan, AVAQMD Implementation Schedule for Measures to Reduce PM pursuant to H&S Code 39614(d), AVAQMD CEQA and Federal Conformity Guidelines

Significance Thresholds:

General Conformity (tons/year): CO (100), NOX, VOC (25); Local construction and operation (tons/year): CO (100), NOX, VOC (25), PM2.5, PM10 (15); Local construction and operation (lbs./day): CO (548), NOX, VOC (137), PM2.5, PM10 (82)

Nearest Sensitive Receptors: Industrial building

Distance to Sensitive Receptor: 1348

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The AVAQMD air quality plans considered in this analysis include the AVAQMD 2004 Ozone Attainment Plan (State and Federal) (AVAQMD 2004 Ozone Plan) (AVAQMD 2004). The purpose of this plan was to (1) demonstrate that the AVAQMD would meet the primary O3 NAAQS by the end of 2007; (2) present progress by the AVAQMD toward meeting all state planning milestones including attainment of the O3 CAAQS; and (3) discuss the 8-hour O3 NAAQS in preparation for a new nonattainment designation under a revised standard. Also considered in this analysis of Project air quality impacts is the AVAQMD Federal 8-Hour Ozone Attainment Plan (Western Mojave Desert Nonattainment Area) (AVAQMD 8-Hour Ozone Plan) (AVAQMD 2008). The purpose of this plan is to (1) demonstrate that the AVAQMD will attain the primary O3 NAAQS by June 2021; (2) present progress by the AVAQMD toward meeting all required O3 planning milestones and NAAQS and CAAQS; and (3) discuss the newest 0.075 ppm O3 NAAQS in anticipation of a nonattainment designation for this revised standard.

Finally, the analysis considered the AVAQMD Implementation Schedule for Measures to Reduce PM pursuant to Health and Safety Code 39614(d) (AVAQMD PM Measures Plan) (AVAQMD 2005). The purpose of this plan is for the AVAQMD to develop a list of Best Available Control Technologies (BACT) either currently being implemented or for future consideration to control particulate emissions within the district.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site MMC. The analysis indicates that emissions from the construction of all the proposed Project sites located in the MDAB including site MMC would not exceed AVAQMD significance thresholds for the listed criteria pollutants including O3 precursor Nox. Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of all the proposed Project sites located in the MDAB would not exceed AVAQMD significance thresholds for any criteria pollutants including O3 precursor Nox and particulate matter. Therefore, the Project would not conflict with or obstruct implementation of the

AVAQMD 2004 Ozone Plan, AVAQMD 8-Hour Ozone Plan, or the AVAQMD PM Measures Plan. Impacts of the proposed Project on the implementation of the AVAQMD plans would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Emissions from the construction from proposed LMR Site FRP or emissions from the simultaneous construction of the three proposed Project sites located in the MDAB would not exceed AVAQMD significance thresholds for criteria pollutants. Per AVAQMD guidance, compliance with these significance thresholds is sufficient to demonstrate that construction of the proposed Project sites in the MDAB would not violate any air quality standards or contribute substantially to an existing or projected air quality violation; therefore, Project construction impacts in the MDAB would be less than significant.

Operational emissions of the proposed LMR Site FRP or the operational emissions of all Project sites in the MDAB are less than significant and would not violate any air quality standard or contribute substantially to an existing or projected air quality violation; therefore, Project operational impacts would be less than significant in the MDAB.

Mitigation Measure(s):

No mitigation measures are required.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O₃ and PM₁₀ (CAAQS) in the MDAB. Cumulatively considerable net increases in these pollutants were examined relative to the AVAQMD significance thresholds for each.

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O₃ and PM₁₀ (CAAQS) in the MDAB. Cumulatively considerable net increases in these pollutants were examined relative to the SCAQMD significance thresholds for each.

Mitigation Measure(s):

No mitigation measures are required.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The AVAQMD considers residences, schools, daycare centers, playgrounds and medical facilities to be sensitive receptor land uses. Exposure of sensitive receptors to substantial pollutant concentrations as defined above in Chapter 3.2.3.1, Criterion 4 is required for the following project types: (1) any industrial project within 1,000 feet; (2) a distribution center (40 or more trucks per day) within 1,000 feet; (3) a major transportation project (50,000 or more vehicles per day) within 1,000 feet; (4) a dry cleaner using perchlorethylene within 500 feet; and (5) a

gasoline dispensing facility within 300 feet. While the Project as proposed does not fall within one of these project types; the analysis of sites within the MDAB includes a qualitative assessment of pollutants that impact human health.

The use of off-road heavy-duty diesel equipment by the Project for demolition, site grading and excavation, and concrete pad construction activities would result in the generation of diesel particulates (DPM) emissions. DPM were identified as a toxic air contaminant (TAC) by CARB in 1998. Other potential TAC sources associated with construction include the demolition of asbestos-containing materials and the excavation of naturally occurring asbestos (NOA) in soils. The monthly one hour test of the backup generator at each proposed Project site, including site MMC would generate DPM emissions. Emergency operation of the backup generators, which is anticipated to have a 200 hour continuous operational capacity would also generate DPM emissions. No other operational sources of these or other TACs would occur.

According to the Consolidated Table of Office of Environmental Health Hazard Assessment (OEHHA)/ CARB Approved Risk Assessment Health Values, the potential cancer risk from the inhalation of DPM outweighs the potential noncancer health impacts (SCAQMD, 2015; SMAQMD, 2014); therefore, noncancer health impacts of DPM were not assessed further. In addition, the OEHHA Air Toxics Hot Spots Program Guidance Manual does not recommend assessing cancer risk from exposures to a 'maximally exposed individual resident' (sensitive receptor) from activities lasting less than two months, due to the uncertainty in assessing cancer risk from very short-term exposures (OEHHA, 2015). As discussed in Appendix B, the maximum construction activity scenario assumed at site MMC and all proposed sites would have a six week duration. Similarly, the duration of the monthly test and emergency operation of backup generators at each site would be sources of short-term exposure to sensitive receptors; therefore, further assessment of the potential cancer risk of the project construction and operation is not warranted.

Demolition of existing structures at proposed sites in the MDAB would be subject to AVAQMD Rule 1403. Rule 1403 is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. The rule addresses the national emissions standards for asbestos along with some additional requirements. The rule requires lead agencies and their contractors to notify the District of any regulated renovation or demolition activity. By complying with District Rule 1403, thereby minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the MDAB, including site MMC, would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per AVAQMD guidance (AVAQMD 2011), compliance with the criteria pollutant significance thresholds and the health risk based significance threshold established by AVAQMD Criterion 4 is sufficient to demonstrate that construction and operation of the proposed Project sites in the MDAB, including site MMC, would not result in sensitive receptor exposure to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to

generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site FRP and all proposed Project sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to AVAQMD Rule 402. In addition, the operation of all Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to AVAQMD Rule 402; therefore, Project impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

None

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

California condor (*Gymnogyps californianus*; ESA-E, CA-E, CDFW-FP)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

Wildlife Linkage – San Gabriels – Tehachapis (Missing Link)

Local Policy or Ordinance for Biological Resources:

City of Palmdale General Plan

Applicable HCP or NCCP:

West Mojave Plan

Dominant Vegetation Community:

Cheatgrass grassland [*Bromus tectorum* Semi-Natural Herbaceous Stands];

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site MMC is located on a mountain top in the San Gabriel Mountains. The vegetation recently burned and the project area contains mostly cheat grass. The project area was probably dominated by scrub oak in the past. Seedlings of bush buckwheat (*Eriogonum fasciculatum*), rubber rabbitbrush (*Chrysothamnus nauseosus*), ceanothus, poodle plant (*Turricula parryi*), and scrub oak (*Quercus berberidifolius*) were observed. The study area is within the foraging range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP). Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at construction sites. Several communication towers and facilities are present at and near the project site and few if any anti-perch devices have been installed on these structures. Coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) may occur on-site and individuals could be killed by project activities. No sensitive plant species were observed or expected at the site. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could

occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

A biological monitor will be present during construction and an environmental awareness program will be presented to all workers; all trash and construction debris (especially small items such as nuts and washers) will be removed from site each day; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) in the project area. Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures:

- BIO MM 1 Mitigation Monitoring and Reporting Plan
- BIO MM 2 WEAP
- BIO MM 3 Biological Compliance Reporting
- BIO MM 4 Site Sanitation
- BIO MM 5 Hazardous Materials Management
- BIO MM 6 Anti-perch Devices
- BIO MM 7 California Condor Protection
- BIO MM 8 Biological Monitoring
- BIO MM 9 Protect Native Vegetation and Common Wildlife
- BIO MM 10 No Pets
- BIO MM 11 Site Access
- BIO MM 18 Nesting Bird Protection
- BIO MM 19 Trenches and Holes Management

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The city of Palmdale does have ordinances about preservation of desert vegetation primarily Joshua trees and junipers. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The City of Palmdale General Plan has policies that protect biological resources. Policy ER-2.1.1 calls for protection of SEAs, but none coincide with MMC. Policy ER-2.1.5 calls for preservation and maintenance of significant Joshua tree woodlands and other significant habitat areas. These do not occur on site. Policy ER-2.2.1 calls for the city to participate in implementation of the WEMO, specifically citing protection of desert tortoise and Mohave ground squirrel. These do not have the potential to occur on site. WEMO, to which Palmdale is a signator, includes protection measures associated with several other species, including conditional measures for Mohave ground squirrel, burrowing owl, ferruginous hawk, prairie falcon, southwestern pond turtle, and short-joint beavertail cactus. Additional information regarding WEMO is provided in the discussion of Impact BIO-6, below. Specific resources that may be protected by the plan that occur on site are discussed in BIO Impact 1. Only limited potential exists to impact individual resources protected by the City of Palmdale General Plan exists. The Authority is exercising intergovernmental immunity, therefore the plan is not applicable and no conflict with the City of Palmdale General Plan exists.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The primary goal of the West Mojave Plan (WEMO) is to protect and manage over 100 listed or sensitive species and puts special emphasis on the desert tortoise and the Mohave ground squirrel. Plan objectives include protecting large habitat blocks, avoiding human impacts on conservation areas, considering habitat specialists in conservation efforts, maintaining biodiversity, and providing a streamlined process for incidental take permits. Site MMC is in the WEMO planning area, specifically within the City of Palmdale. Protections afforded biological resources within the City of Palmdale, a signatory to the WEMO, include conservation measures for several species. Many of these measures are activity-specific (i.e., construction of electrical transmission lines). None of the species protected in the WEMO are known to occur at Site MMC. No conflicts associated with proposed construction or operations activities have been identified and no impacts are anticipated.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: Yes

