ADOPTED

BOARD OF SUPERVISORS
COUNTY OF LOS ANGELES

The Honorable Board of Supervisors
County of Los Angeles
383 Kenneth Hahn Hall of Administration
500 West Temple Street
Los Angeles, California 90012

16 April 12, 2016

LORI GLASGOW
EXECUTIVE OFFICER

Dear Supervisors:

**REQUEST FOR DELEGATED AUTHORITY TO THE CHIEF EXECUTIVE OFFICER
TO NEGOTIATE AND EXECUTE SITE ACCESS AGREEMENTS WITH
LOS ANGELES REGIONAL INTEROPERABLE COMMUNICATIONS SYSTEM AUTHORITY
(FOURTH AND FIFTH DISTRICTS)
(3 VOTES)**

SUBJECT

The recommendation is a request to consider the Final Environmental Impact Report (EIR) and make related environmental findings and to delegate authority to the Chief Executive Officer, or her designee, to execute in substantially similar form, Site Access Agreements with the Los Angeles Regional Interoperable Communications System (LA-RICS) Authority for the collocation, construction, operation and maintenance of the Land Mobile Radio (LMR) System at the Los Angeles County Puente Hills (PHN) and Verdugo Peak (VPK) sites.

IT IS RECOMMENDED THAT THE BOARD:

1. Acting as a responsible agency for the Los Angeles Regional Interoperable Communications System (LA-RICS) Authority Land Mobile Radio (LMR) System, consider the Final Environmental Impact Report (EIR) prepared and certified by LA-RICS Authority prior to the Board of Supervisors consideration of the actions recommended herein; certify that the Board of Supervisors has independently considered and reached its own conclusions regarding the environmental effects of the LA-RICS Authority LMR System at County sites as shown in the Final EIR; adopt the Mitigation Monitoring Program as applicable to the County sites proposed for approval, find that the Mitigation Monitoring Program is adequately designed to ensure compliance with the mitigation measures during project implementation; find that there are no feasible alternatives or feasible mitigation measures within the Board of Supervisors power that would substantially lessen or avoid any significant effect the project would have on the environment; and determine that the significant

adverse effects of the project have either been reduced to an acceptable level or are outweighed by the specific considerations of the project, as outlined in the Environmental Findings of Fact and Statement of Overriding Considerations, which findings and statement are adopted as applicable and incorporated herein by reference;

2. Find that the impacts of the two Site Access Agreements are within the scope of the impacts analyzed in the EIR certified by the LA-RICS Authority on March 29, 2016. There have been no changes to the project at these sites since the Final EIR was certified by the lead agency that would require a new environmental review.

3. Delegate authority to the Chief Executive Officer, or her designee, to execute, in substantially similar form, up to two Site Access Agreements for the collocation, construction, operation, and maintenance of the LMR equipment at County-owned sites.

PURPOSE/JUSTIFICATION OF RECOMMENDED ACTION

The purpose of the recommended action is to consider the Final Environmental Impact Report (EIR) for the Los Angeles Regional Interoperable Communications System (LA-RICS) Land Mobile Radio (LMR) System, adopt the environmental Findings of Fact and Statement of Overriding Consideration and Mitigation Monitoring Plan, as applicable, and allow the Chief Executive Officer (CEO) to execute gratis, non-exclusive Site Access Agreements (SAAs) for the Puente Hills and Verdugo Peak sites, to either permit the LMR equipment to be collocated at existing telecommunications infrastructure for the LA-RICS, Long Term Evolution (LTE) System, or to permit the erection of a new up to 180 foot lattice tower with a new 24' x 24' shelter and generator, for an unlimited period at existing County-owned sites. Collocation work at the existing infrastructure will occur at the Puente Hills site. The Verdugo Peak site, which is an existing telecommunications site with other existing towers, will receive up to a 180 foot lattice tower. The Final EIR and corresponding documents is enclosed as Attachment A.

Expeditious and efficient processing of each SAA is needed to allow the LA-RICS Authority to fulfill its grant funding timeline obligations under Urban Areas Security Initiative (UASI) '11, '12, and '13 for completion of various LMR sites, in a phased manner. The subject County-owned sites are outlined in Attachment B. Public outreach to residents within 500 feet of the sites have been completed at the Puente Hills site. There are no residents/businesses within 500 feet of the Verdugo Peak site.

Implementation of Strategic Plan Goals

The proposed Agreements support the Countywide Strategic Plan Goal of Operational Effectiveness (Goal 1). Upon entering into the proposed SAAs, the LA-RICS Authority will be in a position to further develop a modern public safety LMR communication system that will maximize the effectiveness of processes, structure, and operations to support the timely delivery of customer-oriented and efficient public services, particularly in the areas of public safety.

FISCAL IMPACT/FINANCING

The granting of non-exclusive access to LA-RICS Authority will be on a gratis basis, and will have no fiscal impact for the County-owned sites.

FACTS AND PROVISIONS/LEGAL REQUIREMENTS

LA-RICS was formed in 2009, as a Joint Powers Authority (JPA) comprised of independent cities, the County, and other public agencies throughout Los Angeles County. The County is a member agency in the LA-RICS Authority. The mission of the LA-RICS Authority is engaged in a region-wide cooperative effort to plan and establish a wide-area interoperable public safety communications network known as LA-RICS. When commissioned, the LA-RICS will provide first and secondary responders with the technology to coordinate, in real time, their response in day-to-day operations, and most importantly, during emergencies. The LA-RICS is made up of two independent systems, the LTE and the LMR Systems. The SAAs proposed in this action are only for the LMR System.

These SAAs are necessary to license certain real property owned by the County to the LA-RICS Authority for use as a LMR communications site. The LA-RICS Authority will collocate, construct, own, operate, and maintain the LMR System. The LMR project is a single, unified public safety radio communications system for Los Angeles County. Currently, more than 80 public safety agencies use 40 different and aging radio systems to communicate, preventing them from talking in real-time during catastrophic events. LA-RICS will provide public safety agencies with better, faster, and more accurate information with which to save lives and protect property.

Federal funding has been provided to support LA-RICS' mission, and certain milestones must be fulfilled in connection with this funding. The use of these two sites will facilitate applying these federal funds timely.

The proposed SAAs have been prepared and negotiated by the Chief Executive Office-Real Estate Division (CEO-RED), LA-RICS Authority, and various County Counsel representing each party. Each SAA will be executed in a form substantially similar to Attachment C. The SAAs stipulate that LA-RICS' responsibilities include utility payments, maintenance obligations, as well as certain insurance and indemnity requirements.

The LA-RICS Authority Outreach Team, consisting of specialists with experience in telecommunications, engineering, site acquisition, public safety personnel, and staff experienced with working with elected officials, scheduled and coordinated meetings with the impacted jurisdictions. In regards to the two sites identified in this Board letter, outreach has been completed for Puente Hills, including door-to-door outreach to residents/businesses within 500 feet of the proposed sites. As previously mentioned, there are no residents/businesses within 500 feet of the Verdugo Peak site. The LA-RICS Authority also met with the Rowland Heights Coordinating Council in regards to the Puente Hills site. Once the construction schedule has been approved, and prior to construction, those same residents will receive construction notifications via a door hanger/flyer, one to two weeks prior to the start of construction.

ENVIRONMENTAL DOCUMENTATION

On March 29, 2016, the LA-RICS JPA Board of Directors certified the Final EIR for the LA-RICS LMR System. In approving the two SAA Agreements, the County is acting as a responsible agency for the LA-RICS LMR Project. The LA-RICS Authority, as lead agency under CEQA, has prepared an Initial Study, consulted with the County and certified the Final EIR on March 29, 2016. Since the EIR has been certified as recommended, the approval by the County will determine that the EIR is adequate, and will adopt the Findings of Fact, Statement of Overriding Consideration and Mitigation Monitoring Plan prepared for the LA-RICS LMR Project, as applicable to Sites PHN and VPK.

The proposed Site Access Agreements allow for the LA-RICS Authority to conduct work related to the design, construction, implementation, operation and maintenance of LMR infrastructure at the two sites in Attachment B, owned or leased by the County of Los Angeles. All of these sites are within the scope of the previously-authorized project and were analyzed in the Final EIR.

There have been no changes to the project since the LA-RICS Authority Board certified the EIR or to the circumstances under which the project is undertaken that would result in new effects or the need for new mitigation. Thus, the EIR can be used as the basis for the LA-RICS Authority's approval of the SAAs and no new environmental document is required pursuant to Public Resources Code Section 21166 and CEQA Guidelines Section 15162. Upon the Board's approval of the SAAs, the CEO's Office will file a Notice of Determination with the Registrar-Recorder/County Clerk (RR/CC) in accordance with Section 21152(a) of the California Public Resources Code and pay the required filing and processing fees with RR/CC in the amount of \$75.

IMPACT ON CURRENT SERVICES (OR PROJECTS)

The approval of these Board recommendations will not compromise public safety missions or disrupt any vital, existing County communication systems.

CONCLUSION

It is requested that the Executive Office, Board of Supervisors, return two certified copies of the Minute Order to the CEO, Real Estate Division at 222 South Hill Street, 4th Floor, Los Angeles, CA 90012.

Respectfully submitted,

SACHI A. HAMAI
Chief Executive Officer

1.0 Introduction

1.1 Project Descriptions and Location

The Los Angeles Regional Interoperable Communications System (LA-RICS) Joint Powers Authority (Authority) proposes to establish a Land Mobile Radio (LMR) system as a communications system for first responders in Los Angeles County. The LMR system would consist of installation, operation, and maintenance of LMR facilities at up to 90 sites. The Authority is considering a total of 95 sites to provide alternate locations if some sites are determined to be unviable and are removed from further consideration during site feasibility assessments, system engineering, geotechnical evaluations, the permitting process, and/or in lease agreement discussions with the property owner. Of these 94 sites, the Authority has previously determined that 40 sites are statutorily exempt from California Environmental Quality Act (CEQA) under Public Resources Code section 21080.25. A Draft Environmental Impact Report (EIR) was prepared to analyze the remaining 54 sites that did not qualify for the CEQA statutory exemption. Although potential LMR sites are located in Los Angeles County and adjacent portions of Orange and San Bernardino counties, the sites evaluated in the Draft EIR (i.e., the sites not subject to statutory CEQA exemption) are all located within Los Angeles County with the exception of one site in San Bernardino County. Each of the 54 sites analyzed in the Draft EIR would be equipped with whip and microwave antennas mounted on either (a) an existing building, or on an existing or modified monopole or lattice tower, or (b) a new monopole or new lattice tower. Supporting infrastructure to be developed at each site would include equipment racks to be located inside a new or existing equipment shelter or building, a new up to 85-kilowatt backup generator with up to 1,500-gallon integrated diesel fuel tank, and supporting interconnections for fiber and electrical service.

A more detailed description of the project and the alternatives considered is provided in Chapter 2.0 of the Draft EIR.

1.2 Public Review Process for the Draft EIR

The Authority published a Notice of Availability (NOA) for the Draft EIR on January 11, 2016, initiating a 45-day public review and comment period that ended on February 25, 2016. The NOA was published on the LA-RICS website (<http://www.la-rics.org/wp-content/uploads/2016/01/LA-RICS-LMR-DEIR-NOA-FINAL.pdf>). The availability of the Draft EIR and the dates of public meetings were advertised in the following newspapers:

- *Antelope Valley Press*
- *La Opinión*
- *Los Angeles Wave*
- *Long Beach Press-Telegram*
- *Los Angeles Daily News*
- *Los Angeles Times*

- *Santa Clarita Valley Signal*
- *San Gabriel Valley Tribune*

Public meetings were hosted on the following dates and locations:

Monday, January 25, 2016, 6:30 p.m.

Walnut Senior Center, Assembly Room
21215 La Puente Road, Walnut, CA 91789

Tuesday, January 26, 2016, 6:30 p.m.

Canoga Park Branch Library, Meeting Room
20939 Sherman Way, Canoga Park, CA 91303

Wednesday, January 27, 2016, 6:30 p.m.

Culver City Veterans Memorial Building, Multipurpose Room
4117 Overland Ave., Culver City, CA 90230

Thursday, January 28, 2016, 6:30 p.m.

Jane Reynolds Activity Center, Activity Room
716 Oldfield St., Lancaster, CA 93534

Tuesday, February 2, 2016, 6:30 p.m.

Peck Park Community Center, Auditorium
560 N. Western Ave., San Pedro, CA 90732

Tuesday, February 16, 2016, 4:00 p.m.

Catalina Country Club, Dining Room
1 Country Club Drive, Avalon, CA 90704

The format for each public meeting was the same. The meeting started with introductions of team members present at the meeting. A short presentation provided an overview of LA-RICS, the proposed LMR system, the CEQA process and the contents of the Draft EIR, and methods for providing comments on the Draft EIR. The meeting concluded with an open house where the public could talk one-on-one with project team members to ask questions or gain a better understanding of the project and the locations of proposed LMR sites. Although the meeting format allowed for conversation with the project team, the presentation directed that only written comments to the Draft EIR would be considered. Comment forms were provided at the public meetings. Completed comment forms could be submitted during the meeting or mailed to the Authority.

The Draft EIR was available for review at the following locations and on the LA-RICS website at <http://www.la-rics.org/wp-content/uploads/2016/01/LA-RICS-LMR-DEIR-January-2016.pdf>.

In accordance with CEQA Guidelines §15088, the Authority, as Lead Agency for the Proposed Project, has reviewed and evaluated written comments submitted during the public review period regarding the LMR Project.

The CEQA Guidelines, §15088, "Evaluation of Response to Comments," states:

- a) The lead agency shall evaluate comments on environmental issues received from persons who reviewed the draft EIR and shall prepare a written response. The lead agency shall respond to comments received during the noticed comment period and any extensions and may respond to late comments.
- b) The lead agency shall provide a written proposed response to a public agency on comments made by that public agency at least 10 days prior to certifying an environmental impact report.

- c) The written response shall describe the disposition of significant environmental issues raised (e.g., revisions to the proposed project to mitigate anticipated impacts or objections). In particular, the major environmental issues raised when the lead agency's position is at variance with recommendations and objections raised in the comments must be addressed in detail giving reasons why specific comments and suggestions were not accepted. There must be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice.
- d) The response to comments may take the form of a revision to the draft EIR or may be a separate section in the final EIR. Where the response to comments makes important changes in the information contained in the text of the draft EIR, the lead agency should either:
 - 1) Revise the text in the body of the EIR, or
 - 2) Include marginal notes showing that the information is revised in the response to comments.

No significant changes to the data and analysis contained in the Draft EIR have been required as a result of the comments received during this response process. The responses provided herein clarify, amplify, elaborate, and make minor modifications to the Draft EIR. The Draft EIR remains adequate and complete; therefore, recirculation per CEQA §15088.5 is not required. This Final EIR will be presented to the Authority for certification.

In Chapter 4 of this Final EIR, the Authority has elected, as appropriate, to revise the Draft EIR text where necessary to address errata or update the EIR with information gained in the Responses to Comments document.

CEQA Guidelines §15088 addresses a Lead Agency's responsibilities in responding to comments. The Guidelines require, among other things, that the Lead Agency provide a good faith, reasoned analysis in response to significant environmental issues raised, particularly when the Lead Agency's position is at variance with the objections and recommendations raised by commenters. §15088 does not require an individual response to each comment letter and does not prevent the Authority from responding to comments by way of a summary or comprehensive response that may apply to several individual remarks in comment letters.

Public Resources Code §21091(d)(1) requires that the Authority, as Lead Agency, consider any comments on the proposed Draft EIR that are received within the public review period. As previously discussed, six public meetings were held; however, no public comments were submitted at these meetings; and no additional environmental issues were raised at the meetings that had not been addressed in the Draft EIR. The Authority received 74 comment letters and/or emails on the Draft EIR from public agencies, organizations, and individuals during the public review period.

CEQA Guidelines §15204(a) provides that:

In reviewing draft EIRs, persons and public agencies should focus on the sufficiency of the document in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the project might be avoided or mitigated. Comments are most helpful when they suggest additional specific alternatives or mitigation measures that would provide better ways to avoid or mitigate the significant environmental effects. At the same time, reviewers should be aware that the adequacy of an EIR is determined in terms of what is reasonably feasible, in light of factors such as the magnitude of the project at issue, the severity of its likely environmental impacts, and the geographic scope of the project. CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters. When responding to comments, lead agencies need only respond to significant environmental issues and need not provide all information requested by reviewers, as long as a good faith effort at full disclosure is made in the EIR.

CEQA Guidelines § 15204(c) further advises:

Reviewers should explain the basis for their comments and should submit data or references offering facts, reasonable assumptions based on facts, or expert opinion supported by facts in support of the comments. Pursuant to §15064, an effect shall not be considered significant in the absence of substantial evidence.

CEQA Guidelines § 15204(d) states:

Each responsible agency and trustee agency shall focus its comments on environmental information germane to that agency's statutory responsibility.

CEQA Guidelines § 15024(e) states:

This section shall not be used to restrict the ability of reviewers to comment on the general adequacy of a document or the lead agency to reject comments not focused as recommended by this section.

Each comment received on the Draft EIR is included in its entirety in this document. Each letter or email containing comments on the Draft EIR is followed by responses corresponding to comments submitted in the letter or email. Comments have been arranged herein under the following categories: State Agency Comments, Local/Regional Jurisdiction Comments, Non-Governmental Organization Comments, and Public Comments. No new significant environmental impacts are raised by the submitted comment letters.

1.3 Organization of This Document

This Final EIR briefly summarizes the public review and notification process for the Draft EIR, which are key steps in the CEQA process. Chapter 2.0 of this document identifies the persons and agencies who offered comments on the Draft EIR and how those comments are listed and addressed in Chapter 3.0.

Chapter 4.0 provides the revisions to the Draft EIR that have been made for the Final EIR in response to these comments. This includes corrections or additions identified by Authority staff.

The Draft EIR is incorporated by reference into this Final EIR. Chapter 4.0 includes revisions to the Draft EIR in tracked changes (underline/strikethrough) format.

2.0 Agencies and Persons Commenting on the Draft EIR

During the 45-day review and comment period, 71 written comment submissions were received from state, regional, and local agencies; non-governmental organizations; and the public. The submissions varied, some consisting of a single comment while some included more than one individual comment. Responses to comments received are provided in Chapter 3.0. Comment responses are organized in the order listed below.

2.1 State Agency Comments

One letter was received from a state agency (SA). This letter is referenced in Table 2.1-1.

Table 2.1-1: State Agency Comment Letters

Letter	Commenter	Date	Pages
SA-1	Santa Monica Mountains Conservancy	February 25, 2016	12 – 17

2.2 Local/Regional Agency Comments

Thirteen letters were received from agencies with local or regional (LR) jurisdiction. These letters are referenced in Table 2.2-1.

Table 2.2-1: Local/Regional Agency Comment Letters

Letter	Commenter	Date	Pages
LR-1	Antelope Valley Air Quality Management District	January 21, 2016	18 – 20
LR-2	City of Agoura Hills	February 24, 2016	21 – 37
LR-3	City of Beverly Hills	February 25, 2014	38 – 46
LR-4	City of Chino Hills	February 25, 2016	47 – 49
LR-5	City of El Segundo	February 23, 2016	50 – 52
LR-6	City of Glendora	February 19, 2016	53 – 57
LR-7	City of Industry	January 26, 2016	58 – 60
LR-8	City of Rancho Palos Verdes	February 24, 2016	61 – 65
LR-9	City of Rolling Hills	February 12, 2016	66 – 68
LR-10	City of Rolling Hills Estates	January 13, 2016	69 – 71
LR-11	City of Signal Hill	February 25, 2016	72 – 86
LR-12	South Coast Air Quality Management District	February 19, 2016	87 – 89

2.3 Non-governmental Organization Comments

Three comment letters were received from non-governmental organizations (NGOs). These letters are referenced in Table 2.3-1.

Table 2.3-1: Non-governmental Organization Comment Letters

Letter	Commenter	Date	Pages
NGO-1	Brentwood Hills Homeowners Association	February 20, 2016	90 - 101
NGO-2	Federation of Hillside and Canyon Associations, Inc.	February 25, 2016	102 - 108
NGO-3	Catalina Island Conservancy	February 25, 2016	109 - 145

2.4 Public Comments

Fifty-five comment letters were received from the public. These letters are referenced in Table 2.4-1.

Mr. Paul Edelman, Deputy Director
Natural Resources and Planning
Santa Monica Mountains Conservancy
5750 Ramirez Canyon Road
Malibu, California 90265

Dear Mr. Edelman:

**RESPONSE TO COMMENT LETTER ON THE DRAFT ENVIRONMENTAL IMPACT
REPORT (EIR) FOR THE LOS ANGELES REGIONAL INTEROPERABLE
COMMUNICATIONS SYSTEM (LA-RICS) JOINT POWERS AUTHORITY
(AUTHORITY) LAND MOBILE RADIO (LMR) PROJECT**

The LA-RICS Authority appreciates the comments provided by the Santa Monica Mountains Conservancy on the Draft EIR for the proposed LMR Project. Proposed responses to these comments are provided herein in compliance with Section 15088(b) of the State California Environmental Quality (CEQA) Guidelines. All comments will be provided to the LA-RICS Authority Board prior to their consideration of the EIR for certification. The proposed time, date, and location of the hearing to consider certification of the Final EIR and approval of the proposed project will be provided on the Authority's website (www.la-rics.org).

Sincerely,

A handwritten signature in black ink that reads "Susy Orellana-Curtiss".

**LA-RICS, Land Mobile Radio Project
Draft Environmental Impact Report SCH #2014081025**

Dear Ms. Yang:

1 | The Santa Monica Mountains Conservancy (Conservancy) offers comments and recommendations on the Draft Environmental Impact Report (DEIR) for the Los Angeles Regional Interoperable Communications System (LA-RICS) Land Mobile Radio Project (LMR). The Conservancy is the principal State planning agency for the Santa Monica Mountains. The subject DEIR does not adequately analyze project alternatives which would reduce or eliminate the significant adverse impacts of the proposed project to public visual resources on public lands. The DEIR is deficient under the California Environmental Quality Act (CEQA) for these omissions.

2 | The DEIR fails to adequately analyze the “Environmentally Superior Alternative” with respect to each specific tower location in the Santa Monica Mountains. The Environmentally Superior Alternative section only lists alternative sites for some of the LMR sites being analyzed. The Environmental Impact Report (EIR) will remain deficient until its analysis of the Environmentally Superior Alternative includes a thorough examination of a range of feasible alternatives for each proposed tower location within the Santa Monica Mountains. This discussion of feasible alternatives must provide decision makers with a clear picture of how adverse impacts to public viewshed could be reduced by use of alternative tower heights or antenna configurations at all visually sensitive locations. It should also include an analysis of how the LA-RICS project as a whole would be affected if an individual tower is not constructed at such visually sensitive locations. This includes locations within the viewsheds of public parklands and public trails, on significant ridgelines, and near scenic highways and corridors.

3 |

4 | The proposed Green Mountain (GRM) tower on Temescal Canyon Fire Road is of particular concern due to its unprecedented high visibility from State parkland and public trails. The Site Summary Impact Analysis of this tower location (page 4-569)

Comment Letter SA-1

Ms. Nancy Yang
LA-RICS, Land Mobile Radio Project
Draft Environmental Impact Report SCH #2014081025
February 25, 2016
Page 2

4 | erroneously concludes that the proposed LRM tower would not result in significant visual impacts due to the existing facility at the subject site. However, the existing structures at the proposed GRM site are significantly shorter than the proposed 180-foot lattice tower. As proposed, construction of the GRM tower would result in unmitigable significant adverse impacts to public visual resources. The DEIR is deficient for failing to address these impacts, and for failing to identify feasible alternatives for this project site.

Please send further correspondence regarding this project to me at the above letterhead address, or contact me by phone at 310-589-3200, ext. 128, or by e-mail at edelman@smmc.ca.gov. Thank you for your time and consideration.

Sincerely,

PAUL EDELMAN
Deputy Director
Natural Resources and Planning

Responses to Comment Letter SA-1

The Authority appreciates the Santa Monica Mountains Conservancy's comments on the Draft Environmental Impact Report (EIR) dated February 25, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to the comments are provided below.

Comment 1: Comment 1: The Subject DEIR does not adequately analyze project alternatives which would reduce or eliminate the significant adverse impacts of the proposed project to public visual resources on public lands. The DEIR is deficient under the California Environmental Quality Act for these omissions.

Response to Comment 1: The Authority explored numerous options for providing LMR coverage to the Santa Monica Mountains area. The Authority conducted a candidate site search in the area to identify potential sites that provided coverage to areas that could not be covered by other planned sites. For several sites located in the Santa Monica Mountains area, alternate sites are identified in the Draft EIR. Section 2.3 of the Draft EIR identifies that sites ENT, LACFCP08, and TOP are alternates to each other and sites H-69B and SPN are alternates to each other. Out of the sites in these two groups, only one site would be constructed from each group. For the remaining sites in the Santa Monica Mountains (sites CPK, ENC1, GRM, LACF072, LEPS, PWT, and ZHQ), no other viable alternate sites were identified that could provide coverage for the area.

Comment 2: The DEIR fails to adequately analyze the "Environmentally Superior Alternative" with respect to each specific tower location in the Santa Monica Mountains. The Environmentally Superior Alternative section only lists alternative sites for some of the LMR sites being analyzed. The Environmental Impact Report (EIR) will remain deficient until its analysis of the Environmentally Superior Alternative includes a thorough examination of a range of feasible alternatives for each proposed tower location within the Santa Monica Mountains.

Response to Comment 2: The Authority prepared the Draft EIR in accordance with CEQA and the CEQA Guidelines, PRC Section 21000 et seq. and 14 CCR Section 15000 et seq., respectively. The Authority has analyzed a range of alternatives, taking in to account feasibility and alternative locations consistent with CEQA Guidelines Section 15126.6 (f). As described in Draft EIR Section 2.5, the environmentally superior alternative is the No Project Alternative. Where the environmentally superior alternative is the No Project Alternative, CEQA Guidelines Section 15126.6(e)(2) requires identification of an environmentally superior alternative among the other alternatives. As discussed in response to Comment #1, for all but two groups of sites in the Santa Monica Mountains, only the proposed site could provide coverage for the area and meet project objectives. For the two groups of sites where alternatives have been identified (sites H-69B and SPN; and sites TOP, ENT, and LACFCP08) Section 2.5 of the EIR identifies the environmentally superior alternative.

Please see response to comment #3 regarding the feasibility of alternatives for each of the proposed tower locations in the Santa Monica Mountains.

Responses to Comment Letter SA-1

Comment 3: This discussion of feasible alternatives must provide decision makers with a clear picture of how adverse impacts to public viewshed could be reduced by use of alternative tower heights or antenna configurations at all visually sensitive locations. It should also include an analysis of how the LA-RICS project as a whole would be affected if an individual tower is not constructed at such visually sensitive locations. This includes locations within the viewsheds of public parklands and public trails, on significant ridgelines, and near scenic highways and corridors.

Response to Comment 3: The EIR provides a thorough evaluation and disclosure of the impacts of the project at each site. Detailed impact analysis for each site is provided in Draft EIR Chapter 4. A detailed analysis of the aesthetic impacts was conducted for sites, including impacts to viewsheds of public parklands, trails, significant ridgelines and scenic highways and corridors. This includes all 12 sites within the Santa Monica Mountains and described in detail in Chapter 4 [CPK (discussed at Draft EIR, Pg. 4-296), ENC1 (Pg. 4-372), ENT (Pg. 4-411), GRM (Pg. 4-566), H-69B (Pg. 4-643), LACF072 (Pg. 4-799), LACFCP08 (Pg. 4-837), LEPS (Pg. 4-989), PWT (Pg. 4-1371), SPN (Pg. 4-1563), TOP (Pg. 4-1720), and ZHQ (Pg. 4-2026)].

For sites that would require new towers or monopoles (see Draft EIR Table 2.1-2), site specific analysis is generally based on maximum heights unless otherwise noted; up to 70 feet with an additional 15-foot lightning rod for monopoles and up to 180 feet with an additional 15-foot lighting rod. Analyzing maximum tower heights provides a conservative analysis that discloses the maximum visual impacts that could result from tower construction. Final design of the system will occur if the project is approved. At that time, tower heights would be optimized based on the final system design. Some sites would be constructed exactly or nearly exactly as they are described in the Draft EIR, but the elements would be no higher or larger than analyzed. Other sites may be designed to a shorter height if additional site information or system requirements found during later design stages made this feasible. Other reasons for a change in height could include (but are not limited to) items such as subsurface constraints for foundation depths, compliance with FAA requirements, or coastal consistency issues. At this time, it would be speculative to identify which sites might ultimately accommodate a reduced tower height.

In response to the comment that the EIR should analyze how the LA-RICS project as a whole would be affected if an individual tower is not constructed, the project site locations have been proposed based on their ability to meet the project objectives set forth in Draft EIR section 2.2. This is true in each of the geographic locations served by the sites identified in the Draft EIR, including those in the Santa Monica Mountains. Not constructing one or more of the individual towers proposed within the Santa Monica Mountains would result in a failure to meet these objectives. Specifically, within that geographic area there would be:

- no day-to-day communications made available for first and second responders
- no interoperability among member agencies and mutual aid providers
- no support of communications with federal state and local agencies in emergencies
- no improvement of emergency communications
- no additional capacity created or replacement of aging infrastructure that meets current public safety requirements

Responses to Comment Letter SA-1

- no ability to increase separation of antennas on support structures to reduce interference
- no provision of increased frequency flexibility to increase system coverage or capacity
- no ability to transition from existing T-Band (where it exists) to 700 MHz systems.

The sites proposed in the Santa Monica Mountains provide coverage to serve population centers, transportation corridors, and areas of highest wildland fire, among other concerns. Physical, land use, and other constraints to development within these areas of concern within the Santa Monica Mountains substantially limit suitable sites that serve these areas, hence eliminating the availability of alternatives in many locales. The ultimate selection of which sites will be constructed will be determined based on consideration of the public comment on the Draft EIR, as well as ultimate site feasibility during final system design.

Comment 4: The proposed Green Mountain (GRM) tower on Temescal Canyon Fire Road is of particular concern due to its unprecedented high visibility from State parkland and public trails. The Site Summary Impact Analysis of this tower location (page 4-569) erroneously concludes that the proposed LRM tower would not result in significant visual impacts due to the existing facility at the subject site. However, the existing structures at the proposed GRM site are significantly shorter than the proposed 180-foot lattice tower. As proposed, construction of the GRM tower would result in unmitigable significant adverse impacts to public visual resources. The DEIR is deficient for failing to address these impacts, and for failing to identify feasible alternatives for this project site.

Response to Comment 4: The site-specific project description and visual impact analysis for Site GRM beginning at page 4-568 of the Draft EIR considered, among other factors, the bulk and scale of the existing built landscape of the site and the site's location within Topanga State Park along the heavily traveled Temescal Ridge Trail Road. At Site GRM the Draft EIR identifies that hikers on the Temescal Ridge Trail would be the most likely affected by construction of site GRM. Due to the isolated nature of this site, it is not readily visible from vantage points other than the trail. Views of nature from the trail are currently intruded upon by existing human-made linear structures, such as power poles and powerlines, as well as intermittent views of the existing structures on the proposed site. Due to the area's rolling topography, views of the existing site are limited and intermittent. The analysis in Chapter 4 describes how the proposed facilities would not perceptibly change the scenic vista due to the presence of existing towers, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista. The existing visual character and quality of the site and its surroundings are impacted by the presence of an existing site and tower. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. In addition, although the height of the new tower was analyzed at up to 180 feet, the actual height could be less following detailed system design. Based on the methodology in Section 3.1.4, the impact analysis in the Draft EIR shows that construction would result in a less than significant visual impact on aesthetics at Site GRM. No changes have been made to the Draft EIR.

RE: Notice of Availability of a Draft Environmental Impact Report for the proposed Land Mobile Radio Project-SCH #2014081025

Ms. Yang:

The Antelope Valley Air Quality Management District (District) has received the Notice of Availability for a Draft Environmental Impact Report for the proposed Land Mobile Radio System.

1 The District requires the proposed project comply with all requirements outlined in District Rule 403, Fugitive Dust. Receipt of a District approved Dust Control Plan is required prior to initiating any ground preparation activities if individual sites are greater than 5 acres. During the construction phase, all disturbed areas should be stabilized so that no visible fugitive dust leaves the property line and does not impact traffic or neighboring residents. Upon completion of the project, all disturbed surface areas must meet the definition of a stabilized surface, as defined in Rule 403.

2 In addition, the proponent will need to obtain District permits for any miscellaneous process equipment that may not be exempt under District Rule 219 including, but not limited to Internal Combustion Engines with a manufacturer's maximum continuous rating greater than 50 brake horsepower.

Thank you for the opportunity to review this planning document. If you have any questions regarding the information presented in this letter please contact me at (661) 723-8070 ext. 2 or bbanks@avaqmd.ca.gov.

Sincerely,

Bret Banks
Executive Director

BB/bjl

Responses to Comment Letter LR-1

The Authority appreciates the Antelope Valley Air Quality Management District’s comments on the Draft Environmental Impact Report (EIR) dated January 21, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to the comments are provided below.

Comment 1: The District requires the proposed project comply with all requirements outlined in District Rule 403, Fugitive Dust. Receipt of a District approved Dust Control Plan is required prior to initiating any ground preparation activities if individual sites are greater than 5 acres. During the construction phase, all disturbed areas should be stabilized so that no visible fugitive dust leaves the property line and does not impact traffic or neighboring residents. Upon completion of the project, all disturbed surface areas must meet the definition of a stabilized surface, as defined in Rule 403.

Response to Comment 1: Ground preparation activities would not exceed 5,000 square feet (less than 0.12 acre) at any LMR site; therefore, the requirement for a dust control plan for sites greater than five acres would not apply to the project. However, Best Management Practices consistent with the AVAQMD List of Implementation Measures to Reduce PM pursuant to Health and Safety Code 39614(d) (see Draft EIR Section 3.2.4 Project Impacts) would be implemented as part of the project, and these include measures to limit fugitive dust emissions, such as:

- Apply water to the construction site as needed to comply with Rule 403 of the applicable air quality management district.
- Enclose or water down exposed dirt storage piles.
- Minimize the disturbed area and preserve vegetation to the maximum extent possible.
- Phase construction activities, to the extent possible, to reduce disturbed areas and time of exposure.

Comment 2: In addition, the proponent will need to obtain District permits for any miscellaneous process equipment that may not be exempt under District Rule 219 including but not limited to Internal Combustion Engines with a manufacture’s maximum continuous rating greater than 50 brake horsepower.

Response to Comment 2: A discussion of the Antelope Valley Air Quality Management District Rule 219 permitting requirements will be added to the Final EIR in Section 3.2.2.3 *Local Regulatory Setting*. The Draft EIR assumes that operation of backup generators will comply with District Rule 219. Additional discussion of District Rule 219 to evaluate the significance of project impacts under CEQA is not necessary.

SUBJECT: COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT REPORT (SCH #2014081025) FOR THE LOS ANGELES REGIONAL INTEROPERABLE COMMUNICATIONS SYSTEM LAND MOBILE RADIO PROJECT

Dear Ms. Yang:

1 Thank you for the opportunity to provide comments on the Draft Environmental Impact Report (DEIR) (SCH #2014081025) for the Los Angeles Regional Interoperable Communications System (LA-RICS) Land Mobile Radio (LMR) Project. We understand that the LMR system is a wireless communications system for mobile and portable devices, such as walkie-talkies and two-way radios, and would provide day-to-day voice and narrowband data radio communications coverage for emergency responders. The LMR system would consist of antennas and support equipment at up to 90 sites located mostly in Los Angeles County. However, a total of 94 sites have been considered. Of these, 40 sites were determined to be statutorily exempt from the California Environmental Quality Act (CEQA) under PRC Section 20180.25, and no further CEQA analysis is necessary. The DEIR considers the remaining 54 sites that were not statutorily exempt.

One of the LMR sites being considered in the DEIR is in the City of Agoura Hills. The site, referred to as "AGH," is located at Kimberly Peak, off an unnamed road, near Kimberly Drive in the Morrison Ranch area of the City. The site is zoned, and designated in the City General Plan as, Open Space-Deed Restricted (OS-DR). There are no other sites in Agoura Hills being considered – either in the DEIR or that were found to be statutorily exempt from CEQA.

The DEIR indicates that the proposed improvements at the site include the installation of up to 27 whip antennas (each up to 15 feet long) and up to five (5) microwave antennas (each two (2) to six (6) feet in diameter) on a new 70-foot tall, 6.5-foot diameter monopole, with an additional lightning rod of 15 feet high, for a total 85 foot-tall facility. If tower obstruction lighting is required, it may include red or white LED lamps, either steady or flashing, on the monopole. Either an existing equipment shelter at the site may be used, or a new 600 square-

Comment Letter LR-2

Ms. Nancy Yang
 February 24, 2016
 Page 2

foot shelter, either prefabricated or of concrete masonry unit – CMU, installed on a concrete slab. Exterior security lighting equivalent to one (1) 100-watt bulb would be installed. A diesel emergency generator on a 200-square-foot slab would be constructed and enclosed within a block wall, with a 1,500 gallon belly internal fuel tank integrated into the generator. About 800 feet of chain-link fence up to 12 feet in height is proposed around the facility. The depth of excavation is 36 feet for a drilled caisson for the monopole. In total, an area of 5,000 square feet would be disturbed to install the facilities, with permanent disturbance to a 3,000-square foot area.

We understand that best management practices (BMPs) have been incorporated into the project design to minimize impacts to environmental resources. Examples of BMPs listed in the DEIR include minimizing disturbed areas during construction; watering down the construction site; protecting slopes through erosion control blankets; and using erosion control measures to reduce siltation and runoff, among many others.

Our comments on the DEIR are described below, and are organized by section heading:

Section 2.3 Project Alternatives

2 The DEIR lists seven groups of two or more proposed project sites that would be alternatives to each other. However, the AGH site is not listed here as an alternative or as a site to which there are alternatives being explored. Please discuss why no alternatives to the site are being considered.

3 Given the various environmental impacts of the project at the AGH site, noted below, we recommend that alternatives to the facility at AGH be assessed in the DEIR. These could include reducing the height of the monopole (perhaps with a stronger support at the base); locating the antennas on an existing tower at the same site instead of constructing a new tower; and considering other sites nearby – within and outside of Agoura Hills, that would have less impacts. With regard to using an existing tower, DEIR Section 2.6.1 Collocation indicates that, “At some locations where towers are present, space is not sufficient on the existing tower to mount the LMR antennas.” Please provide information to demonstrate this condition specifically at AGH. This section further states, “Limiting the LMR locations to only those where collocation is possible would not provide the desired coverage; therefore, an alternative consisting entirely of collocation sites would not meet the Project objectives and was not considered further.” Please provide information demonstrating that locating the proposed facilities on an existing tower at the same site would not provide the desired coverage in this instance, particularly since the existing tower is located at the same site as AGH, and would be expected to provide the same, if not very similar, coverage. Additionally, while a project alternative considering all proposed LA-RICS facilities as collocations may not be feasible or desired, it seems appropriate to consider at least collocating the proposed facilities at the specific AGH site as a feasible alternative.

Comment Letter LR-2

Ms. Nancy Yang
February 24, 2016
Page 3

Section 3.1 – Aesthetics

4 We suggest that the AGH site be considered visually sensitive given its location on top of a prominent hill that can be seen from many points in the City, including residential neighborhoods. In particular, the site is situated on a primary ridgeline, the Morrison Highlands, as identified on Figure NR-1 Open Space Resources in the Agoura Hills General Plan 2035 (2010). General Plan Goal NR-2 Visual Resources is for the “preservation of significant visual resources as important quality of life amenities for residents, and as assets for commerce, recreation and tourism.” General Plan Policy NR-2.3 Protect Ridgelines states, “Maintain the community’s primary and secondary ridgelines.” Additionally, the site is designated in the General Plan, and zoned, as Open Space-Deed Restricted (OS-DR). The purpose of the OS-DR zone, in part, is to preserve natural features and open space (Agoura Hills Municipal Code – AHMC Section 9490 et. seq.).

5 While we acknowledge that the AGH site is currently the location of several telecommunications-type facilities, the proposed LMR facility would add substantially more structures and a taller tower than what currently exists on the site, resulting in potentially significant aesthetic impacts from an increase in intensity of development, even though the AGH facilities may not block views. The AGH monopole could reach 85 feet tall, compared to the estimated maximum 60-foot high existing tower at the same location (per the DEIR). The AGH site, with the exception of some existing telecommunications equipment, is situated on a hilltop of the Santa Monica Mountains, in a natural area of the City where there is no hillside development. Single-family residential development is located below the hill, in the flatter portions of the City. The DEIR should analyze the potential impacts to aesthetics from the proposed LMR facilities located in this visually sensitive area. In particular, please consider the following:

1. Show the AGH site as being of high or medium viewer sensitivity on Figure 3.1.1.
2. Revise Table 3.1-1 to include the AGH site under the categories of, “Significant Ridgeline” and “Visual Sensitivity.”
3. Address the AGH site in the discussion of Section 3.1.2.3 Local Regulatory Setting, specifically its location on a primary ridgeline in the General Plan.
4. Analyze the AGH site in Section 3.1.4.1 Project Analysis as a high or medium sensitivity site. Revise the discussion of AGH under Impact “AES-1” (Scenic Vista) beginning on page 3-28, Impact “AES-3” (Visual Character) beginning on page 3-34 and under Impact “AES-4” (Light or Glare) starting on page 3-41, accordingly.

Comment Letter LR-2

Ms. Nancy Yang
 February 24, 2016
 Page 4

5. Further, under the discussion of Impact “AES-3” on page 3.41, the reference to AGH being an “urban” area should be corrected. The site is set within a preserved open space area in a natural state, at the top of a primary ridgeline in the Santa Monica Mountains. The area below the hillside may be considered “urban,” but not the hillside itself, even though there are telecommunications facilities presently. The text under the paragraph heading, “Urban Areas” states that these are, “... areas where numerous sources of day and nighttime lighting are present, such as vehicle headlights, traffic signals, street lights, and building security lights. Because of the presence of these light sources, tower (monopole) lighting, if required, would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area...” Given the minimal lighting at the site presently, and its remote location on the hilltop in the OS-DR zone in the Santa Monica Mountains, where there are no other urban light sources, this analysis should be revised.

7 The project should be considered to cause a potentially significant operational impact on aesthetics from lighting and/or glare from the proposed lighting equivalent to one (1) 100-watt bulb, and possibly FAA required lighting. With regard to the former, the City has policies to shield and direct downward all exterior lighting to prevent light spillover and/or glare (*City Architectural Design Standards & Guidelines*, Section III.G Exterior Lighting). The DEIR should reference and incorporate these requirements as a mitigation measure. We request that LA-RICS consider as minimal lighting as feasible at this site, given the surrounding natural area and visibility from numerous points in the City.

Section 3.3 - Biological Resources

This section identifies vegetation communities in and around the AGH site. The DEIR identifies the site being within a California walnut woodland. The site is also set within an area of coastal sage scrub habitat, which should be addressed in the analysis of impacts to biological resources. Specifically, please consider the following:

1. Table 3.3-1 should include AGH as a site within the “Coastal sage scrub” vegetation community. (Note that this community is listed as being within the area of AGH in Table 3.3-3).
2. Table 3.3-4 should be corrected to list AGH under “California Walnut Woodland,” consistent with the discussion in this section.
3. Within DEIR Section 4.0 Site Summary Forms, the Mitigation Measure under Impact BIO-2 (substantial adverse impact on riparian habitat or other sensitive natural community) reads, “Minimize disturbance to natural vegetation; do not remove California walnut trees. Prior to construction mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Use caution to minimize the use of heavy equipment near (within the dripline) walnut

Comment Letter LR-2

Ms. Nancy Yang
February 24, 2016
Page 5

trees to protect the plant’s root system.” However, this Mitigation Measure does not appear to be referenced in the Biological Resources section or elsewhere in the DEIR. Please incorporate this mitigation into a formal Mitigation Measure and reference it where appropriate for site AGH.

Section 3.4-1 Cultural Resources

We appreciate that Mitigation Measures CUL 6 and CUL 7 related to protecting paleontological resources have been incorporated into the DEIR for site AGH. Table 3.4-4 lists Mitigation Measure CUL 1 (archaeological monitoring), CUL 3 (unexpected discovery of archaeological remains), and CUL (unexpected discovery of human remains) as applicable to site AGH. Yet, Table ES-2 Environmental Impacts and Mitigation Measures in the Executive Summary does not list these mitigation measures for AGH, and the Summary Form for AH in DEIR Section 4.0 Site Summary Forms does not list these mitigation measures as applicable for AGH. Please correct this discrepancy. While the DEIR notes that no identified archaeological sites have been identified within 0.5 mile of the site, Agoura Hills in general is considered a sensitive archaeological area, and discovery of previously unknown cultural resources is possible. As such, the City typically incorporates mitigation measures in construction projects to have an archaeologist and Native American representative monitor subsurface work, and, in the event human remains are uncovered, follow procedures as outlined in the CEQA Guidelines and required under state and federal law. Please ensure that such protective measures are incorporated into the DEIR for site AGH.

Section 3.9 – Land Use/Planning

Table 3.9-4 states that the height limit in the OS-DR zone, where the facilities are proposed, is 60 feet. The OS-DR standards in the Agoura Hills Municipal Code do not list 60 feet as the maximum allowed height. Please also note that the proposed facility is not listed as an allowed use in the OS-DR zone. Consequently, please correct Section 4.0 Site Summary Forms notes under “Setting” and “Impact Analysis” that the required permit would be a Conditional Use Permit.

Section 3.10 - Noise

In addition to the City’s Zoning Ordinance, the General Plan 2035 (2010), Chapter 5: Community Safety, Noise section, addresses noise in Agoura Hills. Please list the appropriate General Plan standards in DEIR Table 3.10-2 and analyze potential noise impacts from ongoing operation of AGH in light of these standards. Specifically, see Table N-1 (Noise/Land Use Compatibility Matrix) and Table N-2 (Interior/Exterior Noise Standards) of the General Plan. This section of the DEIR estimates the potential operational noise from the facility as 58 dBA at 21 feet away

Comment Letter LR-2

Ms. Nancy Yang
February 24, 2016
Page 6

15 | for the emergency generator (assuming solid walls around it, as proposed), and 52 dBA at 10 feet away for the HVAC systems. Please confirm that this estimate would be accurate specifically for AGH, considering that the site would be located on a hilltop, with residential uses below.

16 | The DEIR lists the allowed hours of construction noise pursuant to the Municipal Code, which are from 7:00 a.m. to 7:00 p.m. during the weekdays and on Saturdays. We request that these hours be strictly adhered to, given that the access road to the site begins in a single-family residential neighborhood, and driveway entrance is located specifically between two residences.

Other

17 | While not related to CEQA, we recommend that you coordinate with the property owner, Morrison Ranch Homeowners' Association, at your earliest convenience regarding possible use of the proposed site.

Thank you for your consideration of these comments. If you have any questions, please contact Allison Cook, Assistant Planning Director, at (818) 597-7310 or at acook@ci.agoura-hills.ca.us.

Sincerely,

Greg Ramirez
City Manager

Responses to Comment Letter LR-2

The Authority appreciates the City of Agoura Hills' comments on the Draft Environmental Impact Report (EIR) dated February 24, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to the comments are provided below.