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: Yes

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in November 2014. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). Artifacts associated with these sites have been previously collected and the data recorded (see CULT-1). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Schist of various types and ages, unit 2 (Southern and West-central California)

Stability: Moderate to High pending geotechnical analysis

Soil Type: Sobrante-Lodo Association

Erosion Potential: Low

Expansive Soil: Low to moderate pending geotechnical analysis

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: No

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of well-drained silt to shaly clay loam with low to very high runoff and moderate permeability. Low angle to moderate slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the City of Palmdale planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: Mojave Desert

Air Quality Management District: Antelope Valley

AQMD Significance Threshold: 100,000 tons CO₂eq/year (548,000 lbs. daily), 25,000 metric tons (MT) CO₂equivalent(eq)/year amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

Executive Orders S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, Senate Bill 97, AVAQMD CEQA and Federal Conformity Guidelines, Rule 3011 GHG Provisions of Federal Operating Permits

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site MMC and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the three (3) proposed Project sites in the MDAB. The generator test would last one hour at each site during a single day each month. It was also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site MMC was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all three (3) Project sites in the MDAB are estimated at 142.24 TCO₂e (129 MTCO₂e), or less than 47 TCO₂e (43 MTCO₂e) annually for proposed Project site MMC. To be consistent with the analysis of sites located in the SCAB/SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site LPC would be substantially below the AVAQMD annual 100,000 TCO₂e threshold and Council on Environmental Quality 25,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to

2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site MMC, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the AVAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site MMC would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Lahontan

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: West Mojave

Local Agency Jurisdiction: Palmdale

General Plan Designation: Public Facility

Zoning: Public Facilities

What is the zoning height restriction, if any?:

45 feet, 65 feet with conditional use permit

City or county permit requirements for communication facilities, if any:

Depending on size, may either be an administrative approval or Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Palmdale

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such plans, policies, and regulations are not applicable to the project. Nevertheless, in the exercise of its discretion and in the interest in working cooperatively with local jurisdictions, local land-use plans, policies, and regulations are referenced, described, and addressed in recognition that such plans, policies, and regulations reflect the local community's policy decisions with respect to appropriate uses of land in the area. Consideration of these plans, policies and regulations, therefore, assists in determining whether the proposed project may conflict with nearby land uses, which could affect the analysis of whether the proposed project would result in potentially significant environmental impacts.

Based on the zoning ordinances for this site, the maximum allowable height of structures in this area is 45 feet

with administrative approval or 65 feet with a conditional use permit. However, per the doctrine of intergovernmental immunity, the permit requirement is not applicable to the project. Because the Authority is exercising intergovernmental immunity, the City of Palmdale General Plan is not applicable and no conflict with the plan exists.

The proposed facilities at this site may be inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and the policy to protect areas that have significant natural resources. However, no physical impact would occur as a result of an inconsistency between the proposed project and the policy, and this is not considered a significant impact. As discussed in Sections 3.5 (geologic and soil hazards), Section 3.7 (fire hazards), Section 3.3 (biological effects), as well as in a site-by-site assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than significant.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site MMC contains existing antenna support structures. No impacts to conservation resources are expected or identified in the West Mojave HCP.

The West Mojave Plan is a habitat conservation plan and federal land use plan amendment that (1) presents a comprehensive strategy to conserve and protect the desert tortoise, the Mohave ground squirrel and over 100 other sensitive plants and animals and the natural communities of which they are a part, and (2) provides a streamlined program for complying with the requirements of the California and federal Endangered Species Acts. None of the species addressed by the plan occur at or near Site MMC so there are no conflicts with the plan, as discussed in Section 3.3. The West Mojave HCP does not cover communication sites and does not preclude access and opportunities to build or maintain permitted communications sites. As a result, the proposed Project sites would not conflict with land use policies of the West Mojave HCP. No land use impacts would occur from placing proposed Project sites on land subject to the West Mojave HCP.

Mitigation Measure(s):

None required.

Noise

Setting

City: Palmdale

Applicable Noise Ordinance: Title 8 Health and Safety, Chapter 8.28 Building Construction Hours of Operation and Noise Control

Noise Level Threshold: N/A; no construction from 8 pm to 6:30 am on weekdays and Saturday, all day Sunday

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient

noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Sierra Hwy

Distance (Miles): 4.25

Disaster Route: Elizabeth Lake Road

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Antelope Valley Frwy

Distance (Miles): 4.17

Nearest Major Arterial: Bouquet Canyon Rd

Distance (Miles): 2.21

Access to the Project Site Provided Via: Extension off of Forest Service Road 6N07

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Antelope Valley Recycling and Disposal Facility

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: L A COUNTY WATERWORKS DIST 40-34

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: MML

Site Name: Magic Mountain Link

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This ridge top site is located within Angeles National Forest at a former Nike missile site that included subterranean concrete missile silos built in 1955. The site includes a lattice tower and small building enclosed within a chain link fence, and is a smaller part of a larger area that includes another taller lattice tower with attached microwave dishes adjacent to a large shelter, also enclosed by a chain link fence. The height of the towers is unknown. A utility pole, two smaller one-story equipment shelters, and fuel tank are also present. The proximity of the two sites resembles that of one site. Two large, brown water tanks are located about 200 feet north. The site is accessed from the Angeles Crest Highway, a National Forest Scenic Byway, from the intersection at Red Box Gap, a day-use area with large parking lots, picnic tables, and visitor facilities that provides access to the Gabrieleno Trail. The site is not visible from this recreation area. The existing lattice towers are intermittently visible from southbound Angeles Crest Highway, although steep topography typically blocks the towers from view. The towers rise above the existing evergreen vegetation that surrounds the site. The view is dominated by steep, primarily undeveloped ridgelines. Primary sensitive viewers are ANF visitors and travelers using the Angeles Crest Scenic Byway. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Back Country. The site is also a USFS Designated Communication Site, which allows for such use on national forests except when identified as not suitable because of law, national or regional policy, or the revised forest plan (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Back Country

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present, particularly given the prominence of the unobstructed ridge top. However, the new facilities would be located within a site that includes existing structures that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing structures, which would

attenuate the noticeability of the new towers. In addition, locating the new towers and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. The existing visual character and quality of the site and its surroundings has already been degraded by the presence of an existing site, two lattice towers, shelters, and two water tanks. Although the new towers and associated equipment would contrast and be incompatible with the visual character of the larger area, they would be compatible with the existing site and immediate surrounding landscape, which has been modified for the Nike missile site. There would be no change to the designated scenic attractiveness classification or the scenic byway designation. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For

aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Church

Distance to Sensitive Receptor: 17851

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site MML. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site MML or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site MML would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site MML will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site MML would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site MML or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site MML, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site MML, which is 17.851 feet from the nearest receptors, the LSTs for criteria pollutants are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site MML and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site MML in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site MML and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition,

the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site MML is located on the top of Magic Mountain in the San Gabriel Mountains. The vegetation consists of chamise chaparral. The study area is within the foraging range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP). Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at construction sites. Several communication towers and facilities are present at and near the project site and few if any anti-perch devices have been installed on these structures. Pacoima Wash, approximately 1.5 miles south of Site MML is considered as potentially suitable habitat (and a potential reintroduction site) for California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) by the Angeles National

Forest. Though the project site is located in steep mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

A biological monitor will be present during construction and an environmental awareness program will be presented to all workers; all trash and construction debris (especially small items such as nuts and washers) will be removed from site each day; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) in the project area and along access roads. To protect dispersing California red-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measurable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures:

- BIO MM 1 Mitigation Monitoring and Reporting Plan
- BIO MM 2 WEAP
- BIO MM 3 Biological Compliance Reporting
- BIO MM 4 Site Sanitation
- BIO MM 5 Hazardous Materials Management
- BIO MM 6 Anti-perch Devices
- BIO MM 7 California Condor Protection
- BIO MM 8 Biological Monitoring
- BIO MM 9 Protect Native Vegetation and Common Wildlife
- BIO MM 10 No Pets
- BIO MM 11 Site Access
- BIO MM 18 Nesting Bird Protection
- BIO MM 19 Trenches and Holes Management
- BIO MM 21 Protected Amphibian Protection
- BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Southern coast live oak riparian forest and woodland is within 500 feet of the project site. Site MML is hydrologically connected to stream habitats that include California red-legged frog (*Rana draytonii*; ESA-T, ESA-CH, CDFW-SSC) potentially suitable habitat.