Comment 1: Thank you for the opportunity to provide comments on the Draft Environmental Impact Report (DEIR) (SCH #2014081025) for the Los Angeles Regional Interoperable Communications System (LA-RICS) Land Mobile Radio (LMR) Project. We understand that the LMR system is a wireless communications system for mobile and portable devices, such as walkie-talkies and two-way radios, and would provide day-to-day voice and narrowband data radio communications coverage for emergency responders. The LMR system would consist of antennas and support equipment at up to 90 sites located mostly in Los Angeles County. However, a total of 94 sites have been considered. Of these, 40 sites were determined to be statutorily exempt from the California Environmental Quality Act (CEQA) under PRC Section 20180.25, and no further CEQA analysis is necessary. The DEIR considers the remaining 54 sites that were not statutorily exempt.

One of the LMR sites being considered in the DEIR is in the City of Agoura Hills. The site, referred to as "AGH/" is located at Kimberly Peak, off an unnamed road, near Kimberly Drive in the Morrison Ranch area of the City. The site is zoned, and designated in the City General Plan as, Open Space-Deed Restricted (OS-DR). There are no other sites in Agoura Hills being considered - either in the DEIR or that were found to be statutorily exempt from CEQA.

The DEIR indicates that the proposed improvements at the site include the installation of up to 27 whip antennas (each up to 15 feet long) and up to five (5) microwave antennas (each two (2) to six (6) feet in diameter) on a new 70-foot tall, 6.5-foot diameter monopole, with an additional lightning rod of 15 feet high, for a total 85 foot-tall facility. If tower obstruction lighting is required, it may include red or white LED lamps, either steady or flashing, on the monopole. Either an existing equipment shelter at the site may be used, or a new 600 square-foot shelter, either prefabricated or of concrete masonry unit - CMU, installed on a concrete slab. Exterior security lighting equivalent to one (1) 100-watt bulb would be installed. A diesel emergency generator on a 200-square-foot slab would be constructed and enclosed within a block wall, with a 1,500 gallon belly internal fuel tank integrated into the generator. About 800 feet of chain-link fence up to 12 feet in height is proposed around the facility. The depth of excavation is 36 feet for a drilled caisson for the monopole. In total, an area of 5,000 square feet would be disturbed to install the facilities, with permanent disturbance to a 3,000-square foot area.

We understand that best management practices (BMPs) have been incorporated into the project design to minimize impacts to environmental resources. Examples of BMPs listed in the DEIR include minimizing disturbed areas during construction; watering down the construction site; protecting slopes through erosion control blankets; and using erosion control measures to reduce siltation and runoff, among many others.

Response to Comment 1: The information provided in this comment is accurate.

Responses to Comment Letter LR-2

Comment 2: The DEIR lists seven groups of two or more proposed project sites that would be alternatives to each other. However, the AGH site is not listed here as an alternative or as a site to which there are alternatives being explored. Please discuss why no alternatives to the site are being considered.

Response to Comment 2: The Authority explored numerous options for providing LMR coverage to the City of Agoura Hills and the 101 Freeway areas. The Authority conducted a candidate site search in the area to identify potential sites that provided coverage to areas that could not be covered by other planned sites. The area targeted includes both the north and south sides of the 101 Freeway in Agoura Hills, the City of Westlake Village (particularly the western side of the City), as well as the north facing slopes of the Santa Monica Mountains in order to penetrate the canyons and roads. Although there were other sites that existed (commercial carriers) or could be built (City of Westlake Village), no other viable sites were identified that could provide coverage for this area.

Comment 3: Given the various environmental impacts of the project at the AGH site, noted below, we recommend that alternatives to the facility at AGH be assessed in the DEIR. These could include reducing the height of the monopole (perhaps with a stronger support at the base); locating the antennas on an existing tower at the same site instead of constructing a new tower; and considering other sites nearby - within and outside of Agoura Hills, that would have less impacts. With regard to using an existing tower, DEIR Section 2.6.1 Collocation indicates that, "At some locations where towers are present, space is not sufficient on the existing tower to mount the LMR antennas." Please provide information to demonstrate this condition specifically at AGH. This section further states, "Limiting the LMR locations to only those where collocation is possible would not provide the desired coverage; therefore, an alternative consisting entirely of collocation sites would not meet the Project objectives and was not considered further." Please provide information demonstrating that locating the proposed facilities on an existing tower at the same site would not provide the desired coverage in this instance, particularly since the existing tower is located at the same site as AGH, and would be expected to provide the same, if not very similar, coverage. Additionally, while a project alternative considering all proposed LA-RICS facilities as collocations may not be feasible or desired, it seems appropriate to consider at least collocating the proposed facilities at the specific AGH site as a feasible alternative.

Response to Comment 3: Please see response to Comment 2, above, discussing the lack of other viable sites that could provide LMR coverage for this area. Regarding the comment on collocation, the Authority is considering numerous sites throughout the County for collocation where existing structures are able to meet the existing building codes and provide the level of stability necessary for a public safety network. The Authority has determined that the existing towers at Site AGH do not meet current building codes. Therefore, collocation on existing towers at Site AGH is not feasible under existing conditions and would require retrofitting to ensure the existing towers meet current building codes, which would add extra expense and may not ultimately be possible. Even if upgrade of the tower were feasible, collocation on existing towers at Site AGH would require the Authority to upgrade another entity's infrastructure without compensation and would put the Authority in a position of a lessee on that tower, which would very likely increase the cost of the site to the Authority and by extension, the tax payers. Additionally, it would not be technically feasible to collocate equipment on existing towers at Site AGH because the lower height of the existing towers would limit the amount of equipment the Authority could place on the towers and lower the coverage performance, which would result in a decreased ability to meet the project objectives in this geographic area.

Responses to Comment Letter LR-2

Comment 4: We suggest that the AGH site be considered visually sensitive given its location on top of a prominent hill that can be seen from many points in the City, including residential neighborhoods. In particular, the site is situated on a primary ridgeline, the Morrison Highlands, as identified on Figure NR-1 Open Space Resources in the Agoura Hills General Plan 2035 (2010). General Plan Goal NR-2 Visual Resources is for the *lip* reservation of significant visual resources as important quality of life amenities for residents, and as assets for commerce, recreation and tourism." General Plan Policy NR-2.3 Protect Ridgelines states, "Maintain the community's primary and secondary ridgelines." Additionally, the site is designated in the General Plan, and zoned, as Open Space-Deed Restricted (OS-DR). The purpose of the OS-DR zone, in part, is to preserve natural features and open space (Agoura Hills Municipal Code - AHMC Section 9490 et. seq.).

Response to Comment 4: Site AGH is located outside of the Santa Monica Mountains National Recreation Area on a ridgeline that is surrounded on all sides by dense residential development that has encroached to the base of the hills, and well into natural canyons, such as along Kimberly Drive to the east, Rolling Ridge Drive to the south, and Lake Lindero Drive to the west. Aerial maps display significant slopes cut into the hillside. Due to the extensive development surrounding the site, the Authority determined that Site AGH is located in an urban area rather than a rural or remote area, despite being in an area zoned by the City of Agoura Hills as open space. Urban areas that are not within the coastal zone or parklands are not considered visually sensitive.

The Draft EIR analyzes visual impacts for this project, including at Site AGH, using a quarter-mile radius as a visual buffer. Representative viewpoints in the City of Agoura Hills were selected in relation to this buffer to analyze visual effects, as shown below. Sites were chosen to represent typical views. As shown in the photos that follow, the existing site is not visible from Views 1 and 2. View 1 shows mature landscaping typical of the surrounding residential areas that would preclude views of the ridgeline from many residences. The dominant visual feature in View 2 is the significant slope cut for the road that provides access to residential development. Although the existing tower is visible from the ridgetop in View 3, it is not the dominant visual feature given the tower's size and scale. Rather, the foreground residential elements and the hill itself dominate the view. From this distance, the addition of another 70-foot tall monopole with a 15-foot tall lightning rod would still not dominate the view. The proposed new tower would also be a monopole, with less girth (and therefore, less visual intrusion) than the existing lattice towers. Therefore, the Draft EIR's conclusion that visual impacts would be less than significant at Site AGH is accurate and supported by substantial evidence.

View 2: 5774 Rista Drive, Agoura Hills, CA, Looking North (existing site not visible)

View 3: 29362 Castlehill Drive, Agoura Hills, CA, Looking West

Responses to Comment Letter LR-2

Comment 5: While we acknowledge that the AGH site is currently the location of several telecommunications-type facilities, the proposed LMR facility would add substantially more structures and a taller tower than what currently exists on the site, resulting in potentially significant aesthetic impacts from an increase in intensity of development, even though the AGH facilities may not block views. The AGH monopole could reach 85 feet tall, compared to the estimated maximum 60-foot high existing tower at the same location (per the DEIR). The AGH site, with the exception of some existing telecommunications equipment, is situated on a hilltop of the Santa Monica Mountains, in a natural area of the City where there is no hillside development. Single-family residential development is located below the hill, in the flatter portions of the City. The DEIR should analyze the potential impacts to aesthetics from the proposed LMR facilities located in this visually sensitive area. In particular, please consider the following:

1. Show the AGH site as being of high or medium viewer sensitivity on Figure 3.1.1.
2. Revise Table 3.1-1 to include the AGH site under the categories of, "Significant Ridgeline" and "Visual Sensitivity."
3. Address the AGH site in the discussion of Section 3.1.2.3 Local Regulatory Setting, specifically its location on a primary ridgeline in the General Plan.
4. Analyze the AGH site in Section 3.1.4.1 Project Analysis as a high or medium sensitivity site. Revise the discussion of AGH under Impact "AES-1" (Scenic Vista) beginning on page 3-28, Impact "AES-3" (Visual Character) beginning on page 3-34 and under Impact "AES-4" (Light or Glare) starting on page 3-41, accordingly.

Response to Comment 5: Please see Response to Comment # 4, above, regarding the visual sensitivity of Site AGH. The proposed structures at Site AGH include a monopole up to 70 feet tall with an additional 15-foot lightning rod, equipment racks to be located in an existing equipment shelter or a new 600-square foot shelter, a diesel generator and associated fuel tank, and up to 800 feet of chain-link fence up to 12 feet high. The site currently contains shelters and is surrounded by a chain link fence. A 600-square foot shelter, generator and fuel tank, and 800 feet of chain-link fence do not constitute substantially more structures that would result in significant impacts. The low height of these structures would make them indiscernible from nearby residential vantage points. Therefore, no changes to the Draft EIR are required in response to this comment.

Comment 6: Further, under the discussion of Impact "AES-3" on page 3.41, the reference to AGH being an "urban" area should be corrected. The site is set within a preserved open space area in a natural state, at the top of a primary ridgeline in the Santa Monica Mountains. The area below the hillside may be considered "urban," but not the hillside itself, even though there are telecommunications facilities presently. The text under the paragraph heading, "Urban Areas" states that these are, "... areas where numerous sources of day and nighttime lighting are present, such as vehicle headlights, traffic signals, street lights, and building security lights. Because of the presence of these light sources, tower (monopole) lighting, if required, would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area ..." Given the minimal lighting at the site presently, and its remote location on the hilltop in the OS-DR zone in the Santa Monica Mountains, where there are no other urban light sources, this analysis should be revised.

Responses to Comment Letter LR-2

Response to Comment 6: Please see response to Comment # 4 regarding the visual sensitivity of Site AGH. Even though the site is located on a hilltop and not directly within the adjacent residential area, the proximity of urban encroachment has introduced human-caused light intrusions up to a quarter mile from the site, including vehicle headlights, traffic signals, street lights, etc. Residents within sight of the towers would be exposed to these existing light sources. In addition, the presence of the existing telecommunications facilities has already altered the “natural state” of the ridgeline, and the addition of any FAA-required lighting at site AGH would not substantially change this condition or increase the significance of any visual impact. Therefore, no changes to the Draft EIR are required in response to this comment.

Comment 7: The project should be considered to cause a potentially significant operational impact on aesthetics from lighting and/or glare from the proposed lighting equivalent to one (1) 100-watt bulb, and possibly FAA required lighting. With regard to the former, the City has policies to shield and direct downward all exterior lighting to prevent light spillover and/or glare (*City Architectural Design Standards & Guidelines*, Section III.G Exterior Lighting). The DEIR should reference and incorporate these requirements as a mitigation measure. We request that LA-RICS consider as minimal lighting as feasible at this site, given the surrounding natural area and visibility from numerous points in the City.

Response to Comment 7: Implementation of the proposed project will comply with FAA requirements, which stipulate that tower lighting, where required, be visible to pilots from above. Section AES-4 on page 3-41 of the Draft EIR also notes that, because of the presence of existing light sources in the adjacent residential areas, tower (monopole) lighting, if required, would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area, resulting in a less than significant impact. Plans for any grounds lighting at the site will include consideration of neighboring uses, along with other factors such as site security and safety. Therefore, no changes to the Draft EIR are required in response to this comment.

Comment 8: This section identifies vegetation communities in and around the AGH site. The DEIR identifies the site being within a California walnut woodland. The site is also set within an area of coastal sage scrub habitat, which should be addressed in the analysis of impacts to biological resources. Specifically, please consider the following:

1. Table 3.3-1 should include AGH as a site within the "Coastal sage scrub" vegetation community. (Note that this community is listed as being within the area of AGH in Table 3.3-3).
2. Table 3.3-4 should be corrected to list AGH under "California Walnut Woodland," consistent with the discussion in this section.
3. Within DEIR Section 4.0 Site Summary Forms, the Mitigation Measure under Impact B10-2 (substantial adverse impact on riparian habitat or other sensitive natural community) reads, "Minimize disturbance to natural vegetation; do not remove California walnut trees. Prior to construction mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Use caution to minimize the use of heavy equipment near (within the dripline) walnut trees to protect the plant's root system." However, this Mitigation Measure does not appear to be referenced in the Biological Resources section or elsewhere in the DEIR. Please incorporate this mitigation into a formal Mitigation Measure and reference it where appropriate for site AGH.

Responses to Comment Letter LR-2

Response to Comment 8: Table 3.3-1 will be revised in the Final EIR to include Site AGH under coastal sage scrub. Table 3.3-4 will be revised in the Final EIR to include Site AGH under California walnut woodland. Regarding the comment on mitigation for Impact BIO-2, the text referenced in the comment provides the same protection as mitigation measure **BIO MM 9 Protect Native Vegetation and Common Wildlife**. Because BIO MM 9 is applicable to Site AGH, the referenced text is redundant, and will be deleted from page 4-12. These revisions to the Final EIR do not result in any new significant impact or an increase in the severity of any environmental impact.

Comment 9: We appreciate that Mitigation Measures CUL 6 and CUL 7 related to protecting paleontological resources have been incorporated into the DEIR for site AGH. Table 3.4-4 lists Mitigation Measure CUL 1 (archaeological monitoring), CUL 3 (unexpected discovery of archaeological remains), and CUL (unexpected discovery of human remains) as applicable to site AGH. Yet, Table ES-2 Environmental Impacts and Mitigation Measures in the Executive Summary does not list these mitigation measures for AGH...

Response to Comment 9: Footnotes to Tables 3.4-3 and 3.4-4 in the Draft EIR state that no impacts to historic resources are expected at Site AGH; however, mitigation in the form of monitoring is required at the site at the request of the Soboba Band of Luiseno Indians. Pages 4-14 through 4-16 of the Draft EIR provide the same statement. The following note from Tables 3.4-3 and 3.4-4 applies to Site AGH and will be added as a footnote to Table ES-2 to provide clarification:

² Based on records searches and field surveys, there are no archaeological sites within the direct APE of this project site and there would be no impacts; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

Comment 10: ...and the Summary Form for AH in DEIR Section 4.0 Site Summary Forms does not list these mitigation measures as applicable for AGH. Please correct this discrepancy.

Response to Comment 10: Pages 4-14 and 4-15 of the Draft EIR currently describe the archaeological resources and mitigation measures at Site SGH. None of the identified archaeological resources are historical resources as defined under CEQA and, based on their nature and integrity, would not meet the CEQA criteria. This information is provided under CUL-1, CUL-2, CUL-4, and CUL-5. Therefore, no changes to the Draft EIR are required in response to this comment.

Comment 11: While the DEIR notes that no identified archaeological sites have been identified within 0.5 mile of the site, Agoura Hills in general is considered a sensitive archaeological area, and discovery of previously unknown cultural resources is possible.

Response to Comment 11: The footnote to Draft EIR Table 3.4-4 indicates that no archaeological sites have been identified within the direct APE (i.e., the project ground-disturbing footprint). Pages 4-14 and 4-15 indicate that three archaeological sites have been recorded within the 0.5 mile radius around Site AGH but would not be impacted by construction. None of the identified archaeological resources are historical resources as defined under CEQA and, based on their nature and integrity, would not meet the CEQA criteria. This information is provided under CUL-1, CUL-2, CUL-4, and CUL-5. Therefore, no changes to the Draft EIR are required in response to this comment.

Responses to Comment Letter LR-2

Comment 12: As such, the City typically incorporates mitigation measures in construction projects to have an archaeologist and Native American representative monitor subsurface work, and, in the event human remains are uncovered, follow procedures as outlined in the CEQA Guidelines and required under state and federal law. Please ensure that such protective measures are incorporated into the DEIR for site AGH.

Response to Comment 12: Mitigation measures for the protection of cultural resources have been described on pages 3-314 and 3-315 of Section 3.4.5.1 of the Draft EIR and applied to Site AGH at pages 4-14 and 4-15. The appropriate mitigation measures are shown in Draft EIR Table 3.4-4 and noted in Draft EIR Chapter 4 under CUL-1, CUL-2, CUL-4, and CUL-5 for the site. Therefore, no changes to the Draft EIR are required in response to this comment.

Comment 13: Table 3.9-4 states that the height limit in the OS-DR zone, where the facilities are proposed, is 60 feet. The OS-DR standards in the Agoura Hills Municipal Code do not list 60 feet as the maximum allowed height. Please also note that the proposed facility is not listed as an allowed use in the OS-DR zone. Consequently, please correct Section 4.0 Site Summary Forms notes under "Setting" and "Impact Analysis" that the required permit would be a Conditional Use Permit.

Response to Comment 13: Table 3.9-4 and page 4-28 of the Draft EIR notes will be revised to reflect the OS-DR zoning restrictions. These revisions to the Final EIR do not result in any new significant impact or an increase in the severity of any environmental impact.

Comment 14: In addition to the City's Zoning Ordinance, the General Plan 2035 (2010), Chapter 5: Community Safety, Noise section, addresses noise in Agoura Hills. Please list the appropriate General Plan standards in DEIR Table 3.10-2 and analyze potential noise impacts from ongoing operation of AGH in light of these standards. Specifically, see Table N-1 (Noise/Land Use Compatibility Matrix) and Table N-2 (Interior/Exterior Noise Standards) of the General Plan.

Response to Comment 14: Table 3.10-2 text will be revised to include the referenced City's General Plan noise standards. These revisions to the Final EIR do not result in any new significant impact or an increase in the severity of any environmental impact.

Comment 15: This section of the DEIR estimates the potential operational noise from the facility as 58 dBA at 21 feet away for the emergency generator (assuming solid walls around it, as proposed), and 52 dBA at 10 feet away for the HVAC systems. Please confirm that this estimate would be accurate specifically for AGH, considering that the site would be located on a hilltop, with residential uses below.

Response to Comment 15: Estimated noise levels from operation of Site AGH are provided on pages 4-31 and 4-32 of the Draft EIR, and are consistent with the estimates referenced in the comment. Therefore, no changes to the Draft EIR are required in response to this comment.

Comment 16: The DEIR lists the allowed hours of construction noise pursuant to the Municipal Code, which are from 7:00 a.m. to 7:00 p.m. during the weekdays and on Saturdays. We request that these hours be strictly adhered to, given that the access road to the site begins in a single-family residential neighborhood, and driveway entrance is located specifically between two residences.

Responses to Comment Letter LR-2

Response to Comment 16: The comment has been noted. No changes to the Draft EIR are required in response to this comment.

Comment 17: While not related to CEQA, we recommend that you coordinate with the property owner, Morrison Ranch Homeowners' Association, at your earliest convenience regarding possible use of the proposed site.

Response to Comment 17: The comment has been noted. No changes to the Draft EIR are required in response to this comment.

Dear Mr. Gohlich:

**RESPONSE TO COMMENT LETTER ON THE DRAFT ENVIRONMENTAL IMPACT
REPORT (EIR) FOR THE LOS ANGELES REGIONAL INTEROPERABLE
COMMUNICATIONS SYSTEM (LA-RICS) JOINT POWERS AUTHORITY
(AUTHORITY) LAND MOBILE RADIO (LMR) PROJECT**

The LA-RICS Authority appreciates the comments provided by the City of Beverly Hills on the Draft EIR for the proposed LMR Project. Proposed responses to these comments are provided herein in compliance with Section 15088(b) of the State California Environmental Quality (CEQA) Guidelines. All comments will be provided to the LA-RICS Authority Board prior to their consideration of the EIR for certification. The proposed time, date, and location of the hearing to consider certification of the Final EIR and approval of the proposed project will be provided on the Authority's website (www.la-rics.org).

Sincerely,

A handwritten signature in blue ink that reads "Susy Orellana-Curtiss".

Monterey Park, California 91754

RE: Notice of Availability of a Draft Environmental Impact Report – LA RICS Land Mobile Radio (LMR) Project (SCH #2014081025)

Dear Ms. Nancy Yang:

Thank you for providing the City of Beverly Hills (City) with the opportunity to comment on the Draft Environmental Impact Report (DEIR) for the LA RICS LMR Project (Project). Because a portion of the project is located in the City of Beverly Hills, there is a potential that the City of Beverly Hills and its residents could experience negative impacts both during the construction of this project and as a result of operation thereafter. The City is requesting that the following comments be considered, and, as appropriate, addressed in the Final Environmental Impact Report for the Project.

LOCATION

- 1 | The City is concerned about the use of the Walker drive site for the LA RICS Facility due to the fact that it is a relatively small site and there are a number of other facilities already occupying the space.
- 2 | Further, the City would like to reserve additional space existing on the site for the expansion of City infrastructure. For this reason, the City is opposes the use of this site for the LA RICS LMR Project.

Comment Letter LR-3

LA RICS LMR DEIR Comment Letter
February 25, 2016
Page 2 of 3

TRANSPORTATION/TRAFFIC

3 | The City has concerns about construction equipment in the Trousdale Estates area. Should the Project move forward at the Walker Drive Site please consult with the City’s Transportation Division to ensure that all hauling and Trousdale Construction regulations are being followed. Please call 310.285.1141 for more information.

NOISE

4 | The City continues to have concerns about the potential noise impacts resulting from the construction of the proposed Project. The Trousdale Estates area is a residential neighborhood and construction noise resulting from excavators, trucks and jackhammers would be disruptive to the residents of the neighborhood.

SAFETY AND SECURITY

5 | The City of Beverly Hills Police Department is currently working on a plan to increase security measures and limit access to the Walker Drive site. The addition of equipment on this site is of particular concern to the City due to the fact that it may increase the need for vendors or maintenance teams to access the site.

GEOLOGY AND SOILS

6 | The City has concerns regarding ground stability at the proposed project site due to the fact that it is located in a potential landslide zone area as designated by the California Department of Conservation, California Geological Survey.

HAZARDS AND HAZARDOUS MATERIALS

7 | The City of Beverly Hills is opposed to the introduction of hazardous materials (the proposed diesel fuel tank) on the Walker Drive site as it is located in a residential neighborhood.

AESTHETICS

8 | The City is concerned about the potential aesthetic impacts that the Project may have on the surrounding neighborhood. The extension of the existing tower at the Walker Drive site could negatively impact the views from the surrounding residential properties. Further, the City is concerned about the proposed red or white LED lamps that may be installed as part of the project, as well as the proposed exterior security lighting on the 600 square foot equipment shelter. Lighting of this nature is incompatible with the residential neighborhood surrounding the Project site.

Comment Letter LR-3

LA RICS LMR DEIR Comment Letter
February 25, 2016
Page 3 of 3

LAND USE AND PLANNING

10 The DEIR suggests that the General Plan Designation for the site is Single Family Residential – Low Density and the Zoning is One Family Residential. The Zoning for the parcel is “Parks, Reservoirs, Government (Unzoned)”, please revise.

CULTURAL RESOURCES

11 As a telecommunications project that involves the Federal Communications Commission (FCC), Section 106 review is required to study the impact on historic and cultural resources. Please identify if a Section 106 review has been completed, pursuant to the programmatic agreement. As an interested party, please provide us with a copy of the report.

12 Under Impact Analysis CUL-1, it appears that historic resources within the City of Los Angeles were studied, but not within Beverly Hills. Direct and indirect / visual impacts to historic resources to the immediate site (water tower and surroundings) and the adjacent neighborhoods (i.e. Trousdale Estates) in Beverly Hills should be studied and addressed in your analysis.

Thank you again for this opportunity to provide input on the Draft Environmental Impact Report. The City of Beverly Hills is looking forward to working with the Joint Powers Authority to discuss appropriate and adequate mitigation measures and project alternatives.

Sincerely,

A handwritten signature in black ink, appearing to read "Ryan Gohllich", is written over a light blue horizontal line.

Responses to Comment Letter LR-3

The Authority appreciates the City of Beverly Hills' comments on the Draft Environmental Impact Report (EIR) dated February 25, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to the comments are provided below.

Comment 1: The City is concerned about the use of the Walker drive site for the LA RICS Facility due to the fact that it is a relatively small site and there are a number of other facilities already occupying the space.

Response to Comment 1: The City's concerns are noted. No revisions to the Draft EIR are required in response to this comment.

Comment 2: Further, the City would like to reserve additional space existing on the site for the expansion of City infrastructure. For this reason, the City is opposes the use of this site for the LA RICS LMR Project.

Response to Comment 2: The City's concerns are noted. No revisions to the Draft EIR are required in response to this comment.

Comment 3: The City has concerns about construction equipment in the Trousdale Estates area. Should the Project move forward at the Walker Drive Site please consult with the City's Transportation Division to ensure that all hauling and Trousdale Construction regulations are being followed? Please call 310.285.1141 for more information.

Response to Comment 3: The City's comments are noted. If the site is included in the final design, the Authority will consult with the City Transportation Division prior to initiation of construction at the site. No revisions to the Draft EIR are required in response to this comment.

Comment 4: The City continues to have concerns about the potential noise impacts resulting from the construction of the proposed Project. The Trousdale Estates area is a residential neighborhood and construction noise resulting from excavators, trucks and jackhammers would be disruptive to the residents of the neighborhood.

Response to Comment 4: The City's noise standards were considered in the Draft EIR, as discussed in Section 3.10.2.3, Local Regulatory Setting. Site-specific noise analysis is also provided beginning at page 4-1904 of the Draft EIR. No revisions to the Draft EIR are required in response to this comment.

Comment 5: The City of Beverly Hills Police Department is currently working on a plan to increase security measures and limit access to the Walker Drive site. The addition of equipment on this site is of particular concern to the City due to the fact that it may increase the need for vendors or maintenance teams to access the site.

Response to Comment 5: The City's concerns are noted. If the site is included in the final design, the Authority will coordinate with the City regarding access at the site. No revisions to the Draft EIR are required in response to this comment.

Responses to Comment Letter LR-3

Comment 6: The City has concerns regarding ground stability at the proposed project site due to the fact that it is located in a potential landslide zone area as designated by the California Department of Conservation, California Geological Survey.

Response to Comment 6: The Draft EIR discusses landslide hazards associated with Site WAD in Section 3.5.1.1 and Table 3.5-2. Site specific information regarding the geology of the site is provided beginning at page 4-1890 of the Draft EIR. The Draft EIR identifies that the site lies within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). Antennas would be collocated to existing lattice structure, therefore a geotechnical study for new structures would not be required. Therefore impacts would be less than significant. No revisions to the Draft EIR are required in response to this comment.

Comment 7: The City of Beverly Hills is opposed to the introduction of hazardous materials (the proposed diesel fuel tank) on the Walker Drive site as it is located in a residential neighborhood.

Response to Comment 7: The City's concerns are noted. Management of diesel fuel and other hazardous substances is discussed in Section 3.7 of the Draft EIR, and specific analysis is provided for Site WAD beginning at page 4-1895. As noted in the Draft EIR, management of hazardous substances would occur in accordance with all Federal, state and local regulations. No revisions to the Draft EIR are required in response to this comment.

Comment 8: The City is concerned about the potential aesthetic impacts that the Project may have on the surrounding neighborhood. The extension of the existing tower at the Walker Drive site could negatively impact the views from the surrounding residential properties.

Response to Comment 8: Aesthetic effects of the project were evaluated in Section 3.1 of the Draft EIR with specific analysis provided for Site WAD beginning at page 4-1877. A large water tank, one-story pumping house, three small equipment shelters, narrow lattice tower, and 120-foot-tall monopole are currently present on the proposed site. No additional towers or monopoles would be built at this site; rather, the project proposes to add up to 20 whip and up to 5 microwave antennas on the existing 120-foot monopole, and extend the existing monopole height up to an additional 20 feet. The project also proposes adding a lightning rod that would be up to 15 feet high, and potentially build a 600-square-foot equipment shelter. The visual analysis considered the setting of the site, which includes single-family houses that are typically one story and of various designs. The area's topography is hilly and the existing towers are only intermittently visible due to the topography and mature, dense vegetation. Further, the existing structures on the site, as well as telephone poles and wires that line the narrow streets, currently intrude on views. Despite the height of the existing towers on the site, they are only intermittently visible due to the area's topography and vegetation, as provided below.

Responses to Comment Letter LR-3

Map of viewpoints – site WAD

View: Looking West from 2150 Ridgmont Drive, Los Angeles, CA

Responses to Comment Letter LR-3

View 2: Looking East from 1896 Loma Vista Drive, Beverly Hills, CA

The visual analysis found that the proposed new facilities would be compatible with the existing visual character and quality of the site, which is low due to the presence of manmade development. Despite extending the height of the existing tower, the tall trees that currently surround the site and the varying topography of the area would continue to obscure most of the site from view as they do today. Although the proposed project would result in visual changes to the site; the proposed project would result in less than significant visual impacts for the reasons stated above. No changes to the Draft EIR are required in response to this comment.

Comment 9: Further, the City is concerned about the proposed red or white LED lamps that may be installed as part of the project, as well as the proposed exterior security lighting on the 600 square foot equipment shelter. Lighting of this nature is incompatible with the residential neighborhood surrounding the Project site.

Response to Comment 9: The City's concerns are noted. Effects from lighting or glare were evaluated in Section 3.1 of the Draft EIR, with site specific analysis for light and glare concerns for Site WAD provided at page 4-1878. Site WAD is located within a suburban area with extensive development adjacent to the site. The site is located in an area where numerous sources of lighting are present, such as vehicle headlights, street lights, and residential lighting. The Draft EIR also notes that, because of the presence of these light sources, tower (monopole) lighting, if required, would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area, resulting in a less than significant impact. A new equipment shelter, if built, would be visually subordinate to, and likely blocked by, the existing structures on the site. Further, the exterior security lighting on the new shelter would be equivalent to a 100-watt light bulb. For these reasons, security lighting on the shelter would result in a less than significant visual impact. No changes to the Draft EIR are required in response to this comment.

Comment 10: The DEIR suggests that the General Plan Designation for the site is Single Family Residential — Low Density and the Zoning is One Family Residential. The Zoning for the parcel is "Parks, Reservoirs, Government (Unzoned)", please revise.

Responses to Comment Letter LR-3

Response to Comment 10: Table 3.9-4 in the Draft EIR will be revised to reflect the proper zoning classification. This revision does not result in any change to the impact conclusions in the Draft EIR.

Comment 11: As a telecommunications project that involves the Federal Communications Commission (FCC), Section 106 review is required to study the impact on historic and cultural resources. Please identify if a Section 106 review has been completed, pursuant to the programmatic agreement. As an interested party, please provide us with a copy of the report.

Response to Comment 11: Compliance with Section 106 of the National Historic Preservation Act is not a CEQA requirement. However, it is required pursuant to FCC regulations. Section 106 through the FCC's Form 620/621 process is ongoing, but has not yet been completed for Site WAD. Prior outreach was conducted with the City via correspondence dated August 29, 2014. City representatives William Crouch and Reina Kapadia spoke with the Authority's cultural consultant from Jacobs Engineering (Dr. Paige Peyton). If the site is included in the final design, and upon completion of the 620/621 process, the Authority will be in a position to provide updated information to the City of Beverly Hills consistent with state and federal regulations protecting cultural resources.

Comment 12: Under Impact Analysis CUL- 1, it appears that historic resources within the City of Los Angeles were studied, but not within Beverly Hills. Direct and indirect / visual impacts to historic resources to the immediate site (water tower and surroundings) and the adjacent neighborhoods (i.e. Trousdale Estates) in Beverly Hills should be studied and addressed in your analysis.

Response to Comment 12: Historic resources were identified and assessed for impacts within a 0.5 mile radius of site WAD as stipulated in the *Nationwide Programmatic Agreement for Review under the National Historic Preservation Act (2005)* between the Federal Communications Commission, Advisory Council on Historic Preservation, and the National Conference of State Historic Preservation Officers.. The assessment encompassed the water tank site, the surrounding neighborhood, and Trousdale Estates. A discussion of cultural resources is provided in the Draft EIR at Section 3.4, and site-specific impact analysis and recommended mitigation measures are found for Site WAD beginning at page 4-1887. Significant impacts would be reduced to less than significant with incorporation of CUL MM 5 which requires architectural camouflage is required to minimize the visual effects of the proposed increase in the height of the monopole on identified historical resources within the indirect APE. No changes to the Draft EIR are required in response to this comment.

Dear Mr. Hofflinger:

**RESPONSE TO COMMENT LETTER ON THE DRAFT ENVIRONMENTAL IMPACT
REPORT (EIR) FOR THE LOS ANGELES REGIONAL INTEROPERABLE
COMMUNICATIONS SYSTEM (LA-RICS) JOINT POWERS AUTHORITY
(AUTHORITY) LAND MOBILE RADIO (LMR) PROJECT**

The LA-RICS Authority appreciates the comments provided by the City of Chino Hills on the Draft EIR for the proposed LMR Project. Proposed responses to these comments are provided herein in compliance with Section 15088(b) of the State California Environmental Quality (CEQA) Guidelines. All comments will be provided to the LA-RICS Authority Board prior to their consideration of the EIR for certification. The proposed time, date, and location of the hearing to consider certification of the Final EIR and approval of the proposed project will be provided on the Authority's website (www.la-rics.org).

Sincerely,

Subject: Land Mobile Radio Project DEIR

Ms. Yang:

Thank you for the opportunity to review the Draft Environmental Impact Report for the Land Mobile Radio Project. After carefully looking at the proposed project, which consists of ninety (90) potential sites for the installation of an emergency radio tower, the City of Chino Hills has the following comments;

- 1 | 1. On page 1-9 under Statutory Exemption sites, Pomona 1620 Hillcrest (PSH) is listed as an exempt location. The remainder of the DEIR does not analyze this location as a potential site for a communication tower, only the Aerojet site (AJT). Please clarify that there is only one (1) site within the City of Chino Hills.
- 2 | 2. On page 2-48 under Comprehensive list of projects within two miles, please update the status of the following projects;
 - a. Stonefield – Post Entitlement Review (Construction/Grading Plan Review)
 - b. Canyon Hills – Under Construction
- 3 | 3. On page 3-434 under Table 3.9-4, Pursuant to Section 16.10.030, the maximum building height for Rural Residential (R-R) zone is 35 feet. Please correct maximum height limit under table. Also on page 4-64 refers to building height.
- 4 | 4. Please note that a Site Development Permit Application will be required if the project will be located on an existing tower or structure. If the proposal includes a new facility, a Conditional Use Permit will be required.

Sincerely,

Michael Hofflinger
Associate Planner

City Council: Art Bennett ▪ Ed M. Graham ▪ Ray Marquez ▪ Cynthia Moran ▪ Peter J. Rogers

Responses to Comment Letter LR-4

The Authority appreciates the City of Chino Hills' comments on the Draft Environmental Impact Report (EIR) dated February 25, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to comments are provided below.

Comment 1: On page 1-9 under Statutory Exemption sites, Pomona 1620 Hillcrest (PSH) is listed as an exempt location. The remainder of the DEIR does not analyze this location as a potential site for a communication tower, only the Aerojet site (AJT). Please clarify that there is only one (1) site within the City of Chino Hills.

Response to Comment 1: The Authority found Site PSH statutorily exempt from CEQA pursuant to Public Resources Code section 21080.25, and a Notice of Exemption was filed with the Los Angeles County Clerk's office on November 13, 2014. None of the sites listed Draft EIR Table 1.3-1, including Site PSH, are analyzed within the EIR, with the exception statutorily exempted LMR sites were considered in the cumulative impact analysis as described in Section 2.7. However, any of the sites identified in Draft EIR Table 1.3-1 could be constructed as part of the LMR System. As noted by the commenter, Site AJT is analyzed in the Draft EIR, with site-specific analysis provided beginning at page 4-38. Therefore, up to two sites, PSH and AJT, may be constructed within the City of Chino Hills as part of the LMR project.

Comment 2: On page 2-48 under Comprehensive list of projects within two miles, please update the status of the following projects; a. Stonefield - Post Entitlement Review (Construction/Grading Plan Review); b. Canyon Hills - Under Construction

Response to Comment 2: The status of the Stonefield and Canyon Hills project in Table 2.7-1 will be updated in the Final EIR per your comments. These revisions to the Final EIR do not result in any new significant impact or an increase in the severity of an environmental impact.

Comment 3: On page 3-434 under Table 3.9-4, Pursuant to Section 16.10.030, the maximum building height for Rural Residential (R-R) zone is 35 feet. Please correct maximum height limit under table. Also on page 4-64 refers to building height.

Response to Comment 3: Response to Comment 3: The Authority concurs that the maximum height should be revised to 35 feet on both pages 3-434 and 4-64 based on the zoning as Rural Residential. This change is consistent with Section 16.10.030 and 16.44.060 of the Chino Hill Development Code that states: "... no major facility may exceed the maximum building height for the applicable zoning district...", which is 35 feet for R-R unless otherwise approved by the planning commission. Since Site AJT is a collocation to an existing tower, i.e., equipment would be installed on an existing lattice tower without exceeding the current overall height of the structure including appurtenances, proposed improvements at this site would still be consistent with Chapter 16.44 of the development code and no other changes to the Draft EIR would be required. These revisions to the Final EIR do not result in any new significant impact or an increase in the severity of an environmental impact.

Comment 4: Please note that a Site Development Permit Application will be required if the project will be located on an existing tower or structure. If the proposal includes a new facility, a Conditional Use Permit will be required.

Response to Comment 4: The information provided by the City regarding permitting is noted.

LA-RICS

Re: LA-RICS –LMR EIR

Dear Ms. Yang:

We have been retained as special counsel to the City of Glendora (City) with regard to the LA-RICS proposal to construct communication towers in the Los Angeles region.

1 We have previously written to you on March 5, 2015 regarding the potential location of communications towers at three Los Angeles County owned fire stations within City limits has not been sufficiently coordinated with the City. (A copy of this March 5, 2015 letter is attached.) We are pleased to see these communication towers are not among the towers proposed in the EIR for this project. We ask that you immediately contact us, City Attorney Wayne Leech, City Manager Chris Jeffers and Planning Director Jeff Kugel if our understanding is incorrect, or if there is a proposal to change this project to include such towers in the City of Glendora as we would strongly object to such a proposal.

2 With regard to the project as it is set forth now, we note there are two new towers proposed for Johnstone Peak. (DEIR, p. 2-17.) These are set forth as being within the jurisdiction of the US Forest Service. These towers would be visible from the City of Glendora, and would potentially interfere with the operation of a communication tower that the City currently maintains there.

3 Therefore, we ask that more detail be provided about this potential proposal. Specifically, since the original proposal of the LA-RICS project, the national forest in this area has received National Monument status as of October 2014, (<http://news.nationalgeographic.com/news/2014/10/141008-san-gabriel-mountains-national-monument-conservation/>.) We believe additional investigation should be

Comment Letter LR-6

Nancy Yang
February 19, 2016
Page 2

3 initiated to determine if the additional towers at the Johnstone Peak location are compatible with the new, more protective designation of the National Monument.

4 Furthermore, we are concerned about the potential for interference of operations- both by physical obstruction and by electromagnetic interference- of tower proposal on Johnstone Peak with the City's current communications tower. Potential mitigation measures should be included to address potential interference with the existing communications tower infrastructure.

Conclusion.

5 The LA-RICS project is obviously important to the future of public safety in the local region. Therefore, the City has been a supportive member of the Joint Powers Authority that is implementing this project, and as helpful as possible to you in carrying it out. However, as a member of the JPA we believe the best project possible, with the least damaging environmental impacts possible, should be developed.

Please feel free to contact City Attorney Wayne Leech or City Manager Chris Jeffers directly about this matter. We ask that you do so as soon as possible.

Sincerely,

Douglas P. Carstens

Responses to Comment Letter LR-6

The Authority appreciates the City of Glendora's comments on the Draft Environmental Impact Report (EIR) dated February 19, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to comments are provided below.

Comment 1: We have previously written to you on March 5, 2015 regarding the potential location of communications towers at three Los Angeles County owned fire stations within city limits has not been sufficiently coordinated with the City. (A copy of this March 5, 2015 letter is attached.) We are pleased to see these communication towers are not among the towers proposed in the EIR for this project. We ask that you immediately contact us, City Attorney Wayne Leech, City Manager Chris Jeffers and Planning Director Jeff Kugel if our understanding is incorrect, or if there is a proposal to change this project to include such towers in the City of Glendora as we would strongly object to such a proposal.

Response to Comment 1: The Authority received the letter sent on March 5, 2015, which contained comments related to the LA-RICS Public Safety Broadband Network (PSBN), also known as the Long Term Evolution (LTE) communications system project, and responded via letter dated March 13, 2015. The previously approved LTE system is a separate project from the LA-RICS Land Mobile Radio (LMR) system project that is the subject of the current EIR. Construction of the LTE Project began in December 2014 and was completed in December 2015. No LTE facilities were constructed in the City of Glendora.

Similarly, there are no LMR sites proposed within the City of Glendora.

Comment 2: With regard to the project as it is set forth now, we note there are two new towers proposed for Johnstone Peak. (DEIR, p.2-17.) These are set forth as being within the jurisdiction of the US Forest Service. These towers would be visible from the City of Glendora, and would potentially interfere with the operation of a communication tower that the City currently maintains there.

Response to Comment 2: The Draft EIR analyzes two LMR facilities identified as Johnstone Peak-1 (JPK) and Johnstone Peak-2 (JPK2). As explained in Draft EIR section 2.3 (p. 2-41), the Authority would construct a new LMR lattice tower at only one of the two proposed sites on Johnstone Peak. At either of these sites, the tower could be visible from the City of Glendora, as well as from other observation points. The Draft EIR concludes that impacts to aesthetic resources from project construction at either of these sites would be less than significant, as noted in Draft EIR pages 4-724 through 4-726, and 4-763 through 4-765. Regarding interference, the frequencies used by the antennas to be mounted on any tower installed at Johnstone Peak will be reviewed as part of the FCC licensing process, which sets standards to preclude potential interference to existing communications infrastructure.

Comment 3: Therefore, we ask that more detail be provided about this potential proposal. Specifically since the original proposal of the LA-RICs project, the national forest in this area has received National Monument status as of October 2014. (<http://news.nationalgeographic.com/news/2014110/141008-san-gabriel-mountainsnational-monument-conservation/>.) We believe additional investigation should be initiated to determine if the additional towers at the Johnstone peak location are compatible with the new, more protective designation of the National Monument.

Responses to Comment Letter LR-6

Response to Comment 3: The Authority is aware that sites JPK and JPK2 are on lands designated as a National Monument in October 2014, and this fact is referenced several times in the Draft EIR where relevant to the analysis of environmental impacts (an example is provided at page 3-106). The Authority will continue to work with the U.S. Forest Service during the permitting process for LMR communications infrastructure developed at Johnstone Peak. The commenter may wish to note the federal register proclamation (emphasis added) that created the San Gabriel Mountains National Monument found at [\[https://federalregister.gov/a/2014-24849\]](https://federalregister.gov/a/2014-24849) states:

“Nothing in this proclamation shall be construed to interfere with the operation or maintenance, nor with the replacement or modification within the existing authorization boundary, of existing water resource, flood control, utility, pipeline, or telecommunications facilities that are located within the monument, subject to the Secretary of Agriculture’s special uses authorities and other applicable laws. Existing water resource, flood control, utility, pipeline, or telecommunications facilities located within the monument may be expanded, and new facilities may be constructed within the monument, to the extent consistent with the proper care and management of the objects protected by this proclamation, subject to the Secretary of Agriculture’s special uses authorities and other applicable law.”

As summarized in Draft EIR Table ES-2, starting on page ES-36, all environmental impacts at sites JPK and JPK2 will be less than significant with incorporation of appropriate mitigation.

Comment 4: Furthermore, we are concerned about the potential for interference of operations both by physical obstruction and by electromagnetic interference of tower proposal on Johnstone Peak with the City’s current communications tower. Potential mitigation measures should be included to address potential interference with the existing communications tower infrastructure.

Response to Comment 4: This comment addresses mechanical interference, which is not an environmental issue that requires a response for purposes of CEQA (CEQA Guidelines §15088). Nevertheless, the FCC licensing process, as well as the U.S. Forest Service special use permit application review process require coordination among frequency licensees and between a permit applicant and existing permit holders, respectively, to avoid interference. Any LMR installation at Johnstone Peak would comply with both processes.

Comment 5: The LA-RICS project is obviously important to the future of public safety in the local region. Therefore, the City has been a supportive member of the Joint powers Authority that is implementing this project, and as helpful as possible to you in carrying it out. However, as a member of the JPA we believe the best project possible, with the least damaging environmental impacts possible, should be developed.

Response to Comment 5: The Authority appreciates the support of the City of Glendora. The Authority will continue to comply with CEQA and all other applicable regulatory requirements in development of the LMR system.

Subject: Comments on the EIR for the Los Angeles Regional Interoperable Communications System (LA-RICS) proposed Land Mobile Radio system

Thank you for providing the Draft Environmental Impact Report (EIR) for the Los Angeles Regional Interoperable Communications System (LA-RICS) proposed Land Mobile Radio (LMR) system. Please accept the following comments on the Draft EIR:

- 1 | • Two facilities were found statutorily exempt and have already been constructed in the City of Industry. These are not addressed at all in the EIR, specifically section 1.3.2 and Table 1.3-1. These facilities should be accounted for in the LA-RICS system design and appear not to be.
- 2 | • Neither the City of Industry nor its planning director were consulted on the preparation of the EIR. We were consulted during the construction of the facilities in the City but had no input or knowledge about the review and processing of the system discussed in the EIR. Please remove the City from Section 6 of the EIR.

Brian James
Planning Director

Responses to Comment Letter LR-7

The Authority appreciates the City of Industry's comments on the Draft Environmental Impact Report (EIR) dated January 26, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to the comments are provided below.

Comment 1: Two facilities were found statutorily exempt and have already been constructed in the City of Industry. These are not addressed at all in the EIR, specifically section 1.3.2 and Table 1.3-1. These facilities should be accounted for in the LA-RICS system design and appear not to be.

Response to Comment 1: The Authority is not currently proposing or planning to construct any LMR sites in the City of Industry. However, the Authority has constructed one LA-RICS Long Term Evolution (LTE) site in the City. This is LTE Site LASDIDT, located at the Los Angeles County Sheriff's Industry Station at 150 N. Hudson Street in the City of Industry, which was constructed in 2015. The LTE and the LMR systems are two separate regional communications projects being carried out by the Authority. The LTE system is a wireless day-to-day broadband data communications system for use on a variety of platforms, including cellular smart phones, tablets, and other computers. The LMR system is also dedicated to public safety but is a wireless voice communications system for mobile and portable devices such as walkie-talkies and two-way radios. These independent projects are funded through different federal agencies through individual grant processes.