Mitigation Measure(s):

Recommended Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated San Gabriel Mountains West Natural Landscape Block which overlaps the ranges of approximately 274 amphibian, reptile, mammal and bird species. It is also located within the Essential Habitat Connectivity Area San Gabriel Mountains West - San Francisquito that connects the San Gabriel Mountains through Soledad Canyon Northwest to Liebre/Sawmill Mountains. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

Recommended mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local,

regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within both the direct and indirect areas of potential effects (APE). The resource (P-19-186535) is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. There are no other historical resources within the direct or indirect APEs. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within both the direct and indirect areas of potential effects (APE). The resource (P-19-186535) is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any uniquely definable features associated resource features at this proposed project site, impacts would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Precambrian granitic rocks, unit 2, (San Gabriel Mountains Anorthosite)

Stability: Moderate pending geotechnical analysis

Soil Type: Pismo-Etsel family-Cieneba-Caperton Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of somewhat excessively drained soils that formed in material weathered from sandstone or shale. Moderate to steep slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site MML and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site MML was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site MML. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site MML would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site MML, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site MML would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Backcountry

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Clarita Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health, watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health

(USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as Backcountry. Backcountry includes areas of the national forest that are generally undeveloped with few roads. Most of the national forest's remote recreation and administrative facilities are found in this zone. The level of human use and infrastructure is generally low to moderate. The zone is managed for motorized public access on designated roads and trails. Although this zone generally allows a broad range of uses, the management intent is to retain the natural character inherent in this zone and limit the level and type of development (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. This site is a designated communications site for government use only in the Forest Plan. While this restriction prohibits commercial use of the site for communications, exceptions may be made for state and local government agencies; a permit for a facility that intended for emergency response is likely. Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Backcountry land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. Magic Mountain is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication sites would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Antelope Valley Frwy

Distance (Miles): 2.36

Disaster Route: Sand Canyon Road

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Antelope Valley Frwy

Distance (Miles): 4.25

Nearest Major Arterial: Little Tujunga Canyon Rd

Distance (Miles): 3.03

Access to the Project Site Provided Via: Extension off of Forest Route 2N24

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Sunshine Canyon City/County Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: MTL2

Site Name: Mount Lukens-2

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Surrounding area west of site

Aesthetics

Setting

Visual Description:

This isolated site is located in Angeles National Forest south of Big Tujunga Canyon Road and north of Deukmejian Wilderness Park. This specific site is a dirt lot immediately adjacent to a site that includes a large shelter, lattice tower, and propane tanks enclosed by a chain link fence. The site is within an area that includes several similar sites arranged in an east-west alignment that is served by one dirt access road. A variety of shelters and lattice towers of varying height exist within this alignment, creating several man-made vertical elements along the ridgetop. Surrounding vegetation is sparse chaparral. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Back Country, Motor Vehicle Use Restricted. The site is also a USFS Designated Communication Site, which allows for such use on national forests except when identified as not suitable because of law, national or regional policy, or the revised forest plan (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Back County (Motorized Use Restricted)

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present, particularly given the prominence of the unobstructed ridge top. However, the new facilities would be located within a site that includes numerous existing structures that already create a substantial visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing structures, which would attenuate the noticeability of new tower. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a

staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. Although the Back Country, Motor Vehicle Use Restricted Zone allows a range of low intensity land uses, the management intent is to retain the natural character of the zone and limit the level and type of development. However, the existing visual character and quality of the site and its surroundings has already been degraded by the presence of numerous lattice towers and shelters that form a type of compound on the ridgeline. Although the new tower and associated equipment would contrast and be incompatible with the visual character of the larger area, they would be compatible with the existing site and immediate surrounding landscape, which has been highly modified. There would be no change to the site's scenic attractiveness rating. In addition, the site is located on a USFS Designated Communication Site, which generally allows for such use within the area's landscape. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions

from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 8171

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site MTL2. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site MTL2 or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?**Construction Impact:** Significant Impact Reduced to Less than Significant with Mitigation Incorporated**Operational Impact:** Less than Significant**Discussion:**

Emissions from the construction of proposed site MTL2 would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site MTL2 will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site MTL2 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site MTL2 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site MTL2, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site MTL2, which is 8,171 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site MTL2 and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site MTL2 in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site MTL2 and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly

trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

Davidson's bush-mallow (*Malacothamnus davidsonii*; 1B.2)

Sensitive Communities Recorded within 1 Mile:

Southern Coast Live Oak Riparian Forest; Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); Davidson's bush-mallow (*Malacothamnus davidsonii*; 1B.2)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

US Forest Service - Angeles National Forest; SCAG Zoning - Open Space and Recreation, Wildlife Preserves and Sanctuaries;

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Chamise chaparral [*Adenostoma fasciculatum* Shrubland Alliance]; Association - *Adenostoma fasciculatum*-*Eriogonum fasciculatum*

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site MTL-2 is located along a ridgeline in the San Gabriel Mountains. The site contains chamise chaparral on north-facing slope and buckwheat on the south-facing slopes. American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP) may pass through the study area while foraging, but the study area does not provide steep cliff habitat required for nesting (suitable nesting habitat may be present within one mile). The study areas considered to be outside the current range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), but as the condor population increases it is expected to expand geographically. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. Coast horned lizard

(*Phrynosoma blainvillii*; CDFW-SSC) may occur within the project area and individuals could be killed by project activities. Potentially suitable habitat (and a potential reintroduction site) for California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) has been reported by the Angeles National Forest to occur within 2 miles of site MTL-2 in Big Tujunga Canyon. Though the project site is located in mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. Davidson's bush-mallow (*Malacothamnus davidsonii*; 1B.2) was observed in the project area during surveys conducted 9/8/2014 adjacent to areas disturbed by previous construction. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

To address future use of the area by condors all trash and construction debris (especially small items such as nuts and washers) will be removed from the site; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of California red-legged frog (*Rana draytonii*; ESA-T, ESA-CH, CDFW-SSC), coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC), and Davidson's bush-mallow (*Malacothamnus davidsonii*; 1B.2). Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. To protect dispersing California red-legged frog, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Mark the areas requiring special protection for Davidson's bush-mallow (*Malacothamnus davidsonii*; 1B.2). Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site. Site MTL2 is hydrologically connected to stream habitats that include California red-legged frog (*Rana draytonii*; ESA-T, ESA-CH, CDFW-SSC) potentially suitable habitat.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within both the direct and indirect areas of potential effects (APE). The resource (P-19-186535) is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. The entirety of the direct APE and three quarters of the indirect APE are encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant. In addition there is one additional recorded resource within the indirect APE, Resource No. P-19-186923 (FS-05015100103-HIS) the Lukens-Clear Creek Road Complex that dates from 1907-1942. The road complex is a U.S. Forest Service Heritage Resource, but has not been designated a historical resource under CEQA. LMR activities at this project location include the attachment of whip and microwave antennas on a proposed 180-foot lattice tower; construction of a new equipment shelter; and installation of a backup generator and fuel tank on a concrete pad. The project site consists solely of multiple existing, fenced, communications sites and towers. This was confirmed through archival research and a field survey conducted by both a Secretary of Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Based on the nature of this project location and the identified resources, impacts from proposed project activities would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within both the direct and indirect areas of potential effects (APE). The resource (P-19-186535) is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any uniquely definable features associated resource features at this proposed project site, impacts would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Mesozoic granitic rocks, unit 3 (Sierra Nevada, Death Valley area, Northern Mojave Desert and Transverse Ranges)

Stability: Moderate pending geotechnical analysis

Soil Type: Sobrante-Exchequer-Cieneba Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and

appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of a well-drained silt loam with low to very high runoff and moderate permeability. Moderate slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the City of Los Angeles planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell

with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site MTL2 and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site MTL2 was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site MTL2. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site MTL2 would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source

categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site MTL2, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site MTL2 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: No

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Los Angeles

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Back Country Motorized Use Restricted

Zoning: Open Space

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles

Los Angeles County Community or Area Plan: Antelope Valley Area Plan

City of Los Angeles Community or Area Plan: Sunland - Tujunga - Lake View Terrace - Shadow Hills - East La Tuna Canyon

Other Special District, Area or Specific Plan: San Gabriel/Verdugo Mountains Special Planning Area

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources

including, but not limited to, traditional and contemporary uses, species management, fire, forest health, watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as Backcountry (Motorized Use Restricted), which includes areas of the national forest that are generally undeveloped with few roads. Few facilities are found in this zone, but some may occur in remote locations. Motorized use is restricted to administrative purposes only; this includes Forest Service, other agency, or tribal government needs, as well as access needed to private land or authorized special-uses. Although this zone allows a range of low intensity land uses, the management intent is to retain the natural character of the zone and limit the level and type of development (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. The motorized use restriction may entail additional access challenges as use of the administrative roads requires special-use authorization.

Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Los Angeles

Applicable Noise Ordinance: Municipal Code, Chapter IV Public Welfare

Noise Level Threshold: N/A; no construction from 9 pm to 7 am on weekdays, weekends and holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range

from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would

not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Backcountry Motorized Use Restricted land use desig

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. Mount Lukens is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Angeles Crest Hwy

Distance (Miles): 2.39

Disaster Route: State Route 2

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Foothill Frwy

Distance (Miles): 2.36

Nearest Major Arterial: Big Tujunga Canyon Rd

Distance (Miles): 1.45

Access to the Project Site Provided Via: Mt. Lukens Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: City of Burbank Landfill #3

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: OAT

Site Name: Oat Mountain

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Surrounding area west of site

Aesthetics

Setting

Visual Description:

The site is in a remote area on a barren, undeveloped ridge line approximately 2 miles north of Highway 118 and 2 miles west of I-5. The site includes three existing lattice towers of various heights and a small one-story shelter on a concrete pad enclosed by a chain link fence. The largest lattice tower is 150 feet tall and several microwave dishes are attached to it. The other two are shorter and occupy a smaller footprint. Various small structures, such as a diesel tank and generator, are also on site. A row of utility poles extend southwest from the site, and a green water tank is adjacent to it. The surrounding area is primarily treeless and undeveloped; grasses and low shrubs dominate the landscape on the southern half of the area. Some small structures such as drilling rigs and several circuitous access roads are cut into the hillside to the south. Medium to tall deciduous trees are predominant on the northern side of the ridge line.

Visual Sensitivity: Low

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present, particularly given the prominence of the unobstructed ridge top. However, the new facilities would be located within a site that includes existing structures that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing structures, which would attenuate the noticeability of new tower. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge line, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings has already been degraded by the presence of an existing site and two lattice towers, as well as the numerous road cuts for the nearby oil rigs. The new tower and associated equipment would be compatible with the existing site and much of the surrounding landscape. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Industrial building

Distance to Sensitive Receptor: 2745

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Less than Significant

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site OAT. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site OAT or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site OAT would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site OAT will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site OAT would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site OAT or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Emissions from the construction of proposed site MTL2 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for Nox and could result in cumulatively considerable net increases in O3 from the Nox emissions.