The Authority found LTE Site LASDIDT statutorily exempt from CEQA pursuant to Public Resources Code section 21080.25, and a Notice of Exemption was filed with the Los Angeles County Clerk's office on March 6, 2014. Therefore this site is identified in the list of statutorily exempt sites in Table 1.3.1 in the Draft EIR, and it is not described further or analyzed in the Draft EIR. LTE Site LASDIDT was also analyzed under NEPA in the Broadband Technology Opportunities Program (BTOP) Environmental Assessment (EA) dated October 2014, for which the National Telecommunications & Information Administration (NTIA) issued a Finding of No Significant Impact (FONSI) on July 10, 2015.

Comment 2: Neither the City of Industry nor its planning director were consulted on the preparation of the EIR. We were consulted during the construction of the facilities in the City but had no input or knowledge about the review and processing of the system discussed in the EIR. Please remove the City from Section 6 of the EIR.

Response to Comment 2: The Authority's environmental consultant, Jacobs Engineering, contacted Brian James, Planning Director for the City of Industry, via email on November 10, 2015 to request information about upcoming projects in the City for purposes of preparing the cumulative impacts analysis for the EIR. Mr. James provided a list of upcoming projects to the preparers of the EIR via return email on November 10, 2015. The projects on the list provided by the City of Industry were considered in the cumulative impact analysis conducted for the Draft EIR.

Monterey Park, CA 91754

SUBJECT: Comments on the Draft Environmental Impact Report for the LA-RICS Land Mobile Radio (LMR) System

Dear Ms. Yang:

The City of Rancho Palos Verdes appreciates the opportunity to comment upon the Draft Environmental Impact Report (DEIR) for the above-mentioned project. We have reviewed the DEIR and the LMR project description, and offer the following comments:

- 1. In scoping comments that we submitted on 23 September 2014 (enclosed), we noted a number of issues to be addressed with respect to a proposed LMR site on Coast Guard property at Point Vicente Park/Civic Center (Location ID: PVC). We now understand that the LMR project description in the DEIR no longer includes this site. However, in recent discussions with LA-RICS Staff and contractors, it is clear that LA-RICS is still interested in an LMR site at this general location (although perhaps not on the Coast Guard property). The City remains open to discussions with LA-RICS about its interest in the PVC site. However, we also wish to go on record stating that many (if not all) of the issues previously raised regarding this site in our scoping comments will need to be addressed in any subsequent environmental review for an LMR installation at the PVC site.
- 2. In the same scoping comments from September 2014, we also noted issues to be addressed with respect to a proposed LMR site on Federal Aviation Administration (FAA) property at the top of San Pedro Hill (Location ID: SPC). We now understand that the LMR project description in the DEIR no longer includes this site either. However, the City respectfully suggests that the SPC site—located at the highest point on the Palos Verdes Peninsula and already developed with a large number of antennae and support structures—should be retained as an alternative site that could provide coverage to much of the Peninsula and South Bay region.

Comment Letter LR-8

Nancy Yang
24 February 2016
Page 2

- 3
3. In September 2014, we also noted concerns regarding a proposed LMR site at the County "antenna farm" at 5741 Crestridge Road (Location ID: RHT), primarily related to aesthetics, biological resource impacts, and land use and planning. We now understand that LA-RICS has determined that the RHT site is statutorily exempt from the provisions of the California Environmental Quality Act (CEQA) pursuant to Public Resources Code §21080.25, and will not be addressed in the DEIR. Notwithstanding this determination, the City believes that the issues raised in our scoping comments (enclosed) should be addressed before this LMR installation is constructed. Furthermore, we are concerned that the public outreach efforts undertaken by LA-RICS regarding the RHT site in December 2015 were inadequate. We have recently provided LA-RICS with addresses for several homes on Mistridge Drive and contact information for the *Mesa Palos Verdes* homeowners' association, all of whom should be apprised of LA-RICS' plans for the RHT site.

Again, thank you for the opportunity to comment upon this important project. If you have any questions or need additional information, please feel free to contact me at (310) 544-5226 or via e-mail at kitf@rpvca.gov.

Sincerely,

A handwritten signature in blue ink, appearing to read "Kit Fox", is written over a light blue horizontal line.

Responses to Comment Letter LR-8

The Authority appreciates the City of Rancho Palos Verdes' comments on the Draft Environmental Impact Report (EIR) dated February 24, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to comments are provided below.

Comment 1: In scoping comments that we submitted on 23 September 2014 (enclosed), we noted a number of issues to be addressed with respect to a proposed LMR site on Coast Guard property at Point Vicente Park/Civic Center (Location ID: PVC). We now understand that the LMR project description in the DEIR no longer includes this site. However, in recent discussions with LA-RICS Staff and contractors, it is clear that LA-RICS is still interested in an LMR site at this general location (although perhaps not on the Coast Guard property). The City remains open to discussions with LA-RICS about its interest in the PVC site. However, we also wish to go on record stating that many (if not all) of the issues previously raised regarding this site in our scoping comments will need to be addressed in any subsequent environmental review for an LMR installation at the PVC site.

Response to Comment 1: Site PVC is no longer under consideration as part of the proposed project, and no replacement site has been proposed for inclusion in the LMR system. In the event a replacement site is identified, any approval of the site would be subject to CEQA, as applicable.

Comment 2: In the same scoping comments from September 2014, we also noted issues to be addressed with respect to a proposed LMR site on Federal Aviation Administration (FAA) property at the top of San Pedro Hill (Location ID: SPC). We now understand that the LMR project description in the DEIR no longer includes this site either. However, the City respectfully suggests that the SPC site - located at the highest point on the Palos Verdes Peninsula and already developed with a large number of antennae and support structures -should be retained as an alternative site that could provide coverage to much of the Peninsula and South Bay region.

Response to Comment 2: Site SPC is no longer in consideration as part of the proposed project, and no replacement site has been proposed for inclusion in the LMR system. The Authority notes the City's support for LMR facilities at Site SPC.

Comment 3: In September 2014, we also noted concerns regarding a proposed LMR site at the County "antenna farm" at 5741 Crestridge Road (Location ID: RHT), primarily related to aesthetics, biological resource impacts, and land use and planning. We now understand that LA-RICS has determined that the RHT site is statutorily exempt from the provisions of the California Environmental Quality Act (CEQA) pursuant to Public Resources Code §21080.25, and will not be addressed in the DEIR. Notwithstanding this determination, the City believes that the issues raised in our scoping comments (enclosed) should be addressed before this LMR installation is constructed. Furthermore, we are concerned that the public outreach efforts undertaken by LA-RICS regarding the RHT site in December 2015 were inadequate. We have recently provided LA-RICS with addresses for several homes on Mistridge Drive and contact information for the *Mesa Palos Verdes* homeowners' association, all of whom should be apprised of LA-RICS' plans for the RHT site.

Response to Comment 3: As noted in the commenter's comments, Site RHT was found to be statutorily exempt from CEQA. Although statutorily exempt sites are not included in the project level analysis provided in the Draft EIR, numerous environmental criteria had to be met for a site to qualify for the statutory exemption, including criteria related to biological resources. Additionally, all of the statutorily

Responses to Comment Letter LR-8

exempt LMR sites are considered, where appropriate, in the cumulative impact analysis (see cumulative impacts analyses provided within resource topics in Chapters 2 and 3 of the Draft EIR). Because the Site RHT is exempt from analysis in the EIR, the Authority is not required to respond to the City's scoping comments on Site RHT. However, the comments will be provided to the Authority's decision makers for their consideration in connection with the LMR project, and the Authority will continue to work with stakeholders associated with Site RHT prior to and during construction and operations of the site.

Hi,

I am interested in what the facility will involve and look like at the RHT (Rolling Hills Transmit) site located at 5741 Crestridge Rd. in the City of RPV. I note that the EIR lists this site as Statutorily Exempt, so I presume the EIR is silent on this one??. I presume it is simply going on one of the existing antenna stands/towers given that this is already an antenna farm. Please advise.

Thanks,
David Wahba

The Authority appreciates the City of Rolling Hills Estates' comments on the Draft Environmental Impact Report (EIR) dated January 13, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Comment 1: I am interested in what the facility will involve and look like at the RHT (Rolling Hills Transmit) site located at 5741 Crestridge Rd. in the City of RPV. I note that the EIR lists this site as Statutorily Exempt, so I presume the EIR is silent on this one??. I presume it is simply going on one of the existing antenna stands/towers given that this is already an antenna farm. Please advise.

Response to Comment 1: On November 13, 2014, the Authority found LMR Site RHT statutorily exempt from CEQA pursuant to Public Resources Code section 21080.25, and a Notice of Exemption was filed with the Los Angeles County Clerk's office on November 14, 2014. Therefore, this site is identified in the list of statutorily exempt LMR sites in Table 1.3.1 in the Draft EIR, and it is not described further or analyzed in the EIR. Current design for project implementation at Site RHT includes construction of a new, up to 180-foot lattice tower and related infrastructure and related site development including equipment shelter, emergency generator, and other site improvements.

CITY OF SIGNAL HILL

2175 Cherry Avenue • Signal Hill, CA 90755-3799

February 25, 2016

VIA EMAIL: DraftEIR.Hotline@la-rics.org

Los Angeles
Regional Interoperable Communications System
Joint Powers Authority
Attn: Ms. Nancy Yang
2525 Corporate Place, Suite 100
Monterey Park, CA 91754

RE: LOS ANGELES REGIONAL INTEROPERABLE COMMUNICATIONS SYSTEM
LAND MOBILE RADIO PROJECT DRAFT ENVIRONMENTAL IMPACT
REPORT

Dear Ms. Yang:

The City of Signal Hill has reviewed the Draft Environmental Impact Report (DEIR) for the proposed Los Angeles Regional Interoperable Communications System (LA-RICS). The following is a summary of the City of Signal Hill's (the "City") comments related to the project.

Jurisdiction

The Land Mobile Radio tower proposed to be altered (the SGH tower) is located within the City of Signal Hill. The tower is both owned and operated by the City of Long Beach, a municipal corporation however, it is located on property that is jointly owned by GTE CALIFORNIA INC and THE CITY OF LONG BEACH.

Historically, Long Beach has been the permitting authority for the tower and the City of Long Beach has not contacted us to request, or authorize a shift in that permitting authority. Accordingly, the Long Beach tower does not have a CUP or similar entitlement from the City of Signal Hill.

Comment:

- A copy of the draft and final EIR should be distributed to the City of Long Beach's Department of Technology and Innovation.

Comment Letter LR-11

LA-RICS DEIR Comments
Page 2

Alternative Sites for Signal Hill

2 | The location of the SGH tower is unique from other tower locations studied in the DEIR, in that it is surrounded by residentially zoned property and existing single-family and multi-family dwellings and also has a second antenna tower directly adjacent to it at 2411 Skyline Drive. No other sites appear to have existing residential uses directly adjacent on all sides.

Comments:

- 3 | • The DEIR for the SGH tower should analyze any hazards related to human health impacts and expected nuisances that could impact the adjacent residences and should include the cumulative impacts from the adjacent antenna tower.
- 4 | • The DEIR does not consider alternative site locations in lieu of the location identified for the SGH tower on Stanley Avenue.
- The City is requesting that LA-RICS conduct a due diligence investigation to identify alternative sites that are not in, or surrounded by any residential zoning districts.

Design

5 | The DEIR presents a “worst case scenario”, proposing the maximum number of necessary equipment to be installed at each site.

Comments:

- 6 | • Upon receipt of the final LA-RICS tower design and prior to the issuance of any building permits, the City of Signal Hill shall be provided with the design details for the SGH tower, including but not limited to the tower height, number, type and size of equipment (microwave antennas and whips) and diesel generator size and fuel tank storage size.
- 7 | • The impacts related to noise, construction impacts, area of disturbance and excavation shall also be disclosed.
- Upon receipt of the final LA-RICS tower design, LA-RICS shall coordinate with the City of Signal Hill to schedule and conduct a second a community meeting, in the City of Signal Hill to provide the community with information about the design.

Health Impacts from Radio Frequency Emissions

Comments:

- 8 | • Upon completion of the proposed design and prior to the issuance of building permits by the City of Long Beach, the City of Signal Hill requests a copy of the Radio Frequency (RF) emission safety study, to demonstrate that the existing RF emission level from all equipment on site complies with the Federal Communications Commission (FCC) guidelines and regulations on Maximum Permissible Exposure for the General Public/Uncontrolled and for the Occupational/Controlled groups per the FCC’s Office of Engineering and Technology Bulletin 65.

Comment Letter LR-11

LA-RICS DEIR Comments
Page 3

- 9 | • RF emission levels should be measured from the 20' level as well as from the ground, since the surrounding uses are two-story homes and should include the cumulative emissions from both the SGH tower and the adjacent antenna tower.
- 10 | • Prior to operation of any new equipment, the City of Signal Hill shall be provided with a copy of the report confirming that RF emission levels are in compliance with FCC regulations.
- 11 | • Confirmation that continued regular measurements of emissions will be conducted by certified professionals.

Compounded Radio Frequency Emissions
Comments:

- 12 | • All RF studies should be coordinated with the operator of the adjacent antenna tower at 2411 Skyline Drive, which is immediately adjacent to the subject site.
- 13 | • Specifically, the RF reports should study exposure rates for the General Public if both sites were at full capacity with antennas, whips and or other emitting equipment. A discussion on compounded RF Emissions is not included in the DEIR.
- 14 | • LA-RICS should include details of the procedures, equipment used, regularity, and methods of communicating the results of emissions monitoring before and after installation of equipment at the requested community meeting, or shall coordinate with the City of Signal Hill to conduct a third community meeting with these details.

Coverage Map & Interference

The DEIR does not include a map showing how the SGH tower will provide improved coverage and capacity to the immediate community.

Comments:

- 15 | • A map should be included within the DEIR showing improved coverage and identifying areas of concern where coverage would likely be lost during high emergency use.
- 16 | • The DEIR should discuss how interference issues will be addressed. Particularly, interference with frequencies used by residents for cable, radio, phone and or internet services.

Tower Location and Proximity to the Airport

Comment:

- 17 | • Prior to the issuance of building permits by the City of Long Beach, the City of Signal Hill requests a copy of the Federal Aviation Administration determination of no hazard to air navigation letter or flight operations for any extension of the tower and/or lighting rod (per HAZ Mitigation Measure 2).

Fuel Tank and Proximity to Residential Dwellings

Comment:

- 18 | • Fuel tanks shall be installed in accordance with California Fire Code and applicable hazardous material storage ordinances.

Comment Letter LR-11

LA-RICS DEIR Comments
Page 4

- 19 |
- Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks adjacent to residential dwellings and active oil wells shall be implemented.
- 20 |
- If the tank is greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, a copy of the spill prevention, control and countermeasure plan shall be submitted to the City.

Construction

The City and community should be informed of what to expect during construction and excavation.

Comments:

- 21 |
- Contact information for the contractor and/or project manager should be provided to report any issues during construction.
- 22 |
- Prior to the start of any evening or weekend work, both the City and community should be notified in writing of construction activities expected to occur (between 6 p.m. and 7 a.m. or weekends).

Operations and Maintenance

Comments:

- 23 |
- The DEIR does not describe what noise mitigation there will be for the diesel motor and any other air conditioning, electrical equipment etc. to reduce operational noise to below the 55dBA (ambient noise required by the Signal Hill Municipal Code).
- 24 |
- The DEIR does not describe details for maintaining security at the SGH site.
- 25 |
- The DEIR does not describe annual RF emission reports that will be conducted to ensure that the tower is operating at a safe level as prescribed by the FCC. The City would like a copy of all annual RF emission reports.

Follow-Up Community Meeting Requested

Comment:

- 26 |
- Upon receipt of the final LA-RICS tower design and prior to the issuance of any building permits, the City of Signal Hill requests that the LA-RICS Authority hold at least one additional community meeting to provide the local community (including the Promontory/Skyline Estates Homeowners Association) with information about the final design, share the results of any studies and answer any questions requested in this letter.

Other Comments

- 27 |
- The following updates (shown with strikeouts for deletions and red text for additions) to the DEIR are requested for administrative purposes:

LA-RICS DEIR Comments

Page 6

The City of Signal Hill recognizes the importance of a public communications system and looks forward to receiving the information requested in this letter. We appreciate that LA-RICS conducted a community meeting for interested residents and look forward to coordination of a second community meeting. Should you have any questions or comments regarding the comments please contact me at 562-989-7343 or scharney@cityofsignalhill.org. Please direct any response to comments to my attention and send a copy of the Final EIR.

Regards,

A handwritten signature in blue ink, appearing to read "Scott Charney", with a long, sweeping underline.

Scott Charney
Director of Community Development

cc: City Manager
Chief of Police

Responses to Comment Letter LR-11

The Authority appreciates the City of Signal Hill's comments on the Draft Environmental Impact Report (EIR) dated February 25, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to comments are provided below.

Comment 1: The Land Mobile Radio tower proposed to be altered (the SGH tower) is located within the City of Signal Hill. The tower is both owned and operated by the City of Long Beach, a municipal corporation however, it is located on property that is jointly owned by GTE CALIFORNIA INC and THE CITY OF LONG BEACH.

Historically, Long Beach has been the permitting authority for the tower and the City of Long Beach has not contacted us to request, or authorize a shift in that permitting authority. Accordingly, the Long Beach tower does not have a CUP or similar entitlement from the City of Signal Hill.

Comment:

A copy of the draft and final EIR should be distributed to the City of Long Beach's Department of Technology and Innovation.

Response to Comment 1: The comment is noted

The Draft EIR is available on the Authority's website (www.la-rics.org). If the Authority certifies the Final EIR and approves the project, a Notice of Determination and the Final EIR will be filed with the Los Angeles County Clerk and the San Bernardino County Clerk. The Final EIR will also be posted on the Authority's website where it will be available to all interested parties, including the City of Long Beach. Permitting for the project will be undertaken by the Authority following certification of the EIR and project approval.

Comment 2: The location of the SGH tower is unique from other tower locations studied in the DEIR, in that it is surrounded by residentially zoned property and existing single-family and multi-family dwellings and also has a second antenna tower directly adjacent to it at 2411 Skyline Drive. No other sites appear to have existing residential uses directly adjacent on all sides.

Comments:

The DEIR for the SGH tower should analyze any hazards related to human health impacts and expected nuisances that could impact the adjacent residences and should include the cumulative impacts from the adjacent antenna tower.

Response to Comment 2: While each LMR site included in the Draft EIR is unique, other sites analyzed in the Draft EIR, such as SDW and WAD, are similar to site SGH in that they are located in residential areas with residences adjacent.

Draft EIR Section 3.7.4 – Impact Analysis for Hazards and Hazardous Materials, starting on page 3-382, under HAZ-1, HAZ-2 and HAZ-3, provides an analysis of significant hazards to the public (including residents) or environment for various hazards related to human health. Specific hazards for Site SGH are identified and discussed, beginning on page 4-1508. Hazards associated with transport of diesel fuel to the site would be reduced to a less than significant impact through implementation of regulations and

Responses to Comment Letter LR-11

requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination. The fuel tank within the generator would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Impacts from hazardous material transport and use on the site would be less than significant. The site is not within 0.25 mile of a school; therefore no impacts to schools would occur from diesel fuel use on the site.

Nuisances are not an environmental impact that require analysis under CEQA. However, the Draft EIR analyzes site-specific impacts from noise, starting on page 4-1516, and dust, starting on page 4-1531. Section 3.7.5, Cumulative Impacts, also provides an analysis of the potential impacts from identified hazards. This analysis considered potential impacts from adjacent antennas within the geographic boundary as defined in Section 3.7.5.1, as appropriate depending on the hazard and hazardous material discussed. Other potential cumulative impacts associated with adjacent antennas, such as aesthetics, are discussed in Section 3.1.4 starting on page 3-26.

Comment 3: The DEIR does not consider alternative site locations in lieu of the location identified for the SGH tower on Stanley Avenue.

Response to Comment 3: CEQA requires analysis of alternatives that would reduce or avoid significant effects of the proposed project. The Draft EIR did not identify any significant effects at Site SGH that cannot be mitigated by the mitigation measures identified in the Draft EIR. Therefore, CEQA does not require the Authority to identify an alternative to Site SGH. Additionally, the Authority explored numerous options for providing LMR coverage to the cities of Signal Hill and Long Beach area. The Authority conducted a candidate site search in the area to identify potential sites that provided coverage to areas that could not be covered by other planned sites. No other viable sites were identified that could provide LMR coverage equivalent to Site SGH. However, the Authority analyzed more sites in the Draft EIR than would ultimately be constructed, effectively analyzing numerous alternative sites.

Comment 4: The City is requesting that LA-RICS conduct a due diligence investigation to identify alternative sites that are not in, or surrounded by any residential zoning districts.

Response to Comment 4: Early and throughout the planning process, searches were conducted in the Los Angeles County area for sites suitable for inclusion in the LMR system. Alternative locations were identified and analyzed in the Draft EIR for many sites, when those alternatives were available. Examples of this include sites H-69B and SPN, where one served as an alternative to the other, and both were analyzed. For Site SGH, no suitable alternative location was identified for analysis.

Comment 5: The DEIR presents a "worst case scenario", proposing the maximum number of necessary equipment to be installed at each site.

Comments:

Upon receipt of the final LA-RICS tower design and prior to the issuance of any building permits, the City of Signal Hill shall be provided with the design details for the SGH tower, including but not limited to the tower height, number, type and size of equipment (microwave antennas and whips) and diesel generator size and fuel tank storage size.

Responses to Comment Letter LR-11

Response to Comment 5: The commenter is correct in that the Draft EIR provides a design scenario that allows for a conservative estimate of impacts using reasonable assumptions. The Authority will continue to work with the City of Signal Hill and will provide, as appropriate, information regarding tower and other site design details. No change to the Draft EIR is required as a result of this comment.

Comment 6: The impacts related to noise, construction impacts, area of disturbance and excavation shall also be disclosed.

Response to Comment 6: A complete site-specific impact analysis for Site SGH has been provided, beginning at page 4-1487 of the Draft EIR. The analysis for each resource is provided for both construction and operations activities. Impacts from construction activity are based on analysis that includes the area of disturbance and excavation activity as relevant to the resource topic. The analysis discusses the noise level estimated under a maximum construction activity scenario at proposed Site SGH to the nearest noise-sensitive receiver, which is 89 dBA within 25 feet of the site boundary. The actual construction noise level will not exceed this estimated level. Also discussed in the site-specific analysis, operational noise from the site would be within background levels.

Comment 7: Upon receipt of the final LA-RICS tower design, LA-RICS shall coordinate with the City of Signal Hill to schedule and conduct a second a community meeting, in the City of Signal Hill to provide the community with information about the design.

Response to Comment 7: Upon completion of design and prior to construction, the Authority will coordinate additional community meeting(s) and other outreach efforts with residents of the City of Signal Hill.

Comment 8: Upon completion of the proposed design and prior to the issuance of building permits by the City of Long Beach, the City of Signal Hill requests a copy of the Radio Frequency (RF) emission safety study, to demonstrate that the existing RF emission level from all equipment on site complies with the Federal Communications Commission (FCC) guidelines and regulations on Maximum Permissible Exposure for the General Public/Uncontrolled and for the Occupational/Controlled groups per the FCC's Office of Engineering and Technology Bulletin 65.

Response to Comment 8: As described in Section 5.3 of the Draft EIR, the Authority will manage radiofrequency (RF) electromagnetic energy (EME) radiation in accordance with applicable guidance found at the Federal Communication Commission's Office of Engineering and Technology (OET) Bulletin 65. This will include desktop analysis of RF exposures inclusive of all equipment at the site (including new LMR equipment) prior to construction and confirmatory sampling of RF exposures upon completion of construction to ensure exposures are within regulatory requirements for workers and the public. This information will be provided when available to the City of Signal Hill.

Comment 9: RF emission levels should be measured from the 20' level as well as from the ground, since the surrounding uses are two-story homes and should include the cumulative emissions from both the SGH tower and the adjacent antenna tower.

Response to Comment 9: As noted in response to Comment 8, all RF exposure testing will be conducted in accordance with applicable guidelines, which include consideration of nearest receptors.

Responses to Comment Letter LR-11

Comment 10: Prior to operation of any new equipment, the City of Signal Hill shall be provided with a copy of the report confirming that RF emission levels are in compliance with FCC regulations.

Response to Comment 10: Testing for RF exposures will be conducted in accordance with OET Bulletin 65, as described in the response to comment 8. The Authority will provide the City with findings associated with both design-based desktop analyses and confirmatory sampling conducted upon completion of construction at Site SGH. As noted in Section 5.3 of the Draft EIR, RF EME will be managed in accordance with all applicable regulations.

Comment 11: Confirmation that continued regular measurements of emissions will be conducted by certified professionals.

Response to Comment 11: The Authority is responsible for management of RF EME as part of the FCC licensing process. Long term, the City of Long Beach manages the site. During our community outreach meeting held at Signal Hill on February 17, the City of Long Beach representative stated that they perform site RF EME testing every two years as part of overall site maintenance.

Comment 12: All RF studies should be coordinated with the operator of the adjacent antenna tower at 2411 Skyline Drive, which is immediately adjacent to the subject site.

Response to Comment 12: As noted in response to comment 8, the Authority will conduct all RF EME testing in accordance with FCC OET Bulletin 65.

Comment 13: Specifically, the RF reports should study exposure rates for the General Public if both sites were at full capacity with antennas, whips and or other emitting equipment. A discussion on compounded RF Emissions is not included in the DEIR.

Response to Comment 13: As noted in response to comment 8, the Authority will conduct all RF EME testing in accordance with FCC OET Bulletin 65.

Comment 14: LA-RICS should include details of the procedures, equipment used, regularity, and methods of communicating the results of emissions monitoring before and after installation of equipment at the requested community meeting, or shall coordinate with the City of Signal Hill to conduct a third community meeting with these details.

Response to Comment 14: The Authority will continue to work with the City and adjacent Homeowner's Association to disseminate factual information regarding site operations. We look forward to coordinating additional meeting(s) and additional outreach in the City of Signal Hill to accomplish this goal.

Comment 15: A map should be included within the DEIR showing improved coverage and identifying areas of concern where coverage would likely be lost during high emergency use.

Response to Comment 15: Coverage and capacity are not environmental issues that require a response pursuant to CEQA Guidelines Section 15088. Regardless, it is unlikely that coverage will suffer substantially during an emergency. Unlike long-term evolution (LTE) technology, LMR coverage propagation is relatively consistent by frequency, regardless of traffic.

Responses to Comment Letter LR-11

Comment 16: The DEIR should discuss how interference issues will be addressed. Particularly, interference with frequencies used by residents for cable, radio, phone and or internet services.

Response to Comment 16: Interference is not an environmental issue that requires a response pursuant to CEQA Guidelines Section 15088. Regardless, many of the spectrum bands listed will not be impacted by any of the frequencies being added. For other systems that exist on the tower, if there was evidence (as determined by FCC) that the Authority was causing interference, the Authority would be responsible for resolving the issue.

Comment 17: Prior to the issuance of building permits by the City of Long Beach, the City of Signal Hill requests a copy of the Federal Aviation Administration determination of no hazard to air navigation letter or flight operations for any extension of the tower and/or lighting rod (per HAZ Mitigation Measure 2).

Response to Comment 17: The Authority will continue to provide information to the City of Signal Hill.

Comment 18: Fuel tanks shall be installed in accordance with California Fire Code and applicable hazardous material storage ordinances.

Response to Comment 18: Management of fuels will be conducted in accordance with all applicable regulations. This topic is described in Draft EIR Section 3.7 and specific detail is provided for Site SGH beginning at page 4-1508.

Comment 19: Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks adjacent to residential dwellings and active oil wells shall be implemented.

Response to Comment 19: Management of fuels will be conducted in accordance with all applicable regulations. This topic is described in Draft EIR Section 3.7 and specific detail is provided for Site SGH beginning at page 4-1508.

Comment 20: If the tank is greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, a copy of the spill prevention, control and countermeasure plan shall be submitted to the City.

Response to Comment 20: Management of fuels will be conducted in accordance with all applicable regulations. This topic is described in Draft EIR Section 3.7 and specific detail is provided for Site SGH beginning at page 4-1508.

Comment 21: Contact information for the contractor and/or project manager should be provided to report any issues during construction.

Response to comment 21: Best management practices provided in Appendix C of the Draft EIR include the advance notification to surrounding land uses disclosing the construction schedule and construction activities. The notifications would include project contact information.

Responses to Comment Letter LR-11

Comment 22: Prior to the start of any evening or weekend work, both the City and community should be notified in writing of construction activities expected to occur (between 6 p.m. and 7 a.m. or weekends).

Response to Comment 22: Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the City of Signal Hill; however, it may be necessary for construction activities to take place outside these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work. In the event that is required, the Authority would work cooperatively with the City and make every effort to comply with the City's standards and regulations.

Comment 23: The DEIR does not describe what noise mitigation there will be for the diesel motor and any other air conditioning, electrical equipment etc. to reduce operational noise to below the 55dBA (ambient noise required by the Signal Hill Municipal Code).

Response to Comment 23: Per Chapter 9.16.060 of the Municipal Code, machinery and other equipment, including air conditioning units, generators, etc. operating for more than 5 minutes cannot exceed the ambient noise level at the property line. The daytime (7 a.m. to 10 p.m.) and nighttime (10 p.m. to 7 a.m.) ambient noise level for residential areas prescribed in Chapter 9.16.020 of the Signal Hill Municipal Code are 60 dBA and 50 dBA, respectively. Table 3.10-2 of the Draft EIR will be revised to include this regulation. Draft EIR Section 3.10.4 describes a 52 dBA noise exposure within 10-feet of an operating air conditioning unit. The backup generator, which would be tested one-hour per month and otherwise operate on an emergency basis only, would be enclosed in a solid housing that will provide a minimum 10 dBA noise attenuation and result in a 58 dBA exposure at a distance of 21-feet or approximately 56 dBA at the property line (25-feet); however, the closest adjacent receiver to the SGH property line is separated by a 5-foot privacy wall that would provide an additional 5 dBA of noise mitigation and a net 51 dBA at the property line. Therefore, the operation of these pieces of equipment at proposed site SGH would not create more than a 5dBA increase above the ambient level including during nighttime hours. Chapter 4 of the Draft EIR will be revised in to include this additional information.

Comment 24: The DEIR does not describe details for maintaining security at the SGH site.

Response to Comment 24: Site security is not an environmental issue that requires a response pursuant to CEQA Guidelines Section 15088. Nevertheless, the Authority would install the proposed LMR equipment inside a secure compound, maintained by the City of Long Beach. There is no evidence of a need for any additional levels of security beyond what exists today.

Comment 25: The DEIR does not describe annual RF emission reports that will be conducted to ensure that the tower is operating at a safe level as prescribed by the FCC. The City would like a copy of all annual RF emission reports.

Response to Comment 25: The Authority understands that the City of Long Beach conducts testing at site SGH every two years as part of a regular maintenance program. The City of Signal Hill would need to work with the City of Long Beach to obtain any reports other than those directly associated with the LMR licensing effort (i.e., desktop analysis and post-construction confirmatory sampling required by OET Bulletin 65), which the Authority will provide as requested.

Responses to Comment Letter LR-11

Comment 26: Upon receipt of the final LA-RICS tower design and prior to the issuance of any building permits, the City of Signal Hill requests that the LA-RICS Authority hold at least one additional community meeting to provide the local community (including the Promontory/Skyline Estates Homeowners Association) with information about the final design, share the results of any studies and answer any questions requested in this letter.

Response to Comment 26: The request for a community meeting is not an environmental issue that requires a response pursuant to CEQA Guidelines Section 15088. However, upon completion of design and prior to construction, the Authority will coordinate additional community meeting(s) and other outreach efforts with residents of the City of Signal Hill.

Comment 27: Other Comments: The following updates (shown with strikeouts for deletions and red text for additions) to the DEIR are requested for administrative purposes:

Dear Dr. Wong:

**RESPONSE TO COMMENT LETTER ON THE DRAFT ENVIRONMENTAL IMPACT
REPORT (EIR) FOR THE LOS ANGELES REGIONAL INTEROPERABLE
COMMUNICATIONS SYSTEM (LA-RICS) JOINT POWERS AUTHORITY
(AUTHORITY) LAND MOBILE RADIO (LMR) PROJECT**

The LA-RICS Authority appreciates the comments provided by the South Coast Air Quality Management District on the Draft EIR for the proposed LMR Project. Proposed responses to these comments are provided herein in compliance with Section 15088(b) of the State California Environmental Quality (CEQA) Guidelines. All comments will be provided to the LA-RICS Authority Board prior to their consideration of the EIR for certification. The proposed time, date, and location of the hearing to consider certification of the Final EIR and approval of the proposed project will be provided on the Authority's website (www.la-rics.org).

Sincerely,

A handwritten signature in black ink that reads "Susy Orellana-Curtiss".

Draft Environmental Impact Report (Draft EIR) for the Land Mobile Radio (LMR)

The South Coast Air Quality Management District (SCAQMD) staff appreciates the opportunity to comment on the above-mentioned document both as a commenting agency and a responsible agency. The following comments are meant as guidance for the Lead Agency and should be incorporated into the Final EIR.

The Lead Agency proposes the construction/installation of a wireless communications system. The LMR system would consist of antennas and support equipment at up to 90 sites. LMR antennas would be installed on the rooftops of existing buildings or on existing or new monopoles and lattice tower support structures. Diesel backup generators will be installed at all sites. Since the proposed project includes diesel-fueled generators which are rated greater than 50 brake horsepower (bhp), a permit would be required in accordance with SCAQMD rules including Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Initial Engines and Rule 1110.2 – Emissions From Gaseous- and Liquid-Fueled Engines. If there are permit questions concerning the generator, they can be directed to Engineering and Compliance Staff at (909) 396-2315.

Please provide the SCAQMD with written responses to all comments contained herein prior to the adoption of the Final EIR. SCAQMD staff is available to work with the Lead Agency to address these issues and any other air quality questions that may arise. If you have any questions regarding this letter, please contact me at jcheng@aqmd.gov or call me at (909) 396-2448.

Sincerely,

Jillian Wong

Responses to Comment Letter LR-12

The Authority appreciates the South Coast Air Quality Management District's comments on the Draft Environmental Impact Report (EIR) dated February 19, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to comments are provided below.

Comment 1: The Lead Agency proposes the construction/installation of a wireless communications system. The LMR system would consist of antennas and support equipment at up to 90 sites. LMR antennas would be installed on the rooftops of existing buildings or on existing or new monopoles and lattice tower support structures. Diesel backup generators will be installed at all sites. Since the proposed project includes diesel-fueled generators which are rated greater than 50 brake horsepower (bhp), a permit would be required in accordance with SCAQMD rules including Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Initial Engines and Rule 1110.2 – Emissions From Gaseous- and Liquid-Fueled Engines. If there are permit questions concerning the generator, they can be directed to Engineering and Compliance Staff at (909) 396-2315.

Response to Comment 1: A discussion of the South Coast Air Quality Management District Rule 1470 permitting requirements will be added to the Final EIR in Section 3.2.2.3 *Local Regulatory Setting*. The Draft EIR assumes that operation of backup generators will comply with District Rule 1110.2. Additional discussion of District Rule 1110.2 to evaluate the significance of project impacts under CEQA is not necessary.

February 20, 2016

Los Angeles Regional Interoperable Communications System
Joint Powers Authority
c/o Nancy Yang
2525 Corporate Place, Suite 100
Monterey Park CA 91754

RE: Los Angeles Regional Interoperable Communications System (LA-RICS) Land Mobile Radio (LMR) Project; SCH #2014081025

Dear LA-RICS Board:

I am the First Vice President of Brentwood Hills Homeowners Association (Brentwood Hills), and am writing on behalf of Brentwood Hills in response to the Notice of Availability dated January 11, 2016. That Notice requests comments regarding the Draft Environmental Impact Report (DEIR) circulated under the California Environmental Quality Act (CEQA), and requests comments be submitted by February 25, 2016.

Brentwood Hills represents over 450 homes in the Santa Monica Mountains above Mandeville Canyon Road north of Sunset Blvd in the Brentwood region of Los Angeles. Brentwood Hills is located adjacent to Topanga State Park, the Westridge-Canyonback Wilderness Park, Temescal Park and the Santa Monica National Recreation Area. Brentwood Hills has been instrumental in protecting open space, public access and parklands in the Santa Monica Mountains.

1 Brentwood Hills has serious concerns with the DEIR, which does not comply with either the letter or the spirit of CEQA in terms of its environmental analysis of the 180 foot-tall lattice LMR towers proposed for numerous locations in the Santa Monica Mountains, including locations within, adjacent to, or surrounded by the Santa Monica Mountains National Recreation Area and Topanga State Park. Many of these proposed locations are on significant ridgelines, within the Coastal Zone, and near scenic highways and corridors. Yet the DEIR dismisses the significant environmental impacts of these locations by noting that there is some development at the sites, or claiming that existing small towers located on those sites mean that there will be no significant impacts from the construction of the much larger 180 foot-tall lattice towers proposed for these sites, with their many antennas, dishes, lightning rods and flashing lights— not to mention the necessary power structures, associated equipment and grading activities.

2 For example, the 180 foot-tall lattice tower proposed for the Green Mountain location (GRM) above the popular Temescal Ridge and Waterfall Trail in Temescal Park is much larger than the existing 50

Comment Letter NGO 1

LA-RICS
February 20, 2016

2 foot monopole antenna, both in terms of the height and breadth of the proposed tower, as well as the
visual disruption to the many hiking trails in Topanga State Park and Temescal Park. And the
environmental disruption associated with the necessary grading of the large pad required to support
the associated power and communications equipment makes matters even worse. Similarly, the 180
3 foot-tall lattice tower proposed for Topanga Peak (TOP) is materially larger and more disruptive
than the two existing 26 foot-tall monopole antennas currently located at the site. And many of the
other sites proposed within the Santa Monica Mountains Recreation Area do not have any antennas
at all. Yet the DEIR notes in a cursory fashion that because there is some development or small
towers at these sites, there will be no significant impacts from building the huge 180 foot-tall lattice
towers at the sites. This does not comply with CEQA. The significant impacts of the huge towers
proposed by LA-RICS within the Santa Monica Mountains are not properly analyzed in the DEIR,
and the DEIR should be revised and recirculated.

4 In addition, the DEIR completely fails to analyze the required “no project” alternative for the
specific tower locations in the Santa Monica Mountains. Instead, the DEIR defines the “no project
alternative” to be the construction of no LA-RICS system at any location at all. Not surprisingly, the
DEIR rejects that alternative in a cursory manner as not meeting project objectives. But CEQA
requires much more than that, including a meaningful analysis of the no project alternative at each
proposed tower location within the Santa Monica Mountains. For example, if the proposed 180 foot-
tall lattice tower at Green Mountain is not constructed, how will the LA-RICS system be affected?
Are there other locations that will provide similar coverage and benefits to the system, with fewer
environmental impacts? The public and the decision-makers will never know because those issues
are not analyzed in the DEIR.

5 Nor does the DEIR analyze any alternative tower heights or antenna configurations at those
locations, as CEQA requires. At the public meeting held in Culver City, the LA-RICS
representatives told me they believe that, as long as they analyze the largest tower configuration
possible for the Santa Monica Mountain sites, CEQA will be satisfied, because LA-RICS decision-
makers could later decide to construct a smaller tower, different antenna configurations or even
delete the location when it comes time to actually build the project. But how will members of the
public, affected agencies and even the LA-RICS decision-makers themselves know what the least
impactful, most environmentally sensitive configuration is if the DEIR ignores any such analysis?
CEQA requires a meaningful and thorough analysis of all alternatives, including alternative locations
and tower configurations for each tower location proposed to be located within environmentally
sensitive parklands, on significant ridgelines, within the Coastal Zone and near scenic highways and
corridors.

6 The DEIR also fails to properly analyze the environmental impacts of the proposed towers on the
visual, aesthetic, biological, parkland and ecological resources.

7 Brentwood Hills and many other community organizations feel strongly that the Santa Monica
Mountains National Recreation Area, Topanga State Park, and Temescal Park are inappropriate
locations for the huge 180 foot-tall LMR towers that LA-RICS is proposing for those sites.

Comment Letter NGO 1

LA-RICS
February 20, 2016

8 | Brentwood Hills urges that the DEIR be amended and recirculated to fully analyze both the “no project alternative” and alternative locations and tower configurations for each location within the Santa Monica Mountains where LA-RICS is proposing a 180 foot-tall lattice tower in the DEIR.

9 | Brentwood Hills agrees with the DEIR that the towers proposed for the H-69B and LACPCP08 sites pose significant and unavoidable environmental impacts, and we urge those sites to be deleted from consideration. Brentwood Hills also believes that the Green Mountain (GRM) and Topanga Peak (TOP) sites, if they were properly analyzed as required by CEQA, would also pose significant and unavoidable impacts. We urge those sites as well to be deleted from consideration.

10 | Brentwood Hills hereby incorporates all comments on the DEIR received by other community groups and public agencies, and requests that it be placed on the email and mailing notice lists for all public meetings, notices, letters and environmental reports concerning this project. Please email Brentwood Hills at leslie@caldwell-leslie.com.

We look forward to your thoughtful consideration of the community’s substantial concerns regarding these towers.

Sincerely,

A handwritten signature in blue ink that reads "Michael R. Leslie".

MICHAEL R. LESLIE,
First Vice President, Brentwood Hills Homeowners Association

Responses to Comment Letter NGO 1

The Authority appreciates the Brentwood Hills Homeowners Association’s comments on the Draft EIR dated February 20, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to the comments are provided below.

Comment 1: Brentwood Hills has serious concerns with the DEIR, which does not comply with either the letter or the spirit of CEQA in terms of its environmental analysis of the 180 foot-tall lattice LMR towers proposed for numerous locations in the Santa Monica Mountains, including locations within, adjacent to, or surrounded by the Santa Monica Mountains National Recreation Area and Topanga State Park. Many of these proposed locations are on significant ridgelines, within the Coastal Zone, and near scenic highways and corridors. Yet the DEIR dismisses the significant environmental impacts of these locations by noting that there is some development at the sites, or claiming existing small towers located on those sites mean that there will be no significant impacts from the construction of the much larger 180 foot-tall lattice towers proposed for these sites, with their many antennas, dishes, lightning rods and flashing lights – not to mention the necessary power structures, associated equipment and grading activities.

Response to Comment 1: The EIR was prepared in accordance with CEQA and the CEQA Guidelines, PRC Section 21000 et seq. and 14 CCR Section 15000 et seq., respectively. A detailed description of activities associated with the construction and operation of the project is provided in Chapter 2 of the Draft EIR. Specifically, sections 2.1.2.1 (Project Site Components) and 2.1.2.2 (Project Site Types) discuss in detail what was considered in the impacts analysis. Section 2.1.2.1 specifically addresses “antennas”, “equipment shelters”, “emergency generators”, “grounding”, “cable raceway”, “utilities”, and “lighting”. Exhibits 2.1-2 through 2.1-6 also show the general appearance of the project types and size and composition of the enclosures. Impacts associated with construction of the proposed project types, including grading, are discussed in detail in Draft EIR Section 2.1.3 Construction. Impacts associated with operation and maintenance of the proposed project are discussed in detail in Draft EIR Section 2.1.4 Operations and Maintenance.

The Draft EIR identifies and fully analyzes impacts at each of the 54 sites evaluated for each of the 13 environmental resource areas as discussed in Chapter 3 and Chapter 4 of the Draft EIR. Pursuant to CEQA, a significance determination was made for each impact at each site as described in Chapter 4, aggregated in Chapter 3, and summarized in the executive summary (in particular Table ES-1 and Table ES-2) of the Draft EIR.

The Draft EIR includes information that 12 of the 54 sites analyzed are located within or adjacent to the Santa Monica Mountains National Recreation Area and/or Topanga State Park. These are sites CPK

(discussed at Draft EIR, page 4-296)¹, ENC1 (page 4-372), ENT (page 4-411), GRM (page 4-566), H-69B (page 4-643), LACF072 (page 4-799), LACFCP08 (page 4-837), LEPS (page 4-989), PWT (page 4-1371), SPN (page 4-1563), TOP (page 4-1722), ZHQ (page 4-2026). Of these 12 sites, two sites (LACFCP08 and PWT) are on land administered by the National Park Service, and one site (site GRM) is located on land administered by the California Department of Parks and Recreation in Topanga State Park.

The Draft EIR analysis also considers that:

- Six of these 12 sites (sites CPK, ENT, H-69B, LACFCP08, SPN, and TOP) were identified on significant ridgelines.
- Eight of these 12 sites (sites CPK, ENC1, GRM, LACF072, LACFCP08, PWT, SPN, TOP) are in the coastal zone.
- Nine of these 12 sites (sites CPK, ENC1, ENT, H-69B, LACF072, LACFCP08, PWT, SPN, and TOP) are adjacent to a scenic highway or regional trail.

Of the 12 sites identified above, existing communication support structures occur at sites CPK, GRM, SPN, TOP, and ZHQ. Because these sites already contain communication support structures which are a part of the existing viewshed, it was determined that the addition of a proposed new structure would result in an added visual intrusion to the area, but would not block or remove views, and therefore the visual impacts would not be significant.

Of the seven other sites in the Santa Monica Mountains National Recreation Area and/or Topanga State Park:

Site ENC1 is situated in an existing fire camp, amongst topography and tall vegetation that were determined to obscure the view of the proposed 180-foot tower and associated infrastructure, and aesthetic impacts were determined to be less than significant.

Site ENT includes existing large water towers. While the proposed 70-foot monopole and associated infrastructure would be visible from above, it would not result in a substantial adverse effect on any scenic vista, and aesthetic impacts were determined to be less than significant.

Site LACF072 is an existing fire station that is somewhat developed, containing tall vegetation. Views of the site from Decker Canyon Road are obscured by the cut banks along the roadway, which is lined by telephone/power poles. The site would not interfere with scenic vistas therefore impacts on scenic vistas were determined to be less than significant.

Site LACFCP08 is a developed fire station in an area that has been highly disturbed and is not easily visible from readily accessible viewpoints. The proposed new 70-foot monopole and associated infrastructure would not block or remove views, nor create a substantial impact on a scenic vista. Impacts to aesthetics were determined to be less than significant.

¹ Unless otherwise noted, all page numbers refer to pages in the Draft EIR that contain relevant site-specific analysis, which is incorporated by reference herein.

Site LEPS includes a water tank, that is not currently visible from Encinal Canyon Road. The proposed 70 foot monopole and associated infrastructure would be visible, but the greatly varying topography would help to obscure the monopole from some locations. The new facilities would be visible from certain view points in the area, particularly those north of the site toward the ocean. The relatively low height and narrow girth of the structure would make it difficult to see from more distant viewing locations, and the facilities would be below the viewing plane in many instances. Aesthetic impacts were determined to be less than significant.

Site PWT is adjacent to an existing water tank, and the proposed 28-foot monopole and associated infrastructure would not exceed the height of this existing infrastructure. Scenic views would not be substantially impacted, and aesthetic impacts would be less than significant.

Site H-69B is already highly disturbed, but the site is located on a scenic route on a significant ridgeline that contains no current infrastructure. Views would be substantially altered, since no infrastructure is present. As a result, the Draft EIR determined that aesthetic impacts at the site would be significant. The only potential mitigation measure for this impact would be to paint the structure. However, this mitigation is infeasible as FAA standards would dictate any painting or camouflaging activities associated with the proposed 180-foot tower for aviation safety purposes. Impacts were determined to be significant and unavoidable at this site.

The comment does not provide any evidence that would result in any revisions to the Draft EIR's conclusions.

Comment 2: For example, the 180 foot-tall lattice tower proposed for the Green Mountain location (GRM) above the popular Temescal Ridge and Waterfall Trail in Temescal Park is much larger than the existing 50 foot monopole antenna, both in terms of the height and breadth of the proposed tower, as well as the visual disruption to the many hiking trails in Topanga State Park and Temescal Park. And the environmental disruption associated with the necessary grading of the large pad required to support the associated power and communications equipment makes matters even worse.

Response to Comment 2: The site specific description and impact analysis for site GRM beginning at page 4-568 of the Draft EIR considered, among other factors, the bulk and scale of the existing built landscape of the site and the site's location within Topanga State Park along the heavily traveled Temescal Ridge Trail Road. At site GRM, the Draft EIR determined that hikers on the Temescal Ridge Trail would be the viewers most likely affected by construction of GRM. Due to the isolated nature of this site, it is not readily visible from vantage points other than the trail. Views of nature from the trail are currently intruded upon by existing human-made linear structures, such as power poles and powerlines, as well as intermittent views of the existing structures on the proposed site. As discussed on page 4-569 of the Draft EIR:

“Primary sensitive viewers include hikers on the ‘heavily traveled’ Temescal Ridge Trail, which ‘begins with a 1,000-foot ascent that gives way to panoramic ocean-and-city views, then descends into a sycamore-shaded canyon to a seasonal waterfall’ (trails.com 2014).”

Visual impacts were evaluated according to CEQA criteria as discussed in Chapters 3.0 and 4.0 of the Draft EIR. The aesthetic analysis considered several factors to determine visual sensitivity, visual changes, and visual impacts of each site, as summarized in the methodologies discussed in Section 3.1.1 of the Draft EIR. As noted in Section 3.1.4 of the Draft EIR, the analysis considered, among many other factors, the visual character of each site based the relationships between the existing visible natural and built landscape features of each site, the dominance, scale, diversity, and continuity of each site’s visual environment, as well as the height, bulk, and scale of existing site uses. Open spaces (such as parks and undeveloped land) and significant viewpoints and scenic viewers were also considered in the analysis. Section 3.1.4 of the Draft EIR notes that the sensitivity of existing visual resources is influenced by whether the visual resource is common or rare within the study area; whether it is considered to be of local, regional, national, or global importance, the quality of the resource; public awareness and tolerance of adverse visual change; and the ability of the resource to accommodate change.

Based on the methodology in Section 3.1.4, the impact analysis in the Draft EIR shows that construction would result in less than significant impacts on aesthetics at site GRM.

The existing visual character and quality of the site and its surroundings are impacted by the presence of an existing site and tower. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site.

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new facilities would be located within a site that includes existing towers that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing towers, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

The commenter does not provide any new information or specific concerns related to the methodology, developed by the Authority’s aesthetics expert, utilized in the Draft EIR that would require the Authority to reconsider methodology or impact analysis at site GRM or any other site.

Other impacts resulting from grading, trenching, foundation excavation, construction, provision of power and communications lines, and other activities at site GRM were fully analyzed in the Draft EIR, as provided in the site specific analysis provided in Chapter 4 of the Draft EIR beginning on page 4-568.

Comment 3: Similarly, the 180 foot-tall lattice tower proposed for Topanga Peak (TOP) is materially larger and more disruptive than the two existing 26 foot-tall monopole antennas currently located at the site. And many of the other sites proposed within the Santa Monica Mountains Recreation Area do not have any antennas at all. Yet the DEIR notes in a cursory fashion that because these is some development or small towers, there will be no significant impacts from building the huge 180 foot-tall lattice towers at the sites. This does not comply with CEQA. The significant impacts of the huge towers proposed by LA-RICS within the Santa Monica Mountains are not properly analyzed in the DEIR, and the DEIR should be revised and recirculated.

Response to Comment 3: The visual impact analysis for site TOP considered the same factors as those considered for site GRM and all the other proposed sites, summarized above. Chapter 4.0 of the Draft EIR notes that site TOP is located on a significant ridgeline and includes existing infrastructure such as a microwave dish and whip antennas mounted to monopoles, as well as a water tank and small one-story building. A large radio relay tower is immediately adjacent to the site to the east. The existing radio tower is tall and very broad, and is an extremely prominent feature on the ridgeline (see photo below). The analysis notes that both the monopoles and radio tower are clearly visible from segments of east- and west-bound traffic on Saddle Peak Road. The Backbone Trail passes between the site and Saddle Peak Road, and a trailhead and pullout exist on the road just east of the site. The view is dominated by the ridgeline, the roadway corridor, and the radio tower.

Due to the area’s extensively rolling topography, views of the existing site are limited and intermittent. Similar to site GRM, Chapter 4.0 notes that the proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new facilities would be located within a site that includes a large, bulky radio tower and two shorter, slim monopoles that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing towers, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that only a small area of the scenic vista is altered. The existing visual character and quality of the site and its surroundings are impacted by the presence of the existing towers. Although the proposed lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, this new infrastructure would be compatible with the existing site. There would be no substantial adverse change to the visual character or quality of the significant ridgeline or the Backbone Trail. In short, the proposed project would result in visual changes; however, the visual changes would result in a less than significant visual impact.

Regarding this comment, no new information or specific concerns were raised by the reviewer related to the methodology or impact analysis used for site TOP that would cause the Authority to reconsider the impact analysis presented in the Draft EIR.

Comment 4: In addition, the DEIR completely fails to analyze the required “no project” alternative for the specific tower locations in the Santa Monica Mountains. Instead, the DEIR defines the “no project alternative” to be the construction of no LA-RICS system at any location at all. Not surprisingly, the DEIR rejects that alternative in a cursory manner as not meeting project objectives. But CEQA requires much more than that, including a meaningful analysis of the no project alternative at each proposed tower location within the Santa Monica Mountains. For example, if the proposed 180 foot-tall lattice tower at Green Mountain is not constructed, how will the LA-RICS system be affected? Are there other locations that will provide similar coverage and benefits to the system, with fewer environmental impacts? The public and the decision-makers will never know because those issues are not analyzed in the DEIR.

Response to Comment 4: The Draft EIR defines the No Project Alternative as a scenario in which none of 54 sites considered within the Draft EIR would be constructed in compliance with CEQA Guidelines section 15126.6(e)(3)(B), which states that when the proposed project is a development project on identifiable property, the “no project” alternative is the scenario under which the project does not proceed.

Not constructing one or more of the individual towers proposed would not represent the “no project” alternative as defined in CEQA, and would result in a failure to meet the project objectives set forth in Draft EIR section 2.2 in the geographic location served by that site. Specifically, within that geographic area there would be:

- no day-to-day communications made available for first and second responders

- no interoperability among member agencies and mutual aid providers
- no support of communications with federal state and local agencies in emergencies
- no improvement of emergency communications
- no additional capacity created or replacement of aging infrastructure that meets current public safety requirements
- no ability to increase separation of antennas on support structures to reduce interference
- no provision of increased frequency flexibility to increase system coverage or capacity
- no ability to transition from existing T-Band (where it exists) to 700 MHz systems.

The sites proposed in the Santa Monica Mountains National Recreation Area and Topanga State Park provide coverage to serve population centers, transportation corridors, and areas of highest wildland fire, among other concerns. Physical, land use, and other constraints to development within these areas of concern within the Santa Monica Mountains National Recreation Area and Topanga State Park substantially limit suitable sites that serve these areas, hence eliminating the availability of alternatives in many locales. The ultimate selection of which sites will be constructed will be determined based on consideration of the public comment on the Draft EIR, as well as ultimate site feasibility during final system design. Ultimately the system design will seek to maximize Project Objectives discussed in Draft EIR Section 2.2.

Comment 5: Nor does the DEIR analyze any alternative tower heights or antenna configurations at those locations, as CEQA requires. At the public meeting held in Culver City, the LA-RICS representative told me they believe that, as long as they analyze the largest tower configuration possible for the Santa Monica Mountain sites, CEQA will be satisfied, because LA-RICS decision-makers could later decide to construct a smaller tower, different antenna configurations or even delete the location when it comes time to actually build the project. But how will members of the public, affected agencies and even the LA-RICS decision-makers themselves know what the least impactful, most environmentally sensitive configuration is if the DEIR ignores any such analysis? CEQA requires meaningful and thorough analysis of all alternatives, including alternative locations and tower configurations for each tower location proposed to be located within environmentally sensitive parklands, on significant ridgelines, within the Coastal Zone and near scenic highways and corridors.

Response to Comment 5: Final design of the system will occur if the project is approved. At that time, tower heights would be optimized based on the final system design. Some of these site would be constructed nearly exactly as they are described in the Draft EIR. Other sites may be designed to a shorter height if additional site information or system requirements found during later design stages made this feasible. Other reasons for a change in height could include (but are not limited to) items such as subsurface constraints for foundation depths, compliance with FAA requirements, or coastal consistency issues. At this time, it would be speculative to identify which sites might ultimately accommodate a reduced tower height.

The analysis conducted in Chapter 2 of the Draft EIR; Sections 2.1.2.1 Project Site Components and 2.1.2.2 Project Site Types provides the best design information currently available for the project.

Exhibits 2.1-2 through 2.1-6 also show the general appearance of the project types and size and composition of the enclosures. Impacts associated with construction of the proposed project types, including grading, are discussed in detail in Draft EIR Section 2.1.3 Construction. Impacts associated with operation and maintenance of the proposed project is discussed in detail in Draft EIR Section 2.1.4 Operations and Maintenance. Associated impacts are analyzed in Chapters 3 and Chapter 4 of the Draft EIR.

Comment 6: The DEIR also fails to properly analyze the environmental impacts of the proposed towers on the visual, aesthetics, biological, parkland, and ecological resources.

Response to Comment 6: The Draft EIR fully analyzed environmental impacts of the proposed towers on visual, aesthetics, biological, parkland and ecological resources. Site specific analysis for each of the 54 sites in the Draft EIR is provided in Chapter 4 and is summarized, as applicable in Chapter 3; Specifically, Section 3.1 (“visual” and “aesthetics”), Section 3.3 (“biological” and “ecological resources”) and Sections 3.9 and 3.11 (“parkland”). The Draft EIR was prepared in accordance with CEQA and the CEQA Guidelines, PRC Section 21000 et seq. and 14 CCR Section 15000 et seq., respectively.

Comment 7: Brentwood Hills and many other community organizations feel strongly that the Santa Monica Mountains National Recreation Area, Topanga State Park, and Temescal Park are inappropriate locations for the huge 180 foot-tall LMR towers that LA-RICS is proposing for those sites.

Response to Comment 7: The project site locations have been selected to maximize coverage to enhance safety and emergency response for 10 million Los Angeles County residents and the over 40 million Los Angeles County tourists. Your opposition to the project locations within the Santa Monica Mountains National Recreation Area, Topanga State Park, and Temescal Park is noted, is included in the record of proceedings, and will be considered by the Authority’s decision makers in connection with their consideration of the proposed project.

Comment 8: Brentwood Hills urges that the DEIR be amended and recirculated to fully analyze both the “no project alternative” and alternative locations and tower configurations for each location within the Santa Monica Mountains where LA-RICS is proposing a 180 foot-tall lattice tower in the DEIR.

Response to Comment 8: Please see response to Comment 4 and 5 above for a discussion of how the EIR’s analysis of alternatives complies with CEQA. The project locations within the Santa Monica Mountains, regardless of the project site type, are critical to the design of the system to provide county-wide coverage. These sites provide coverage to serve population centers, transportation corridors, and areas of highest wildland fire, among other concerns. Physical, land use, and other constraints to development within these areas of concern substantially limit suitable sites that serve these areas, hence eliminating the availability of alternatives in many locales. The commenter does not specifically identify alternative locations for consideration within the Santa Monica Mountains.

Nothing in the comments or the Authority’s responses to these comments is “significant new information” as that term is defined in CEQA guidelines section 15088.5, and recirculation of the Draft EIR is not required.

Comment 9: Brentwood Hills agrees with the DEIR that the towers proposed for the H-69B and LACPCP08 sites pose significant and unavoidable environmental impacts, and we urge those sites to be deleted from consideration. Brentwood Hills also believes that the Green Mountain (GRM) and Topanga Peak (TOP) sites, if they were properly analyzed as required by CEQA, would also pose significant and unavoidable impacts. We urge those sites as well to be deleted from consideration.

Response to Comment 9: As discussed in response to the comments above, and as stated in the Draft EIR, no significant and unavoidable impacts were found for sites GRM or TOP. (See DEIR pp. 4-566 through 4-603 (GRM) and pp. 4-1722 through 4-1761 (TOP).) The comment letter does not provide any evidence that would require a revision to these conclusions in the EIR. The request that these sites be deleted from consideration will be considered by the Authority’s decision makers in connection with the proposed project.

Comment 10: Brentwood Hills hereby incorporates all comments on the DEIR received by other community groups and public agencies, and requests that it be placed on the email and mailing notice lists for all public meetings, notices, letters and environmental reports concerning this project. Please email Brentwood Hills at leslie@caldwell-leslie.com.

Response to Comment 10: The Authority acknowledges the incorporation of other comments into this comment letter. In response, the Authority incorporates its responses to those comments by reference.

Dear LA-RICS Board:

The Federation of Hillside and Canyon Associations, Inc., founded in 1952, represents 45 resident and homeowner associations with approximately 250,000 constituents spanning the Santa Monica Mountains. Thank you for the opportunity to provide public comment on the Draft Environmental Impact Report (DEIR) for the above-captioned project.

The Federation is aware of a DEIR comment letter submitted by our member organization, Brentwood Hills Homeowners Association, dated February 20, 2016. We have had an opportunity to review the letter, which we incorporate by reference, and join Brentwood Hills in its numerous concerns regarding the adequacy of the project's DEIR.

In particular, we share Brentwood Hills' following concerns that:

- Potentially significant environmental impacts associated with proposed towers within and adjacent to the Santa Monica Mountains National Recreation Area and Topanga State Park, some on or near significant ridgelines, within the Coastal Zone, or near scenic highways and corridors, have not been identified or adequately analyzed. Existing facilities at some of these sites are considerably smaller than the proposed towers, and thus cannot justify a finding of no significant impact.
- The DEIR fails to analyze the "no project" alternative on a site-by-site basis.
- The DEIR fails to analyze alternative tower heights, technologies, and configurations.
- The DEIR fails to properly analyze the environmental impacts of the proposed towers on wilderness area resources, including visual, aesthetic, biological, parkland, and ecological resources, among others.

Comment Letter NGO 2

5 | • If all potentially significant impact areas are properly analyzed, some parkland locations will likely be deemed inappropriate for inclusion in the proposed project due to significant unavoidable impacts, including the Green Mountain (GRM) and Topanga Peak (TOP) sites.

Thank you for your consideration of the Hillside Federation’s concerns.

Sincerely,

Marian Dodge

Responses to Comment Letter NGO 2

The Authority appreciates the Federation of Hillside and Canyons Association’s comments on the Draft EIR dated February 22, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to the comments are provided below.

Comment 1: The Federation is aware of a DEIR comment letter submitted by our member organization, Brentwood Hills Homeowners Association, dated February 20, 2016. We have had an opportunity to review the letter, which we incorporate by reference, and join Brentwood Hills in its numerous concerns regarding the adequacy of the project’s DEIR.

Response to Comment 1: The Authority acknowledges the incorporation of the Brentwood Hills Homeowners Association into this comment letter. In response, the Authority incorporates its responses to those comments by reference.

Comment 2: Potentially significant environmental impacts associated with proposed towers within and adjacent to the Santa Monica Mountains National Recreation Area and Topanga State Park, some on or near significant ridgelines, within the Coastal Zone, or near scenic highways and corridors, have not been identified or adequately analyzed. Existing facilities at some of these sites are considerably smaller than the proposed towers, and thus cannot justify a finding of no significant impact.

Response to Comment 2: The Draft EIR identifies and fully analyzes impacts at each of the 54 sites evaluated for each of the 13 environmental resource areas, as discussed in Chapter 3 and Chapter 4 of the Draft EIR. Pursuant to CEQA, a significance determination was made for each impact at each site as described in Chapter 4, aggregated in Chapter 3, and summarized in the executive summary (in particular Table ES-1 and Table ES-2) of the Draft EIR.

The Draft EIR includes information that 12 of the 54 sites analyzed are located within or adjacent to the Santa Monica Mountains National Recreation Area and/or Topanga State Park. These are sites CPK (discussed at Draft EIR, page 4-296)², ENC1 (page 4-372), ENT (page 4-411), GRM (page 4-566), H-69B (page 4-643), LACF072 (page 4-799), LACFCP08 (page 4-837), LEPS (page 4-989), PWT (page 4-1371), SPN (page 4-1563), TOP (page 4-1722), ZHQ (page 4-2026). Of these 12 sites, two sites (LACFCP08 and PWT) are on land administered by the National Park Service, and one site (site GRM) is located on land administered by the California Department of Parks and Recreation in Topanga State Park.

The Draft EIR analysis also considers that:

- Six of these 12 sites (sites CPK, ENT, H-69B, LACFCP08, SPN, and TOP) were identified on significant ridgelines.
- Eight of these 12 sites (sites CPK, ENC1, GRM, LACF072, LACFCP08, PWT, SPN, TOP) are in the coastal zone.
- Nine of these 12 sites (sites CPK, ENC1, ENT, H-69B, LACF072, LACFCP08, PWT, SPN, and TOP) are adjacent to a scenic highway or regional trail.

Of the 12 sites identified above, existing communication support structures occur at sites CPK, GRM, SPN, TOP, and ZHQ. Because these sites already contain communication support structures which are a part of the existing viewshed, it was determined that the addition of a proposed new structure would result in an added visual intrusion to the area, but would not block or remove views, and therefore the visual impacts would not be significant.

Of the seven other sites in the Santa Monica Mountains National Recreation Area and/or Topanga State Park:

Site ENC1 is situated in an existing fire camp, amongst topography and tall vegetation that obscure the view of the proposed 180-foot tower and associated infrastructure, and aesthetic impacts were determined to be less than significant.

Site ENT includes existing large water towers. While the proposed 70-foot monopole and associated infrastructure would be visible from above, it would not result in a substantial adverse effect on any scenic vista, and aesthetic impacts were determined to be less than significant.

Site LACF072 is an existing fire station that is somewhat developed, containing tall vegetation. Views of the site from Decker Canyon Road are obscured by the cut banks along the roadway, which is lined by telephone/power poles. The site would not interfere with scenic vistas therefore impacts on scenic vistas were determined to be less than significant.

Site LACFCP08 is a developed fire station in an area that has been highly disturbed and is not easily visible from readily accessible viewpoints. The proposed new 70-foot monopole and associated

² Unless otherwise noted, all page numbers refer to pages in the Draft EIR that contain relevant site-specific analysis, which is incorporated by reference herein.

infrastructure would not block or remove views, nor create a substantial impact on a scenic vista. Impacts to aesthetics were determined to be less than significant.

Site LEPS includes a water tank, that is not currently visible from Encinal Canyon Road. The proposed 70 foot monopole and associated infrastructure would be visible, but the greatly varying topography would help to obscure the monopole from some locations. The new facilities would be visible from certain view points in the area, particularly those north of the site toward the ocean. The relatively low height and narrow girth of the structure would make it difficult to see from more distant viewing locations, and the facilities would be below the viewing plane in many instances. Aesthetic impacts were determined to be less than significant.

Site PWT is adjacent to an existing water tank, and the proposed 28-foot monopole and associated infrastructure would not exceed the height of this existing infrastructure. Scenic views would not be substantially impacted, and aesthetic impacts would be less than significant.

Site H-69B is already highly disturbed, but the site is located on a scenic route on a significant ridgeline that contains no current infrastructure. Views would be substantially altered, since no infrastructure is present. As a result, the Draft EIR determined that aesthetic impacts at the site would be significant. The only potential mitigation measure for this impact would be to paint the structure. However, this mitigation is infeasible as FAA standards would dictate any painting or camouflaging activities associated with the proposed 180-foot tower for aviation safety purposes. Impacts were determined to be significant and unavoidable at this site.

The comment does not provide any evidence that would result in any revisions to the Draft EIR's conclusions.

Comment 3: The DEIR fails to analyze the “no project” alternative on a site-by-site basis.

Response to Comment 3: The Draft EIR defines the No Project Alternative as a scenario in which none of 54 sites considered within the Draft EIR would be constructed in compliance with CEQA Guidelines section 15126.6(e)(3)(B), which states that when the proposed project is a development project on identifiable property, the “no project” alternative is the scenario under which the project does not proceed.

Not constructing one or more of the individual towers proposed would not represent the “no project” alternative as defined in CEQA, and would result in a failure to meet the project objectives set forth in Draft EIR section 2.2 in the geographic location served by that site. Specifically, within that geographic area there would be:

- no day-to-day communications made available for first and second responders
- no interoperability among member agencies and mutual aid providers
- no support of communications with federal state and local agencies in emergencies
- no improvement of emergency communications

- no additional capacity created or replacement of aging infrastructure that meets current public safety requirements
- no ability to increase separation of antennas on support structures to reduce interference
- no provision of increased frequency flexibility to increase system coverage or capacity
- no ability to transition from existing T-Band (where it exists) to 700 MHz systems.

The sites proposed in the Santa Monica Mountains National Recreation Area and Topanga State Park provide coverage to serve population centers, transportation corridors, and areas of highest wildland fire, among other concerns. Physical, land use, and other constraints to development within these areas of concern within the Santa Monica Mountains National Recreation Area and Topanga State Park substantially limit suitable sites that serve these areas, hence eliminating the availability of alternatives in many locales. The ultimate selection of which sites will be constructed will be determined based on consideration of the public comment on the Draft EIR, as well as ultimate site feasibility during final system design. Ultimately the system design will seek to maximize Project Objectives discussed in Draft EIR Section 2.2.

Comment 4: The DEIR fails to analyze alternative tower heights, technologies, and configurations.

Response to Comment 4: Various other types of technologies and configurations were considered and subsequently eliminated from further consideration because they would not meet project objectives and/or they would not be feasible for additional reasons (see DEIR Section 2.6).

A “Collocation” alternative was considered that would have limited LMR antennas to existing structures. Limiting the LMR locations to only those where collocation is possible would not provide the desired coverage, would not meet the Project objectives and was not considered further.

An alternative identified as “Use Cell on Wheels” (COW) was considered and would have included portable towers or monopoles with self-contained equipment and generators. Height limitations for portable towers and equipment weight limitation for portable monopoles limited applicability to only a few sites and would not provide desired coverage. Use of COWs would not meet the Project objectives and was not considered further.

An alternative identified as “Use of Satellites” was considered, and it was determined that LMR communication could be conducted by using a satellite system. However use of satellites for LMR communication would result in a lag time between sender and receiver that does not allow for quick communication required during emergencies. Use of satellites would not meet the Project objectives and was not considered further.

Additionally, the Authority reviewed various telecommunications options and worked with industry experts to modernize their systems, and ease transition from the existing network to a hybrid of digital and analog networks to provide a mobile data system. In November 2011, requests for proposals were developed to support the hybrid system. In January 2012, proposals were received and a vendor was chosen. No alternative system to the hybrid system was identified.

Final design of the system will occur if the project is approved. At that time, tower heights would be optimized based on the final system design. Some of these sites would be constructed nearly exactly as they are described in the Draft EIR. Other sites may be designed to a shorter height if additional site information or system requirements found during later design stages made this feasible. Other reasons for a change in height could include (but are not limited to) items such as subsurface constraints for foundation depths, compliance with FAA requirements, or coastal consistency issues. At this time, it would be speculative to identify which sites might ultimately accommodate a reduced tower height.

The analysis conducted in Chapter 2 of the Draft EIR; Sections 2.1.2.1 Project Site Components and 2.1.2.2 Project Site Types provides the best design information currently available for the project. Exhibits 2.1-2 through 2.1-6 also show the general appearance of the project types and size and composition of the enclosures. Impacts associated with construction of the proposed project types, including grading, are discussed in detail in Draft EIR Section 2.1.3 Construction. Impacts associated with operation and maintenance of the proposed project is discussed in detail in Draft EIR Section 2.1.4 Operations and Maintenance. Associated impacts are analyzed in Chapters 3 and Chapter 4 of the Draft EIR

Comment 5: The DEIR fails to properly analyze the environmental impacts of the proposed towers on wilderness area resources, including visual, aesthetic, biological, parkland, and ecological resources, among others.

Response to Comment 5: Wilderness is defined in the Wilderness Act of 1964 as “an area where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain.” (See Draft EIR, p. 3-494.) There are no wilderness areas in the Santa Monica Mountains National Recreation Area or Topanga State Park. The closest wilderness areas to the project are the San Gabriel Wilderness in the San Gabriel Mountains National Monument, which is approximately 1.5 miles north of the Pine Mountain site (PMT), and the Cucamonga Wilderness in the Angeles National Forest, which is approximately 3 miles northeast of the Sunset Ridge sites (SUN and SUN2). (See Draft EIR, p. 3-53.) The Draft EIR analyzed the potential impacts of the proposed project on aesthetics, biological resources, and recreation and determined that impacts would be less than significant. The Draft EIR also fully analyzed environmental impacts of the proposed towers on visual, aesthetics, biological, parkland and ecological resources. Site specific analysis for each of the 54 sites in the Draft EIR is provided in Chapter 4 and is summarized, as applicable in Chapter 3; Specifically, Section 3.1 (“visual” and “aesthetics”), Section 3.3 (“biological” and “ecological resources”) and Sections 3.9 and 3.11 (“parkland”). The Draft EIR was prepared in accordance with CEQA and the CEQA Guidelines, PRC Section 21000 et seq. and 14 CCR Section 15000 et seq., respectively.

Comment 6: If all potentially significant impact areas are properly analyzed, some parkland locations will likely be deemed inappropriate for inclusion in the proposed project due to significant unavoidable impacts, including the Green Mountain (GRM) and Topanga Peak (TOP) sites.

Response to Comment 6: As discussed in response to your comments above, and as stated in the Draft EIR, no significant and unavoidable impacts were found for sites GRM or TOP. (See DEIR pp. 4-566 through 4-603 (GRM) and pp. 4-1722 through 4-1761 (TOP).) The project site locations have been selected to maximize coverage to enhance safety and emergency response for 10 million Los Angeles County residents and the over 40 million Los Angeles County tourists. Your opposition to the project locations within the Santa Monica Mountains National Recreation Area, Topanga State Park, and Temescal Park are noted, is included in the record of proceedings, and will be considered by the Authority’s decision makers in connection with their consideration of the proposed project.

RE: Comments on Draft EIR of the Catalina Island Conservancy

The Santa Catalina Island Conservancy (Conservancy) is the Santa Catalina Island landowner, where the new and additional towers for the Los Angeles Interoperability Communications System (LA-RICS) proposal of Land Mobile Radio (LMR) systems is to be installed. The Conservancy acts as a responsible steward of its lands. We give tremendous efforts toward conservation and Catalina wildland aesthetics. The Conservancy supports the LA-RICS project goal proposal of Land Mobile Radio (LMR) Systems to be installed on Blackjack Peak (BJM), Dakin Peak (DPK), Tower Peak (TWR). The Conservancy hereby submits the following comments on the Draft Environmental Impact Report (Draft EIR) dated January 2016.

The Santa Catalina Island Conservancy is a 501(c)(3) non-profit corporation and is the fee simple owner of its lands and is responsible for all aspects of conservation and land management in accordance with its Articles of Incorporation and strategic and other plans.

A summary of the main issues regarding the project are provided in the body of this letter. Specific comments are referenced to section, table, page number and/or figure in Attachment A to this letter.

The Conservancy's main issues with the Draft EIR fall into four main categories: Aesthetic/Viewshed Analysis, Alternatives Analysis, Environmental Impacts/Mitigation and Local Zoning Requirements.

Aesthetic/Viewshed Analysis

Based on our review of the Draft EIR, the document plays short shift with this issue, basically concluding that since there is already a 100 foot tower at all three proposed sites (BJM, DPK, TWR), there are no aesthetic or viewshed issues with building a second 180-200 feet tower (plus 15 foot lighting rod) adjacent to the existing tower. It is the Conservancy's position that "co-location" does not resolve this issue for Catalina Island. All three existing towers can be viewed from multiple, long distance vantages as you approach Catalina Island from the sea. They are also distinct features from multiple vantages throughout Catalina Island's interior. Blackjack Peak is the third highest mountain on Catalina Island and it and its tower can be seen from locations from the far East End to the far West End of the Island. The new towers will be

CATALINA ISLAND CONSERVANCY

A responsible steward of its lands through a balance of conservation, education and recreation.

twice as tall, wider at the base, and also permanently lit at night. They will permanently and irrevocably alter the skyline of the Island. The Conservancy believes the Draft EIR must take an island-specific, detailed and extended look at this issue and how it should be resolved for all three proposed Catalina Island sites.

1 | 2

Alternatives Analysis

This issue is closely related to the aesthetic/viewshed issue. The Conservancy believes the alternatives analysis in the Draft EIR is incomplete in that it does not specifically address at least two obvious alternatives than the one selected. First, the Draft EIR does not address whether the existing 100 foot towers could be replaced by a single larger tower that could house all of the antennas and dishes of the existing tower plus the antennas and dishes for the LA-RICS LMR project. This alternative, if acceptable, would help to resolve the aesthetic/viewshed issue discussed above in that while the replacement tower would be much taller, there would still only be one tower at each of the three sites. Second, the Draft EIR does not discuss as an alternative whether an additional tower is actually needed at all three locations to accomplish the LA-RICS LMR project goals. Third, the Draft EIR does not discuss whether a second much larger tower at one location plus larger replacement towers at the other two sites is an option (or other variants on this theme).

3 | 4 | 5

The Conservancy believes the Draft EIR must take an island-specific, detailed and extended look at this issue and how it should be resolved for all three proposed Catalina Island sites. The Conservancy believes the project proponent should provide to the Conservancy and the Island Community 3D animations from multiple vantage points and appropriate GIS maps of the various alternatives for all three sites discussed here and in the Draft EIR.

6

Environmental/Mitigation Issues

As outlined in detail in Attachment A, the project as proposed entails a number of less-than-trivial environmental and mitigation issues. The Conservancy has proposed Catalina-specific language and requirements that it would like to see incorporated into the various tables and text of the Draft EIR. Three main issues emerge from the Conservancy's review of the environmental issues associated with the project:

7

1) While the Blackjack site appears to have an already developed pad that would allow the construction of a new or replacement tower without further habitat disturbance, the Dakin Peak and Tower Peak sites do not appear large enough to accomplish this with permanent alteration of natural habitat. In particular, level ground at the Tower Peak site is fully occupied by the existing tower, shed, and generator and to co-locate a second tower or even replace the existing tower with a new larger tower would appear to require cutting down the existing peak 10-20 feet or more or significant fill and grading to create a large enough level space. Given the stringent regulatory requirements specific to Catalina Island in the Los Angeles County Zoning Code (see discussion below), the Conservancy believes the Draft EIR must take an island-specific, detailed and extended look at each of the three proposed sites, with actual, not "typical" site plans.

8

Comment Letter NGO-3

CATALINA ISLAND CONSERVANCY

A responsible steward of its lands through a balance of conservation, education and recreation.

2) The Draft EIR does only a cursory analysis of how migratory or resident birds or resident bats will be affected by up to three 200 foot lattice tower mounted with 80 whip antennas and multiple dishes. The island's position as a mountain in the ocean presents different risk factors than a typical mainland location to migratory species in particular who are flying across and over the island. The Conservancy believes the Draft EIR must take an island-specific, detailed and extended look at each of the three proposed sites, with regards to the presumed increase in bird and/or bat mortality that would be expected

9

3) The Draft EIR should include on-the-ground mitigation proposals and not just the "process" (plans, inspections, construction practices, etc.) proposed in the Draft EIR. The Conservancy will expect that unavoidable, and permanent habitat or species impacts will be mitigated by on-the-ground improvements and long-term monitoring (e.g. of bird or bat mortality) funded by annual return from a monitoring fund.

10

Local Zoning Requirements

Finally, the Conservancy was surprised to not find any discussion of the stringent zoning requirements applicable to the Island found in Title 22 of the Los Angeles County Code. The 1983 Local Coastal Plan, which is referenced in the Draft EIR, was codified into ordinance in Title 22, Sections 22.46.050 through 22.46.750, of the Los Angeles County Code and is the controlling rule for approving development on Santa Catalina Island. Principal and Accessory Permitted Uses for Open Space/Conservation District zones are listed in Section 22.46.120 through 22.46.160. Development standards for archeological/historical, flora and fauna, soils and geology, slopes, fire, noise, view protection and signs are found in Sections 22.46.450 through 22.46.530. Development of communication equipment buildings and antennas require a Coastal Development Permit and Conditional Use Permit (Section 22.46.150) and must comply with view protection requirements in Section 22.46.520. The current EIR is silent as to whether the proposed new towers at BJM, DPK and TWR will comply with the standards in Title 22 applicable to Catalina Island. Again, the Conservancy believes the Draft EIR must take an island-specific, detailed and extended look at each of the three proposed sites in relation to now codified LCP in Title 22. Finally in addition to the Title 22 requirements, two of the three tower locations (BJM, DPK) are located in Significant Ecological Areas (SEAs). Los Angeles County Code and Policy includes an additional level of review, over and above the CDP/CUP permit process, by the SEA Technical Advisory Committee (SEATAC) for projects located in SEAs or in LACA Lots where an SEA is located. This process is also not addressed in the relevant code summary sections of the Draft EIR.

11

12

In closing, the Conservancy wishes to emphasize that it is fully in support of the broad goals and improvements in safety, emergency response and law enforcement which will come from the implementation of the LA-RICS LMR project. However, given its own mandates in its corporate charter for the long-term care and protection of its lands on Catalina Island, a much more detailed and nuanced, island-specific analysis is required for the tower locations proposed on the island.

CATALINA ISLAND CONSERVANCY

A responsible steward of its lands through a balance of conservation, education and recreation.

ATTACHMENT A

Table ES-2. AES-1 through 4. As discussed in the general comments section, the Conservancy does not concur with the analysis or results of the Aesthetic Review.	13
Table ES-2. BIO-MM-1. The EIR should state the Conservancy will need to review and concur in the Mitigation Monitoring and Reporting Plan (MMRP) and Worker Environmental Awareness Program (WEAP) plans prior to initiating any construction activities on its lands.	14
Table ES-2. BIO-MM-1. The EIR should state that for sites DPK, BJM, TWR the biological monitor shall visit the sites at least once per week during weeks when construction workers are present on site, and at least monthly during periods when active construction is not occurring but the project is not yet completed and the biological monitor shall contact the Conservancy's Director of Conservation prior to each visit in order to coordinate a joint site inspection with Conservancy staff.	15
Table ES-2. BIO-MM-4. Site Sanitation. The EIR should state that all solid waste will be placed in wildlife proof containers with tight fitting secure lids. Containers with any liquids of any sort, e.g. drums, roll-off boxes, dumpsters, etc., shall be tightly sealed to prevent foxes or other wildlife from drowning in the containers.	16
Table ES-2. BIO-MM-5. The EIR should state that only "hazardous materials" allowed on the site are fuel, equipment lubricants or other materials, such that if disposed would not be considered "hazardous waste" under the Resource Conservation and Recovery Act (RCRA) or equivalent state law hazardous waste definitions.	17
Table ES-2. BIO-MM-8. The EIR should specifically reference the Catalina Island Fox for sites BJM, DPK and TWR and state that all holes, trenches or other excavations must be completely and securely covered at the end of each work day and/or provided with fox escape ramps.	18
Table ES-2. BIO-MM-9(b). The EIR should state that surveys for special status plant species at sites BJM, DPK, and TWR will be performed during the appropriate time of year for the particular species, e.g. spring surveys for special status annual plants, to be observed and identified.	19
Table ES-2. BIO-MM-9(f). The EIR should state that for sites BJM, DPK and TWR the limits of disturbance shall be clearly delimited with properly installed construction fencing or closely-spaced 4 foot grading stakes with at least two signs per side of the construction site that state, "No Equipment or Soil Disturbance Beyond this Point."	20
Table ES-2. BIO-MM-11. The EIR should state that for sites BJM, DPK and TWR the Project contactor(s) shall obtain all necessary Conservancy vehicle access permits at least 30 days prior	21

P. O. Box 2739, Avalon, CA 90704 – 310.510.2595 – www.catalinaconservancy.org

Comment Letter NGO-3

CATALINA ISLAND CONSERVANCY

A responsible steward of its lands through a balance of conservation, education and recreation.

to bringing vehicles or other wheeled equipment onto Conservancy lands. Project contractor(s) shall also provide proof of insurance (\$1,000,000) for any damage to Conservancy infrastructure and provide a written plan for how Conservancy primary and secondary roads will be used, contingencies for non-use or upgrade during rainy periods, frequency of access, minimizing ingress and egress, etc. | 21

Table ES-2. BIO-MM-23(a). The EIR should state that for sites BJM, DPK and TWR only seeds or plants obtained from the Conservancy's native plant nursery will be used for revegetating disturbed ground at the project sites. | 22

Table ES-2. BIO-MM-23(b). The EIR should state that for sites BJM, DPK and TWR, vehicles or other equipment shall enter Conservancy unless inspected by the Conservancy's Invasive Plant Program Manager. | 23

Table ES-2. CUL-1. The EIR should add BJM, DPK and TWR to the "sites" column for CUL-1 rows. All three sites have known cultural locations on (BJM) or within 500 foot buffer. The EIR should state that for sites BJM, DPK and TWR that an archeology monitor is present at all times excavation is occurring at each site. | 24

Table ES-2. HAZ-4-MM-1. The EIR should state that for sites BJM, DPK and TWR the construction contractor shall coordinate the completion of the Phase 1 audit with the Conservancy's Chief of Conservation and provide the Conservancy an opportunity to review the draft audit prior to finalization. | 25

Table ES-2. HAZ-8-MM-3. The EIR should state that for sites BJM, DPK and TWR, the draft Fire Management Plan be provided to the Conservancy for its review and comment prior to initiating construction activities. | 26

Table ES-2. WQ-1. The EIR should state that for sites BJM, DPK and TWR all stormwater and sediment generated shall be contained within the marked disturbance footprint. For site BJM, unmanaged stormwater from the existing access road to the site is causing serious erosion and damage to the Conservancy's Blackjack Campground Road which must be addressed in order to expand the uses at the BJM site. | 27

Table 2.1-1. Dakin Peak is located on Divide Rd. | 28

Table 2.1-3. Anticipated Construction Activities. It appears that both the DPK and TWR sites would require substantial amounts of cutting and filling to create sufficient space for new or replacement towers. Any fill used will need to be certified as weed free. If this is not possible, funds from the interest of an invasive plant control fund will need to be provided in order for the Conservancy to perform invasive plant surveys and/or control at the sites for at least 10 | 29

P. O. Box 2739, Avalon, CA 90704 – 310.510.2595 – www.catalinaconservancy.org
330 Golden Shore, Suite 170, Long Beach, CA 90802 – 562.437.8555

Comment Letter NGO-3

CATALINA ISLAND CONSERVANCY

A responsible steward of its lands through a balance of conservation, education and recreation.

years. The applicable BIO standard should also be modified to reflect this potential invasive introduction.	29
Figure 2.1-3. The proposed new lattice towers at BJM, DPK and TWR will be significantly taller than the existing towers. The current EIR does a cursory analysis of aesthetic and viewsheds effects as well as potential for additional or worse migratory bird fatalities (See general discussion in letter).	30
Figure 2.1-4. The typical site plan appears to require substantially more space than is present in the already developed areas at these locations which will require destruction of natural habitat at DPK and TWR, which is not addressed in the EIR.	31
Section 2.1.2.1. Emergency Generators. Fuel tanks are very large and given remote locations, secondary containment must be a feature of the BJM, DPK and TWR sites.	32
Section 2.1.2.1. Lighting. Security lights should be motion sensitive and should not remain on throughout the night. Existing towers at BJM, DPK and TWR have red navigation lights. Cumulative negative effect of additional tower with light was not discussed in EIR.	33
Section 2.6. Alternatives Considered. There is no discussion as to why the existing 100 ft towers cannot be replaced with a single, new, much larger tower that can be instrumented with all the dishes and antennas required by the existing tower and the LA-RICS LMR system. This option would preserve the existing viewsheds and location aesthetics of a single tower at these locations rather than a two tower approach.	34
Section 3.1.1. Conservancy lands should be accorded the same "high visual sensitivity" as public lands where the owner/management entity is focused on natural resource protection and protection of scenic resources. The Conservancy's articles of incorporation mandate both of these for Conservancy lands. Under the 1974 Open Space Easement Agreement with Los Angeles County, Conservancy lands are also part of the Los Angeles County parks system.	35
Table 3.1-1. Regional or municipal park should also be checked for the BJM, DPK and TWR sites.	36
Section 3.1.1.3. TransCatalina Trail. As it is part of Los Angeles County Park system's trail network, please delete the "Although it has no official scenic designation."	37
Section 3.1.1.4. Conservancy lands are Open Space Easement areas in the Los Angeles County park system and should be listed in this section as such.	38
Section 3.1.2.3, 3.1.4, 3.1.5. Santa Catalina Island. The 1983 Local Coastal Plan was codified into ordinance in Title 22, Sections 22.46.050 through 22.46.750, of the Los Angeles County Code which is the controlling rule for approving development on Santa Catalina Island. Principal and	same as 11 above

Comment Letter NGO-3

CATALINA ISLAND CONSERVANCY

A responsible steward of its lands through a balance of conservation, education and recreation.

Accessory Permitted Uses for Open Space/Conservation District zones are listed in Section 22.46.120 through 22.46.160. Development standards for archeological/historical, flora and fauna, soils and geology, slopes, fire, noise, view protection and signs are found in Sections 22.46.450 through 22.46.530. Development of communication equipment buildings and antennas require a Coastal Development Permit and Conditional Use Permit (Section 22.46.150) and must comply with view protection requirements in Section 22.46.520. The current EIR is silent as to whether the proposed new towers at BJM, DPK and TWR will comply with the standards in Title 22 applicable to Catalina Island. In addition, the addition of a second tower that is 80-100 feet taller than the existing towers at BJM, DPK and TWR, the second tower at these sites represents a significant alteration of island viewsheds and deserves a more robust analysis than accorded in Sections 3.1.4 and 3.1.5 of the Draft EIR, and, if eventually permitted, actual mitigation. Finally in addition to the Title 22 requirements, two of the three tower locations (BJM, DPK) are located in Significant Ecological Areas (SEAs). Los Angeles County Code and Policy includes an additional level of review, over and above the CDP/CUP permit process, by the SEA Technical Advisory Committee (SEATAC) for projects located in SEAs or in LACA Lots where an SEA is located. This process is also not addressed in the relevant code summary sections of the Draft EIR.

12 above

Section 3.3.1. Prior to finalizing the EIR, the extensive databases maintained by the Catalina Island Conservancy should be consulted and results included in the EIR (See attached maps). The fall floristic survey performed needs to be supplemented by a spring survey in order to be considered sufficient.

39

Table 3.1-1. For the BJM, DPK and TWR sites, plant communities within 500 feet of the existing tower include the following: Island Scrub Oak (*Quercus pacifica*) Chaparral, Coastal Sage Scrub, Non-native Grassland.

40

Table 3.3-3. The following text should be substituted for that in Table 3.3-3:

Site BJM is located on the top of Blackjack Peak, the third highest mountain on Catalina Island. North facing slopes of Blackjack are dominated by intact Island Scrub Oak (*Quercus pacifica*) Chaparral; south-facing slopes are dominated by intact Coastal Sage Scrub (note: areas mapped as Bare Ground in 2003 are largely recovering into Coastal Sage Scrub). A former silver mine pit is located above the Blackjack Campground access road on the north side of the peak. Black jack peak is visible from many locations on and around Catalina Island. The Trans-Catalina Trail passes just southeast of the peak, and the Airport Road, very popular for motor tours, just to the northwest.

41

Table 3.3.-3. The plant species list in this table for Blackjack Peak should be as follows (Note all edit species list in Section 4.0 Site Summary Forms. Species not listed here have no records near project site):

Comment Letter NGO-3

CATALINA ISLAND CONSERVANCY

A responsible steward of its lands through a balance of conservation, education and recreation.

The following special status species have records within 1 mile of the project site (those with an "*" within 1000 feet, those with "***" within 500 feet):

- Arctostaphylos catalinae*
- Atriplex coulteri
- Ceanothus megacarpus var. insularis
- Crossosoma californicum
- Crocanthemum greenei
- Dendromecon harfordii*
- Dichondra occidentalis
- Dissanthelium californicum
- Eriogonum giganteum var. giganteum
- Eschscholzia ramosa
- Galium catalinense ssp. catalinense
- Galium nuttallii ssp. insulare*
- Gilia nevinii
- Hordeum intercedens
- Jepsonia malvifolia
- Lepechinia fragrans
- Lyonothamnus floribundus ssp. floribundus
- Ophioglossum californicum
- Quercus tomentella
- Ribes viburnifolium
- Scrophularia villosa
- Solanum Wallacei*

42

Site DPK is located on the top of Dakin Peak, a prominent high point above Avalon and Silver/Grand Canyons. The peak is dominated by Coastal Sage Scrub with areas of Grassland (*Bromus-Avena-Nasella*) and Island Scrub Oak (*Quercus pacifica*) Chaparral. Dakin peak is visible from many locations on and around Catalina Island. The Trans-Catalina Trail follows the Divide Road immediately northwest of the existing tower. The Divide Road is also a very popular road for interior jeep tours.

43

The following special status species have records within 1 mile of the project site (those with an "*" within 1000 feet, those with "***" within 500 feet):

- Arctostaphylos catalinae
- Atriplex coulteri
- Ceanothus megacarpus var. insularis
- Crossosoma californicum
- Crocanthemum greenei
- Dudleya virens ssp. insularis

CATALINA ISLAND CONSERVANCY

A responsible steward of its lands through a balance of conservation, education and recreation.

Section 3.3.2.3. Local Regulatory Setting. As discussed above for Sections 3.1.4 and 3.1.5, Catalina Island is part of unincorporated Los Angeles County and subject to land use ordinances of general applicability as well as Title 22, specific to Catalina Island. | 48

Table 3.3-7. Species with Suitable Habitat within Study Areas. The following should be added to this table: | 49

Burrowing Owl: BJM, DPK, TWR
California Mountain Kingsnake: BJM | 49

Section 3.3.4.1, Page 3-147 4th full paragraph and 3-148 first full paragraph. Burrowing owls are frequently observed throughout Catalina Island and should be listed for the BJM, DPK and TWR sites. | 50

Section 3.3.4.1, Page 3-149. Migratory Birds. The Draft EIR does only a cursory analysis of how migratory or resident birds or resident bats will be affected by up to three 200 foot lattice tower mounted with 80 whip antennas and multiple dishes. The island's position as a mountain in the ocean presents different risk factors than a typical mainland location to migratory species in particular who are flying across and over the Island. The Conservancy believes the Draft EIR must take a island-specific, detailed and extended look at each of the three proposed sites, with regards to the presumed increase in bird and/or bat mortality that would be expected. | Same as comment 9 above

Section 3.3.4.1, Pages 3-154 to 3-155. Santa Catalina Island Fox. The following changes should be made: | 51

1st Paragraph, 1st Sentence should state: "The Santa Catalina Island Fox is a habitat generalist and is found throughout Catalina Island in all natural habitats and areas of human habitation and development."

1st Paragraph, last sentence should state: "Young can be born any time from late February through late April..."

2nd Paragraph, should state: "The major threat to Catalina Island Foxes have been disease outbreaks, e.g. the canine distemper outbreak in the late 1990s that almost wiped out the population, and mortality from vehicle collisions or other dangers associated with human development, e.g. drowning in open containers of liquids, poisoning, becoming trapped in open excavations. Catalina Island Foxes should be expected at all three Catalina Island project sites and should definitely expected to investigate any changes to the sites during active construction, especially open holes and trenches, open containers of liquids and improperly enclosed solid or food wastes."