With implementation of Mitigation Measure AQ MM 1, compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in O3 precursor Nox, PM10 or PM2.5 for which the SCAB is in non-attainment of the NAAQS and/or CAAQS; therefore, the impact of Project construction would be less than significant. Operational emissions of proposed site MTL2 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the

types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NOx, CO, PM10, and PM2.5. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site OAT, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site OAT, which is 2,745 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 6 are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site OAT and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site OAT in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site OAT and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

California condor (*Gymnogyps californianus*; ESA-E, CA-E, CDFW-FP); western mastiff bat (*Eumops perotis californicus*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

California Orcutt grass (*Orcuttia californica*; ESA-E, CA-E, 1B.1); slender-horned spineflower (*Dodecahema leptoceras*; ESA-E, CA-E, 1B.1)

Sensitive Communities Recorded within 1 Mile:

California Walnut Woodland; Southern Coast Live Oak Riparian Forest; Southern Cottonwood Willow Riparian Forest; Southern Mixed Riparian Forest; Valley Oak Woodland; coastal California gnatcatcher (*Polioptila californica californica*; ESA-T, ESA-CH, CDFW-SSC)

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

California condor - foraging (*Gymnogyps californianus*; ESA-E, CA-E, CDFW-FP); golden eagle - foraging (*Aquila chrysaetos*; CDFW-FP); western mastiff bat - foraging (*Eumops perotis californicus*; CDFW-SSC); Valley Oak Woodland

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

SEA - Santa Susana Mountains/Simi Hills; Essential Connectivity Area - Contract Point - Santa Susana Mountains

Local Policy or Ordinance for Biological Resources:

Los Angeles County General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Valley oak woodland [*Quercus lobata* Woodland Alliance]; Association- *Quercus lobata*-*Juglans californica*

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site OAT is one of a series of hilltop communications facilities along the Oat Mountain ridgeline in the Santa Susana Mountains. Valley Oak (*Quercus lobata*) Woodland occurs in close proximity in the study area. Numerous oil extraction wells and facilities are within 0.5 to 1 mile of the site, with many roads curving along ridgelines. Due to these operations there is limited vegetation on the south side of the Oak Mountain ridgeline (oak forests are on north exposures). Vegetation includes a large non-native herbaceous component with Valley Oak (*Quercus lobata*) Woodland on the north-facing slopes and canyons. The project area does not contain California Walnut Woodland,

though individual trees are present. California Orcutt grass (*Orcuttia californica*; ESA-E, CA-E, 1B.1) is a vernal pool species; slender-horned spineflower (*Dodecahema leptoceras*; ESA-E, CA-E, 1B.1) grows in mature wash benches of major drainages. The project area does not contain habitat for these species. Coastal sage scrub vegetation is not present; the project area does not contain habitat for coastal California gnatcatcher (*Poliptila californica californica*; ESA-T, ESA-CH, CDFW-SSC). Western mastiff bat (*Eumops perotis californicus*; CDFW-SSC) may forage in the project area, but no potential roost sites of cliffs with crevices, or tall trees or buildings that provide a vertical drop for the bat to take flight occur in the project area (potential roost sites may be found 0.5 to 1 mile away). The study area is within the foraging range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP). Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at construction sites. Several communication towers and facilities are present at and near the project site and few if any anti-perch devices have been installed on these structures. The proposed developments include the addition of a new lattice tower that could be used as perches by condors. The project site is within the foraging range of the golden eagle (*Aquila chrysaetos*; CDFW-FP). Eagles may pass by the project site while foraging, but the area around the site does not provide steep cliffs or rocky crags used for nesting. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

A biological monitor will be present during construction and an environmental awareness program will be presented to all workers; all trash and construction debris (especially small items such as nuts and washers) will be removed from site each day; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The Southern mixed riparian forest Sensitive Community occurs within 500 feet of the project site. Valley Oak (*Quercus lobata*) Woodland does not occur on the project site, but trees do occur in close proximity in the project area; no trees would be removed as part of project activities.

Mitigation Measure(s):

Minimize disturbance to natural vegetation; do not remove valley oak trees or California walnut trees. Prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads; use caution to minimize the use of heavy equipment near valley oak and California walnut trees to protect the plant's root system. Recommended Mitigation Measures: • BIO MM 1 Mitigation Monitoring and

Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Freshwater Forested/Shrub wetland feature type as indicated by the National Wetland Inventory (USFWS 2014). However, this wetland type is restricted to an ephemeral drainage. Construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located within a CDFW Essential Habitat Connectivity Area Contract Point - Santa Susanna Mountains that connects the Santa Susanna Mountains eastward to the San Gabriel Mountains through Contract Point. It is also located in the approved Santa Susanna Mountains Significant Ecological Area, which is identified as an important regional habitat linkage in the Los Angeles General Plan. This SEA provides important linkages through a large open space corridor between the Santa Monica Mountains to the south, San Gabriel Mountains to the east, and the Los Padres National Forest to the north. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

Recommended mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Construction at Site OAT could result in removal of vegetation and human disturbance at each site and therefore could result in conflict with the Los Angeles County General Plan's Policy C/NR 3.1, which calls for conservation and enhancement of ecological function diverse natural habitats and biological resources. The site contains an existing

tower facility, related infrastructure, and access road along with disturbed native scrub vegetation. The current use at the site is communications facility, and substantive removal of native vegetation is not expected. Construction and operations activities at the site do have the potential to impact biological resources, as described in Impact BIO 1 and Impact BIO 2. These impacts to resources conflict with Policy C/NR 3.1. Because a potential for significant impact associated with the resources protected by the Los Angeles County General Plan exists, this would constitute a significant impact.

Mitigation Measure(s):

The mitigation measures identified in Impact BIO 1 and Impact BIO 2 would reduce impacts from construction and operations to less than significant. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 4 Site Sanitation • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 13 Coastal California Gnatcatcher Breeding Season Protocol Surveys • BIO MM 14 Coastal California Gnatcatcher Breeding Season Restriction • BIO MM 15 Southwestern Willow Flycatcher Protection • BIO MM 16 Snowy Plover Protection • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Monarch Butterfly Protection • BIO MM 24 Prevent the Spread of Nonnative Vegetation • BIO MM 25 Special Status Plants Surveys and Protection

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and a field survey conducted by both a Secretary of Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Miocene Monterey Formation, which is known to be fossiliferous. No localities are recorded within the proposed site; however, vertebrate fossil localities have been recorded from this formation in the vicinity. Recovered fossils include the extinct four-legged marine mammal *Desmostylus*, walrus, and primitive baleen whale. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Monterey Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: Moderate pending geotechnical analysis

Soil Type: Rock outcrop-Lithic Xerorthents-Calleguas-Badland Association

Erosion Potential: Low to moderate potential

Expansive Soil: Low to moderate potential

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line has been identified approximately 3/4 of a mile south of the property (Santa Susana) (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These

acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of well-drained clay loam and clayey shales with medium or high runoff and moderate permeability. Moderate to steep slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site OAT and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site OAT was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site OAT. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site OAT would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site OAT, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site OAT would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: Approximately 400 feet from oil/gas well to the south. Verify distance.

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: N/A

Located in a State Fire Hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Non-Urban

Zoning: Heavy Agriculture

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing telecommunications structure and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

The proposed facilities at this site may be inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and the policy to protect areas that have significant natural resources. However, no physical impact would occur as a result of an inconsistency between the proposed project and the policy, and this is not considered a significant impact. As discussed in Sections 3.5 (geologic and soil hazards), Section 3.7 (fire hazards), Section 3.3 (biological effects), as well as in a site-by-site assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than

significant.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Golden State Frwy

Distance (Miles): 3.25

Disaster Route: Interstate 5/State Route 118

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Golden State Frwy

Distance (Miles): 2.39

Nearest Major Arterial: Tampa Ave

Distance (Miles): 1.85

Access to the Project Site Provided Via: Extension off of Palo Sola Truck Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Sunshine Canyon City/County Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: PASPD01

Site Name: Pasadena Police Department

Site Discussion:

Propose installation of up to 27 whip and up to 5 microwave antennas on new monopole up to 70 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 150 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 8 foot diameter x 36 foot deep drilled caisson with concrete cap for monopole support; or up to 16 foot x 16 foot x 10 foot deep concrete mat foundation.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

The Pasadena Police Department site is located on a vacant lot encompassing approximately 317 square feet within the City of Pasadena's historic civic center area. The Pasadena Civic Center District is a historic district roughly bounded by Walnut and Green Streets to the north and south, and Raymond and Euclid Avenues to the west and east. The district is a "nationally significant example of civic art in the 'City Beautiful' style of the 1920s" (NPS 1980). The centerpieces are the Pasadena City Hall, which is fronted by a large open plaza, Pasadena Public Library, and Pasadena Civic Auditorium. The district is dominated by its 1925 Beaux Arts-style City Hall and other "magnificent 1920s and 1930s buildings of the civic center" (Los Angeles Conservancy 2013). The Civic Center area is distinct from surrounding neighborhoods both in architectural style and feeling, and is less commercial and more park-like. It is a "carefully planned architectural entity" and a "unique collection of buildings and sites whose greatest value and impact arise from the fact that they relate to each other and the environment in a special way" (NPS 1980). The streets are wide and lined with trees, some paved with tile and brick set in decorative patterns. Small parks abound, and are planted with trees and flowers (NPS 1980). Several other buildings located within the historic district, including the Pasadena Public Library and First Baptist Church, incorporate similar design styles. The key buildings were designed in a homogenous style by nationally recognized architects. The site is directly south of the Pasadena Police Department, which was designed to be sensitive to the historic surroundings. The police department building has a 50-foot-high architectural tower with exaggerated scrolled buttress supports. The beige stucco walls, arched windows, terra cotta tile roof were meant to echo the 1920s-era themes of the civic center. The property is landscaped with a giant sycamore tree and drought-resistant plants (Los Angeles Conservancy 2013). Newer structures show "an abandonment of architectural standards" that are out of keeping with the Civic Center as a whole (NPS 1980). One such structure is a five-level parking garage directly north of the PASPD01 site and west of the Police Department.