P. O. Box 2739, Avalon, CA 90704 – 310.510.2595 – www.catalinaconservancy.org
330 Golden Shore, Suite 170, Long Beach, CA 90802 – 562.437.8555

Comment Letter NGO-3

CATALINA ISLAND CONSERVANCY

A responsible steward of its lands through a balance of conservation, education and recreation.

3rd Paragraph, Construction Impacts should read: The noise and activities associated with construction of the proposed Project sites could result in temporary disturbance of fox. Therefore, construction cannot be initiated from late February the end July. Foraging foxes will investigate the construction site for new food sources and for cover in uncovered excavations, under equipment or stored materials. Discarded food and trash is effectively an attractive nuisance for foxes and can result in increased habituation and dependence on humans for food." 51

BIO-MM-19(e). Add the following: "Any trenches, holes or other excavations that are not covered at the end of the work day, must be provided with a fox escape ramp." 52

BIO-MM-20(a). Add the following: "Crews should be informed that there is absolutely no feeding of foxes allowed on Catalina Island." 53

Section 3.3.4.1, Pages 3-157 to 3-158. Small Animals, California Mountain Kingsnake, Coast Horned Lizard, San Diego Woodrat, Tehachapi Pocket Mouse, Townsend's Big-eared Bat and Western Mastiff Bat. The Conservancy has documentation of California Mountain Kingsnake at nearby Blackjack Campground. Townsend's Big-eared Bats breed on Catalina Island in caves and abandoned mines. 54

Section 3.3.4.1, Pages 3-158 and 3-159. BJM should be added to the list of sites at the top of page 3-158, in the fourth full paragraph of page 3-158, and in the first full paragraph on page 3-159. 55

Section 3.3.4.1, Page 3-168. BIO-MM-23(a). Add the following: "For sites BJM, DPK and TWR, only seed or plant material from the Catalina Island Conservancy's native plant nursery shall be used." same as comment 22

Section 3.3.4.1, Page 3-169. BIO-MM-23(b). Add the following: "For sites BJM, DPK and TWR, all construction vehicles and equipment shall be washed prior to being brought to Catalina Island and shall not enter Conservancy property until it is inspected by the Conservancy's Invasive Plant Program Manager." 56

Section 3.3.4.1, Page 3-207. See earlier comment regarding reference to Title 22 regulations. 57

Table 3.3-12. Special Status Species. The following species should be added to this table for Sites BJM, DPK and TWR: 58

- Burrowing Owl
- Island Loggerhead Shrike
- Catalina Island Quail
- San Clemente Spotted Towhee
- Hutton's Vireo

P. O. Box 2739, Avalon, CA 90704 – 310.510.2595 – www.catalinaconservancy.org

Comment Letter NGO-3

CATALINA ISLAND CONSERVANCY

A responsible steward of its lands through a balance of conservation, education and recreation.

In addition, the consultant should refer to Appendix G of the LCP for other species of special concern regulated under Title 22 of the LA County Code. 58

Section 3.4. Cultural Resources. Extensive prehistoric and historic cultural resources are present nearly everywhere on Catalina Island. Human habitation and use of the island extends at least to 8,000 BP and likely much earlier. Any excavation or drilling, even in previously developed areas, should expect to encounter cultural artifacts, human remains, middens, lithic scatters, and/or habitation sites. All three Catalina Island sites have mapped cultural locations in or near the project location (see attached maps). No excavation or soil disturbance should be undertaken without an archeological monitor present. All of the tables and text in Section 3.4 should be edited to include BJM, DPK and TWR as actual or likely locations for cultural resources to be present. 59

Section 4.0. Site Summary Forms.

All site summary forms for BJM, DPK and TWR should be thoroughly edited to reflect changes discussed above. 60

P. O. Box 2739, Avalon, CA 90704 – 310.510.2595 – www.catalinaconservancy.org
330 Golden Shore, Suite 170, Long Beach, CA 90802 – 562.437.8555

Responses to Comment Letter NGO 3

The Authority appreciates your comments on the Draft EIR dated February 25, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to the comments are provided below.

Comment 1: Aesthetic/Viewshed Analysis. Based on our review of the Draft EIR, the document plays short shift with this issue, basically concluding that since there is already a 100 foot tower at all three proposed sites (BJM, DPK, TWR), there are no aesthetic or viewshed issues with building a second 180-200 feet tower (plus 15 foot lighting rod) adjacent to the existing tower. It is the Conservancy's position that "co-location" does not resolve this issue for Catalina Island. All three existing towers can be viewed from multiple, long distance vantages as you approach Catalina Island from the sea. They are also distinct features from multiple vantages throughout Catalina Island's interior. Blackjack Peak is the third highest mountain on Catalina Island and it and its tower can be seen from locations from the far East End to the far West End of the Island.

Response to Comment 1: Of the three proposed sites on Catalina Island, the existing tower at Site TWR site is 100 feet tall; the existing tower at Site BJM is 125 feet tall; and the existing tower at Site DPK is 200 feet tall, as noted in the Draft EIR at pages 4-110 and 4-335, respectively. Each existing tower is a lattice type. The existing towers are prominent visual features in the existing landscape, as shown in the example photos below of Site BJM. Based on the existing visual conditions at these sites, the Draft EIR describes the visual impact of locating new towers at these sites, and concludes that the addition of these towers would not result in a significant visual impact. (See DEIR pp. 4-113 to 4-114 (BJM), pp. 4-338 to 4-339 (DPK), and pp. 4-1802 to 4-1803 (TWR).) Additionally, two separate towers would be viewed as one structure from vantage points where one tower is in front of, and thus blocks views of, the other, and the increase in bulk associated with two separate towers would be minimal due to the linear nature of the structures. The comment provides no evidence that that requires a revision to the conclusions in the Draft EIR.

The comment is correct that all three existing towers could be viewed from multiple, long-distance vantages on the approach to Santa Catalina Island from the sea. However, collocating the towers would result in the two towers appearing more indistinguishable as separate structures (see photos of site BJM below). The sites would also be obscured by extremely steep cliffs as boaters approach the island, particularly south and north of Site TWR, south and east of Site DPK, and north of Site BJM.

In addition, the heights of the proposed towers may ultimately be lower than analyzed in the Draft EIR. If the project is approved, tower heights would be optimized based on the final system design. Some sites would be constructed as they are described in the Draft EIR. Other sites may be designed to a shorter height if additional site information or system requirements found during later design stages made this feasible. At this time, however, it would be speculative to identify which sites might ultimately accommodate a reduced tower height.

Comment 2: The new towers will be twice as tall, wider at the base, and also permanently lit at night. They will permanently and irrevocably alter the skyline of the Island. The Conservancy believes the Draft EIR must take an island-specific, detailed and extended look at this issue and how it should be resolved for all three proposed Catalina Island sites.

Response to Comment 2: While the new towers would be taller, they would not be “twice as tall” as existing towers. The BJM tower would be up to 180 feet tall and sited adjacent to an existing 125-foot tower; the DPK tower would be the same size as the existing tower (both 200 feet tall); and the TWR tower would be up to 180 feet tall and sited adjacent to an existing 100-foot tower. The lightning rods would be of such insignificant girth as to be generally indistinguishable from most viewing distances. Also, the heights of the proposed towers may ultimately be less than described in the Draft EIR, as explained above. Lighting at the tower is addressed for Site BJK at page 4-114, for Site DPK at page 4-339, and for Site TWR at page 4-1803. The analysis shows that regardless of the type of FAA-required lighting, no substantial new source of light or glare would be introduced at any of these sites.

While the new towers would alter the Island’s skyline, the Island’s skyline has already been altered by the presence of the existing towers. The new towers would not “substantially degrade the existing visual character or quality of the site and its surroundings” (Impact AES-3). Although the new towers would introduce a new manmade element to each site, the existing conditions demonstrate a substantially altered visual environment.

Comment 3: Alternatives Analysis. This issue is closely related to the aesthetic/viewshed issue. The Conservancy believes the alternatives analysis in the Draft EIR is incomplete in that it does not specifically address at least two obvious alternatives than the one selected. First, the Draft EIR does not address whether the existing 100 foot towers could be replaced by a single larger tower that could house all of the antennas and dishes of the existing tower plus the antennas and dishes for the LA-RICS LMR project. This alternative, if acceptable, would help to resolve the aesthetic/viewshed issue discussed above in that while the replacement tower would be much taller, there would still only be one tower at each of the three sites.

Response to Comment 3: As a preliminary matter, the existing towers at the three sites are not all 100 feet tall. The existing tower at Dakin Peak (DPK) is 200 feet while the towers at Tower Peak (TWR) and Black Jack Peak (BJM) are 100 feet and 125 feet tall, respectively. Regarding the suggested alternative of placing existing equipment and proposed LMR equipment all on a single larger tower, each of the existing towers currently has a substantial number of antennas, and the proposed project would add a minimum of twenty five (25) additional antennas to each site. Collocating all of this equipment on a single tower would require installation of a substantially taller and larger tower. Given the open nature of the surrounding landscape, replacing an existing tower with a new tower of an increased size and height would create a greater visual intrusion than the proposed addition of a single tower of the same or similar height to the existing structure. A higher tower would be more visible from a greater distance than two separate towers, particularly from distant vantage points such as boats approaching the Island. In addition, two separate towers would be viewed as one structure from vantage points where one

tower is in front of, and thus blocks views of, the other. The increase in bulk associated with two separate towers would also be minimal due to the linear nature of the structures compared to the increase in height that would be required to accommodate all existing and proposed equipment on a single tower. For these reasons, the alternative of placing existing equipment and proposed LMR equipment all on a single larger tower would not reduce or avoid the visual impacts of the proposed project at these sites, and no revisions to the Draft EIR are required to analyze this alternative.

Comment 4: Second, the Draft EIR does not discuss as an alternative whether an additional tower is actually needed at all three locations to accomplish the LA-RICS LMR project goals.

Response to Comment 4: The Authority did examine whether the existing towers could accommodate the proposed installation of LMR equipment in addition to the equipment currently located on the existing towers. As discussed above, each of the existing towers currently has a substantial number of antennas, and the proposed project would add a minimum of twenty five (25) additional antennas to each site. The Authority determined that it would not be feasible to locate all of the existing and proposed equipment on the existing towers, and that new towers would be required for each of the three sites to accommodate the proposed LMR equipment.

Comment 5: Third, the Draft EIR does not discuss whether a second much larger tower at one location plus larger replacement towers at the other two sites is an option (or other variants on this theme).

Response to Comment 5: The alternative suggested in this comment is unclear, but seems to suggest installation of larger towers at the three sites on the Island than currently proposed. Installing larger towers than those proposed would result in increased visual and other impacts. As such, the Draft EIR does not require revisions to analyze this alternative. The Authority’s proposed design seeks to minimize the impacts on aesthetics while still meeting project objectives.

Comment 6: The Conservancy believes the Draft EIR must take an island-specific, detailed and extended look at this issue and how it should be resolved for all three proposed Catalina Island sites. The Conservancy believes the project proponent should provide to the Conservancy and the Island Community 3D animations from multiple vantage points and appropriate GIS maps of the various alternatives for all three sites discussed here and in the Draft EIR.

Response to Comment 6:

Site-specific analysis is provided in Chapter 4 for sites BJM (at pages 4-110 et seq.), DPK (at pages 4-335 et seq.), and TWR (at pages 4-1799 et seq.). The methodology for aesthetic impact analysis, provided in Section 3.1.4 starting on page 3-26 of the Draft EIR was applied to these sites. 3D animations from multiple vantage points and GIS maps of the commenter’s suggested alternatives are not a requirement for aesthetic impact assessment. An EIR is to be prepared with “a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluated of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in light of what is

reasonably feasible.” (CEQA Guidelines § 15151.) Additionally, “reviewers [of an EIR] should be aware that the adequacy of an EIR is determined in terms of what is reasonably feasible, in light of factors such as the magnitude of the project at issue, the severity of its likely environmental impacts, and the geographic scope of the project. CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors. When responding to comments, lead agencies need only respond to significant environmental issues and do not need to provide all information requested by reviewers, as long as a good faith effort at full disclosure is made in the EIR.” (CEQA Guidelines § 15204(a).) No change has been made to the Draft EIR.

Comment 7: Environmental/Mitigation Issues. As outlined in detail in Attachment A, the project as proposed entails a number of less-than-trivial environmental and mitigation issues. The Conservancy has proposed Catalina-specific language and requirements that it would like to see incorporated into the various tables and text of the Draft EIR. Three main issues emerge from the Conservancy’s review of the environmental issues associated with the project:

Response to Comment 7: Please see the responses to the comments in Attachment A, below, regarding the environmental and mitigation issues referenced in this comment. Please see the responses below for responses to the three main issues referenced in this comment.

Comment 8: 1) While the Blackjack site appears to have an already developed pad that would allow the construction of a new or replacement tower without further habitat disturbance, the Dakin Peak and Tower Peak sites do not appear large enough to accomplish this with permanent alteration of natural habitat. In particular, level ground at the Tower Peak site is fully occupied by the existing tower, shed, and generator and to co-locate a second tower or even replace the existing tower with a new larger tower would appear to require cutting down the existing peak 1-0-20 feet or more or significant fill and grading to create a large enough level space. Given the stringent regulatory requirements specific to Catalina Island in the Los Angeles County Zoning Code (see discussion below), the Conservancy believes the Draft EIR must take an island-specific, detailed and extended look at each of the three proposed sites, with actual, not “typical” site plans.

Response to Comment 8: The level of disturbance associated with project site development at all sites is limited to that analyzed in the EIR, as described in Section 2.1.3, and on a site specific basis for sites BJM (at page 4-110), DPK (at page 4-335), and TWR (at page 4-1799). The Authority will examine each site based on the site’s unique characteristics and propose the least intrusive installation while still meeting the Project’s Objectives. Regarding the request for “an island-specific, detailed and extended look at each of the three proposed sites”, please see response to comment 6 regarding the level of detail required in an EIR.

Comment 9: 2) The Draft EIR does only a cursory analysis of how migratory or resident birds or resident bats will be affected by up to three 200 foot lattice tower mounted with 80 whip antennas and multiple dishes. The island's position as a mountain in the ocean presents different risk factors than a typical mainland location to migratory species in particular who are flying across and over the

Island. The Conservancy believes the Draft EIR must take an island specific, detailed and extended look at each of the three proposed sites, with regards to the presumed increase in bird and/or bat mortality that would be expected.

Response to Comment 9: Please note that only one of the proposed towers on the Island (DPK) would be 200 feet. The others (BJM and TWR) are proposed at up to 180 feet. The Cumulative Impact Analysis section (3.3.5.3) on pages 3-239 through 3-241 of the Draft EIR gives an extensive discussion on the effects of towers on birds. BIO MM 18 (h) and (i) (page ES-44) give protection measures for migratory birds in relation to the communication towers. This measure states that the USFWS Office of Migratory Birds voluntary guidelines for communications towers will be followed for all sites (<https://www.fws.gov/Midwest/es/planning/pdf/USFWS2013RevisedGuidanceCommTowers27Sept13.pdf>). In addition, this measure requires coordination with USFWS and FAA to implement their lighting requirements (http://www.faa.gov/documentLibrary/media/Advisory_Circular/AC_70_7460-1L_.pdf) with the minimal attraction and resulting mortality to migratory birds. These impacts will be addressed and minimized to the extent possible at *all* sites, including BJM, DPK, and TWR, individually based on coordination with FAA and USFWS. As noted at pages 3-157 and 3-158, impacts to bats are not anticipated. Additional text associated with this analysis will be included for the discussion of sites BJM, DPK, and TWR in this section in the Final EIR, as follows:

Bat mortality is not a concern due to new towers being added to any site or addition of lighting. Bats may be attracted to the lights for insect foraging, but strikes are not anticipated as all parts of the towers will be stationary and not mobile, thus allowing the bats to navigate safely around the structures.

Comment 10: 3) The Draft EIR should include on-the-ground mitigation proposals and not just the “process” (plans, inspections, construction practices, etc.) proposed in the Draft EIR. The Conservancy will expect that unavoidable, and permanent habitat or species impacts will be mitigated by on-the-ground improvements and long-term monitoring (e.g. of bird or bat mortality) funded by annual return from a monitoring fund.

Response to Comment 10: With the exception of cumulative impacts to migratory birds, the Draft EIR concluded that impacts to certain biological resources at sites BJM, DPK, and TWR would be significant but impacts would be reduced to less than significant with implementation of mitigation measures. A total of 16 mitigation measures were identified for implementation to protect biological resources at sites BJM, DPK, and TWR. These included measures specifically designed to avoid or minimize impacts to special status species and habitats. Since impacts have been determined to be less than significant after application of the measures identified in the Draft EIR, CEQA does not require further mitigation measures to be applied at sites BJM, DPK, and TWR.

Comment 11: Local Zoning Requirements. Finally, the Conservancy was surprised to not find any discussion of the stringent zoning requirements applicable to the Island found in Title 22 of the Los Angeles County Code. The 1983 Local Coastal Plan, which is referenced in the Draft EIR, was codified

into ordinance in Title 22, Sections 22.46.050 through 22.46.750, of the Los Angeles County Code and is the controlling rule for approving development on Santa Catalina Island. Principal and Accessory permitted Uses for Open Space/Conservation District zones are listed in Section 22.46.120 through 22.46.160. Development standards for archeological/historical, flora and fauna, soils and geology, slopes, fire, noise, view protection and signs are found in Sections 22.46.450 through 22.46.530. Development of communication equipment buildings and antennas require a Coastal Development Permit and Conditional Use Permit (Section 22.46.150) and must comply with view protection requirements in Section 22.46.520. **The current EIR is silent as to whether the proposed new towers at BJM, DPK, and TWR will comply with the standards in Title 22 applicable to Catalina Island.** Again, the Conservancy believes the Draft EIR must take an island specific, detailed and extended look at each of the three proposed sites in relation to now codified LCP in Title 22.

Response to Comment 11: Section 3.9.1.3 of the Draft EIR addresses sites in the coastal zone and the policies of the Local Coastal Plan that are most applicable to the proposed telecommunications facilities. Section 3.1.2.3 of the Draft EIR addresses relevant policies of the Santa Catalina Island LCP, and Table 3.9-2 identifies Sites BJM, DPK, and TWR as being located within the Santa Catalina Island Coastal Zone. Table 3.9-5 identifies site characteristics and coastal zone policies of relevance. The final determination of consistency for sites BJM, DPK, and TWR would be made by the Los Angeles County Department of Regional Planning, the agency responsible for issuing a Coastal Development Permit. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions.

Additionally, Table 3.9-4 identifies planning and/or zoning designations for the proposed project sites. As shown in that table, the EIR's analysis found that implementation of the proposed project at sites BJM, DPK and TWR would not be inconsistent with relevant general plan and zoning designations.

The Authority will comply with Title 22 of the Los Angeles County Code as it develops the three sites on Santa Catalina Island, and the Final EIR has been updated at Section 3.9.4.1 to explicitly include this information in the discussion regarding the *Santa Catalina Island Local Coastal Plan*. Additional information relevant to biological resources, specifically plant species identified in Section 22.46.470 (Appendix G), has been included in the Final EIR in a list at Section 3.3.1.2. The added plant species would be considered during the coastal development permitting process. The proposed project and Mitigation Measures meet and/or exceed those measures outlined in Section 22.46.470 – Flora and Fauna. Relevant subsections of 22.6.470 include Section A, which requires a site plan with a 100 foot buffer of mapped vegetation prepared by a qualified botanist, impact analysis on native vegetation and wildlife, and suggested mitigation measures including transplanting vegetation or revegetating impacted areas; and Section B, preventing development that would remove or damage “rare or endangered plant species” as defined in Appendix G of the 1989 Santa Catalina Island Specific Plan; and G, development within SEAs shall be subject to Title 22 except for the exemption provisions contained in Section 22.56.215. The Authority believes that incorporation of the BIO MM 1, 2, 8, 3, 4, 5, 6, 8, 9, 10, 11, 17, 18, 19, 20, 23, and 24 at all sites on Santa Catalina Island will ensure adherence to Title 22 with regards to biological resources. These revisions do not result in any changes to the conclusions in the Draft EIR.

Comment 12: Finally in addition to the Title 22 requirements, two of the three tower locations (BJM, DPK) are located in Significant Ecological Areas (SEAs). Los Angeles County Code and Policy includes an additional level of review, over and above the CDP/CUP permit process, by the SEA Technical Advisory Committee (SEATAC) for projects located in SEAs or in LACA Lots where an SEA is located. This process is also not addressed in the relevant code summary sections of the Draft EIR.

Response to Comment 12: Section 3.3.2.3 of the Draft EIR acknowledges that the Los Angeles County SEAs ordinance regulates a wide range of biotic communities through the use of environmentally sensitive development standards and designs, and acknowledges the permitting process associated with these areas. Section 3.3.2.3 of the Draft EIR also discusses SEAs and explains that properties mapped within, or partially within, an adopted SEA are subject to the rules in the SEA ordinance. Table 3.3-10 acknowledges that the three sites are under the jurisdiction of the Santa Catalina Island Local Coastal Plan. The site-specific analysis beginning at page 4-121 and continuing at pages 4-123 and 4-125 (for Site BJM); at page 4-345 and continuing at pages 4-347 and 4-348 (for Site DPK); and at page 4-1809 and continuing at pages 4-1811 and 4-1812 (for Site TWR) provide SEA/CRA status and analysis of consistency with the LCP at each of the sites. As noted in the impact discussion for the three sites under Impact LU-2 (beginning at page 4-138 for Site BJM, page 4-363 for Site DPK and page 4-1827 for TWR), the final determination of consistency with the plan would be made by the agency responsible for issuing the coastal permit. If the permit were issued, activities at each site would occur consistent with any applicable permit conditions. Table 3.3-10 has been updated to reference the SEA/CRA designation applicable at the three sites. These revisions do not result in any changes to the conclusions in the Draft EIR.

Comment 13: Table ES-2. AES-1 through 4. As discussed in the general comments section, the Conservancy does not concur with the analysis or results of the Aesthetic Review.

Response to Comment 13: Comment noted. See response to comment #1 and #2 above for additional information.

Comment 14: Table ES-2. BIO-MM-1. The EIR should state the Conservancy will need to review and concur in the Mitigation Monitoring and Reporting Plan (MMRP) and Worker Environmental Awareness Program (WEAP) plans prior to initiating any construction activities on its lands.

Response to Comment 14: In response to the comment, the following changes were made to BIO MM 1:

Prior to construction, the Authority shall develop and implement or require the system contractor to develop and implement a mitigation monitoring and reporting plan (MMRP) for the proposed Project. The MMRP would serve to organize environmental compliance requirements identified in best management practices, mitigation measures, permit requirements, real property agreement conditions, [coordination with the land management agency\(s\)](#), and other applicable sources. The MMRP shall contain an organization chart and communication plan for environmental compliance as it relates to the proposed Project.

And to BIO MM 2:

BIO MM 2 Worker Environmental Awareness Program: Prior to construction, the Authority shall develop and implement or require the system contractor to develop and implement, [including coordination with the respective land management agency](#), a Worker Environmental Awareness Program (WEAP) for the proposed Project. This mitigation measure would serve to institute and formalize an education program to increase awareness of environmental resources and measures and rules that are in place to help minimize impacts to those resources.

Comment 15: Table ES-2. BIO-MM-1. The EIR should state that for sites DPK, BJM, TWR the biological monitor shall visit the sites at least once per week during weeks when construction workers are present on site, and at least monthly during periods when active construction is not occurring but the project is not yet completed and the biological monitor shall contact the Conservancy's Director of Conservation prior to each visit in order to coordinate a joint site inspection with Conservancy staff.

Response to Comment 15: The revision to BIO MM 1 to add “coordination with respective land management agencies”, as outlined in response to comment #13 above, will allow the Conservancy to request site-specific details through Authority/Conservancy coordination such as the biological monitoring site visit schedule suggested in Comment #14. No additional change has been made to BIO MM 1.

Comment 16: Table ES-2. BIO-MM-4. Site Sanitation. The EIR should state that all solid waste will be placed in wildlife proof containers with tight fitting secure lids. Containers with any liquids of any sort, e.g. drums, roll-off boxes, dumpsters, etc., shall be tightly sealed to prevent foxes or other wildlife from drowning in the containers.

Response to Comment 16: The revision to BIO MM 1 to add “coordination with respective land management agencies”, as outlined above, will allow the Conservancy to request site specific details through Authority/Conservancy coordination such as the solid waste provisions suggested in Comment #15. No change has been made to BIO MM 4.

Comment 17: Table ES-2. BIO-MM-5. The EIR should state that only "hazardous materials" allowed on the site are fuel, equipment lubricants or other materials, such that if disposed would not be considered "hazardous waste" under the Resource Conservation and Recovery Act (RCRA) or equivalent state law hazardous waste definitions.

Response to Comment 17: The revision to BIO MM 1 to add “coordination with respective land management agencies”, as outlined above, will allow the Conservancy to request site-specific details through Authority/Conservancy coordination such as the hazardous waste requirements suggested in Comment #16. No change has been made to BIO MM 5.

Comment 18: Table ES-2. BIO-MM-8. The EIR should specifically reference the Catalina Island Fox for sites BJM, DPK and TWR and state that all holes, trenches or other excavations must be completely and securely covered at the end of each work day and/or provided with fox escape ramps.

Response to Comment 18: Components of trench and hole management in reference to the Catalina Island Fox were included in the Draft EIR. The EIR specifically references the Catalina Island Fox for sites BJM, DPK, and TWR in Section 3.3, Santa Catalina Island Fox (page 3-154) and trench management under BIO MM 19 Trenches and Holes Management (pages ES-44 and 3-155-6). Trenches and holes would be covered and secured, as noted in subsection a), b), and e). Since all trenches and holes would be secured and inspected, no fox escape ramps would be necessary. No change has been made to BIO MM 8.

Comment 19: Table ES-2. BIO-MM-9(b). The EIR should state that surveys for special status plant species at sites BJM, DPK, and TWR will be performed during the appropriate time of year for the particular species, e.g. spring surveys for special status annual plants, to be observed and identified.

Response to Comment 19: The Draft EIR currently requires special status plant surveys to occur “in the proper season and in suitable habitat” (BIO MM 24). The phrase implies spring surveys for special status annual plants and any other season requirements for each plant species. The Draft EIR specifically references the Special Status Plants Surveys and Protection for sites BJM, DPK, and TWR in Table ES-2, and in Section 3.3, Special Status Plants: (page 3-167) and under BIO MM 24 Special Status Plants Surveys and Protection (pages ES-47 and 3-169). See page ES-47 for the full text for BIO MM 24 Special Status Plants Surveys and Protection. No change has been made to BIO MM 9.

Comment 20: Table ES-2. BIO-MM-9(f). The EIR should state that for sites BJM, DPK and TWR the limits of disturbance shall be clearly delimited with properly installed construction fencing or closely spaced 4 foot grading stakes with at least two signs per side of the construction site that state, "No Equipment or Soil Disturbance Beyond this point."

Response to Comment 20 The revision to BIO MM 1 to add “coordination with respective land management agencies”, as outlined above, will allow the Conservancy to request site-specific details through Authority/Conservancy coordination such as the fencing requirements suggested in Comment #19. No change has been made to BIO MM 9.

Comment 21: Table ES-2. BIO-MM-11. The EIR should state that for sites BJM, DPK and TWR the project contactor(s) shall obtain all necessary Conservancy vehicle access permits at least 30 days prior to bringing vehicles or other wheeled equipment onto Conservancy lands. project contractor(s) shall also provide proof of insurance (\$1,000,000) for any damage to Conservancy infrastructure and provide a written plan for how Conservancy primary and secondary roads will be used, contingencies for non-use or upgrade during rainy periods, frequency of access, minimizing ingress and egress, etc.

Response to Comment 21: The revision to BIO MM 1 to add “coordination with respective land management agencies”, as outlined above, will allow the Conservancy to request site-specific details

through Authority/Conservancy coordination such as this issue. No change has been made to BIO MM 11.

Comment 22: Table ES-2. BIO-MM-23(a). The EIR should state that for sites BJM, DPK and TWR only seeds or plants obtained from the Conservancy's native plant nursery will be used for revegetating disturbed ground at the project sites.

Response to Comment 22: The revision to BIO MM 1 to add “coordination with respective land management agencies”, as outlined above, will allow the Conservancy to request site-specific details through Authority/Conservancy coordination such as the native seed provisions suggested in Comment #21 above. No change has been made to BIO MM 23(a).

Comment 23: Table ES-2. BIO-MM-23(b). The EIR should state that for sites BJM, DPK and TWR, vehicles or other equipment shall enter Conservancy unless inspected by the Conservancy's invasive plant Program Manager.

Response to Comment 23: The revision to BIO MM 1 to add “coordination with respective land management agencies”, as outlined above, will allow the Conservancy to request site-specific details through Authority/Conservancy coordination such as the invasive species prevention protocol suggested in Comment #22 above. No change has been made to BIO MM 23(b).

Comment 24: Table ES-2. CUL-1. The EIR should add BJM, DPK and TWR to the "sites" column for CUL-1 rows. All three sites have known cultural locations on (BJM) or within 500 foot buffer. The EIR should state that for sites BJM, DPK and TWR that an archeology monitor is present at all times excavation is occurring at each site.

Response to Comment 24: Based on records searches and field surveys, no prehistoric or historic archaeological resources were identified at sites BJM, DPK, or TWR that would be impacted by LMR project activities. However, to accommodate the concerns of the commenter, an archaeological monitor will be present during all ground-disturbing activities at sites BJM, DPK, and TWR. This information will be included for the three sites in Section 3.4.5.1, and at page 4-125 (for Site BJM), page 4-349 (for Site DPK), and page 4-1813 (for Site TWR). These revisions do not result in any changes to the conclusions in the Draft EIR.

Comment 25: Table ES-2. HAZ-4-MM-1. The EIR should state that for sites BJM, DPK and TWR the construction contractor shall coordinate the completion of the Phase I audit with the Conservancy's Chief of Conservation and provide the Conservancy an opportunity to review the draft audit prior to finalization.

Response to Comment 25: An environmental database records search was conducted for all proposed Project sites as described in Section 3.7.1.1 on page 3-370 of the Draft EIR. As a result of this records search, these three sites were identified as “no concern to encounter recognized environmental

concerns during intrusive site-related activities” as listed in Table 3.7-5 on page 3-373 of the Draft EIR. Therefore, HAZ MM 1 is not required at these sites. No change has been made to the Draft EIR.

Comment 26: Table ES-2. HAZ-8-MM-3. The EIR should state that for sites BJM, DPK and TWR, the draft Fire Management Plan be provided to the Conservancy for its review and comment prior to initiating construction activities

Response to Comment 26: A copy of the draft Fire Management Protection Plan will be provided to the Conservancy for review and comment.

Comment 27: Table ES-2. WQ-1. The EIR should state that for sites BJM, DPK and TWR all stormwater and sediment generated shall be contained with the marked disturbance footprint. For site BJM, unmanaged stormwater from the existing access road to the site is causing serious erosion and damage to the Conservancy's Blackjack Campground Road which must be addressed in order to expand the uses at the BJM site.

Response to Comment 27: During construction, as described in Section 2.0 – Description of Project, on pages 2-36 through 2-38, stormwater and sediment would be controlled through use of Best Management Practices (BMPs). BMPs include evaluation of the site conditions and may include diversion of stormwater from coming on to the project during construction, control of stormwater runoff during construction with use of berms, hay bales, and sand bags, and control of sediment runoff with fiber rolls, hay bales, silt fences, covering of stockpiles, and minimizing exposed areas to the maximum extent possible. Stormwater generated on site will be directed towards existing drainages (manmade or natural). If required, baffle systems such as gravel or rock will be put in place to reduce flow rate of water and help prevent erosion. The design of the facility will include review of stormwater flow to and from the site. Stormwater will be directed towards natural or manmade drainages, and as required, may have baffle systems to reduce flow rate of water to reduce the potential for erosion. Design of the facility will include analysis of stormwater flow across and through the site. Grading of project will incorporate appropriate stormwater management design requirements and will be reviewed and approved by the appropriate agency issuing the building permit.

Comment 28: Table 2.1-1. Dakin Peak is located on Divide Rd.

Response to Comment 28: Table 2.1-1 of the Draft EIR has been revised to indicate the location of the proposed Dakin Peak site on Divide Road. The address for Site DPK on the site summary form in Chapter 4 has also been revised.

Comment 29: Table 2.1-3. Anticipated Construction Activities. It appears that both the DPK and TWR sites would require substantial amounts of cutting and filling to create sufficient space for new or replacement towers. Any fill used will need to certified as weed free. If this is not possible, funds from the interest of an invasive plant control fund will need to be provided in order for the Conservancy to perform invasive plant surveys and/or control at the sites for at least 10 years. The applicable BIO standard should also be modified to reflect this potential invasive introduction.

Response to Comment 29: The level of disturbance associated with project site development at all sites is limited to that analyzed in the EIR, as described in Section 2.1.3, and on a site-specific basis for sites BJM (at page 4-110), DPK (at page 4-335), and TWR (at page 4-1799). The Authority will examine each site based on the site’s unique characteristics and propose the least intrusive installation while still meeting the project’s objectives.

Comment 30: Figure 2.1-3. The proposed new lattice towers at BJM, DPK and TWR will be significantly taller than the existing towers. The current EIR does a cursory analysis of aesthetic and viewsheds effects as well as potential for additional or worse migratory bird fatalities (See general discussion in letter).

Response to Comment 30: See responses to comments #1, #2, and #8 above.

Comment 31: Figure 2.1-4. The typical site plan appears to require substantially more space than is present in the already developed areas at these locations which will require destruction of natural habitat at DPK and TWR, which is not addressed in the EIR.

Response to Comment 31: See response to Comment 28.

Comment 32: Section 2.1.2.1. Emergency Generators. Fuel tanks are very large and given remote locations, secondary containment must be a feature of the BJM, DPK and TWR sites.

Response to Comment 32: As noted at Section 3.7.4.1 and on a site-specific basis (at page 4-131 for Site BJM, page 4-355 for Site DPK, and 4-1819 for Site TWR) of the Draft EIR, the proposed fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented.

Comment 33: Section 2.1.2.1. Lighting. Security lights should be motion sensitive and should not remain on throughout the night. Existing towers at BJM, DPK and TWR have red navigation lights. Cumulative negative effect of additional tower with light was not discussed in EIR.

Response to Comment 33: Tower and security lighting for sites BJM, TPK, and TWR are described in Draft EIR Section 3.1.4.1 (Project Analysis) on page 3-42 under Rural or Remote areas. Cumulative lighting analysis is discussed in Draft EIR Section 3.1.5.3 (Cumulative Impact Analysis) on page 3-45 under AES-4. The Authority concurs that motion sensitive security lighting should be applied at remote sites, including sites BJM, DPK, and TWR. Section 2.1.2.1 will be updated to reflect this new information. These revisions do not result in any changes to the conclusions in the Draft EIR. Based on the analysis methodology developed for the Draft EIR, no other past present or reasonably foreseeable additional projects were noted within 0.25 mile of any of the three sites. Therefore, no cumulative impact from light and glare would occur.

Comment 34: Section 2.6. Alternatives Considered. There is no discussion as to why the existing 100 ft towers cannot be replaced with a single, new, much larger tower that can be instrumented with all

the dishes and antennas required by the existing tower and the LA-RICS LMR system. This option would preserve the existing viewsheds and location aesthetics of a single tower at these locations rather than a two tower approach.

Response to Comment 34: See response to comment #3.

Comment 35: Section 3.1.1. Conservancy lands should be accorded the same "high visual sensitivity" as public lands where the owner/management entity is focused on natural resource protection and protection of scenic resources. The Conservancy's articles of incorporation mandate both of these for Conservancy lands. Under The 1974 Open Space Easement Agreement with Los Angeles County, Conservancy lands are also part of the Los Angeles County parks system.

Response to Comment 35: The Draft EIR *does* identify that the Conservancy lands are an area of high visual sensitivity, as shown in Figure 3.1-1 on page 3-6 and on Table 3.1-1 (page 3-7), where sites BJM, DPK, and TWR are all listed as having high visual sensitivity and being located within a scenic vista, the coastal zone, and adjacent to a regional trail. These sites are also described on page 3-17 under the discussion of the Trans-Catalina Trail, and are listed on page 3-28 as sites located within an area that would be considered a scenic vista.

Comment 36: Table 3.1-1. Regional or municipal park should also be checked for the BJM, DPK and TWR sites.

Response to Comment 36: The Catalina Island Conservancy Open Space Easement has been added in the column for regional or municipal park for these sites in Table 3.1-1 of the Draft EIR. A discussion of the Catalina Island Conservancy Open Space Easement has been added as described in the response to comment 36 below. These revisions do not result in any changes to the conclusions in the Draft EIR.

Comment 37: Section 3.1.1.3. Trans Catalina Trail. As it is part of Los Angeles County park system's trail network, please delete the "Although it has no official scenic designation."

Response to Comment 37: The text has been deleted in accordance with this comment. This revision does not result in any changes to the conclusions in the Draft EIR.

Comment 38: Section 3.1.1.4. Conservancy lands are Open Space Easement areas in the Los Angeles County park system and should be listed in this section as such.

Response to Comment 38: A discussion of the Catalina Island Conservancy Open Space Easement has been added to Section 3.1.1.4. This revision does not result in any changes to the conclusions in the Draft EIR.

Comment 39: Section 3.3.1. Prior to finalizing the EIR, the extensive databases maintained by the Catalina Island Conservancy should be consulted and results included in the EIR (See attached maps). The fall floristic survey performed needs to be supplemented by a spring survey in order to be considered sufficient.

Response to Comment 39: Thank you for offering the Conservancy’s database. Please note that the maps that were attached to the comment letter have been redacted. Botanical surveys, as implemented under BIO MM 24 – Special Status Plant Surveys and Protection, will target any special-status plants that have the potential to occur at the project sites. BIO MM 1, as revised in comment #13, will provide the Conservancy a chance to specify details (e.g., add special-status plants from the Conservancy’s database), prior to finalization of the MMRP. Therefore, qualified botanists will have updated population and location information prior to conducting surveys.

In compliance with BIO MM 24 (page ES-47) surveys for special status plants shall be conducted by a qualified botanist prior to ground-disturbing activities in the proper season and in suitable habitat. Surveys would be conducted in the appropriate season and for the appropriate conditions for the given species, as noted in Section 3.1, Special Status Plants (page 3-167),” Each species has specific habitat requirements and a species-appropriate survey period.”

Comment 40: Table 3.1-1. For the BJM, DPK and TWR sites, plant communities within 500 feet of the existing tower include the following: Island Scrub Oak (*Quercus pacifica*) Chaparral, Coastal Sage Scrub, Non-native Grassland.

Response to Comment 40: Table 3.3-1 was revised to add sites BJM, DPK, and TWR to these plant communities. This revision does not result in any changes to the conclusions in the Draft EIR.

Comment 41: Table 3.3-3. The following text should be substituted for that in Table 3.3-3: Site BJM is located on the top of Blackjack Peak, the third highest mountain on Catalina Island. North facing slopes of Blackjack are dominated by intact Island scrub oak (*Quercus pacifica*) Chaparral; south-facing slopes are dominated by intact Coastal Sage Scrub (note: areas mapped as Bare Ground in 2003 are largely recovering into Coastal Sage Scrub). A former silver mine pit is located above the Blackjack Campground access road on the north side of the peak. Black jack peak is visible from many locations on and around Catalina Island. The Trans-Catalina Trail passes just southeast of the peak, and the Airport Road, very popular for motor tours, just to the northwest.

Response to Comment 41: The study area description for Site BJM in Table 3.3-3 has been revised in accordance with this comment. This revision does not result in any changes to the conclusions in the Draft EIR.

Comment 42: Table 3.3.-3. The plant species list in this table for Blackjack Peak should be as follows (Note all edit species list in Section 4.0 Site Summary Forms. Species not listed here have no records near project site):

The following special status species have records within 1 mile of the project site (those with an "*" within 1000 feet, those with "*x" within 500 feet):

*Arctostaphylos catalinae**
Atriplex coulteri

Ceanothus megacarpus var. insularis
Crossosoma californicum

Crocانthemum greenei
*Dendromecon harfordii**
Dichondra occidentalis
Dissanthelium californicum
Eriogonum giganteum var. giganteum
Eschscholzia ramosa
Galium catalinense ssp. catalinense
*Galium nuttallii ssp. insulare**
Gilia nevinii

Hordeum intercedens
Jepsonia malvifolia
Lepechinia fragrans
Lyonothamnus floribundus ssp. floribundus
Ophioglossum californicum
Quercus tomentella
Ribes viburnifolium
Scrophularia villosa
Solanum Wallacei

Response to Comment 42: We appreciate the updated plant occurrence data provided in the comment letter. A species list that includes these species has been added into Section 3.3.1.2. . This revision does not result in any changes to the conclusions in the Draft EIR.

Comment 43: Site DPK is located on the top of Dakin Peak, a prominent high point above Avalon and Silver/Grand Canyons. The peak is dominated by Coastal Sage Scrub with areas of Grassland (*Bromus-Avena-Nasella*) and Island Scrub Oak (*Quercus pacifica*) Chaparral. Dakin peak is visible from many locations on and around Catalina Island. The Trans-Catalina Trail follows the Divide Road immediately northwest of the existing tower. The Divide Road is also a very popular road for interior jeep tours.

Response to Comment 43: The study area description for Site DPK in Table 3.3-3 has been revised in accordance with this comment. This revision does not result in any changes to the conclusions in the Draft EIR.

Comment 44: The following special status species have records within 1 mile of the project site (those with an "*" within 1000 feet, those with "***" within 500 feet):

Arctostaphylos catalinae
Atriplex coulteri
Ceanothus megacarpus var. insularis
Crossosoma californicum
Crocانthemum greenei
Dudleya virens ssp. insularis
*Eriogonum giganteum var. giganteum***
Eschoscholzia ramosa

Hordeum intercedens
Jepsonia malvifolia
Lyonothamnus floribundus ssp. floribundus
Quercus tomentella
Ribes viburnifolium
Scrophularia villosa
Solanum Wallacei

Response to Comment 44: We appreciate the updated plant occurrence data provided in the comment letter. A species list that includes these species will be added into Section 3.3.1.2. This revision does not result in any changes to the conclusions in the Draft EIR.

Comment 45: Site TWR is located on the top of Tower Peak, a prominent high point above the Isthmus/Two Harbors area. The peak is dominated by Coastal Sage Scrub with areas of Grassland (*Bromus-Avena-Nasella*) and Island Scrub Oak (*Quercus pacifica*) Chaparral. Tower peak is visible from many locations on and around Catalina Island. The Trans-Catalina Trail follows the Banning Road immediately west of the existing tower.

Response to Comment 45: The study area description for Site TWR in Table 3.3-3 has been revised in accordance with this comment. This revision does not result in any changes to the conclusions in the Draft EIR.

Comment 46: The following special status species have records within 1 mile of the project site (those with an "*" within 1000 feet, those with "***" within 500 feet):

Atriplex coulteri
Constancea nevinii
Crossosoma californicum
Cryptantha wigginsii
Deinandra clementina
Dichondra occidentalis
Dissanthelium californicum (1400 feet west of site)
Dudleya virens ssp. hassei
Eriogonum giganteum var. giganteum
Eriogonum grande var. grande
Eschoscholzia ramosa
Galium catalinense ssp. catalinense
Gambelia speciosa
Hordeum intercedens
Jepsonia malvifolia
Lyonothamnus floribundus ssp. floribundus
Pentachaeta lyonii (1400 feet northwest of site)
*Ribes viburnifolium***
Scrophularia villosa

Response to Comment 46: We appreciate the updated plant occurrence data provided in the comment letter. A species list that includes these species will be added into Section 3.3.1.2. This revision does not result in any changes to the conclusions in the Draft EIR.

Comment 47: Section 3.3.1.6. Local Policies and Ordinances. As discussed above for Sections 3.1.4 and 3.1.5, Catalina Island is part of unincorporated Los Angeles County and subject to land use ordinances of general applicability as well as Title 22, specific to Catalina Island.

Response to Comment 47: Refer to response to Comment #10. Additionally, the Authority believes that the proposed project and Mitigation Measures meet and/or exceed those measures outlined in Section 22.46.470 – Flora and Fauna. Relevant subsections of 22.6.470 include Section A, which requires a site plan with a 100 foot buffer of mapped vegetation prepared by a qualified botanist, impact analysis on native vegetation and wildlife, and suggested mitigation measures including transplanting vegetation or revegetating impacted areas; and Section B, preventing development that would remove or damage “rare or endangered plant species” as defined in Appendix G of the 1989 Santa Catalina Island Specific Plan; and G, development within SEAs shall be subject to Title 22 except for the exemption provisions contained in Section 22.56.215. The Authority believes that incorporation of the BIO MM 1, 2, 8, 3, 4, 5, 6, 8, 9, 10, 11, 17, 18, 19, 20, 23, and 24 at all sites on Santa Catalina Island will ensure adherence to Title 22 with regards to biological resources. Additionally, the project will be required to obtain a coastal development permit, and therefore the specific project will be analyzed for adherence to Title 22 and any other land use ordinances of general applicability.

Comment 48: Section 3.3.2.3. Local Regulatory Setting. As discussed above for Sections 3.1.4 and 3.1.5, Catalina Island is part of unincorporated Los Angeles County and subject to land use ordinances of general applicability as well as Title 22, specific to Catalina Island.

Response to Comment 48: Refer to responses to Comments #10 and #44 above.

Comment 49: Table 3.3-7. Species with Suitable Habitat within Study Areas. The following should be added to this table:

Burrowing Owl: BJM, DPK, TWR

California Mountain Kingsnake: BJM

Response to Comment 49: Table 3.3-7 has been revised to add the sites for these species. This revision does not result in any changes to the conclusions in the Draft EIR.

Comment 50: Section 3.3.4.1, Page 3-147 4th full paragraph and 3-148 first full paragraph. Burrowing owls are frequently observed throughout Catalina Island and should be listed for the BJM, DPK and TWR sites.

Response to Comment 50: The presence of burrowing owls at sites BJM, DPK, and TWR has been added to the text in the 4th full paragraph on page 3-147 and in the first paragraph on page 3-148. This revision does not result in any changes to the conclusions in the Draft EIR.

Comment 51: Section 3.3.4.1, Pages 3-154 to 3-155. Santa Catalina Island Fox. The following changes should be made:

1st Paragraph, 1st Sentence should state: "The Santa Catalina Island Fox is a habitat generalist and is found throughout Catalina Island in all natural habitats and areas of human habitation and development."

1st Paragraph, last sentence should state: "Young can be born any time from late February through late April..."

2nd Paragraph, should state: "The major threat to Catalina Island Foxes have been disease outbreaks, e.g. the canine distemper outbreak in the late 1990s that almost wiped out the population, and mortality from vehicle collisions or other dangers associated with human development, e.g. drowning in open containers of liquids, poisoning, becoming trapped in open excavations. Catalina Island Foxes should be expected at all three Catalina Island project sites and should definitely expected to investigate any changes to the sites during active construction, especially open holes and trenches, open containers of liquids and improperly enclosed solid or food wastes.,'

3rd Paragraph, Construction impacts should read: The noise and activities associated with construction of the proposed Project sites could result in temporary disturbance of fox. Therefore, construction cannot be initiated from late February the end July. Foraging foxes will investigate the construction site for new food sources and for cover in uncovered excavations, under equipment or stored materials. Discarded food and trash is effectively an attractive nuisance for foxes and can result in increased habituation and dependence on humans for food."

Response to Comment 51: Revisions were made to the 1st and 2nd paragraphs in accordance with the comment. These revisions do not result in any changes to the conclusions in the Draft EIR. Regarding the comment to the 3rd paragraph, since BIO MM 20 part b) includes the inspection for fox dens within the project area and within an additional 250 foot buffer, and that construction activities will be stopped and USFWS and CDFW contacted if a den is found, there is no additional need for a seasonal restriction. No change to text has been made.

Comment 52: BIO-MM-19(e). Add the following: "Any trenches, holes or other excavations that are not covered at the end of the work day, must be provided with a fox escape ramp."

Response to Comment 52: See response to Comment #17.

Comment 53: BIO-MM-20(a). Add the following: "Crews should be informed that there is absolutely no feeding of foxes allowed on Catalina Island."

Response to Comment 53: In compliance with BIO MM 20, Santa Catalina Island Fox Protection, construction crews will be informed on measures to avoid impacts to the fox, including no feeding. No change has been made to BIO MM 20.

Comment 54: Section 3.3.4.1, Pages 3-157 to 3-158. Small Animals, California Mountain Kingsnake, Coast Horned Lizard, San Diego Woodrat, Tehachapi Pocket Mouse, Townsend's Big-eared Bat and Western Mastiff Bat. The Conservancy has documentation of California Mountain Kingsnake at nearby Blackjack Campground. Townsend's Big-eared Bats breed on Catalina Island in caves and abandoned mines.

Response to Comment 54: Site BJM has been added for the discussion of California mountain kingsnake, and sites DPK and TWR have been added to the discussion of Townsend's big-eared bat in the paragraphs indicated on pages 3-157 and 3-158. These revisions do not result in any changes to the conclusions in the Draft EIR.

Comment 55: Section 3.3.4.1., Pages 3-158 and 3-159. BJM should be added to the list of sites at the top of page 3-158, in the fourth full paragraph of page 3-158, and in the first full paragraph on page 3-159.

Response to Comment 55: Site BJM has been added to the paragraphs indicated on pages 3-158 and 3-159. This revision does not result in any changes to the conclusions in the Draft EIR.

Comment 56: Section 3.3.4.1, Page 3-169. BIO-MM-23(b). Add the following: "For sites BJM, DPK and TWR, all construction vehicles and equipment shall be washed prior to being brought to Catalina Island and shall not enter Conservancy property until it is inspected by the Conservancy's invasive Plant Program Manager.

Response to Comment 56: See response to Comment #22.

Comment 57: Section 3.3.4.1, Page 3-207. See earlier comment regarding reference to Title 22 regulations.

Response to Comment 57: The authority acknowledges the project must adhere to Title 22, which will occur during the coastal plan permitting phase. See response to Comments #10 and #44.

Comment 58: Table 3.3-12. Special Status Species. The following species should be added to this table for Sites BJM, DPK and TWR:

- Burrowing Owl**
- Island Loggerhead Shrike**
- Catalina Island Quail**
- San Clemente Spotted Towhee**
- Hutton's Vireo**

In addition, the consultant should refer to Appendix G of the LCP for other species of special concern regulated under Title 22 of the LA County Code.

Response to Comment 58: The bird species listed in the comment have been added to the species list for sites BJM, DPK, and TWR in Table 3.3-12. These revisions do not result in any changes to the conclusions in the Draft EIR.

Thank you for providing the reference to the list of rare Catalina Island native plants, referred to in your comment as Appendix G of the LCP (http://planning.lacounty.gov/assets/upl/data/pd_santa-catalina-island-implementation.pdf). A species list that includes these species will be added into Section 3.3.1.2. Appendix G was reviewed and these plant species were also included in this revised list. This revision does not result in any changes to the conclusions in the Draft EIR.

In accordance with established mitigation measures, impacts to native vegetation will be minimized with the application of BIO MM 9 (page ES-40), and special status plants will be protected with the application of BIO MM 24 (page ES-47). A comprehensive inventory of plant species will be conducted at each project site where project activities would result in ground disturbance. Any special status plant species found on site will be identified for protection.

Comment 59: Section 3.4. Cultural Resources. Extensive prehistoric and historic cultural resources are present nearly everywhere on Catalina Island. Human habitation and use of the island extends at least to 8,000 BP and likely much earlier. Any excavation or drilling, even in previously developed areas, should expect to encounter cultural artifacts, human remains, middens, lithic scatters, and/or habitation sites. All three Catalina Island sites have mapped cultural locations in or near the project location (see attached maps). No excavation or soil disturbance should be undertaken without an archeological monitor present. All of the tables and text in Section 3.4 should be edited to include BJM, DPK and TWR as actual or likely locations for cultural resources to be present.

Response to Comment 59: Please note that the maps that were attached to the comment letter have been redacted. Protocols for the identification of prehistoric and historic archaeological resources included records searches; a review of site records, site maps, and archaeological survey reports; GIS mapping; and field surveys of all Project sites, including BJM, DPK, and TWR. Although Santa Catalina Island is known to have a long history of human habitation, based on the identification protocols, there were no prehistoric or historic archaeological sites, features, or other remains that would be impacted by Project activities identified within the proposed ground disturbing areas at sites BJM, DPK, or TWR. Within a 0.5-mile radius of Site BJM, one prehistoric site was noted approximately 0.21 mile to the north. Within a 0.5-mile radius of Site DPK, one prehistoric site (a single artifact) was noted approximately 0.23 mile to the southwest; and one historic site (two concrete water line markers) was noted approximately 0.12 mile to the northeast. No prehistoric or historic archaeological remains were found within 0.5-mile radius of Site TWR. None of the identified archeological remains were recorded as being historical resources as defined in California PRC section 21084.1 and CEQA Guidelines Section 15064.5(a) – i.e., listed in, or eligible for listing in the California Register of Historical Resources.

However, to address the concerns of the Conservancy, an archaeological monitor will be present during all ground-disturbing activities at sites BJM, DPK, and TWR.

These revisions do not result in any changes to the conclusions in the Draft EIR.

Comment 60: Section 4.0. Site Summary Forms. -- All site summary forms for BJM, DPK and TWR should be thoroughly edited to reflect changes discussed above.

Response to Comment 60: Site summary forms for BJM, DPK and TWR have been edited for consistency with the revisions described in previous responses.

Comment Letter Public 1

February 19, 2016

To whom it may concern,

1 I live in Promontory Crest and within our gated community is an antenna tower, just a few feet away from many of the homes. I vehemently oppose any extension to this antenna tower and any placement of additional radio transmitters.

2 We were told by LA-RICS officials that our site is unique in that it is the only proposed location out of 92 sites that is surrounded by a residential neighborhood. The antenna tower was here first; however, there was no public disclosure that the antenna tower could grow by 35 feet and could grow up to 49 additional antennas. Many residents have talked about raising money for a class action lawsuit, but we are confident that if we get our voices heard that all parties will realize that increasing the radiation field in a residential neighborhood is not the right thing to do. We have hundreds of condos nearby and numerous million dollar homes that have an interest in making sure the antenna tower does not grow.

3 There have been nine cases of cancer on our street and two cancer related deaths. The safety guidelines for the amount of allowable RF are based on what we "know". But I would venture to guess, there is much more that we don't know about RF than what we do know. Simply following the safety guidelines does not ensure safety for our residents. It wasn't that long ago that smoking was considered safe. RF causes cancer and kills people. There is no justification to add harmful radiation to a residential neighborhood, especially when there are nearly a hundred other sites to choose from.

4 In addition, there is talk about placing a 1,500 gallon diesel storage tank to power a new 85 KW generator to power the antennas in case of a power failure. This is a bad idea. On every home sale, a natural hazards report is released and underground storage tanks and leaks could impact the values and desirability of nearby homes. Signal Hill is on an earthquake fault line and we do not need thousands of gallons of fuel placed buried in our soil. The generator may also create a lot of noise that would be a nuisance to neighboring homes.

5 If this project moves forward, there will be an outpouring of support to hold the decision makers accountable for harming our quality of life. LA-RICS has engaged in obfuscating the truth from the public. We received a form letter from LA-RICS, which did not explain the scope of the project. Instead it directed the public to a 3,200 page document and buried inside were the pertinent details of the antenna growing by leaps and bounds. In addition, the public meetings were very far away from the proposed site and in one case, we'd have to hop on a boat to have our voices heard. I urge you to take our complaint seriously. Once everyone knows the truth about this proposal you will have hundreds of very angry families who will do everything to stop you from pulling a Porter Ranch on us.

Sincerely,

AR ALEX ARHENDARIZ / DANIEL BAYER
ARHENDARIZ-BAYER HOUSEHOLD

Responses to Comment Letter Public 1

The Authority appreciates your comments on the Draft EIR dated February 19, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to the comments are provided below.

Comment 1: I live in Promontory Crest in Signal Hill and within our gated community is an antenna tower, just a few feet away from many of the homes. I vehemently oppose any extension to this antenna tower and any placement of additional radio transmitters.

Response to Comment 1: Your opposition to the use of Site SGH is noted.

Comment 2: We were told by LA-RICS officials that our site is unique in that it is the only proposed location out of 92 sites that is surrounded by a residential neighborhood. The antenna tower was here first; however, there was no public disclosure that the antenna tower could grow by 35 feet and could grow up to 49 additional antennas. Many residents have talked about raising money for a class action lawsuit, but we are confident that if we get our voices heard that all parties will realize that increasing the radiation field in a residential neighborhood is not the right thing to do. We have hundreds of condos nearby and numerous million dollar homes that have an interest in making sure the antenna tower does not grow.

Response to Comment 2: The total number of potential locations considered for the LMR project is 94. Information on the numbers of sites that was provided during public meetings and community outreach meetings is consistent with the information in the Draft EIR. While each LMR site included in the Draft EIR is unique, other sites analyzed in the Draft EIR, such as SDW and WAD, are similar to site SGH in that they are located in residential areas with residences adjacent. Regarding the comment that there was a lack of public disclosure, the Draft EIR was circulated for a 45 day public review period. The Draft EIR explains that the Authority is proposing installation of up to 40 whip and up to 9 microwave antennas on an existing 160-foot tower, which would be extended to 180 feet, with an additional 15 foot lighting rod. (Draft EIR, pp. 2-32, 4-1487.) Regarding the comment on “radiation fields,” please see response to comment 3, below.

Comment 3: There have been nine cases of cancer on our street and two cancer related deaths. The safety guidelines for the amount of allowable RF are based on what we "know". But I would venture to guess, there is much more that we don't know about RF than what we do know. Simply following the safety guidelines does not ensure safety for our residents. It wasn't that long ago that smoking was considered safe. RF causes cancer and kills people. There is no justification to add harmful radiation to a residential neighborhood, especially when there are nearly a hundred other sites to choose from.

Response to Comment 3: As described in Section 5.3 of the Draft EIR, the Authority will manage radiofrequency (RF) electromagnetic energy (EME) radiation in accordance with applicable guidance

found at the Federal Communication Commission’s Office of Engineering and Technology (OET) Bulletin 65. This will include desktop analysis of RF exposures inclusive of all equipment at the site (including new LMR equipment) prior to construction and confirmatory sampling of RF exposures upon completion of construction to ensure exposures are within regulatory requirements for workers and the public. The assessments from the different health and safety organizations seem to be different on how they classify RF EME field. See the below FCC web link: <https://www.fcc.gov/engineering-technology/electromagnetic-compatibility-division/radio-frequency-safety/general/rf>. However RF-EME is classified by the different health and safety organizations, per information on <https://www.fcc.gov/general/radio-frequency-safety-0>, “...the FCC has continuously monitored research and conferred with experts in this field, and is confident in its RF exposure guidelines and the soundness of the basis for its rules”, the FCC guideline is still current and valid. It is unclear whether any organization besides the FCC has established new safety guidelines, nor is there any evidence that RF exposure is harmful at the levels that would occur with the proposed project.

Comment 4: In addition, there is talk about placing a 1,500 gallon diesel storage tank to power a new 85 KW generator to power the antennas in case of a power failure. This is a bad idea. On every home sale, a natural hazards report is released and underground storage tanks and leaks could impact the values and desirability of nearby homes. Signal Hill is on an earthquake fault line and we do not need thousands of gallons of fuel place buried in our soil. The generator may also create a lot of noise that would be a nuisance to neighboring homes.

Response to Comment 4: The proposed 1,500 gallon diesel storage tank would be an aboveground, double-walled belly tank on the 85-KW diesel generator, not a buried underground storage tank. The diesel storage tank would be installed in accordance with all federal, state and local regulations, and the California Fire Code as discussed in Section 3.7 of the Draft EIR, with specific detail for Site SGH at pages 4-1508 and 4-1509. The regulations are promulgated to ensure diesel storage tanks are safely constructed and include secondary spill control containment requirements to prevent leaks into the environment. Also, for facilities that have a fuel tank greater than 660 gallons or fuel storage greater than 1,320 gallons, a Spill Prevention, Control and Countermeasures Plan (SPCC Plan) will be prepared and kept on site. Management of fuels will be conducted in accordance with all applicable regulations.

Signal Hill is bounded by a fault system. According to the California Geologic Special Studies Zones, Long Beach Quadrangle, the active fault trace is located near the bottom of Signal Hill, approximately 1/8 mile from the site, but the site is not within an Alquist-Priolo Fault Zone. However significant shaking would occur at the site should an earthquake rupture along the active fault trace. A discussion of geologic hazards at the site is provided on page 4-1504 of the Draft EIR. The storage tank would be installed in compliance with the local building codes to minimize seismic hazards (page 3-349 of DEIR).

Noise levels associated with the period operation of the diesel generator, estimated to be one hour per month as part of routine maintenance, and as required in the event of power outage. Section 4, page 4-1518 of the Draft EIR provides a detailed analysis of noise from the period use of the generator. The Draft EIR concludes that “resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet.

Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding this occasional operational noise to ambient conditions would fall far below the daytime (90 dBA) or nighttime (80 dBA) thresholds identified by the Federal Transit Authority used in the analysis. The more continuous noise associated with the air conditioning unit used to regulate temperature in the equipment shelters would fall within background noise levels; therefore, impacts from operational noise would be less than significant.”

Comment 5: If this project moves forward, there will be an outpouring of support to hold the decision makers accountable for harming our quality of life. LA-RICS has engaged in obfuscating the truth from the public. We received a form letter from LA-RICS, which did not explain the scope of the project. Instead it directed the public to a 3,200 page document and buried inside were the pertinent details of the antenna growing by leaps and bounds. In addition, the public meetings were very far away from the proposed site and in one case, we'd have to hop on a boat to have our voices heard. I urge you to take our complaint seriously. Once everyone knows the truth about this proposal you will have hundreds of very angry families who will do everything to stop you from pulling a Porter Ranch on us.

Response to Comment 5: As lead agency and proponent of the project, the Authority has and will continue to perform outreach with the public regarding LMR project implementation. The Authority is fully accountable for the decisions being made regarding the implementation of LMR Project. The Authority’s Board will consider the Draft EIR and Final EIR, inclusive of your comments, prior to making a decision on the proposed project. The LMR system would provide emergency responders with an improved communications system that will enable efficient and coordinated response to incidents and emergencies that is currently not possible in Los Angeles County. The improved communications could reduce response times and ultimately save lives. The LMR system would support faster, better-coordinated, large-scale multi-agency response to emergencies such as terrorist attacks, earthquakes, civil disturbance, wildfire or other disasters, improving overall system capacity and coverage for first and second responders region-wide. The LMR project would enhance safety and emergency response for 10 million Los Angeles County residents and the over 40 million Los Angeles County tourists.

The DEIR fully discloses the project and potential project impacts based on the best available information at the time it was released for public review. The form letter that you note in your comment was likely the Notice of Availability (NOA). The NOA was provided to you in accordance with Section 21092 of the California Public Resources Code. The NOA included: Project Description and Location; Significant Anticipated Environmental Effects; Hazardous Waste Sites; Document Availability (including both the Website for electronic review and 16 locations for where hard copies of the document could be reviewed) and Public Review and Meetings (which included location and time for six public hearings and both e-mail and physical address for submitting public comments). A total of six public meetings were held for the Draft EIR: one in each of the five districts of the Los Angeles County Board of Supervisors, plus one in Avalon on Catalina Island. The nearest location of a public meeting for the Draft EIR to the site in Signal Hill was approximately 12 miles from the site at Peck Park Community Center Auditorium at 560 N. Western Ave. in San Pedro. The project spans all of the Los Angeles County area, and the Authority selected locations that would provide opportunities for people all across the county to attend

a public meeting if desired. The format and information provided at each of the public meetings was the same.

The Draft EIR included all pertinent details of the proposed project at Site SGH. As described in the Draft EIR on page 2-32, Site SGH is an “Existing 160’ tower to be extended to 180’.” As described in more detail beginning at page 4-1487, Site SGH describes installation of up to 40 whip and up to 9 microwave antennas on existing 160-foot lattice tower to be extended to 180 feet tall, with additional up to 15-foot lightning rod.

Comment Letter Public 6

February 19, 2016

To whom it may concern,

I live in Promontory Crest in Signal Hill and within our gated community is an antenna tower, just a few feet away from many of the homes. I vehemently oppose any extension to this antenna tower and any placement of additional radio transmitters.

We were told by LA-RICS officials that our site is unique in that it is the only proposed location out of 92 sites that is surrounded by a residential neighborhood. The antenna tower was here first; however, there was no public disclosure that the antenna tower could grow by 35 feet and could grow up to 49 additional antennas. Many residents have talked about raising money for a class action lawsuit, but we are confident that if we get our voices heard that all parties will realize that increasing the radiation field in a residential neighborhood is not the right thing to do. We have hundreds of condos nearby and numerous million dollar homes that have an interest in making sure the antenna tower does not grow.

There have been nine cases of cancer on our street and two cancer related deaths. The safety guidelines for the amount of allowable RF are based on what we "know". But I would venture to guess, there is much more that we don't know about RF than what we do know. Simply following the safety guidelines does not ensure safety for our residents. It wasn't that long ago that smoking was considered safe. RF causes cancer and kills people. There is no justification to add harmful radiation to a residential neighborhood, especially when there are nearly a hundred other sites to choose from.

In addition, there is talk about placing a 1,500 gallon diesel storage tank to power a new 85 KW generator to power the antennas in case of a power failure. This is a bad idea. On every home sale, a natural hazards report is released and underground storage tanks and leaks could impact the values and desirability of nearby homes. Signal Hill is on an earthquake fault line and we do not need thousands of gallons of fuel placed buried in our soil. The generator may also create a lot of noise that would be a nuisance to neighboring homes.

If this project moves forward, there will be an outpouring of support to hold the decision makers accountable for harming our quality of life. LA-RICS has engaged in obfuscating the truth from the public. We received a form letter from LA-RICS, which did not explain the scope of the project. Instead it directed the public to a 3,200 page document and buried inside were the pertinent details of the antenna growing by leaps and bounds. In addition, the public meetings were very far away from the proposed site and in one case, we'd have to hop on a boat to have our voices heard. I urge you to take our complaint seriously. Once everyone knows the truth about this proposal you will have hundreds of very angry families who will do everything to stop you from pulling a Porter Ranch on us.

Sincerely,

2301 Promontory Drive
Signal Hill, CA 90755

Signal Hill is on an earthquake fault line and we do not need thousands of gallons of fuel buried in our soil. The generator may also create a lot of noise that would be a nuisance to neighboring homes.

If this project moves forward, there will be an outpouring of support to hold the decision makers accountable for harming our quality of life. LA-RICS has engaged in obfuscating the truth from the public. We received a form letter from LA-RICS, which did not explain the scope of the project. Instead it directed the public to a 3,200 page document and buried inside were the pertinent details of the antenna growing by leaps and bounds. In addition, the public meetings were very far away from the proposed site and in one case, we'd have to hop on a boat to have our voices heard. I urge you to take our complaint seriously. Once everyone knows the truth about this proposal you will have hundreds of very angry families who will do everything to stop you from pulling a Porter Ranch on us.

Sincerely,

Jonathan Kent

To whom it may concern,

I live in Promontory Crest in Signal Hill and within our gated community is an antenna tower, just a few feet away from many of the homes. I vehemently oppose any extension to this antenna tower and any placement of additional radio transmitters.

We were told by LA-RICS officials that our site is unique in that it is the only proposed location out of 92 sites that is surrounded by a residential neighborhood. The antenna tower was here first; however, there was no public disclosure that the antenna tower could grow by 35 feet and could grow up to 49 additional antennas. Many residents have talked about raising money for a class action lawsuit, but we are confident that if we get our voices heard that all parties will realize that increasing the radiation field in a residential neighborhood is not the right thing to do. We have hundreds of condos nearby and numerous million dollar homes that have an interest in making sure the antenna tower does not grow.

There have been nine cases of cancer on our street and two cancer related deaths. The safety guidelines for the amount of allowable RF are based on what we "know". But I would venture to guess, there is much more that we don't know about RF than what we do know. Simply following the safety guidelines does not ensure safety for our residents. It wasn't that long ago that smoking was considered safe. RF causes cancer and kills people. There is no justification to add harmful radiation to a residential neighborhood, especially when there are nearly a hundred other sites to choose from.

In addition, there is talk about placing a 1,500 gallon diesel storage tank to power a new 85 KW generator to power the antennas in case of a power failure. This is a bad idea. On every home sale, a natural hazards report is released and underground storage tanks and leaks could impact the values and desirability of nearby homes. Signal Hill is on an earthquake fault line and we do not need thousands of gallons of fuel place buried in our soil. The generator may also create a lot of noise that would be a nuisance to neighboring homes.

If this project moves forward, there will be an outpouring of support to hold the decision makers accountable for harming our quality of life. To whom it may concern,

I live in Promontory Crest and within our gated community is an antenna tower, just a few feet away from many of the homes. I vehemently oppose any extension to this antenna tower and any placement of additional radio transmitters.

We were told by LA-RICS officials that our site is unique in that it is the only proposed location out of 92 sites that is surrounded by a residential neighborhood. The antenna tower was here first; however, there was no public disclosure that the antenna tower could grow by 35 feet and could grow up to 49 additional antennas. Many residents have talked about raising money for a class action lawsuit, but we are confident that if we get our voices heard that all parties will realize that increasing the radiation field in a residential neighborhood is not the right thing to do. We have hundreds of condos nearby and numerous million dollar homes that have an interest in making sure the antenna tower does not grow.

There have been nine cases of cancer on our street and two cancer related deaths. The safety guidelines for the amount of allowable RF are based on what we "know". But I would venture to guess, there is much more that we don't know about RF than what we do know. Simply following the safety guidelines does not ensure safety for our residents. It wasn't that long ago that smoking was considered safe. RF causes cancer and kills people. There is no justification to add harmful radiation to a residential neighborhood, especially when there are nearly a hundred other sites to choose from.

In addition, there is talk about placing a 1,500 gallon diesel storage tank to power a new 85 KW generator to power the antennas in case of a power failure. This is a bad idea. On every home sale, a natural hazards report is released and underground storage tanks and leaks could impact the values and desirability of nearby homes. Signal Hill is on an earthquake fault line and we do not need thousands of gallons of fuel placed buried in our soil. The generator may also create a lot of noise that would be a nuisance to neighboring homes.

If this project moves forward, there will be an outpouring of support to hold the decision makers accountable for harming our quality of life. LA-RICS has engaged in obfuscating the truth from the public. We received a form letter from LA-RICS, which did not explain the scope of the project. Instead it directed the public to a 3,200 page document and buried inside were the pertinent details of the antenna growing by leaps and bounds. In addition, the public meetings were very far away from the proposed site and in one case, we'd have to hop on a boat to have our voices heard. I urge you to take our complaint seriously. Once everyone knows the truth about this proposal you will have hundreds of very angry families who will do everything to stop you from pulling a Porter Ranch on us.

Sincerely,

Linda Simmons

There is no justification to add harmful radiation to a residential neighborhood, especially when there are nearly a hundred other sites to choose from.

In addition, there is talk about placing a 1,500 gallon diesel storage tank to power a new 85 KW generator to power the antennas in case of a power failure. This is a bad idea. On every home sale, a natural hazards report is released and underground storage tanks and leaks could impact the values and desirability of nearby homes. Signal Hill is on an earthquake fault line and we do not need thousands of gallons of fuel placed buried in our soil. The generator may also create a lot of noise that would be a nuisance to neighboring homes.

If this project moves forward, there will be an outpouring of support to hold the decision makers accountable for harming our quality of life. LA-RICS has engaged in obfuscating the truth from the public. We received a form letter from LA-RICS, which did not explain the scope of the project. Instead it directed the public to a 3,200 page document and buried inside were the pertinent details of the antenna growing by leaps and bounds. In addition, the public meetings were very far away from the proposed site and in one case, we'd have to hop on a boat to have our voices heard. I urge you to take our complaint seriously. Once everyone knows the truth about this proposal you will have hundreds of very angry families who will do everything to stop you from pulling a Porter Ranch on us.

Sincerely,

To whom it may concern,

I live in Promontory Crest and within our gated community is an antenna tower, just a few feet away from many of the homes. I vehemently oppose any extension to this antenna tower and any placement of additional radio transmitters.

We were told by LA-RICS officials that our site is unique in that it is the only proposed location out of 92 sites that is surrounded by a residential neighborhood. The antenna tower was here first; however, there was no public disclosure that the antenna tower could grow by 35 feet and could grow up to 49 additional antennas. Many residents have talked about raising money for a class action lawsuit, but we are confident that if we get our voices heard that all parties will realize that increasing the radiation field in a residential neighborhood is not the right thing to do. We have hundreds of condos nearby and numerous million dollar homes that have an interest in making sure the antenna tower does not grow.

There have been nine cases of cancer on our street and two cancer related deaths. The safety guidelines for the amount of allowable RF are based on what we "know". But I would venture to guess, there is much more that we don't know about RF than what we do know. Simply following the safety guidelines does not ensure safety for our residents. It wasn't that long ago that smoking was considered safe. RF causes cancer and kills people. There is no justification to add harmful radiation to a residential neighborhood, especially when there are nearly a hundred other sites to choose from.

In addition, there is talk about placing a 1,500 gallon diesel storage tank to power a new 85 KW generator to power the antennas in case of a power failure. This is a bad idea. Please see response to comment letter Public 1

Comment Letter Public 52

February 19, 2016

To whom it may concern,

I live in Promontory Crest in Signal Hill and within our gated community is an antenna tower, just a few feet away from many of the homes. I vehemently oppose any extension to this antenna tower and any placement of additional radio transmitters.

We were told by LA-RICS officials that our site is unique in that it is the only proposed location out of 92 sites that is surrounded by a residential neighborhood. The antenna tower was here first; however, there was no public disclosure that the antenna tower could grow by 35 feet and could grow up to 49 additional antennas. Many residents have talked about raising money for a class action lawsuit, but we are confident that if we get our voices heard that all parties will realize that increasing the radiation field in a residential neighborhood is not the right thing to do. We have hundreds of condos nearby and numerous million dollar homes that have an interest in making sure the antenna tower does not grow.

There have been nine cases of cancer on our street and two cancer related deaths. The safety guidelines for the amount of allowable RF are based on what we "know". But I would venture to guess, there is much more that we don't know about RF than what we do know. Simply following the safety guidelines does not ensure safety for our residents. It wasn't that long ago that smoking was considered safe. RF causes cancer and kills people. There is no justification to add harmful radiation to a residential neighborhood, especially when there are nearly a hundred other sites to choose from.

In addition, there is talk about placing a 1,500 gallon diesel storage tank to power a new 85 KW generator to power the antennas in case of a power failure. This is a bad idea. On every home sale, a natural hazards report is released and underground storage tanks and leaks could impact the values and desirability of nearby homes. Signal Hill is on an earthquake fault line and we do not need thousands of gallons of fuel place buried in our soil. The generator may also create a lot of noise that would be a nuisance to neighboring homes.

If this project moves forward, there will be an outpouring of support to hold the decision makers accountable for harming our quality of life. LA-RICS has engaged in obfuscating the truth from the public. We received a form letter from LA-RICS, which did not explain the scope of the project. Instead it directed the public to a 3,200 page document and buried inside were the pertinent details of the antenna growing by leaps and bounds. In addition, the public meetings were very far away from the proposed site and in one case, we'd have to hop on a boat to have our voices heard. I urge you to take our complaint seriously. Once everyone knows the truth about this proposal you will have hundreds of very angry families who will do everything to stop you from pulling a Porter Ranch on us.

Sincerely,

A handwritten signature in blue ink, appearing to read "Greg M. H."

Responses to Comment Letter Public 53

The Authority appreciates your comments on the Draft EIR dated February 23, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to the comments are provided below.

Comment 1: I live in Promontory Crest and within our gated community is an antenna tower, just a few feet away from many of the homes. I vehemently oppose any extension to this antenna tower and any placement of additional radio transmitters.

Response to Comment 1: The commenter’s opposition to the use of Site SGH is noted.

Comment 2: We were told by LA-RICS officials that our site is unique in that it is the only proposed location out of 92 sites that is surrounded by a residential neighborhood. The antenna tower was here first; however, there was no public disclosure that the antenna tower could grow by 35 feet and could grow up to 49 additional antennas.

Response to Comment 2: While each LMR site included in the Draft EIR is unique, other sites analyzed in the Draft EIR, such as sites SDW and WAD, are similar to Site SGH in that they are located in residential areas with residences adjacent. Regarding the comment that there was a lack of public disclosure, the Draft EIR was circulated for a 45 day public review period. The Draft EIR explains that the Authority is proposing installation of up to 40 whip and up to 9 microwave antennas on an existing 160-foot tower, which would be extended to 180 feet, with an additional 15 foot lighting rod. (Draft EIR, pp. 2-32, 4-1487.)

Comment Letter Public 54

February 12, 2016

Regarding Proposed LMR Site
in Signal Hill.

To whom it may concern,

1 | We are outraged at the proposal to extend the radio antenna tower by an additional 20 feet and install a new 15 foot lighting rod on top of it. There are hundreds of homes and condos nearby that would be adversely affected. We have children growing up in the neighborhood and we do not want to be bombarded by additional radiation.

2 | As homeowners, all of us signed disclosures acknowledging the existence of the radio tower. What was never disclosed to any of us was that the radio tower could grow by 35 feet. That is the size of a school bus planted vertically on top of the antenna. That is a big deal. That is unacceptable and that is something you would not allow in your backyard. From my understanding, it would be illegal to build the antenna after the homes were already here, so I do not see how increasing the size and scope of the existing antenna is legal.

3 | If every home went down in value by \$25,000 as a result of the antenna tower's giant growth, we are talking about tens of millions of dollars of damages to the local real estate market. Not only does increasing the size of the antenna impact home values, it does additional damage to property values because now homeowners would have to disclose that the antenna was increased in size by 35 feet and it could happen again in the future. The precedent of growing the antenna by leaps and bounds at any time would further depreciate property values for hundreds of property owners.

4 | Notice of the initiative was sent out to the neighbors; however, nowhere in the notice does it mention that the antenna will grow by 35 feet. That's disingenuous and obfuscating the truth. It is also inappropriate and manipulative to hold six public meetings regarding the impact of the antenna and not one of these public meetings held by the LA-RICS is taking place near the proposed site, where the health of the families will be affected. We would literally have to get on a boat to get to the February 1st meeting on Catalina Island.

5 | If this proposal passes, I will personally send out thousands of postcards to the nearby residents to hold the decision makers accountable for endangering our health and damaging our property values.

Sincerely,

Matthew Simmons

Responses to Comment Letter Public 54

The Authority appreciates your comments on the Draft EIR dated February 12, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to the comments are provided below.

Comment 1: We are outraged at the proposal to extend the radio antenna tower by an additional 20 feet and install a new 15 foot lighting rod on top of it. There are hundreds of homes and condos nearby that would be adversely affected. We have children growing up in the neighborhood and we do not want to be bombarded by additional radiation.

Response to Comment 1: The commenter's concerns regarding increasing the height of the existing tower at Site SGH are noted and will be reviewed by the LA-RICS Joint Powers Authority Board of Directors prior to their consideration of the project, and made a part of the administrative record for this project. The management of radiofrequency exposures at the site would be conducted, as noted in the Draft EIR at Section 5.3 (page 5-8), in accordance with applicable regulations and guidelines.

Comment 2: As homeowners, all of us signed disclosures acknowledging the existence of the radio tower. What was never disclosed to any of us was that the radio tower could grow by 35 feet. That is the size of a school bus planted vertically on top of the antenna. That is a big deal. That is unacceptable and that is something you would not allow in your backyard. From my understanding, it would be illegal to build the antenna after the homes were already here, so I do not see how increasing the size and scope of the existing antenna is legal.

Response to Comment 2: The Authority's proposal for Site SGH is to extend the existing 160-foot lattice tower by 20 feet to 180 feet. A 15-foot lightning rod would be installed on the top of the extended tower. The tower would not be extended by 35 feet. The commenter's opposition to the proposed project at Site SGH is noted. The commenter's comment regarding the legality of building antenna is not an environmental issue that requires a response pursuant to CEQA Guidelines section 15088 and is outside the scope of the EIR.

Comment 3: If every home went down in value by \$25,000 as a result of the antenna tower's giant growth, we are talking about tens of millions of dollars of damages to the local real estate market. Not only does increasing the size of the antenna impact home values, it does additional damage to property values because now homeowners would have to disclose that the antenna was increased in size by 35 feet and it could happen again in the future. The precedent of growing the antenna by leaps and bounds at any time would further depreciate property values for hundreds of property owners.

Response to Comment 3: CEQA does not require social or economic impacts to be treated as significant effects on the environment (CEQA Guidelines §§ 15064(e), 15382). Additionally, there is no evidence that the proposed project would have any impact on property values near Site SGH, or that any potential change in property value would result in a physical impact on the environment.

Comment 4: Notice of the initiative was sent out to the neighbors; however, nowhere in the notice does it mention that the antenna will grow by 35 feet. That's disingenuous and obfuscating the truth. It is also inappropriate and manipulative to hold six public meetings regarding the impact of the antenna and not one of these public meetings held by the LA-RICS is taking place near the proposed site, where the health of the families will be affected. We would literally have to get on a boat to get to the February 1st meeting on Catalina Island.

Response to Comment 4: As lead agency and proponent of the project, the Authority has and will continue to perform outreach with the public regarding LMR project implementation. The Authority is fully accountable for the decisions being made regarding the implementation of LMR Project. The Authority's Board will consider the Draft EIR and Final EIR, inclusive of comments received, prior to making a decision on the proposed project. The LMR system would provide emergency responders with an improved communications system that will enable efficient and coordinated response to incidents and emergencies that is currently not possible in Los Angeles County. The improved communications could reduce response times and ultimately save lives. The LMR system would support faster, better-coordinated, large-scale multi-agency response to emergencies such as terrorist attacks, earthquakes, civil disturbance, wildfire or other disasters, improving overall system capacity and coverage for first and second responders region-wide. The LMR project would enhance safety and emergency response for 10 million Los Angeles County residents and the over 40 million Los Angeles County tourists.

The Draft EIR fully discloses the project and potential project impacts based on the best available information at the time it was released for public review. The notice identified in the comment was likely the Notice of Availability (NOA). The NOA was provided to you in accordance with Section 21092 of the California Public Resources Code. The NOA included: Project Description and Location; Significant Anticipated Environmental Effects; Hazardous Waste Sites; Document Availability (including both the Website for electronic review and 16 locations for where hard copies of the document could be reviewed) and Public Review and Meetings (which included location and time for 6 public hearings and both e-mail and physical address for submitting public comments). A total of six public meetings were held for the Draft EIR: one in each of the five districts of the Los Angeles County Board of Supervisors, plus one in Avalon on Santa Catalina Island. The nearest location of a public meeting for the Draft EIR to the site in Signal Hill was approximately 12 miles from the site at Peck Park Community Center Auditorium at 560 N. Western Ave. in San Pedro. The project spans all of the Los Angeles County area and the Authority selected locations that would provide opportunities for people all across the county to attend a public meeting if desired. The format and information provided at each of the public meetings was the same.

The Draft EIR included all pertinent details of the proposed project at Site SGH. As described in the Draft EIR on page 2-32, Site SGH is an "Existing 160' tower to be extended to 180'". As described in more detail beginning at page 4-1487, Site SGH describes installation of up to 40 whip and up to 9 microwave antennas on existing 160 foot lattice tower to be extended to 180 feet tall, with additional up to 15 foot lightning rod.

Comment 5: If this proposal passes, I will personally send out thousands of postcards to the nearby residents to hold the decision makers accountable for endangering our health and damaging our property values.

Response to Comment 5. The commenter’s concerns are noted.

Comment Letter Public 55

To: DraftEIR Hotline
Subject: LMR Site in 409 Walker Drive, Beverly Hills, Ca. 90210

- 1 | We hereby oppose to installation of additional Towers at this location due to known health risk hazard to residents who live close to such sites .
- 2 | There are already TWO (2) communication towers at this address and adding another, will surely intensify the risk and hazard to health by factor of 75%. Why not share and use the existing towers?
- 3 | The studies made by various countries and independent institution show very high health risk to close residence even at radiations of 100 times less that what is being proposed. (please refer to attachments).
- 4 | Who and which organization is going to accept liability and be responsible for the short and long term well being of the immediate residents? Have any one of the studies presented in this (EIR) been done by independent contractors with no connection what so ever to beneficiaries?
- 5 | Has there been any study to evaluate the effect of these towers on the value of the properties close to this specific site?? Who or which organization is going to compensate the property owners for such losses.

Awaiting for your formal response.

Respectfully,

Abe Yedidsion
1890 Loma Vista Drive
Beverly Hills, Ca 90210

Responses to Comment Letter Public 55

The Authority appreciates your comments on the Draft EIR dated February 25, 2016. The comments will be provided to the LA-RICS Authority Board when the EIR is considered for certification.

Responses to the comments are provided below.

Comment 1: We hereby oppose to installation of additional Towers at this location due to known health risk hazard to residents who live close to such sites.

Response to Comment 1: The Authority acknowledges the commenter's opposition to the installation of additional towers at the proposed Walker Drive site (WAD). As the Draft EIR explains on page 4-1874, the proposed project would utilize an existing monopole at site WAD, which would be increased from its current height of 120 feet to 140 feet. No new tower(s) is proposed for this location.

Comment 2: There are already TWO (2) communication towers at this address and adding another, will surely intensify the risk and hazard to health by factor of 75%. Why not share and use the existing towers?

Response to Comment 2: The commenter is correct regarding the number of existing towers (a lattice tower and monopole currently exist at Site WAD). The Draft EIR includes a site-specific analysis of the potential for exposure to hazardous conditions at Site WAD on pages 4-1895 through 4-1898. The Draft EIR also includes a discussion of Radio Frequency (RF) exposures in Section 5.3. As explained there, RF exposures from operation of each site are not permitted to exceed the maximum permissible exposure (MPE) standards established by the FCC as set forth in 47 CFR Sections 1.1307 and 1.1310, and expressed in FCC OET Bulletin 65. To comply with this legal standard at each operational site, the Authority will require its contractor to perform an RF emission safety study prior to construction that will model the RF emission level from all equipment on site and demonstrate that it complies with the FCC guidelines and regulations on MPE for the General Public / Uncontrolled and for the Occupational / Controlled groups per the FCC's OET Bulletin 65. After installation of the proposed Project site equipment and prior to operation, the contractor will conduct field measurements to confirm RF emission levels are in compliance and will identify, resolve, and correct any noncompliance (including posting appropriate signage) until compliance can be demonstrated. Radiofrequency exposures at proposed LMR project sites would be managed in accordance with applicable regulations contained in OET Bulletin 65.

There is no evidence that the proposed project would intensify health hazards. Additionally, as discussed above, the proposed project would use an existing tower at Site WAD, as the commenter suggests.

Comment 3: The studies made by various countries and independent institution show very high health risk to close residence even at radiations of 100 times less that what is being proposed. (please refer to attachments.)

Response to Comment 3: The Authority has reviewed the referenced six web sites. The information and related references do not contain any evidence that would compel the Authority to revise the discussion of radio frequency emissions in the Draft EIR. The Authority will continue to follow the underlying guidance provided by the FCC (i.e., FCC OET Bulletin 65) as the accepted and authoritative guidance used for management of RF-EME, as documented in the Draft EIR. No information applicable to the analysis in the Draft EIR that would result in a change to the conclusions of the Draft EIR was identified.

Comment 4: Who and which organization is going to accept liability and be responsible for the short and long term wellbeing of the immediate residents? Have any one of the studies presented in this (EIR) been done by independent contractors with no connection what so ever to beneficiaries?

Response to Comment 4: The EIR, and all reports prepared in connection with the EIR, reflect the independent judgment of the Authority and have been prepared in compliance with CEQA.

Comment 5: Has there been any study to evaluate the effect of these towers on the value of the properties close to this specific site?? Who or which organization is going to compensate the property owners for such losses?

Response to Comment 5: CEQA does not require social or economic impacts to be treated as significant effects on the environment. (CEQA Guidelines §§ 15064(e), 15382.) Additionally, there is no evidence that the proposed project would have any impact on property values near Site WAD, or that any potential change in property value would result in a physical impact on the environment.

4.0 Revisions to the Draft EIR

This chapter presents specific changes to the Draft EIR made in response to written comments received from the public and/or reviewing agencies. Text in blue underline (i.e., blue underline) represents language that has been added to the EIR; text in red strikethrough (i.e., ~~red strikethrough~~) has been deleted from the EIR.

Page ES-36; Table ES-2: Environmental Impacts and Mitigation Measures

The text of BIO MM 1, BIO MM 2, BIO MM 5, BIO MM12, BIO MM 14, CUL MM 2, CUL MM 5 through CUL MM 7, GEO MM 1, HAZ MM 1 through HAZ MM 3, NOI MM 2, TRANS MM 1, TRANS MM 2, and UTL MM 1 in Table ES-2 is hereby amended as follows:

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
Biological Resources	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	BIO MM 1 Conservation <u>Mitigation</u> . Monitoring and Reporting Plan: Prior to construction, the Authority shall develop and implement or require the system contractor to develop and implement a mitigation monitoring and reporting plan (MMRP) for the proposed Project. The MMRP would serve to organize environmental compliance requirements identified in best management practices, mitigation measures, permit requirements, real property agreement conditions, <u>coordination with the land management agency(s)</u> , and other applicable sources. The MMRP shall contain an organization chart and communication plan for environmental compliance as it relates to the proposed Project.	AGH, AJT, BJM, BUR, BUR1, BUR2, BUR3, CPK, DPK, ENC1, ENT, FRP, FTP, GMT, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACF072, LACFCP08, LACFCP09, LACFCP11, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PHN, PMT, PWT, RIH, SDW, SGH, SPN, SUN, SUN2, TMT, TOP, TPK, TWR, VPK, WAD, WMP, WTR, ZHQ
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	<p>BIO MM 2 Worker Environmental Awareness Program: Prior to construction, the Authority shall develop and implement or require the system contractor to develop and implement, <u>including coordination with the respective land management agency</u>, a Worker Environmental Awareness Program (WEAP) for the proposed Project. This mitigation measure would serve to institute and formalize an education program to increase awareness of environmental resources and measures and rules that are in place to help minimize impacts to those resources.</p> <p>a) A WEAP shall be developed and shall be required for all construction employees prior to placement of Project equipment, construction, or any ground-disturbing activities at the proposed Project site. Training of additional workers, contractors, and visitors shall be provided, as needed.</p> <p>b) The WEAP is to inform on-site workers of the possible presence of special status species, the measures to be taken to protect these species, and the importance of minimizing impacts to the natural environment through the protection of native vegetation, adhering to required buffers and protection zones, staying on existing roads, and implementing best management practices, that include containment of any spills, disposal of trash, and management of runoff and sediment transport.</p> <p>c) To assure long-term implementation of mitigation measures, an information sheet listing potential sensitive species and what to do if any are encountered shall be prepared, distributed to workers, and posted on site.</p>	AGH, AJT, BJM, BUR, BUR1, BUR2, BUR3, CPK, DPK, ENC1, ENT, FRP, FTP, GMT, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACF072, LACFCP08, LACFCP09, LACFCP11, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PHN, PMT, PWT, RIH, SDW, SGH, SPN, SUN, SUN2, TMT, TOP, TPK, TWR, VPK, WAD, WMP, WTR, ZHQ

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	<p>BIO MM 5 Hazardous Materials Management:</p> <ul style="list-style-type: none"> a) A toxic substance management and spill response plan shall be prepared by the contractor for review and approval by the Authority. c) Hazardous materials shall be contained; spills shall be prevented; and any spills at the Project site or along access roads shall be contained and cleaned up immediately. d) All construction vehicles are required to carry at least one spill response kit. d) Any spills shall be accounted for in reports prepared by the biological/environmental monitor. 	BJM, BUR, BUR1, BUR2, BUR3, DPK, FRP, GMT, JOP, JPK, JPK2, LACFCP09, LACFCP11, LPC, MMC, MML, MTL2, OAT, PMT, SUN, SUN2, TMT, TPK, TWR, VPK, WMP, WTR
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	<p>BIO MM 12 Coastal California Gnatcatcher Protection:</p> <ul style="list-style-type: none"> a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of coastal California gnatcatchers in the area and the importance of maintaining coastal sage scrub vegetation. b) As part of BIO MM 9 Protect Native Vegetation and Common Wildlife, disturbance to native perennial vegetation, especially coastal sage scrub vegetation (e.g., California sagebrush, sage, laurel sumac, and California buckwheat), would be minimized. Surveys shall be conducted by a qualified biologist for the presence of coastal sage scrub perennial vegetation, and plants not identified for removal within or near the construction zone shall be marked for protection. c) As part of BIO MM 3 Biological Compliance Reporting, the environmental monitor shall verify at least once a week during active construction and upon completion of construction activities that habitat protection measures have been followed. d) At proposed Project sites H-17A, PHN, and RIH, a higher level of protection is required to ensure that gnatcatchers are not present when construction activities would occur and adverse effects would be avoided. For proposed Project sites that include known or suspected gnatcatcher nesting or otherwise include suitable nesting habitat where the bird is expected to be present, the following mitigation measure is to ensure the highest level of protection to the bird. All the above measures (BIO MM 1 through BIO MM 3, and BIO MM 8 through BIO MM 12) apply as well as BIO MM 13 Coastal California Gnatcatcher Breeding Season Restrictions 	H-17A, LEPS, PHN, PWT, RIH, SDW, VPK
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	<p>BIO MM 14 Coastal California Gnatcatcher Protocol Surveys</p> <ul style="list-style-type: none"> a) To determine if coastal California gnatcatchers are present within 500 feet of specified Project sites and if breeding season restrictions would be required, surveys following the most recent version of the USFWS Coastal California Gnatcatcher Presence/Absence Survey Protocol (current revision issued by USFWS Carlsbad Office 1997) shall be conducted prior to initiating 	LEPS, PWT

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		<p>any construction activities that may result in ground disturbance or loud noises during the gnatcatcher breeding season (February 15 through August 30). This protocol requires call-playback surveys by a permitted biologist, conducting a minimum of six surveys at least one week apart between March 15 and June 30 (additional survey requirements are presented in the protocol).</p> <p>b) If adult, nesting, or fledgling gnatcatchers are detected even once within 500 feet of the proposed Project site, or if surveys are not completed in compliance with the protocol, BIO MM 13 Coastal California Gnatcatcher Breeding Season Restrictions shall apply to the site, precluding any construction activities that include loud noises (e.g., trenching, drilling, concrete cutting), the use of large equipment (e.g., booms, cranes, drills, concrete pouring), or the removal of perennial vegetation between February 15 and August 30.</p> <p>c) If no adult, nesting, or fledgling gnatcatchers are detected within 500 feet of the proposed Project site, construction activities may commence beginning July 1 through February 14.</p> <p>d) Survey requirements shall be applied each year that construction activities take place at the Project site.</p>	
Cultural Resources	CUL-1: Significant and Unavoidable	<p>CUL MM 2: Archaeological Monitoring – Historic-Age Resources</p> <p>At proposed Project LMR sites with known or potential presence of historic-age archaeological material (artifacts and/or features) within the defined APEs, a qualified archaeological monitor shall be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations. Monitors will also be responsible for restricting access by construction personnel to any identified archaeological resources as noted in this EIR section or Chapter 4. The direct and indirect APEs are defined at the beginning of this EIR section.</p> <p>The archaeological monitor will, at a minimum, have a B.A. in anthropology or related field or will have successfully completed an archaeological field methods school. The monitor will work under the supervision of an archaeologist who meets the Secretary of the Interior’s Professional Qualifications Standards (Project Archaeologist). The standards are published in CFR 36 Part 61 and found on the National Park Service website at http://www.nps.gov/history/local-law/arch_stnds_9.htm.</p>	H-69B, LACFCP08, LACFCP09, LPC
Cultural Resources	CUL-1: Significant and Unavoidable	<p>CUL MM 5: Architectural Resources Protection and Camouflage</p> <p>Attachment of Equipment to Historic Buildings and Structures</p>	H-69B, LACFCP08, LACFCP09, LPC

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		<p>Exterior antennas, wiring, towers, and other LMR equipment that are proposed to be attached to buildings, structures, objects, and other features that are listed, eligible, or potentially eligible for inclusion in the NRHP or CRHR, or are locally designated landmarks under CEQA may cause an adverse direct and/or visual effect. Mitigation measures to offset potential effects would include review of the Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards) and the Secretary of the Interior's Guidelines for the Treatment of Historic Properties (Guidelines), which can be found on the National Park Service's website at http://www.nps.gov/tps/standards.htm and http://www.nps.gov/tps/standards/four-treatments/standguide/index.htm respectively. The Standards are a series of practices for maintaining, repairing, and replacing historic materials, as well as designing new additions or making alterations. The Guidelines assist in applying the complementary Standards to a specific property. Together, they provide a framework and guidance for decision-making about work or changes to a historical resource.</p> <p>For historic buildings or structures where communications-related equipment will be attached, the following preservation practices would shall be employed, as applicable, to ensure that impacts are less than ± significant:</p> <ol style="list-style-type: none"> 1) When running new exterior wiring to a historic building, existing entry points shall be utilized. If a new entry point is required, the entry shall be placed at the rear of the building or in an unobtrusive area on the side of the building i.e., an area where it will be hidden by an existing architectural feature. that [insert language characterizing what it means to be "unobtrusive" for purposes of this measure to ensure no impact]. 2) When wireless nodes, antennas, microwave or satellite dishes, etc. are installed on historic buildings, existing mounting points shall be utilized. For new mounts, nonpenetrating mounts shall be used. 3) Equipment shall be placed where it does not detract from the building's overall appearance; roof-mounted equipment shall be placed where it will not be visible from accessible locations at grade. Adequate structural support for the new equipment and design shall be ensured, and a system that minimizes the number of cutouts or holes in structural members and historic material shall be installed. Existing building features shall be used to conceal equipment. 4) New equipment installations on a historic building that will be visible shall be painted or color-matched to the surrounding building materials. Concealment with color-matched FRP (fiberglass reinforced plastic) shrouds (boxes) is acceptable. 5) Any supports or brackets for new equipment shall be color-matched to the existing materials. 	