Visual Sensitivity: High

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: Yes

If yes, enter name: Pasadena Civic Center Historic District

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located in a highly developed civic/urban setting within. Although it is located within a high sensitive viewing area (urban historic area), the site is not located within a scenic vista or within view of one.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

The site is within the City of Pasadena's historic civic center area. These proposed new project elements would not be compatible with the civic center's distinctive Beaux Arts architectural style and feeling. The new structures would represent another "abandonment of architectural standards" that would not be consistent with the setting that led to formation of the historic district. Construction impacts would be related to construction of the new tower and equipment. Construction would create dust that would temporarily affect the visual character and quality.

Mitigation Measure(s):

Under Cultural Resources, implementation of CUL MM 5 (camouflage) would reduce significant visual impacts to less than significant with mitigation incorporated. This mitigation measure would also serve to reduce significant visual and aesthetic impacts at this site to less than significant with mitigation incorporated. Refer to Cultural Resources for more information.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in an urban area and would include construction of new facilities. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. This site is in an urban area where numerous sources of day and nighttime lighting are present, such as vehicle headlights, traffic signals, street lights, and building security lights. Because of the presence of these light sources, tower lighting, if required, would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Office building

Distance to Sensitive Receptor: 50

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site PASPD01. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site PASPD01 or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site PASPD01 would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site PASPD01 will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site PASPD01 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site PASPD01 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site PASPD01, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site PASPD01, which is 50 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 8 are lower than the SCAQMD thresholds for all non-attaining/maintenance pollutants but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site PASPD01 and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site PASPD01 in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site PASPD01 and all proposed Projects sites

would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

American peregrine falcon (*Falco peregrines anatum*; CDFW-FP); bank swallow (*Riparia riparia*; CA-T); burrowing owl (*Athene cunicularia*; CDFW-SSC); least Bell's vireo (*Vireo bellii pusillus*; ESA-E, CA-E); pallid bat (*Antrozous pallidus*; CDFW-SSC); southwestern willow flycatcher (*Empidonax traillii extimus*; ESA-E, CA-E); western mastiff bat (*Eumops perotis californicus*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

Coulter's goldfields (*Lasthenia glabrata ssp coulteri*; 1B.1); mesa horkelia (*Horkelia cuneata var. puberula*; 1B.1); Parish's gooseberry (*Ribes divaricatum var. parishii*; 1A); white rabbit-tobacco (*Pseudognaphalium leucocephalum*; 2B.2)

Sensitive Communities Recorded within 1 Mile:

Southern Coast Live Oak Riparian Forest; Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

None

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

None

Local Policy or Ordinance for Biological Resources:

City of Pasadena General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Ornamentals

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site PASPD01 is totally urbanized and located in downtown Pasadena. The project area does not contain native vegetation. The structures in the vicinity are very large and old structures. Vegetation is primarily large expanses of lawn with very few trees or shrubs. The survey area does not contain native vegetation or habitat for any sensitive species of plants or wildlife. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities.

Mitigation Measure(s):

Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 18 Nesting Bird Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The city of Pasadena is in the process of updating their general plan. Most of the city limits are urbanized but natural vegetation occurs in the foothills of the San Gabriel Mountains. Special interest areas with potential sensitive species has been identified in Arroyo Seco Watershed Assessment and the Eaton Wash/Canyon Corridor Plan. Hastings Canyon and the San Rafael Hills. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The City of Pasadena General Plan includes an Open Space and Conservation Element adopted in 2012. This element includes protection measures for wildlife, native plants, habitat connectivity, and Pasadena's urban forest. None of these resources occurs at the site. As a result, the proposed project would not conflict with any biological policies outlined in the City of Pasadena General Plan.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: Yes

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

Yes

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

Yes

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

The direct APE is completely encompassed by the National Register of Historic Places-listed Pasadena Civic Center Historic District. The district encompasses 15 individual historical resources. Within the indirect APE, there are numerous additional historical resources. Among these are individual properties and historic districts that are either listed or eligible for inclusion in the National Register, the California Register of Historical Resources, or are locally designated properties or landmarks. There is also one potential National Historic Landmark district within the indirect APE. This was confirmed through archival research and a field survey conducted by both a Secretary of Interior (SOI)-qualified archaeologist and architectural historian in January 2015. LMR activities at this project location include the attachment of whip and microwave antennas on a proposed 70-foot monopole; construction of a new equipment shelter; and installation of a backup generator and fuel tank on a concrete pad. Construction of a 70-foot monopole and its associated infrastructure features at this project location would have an adverse visual effect on the Pasadena Civic Center Historic District and surrounding historic properties within the viewshed of the indirect APE. Impacts at this project location would be out of character in both design and massing for this historic district and landscape and a significant impact; however, with implementation of CUL MM 5, significant impacts would be reduced to less than significant.

Mitigation Measure(s):

CUL MM 5 would be implemented at this project location. With implementation of CUL MM 5 (camouflage)

significant visual impacts would be reduced to less than significant.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The area is mapped as Quaternary older alluvium, which has a moderate potential for significant vertebrate fossils from the late Pleistocene. No localities are recorded within the proposed site; however, vertebrate fossil localities have been recorded from this geologic unit within the Santa Gabriel Valley. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Quaternary older alluvium to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014

and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Quaternary alluvium and marine deposits

Stability: Moderate pending geotechnical analysis

Soil Type: Zamora-Urban land-Ramona Association

Erosion Potential: Low

Expansive Soil: Low

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: No

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of well-drained silt to fine sandy loam with slow to medium runoff and moderately slow permeability. The site is located on flat grade in an urban environment. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the City of Pasadena planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing storm drains inlets.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located in an suburban to urban area. The fire station is within a neighborhood of homes and businesses and the monopole would be placed in previously developed area within a paved area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site PASPD01 and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site PASPD01 was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site PASPD01. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site PASPD01 would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site PASPD01, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site PASPD01 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: Yes, University of Phoenix

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: California Title Building Heliport and Huntington Hospital Heliport

Applicable Emergency Response or Emergency Evacuation Plan: yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage

Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: Yes

If yes, please explain: LMR Site is within 1/4 mile of multiple permitted USTs and 1 open LUST (Kaiser Permanente), 3 closed LUSTs, multiple drycleaners and auto supply and repair facilities less than 1/8 mile and upgradient from LMR Site, one CERCLIS corrective action site.

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste

transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A branch campus of the University of Phoenix is located within 0.25 mile of the proposed Project site. Construction activities could include refueling of equipment on site, which would be done using the BMPs identified in Chapter 2. Operations could include transport to and refueling of the up to 1500 gallon diesel tank integrated into the generator proposed for the site. Use, transport, and disposal of hazardous materials and wastes are required to occur in compliance with federal, state, and local regulations.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The project site is not within a designated Fire Hazard Severity Zone.

Mitigation Measure(s):

None required.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: San Gabriel Valley

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Pasadena

General Plan Designation: Central District Specific Plan

Zoning: CD-2 Central District

What is the zoning height restriction, if any?:

50 feet

City or county permit requirements for communication facilities, if any:

None identified

Comprehensive Plan or General Plan Local Agency: Pasadena

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such plans, policies, and regulations are not applicable to the project. Nevertheless, in the exercise of its discretion and in the interest in working cooperatively with local jurisdictions, local land-use plans, policies, and regulations are referenced, described, and addressed in recognition that such plans, policies, and regulations reflect the local community's policy decisions with respect to appropriate uses of land in the area. Consideration of these plans, policies and regulations, therefore, assists in determining whether the proposed project may conflict with nearby land uses, which could affect the analysis of whether the proposed project would result in potentially significant environmental impacts.

Based on the zoning ordinances for this site, the maximum allowable height of structures in this area is 50 feet.

Exceptions to the ordinance may be allowed, ordinarily with a conditional use permit. However, per the doctrine of intergovernmental immunity, the permit requirement is not applicable to the project. Because the Authority is exercising intergovernmental immunity, the City of Pasadena Comprehensive General Plan is not applicable and no conflict with the plan exists.

The proposed facilities at this site may be inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and the policy to protect areas that have significant natural resources. However, no physical impact would occur as a result of an inconsistency between the proposed project and the policy, and this is not considered a significant impact. As discussed in Sections 3.5 (geologic and soil hazards), Section 3.7 (fire hazards), Section 3.3 (biological effects), as well as in a site-by-site assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than significant.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Pasadena

Applicable Noise Ordinance: Title 9 Public Peace, Morals and Welfare, Article IV Offenses Against Public Peace, Chapter 9.36 Noise Restrictions

Noise Level Threshold: 85 dBA within 100 feet; no construction from 7 pm to 7 am on weekdays, 5 pm to 8 am on Saturday, all day Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: Huntington Memorial Hospital Heliport, Mesa Heliport, Super Bowl Heliport

Distance to Nearest Off-Site Sensitive Receiver: 175 feet

Ambient Noise Level: 60 dBA

Sensitive Noise Receiver 1: First Baptist Church

Sensitive Noise Receiver 2: Multi-family Residential Dwellings

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

Hourly average construction noise levels are anticipated to be approximately 89 dBA. The predicted noise levels represent the demolition phase which is anticipated to be the loudest construction phase. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site. However, in some instances, it may be necessary for construction activities to take place outside of these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The affected jurisdiction has not established a construction noise level threshold. Therefore, construction noise levels at the proposed Project site would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable" community noise equivalent level (CNEL) developed by the California Department of Health Services was referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. Noise levels from both sources would be below the 60 dBA "normally acceptable" level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers within this distance to the site; therefore, groundborne vibrational noise impacts would be less than significant.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings or sensitive receivers within this distance to the site; therefore, impacts from groundborne vibration would be less than significant.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. Therefore, extremely sensitive (fragile) buildings and sensitive receivers would not be exposed to excessive groundborne vibration or groundborne noise from Project operation and impacts would be less than significant.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, the estimated noise level at 175 feet from proposed sites would be 72 dBA and not exceed the 90 dBA daytime or 80 dBA nighttime criterion; therefore, construction impacts would be less than significant.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds; therefore, impacts from operational noise would be less than significant.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This site is located within an urban environment and adjacent to a private airstrip (Huntington Memorial Hospital Heliport, Mesa Heliport, Super Bowl Heliport). However, this site is located outside of the airstrip area where most noise is generated. Conservatively assuming a 65 CNEL at proposed Project sites such as PASPD01, this combined

baseline noise level in combination with the estimated construction noise levels for all proposed Project sites would be below the 90-Dba threshold where adverse community reaction could occur. Therefore, construction of this site would not expose people, workers or residents, to excessive noise levels.