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		<p>6) The installation of exterior wiring shall be minimized; where unavoidable, the wiring will be color-matched to the original building material to reduce the visual impact.</p> <p>7) Equipment shall not be directly anchored into stone or brick; mortar joints for anchoring the equipment will be utilized.</p> <p>8) Rust-resistant mounts to prevent staining of the building materials shall be used.</p> <p>9) Reversible mounting techniques shall be used to avoid damage to building materials.</p> <p>10) Installation of underground cable or conduit at a historical resource shall be undertaken in a manner that considers the stability of the historic building, including limiting any new excavations adjacent to historic foundations that could undermine the structural stability of the building and avoiding landscape or other changes that could alter drainage patterns and cause water-related damage to the building.</p> <p>11) New interior wiring shall utilize space in existing chases, closets, or shafts.</p> <p>12) Equipment and systems shall be installed to cause the least alteration possible to the building's floor plan and the least damage to the historic building material.</p> <p>13) Vertical runs of conduit and cables shall be placed in closets, service rooms, and wall cavities to create the least intrusion into the historic fabric of the building and to avoid major intervention into the wall and floor systems.</p> <p>Architectural Camouflage</p> <p>All new towers and monopoles or a proposed increase in the height of existing towers and monopoles may that would cause adverse visual impacts on historical resources that are adjacent or within the viewshed shall be camouflaged. All camouflage implemented for the proposed Project designs would shall be sympathetic to the existing landscape and visually compatible with the surrounding architecture, and acceptable to the property owner (http://www.generalcode.com/codification/sample-legislation/cell-towers) and/or host community in accordance with applicable municipal codes (http://clkrep.lacity.org/onlinedocs/2009/09-2645_RPT_ATT_06-07-11.pdf). Tower disguises may include, but are not limited to, painting and various types of concealments, including (e.g., clock/water towers, flag/light poles, silos, trees, and unique site-specific designs). Such measures must also be consistent with the Secretary of the Interior's Standards/Guidelines for the Treatment of Historic Properties (see Attachment of Equipment discussion above). As noted within the required mitigation measures for some Project sites, the painting of towers of certain heights is controlled by FAA Advisory Circulars 47 CFR 5-17.21-17.58 to prevent aviation hazards; therefore,</p>	

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		painting would not, be a feasible mitigation at those sites.	
Cultural Resources	CUL-3: Less than Significant with Mitigation	<p>CUL MM 6: Potential Paleontological Resources Plan</p> <p>Proposed Project sites with the potential for paleontological resources would require preparation of a paleontological monitoring plan and a qualified paleontological monitor to be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations.</p> <p>In the event that a previously unidentified paleontological resource is uncovered, the following actions shall be taken:</p> <ol style="list-style-type: none"> 1) All ground disturbing work within 165 feet (50 meters) of the discovery shall be halted. A qualified paleontologist shall divert or direct construction activities in the area of an exposed fossil in order to facilitate evaluation and, if necessary, salvage of the exposed fossil. 2) The paleontologist shall inspect the discovery and determine whether further investigation is required. If the discovery can be avoided and no further impacts will occur, no further effort shall be required. 3) If the resource cannot be avoided and may be subject to further impact, the paleontologist shall evaluate the resource and determine whether it is "unique" under CEQA, Appendix G, Part V. If the resource is determined not to be unique, work may commence in the area. 4) If the resource is determined to be a unique paleontological resource, work shall remain halted, and the paleontologist shall consult with LA-RICS Authority staff regarding methods to ensure that no substantial adverse change would occur to the significance of the resource. Preservation in place (i.e., avoidance) is the preferred method of ensuring that no substantial adverse impacts occur to the resource and shall be required unless other equally effective methods are available. Other methods include ensuring that the fossils are scientifically recovered, prepared, identified, catalogued, and analyzed according to current professional standards. 5) Due to the small nature of some fossils, a fine mesh screen may be used at the discretion of the paleontologist at project-specific inspections to collect matrix samples for processing. 6) Provisions for preparation and identification of any fossils collected shall be made before donation to a suitable repository. 7) All recovered fossils shall be curated at a local accredited and permanent scientific institution 	AGH, AJT, ASD, CPK, ENT, GRM, H-17A, H-69B, LACFCP08, LARICSHQ, LEPS, SPN, OAT, PASPD01, PDC, PHN, PWT, RIH, SDW, SGH, SIM, TOP, WS1, ZHQ

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		<p>according to Society of Vertebrate Paleontology standard guidelines standards. Work may commence upon completion of the appropriate treatment and the approval from the Authority.</p> <p><u>A Paleontological Resources Monitoring Plan shall be developed and approved prior to construction to guide the activities of monitors during ground-disturbing activities. The plan would include, but not be limited to, a description of the project location, the regulatory framework, site-specific impact mitigation requirements designed to reduce impacts to less than significant, specific locations and construction activities requiring monitoring and/or spot checking, procedures to follow for construction monitoring and fossil discovery and recovery, and a repository agreement with the Natural History Museum of Los Angeles County or other accredited repository. Mitigation measures that may be implemented to ensure that impacts to paleontological resources would be reduced to less than significant may include but are not limited to the following:</u></p> <p>a) <u>Worker awareness training on paleontological resources presented to construction personnel prior to the start of construction. The training should include at minimum, the following:</u></p> <ul style="list-style-type: none"> • <u>The types of fossils that could occur at the project site</u> • <u>The procedures that should be taken in the event of a fossil discovery</u> • <u>Laws protecting paleontological resources</u> • <u>Penalties for destroying or removing paleontological resources</u> <p>b) <u>Paleontological monitoring during ground disturbance at all sites with moderate/unknown or high paleontological potential</u></p> <p>c) <u>Salvage of significant fossil resources</u></p> <p>d) <u>Screenwashing of matrix samples for microfossils</u></p> <p>e) <u>Laboratory preparation of recovered fossils to the point of identification and curation</u></p> <p>f) <u>Identification of recovered fossils to the lowest possible taxonomic order</u></p> <p>g) <u>Curation of significant fossils at the Natural History Museum of Los Angeles County or other accredited repository</u></p> <p>h) <u>Preparation of a final monitoring report that includes at a minimum the dates of field work, results of monitoring, fossil analyses, significance evaluation, conclusions, locality forms, and an itemized list of specimens</u></p> <p><u>The Plan shall be submitted to the Authority for review and approval and finalized at least 14 days prior to the start of construction.</u></p>	

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
Cultural Resources	<p><u>CUL-3:Less than Significant with Mitigation</u></p>	<p><u>CUL MM 7: Paleontological Resources Monitoring</u></p> <p><u>Paleontological monitoring shall be conducted by a qualified paleontological monitor who has demonstrated experience in the collection and salvage of fossil materials. An undergraduate degree in geology or paleontology is preferable but is less important than documented experience performing paleontological monitoring and mitigation. The monitor will work under the supervision of a Principal Paleontologist.</u></p> <p><u>The qualified professional paleontological monitor shall be present during ground disturbance at all sites with moderate/unknown or high paleontological potential and as specified in the Paleontological Resources Monitoring Plan prepared in accordance with CUL MM 6. The monitor shall be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations. Any sites that require monitoring or mitigation within the Angeles National Forest will require a qualified paleontologist to have a U.S. Department of Agriculture Forest Service-Temporary Special-Use Permit for paleontology. Based on the specific site conditions observed during monitoring (type of sediment impacted, previous disturbances, nature of site conditions), the Principal Paleontologist may reduce or increase monitoring efforts in consultation with the Agency.</u></p> <p><u>In the event that a previously unidentified paleontological resource is uncovered, the following actions shall be taken:</u></p> <ol style="list-style-type: none"> <u>1) All ground-disturbing work within 50 feet of the discovery shall be halted. A qualified paleontologist shall divert or direct construction activities in the area of an exposed fossil in order to facilitate evaluation and, if necessary, salvage of the exposed fossil. Work shall not resume in the discovery area until authorized by the qualified paleontologist.</u> <u>2) The paleontologist shall inspect the discovery and determine whether further investigation is required. If the discovery can be avoided and no further impacts will occur, no further effort shall be required.</u> <u>3) If the resource cannot be avoided and may be subject to further impact, the paleontologist shall evaluate the resource and determine whether it is “unique” under CEQA, Appendix G, Part V. If the resource is determined not to be unique, work may commence in the area.</u> <u>4) If the resource is determined to be a unique paleontological resource, work shall remain halted, and the paleontologist shall consult with LA-RICS Authority staff regarding methods to ensure that no substantial adverse change would occur to the significance of</u> 	<p><u>AGH, AJT, ASD, CPK, ENT, GRM, H-17A, H-69B, LACFCP08, LARICSHQ, LEPS, SPN, OAT, PASPD01, PDC, PHN, PWT, RIH, SDW, SGH, SIM, TOP, WS1, ZHQ</u></p>

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		<p><u>the resource. Preservation in place (i.e., avoidance) is the preferred method of ensuring that no substantial adverse impacts occur to the resource and shall be required unless other equally effective methods are available. Other methods include ensuring that the fossils are scientifically recovered, prepared, identified, catalogued, and analyzed according to current professional standards.</u></p> <p>5) <u>Due to the small nature of some fossils, a fine mesh screen may be used at the discretion of the paleontologist to screen matrix test samples on site during monitoring. Additionally, bulk matrix samples may be collected and transported to a laboratory facility for processing.</u></p> <p>6) <u>Provisions for preparation and identification of any fossils collected shall be made before donation to a suitable repository.</u></p> <p>7) <u>All recovered fossils shall be curated at the Natural History Museum of Los Angeles County or a local accredited and permanent scientific institution according to Society of Vertebrate Paleontology standard guidelines standards. Work may commence upon completion of the appropriate treatment and the approval from the Authority.</u></p>	
Geology and Soils	GEO-1: Less than Significant with Mitigation	<p>GEO MM 1 : Prior to or concurrently with submittal of the application for a building permit for any portion of the proposed Project site, the project sponsor <u>Contractor</u> shall:</p> <p>1) Submit to the appropriate municipality (County of Los Angeles, County of San Bernardino, or city having jurisdiction over the site) a site-specific, design-level geotechnical report reviewed and approved by both an engineering geologist licensed in the State of California and a civil engineer licensed in the State of California. The report shall comply with all applicable state and local code requirements and shall:</p> <ul style="list-style-type: none"> a. include an analysis of the expected ground motions at the site from known active faults using accepted methodologies b. include an analysis of all potential geologic hazards including but not limited to, landslides, mudslides, liquefaction potential, identification of active faults, land spreading, and land subsidence. The report shall be prepared in accordance with and meet the requirements of the County of Los Angeles Department of Public Works (LACDPW) Manual for Preparation of Geotechnical Reports, July 1, 2013. c. Specify liquefaction mitigations that shall use proven methods generally accepted by professional engineers to reduce the risk of liquefaction to a less than significant level such as: <ul style="list-style-type: none"> i. subsurface soil improvement 	AGH, ASD, BJM, BUR, BUR1, BUR2, BUR3, CPK, DPK, ENC1, ENT, FRP, FTP, GMT, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACF072, LACFCP08, LACFCP09, LACFCP11, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PHN, PMT, PWT, RIH, SDW, SGH, SPN, SUN, SUN2, TMT, TOP, TPk, TWR, VPK, WAD, WMP, WTR, ZHQ

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		<ul style="list-style-type: none"> ii. deep foundations extending below the liquefiable layers iii. structural slabs designed to span across areas of non-support iv. soil cover sufficiently thick over liquefaction soil to bridge liquefaction zones v. dynamic compaction vi. compaction grouting vii. jet grouting viii. mitigation for liquefaction hazards suggested in the California Geological Survey’s (CGS) Geology Guidelines for Evaluating and Mitigating Seismic Hazards (CGS Special Publication 117, 1997) including edge containment structures (berms, dikes, sea walls, retaining structures, compacted soil zones), removal or treatment of liquefiable soils, modification of site geometry, lowering the groundwater table, in-situ ground densification, deep foundations, reinforced shallow foundations, and structural design that can withstand predicated displacements d. Determine structural design requirements as prescribed by the most current version of the California Building Code, including applicable local county and local city amendments, to ensure that structures can withstand ground accelerations expected from known active faults e. Determine the final design parameters for walls, foundations, foundation slabs, utilities, roadways, parking lots, sidewalks, and other surrounding improvements <p>2) Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigations in the site specific investigations.</p> <p>3) The project structural engineer shall review the site specific investigations, provide any additional necessary mitigation to meet Building Code requirements, and incorporate all applicable mitigations from the investigation in the structural design plans and shall ensure that all structural plans for the project meet current Building Code requirements.</p> <p>4) Site construction shall not begin until:</p> <ul style="list-style-type: none"> a. The registered geotechnical engineer representing the applicable permitting municipality for the project site (county or city), or third party registered engineer retained to review the geotechnical reports, has reviewed each site specific geotechnical investigation, approved the final report, and required compliance with geotechnical mitigations contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure and other relevant construction permits; and

		<p>b. The applicable permitting municipality for the project site (county or city) has reviewed all project plans for grading, foundations, structural, infrastructure and other relevant construction permits to ensure compliance with the applicable geotechnical investigation and other applicable Code requirements</p>	
Hazards and Hazardous Materials	HAZ-4: Less than Significant with Mitigation	<p>HAZ MM 1: Prior to construction activity, the construction contractor must shall prepare a Phase I Environmental Site Assessment meeting the standards outlined in the American Society for Testing Materials (ASTM), Practice for Limited Environmental Due Diligence: Transaction Screen Process E 1528.</p> <ul style="list-style-type: none"> Phase I documents shall be reviewed to determine if the lateral and vertical extent of impacted soil and/or groundwater will be encountered by proposed construction activities. If proposed construction activities will not encounter impacted soil or groundwater based on the documented vertical and lateral extent, no further action will be required. If it is determined that the construction footprint will encounter impacted soils or encounter impacted groundwater, the contractor shall prepare a site-specific Health and Safety Plan that meets the requirements of 29 CFR 1910 for worker safety. If the lateral and vertical extent or the nature of the impacted soil cannot be determined from available documents, a Phase II investigation shall be completed to determine if the soils and/or groundwater that may be encountered during construction (within the footprint any excavation) are impacted. The Phase II investigation shall also determine the nature of contaminations that may be encountered. The Phase II report should also address disposal alternatives and procedures for any impacted soil that may be encountered or groundwater which may need to be removed. 	PDC
Hazards and Hazardous Materials	HAZ-5: Less than Significant with Mitigation	<p>HAZ MM 2: Prior to issuance of building permits, the Contractor shall submit Form 7460-1 (Notice of Proposed Construction or Alteration) to the FAA, in the form and manner prescribed in 14 CFR Part 77. The Contractor shall also provide documentation to the appropriate city or county planning agency demonstrating that the FAA has issued a “Determination of No Hazard to Air Navigation”</p> <p>The FAA regulates objects affecting navigable airspace according to 14 CFR Part 77. The federal and state Departments of Transportation also require the proponent to submit FAA Form 7460-1, Notice of Proposed Construction or Alteration. According to 14 CFR Part 77, notification allows the FAA to identify potential aeronautical hazards in advance, thus preventing or minimizing any adverse impacts on the safe and efficient use of navigable airspace.</p>	SDW

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		Per 14 CFR Part 77, notification requirements include sending one executed form set (four copies) of FAA Form 7460–1, Notice of Proposed Construction or Alteration, to the Manager, Air Traffic Division, of the FAA Regional Office having jurisdiction over the area within which the construction or alteration will be located. The notice required must be submitted at least 45 days before the earlier of the following dates: (1) the date the proposed construction or alteration is to begin, or (2) the date an application for a construction permit is to be filed.	
Hazards and Hazardous Materials	HAZ-8: Less than Significant with Mitigation	HAZ MM 3: Fire Management Plan. Prior to construction activity, the Authority must shall work with the agency responsible for fire protection in the jurisdiction where the site is located to develop and implement a fire management plan for use during construction activity. The plan will identify project locations, project descriptions, anticipated construction activities, limitation of activities during periods of elevated fire risk (e.g., “red flag” days), level of suppression equipment required on site, training requirements, and points of contact. DPK	Dakin Peak	Avalon Canyon Rd. Divide Road	Santa Catalina Island	90704	Los Angeles County
SGH	Signal Hill	2321 Stanley Ave.	Signal Hill	90755	Signal Hill Long Beach

Page 2-28; Lighting

The text in this section is hereby amended as follows:

The sites would have security lighting. New equipment shelters would generally require exterior security lighting equivalent to a 100-watt light bulb. [Security lighting would be motion-sensing in rural locations and continuous in urban locations.](#) Where required by the FAA, new antenna support structures would be lighted and/or marked consistent with FAA Advisory Circular, AC 70/7460-1L Obstruction Marking and Lighting, for visibility to aircraft, as applicable, based on proposed structure height and location. FAA lighting is not generally required for towers less than 200 feet in height above ground level; however, lighting for air navigation safety may be required at specific locations for shorter structures, depending

on site conditions. If tower obstruction lighting is installed on a tower, it may include red or white light-emitting diode (LED) lamps or strobe lights that are steady and/or flashing.

Page 3-16; Section 3.1.1.3

Section 3.1.1.3, addressing scenic corridors, is hereby amended to add the following text after the City of Malibu Scenic Roads text and before the discussion on Santa Monica Mountains North Plan Scenic Routes:

City of Signal Hill Scenic Route

The SGH site is located on a hilltop within a gated residential community, approximately 200 feet north of Skyline Drive. The 2009 City of Signal Hill General Plan Circulation Element identifies Skyline Drive as a scenic route (City of Signal Hill 2009). The plan notes that ‘The entire route provides views of urban Southern California, the ocean, and the downtown Long Beach skyline.’ These views are on the south side of the scenic route. Site SGH is entirely surrounded by residences, as well as a similar site with a large lattice tower immediately adjacent to the south, and an oil drilling rig directly east of and adjacent to the other telecommunication tower.

Page 3-17; Section 3.1.1.3

Section 3.1.1.3, addressing Trans-Catalina Trail is hereby amended to delete the following text:

~~Although it has no official scenic designation,~~ The 37-mile Trans-Catalina trail, completed in 2009, traverses Catalina Island in its entirety and offers “spectacular views across the 43,000-acre Nature Preserve of the Catalina Island Conservancy” (Catalina Island Conservancy 2014). Sites BJM, DPK, and TWR are adjacent to this trail.

Page 3-17; Section 3.1.1.4

Section 3.1.1.4, addressing State and regional parks as well as open space and recreation areas, is hereby amended to add the following text after the subheading and before Topanga State Park:

Catalina Island Conservancy Open Space Easement

A 50-year Open Space Easement Agreement was signed between the County of Los Angeles and the Santa Catalina Island Company in 1974 to preserve the natural character of the island (City of Santa Catalina Island 1983). Land uses defined as Open Space/Directed Recreation and Conservation/Primitive Recreation together comprise 96 percent of Catalina Island. Although no maps were readily available identifying or designating this open space at the time of this analysis, it is assumed that sites BJM, DPK, and TWR are located within this open space.

Page 3-33; Section 3.1.4.1

The project analysis for CEQA Question AES-2 within Section 3.1.4.1 is hereby revised as follows:

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

No scenic resources were identified within any Project site boundary. The following Project sites are located adjacent to scenic highways as discussed in Section 3.1.1.3:

ENC1	ENT	H-69B	JOP	LACF072
LACFCP08	LEPS	PWT	<u>SGH</u>	TMT
WS1	ZHQ			

Operation Impacts

The SGH site is located approximately 200 feet north of Skyline Drive, designated as scenic by the City of Signal Hill for providing ‘views of Southern California, the ocean, and the downtown Long Beach Skyline.’ However, these views are to the south of the road; the site is on the opposite (north) side of the road. Therefore, the site would not interfere with those views or affect the road’s scenic designation. In addition, views to the south from Skyline Drive adjacent to the site are blocked by existing residential structures. Operational impacts for all other sites would be as described under AES-1 (effects on a scenic vista). Operational impacts on scenic resources would be less than significant.

Page 3-56; Section 3.2.2.3

The local regulatory setting for the Antelope Valley Air Quality Management District (AVAQMD) is hereby revised to add the following:

AVAQMD

AVAQMD Regulation II, Rule 219 (2011) – Federal Operating Permit Requirements

The purpose of this rule is to describe equipment that does not require a permit and which does not need to be listed on an application for a Federal Operating Permit (FOP) or on an issued FOP. Equipment powered by piston type internal combustion engines with a manufacturer’s rating of 50 bhp or less do not require a FOP under this rule.

Page 3-57; Section 3.2.2.3

The local regulatory setting for the South Coast Air Quality Management District (AVAQMD) is hereby revised to add the following:

SCAQMD

SCAQMD Regulation XIV, Rule 1470 (2012) – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines

This rule shall apply to any person who sells, owns, or operates a stationary combustion ignition (CI) engine in the SCAQMD with a rated brake horsepower greater than 50 bhp. Equipment powered by CI engines in excess of 50 bhp, with some exceptions, are required to obtain a permit from the District.

Pages 3-80 to 3-81, Table 3.3-1: Vegetation Communities within the Study Area

Table 3.3-1 is hereby amended to add to the list of Project sites within the study area for selected vegetation communities, as follows:

Table 2.4-4: Vegetation Communities within the Study Areas¹

Vegetation Community	Vegetation Alliance	Study Area(s)
Coastal Sage Scrub	California sagebrush scrub	AGH, BJM, DPK, FTP, GRM, LEPS, MMC, TWR, WTR
Mixed chaparral	Scrub oak chaparral	BJM, CPK, DPK, ENT, TWR, VPK
	Thick-leaved Yerba Santa scrub	JOP
	Toyon chaparral	GRM, TWR
Non-native grassland	Annual brome grass Semi-natural herbaceous stands	BJM, DPK, TPK, TWR

Page 3-83, Section 3.3.1.2

The text revising special status species designations is hereby amended as follows:

[Santa Catalina Island](#)

[Species identified from the Santa Catalina Island Local Coastal Plan \(Appendix G\)](#)

[Species information received in public comments from the Catalina Conservancy](#)

Page 3-85, Table 3.3-3

The study area description for sites BJM, DPK, and TWR, as listed in Table 3.3-3, are hereby amended as follows:

Table 2.4-5: Special Status Plant and Animal Species Recorded within One Mile of Proposed Project Sites¹

Site	Study Area Description	Species Recorded Within One Mile ²	Status Designations ³
BJM	<p>Site BJM is located on Black Jack Peak on Santa Catalina Island on a hilltop that has been leveled and mostly paved to support the existing facilities. The vegetation in the area has been heavily impacted by overgrazing and long term drought, resulting in bare soil and an increase in non-palatable plant species. Adjacent to the site is coastal sage scrub bisected by hiking trails and bike paths. The site contains many native and nonnative mature trees. Diagnostic woody shrubs include coast prickly pear (<i>Opuntia littoralis</i>), laurel sumac (<i>Malosma laurina</i>), toyon (<i>Heteromeles arbutifolia</i>), coyote bush (<i>Baccharis pilularis</i>), bush monkeyflower (<i>Diplacus aurantiacus</i>), lemonadeberry (<i>Rhus integrifolia</i>), and island oak (<i>Quercus pacifica</i>).</p> <p>Site BJM is located on the top of Blackjack Peak, the third highest mountain on Catalina Island. North-facing slopes of Blackjack are dominated by intact Island Scrub Oak (<i>Quercus pacifica</i>) Chaparral; south-facing slopes are dominated by intact Coastal Sage Scrub (note: areas mapped as Bare Ground in 2003 are largely recovering into Coastal Sage Scrub). Outside the study area, a former silver mine pit is located above the Blackjack Campground access road on the north side of the peak. Blackjack Peak is visible from many locations on and around Catalina Island. The Trans-Catalina Trail passes just southwest of the peak; and the Airport Road, very popular for motor tours, is just to the east.</p>	Santa Catalina Island fox (<i>Urocyon littoralis catalinae</i>)	ESA-E CA-T

The text is hereby amended by including the following information:

In addition to the sensitive species identified in Table 3.3-3, the following species have been identified as locally important from the Catalina Conservancy and Appendix G of the Santa Catalina Island Local Coastal Plan. Where appropriate, species names shown from Appendix G of the Local Coastal Plan have been updated (with the former names shown in parentheses).

<u><i>Abronia umbellata</i></u>	<u><i>Acmispon (Lotus) argophyllus</i> var <i>ornithopus</i></u>	<u><i>Acmispon (Lotus) grandiflora</i></u>	<u><i>Acmispon glaber (Lotus scoparius)</i></u>
<u><i>Acmispon subpinnatus</i></u>	<u><i>Ammannia coccinea</i></u>	<u><i>Andropogon barbinodis</i></u>	<u><i>Arthrocnemum (Salicornia) subterminale</i></u>
<u><i>Antirrhinum kelloggii</i></u>	<u><i>Aphanisma blitoides</i></u>	<u><i>Arctostaphylos catalinae</i></u>	<u><i>Arenaria douglasii</i></u>
<u><i>Aristida adscensionis</i></u>	<u><i>Asclepias fascicularis</i></u>	<u><i>Aspidotis californica</i></u>	<u><i>Astragalus didymocarpus</i> var <i>didymocarpus</i></u>
<u><i>Astragalus trichopodus</i> var <i>trichopodus</i></u>	<u><i>Athysanus pusillus</i></u>	<u><i>Atriplex coulteri</i></u>	<u><i>Atriplex watsonii</i></u>
<u><i>Bergerocactus emoryi</i></u>	<u><i>Brodiaea jolonensis</i></u>	<u><i>Bromus arizonicus</i></u>	<u><i>Calandrinia maritima</i></u>
<u><i>Callitriche marginata</i></u>	<u><i>Cardamine californica</i></u>	<u><i>Carex praeagrailis</i></u>	<u><i>Carex triquetra</i></u>
<u><i>Carpobrotus aequilaterus</i></u>	<u><i>Ceanothus arboreus</i></u>	<u><i>Ceanothus megaracarpus</i> var <i>insularis</i></u>	<u><i>Cercocarpus traskiae</i></u>
<u><i>Chenopodium macrospermum</i> var <i>farinosum</i></u>	<u><i>Chorizanthe staticoides</i></u>	<u><i>Clinopodium (Satureja) douglasii</i></u>	<u><i>Constancea (Eriophyllum) nevinii</i></u>
<u><i>Crassula aquatica</i></u>	<u><i>Cressa truxillensis</i> var <i>vallicola</i></u>	<u><i>Crocyanthemum (Helianthemum) greenei</i></u>	<u><i>Crossosoma californicum (californica)</i></u>
<u><i>Cryptantha micromeres</i></u>	<u><i>Cryptantha wigginsii</i></u>	<u><i>Deinandra (Hemizonia) clementina</i></u>	<u><i>Dendromecon harfordii</i></u>
<u><i>Dendromecon rigida</i> ssp <i>rhamnoides</i></u>	<u><i>Dichondra occidentalis</i></u>	<u><i>Dissanthelium californicum</i></u>	<u><i>Dudleya greenei</i></u>
<u><i>Dudleya virens</i> ssp <i>hassei</i></u>	<u><i>Dudleya virens</i> ssp <i>insularis</i></u>	<u><i>Elatine californica</i></u>	<u><i>Eriastrum filifolium</i></u>
<u><i>Eriqeron foliosus</i></u>	<u><i>Eriqeron grande</i> var <i>grande</i></u>	<u><i>Eriodictyon traskiae</i> ssp <i>traskiae</i></u>	<u><i>Eriogonum giganteum</i> var <i>giganteum</i></u>
<u><i>Eschscholtzia ramosa</i></u>	<u><i>Euphorbia misera</i></u>	<u><i>Euphorbia spatulata</i></u>	<u><i>Galium catalinense</i> ssp <i>catalinense</i></u>
<u><i>Galium nuttallii</i> ssp <i>insulare</i></u>	<u><i>Gambelia (Galvesia) speciosa</i></u>	<u><i>Gilia capitata</i> ssp <i>abrotanifolia</i></u>	<u><i>Gilia nevinii</i></u>

<u>Gnaphalium palustre</u>	<u>Helenium puberulum</u>	<u>Hesperolinon micranthum</u>	<u>Heteromeles arbutifolia var macrocarpa</u>
<u>Holodiscus discolor</u>	<u>Hordeum intercedens</u>	<u>Hordeum californicum</u>	<u>Jaumea carnosa</u>
<u>Jepsonia malvifolia</u>	<u>Lavatera assurgentiflora</u>	<u>Laennecia (Conyza) coulteri</u>	<u>Lastarriaea (Chorizanthe) coriacea</u>
<u>Lepechinia fragrans</u>	<u>Leptosyne (Coreopsis) gigantea</u>	<u>Linanthus bicolor</u>	<u>Lithophragma affine ssp mixtum</u>
<u>Lycium brevipes var hassei</u>	<u>Lyonothamnus floribundus ssp floribundus</u>	<u>Malvella (Sida) leprosa</u>	<u>Mentzelia micrantha</u>
<u>Microseris douglasii ssp platycarpha</u>	<u>Mimulus guttatus</u>	<u>Mimulus traskiae</u>	<u>Monanthochloe littoralis</u>
<u>Nemophila menziesii</u>	<u>Notholaena californica</u>	<u>Ophioglossum californicum</u>	<u>Orobanche bulbosa</u>
<u>Orobanche fasciculata franciscana</u>	<u>Papaver californicum</u>	<u>Paspalum distichum</u>	<u>Pentachaeta (Chaetopappa) lyonii</u>
<u>Phacelia distans</u>	<u>Phacelia grandiflora</u>	<u>Phacelia lyonii</u>	<u>Piperia unalascensis</u>
<u>Plagiobothrys nothofulvus</u>	<u>Platystemon californicus</u>	<u>Pluchea odorata (purpurascens)</u>	<u>Potamogeton foliosus</u>
<u>Potentilla glandulosa</u>	<u>Pseudognaphalium (Gnaphalium) microcephalum</u>	<u>Psilocarphus tenellus</u>	<u>Quercus engelmannii</u>
<u>Quercus lobata</u>	<u>Quercus tomentella</u>	<u>Rhamnus pirifolia</u>	<u>Ribes viburnifolium</u>
<u>Salicornia pacifica</u>	<u>Shoenoplectus americanus (Scirpus olneyi)</u>	<u>Scirpus robustus</u>	<u>Scrophularia villosa</u>
<u>Sibara filifolia</u>	<u>Sisyrinchium bellum</u>	<u>Solanum wallacei</u>	<u>Solidago velutina ssp californica</u>
<u>Senecio lyonii</u>	<u>Spergularia marina</u>	<u>Stebbinoseris (Microseris) heterocarpa</u>	<u>Stipa cernua</u>
<u>Stylomecon heterophylla</u>	<u>Suaeda californica</u>	<u>Thysanocarpus curvipes ssp elegans</u>	<u>Trichostema lanceolatum</u>

<u>Trifolium palmeri</u>	<u>Tropidocarpum gracile</u>	<u>Vitis girdiana</u>	<u>Xylococcus bicolor</u>

Page 3-103, Table 3.3-4: Sensitive Plant Communities Located within One Mile of Proposed Project Sites

The list of Project sites located within one mile of the California Walnut Woodland vegetative community is hereby amended as follows:

Table 2.4-6: Sensitive Plant Communities Located within One Mile of Proposed Project Sites

Sensitive Community	Project Sites
California Walnut Woodland	AGH , AJT, ENT, OAT, PHN, SIM

Pages 3-126 and 3-128; Table 3.3-7: Species with Suitable Habitat Generally within the Study Areas

The list of Project sites with a study area generally within suitable habitat for certain protected species is hereby amended as follows:

Table 2.4-7: Species with Suitable Habitat Generally within the Study Areas

Species	Status Designations	Proposed Project Site Study Area(s)
burrowing owl (<i>Athene cunicularia</i>)	CDFW-SSC	BJM , DPK , H-17A, TWR
California mountain kingsnake (<i>Lampropeltis zonata</i>)	CDFW-SSC USFS-Sens	BJM , H-69B, SPN, TOP
Townsend's big-eared bat (<i>Corynorhinus townsendii</i>)	CA-PT CDFW-SSC USFS-Sens	BJM, DPK , TWR

Pages 3-131 and 3-132; Section 3.3.4.1

Three biological resource mitigation measures are hereby amended as follows:

BIO MM 1 **Conservation** [Mitigation](#) Monitoring and Reporting Plan

Prior to construction, the Authority shall develop and implement or require the system contractor to develop and implement a mitigation monitoring and reporting plan (MMRP) for the proposed Project. The MMRP would serve to organize environmental compliance requirements identified in best management practices, mitigation measures, permit requirements, real property agreement conditions, [coordination with the land management agency\(s\)](#), and other applicable sources. The MMRP shall contain an organization chart and communication plan for environmental compliance as it relates to the proposed Project.

BIO MM 2 Worker Environmental Awareness Program

Prior to construction, the Authority shall develop and implement or require the system contractor to develop and implement, [including coordination with the respective land management agency](#), a Worker Environmental Awareness Program (WEAP) for the proposed Project. This mitigation measure would serve to institute and formalize an education program to increase awareness of environmental resources and measures and rules that are in place to help minimize impacts to those resources.

BIO MM 5 Hazardous Materials Management:

- a) A toxic substance management and spill response plan shall be prepared by the contractor [for review and approval by the Authority](#).
- b) Hazardous materials shall be contained; spills shall be prevented; and any spills at the Project site or along access roads shall be contained and cleaned up immediately.
- c) All construction vehicles are required to carry at least one spill response kit.
- d) Any spills shall be accounted for in reports prepared by the biological/environmental monitor.

Page 3-147; Section 3.3.4.1

The last paragraph of the impact analysis for raptors is hereby amended as follows:

The burrowing owl was recorded about 0.2 mile west of the proposed Project Site H-17A along Skyline/Fire Ridge Road. The bird was using the cleared firebreak along the road following the ridge. Similar and contiguous habitat is found within Site H-17A and its study area. [Burrowing owls are also known to be present throughout Santa Catalina Island, which includes the vicinity of sites BJM, DPK, and TWR. Site DPK is located in rolling grassland, while sites BJM and TWR are in mountainous terrain, less conducive to burrowing owls.](#)

Page 3-148; Section 3.3.4.1

In the discussion of construction impacts to raptors, the first paragraph on Page 3-148 is hereby amended to the following:

Burrowing owls typically remain in the vicinity of their burrows and would be more susceptible to disturbance or destruction; impacts to burrowing owl from construction at proposed Project [Site sites BJM, DPK, H-17A, or TWR](#) would be significant.

Page 3-154; Section 3.3.4.1

The introductory impact analysis for the Santa Catalina Island Fox is hereby amended as follows:

The Santa Catalina Island fox ~~typically is found in dense shrubby vegetation; however, it has been observed using all habitat types present on Santa Catalina Island and could be found anywhere on the island—grasslands, shrublands, coastal marshes, and forests.~~ is a habitat generalist and is found throughout Catalina Island in all natural habitats and areas of human habitation and development. The fox is omnivorous, eating fruits, insects, birds, eggs, crabs, lizards, and small mammals. Individual foxes tend to move about rather than travel in packs. The fox is generally nocturnal, with peaks of activity at dawn and dusk; it is not intimidated by humans. Santa Catalina Island foxes give birth to young in simple dens, under shrubs, or in the sides of ravines (Laughrin 1973). Young ~~are born from early to~~ can be born any time from late February through late April after a gestation period of approximately 50 to 53 days. Litter size ranges from one to five kits (Moore and Collins 1995).

Major threats to the fox ~~have been canine distemper~~ have been disease outbreaks (e.g., the canine distemper outbreak in the late 1990s that almost wiped out the population), mortality from vehicle collisions or other dangers associated with human development (e.g., drowning in open containers of liquids, poisoning, becoming trapped in open excavations), and predation by golden eagles; however, no golden eagles have been seen on the island since the mid-1980s (Catalina Island Conservancy 2015). Though none of the three proposed Project sites on Santa Catalina Island (BJM, DKP, and TWR) are within what may be considered preferred fox habitat, the area surrounding each of these three sites could be occupied by foxes. Catalina Island foxes could be expected at all three sites and would be expected to investigate any changes to the sites during active construction, including open holes and trenches, open containers of liquids, and food wastes.

Page 3-157; Section 3.3.4.1

The impact analysis for small animals is hereby amended as shown in the following sentence:

...Potentially suitable habitat for one or more of these species is assumed to be found within 14 study areas (see **Table 2.4-7**), with the coast horned lizard and California mountain kingsnake potentially occurring within multiple locations (12 study areas and ~~3~~ 4 study areas, respectively)...

Page 3-157 and 3-158; Section 3.3.4.1

In the discussion of construction impacts to small animals, the second and third paragraphs are hereby amended to the following:

There would be no impact to Townsend's big-eared bat or western mastiff bat due to construction-related impacts at sites BJM, DPK, and OAT, and TWR.

Construction-related impacts to coast horned lizard, California mountain kingsnake, San Diego woodrat, and Tehachapi pocket mouse would be less than significant at sites BJM, CPK, ENT, FTP, H-17A, H-69B, LACFCP11, MMC, MTL2, RIH, SPN, TOP, and TPK.

Page 3-158; Section 3.3.4.1

In the discussion of operational impacts to small animals, the second and third paragraphs are hereby amended to the following and the introduction to the mitigation measures is also amended:

Bat mortality is not a concern due to new towers being added to any site or addition of lighting. Bats may be attracted to the lights for insect foraging; but strikes are not anticipated as all parts of the towers will be stationary and not mobile, thus allowing the bats to navigate safely around the structures. There would be no impact to Townsend’s big-eared bat or western mastiff bat due to operational activities at sites BJM, ~~DPK, and OAT, and TWR.~~

Operations-related impacts to coast horned lizard, California mountain kingsnake, San Diego woodrat, and Tehachapi pocket mouse would be less than significant at sites BJM, CPK, ENT, FTP, H-17A, H-69B, LACFCP11, MMC, MTL2, RIH, SPN, TOP, and TPK.

Mitigation Measures

The following mitigation measures would be implemented for California mountain kingsnake, coast horned lizard, San Diego woodrat, and Tehachapi pocket-mouse at proposed Project sites BJM, CPK, ENT, FTP, H-17A, H-69B, LACFCP11, MMC, MTL2, RIH, SPN, TOP, and TPK (see Table 2.4-7) (mitigation measures previously described are listed by name only):

Page 3-159; Section 3.3.4.1

The first paragraph of post-mitigation impact analysis for small animals is hereby amended as follows:

Though impacts to California mountain kingsnake, coast horned lizard, San Diego woodrat, and Tehachapi pocket-mouse at proposed Project sites would be less than significant without application of mitigation measures, these measures would still apply at these sites regardless of the level of significance and would further reduce the already less than significant impacts at sites BJM, CPK, ENT, FTP, H-17A, H-69B, LACFCP11, MMC, MTL2, RIH, SPN, TOP, and TPK. Since there would be no impact to Townsend’s big-eared bat or western mastiff bat, no mitigation measures for these species apply to Project sites BJM, ~~DPK, and OAT, and TWR.~~

Page 3-192; Table 3.3-10

Table 3.3-10 is hereby amended as follows:

Table 2.4-8: Plans and Relevant Land Use Designations for Protection of Biological Resources

Local Policies - Santa Catalina Island Local Coastal Plan	LM		

Page 3-327; following Section 3.3.4.1

A new Section 3.3.4.2 is hereby added to state the following:

3.3.4.2 No Project Alternative

Under the No Project Alternative, the proposed Project sites would not be developed as communications sites. As a result, no biological resources would be affected by implementation of this alternative

Page 3-319, Table 3.4-3

Table 3.4-3 is hereby amended to add a footnote for Sites BJM, DPK, and TWR, as follows:

Table 2.4-9. Proposed Project Sites by Impact Level – Archaeological and Architectural Resources

Impact Level	No Historical Resources impacted	Less Than Significant Impacts	Adverse Impacts Mitigated to Less than Significant Levels	Significant and Unavoidable Impacts
Sites	AGH**, AJT, ASD, BJM***, CPK, DPK***, ENT**, FTP, GRM, H-17A, LACF072, LARICSHQ, LEPS**, MMC, OAT, PDC, PHN, RIH, SDW, SGH, SIM, SPN, TPK, TWR***, VPK, WS1	BUR*, BUR1*, BUR2*, BUR3*, FRP*, GMT*, JOP*, JPK*, JPK2*, LACFCP11*, MML*, MTL2*, PMT*, SUN*, SUN2*, TMT*, WMP*, WTR*	PASPD01, PWT*, WAD, ENC1, TOP, ZHQ	H-69B, LACFCP08*, LACFCP09*, LPC*
<p>* Proposed Project sites on federal lands require consultation and coordination with the appropriate federal agency.</p> <p>** Based on records searches and field surveys, there are no archaeological sites within the direct APE of this project site and there would be no impacts; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.</p> <p>*** Based on records searches and field surveys, no archaeological sites are within the direct APE of this project site and there would be no impacts; however, a monitor would be present during ground-disturbing activities at the request of the Catalina Island Conservancy.</p>				

Page 3-350; Section 3.5.4.1

Mitigation measures GEO MM 1 is hereby amended as follows:

GEO MM 1 Prior to or concurrently with submittal of the application for a building permit for any portion of the proposed Project site, the ~~project sponsor~~ Contractor shall:

Page 3-372; Table 3.7-4: Proposed Project Sites with Low Potential to Encounter Recognized Environmental Concerns during Intrusive Site-Related Activities

A typographical error in the address for Site SGH is hereby corrected as follows:

Table 2.4-10: Proposed Project Sites with Low Potential to Encounter Recognized Environmental Concerns during Intrusive Site-Related Activities

Site ID	Site Name	Address
SGH	Signal Hill	2321 Stanley Ave, Signal Hills CA 90755

Pages 3-385 and 3-389; Section 3.7.4.1

Mitigations measures HAZ MM 1 and HAZ MM 3 are hereby amended as follows:

HAZ MM 1 Prior to construction activity, the construction contractor ~~must~~shall prepare a Phase I Environmental Site Assessment meeting the standards outlined in the American Society for Testing Materials (ASTM), Practice for Limited Environmental Due Diligence: Transaction Screen Process E 1528.

HAZ MM 3 Fire Management Plan. Prior to construction activity, the Authority ~~must~~shall work with the agency responsible for fire protection in the jurisdiction where the site is located to develop and implement a fire management plan for use during construction activity. The plan will identify project locations, project descriptions, anticipated construction activities, limitation of activities during periods of elevated fire risk (e.g., “red flag” days), level of suppression equipment required on site, training requirements, and points of contact.

Page 3-427, Section 3.9.4.1

Text describing the Santa Catalina Island Local Coastal Plan is hereby amended as follows:

The *Santa Catalina Island Local Coastal Plan* was approved by the Los Angeles County Board of Supervisors on March 15, 1983, and was certified by the CCC on November 17, 1983. [The plan is codified in the Los Angeles County Code at Sections 22.46.050 through 22.46.750.](#)

Page 3-434 – 3-442, Table 3.9-4: Planning and/or Zoning Designations for Proposed Project Sites

Table 3.9-4 is hereby amended as follows:

Site ID	Site Name	General Plan Name	General Plan Designation	Zoning Designation	Height Restriction	Inconsistent with Plans or Policies
AGH	Agoura Hills	City of Agoura Hills General Plan Update Los Angeles County General Plan 2035	Open Space Deed Restricted	Open Space Deed Restricted	60 feet <u>Not allowed in Open Space Deed Restricted zone</u>	Yes, exceeds height restriction by up to 10 feet² <u>prohibited use in Open Space Deed Restricted zone¹</u>

Page 3-444; Section 3.9.4.1

The discussion of construction impact for question LU-1 is hereby amended as follows:

As indicated in Table 3.9-4, a review of city and county general plans and zoning ordinances indicate that Sites ~~AGH~~, FTP, H-17A, JPK, JPK2, LEPS, MMC, PASPD01, and SDW are inconsistent with local zoning ordinances regarding height restrictions. [Site AGH is inconsistent with the Open Space Deed Restricted zoning, which is designated to set aside natural open space by restricting development.](#) Additionally, Sites JPK and JPK2...