After construction, this site will be unmanned during operation except for occupational maintenance, which would include landscaping maintenance, routine site inspections, and occasional equipment repairs. Conservatively assuming a 65 dBA CNEL at proposed Project sites located 0.25 miles from private airstrips, operation of this Project site, including the HVAC systems and emergency generators, would result in noise emissions below 60 dBA and would be considered “normally acceptable” for outdoor residential exposure. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels. Impacts from operation of the Project would be less than significant.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: N Arroyo Pkwy

Distance (Miles): 0.07

Disaster Route: Colorado Boulevard

Transit, Bicycle, or Pedestrian Facilities: Located within 0.25 miles of the LA Metro Rail

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Foothill Frwy

Distance (Miles): 0.11

Nearest Major Arterial: E Colorado Blvd

Distance (Miles): 0.12

Access to the Project Site Provided Via: Ramona Street

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In this urbanized area, this construction-related traffic would be less than one-quarter of a percent of the average daily traffic.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day at each site, and typically would be less than 1 percent of average daily traffic on nearby streets. Construction-related activities may require lane narrowing at a driveway or detours in the parking lots of existing facilities. These actions could temporarily impair access on adjacent roadways, potentially creating traffic hazards and limiting emergency access, resulting in a significant impact. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

TRANS MM 1: The construction contractor shall maintain a minimum of one open lane of traffic at all site access roads during project construction. Use of standard construction traffic control practices such as flagmen, warning signs, and other measures shall be implemented as necessary to ensure that traffic flow remains uninterrupted at all times.

TRANS MM 2: Any temporary road or lane closures that may affect state highways shall be coordinated with Caltrans prior to commencement of construction at the site that will require the road or lane closures. If construction requires temporary road or lane closures on roads and streets managed by local entities, a traffic management plan shall be prepared and submitted to the relevant county and/or city public works department or other appropriate department for approval prior to commencement of construction at the site. Encroachment permits would be obtained where applicable.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Scholl Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: CITY OF PASADENA

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: PDC

Site Name: Pacific Design Center

Site Discussion:

Propose installation of up to 20 whip and up to 7 microwave antennas on roof top of existing building without exceeding current overall height of the structure including appurtenances. Propose indoor equipment racks to be located in room in existing building, or in a new up to 600 square foot shelter on building roof, or up to 600 square foot shelter on adjacent grounds (prefab or CMU). Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank adjacent to the building.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 100 cubic yards removed

Proposed trenching for underground conduits to accommodate power and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide

Proposed foundations include:

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Address: 8687 Melrose Ave

Aesthetics

Setting

Visual Description:

The site is one of three ultra-modern buildings that constitute the Pacific Design Center in West Hollywood. The Pacific Design Center sells interior building supplies within a 1.2 million square-foot complex with over 120 showrooms. The complex includes three massive, multi-story “centers” in bold colors —blue, green, and red — each with a distinctive and unusual shape and sleek façade. The site is located on the red building. The center also includes two restaurants, a theater, conference center, and fitness center. Landscaping around the complex includes palm trees, shrubs, and a pool with fountains. The massive forms, vivid colors, and unusual shapes formed by the buildings within the design center are a stark contrast to the neighboring buildings in this urban area. A small landscaped park consisting of hardscape, lawns, and low shrubs and trees, is directly opposite San Vicente Blvd, a 5-lane roadway. Smaller commercial buildings are adjacent to the site, and Melrose Avenue to the south includes storefronts that have a traditional “Main Street” feel that contrasts sharply with the design center. The red building, and hence, the site, is a dominant visual feature for residents of the single- and multi-family buildings dwellings directly east of the site. The site is less evident from other locations within a 0.25-mile radius.

Visual Sensitivity: Low

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located in a commercial/residential urban setting that includes a large commercial building complex. The site is not within a scenic vista or within view of one.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Operational impacts would result from mounting whip and microwave antennas to an existing antenna mounting platform on the penthouse on the roof of the red design center building. The proposed new facilities would be obscured from view and would be compatible with the existing visual character and quality, which consists of a large commercial complex that is surrounded primarily by residences. Short-term construction impacts would not affect visual character or quality given the height of the building.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site is in an urban area. The proposed Project facilities would be roof mounted or collocated and constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. No additional lighting would be required. This would not result in a substantial new source of day or nighttime light or glare that would adversely affect nighttime views of the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Police station

Distance to Sensitive Receptor: 60

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site PDC. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site PDC or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site PDC would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site PDC will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site PDC would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site PDC or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site PDC, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site PDC, which is 60 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds for NO_x, CO, lower for PM₁₀, PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site PDC and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site PDC in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site PDC and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

monarch butterfly (*Danaus plexippus*; ESA-Pet)

Special Status Plants Recorded within 1 Mile:

Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, 1B.1)

Sensitive Communities Recorded within 1 Mile:

None

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

None

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

None

Local Policy or Ordinance for Biological Resources:

City of West Hollywood General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Ornamentals

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site PDC is located at the base of the east side of the Hollywood Hills entirely within an urban setting containing buildings, roads, paved parking areas, and landscaped areas. The Pacific Design Center is a complex of extremely large buildings surrounded by walkways, lawn, and ornamental trees. The site contains a multi-story parking structure. The survey area does not contain habitat for Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, CNPS 1B.1). Monarch butterflies may pass through the project area, but suitable roost sites are lacking. The antennae would be placed on the roof on one of the buildings.

Mitigation Measure(s):

None required.

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

According to the city general plan the city limits are completely urbanized and the only open space are 15.3 acres of parks and vacant lots. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The City of West Hollywood General Plan does not include policies to protect biological resources.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct area of potential effects (APE). The direct APE consists solely of the Pacific Design Center (Red Building), which was built in 2012 and, based on archival research and field survey, is not a historical resource. Within the indirect APE there are more than 60 historical resources, including individual properties and historic districts. These properties are listed in or eligible for inclusion in the National Register of Historic Places, the California Register of Historical Resources, or are locally designated properties or landmarks. The closest of the historical resources to the direct APE are Resource No. P-19-176757, the Pacific Design Center (Blue Building), which is approximately 500 feet to the southeast and Resource No. P-19-189252, the San Vicente Branch Library, which is approximately 430 feet to the southwest. Both of these buildings are eligible for listing in both the National and California Registers. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. LMR activities at this project location include the attachment of whip and microwave antennas to an existing antenna mounting platform recessed within the PDC roofline; proposed indoor equipment racks would be located in an existing equipment room inside the building. Given the height of this building (15 stories including 5 parking levels) and the low profile of the proposed antennas within the recessed platform, there would be no visual effects on any of the surrounding historical resources; therefore, there would be no impacts on historical resources at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as low sensitivity younger Quaternary alluvial sediments at the surface. However, these deposits typically overlie older geologic units that may contain significant vertebrate fossils at depth. No localities are recorded within the proposed site; however fossil localities have been recorded in the vicinity. Recovered fossils include extinct horse from unspecified depth. Similar Quaternary sediments in the Los Angeles Basin have produced significant fossils at depths as shallow as two to eight feet. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Periodic paleontological spot checks are required when excavation exceeds depths of five feet into the Quaternary alluvium to determine if older, paleontologically sensitive sediments are present. If present, monitoring would be conducted during excavation into paleontologically sensitive sediments to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Quaternary alluvium and marine deposits

Stability: Moderate pending geotechnical analysis

Soil Type: Urban land-Sorrento-Hanford Association

Erosion Potential: Low

Expansive Soil: Low

Alquist-Priolo Zone: No

Liquefaction Potential: Yes

Landslide Zone: No

Steep Slopes: No

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line has been identified approximately 1/8 of a mile east of the property (Santa Susana) (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, or potential land subsidence area. The site does lie within a potential liquefaction area as designated by California Department of Conservation, California Geological Survey (CGS). Antennas would be located on the roof of the existing building, therefore a geotechnical study for new structures is not required. All structures in southern California are located within an area subject to seismic shaking. The UBC and CBC have specific design requirements to reduce or eliminate the effects of seismic shaking. Permitting processes are required to evaluate and mitigate other geologic hazards such as liquefaction prior to issuance of a building permit. Existing structures

were built in accordance with current UBC and CBC at the time of construction. Therefore, the effects of seismic shaking or liquefaction would be less than significant.

Mitigation Measure(s):

None required.

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located on flat grade in an urban environment. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the City of West Hollywood planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing storm drains inlets.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, or potential land subsidence area. The site does lie within a potential liquefaction area as designated by California Department of Conservation, California Geological Survey (CGS). Antennas would be located on the roof of the existing building, therefore a geotechnical study for new structures is not required. All structures in southern California are located within an area subject to seismic shaking. The UBC and CBC have specific design requirements to reduce or eliminate the effects of seismic shaking. Permitting processes are required to evaluate and mitigate other geologic hazards such as liquefaction prior to issuance of a building permit. Existing structures were built in accordance with current UBC and CBC at the time of construction. Therefore, the effects of seismic shaking or liquefaction would be less than significant.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site PDC and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site PDC was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site PDC. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site PDC would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site PDC, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site PDC would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: Yes

If yes, please explain: There is 1 WDR site, opened on 4/20/2015 no reports available and one Military site reported in a INPR report. The site was declared ineligible for FUDS, no report of hazardous chemical release associated with the INPR.

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage

Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: Yes

If yes, please explain: Multiple closed LUSTs on-site. LMR Site within 1/4 mile of permitted 1 USTs and 2 open closed LUST sites. FUDS less than 1/8 mile from LMR.

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: Yes

If yes, please explain: 7 gas wells within 200 FT of LMR Site Boundary. All wells are reported as plugged and therefor do not present a methane hazard.

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with

transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed Project site is included in the Cortese List with multiple closed LUSTs on target property. Excavation would be limited to trenching for utilities/fiber, however, effort should be made to locate and characterize potential contamination associated with any soils excavated prior to construction to prevent exposure to existing contaminants. If contaminants are encountered, all excavation activity and excavated soils would be managed in accordance with applicable regulations. Operations activities would not trigger exposures to contaminants.

Mitigation Measure(s):

HAZ MM 1 - Prior to construction activity on proposed Project sites listed above in HAZ-4, the construction

contractor must prepare a Phase I Environmental Site Assessment meeting the standards outlined in the American Society for Testing Materials (ASTM), Practice for Limited Environmental Due Diligence: Transaction Screen Process E 1528.

- Phase I documents shall be reviewed to determine if the lateral and vertical extent of impacted soil and/or groundwater will be encountered by proposed construction activities.
- If proposed construction activities will not encounter impacted soil or groundwater based on the documented vertical and lateral extent, no further action will be required.
- If it is determined that the construction footprint will encounter impacted soils or encounter impacted groundwater, the contractor shall prepare a site-specific Health and Safety Plan that meets the requirements of 29 CFR 1910 for worker safety.
- If the lateral and vertical extent or the nature of the impacted soil cannot be determined from available documents, a Phase II investigation shall be completed to determine if the soils and/or groundwater that may be encountered during construction (within the footprint any excavation) are impacted. The Phase II investigation shall also determine the nature of contaminations that may be encountered.
- The Phase II report should also address disposal alternatives and procedures for any impacted soil that may be encountered or groundwater which may need to be removed.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency

responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The project site is not within a designated Fire Hazard Severity Zone.

Mitigation Measure(s):

None required.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Coastal Plain Of Los Angeles

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation would not be required at the site therefore dewatering would not be necessary. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting

process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: West Hollywood

General Plan Designation: C4 (Unknown)

Zoning: Pacific Design Center Specific Plan

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Project Conformity Review

Comprehensive Plan or General Plan Local Agency: West Hollywood

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing building and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: West Hollywood

Applicable Noise Ordinance: Title 9 Public Peace, Morals and Safety, Article 2 Miscellaneous, Chapter 9.08 Noise

Noise Level Threshold: N/A; no construction from 7 pm to 8 am on weekdays and Saturdays, or at time on Sunday and holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: 25 feet

Ambient Noise Level: 60 dBA

Sensitive Noise Receiver 1: West Hollywood Park

Sensitive Noise Receiver 2: West Hollywood Pool

Sensitive Noise Receiver 3: West Hollywood Library

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

Hourly average construction noise levels are anticipated to be approximately 89 dBA. The predicted noise levels represent the demolition phase which is anticipated to be the loudest construction phase. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site. However, in some instances, it may be necessary for construction activities to take place outside of these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The affected jurisdiction has not established a construction noise level threshold. Therefore, construction noise levels at the proposed Project site would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable"

community noise equivalent level (CNEL) developed by the California Department of Health Services was referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. Noise levels from both sources would be below the 60 dBA “normally acceptable” level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. Sensitive receivers (recreational uses) are located within 25 feet of Project site PDC; therefore, groundborne vibrational noise impacts would be significant.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site; therefore, impacts from groundborne vibration would be less than significant.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. Therefore, extremely sensitive (fragile) buildings and sensitive receivers would not be exposed to excessive groundborne vibration or groundborne noise from Project operation and impacts would be less than significant.

Mitigation Measure(s):

NOI MM 1

Prior to commencement of construction at site PDC, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction vibration impacts. Such measures may include but are not limited to the following:

- Route heavily-loaded trucks away from residential streets, if possible, selecting streets with the fewest homes if no other alternatives are available.

- Operate earth moving equipment including excavators/mini excavators and dump trucks as far away from vibration-sensitive locations as possible.
- Phase demolition and earth-moving operations so as not to occur simultaneously. Total vibration could be significantly less when each vibration event occurs separately.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, the estimated noise level at 25 feet from proposed sites would be 89 dBA and not exceed the 90 dBA daytime criterion but would exceed the 80 dBA nighttime criterion; therefore, construction noise impacts for this Site would be significant.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds; therefore, impacts from operational noise would be less than significant.

Mitigation Measure(s):

NOI MM 2

• Prior to commencement of construction aSite PDC, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction noise impacts below the levels specified in FTA nighttime threshold. Such measures may include but are not limited to the following:

- Use noise blankets or other muffling devices on equipment and quiet-use generators at noise-sensitive receivers.
- Use well-maintained equipment and have equipment inspected regularly.
- Operate construction equipment for periods of fewer than 15 consecutive minutes when possible.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Santa Monica Blvd

Distance (Miles): 1.59

Disaster Route: Santa Monica Boulevard

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Interstate 10

Distance (Miles): 0.07

Nearest Major Arterial: N Robertson Blvd

Distance (Miles): 0.09

Access to the Project Site Provided Via: N. San Vicente Boulevard

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In this urbanized area, this construction-related traffic would be less than one-quarter of a percent of the average daily traffic.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day at each site, and typically would be less than 1 percent of average daily traffic on nearby streets. Construction-related activities may require lane narrowing at a driveway or detours in the parking lots of existing facilities. These actions could temporarily impair access on adjacent roadways, potentially creating traffic hazards and limiting emergency access, resulting in a significant impact. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

TRANS MM 1: The construction contractor shall maintain a minimum of one open lane of traffic at all site access roads during project construction. Use of standard construction traffic control practices such as flagmen, warning signs, and other measures shall be implemented as necessary to ensure that traffic flow remains uninterrupted at all times.

TRANS MM 2: Any temporary road or lane closures that may affect state highways shall be coordinated with Caltrans prior to commencement of construction at the site that will require the road or lane closures. If construction requires temporary road or lane closures on roads and streets managed by local entities, a traffic management plan shall be prepared and submitted to the relevant county and/or city public works department or other appropriate department for approval prior to commencement of construction at the site. Encroachment permits would be obtained where applicable.

Utilities

Setting

Nearest Solid Waste Disposal Facility: City of Burbank Landfill #3

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: CITY OF LOS ANGELES

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Dewatering would not be required for building mount or collocation sites because groundwater is not expected at the shallow depths of excavation associated with this activity. Wastewater treatment plants in the project would not be affected during construction. During operations, the project would not result in the production of any wastewater that would require treatment.

Mitigation Measure(s):

None required.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: PHN

Site Name: Puente Hills

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This site is on an undeveloped hill top and consists of a 150-foot tall lattice tower with three microwave dishes attached, a small shelter, and propane tank enclosed within a chain link fence on a small concrete pad. The site is adjacent to the Puente Hills Nike missile site, which includes an abandoned guard shack, rectangular concrete pad, two triangular radar tower platforms, and a one-story square structure. The surrounding area is undeveloped. Vegetation is predominantly grasses and scattered low trees to the north and in the drainages to the south. Cattle graze in the area. A large, bright white water tank is on the periphery of the area to the northwest. A smaller, brown water tank is west of the site and surrounded by vegetation, which helps obscure it from view. A fence encloses a large area that includes the existing site, Nike missile site, and a swath of land to the northwest.

Visual Sensitivity: Low

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present, particularly given the prominence of the unobstructed ridge top. However, the new facilities would be located within a site that includes existing structures that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing structures, which would attenuate the noticeability of new tower. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge line, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings has already been degraded by the presence of an existing site and lattice towers, as well as the Nike missile site radio tower platforms. The new tower and associated equipment would be compatible with the existing site and adjacent disturbed sites. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Water tower

Distance to Sensitive Receptor: 70

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site PHN. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site PHN or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?**Construction Impact:** Significant Impact Reduced to Less than Significant with Mitigation Incorporated**Operational Impact:** Less than Significant**Discussion:**

Emissions from the construction of proposed site PHN would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site PHN will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site PHN would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site PHN or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site PHN, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site PHN, which is 70 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 10 are higher than the SCAQMD thresholds for No_x, CO, below for PM₁₀, PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site PHN and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site PHN in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site PHN and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site PHN is located in the Puente Hills on a hilltop with existing communication towers and associated facilities; the compound is paved and fenced. The immediate area adjacent to the compound is either mowed or treated with herbicide. The project area is primarily non-native grassland with small patches of coastal sage scrub vegetation on steep slopes; California black walnut (*Juglans californica*) woodland and coast live oak (*Quercus agrifolia*) are found on slopes and in drainage channels. The project area is within designated critical habitat for the coastal California gnatcatcher (*Polioptila californica californica*; ESA-T, ESA-CH, CDFW-SSC). However, only small patches of coastal sage scrub vegetation are found on steep slopes near the perimeter of the project area. No suitable nesting habitat for the gnatcatcher occurs within the project area. The project area does not contain canyon habitat for the many-stemmed dudleya (*Dudleya multicaulis*; 1B.2). Disturbance to or destruction of nests of native bird species that are

protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of coastal California gnatcatchers (*Poliophtila californica californica*; ESA-T, ESA-CH, CDFW-SSC) in the project area, and the importance of maintaining coastal sage scrub vegetation. Minimize disturbance to natural vegetation; do not remove coastal sage scrub vegetation (e.g., California sagebrush [*Artemisia californica*], sage [*Salvia* spp], and Laurel sumac [*Malosma laurina*], and California buckwheat [*Eriogonum fasciculatum*]). Prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. No construction activities during the gnatcatcher breeding season. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 13 Coastal California Gnatcatcher Breeding Season Restrictions • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats within 500 feet of the project site. California black walnut (*Juglans californica*) woodlands are found within the project area on the north-facing slopes beginning about 150 feet below the existing facility.

Mitigation Measure(s):

Minimize disturbance to natural vegetation; do not remove California walnut trees. Prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Recommended Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes the following two wetland feature types as indicated by the National Wetland Inventory (USFWS 2014): 1) Freshwater Forested/Shrub Wetland; and 2) Riverine. However, these wetland types are restricted to ephemeral drainages. Adverse impacts to these wetlands may occur due to sedimentation as a result of runoff from the construction. However, construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from

stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is located within the proposed Puente Hills (Sycamore and Turnbull Canyons) Significant Ecological Area, which is identified as an important regional habitat linkage in the Los Angeles General Plan. This SEA has been found to support significant wildlife movement as well as residential habitat, and serves as a linkage between the Puente Hills and Chino Hills. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. Additionally, due to the nature of the project, impacts to wildlife movement would be minimal to none. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Construction at Site PHN could result in removal of vegetation and human disturbance at each site and therefore could result in conflict with the Los Angeles County General Plan's Policy C/NR 3.1, which calls for conservation and enhancement of ecological function diverse natural habitats and biological resources. The site contains an existing tower facility, related infrastructure, and access road along with disturbed native scrub vegetation. The current use at the site is communications facility, and substantive removal of native vegetation is not expected. Construction and operations activities at the site do have the potential to impact biological resources, as described in Impact BIO 1 and Impact BIO 2. These impacts to resources conflict with Policy C/NR 3.1. Because a potential for significant impact associated with the resources protected by the Los Angeles County General Plan exists, this would constitute a significant impact.

Mitigation Measure(s):

The mitigation measures identified in Impact BIO 1 and Impact BIO 2 would reduce impacts from construction and operations to less than significant. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 4 Site Sanitation • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 13 Coastal California Gnatcatcher Breeding Season Protocol Surveys • BIO MM 14 Coastal California Gnatcatcher Breeding Season Restriction • BIO MM 15 Southwestern Willow Flycatcher Protection • BIO MM 16 Snowy Plover Protection • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Monarch Butterfly Protection • BIO MM 24 Prevent the Spread of Nonnative Vegetation • BIO MM 25 Special Status Plants Surveys and Protection

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: Yes

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in October 2014. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Miocene Monterey Formation, which has a high potential for significant vertebrate fossils. No localities are recorded within the proposed site; however, there are significant fossil localities recorded in the vicinity. Recovered fossils include the holotype specimen of the fossil Sciaenid fish, *Seriphus lavenbergi*. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Monterey Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: Moderate pending geotechnical analysis

Soil Type: Soper-Fontana-Calleguas-Balcom-Anaheim Association

Erosion Potential: Low Potential

Expansive Soil: Moderate potential

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate slopes

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line (Whittier Fault) has been identified approximately 1/2 of a mile south of the property (Santa Susana) (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These

acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site ranges from a well-drained gravelly loam to a clay loam with rapid runoff and moderately slow permeability. Moderate slopes surround the flat site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site PHN and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site PHN was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site PHN. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site PHN would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site PHN, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site PHN would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: N/A

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space

Zoning: Light Agriculture

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Rowland Heights Community Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing telecommunications structure and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

The proposed facilities at this site may be inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and the policy to protect areas that have significant natural resources. However, no physical impact would occur as a result of an inconsistency between the proposed project and the policy, and this is not considered a significant impact. As discussed in Sections 3.5 (geologic and soil hazards), Section 3.7 (fire hazards), Section 3.3 (biological effects), as well as in a site-by-site assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than

significant.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: Yes

Trail Name: Located within 0.25 miles of Schabarum Extension Trail

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Orange Frwy

Distance (Miles): 2.22

Disaster Route: State Route 57

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Orange Frwy

Distance (Miles): 1.59

Nearest Major Arterial: Brea Canyon Rd

Distance (Miles): 1.05

Access to the Project Site Provided Via: Vantage Pointe Drive

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Savage Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: ROLAND W DIST

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: PMT

Site Name: Pine Mountain

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of two (2) up to 85kW diesel generators each with up to 1,500 gallon belly tanks. Propose installation of two solar arrays up to 1500 square feet total. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 10,000 square feet

Permanent disturbance area: Up to 8,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Surrounding area east of site

Site view looking west

Surrounding area west of site

Aesthetics

Setting

Visual Description:

This isolated site is located in Angeles National Forest west of San Gabriel Reservoir on an undeveloped ridgeline accessible via a gated dirt road. Vegetation is sparse and consists primarily of low shrubs. The site is approximately 500 feet southeast of, and at a lower elevation than, an existing site that includes a small cleared area with two lattice towers approximately 30 feet tall. One tower has three microwave dishes attached. A solar array consisting of approximately 5 panels is also on-site. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Experimental Forest, which is generally closed to the public except by permit.

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Back County (Motorized Use Restricted)

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present, particularly given the prominence of the unobstructed ridge top. However, the new facilities would be located within a site that includes existing towers that already create a visual intrusion onto the landscape. The new monopole would not perceptibly change the scenic vista due to the presence of the existing towers, which would attenuate the noticeability of new structure. In addition, locating the new monopole and equipment in proximity to the existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a state scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. The existing visual character and quality of the site and its surroundings has already been degraded by the presence of an existing site and lattice towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. There would be no change to the site's scenic attractiveness rating. In addition, the site is located on a USFS Designated Communication Site, which generally allows for such use within the area's landscape. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Reservoir

Distance to Sensitive Receptor: 13030

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site PMT. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site PMT or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site PMT would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site PMT will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site PMT would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for Nox and could result in cumulatively considerable net increases in O3 from the Nox emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor Nox would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, Nox emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site PMT or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site PMT, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site PMT, which is 13,030 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 9 are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site PMT and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site PMT in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site PMT and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly

trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

None

Special Status Plants Recorded within 1 Mile:

Rock Creek broomrape (*Orobanche valida* ssp *valida*; 1B.2)

Sensitive Communities Recorded within 1 Mile:

Canyon Live Oak Ravine Forest; Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E); Rock Creek broomrape (*Orobanche valida* ssp *valida*; 1B.2)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

US Forest Service - Angeles National Forest; SEA – San Gabriel Canyon; SCAG Zoning - Wildlife Preserves and Sanctuaries; Essential Connectivity Area - Sugarloaf Mountain/Keller Peak - San Gabriel/Cucamonga; Natural Landscape Block - San Gabriel/Cucamonga

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Mountain white thorn chaparral [*Ceanothus cordulatus* Shrubland Alliance];

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site PMT is located on a remote mountain top in the San Gabriel Mountains. The project area is within the montane chaparral vegetation community. The study areas considered to be outside the current range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), but as the condor population increases it is expected to expand geographically. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. Southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) is known to occur in Bear Creek and portions of the West Fork of the San Gabriel River, about 1.5 miles to the northeast of Site PMT. Though the project site is located in steep mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland,

regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. Site PMT is hydrologically connected to the West Fork of the San Gabriel River. Rock Creek broomrape (*Orobanche valida* ssp. *Valida*; 1B.2) is a parasitic herbaceous plants; its host plant is silk tassel bush (*Garrya* sp). Silk tassel bush was observed in the project area during the habitat assessment survey conducted on 9/24/2014 but the broomrape was not; a summer surveys is necessary to detect broomrape though the dense vegetation and steep terrain surrounding the site would preclude a thorough survey. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

To address future use of the area by condors all trash and construction debris (especially small items such as nuts and washers) will be removed from the site; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) and Rock Creek broomrape; *Orobanche valida* ssp *valida*; 1B.2) in the project area and along access roads. To protect dispersing southern mountain yellow-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Conduct summer botanical survey for Rock Creek broomrape and its host plant the silk tassel bush; if present mark the areas requiring special protection. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site. Canyon Live Oak Ravine Forest was not observed within the project area.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Riverine wetland feature type as indicated by the National Wetland Inventory (USFWS 2014). However, this wetland type is restricted to ephemeral drainages. Construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated San Gabriel/Cucamonga Natural Landscape Block which overlaps the ranges of approximately 261 amphibian, reptile, mammal and bird species. It is also located within an Essential Connectivity Habitat Area that connects the Pleasant View Ridge and San Dimas Natural Landscape Blocks. Additionally, this site is located within the Proposed San Gabriel Canyon Significant Ecological Area. According to the Los Angeles General Plan, this SEA provides for consistent seasonal movement up and down its many drainages, particularly for large mobile mammals. It also provides movement and residential habitats for riparian-favoring birds. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement. This SEA However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

Recommended mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant. There are no other historical resources within the direct or indirect APEs. LMR activities at this project location include the attachment of whip and microwave antennas on a proposed lattice tower (up to 180 feet in height); construction of a new equipment shelter; and installation of a backup generator and fuel tank on a concrete pad. The direct APE consists solely of two existing fenced communications facilities on paved or compacted earth areas and a dirt access road. Based on the nature of this project site and the identified resources, impacts would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within both the direct and indirect areas of potential effects (APE). Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Precambrian igneous and metamorphic rock complex

Stability: Moderate pending geotechnical analysis

Soil Type: Tollhouse-Rock outcrop-Etsel family-Bakeoven Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line (Sierra Madre) has been identified approximately 1/3 of a mile south of the property (Santa Susana) (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These

acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of excessively-drained, coarse sandy to gravelly loam with rapid to very rapid runoff and moderately rapid permeability. Moderate to steep slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site PMT and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site PMT was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site PMT. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site PMT would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site PMT, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site PMT would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.