Pages 3-460 and Page 3-470, Table 3.10-2; Summary of Local Regulations

Table 3.10-2 is hereby amended for selected sites, as follows

Site ID(Name)	Jurisdiction		Noise Ordinance	Noise Level Threshold	Noise Restrictions	Vibration Restrictions
	City	County				
AGH(Agoura Hills)	Agoura Hills	Los Angeles	<p>City of Agoura Hills; Article IX - Zoning; Chapter 6 - Regulatory Provisions, Part 2 - Special Regulations; Division 6 - Noise Regulations.</p> <p>City of Agoura Hills 2035 General Plan Update.</p>	<p>None specified General Plan Community Noise Equivalent Levels: Table N-1 Land Use Compatibility (Residential)</p> <p>Zone A (clearly compatible) < 60 Dba CNEL</p> <p>Zone B (normally compatible) 60 – 70 dBA CNEL</p> <p>Zone C (normally incompatible) 70 – 75 dBA CNEL</p> <p>Zone D (clearly incompatible) > 75 dBA CNEL</p> <p>Table N-2 Interior/Exterior Standards(Residential)</p> <p>Interior 45 dBA CNEL</p> <p>Exterior 55 dBA CNEL</p>	<p>Work must not occur between 8:00 p.m. and 7:00 a.m. on weekdays, including Saturday, or at any time on Sunday or a legal holiday.</p>	<p>See noise restrictions</p>
SGH (Signal Hill)	Signal Hill	Los Angeles	<p>City of Signal Hill, California, Municipal Code, Title 9 Public, Peace, Morals and Welfare, Chapter 9.16</p>	<p>none specified</p>	<p>No person shall carry on any construction activities, including the erection, demolition, excavation, modification, alteration or repair of any building or structures, or any other activities creating construction noise as defined in this section other than between the hours of seven a.m. and six</p>	<p>See noise restrictions</p>

Site ID(Name)	Jurisdiction		Noise Ordinance	Noise Level Threshold	Noise Restrictions	Vibration Restrictions
	City	County				
			Noise		<p>p.m. on weekdays, except as otherwise permitted in this section. It is the purpose of this section to promote quiet and peaceful residential areas by limiting construction activities which create disturbing noise to reasonable times and circumstances, but such limitations shall not apply where residences will not be affected, where individual homeowners are performing maintenance work, or to emergency circumstances.</p> <p><u>Per Chapter 9.16.060 of the Municipal Code, machinery and other equipment, including air conditioning units, generators, etc. operating for more than 5 minutes cannot exceed the ambient noise level at the property line. The daytime (7 a.m. to 10 p.m.) and nighttime (10 p.m. to 7 a.m.) ambient noise level for residential areas prescribed in Chapter 9.16.020 of the Signal Hill Municipal Code are 60 dbA and 50 dbA, respectively.</u></p>	

Page 3-516; Section 3.12.2.3

The discussion of Signal Hill Circulation Element, Scenic Routes is hereby amended as follows:

City of Signal Hill General Plan (2009)

Circulation Element, Scenic Routes – designates a series of roadways at higher elevations as scenic routes. [Skyline Drive, located immediately south of the project site, is a designated scenic route.](#)

Page 4-12, Site AGH

Site AGH, Question BIO-2, Mitigation Measure(s) is hereby amended as follows:

Mitigation Measure(s):

~~Minimize disturbance to natural vegetation; do not remove California walnut trees. Prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Use caution to minimize the use of heavy equipment near (within the dripline) walnut trees to protect the plant's root system.~~ Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management • BIO MM 23

Page 4-28, Site AGH

Site AGH, Land Use Planning Setting, zoning height restriction question and the second paragraph in the discussion for Question LU-1 are hereby amended as follows:

What is the zoning height restriction, if any?: ~~60-feet~~ [Development is limited to passive recreational facilities; height restriction for this zone is not identified.](#)

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Discussion:

Based on the zoning ordinances for this site, ~~the maximum allowable height of structures in this area is 60-feet~~ [development is limited to passive recreational facilities \(such as parks and trails\) with a conditional use permit.](#)

Page 4-64, Site AJT

Site AJT, Land Use Planning Setting, zoning height restriction question is hereby amended as follows:

What is the zoning height restriction, if any?: ~~70~~ [35](#) feet

Page 4-113, Site BJM

The Site BJM Aesthetic Setting section is hereby amended as follows:

State, regional, or municipal recreation area: ~~No~~-Yes

If yes, enter recreation area name: ~~N/A~~ [Catalina Island Conservancy Open Space Easement](#)

Page 4-121, Site BJM

For Site BJM, Biology Setting, the discussion for special status animals recorded within 1 mile, special status plants recorded within 1 mile, and species or habitat present in Project vicinity (generally within 500 Feet) is hereby amended as follows:

Special Status Animals Recorded within 1 Mile:

[California mountain kingsnake \(*Lampropeltis zonata*; CDFW-SSC, USFS-Sens\)](#); Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T); Townsend's big-eared bat (*Corynorhinus townsendii*; CA-PT; CDFW-SSC); two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC); groundfish (M&FEFH).

Special Status Plants Recorded within 1 Mile:

beach spectaclepod (*Dithyrea maritima*; CA-T, 1B.1); [bobtail barley \(*Hordeum intercedens*, 3.2, SCI\)](#); [California adderstongue \(*Ophioglossum californicum*; 4.2, SCI\)](#); California dissanthelium (*Dissanthelium californicum*; 1B.2); Catalina crossosoma (*Crossosoma californicum*; 1B.2); [climbing bedstraw \(*Galium nuttallii* ssp. *insulare*; 4.3, SCI\)](#); [Coulter's saltbush \(*Atriplex coulteri*; 1B.2\)](#); [island ceanothus \(*Ceanothus megacarpus* var. *insularis*; 4.3, SCI\)](#); [island Jepsonia \(*Jepsonia malvifolia*; 4.2, SCI\)](#); [island live oak \(*Quercus tomentella*; 4.2, SCI\)](#); [island pitchersage \(*Lepechinia fragrans*; 4.2, SCI\)](#); [island poppy \(*Eschscholzia ramosa*; 4.3, SCI\)](#); island rush-rose (*Crocanthemum greeni*; ESA-T, 1B.2); [Nevin's gilia \(*Gilia nevinii*; 4.3, SCI\)](#); roundleaved filaree (*California macrophylla*; 1B.1); Santa Catalina figwort (*Scrophularia villosa*; 1B.2); [Santa Catalina Island bedstraw \(*Galium catalinense* ssp. *catalinense*; 1B.3\)](#); [Santa Catalina Island buckwheat \(*Eriogonum giganteum* var. *giganteum*; 4.3, SCI\)](#); Santa Catalina Island currant (*Ribes viburnifolium*; 1B.2); Santa Catalina Island ironwood (*Lyonothamnus floribundus* ssp. *floribundus*; 1B.2); Santa Catalina Island manzanita (*Arctostaphylos catalinae*; 1B.2); Santa Cruz Island wingedrock cress (*Sibara filifolia*; ESA-E, 1B.1); south island bush-poppy (*Dendromecon harfordii* var. *ramnoides*; 3.1); Wallace's nightshade (*Solanum wallacei*; 1B.1); [western dichondra \(*Dichondra occidentalis*; 4.2, SCI\)](#).

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

[burrowing owl \(*Athene cunicularia*; CDFW-SSC\)](#); [California mountain kingsnake \(*Lampropeltis zonata*; CDFW-SSC, USFS-Sens\)](#); Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T); Townsend's big-eared bat – foraging (*Corynorhinus townsendii*; CA-PT); bald eagle (*Haliaeetus leucocephalus*; CA-E, CDFW-FP, USFS-S); groundfish (M&FEFH); [Coulter's saltbush \(*Atriplex coulteri*; 1B.2\)](#); dissanthelium (*Dissanthelium californicum*; 1B.2); round-leaved filaree (*California macrophylla*; 1B.1); [Santa Catalina Island bedstraw \(*Galium catalinense* ssp. *catalinense*; 1B.3\)](#); Santa Cruz Island winged-rock cress (*Sibara filifolia*; ESA-E, 1B.1); round-leaved filaree (*California macrophylla*; 1B.1); island rush-rose (*Crocanthemum greeni*; ESA-T, 1B.2); Wallace's nightshade (*Solanum wallacei*; CNPS-1B.1)

Impact analysis for Impact CUL-1 is hereby modified as follows:

Mitigation Measure(s):

~~None required~~ [CUL MM 1](#)

Page 4-335, Site DPK

Site DPK, Project Description, address is hereby amended as follows:

Address: ~~Avalon Canyon Rd.~~ [Divide Road](#)

Page 4-338, Site DPK

The Site DPK Aesthetic Setting section is hereby amended as follows:

State, regional, or municipal recreation area: ~~No~~ [Yes](#)

If yes, enter recreation area name: ~~N/A~~ [Catalina Island Conservancy Open Space Easement](#)

Page 4-345, Site DPK

For Site DPK, Biology Setting, the discussion for special status animals recorded within 1 mile, special status plants recorded within 1 mile, and species or habitat present in Project vicinity (generally within 500 Feet) is hereby amended as follows:

Special Status Animals Recorded within 1 Mile:

aphanisma (*Aphanisma blitoides*; 1B.2); beach spectaclepod (*Dithyrea maritima*; CA-T, 1B.1); [bright green dudleya \(*Dudleya virens* ssp. *insularis*; 1B.2, SCI\)](#); [bobtail barley \(*Hordeum intercedens*, 3.2, SCI\)](#); [California adderstongue \(*Ophioglossum californicum*; 4.2, SCI\)](#); California dissanthelium (*Dissanthelium californicum*; 1B.2); Catalina crossosoma (*Crossosoma californicum*; 1B.2); chaparral ragwort (*Senecio aphanactis*; 2B.2); coast woolly-heads (*Nemacaulis denudata* var. *denudata*; 1B.2); Coulter's saltbush (*Atriplex coulteri*; 1B.2); Davidson's saltscale (*Atriplex serenana* var. *davidsonii*; 1B.2); [island ceanothus \(*Ceanothus megacarpus* var. *insularis*; 4.3, SCI\)](#); island green dudleya (*Dudleya virens* ssp. *insularis*; 1B.2); [island Jepsonia \(*Jepsonia malvifolia*; 4.2, SCI\)](#); [island live oak \(*Quercus tomentella*; 4.2, SCI\)](#); [island poppy \(*Eschscholzia ramosa*; 4.3, SCI\)](#); island rush-rose (*Crocyanthemum greenei*; ESA-T, 1B.2); Nevin's woolly sunflower (*Constancea nevinii*; 1B.3); round-leaved filaree (*California macrophylla*; 1B.1); Santa Catalina figwort (*Scrophularia villosa*; 1B.2); Santa Catalina Island bedstraw (*Galium catalinense* ssp. *catalinense*; 1B.2); [Santa Catalina Island buckwheat \(*Eriogonum giganteum* var. *giganteum*; 4.3, SCI\)](#); Santa Catalina Island currant (*Ribes viburnifolium*; 1B.2); Santa Catalina Island desert-thorn (*Lycium brevipes* var. *hasse*; 1B.1) ; Santa Catalina Island ironwood (*Lyonothamnus floribundus* ssp. *Floribundus*; 1B.2); Santa Catalina Island manzanita (*Arctostaphylos catalinae*; 1B.2); Santa Catalina Island monkeyflower (*Mimulus traskiae*; 1A); Santa Cruz Island winged-rockcress (*Sibara filifolia*; ESA-E, 1B.1);

showy island snapdragon (*Gambelia speciosa*; 1B.2); south coast saltscale (*Atriplex pacifica*; 1B.2); [south island bush-poppy \(*Dendromecon harfordii* var. *rhamnoides*; 3.1\)](#); Wallace's nightshade (*Solanum wallacei*; 1B.1); [western dichondra \(*Dichondra occidentalis*; 4.2, SCI\)](#).

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

[burrowing owl \(*Athene cunicularia*; CDFW-SSC\)](#); Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T); Townsend's big-eared bat – foraging (*Corynorhinus townsendii*; CA-CT; CDFW-SSC); bald eagle (*Haliaeetus leucocephalus*; CA-E, CDFW-FP, USFS-S) island rush-rose (*Crocathemum greenei*; ESA-T, CNPS-1B.2); Santa Cruz Island winged-rockcress (*Sibara filifolia*; ESA-E, 1B.1)

Page 4-349, Site DPK

Impact analysis for Impact CUL-1 is hereby modified as follows:

Mitigation Measure(s):

~~None required~~ [CUL MM 1](#)

Page 4-1487, Site SGH

Site SGH, Project Description, the city and land owner are hereby amended as follows:

City: ~~Signal Hill~~ [Long Beach](#)

Landowner: GTE California Inc. [and Long Beach City](#)

Page 4-1490, Site SGH

For Site SGH, Aesthetics Setting, the visual description is hereby amended as follows:

Visual Description: The site is located on a hilltop within a gated residential community, [approximately 200 feet north of Skyline Drive. The 2009 City of Signal Hill General Plan Circulation Element identifies Skyline Drive as a scenic route \(City of Signal Hill 2009\). The plan notes that ‘The entire route provides views of urban Southern California, the ocean, and the downtown Long Beach skyline. The site consists of an elongated concrete surface ...](#) A small park (Sunset View Park) is south of the site and provides views of the distant horizon to the south. This elongated park parallels ~~a road~~ [Skyline Drive](#) and consists of low grasses and shrubs, concrete benches, and a concrete path.

Page 4-1505, Site SGH

For Site SGH, Question GEO-2, Discussion is hereby amended as follows:

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Discussion:

The site is located on flat grade in an urban environment. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the City of ~~Signal Hill~~ [Long Beach](#) planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing storm drains inlets.

Page 4-1514, Site SGH

Site SGH, Land Use Planning Setting, local agency jurisdiction and zoning are hereby amended as follows:

Local Agency Jurisdiction: ~~Signal Hill~~ [City of Long Beach](#)

Zoning: Hilltop Specific Plan District, [Antenna and Microwave Consolidation/Park Site](#). Note: The Hilltop Area Specific Plan includes view protection provisions, but the City of Signal Hill is not administering permits for the project.

Pages 4-1516 and 4-1517, Site SGH

For Site SGH, Question NOI-1, the fifth paragraph of the discussion is hereby amended as follows:

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable" community noise equivalent level (CNEL) developed by the California Department of Health Services was referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. In addition, the closest adjacent receiver to the site property line is separated by a 5-foot privacy wall that would provide an additional 5 dBA of noise mitigation and a net 51 dBA at the property line. Noise levels from both sources would be below the 60 dBA "normally acceptable" level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Page 4-1524, Site SGH

Site SGH, Utilities Setting, nearest solid waste disposal facility is hereby amended as follows:

Nearest Solid Waste Disposal Facility: ~~Savage Canyon Landfill~~ [EDCO Disposal, 2755 California Ave., Signal Hill](#)

Page 4-1802, Site TWR

The Site TWR Aesthetic Setting section is hereby amended as follows:

State, regional, or municipal recreation area: ~~No~~-Yes

If yes, enter recreation area name: ~~N/A~~ Catalina Island Conservancy Open Space Easement

Page 4-1809, Site TWR

For Site TWR, Biology Setting, the discussion for special status animals recorded within 1 mile, special status plants recorded within 1 mile, and species or habitat present in Project vicinity (generally within 500 Feet) is hereby amended as follows:

Special Status Animals Recorded within 1 Mile:

beach spectaclepod (*Dithyrea maritima*; CA-T, 1B.1); bobtail barley (*Hordeum intercedens*, 3.2, SCI); bright green dudleya (*Dudleya virens* ssp. *hassei*; 1B.2, SCI); California dissanthelium (*Dissanthelium californicum*; 1B.2); Catalina crossosoma (*Crossosoma californicum* ; 1B.2); Catalina Island dudleya (*Dudleya virens* ssp. *Hassei*; 1B.2); Coulter's saltbush (*Atriplex coulteri*; 1B.2); decumbent goldenbush (*Isocoma menziesii* var. *decumbens*; 1B.2); island buckwheat (*Eriogonum grande* var. *grande*; 4.2, SCI); island Jepsonia (*Jepsonia malvifolia*; 4.2, SCI); island poppy (*Eschscholzia ramosa*; 4.3, SCI); Lyon's pentachaeta (*Pentachaeta lyonii*; ESA-E, CA-E, 1B.1); Nevin's woolly sunflower (*Constancea nevinii*; 1B.3); round-leaved filaree (*California macrophylla*; 1B.1); Santa Catalina figwort (*Scrophularia villosa*; 1B.2); Santa Catalina Island bedstraw (*Galium catalinense* ssp. *catalinense*; 1B.2); Santa Catalina Island buckwheat (*Eriogonum giganteum* var. *giganteum*; 4.3, SCI); Santa Catalina Island currant (*Ribes viburnifolium*; 1B.2); Santa Catalina Island ironwood (*Lyonothamnus floribundus* ssp. *Floribundus*; 1B.2); showy island snapdragon (*Gambelia speciosa*; 1B.2); western dichondra (*Dichondra occidentalis*; 4.2, SCI); Wiggins' cryptantha (*Cryptantha wigginsii*; 1B.2)

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

burrowing owl (*Athene cunicularia*; CDFW-SSC); Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T); bald eagle (*Haliaeetus leucocephalus*; CA-E, CDFW-FP, USFS-S); groundfish (M&F-EFH); Townsend's big-eared bat – foraging (*Corynorhinus townsendii*; CA-PT; CDFW-SSC); island rush-rose (*Crocantemum greenei*; ESA-T, CNPS-1B.2); Lyon's pentachaeta (*Pentachaeta lyonii*; ESA-E, ESA-CH, CA-E, CNPS-1B.1); round-leaved filaree (*California macrophylla*; CNPS-1B.1); Santa Catalina Island bedstraw (*Galium catalinense* ssp. *catalinense*; CNPS-1B.2); Santa Catalina Island currant (*Ribes viburnifolium*; 1B.2); Wiggins' cryptantha (*Cryptantha wigginsii*; CNPS-1B.2)

Page 4-1813, Site TWR

Impact analysis for Impact CUL-1 is hereby modified as follows:

Mitigation Measure(s):

None required [CUL MM 1](#)

Pages 4-1982 and 4-1983, Site WS1

Site WS1, Question NOI-2, Mitigation Measure(s) is hereby amended as follows:

Mitigation Measure(s):

NOI MM 2

Prior to commencement of construction at site Site WS1, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction noise impacts below the levels specified in the City of Santa Monica noise ordinance. Such measures may include but are not limited to the following:

- Use noise blankets or other muffling devices on equipment and quiet-use generators at noise-sensitive receivers.
- Use well-maintained equipment and have equipment inspected regularly.
- Operate construction equipment for periods of fewer than 15 consecutive minutes when possible.

~~NOI MM 3~~

~~Prior to commencement of construction at any site with an applicable noise ordinance where construction activities are necessary outside the specified hours in the ordinance, the Authority shall apply for and obtain variances from the agency with jurisdiction at that site.~~

**MITIGATION MONITORING PLAN
FOR THE
LOS ANGELES REGIONAL INTEROPERABLE
COMMUNICATIONS SYSTEM (LA-RICS)
LAND MOBILE RADIO (LMR) SYSTEM**

Prepared for:

LA-RICS Joint Powers Authority
2525 Corporate Place, Suite 200
Monterey Park, CA 91754

MARCH 2016

This page intentionally left blank

Pursuant to Public Resources Code section 21081.6 and Section 15097 of the California Environmental Quality Act (CEQA) Guidelines, when an agency finds that mitigation measures have been required in, or incorporated into a project, to avoid or substantially lessen its significant environmental effects, the agency must adopt a program for monitoring or reporting on such mitigation measures. The Environmental Impact Report (EIR) prepared for the Los Angeles Regional Interoperable Communications System (LA-RICS) Land Mobile Radio (LMR) project identifies mitigation measures to reduce the significant environmental effects of the proposed project. This Mitigation Monitoring Plan (MMP) is prepared in compliance with CEQA and is designed to aid the LA-RICS Joint Powers Authority (Authority) in their implementation and monitoring of the adopted mitigation measures. The LA-RICS Authority is the designated lead agency for purposes of CEQA compliance and is responsible for implementation of the MMP. The MMP will be used by Authority staff responsible for ensuring compliance with mitigation measures associated with the LMR project. Monitoring will consist of review of appropriate documentation, such as plans and reports prepared by the Contractor, or field observation of the mitigation measures during implementation. The MMP will be in place throughout all phases of development of the LMR project. The MMP is presented in table format and describes the actions that must take place to implement each mitigation measure, the entities responsible for implementing the actions, the timing of those actions, and the entities responsible for monitoring compliance. Not all mitigation measures are applicable at every site analyzed in the EIR. The MMP identifies the sites at which specific mitigation measures are applicable.

Mitigation Monitoring Plan

Resource Area	Sites	Mitigation Measure	Responsible Implementation Party	Phase and Frequency (frequency is once unless otherwise noted)	Monitoring Agency
Aesthetics	PASPD01	CUL MM 5: Architectural Resources Protection and Camouflage: See Below	Contractor	Prior to Construction	Authority
Air Quality	All Sites In SCAQMD	AQ MM 1: No later than 12:00 p.m. on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) if combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which USEPA regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NO _x emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.	Contractor	Weekly	Authority
Biological Resources	All sites	BIO MM 1 Mitigation Monitoring and Reporting Plan: Prior to construction, the Authority shall develop and implement or require the system contractor to develop and implement a mitigation monitoring and reporting plan (MMRP) for the proposed Project. The MMRP would serve to organize environmental compliance requirements identified in best management practices, mitigation measures, permit requirements, real property agreement conditions, coordination with the land management agency(s), and other applicable sources. The MMRP shall contain an organization chart and communication plan for environmental compliance as it relates to the proposed Project.	Authority	Prior to construction	Not applicable
	All sites	BIO MM 2 Worker Environmental Awareness Program: Prior to construction, the Authority shall develop and implement or require the system contractor to develop and implement, including coordination with the respective land management agency, a Worker Environmental Awareness Program (WEAP) for the proposed Project. This mitigation measure would serve to institute and formalize an education program to increase awareness of environmental resources and measures and rules that are in place to help minimize impacts to those resources. a) A WEAP shall be developed and shall be required for all construction employees prior to placement of Project equipment, construction, or any ground-disturbing activities at the proposed Project site. Training of additional workers, contractors, and visitors shall be provided, as needed. b) The WEAP is to inform on-site workers of the possible presence of special status species, the measures to be taken to protect these species, and the importance of minimizing impacts to the natural environment through the protection of native vegetation, adhering to required buffers and protection zones, staying on existing roads, and implementing best management practices, that include containment of any spills, disposal of trash, and management of runoff and sediment transport. c) To assure long-term implementation of mitigation measures, an information sheet listing potential sensitive species and what to do if any are encountered shall be prepared, distributed to workers, and posted on site.	Authority	a) Prior to construction b) Prior to construction c) Prior to construction	Authority

	AGH, AJT, BJM, CPK, DPK, FRP, FTP, GRM, H-17A, JOP, LACF072, LACFCP11, LEPS, LPC, MMC, MML, MTL2, OAT, PHN, PMT, PWT, RIH, SDW, SPN, SUN, SUN2, TOP, TPK, TWR, VPK, WMP, WTR	BIO MM 11 Site Access: a) On access roads operate all vehicles within the posted speed limits. b) If access road speed limits are not posted, do not exceed 15 miles per hour (mph). c) Adjust vehicle speed as appropriate to road conditions; avoid causing ruts and gullies; and minimize dust. d) Watch for wildlife on roads (including amphibians, snakes, rodents, and tortoises), especially during rainy periods, and avoid running them over. e) Look under parked vehicles for the presence of wildlife (especially desert tortoise) before pulling away to avoid running over wildlife. f) Do not park on or drive over native perennial vegetation. g) Avoid cutting corners on access roads and impacting vegetation when large equipment and trailers are brought to the Project site. h) Do not drive off the designated roadway or make any modifications to the road or road shoulders.	Contractor	Continuous during construction and operation	Authority
	H-17A, LEPS, PHN, PWT, RIH, SDW, VPK	BIO MM 12 Coastal California Gnatcatcher Protection: a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of coastal California gnatcatchers in the area and the importance of maintaining coastal sage scrub vegetation. b) As part of BIO MM 9 Protect Native Vegetation and Common Wildlife, disturbance to native perennial vegetation, especially coastal sage scrub vegetation (e.g., California sagebrush, sage, laurel sumac, and California buckwheat), would be minimized. Surveys shall be conducted by a qualified biologist for the presence of coastal sage scrub perennial vegetation, and plants not identified for removal within or near the construction zone shall be marked for protection. c) As part of BIO MM 3 Biological Compliance Reporting, the environmental monitor shall verify at least once a week during active construction and upon completion of construction activities that habitat protection measures have been followed. d) At proposed Project sites H-17A, PHN, and RIH, a higher level of protection is required to ensure that gnatcatchers are not present when construction activities would occur and adverse effects would be avoided. For proposed Project sites that include known or suspected gnatcatcher nesting or otherwise include suitable nesting habitat where the bird is expected to be present, the following mitigation measure is to ensure the highest level of protection to the bird. All the above measures (BIO MM 1 through BIO MM 3, and BIO MM 8 through BIO MM 12) apply as well as: BIO MM 13 Coastal California Gnatcatcher Breeding Season Restrictions.	Contractor	a) Prior to construction b) Prior to construction c) Weekly during construction	Authority
	H-17A, PHN, RIH, SDW	BIO MM 13 Coastal California Gnatcatcher Breeding Season Restrictions: Construction activities that include loud noises (e.g., trenching, drilling, concrete cutting), the use of large equipment (e.g., booms, cranes, drills, concrete pouring), or the removal of perennial vegetation shall be precluded between February 15 and August 30. This measure is applicable to identified Project sites where coastal California gnatcatchers are known to be or likely would be present, and construction activities may result in disturbance to the bird.	Contractor	Continuous during construction occurring February 15 – August 30	Authority

Mitigation Monitoring Plan

Resource Area	Sites	Mitigation Measure	Responsible Implementation Party	Phase and Frequency (frequency is once unless otherwise noted)	Monitoring Agency
	LEPS, PWT	<p>BIO MM 14 Coastal California Gnatcatcher Protocol Surveys:</p> <p>a) To determine if coastal California gnatcatchers are present within 500 feet of specified Project sites and if breeding season restrictions would be required, surveys following the most recent version of the USFWS Coastal California Gnatcatcher Presence/ Absence Survey Protocol (current revision issued by USFWS Carlsbad Office 1997) shall be conducted prior to initiating any construction activities that may result in ground disturbance or loud noises during the gnatcatcher breeding season (February 15 through August 30). This protocol requires call-playback surveys by a permitted biologist, conducting a minimum of six surveys at least one week apart between March 15 and June 30 (additional survey requirements are presented in the protocol).</p> <p>b) If adult, nesting, or fledgling gnatcatchers are detected even once within 500 feet of the proposed Project site, or if surveys are not completed in compliance with the protocol, BIO MM 13 Coastal California Gnatcatcher Breeding Season Restrictions shall apply to the site, precluding any construction activities that include loud noises (e.g., trenching, drilling, concrete cutting), the use of large equipment (e.g., booms, cranes, drills, concrete pouring), or the removal of perennial vegetation between February 15 and August 30.</p> <p>c) If no adult, nesting, or fledgling gnatcatchers are detected within 500 feet of the proposed Project site, construction activities may commence beginning July 1 through February 14.</p> <p>d) Survey requirements shall be applied each year that construction activities take place at the Project site.</p>	Contractor	<p>a) Prior to construction</p> <p>b) Continuous during construction</p> <p>c) Continuous during construction</p> <p>d) Annually during operation</p>	Authority
	LACFCP11	<p>BIO MM 15 Southwestern Willow Flycatcher Protection:</p> <p>a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of southwestern willow flycatchers in the area and the importance of maintaining riparian vegetation.</p> <p>b) As part of BIO MM 9 Protect Native Vegetation and Common Wildlife, disturbance to native perennial vegetation, especially riparian species (e.g., sycamore, cottonwood, willow), would be minimized; no ground-disturbing activities or removal of vegetation would occur within stream corridors or floodplains. Prior to construction, surveys for the presence of riparian vegetation shall be conducted by a qualified biologist, and those plants within or near the construction zone not identified for removal shall be marked for protection and monitored for adherence to these boundaries.</p>	Contractor	<p>a) Prior to construction</p> <p>b) Prior to construction</p>	Authority
	ZHQ	<p>BIO MM 16 Snowy Plover Protection:</p> <p>a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of western snowy plover in the area and the importance of not disturbing nesting birds.</p> <p>b) If construction occurs between February 1 and July 31, prior to beginning construction a biological monitor shall verify through coordination with USFWS and on-site surveys that no breeding western snowy plovers are using the Project site or are within 500 feet of any Project activity.</p> <p>c) If plovers are nesting in the vicinity, BIO MM 8 Biological Monitoring would apply, and a 500-foot protection buffer shall be required where no construction activities may occur while birds remain in the area.</p>	Contractor	<p>a) Prior to construction</p> <p>b) Prior to construction, if construction occurs between February 1 and July 31</p> <p>c) Continuous during construction</p>	Authority
	AGH, AJT, BJM, CPK, DPK, ENC1, FTP, GMT, H-17A, JOP, OAT, PWT, SPN, TOP, TPK, TWR, VPK, WTR	<p>BIO MM 17 Raptor Protection:</p> <p>a) If construction activities occur during the American peregrine falcon, bald eagle, golden eagle, long-eared owl, or burrowing owl breeding period, January 1 through July 31, preconstruction surveys would be conducted in all suitable habitats within 500 feet of the Project site as well as within a species-appropriate distance beyond the 500-foot buffer based on line of sight between potential nesting habitat and the construction site.</p>	Contractor	<p>a) Prior to construction during breeding season (January 1 through July 31)</p> <p>b) Prior to construction</p> <p>c) Continuous during construction</p> <p>d) Continuous during construction</p>	Authority

Mitigation Monitoring Plan

Resource Area	Sites	Mitigation Measure	Responsible Implementation Party	Phase and Frequency (frequency is once unless otherwise noted)	Monitoring Agency
		<ul style="list-style-type: none"> b) If construction takes place during the breeding period, the biological monitor shall contact appropriate land management and resource agencies to ascertain if they have any current information on raptor nesting activities in the general vicinity of the proposed Project sites. c) If an active American peregrine falcon, bald eagle, golden eagle, long-eared owl, or burrowing owl nest is discovered within 500 feet of the construction site, work shall not be undertaken at that site until the nest is no longer active, with an additional five days to allow the fledging birds to disperse. An active nest is defined as one that is attended, built, maintained, or used by a pair of birds during a given breeding season, whether or not eggs are laid; a nest is considered inactive if not attended to for a period of 10 days or longer. d) If an active American peregrine falcon, bald eagle, golden eagle, long-eared owl, or burrowing owl nest is discovered between 500 feet and 0.5 mile of the construction site, the potential for disturbance of the nesting birds would be evaluated based on line-of-sight, degree of potentially disturbing activities, and other site-specific factors. If the CDFW and land management agency concur, the protection buffer distance may be reduced. 			
	All sites	<p>BIO MM 18 Nesting Bird Protection:</p> <ul style="list-style-type: none"> a) It is preferred that removal of trees or large tree limbs and other vegetation removal activities such as grubbing or shrub clearing avoid the typical bird nesting season of January 1 through September 15. b) If construction activities occur during the bird nesting season, and to prevent disturbance to or destruction of nests of protected native bird species that could occur as a result of vegetation removal, disturbance, or other on-site construction activities, preconstruction surveys for nesting birds shall be conducted by a qualified biological monitor within 10 calendar days prior to on-site construction-related disturbance activities from March 1 through September 15 for non-raptors, and January 1 through July 31 for raptors. c) If nesting protected non-raptor species are detected, a 300-foot avoidance buffer shall be implemented; a 500-foot avoidance buffer would be applied to any active nest of a raptor or other species of special status bird. d) Appropriate site-specific buffers may be established with the approval of a project designated avian expert, based in part on the species of nesting bird present, location of nest, nesting phenology, magnitude of potential disturbance, and other site conditions (e.g., levels of ambient noise; line-of-sight). e) If construction activities would occur within the general buffer distances for active nests (300 feet for non-raptors, 500 feet for raptors, and up to 1.5 miles for condors and eagles), a Biological Monitor must be present during those activities. f) No active nests may be destroyed; inactive bird nests may be destroyed as part of vegetation removal but may not be reduced to possession. g) Between September 16 and December 30, grubbing, shrub clearing, and tree/limb removal activities are not subject to restrictions based on the protection of migratory birds. h) Comply with the USFWS Office of Migratory Birds voluntary guidelines (USFWS 2013a) for communications tower placement, construction, and operation. i) For any towers that must exceed 199 feet in height, lighting requirements would be designed in cooperation with FAA and USFWS Office of Migratory Birds to minimize attraction and resulting mortality of migratory birds. 	Contractor	<ul style="list-style-type: none"> a) Continuous, prior to and during construction b) Prior to construction c) Prior to construction d) Prior to construction e) Prior to construction f) Prior to construction g) During construction (Sept. 16 – Dec. 31) h) Continuous, prior to and during construction i) Prior to construction 	Authority

	LPC	<p>CUL MM 2: Archaeological Monitoring – Historic-Age Resources</p> <p>At proposed Project sites with known or potential presence of historic-age archaeological material (artifacts and/or features) within the defined APEs, a qualified archaeological monitor shall be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations. Monitors will also be responsible for restricting access by construction personnel to any identified archaeological resources as noted in this EIR section or Chapter 4. The direct and indirect APEs are defined at the beginning of this EIR section.</p> <p>The archaeological monitor will, at a minimum, have a B.A. in anthropology or related field or will have successfully completed an archaeological field methods school. The monitor will work under the supervision of an archaeologist who meets the Secretary of the Interior’s Professional Qualifications Standards (Project Archaeologist). The standards are published in CFR 36 Part 61 and found on the National Park Service website at http://www.nps.gov/history/local-law/arch_stnds_9.htm.</p>	Contractor	Continuous during construction for all ground-disturbing activities.	Authority
	AGH, ENC1, LEPS, LPC, PASPD01, PWT, TOP, ZHQ	<p>CUL MM 3: Unexpected Discovery of Archaeological Materials</p> <p>In the event that previously unidentified prehistoric or historic-age archaeological resources are uncovered, the following actions shall be taken:</p> <ol style="list-style-type: none"> 1) All ground-disturbing work within 165 feet (50 meters) of the discovery shall be halted. The qualified archaeological monitor will mark the immediate area with highly visible flagging and immediately notify the Project Archaeologist. 2) The Project Archaeologist shall inspect the discovery and determine whether further investigation is required. If the discovery can be avoided and no further impacts will occur, the resource shall be documented on California State Department of Parks and Recreation cultural resource record forms, and no further effort shall be required. 3) If the resource cannot be avoided and may be subject to further impact, the Project Archaeologist shall evaluate the resource and determine whether it is (1) eligible for inclusion in the NRHP and is thus a historic property for the purposes of the NHPA and NEPA; (2) eligible for the CRHR and thus a historical resource for the purposes of CEQA; (3) a “unique” archaeological resource as defined by CEQA; (4) a Tribal resource as defined by AB 52. If the resource is determined not to be significant under any of these four categories, work may commence in the area following collection (as appropriate) and recording, including mapping and photography, of the archaeological materials or features. 4) If the resource meets the criteria for any or all of the categories described in CUL MM3 (3), work shall remain halted, and the Project Archaeologist shall consult with LA-RICS Authority staff regarding methods to ensure that no substantial adverse changes occur. Preservation in place (i.e., avoidance) is the preferred method of ensuring no substantial adverse impacts occur on historic properties/historical resources and shall be required unless other equally effective methods are agreed upon among the Project Archaeologist, the Authority, and any other stakeholders. <p>If the archaeological material appears to represent a site – defined as three or more artifacts and/or features in an intact deposit – an archaeological test program (Phase II) may be necessary. Associated mitigation measures include, but are not limited to, collection of the archaeological materials, recordation (e.g., DPR Primary Record and Site Forms), and analysis of any significant cultural materials in accordance with a Data Recovery Plan, and curation of artifacts at an approved curation facility. A curation agreement for this Project is already in place with the University of California, Los Angeles, Archaeological Collections Facility at the Fowler Museum. At the</p>	Contractor	Continuous during construction	Authority

		<p>completion of the appropriate mitigation measures, a professional-level technical report shall be filed with the appropriate California Historical Resources Information System (CHRIS) Information Center (IC).</p> <p>5) Work at the project location may commence upon completion of the appropriate mitigation treatment(s).</p>			
	AGH, ENC1, LEPS, PWT, TOP, ZHQ	<p>CUL MM 4: Unexpected Discovery of Human Remains</p> <p>In the event that human remains are unexpectedly encountered, the following procedures shall immediately be followed. This guidance is also provided on the NAHC's website at http://nahc.ca.gov/resources/discovery-of-native-american-human-remains-what-to-do/.</p> <ol style="list-style-type: none"> 1) All construction activity shall stop immediately, and the Project Archaeologist shall be notified. The Project Archaeologist will contact the Los Angeles (or applicable) County Coroner. The list of California Coroners can be found on the Native American Heritage Commission's website at http://nahc.ca.gov/2015/06/implementation-of-ab52-sample-letters-request-for-formal-notification-and-request-for-consultation/. 2) The Coroner has two working days to examine human remains after being notified by the responsible person. If the remains are Native American, the Coroner has 24 hours to notify the Native American Heritage Commission. 3) The Native American Heritage Commission will immediately notify the person it believes to be the most likely descendent of the deceased Native American. 4) The most likely descendent has 48 hours to make recommendations to the owner, or representative, for the treatment or disposition, with proper dignity, of the human remains and grave goods. 5) If the descendent does not make recommendations within 48 hours the owner shall reinter the remains in an area of the property secure from further disturbance, or; 6) If the owner does not accept the descendant's recommendations, the owner or the descendent may request mediation by the Native American Heritage Commission. 	Contractor	Continuous during construction	Authority
	LPC, PASPD01, WAD	<p>CUL MM 5: Architectural Resources Protection and Camouflage</p> <p>Attachment of Equipment to Historic Buildings and Structures</p> <p>For historic buildings or structures where communications-related equipment will be attached, the following preservation practices shall be employed, as applicable, to ensure that impacts are less than significant:</p> <ol style="list-style-type: none"> 1) When running new exterior wiring to a historic building, existing entry points shall be utilized. If a new entry point is required, the entry shall be placed at the rear of the building or in an area on the side of the building where it will be hidden by an existing architectural feature. 2) When wireless nodes, antennas, microwave or satellite dishes, etc. are installed on historic buildings, existing mounting points shall be utilized. For new mounts, nonpenetrating mounts shall be used. 3) Equipment shall be placed where it does not detract from the building's overall appearance; roof-mounted equipment shall be placed where it will not be visible from accessible locations at grade. Adequate structural support for the new equipment and design shall be ensured, and a system that minimizes the number of cutouts or holes in structural members and historic material shall be installed. Existing building features shall be used to conceal equipment. 	Contractor submits plan to Authority for approval	Prior to construction and continuous during construction	Authority

Mitigation Monitoring Plan

Resource Area	Sites	Mitigation Measure	Responsible Implementation Party	Phase and Frequency (frequency is once unless otherwise noted)	Monitoring Agency
		<p>4) New equipment installations on a historic building that will be visible shall be painted or color-matched to the surrounding building materials. Concealment with color-matched FRP (fiberglass reinforced plastic) shrouds (boxes) is acceptable.</p> <p>5) Any supports or brackets for new equipment shall be color-matched to the existing materials.</p> <p>6) The installation of exterior wiring shall be minimized; where unavoidable, the wiring will be color-matched to the original building material to reduce the visual impact.</p> <p>7) Equipment shall not be directly anchored into stone or brick; mortar joints for anchoring the equipment will be utilized.</p> <p>8) Rust-resistant mounts to prevent staining of the building materials shall be used.</p> <p>9) Reversible mounting techniques shall be used to avoid damage to building materials.</p> <p>10) Installation of underground cable or conduit at a historical resource shall be undertaken in a manner that considers the stability of the historic building, including limiting any new excavations adjacent to historic foundations that could undermine the structural stability of the building and avoiding landscape or other changes that could alter drainage patterns and cause water-related damage to the building.</p> <p>11) New interior wiring shall utilize space in existing chases, closets, or shafts.</p> <p>12) Equipment and systems shall be installed to cause the least alteration possible to the building's floor plan and the least damage to the historic building material.</p> <p>13) Vertical runs of conduit and cables shall be placed in closets, service rooms, and wall cavities to create the least intrusion into the historic fabric of the building and to avoid major intervention into the wall and floor systems.</p> <p>Architectural Camouflage</p> <p>All new towers and monopoles or a proposed increase in the height of existing towers and monopoles that would cause adverse visual impacts on historical resources that are adjacent or within the viewshed shall be camouflaged. All camouflage implemented for the proposed Project shall be sympathetic to the existing landscape (http://www.generalcode.com/codification/sample-legislation/cell-towers) and/or in accordance with applicable municipal codes (http://clkrep.lacity.org/onlinedocs/2009/09-2645_RPT_ATT_06-07-11.pdf). Tower disguises may include, but are not limited to, painting and various types of concealments, including clock/water towers, flag/light poles, silos, trees, and unique site-specific designs. Such measures must be consistent with the Secretary of the Interior's Standards/Guidelines for the Treatment of Historic Properties (see Attachment of Equipment discussion above).</p>			
	<p>AGH, AJT, ASD, CPK, GRM, H-17A, LARICSHQ, LEPS, SPN, OAT, PASPD01, PDC, PHN, PWT, RIH, SDW, SGH, SIM, TOP, WS1, ZHQ</p>	<p>CUL MM 6: Potential Paleontological Resources Plan</p> <p>A Paleontological Resources Monitoring Plan shall be developed and approved prior to construction to guide the activities of monitors during ground-disturbing activities. The plan would include, but not be limited to, a description of the project location, the regulatory framework, site-specific impact mitigation requirements designed to reduce impacts to less than significant, specific locations and construction activities requiring monitoring and/or spot checking, procedures to follow for construction monitoring and fossil discovery and recovery, and a repository agreement with the Natural History Museum of Los Angeles County or other accredited repository. Mitigation measures that may be implemented to ensure that impacts to paleontological resources would be reduced to less than significant may include but are not limited to the following:</p>	<p>Contractor</p>	<p>Prior to construction and continuous during construction</p>	<p>Authority</p>

Mitigation Monitoring Plan

Resource Area	Sites	Mitigation Measure	Responsible Implementation Party	Phase and Frequency (frequency is once unless otherwise noted)	Monitoring Agency
		<p>a) Worker awareness training on paleontological resources presented to construction personnel prior to the start of construction. The training should include at minimum, the following:</p> <ul style="list-style-type: none"> • The types of fossils that could occur at the project site • The procedures that should be taken in the event of a fossil discovery • Laws protecting paleontological resources • Penalties for destroying or removing paleontological resources <p>b) Paleontological monitoring during ground disturbance at all sites with moderate/unknown or high paleontological potential</p> <p>c) Salvage of significant fossil resources</p> <p>d) Screenwashing of matrix samples for microfossils</p> <p>e) Laboratory preparation of recovered fossils to the point of identification and curation</p> <p>f) Identification of recovered fossils to the lowest possible taxonomic order</p> <p>g) Curation of significant fossils at the Natural History Museum of Los Angeles County or other accredited repository</p> <p>h) Preparation of a final monitoring report that includes at a minimum the dates of field work, results of monitoring, fossil analyses, significance evaluation, conclusions, locality forms, and an itemized list of specimens.</p> <p>The Plan shall be submitted to the Authority for review and approval and finalized at least 14 days prior to the start of construction.</p>			
	<p>AGH, AJT, ASD, CPK, GRM, H-17A, LARICSHQ, LEPS, SPN, OAT, PASPD01, PDC, PHN, PWT, RIH, SDW, SGH, SIM, TOP, WS1, ZHQ</p>	<p>CUL MM 7: Paleontological Resources Monitoring</p> <p>Paleontological monitoring shall be conducted by a qualified paleontological monitor who has demonstrated experience in the collection and salvage of fossil materials. An undergraduate degree in geology or paleontology is preferable but is less important than documented experience performing paleontological monitoring and mitigation. The monitor will work under the supervision of a Principal Paleontologist.</p> <p>The qualified professional paleontological monitor shall be present during ground disturbance at all sites with moderate/unknown or high paleontological potential, and as specified in the Paleontological Resources Monitoring Plan prepared in accordance with CUL MM 6. The monitor shall be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations. Any sites that require monitoring or mitigation within the Angeles National Forest will require a qualified paleontologist to have a U.S. Department of Agriculture Forest Service-Temporary Special-Use Permit for paleontology. Based on the specific site conditions observed during monitoring (type of sediment impacted, previous disturbances, nature of site conditions), the Principal Paleontologist may reduce or increase monitoring efforts in consultation with the Agency.</p> <p>In the event that a previously unidentified paleontological resource is uncovered, the following actions shall be taken:</p> <ol style="list-style-type: none"> 1) All ground-disturbing work within 50 feet of the discovery shall be halted. A qualified paleontologist shall divert or direct construction activities in the area of an exposed fossil in order to facilitate evaluation and, if necessary, salvage of the exposed fossil. Work shall not resume in the discovery area until authorized by the qualified paleontologist. 2) The paleontologist shall inspect the discovery and determine whether further investigation is required. If the discovery can be avoided and no further impacts will occur, no further effort shall be required. 3) If the resource cannot be avoided and may be subject to further impact, the paleontologist shall evaluate the resource and determine whether it is "unique" under CEQA, Appendix G, Part V. If the resource is determined not to be unique, work may commence in the area. 	<p>Contractor</p>	<p>During construction</p>	<p>Authority</p>

Mitigation Monitoring Plan

Resource Area	Sites	Mitigation Measure	Responsible Implementation Party	Phase and Frequency (frequency is once unless otherwise noted)	Monitoring Agency
		<p>4) If the resource is determined to be a unique paleontological resource, work shall remain halted, and the paleontologist shall consult with LA-RICS Authority staff regarding methods to ensure that no substantial adverse change would occur to the significance of the resource. Preservation in place (i.e., avoidance) is the preferred method of ensuring that no substantial adverse impacts occur to the resource and shall be required unless other equally effective methods are available. Other methods include ensuring that the fossils are scientifically recovered, prepared, identified, catalogued, and analyzed according to current professional standards.</p> <p>5) Due to the small nature of some fossils, a fine mesh screen may be used at the discretion of the paleontologist to screen matrix test samples on-site during monitoring. Additionally, bulk matrix samples may be collected and transported to a laboratory facility for processing.</p> <p>6) Provisions for preparation and identification of any fossils collected shall be made before donation to a suitable repository.</p> <p>7) All recovered fossils shall be curated at the Natural History Museum of Los Angeles County, or a local accredited and permanent scientific institution according to Society of Vertebrate Paleontology standard guidelines standards. Work may commence upon completion of the appropriate treatment and the approval from the Authority.</p>			
Geology and Soils	AGH, ASD, BJM, BUR1, CPK, DPK, ENC1, FRP, FTP, GMT, GRM, H-17A, JOP, JPK, LACF072, LACFCP11, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PHN, PMT, PWT, RIH, SDW, SGH, SPN, SUN, SUN2, TOP, TPK, TWR, VPK, WAD, WMP, WTR, ZHQ	<p>GEO MM 1 : Prior to or concurrently with submittal of the application for a building permit for any portion of the proposed Project site, the Contractor shall:</p> <p>1) Submit to the appropriate municipality (County of Los Angeles, County of San Bernardino, or city having jurisdiction over the site) a site-specific, design-level geotechnical report reviewed and approved by both an engineering geologist licensed in the State of California and a civil engineer licensed in the State of California. The report shall comply with all applicable state and local code requirements and shall:</p> <ul style="list-style-type: none"> a. include an analysis of the expected ground motions at the site from known active faults using accepted methodologies b. include an analysis of all potential geologic hazards including but not limited to, landslides, mudslides, liquefaction potential, identification of active faults, land spreading, and land subsidence. The report shall be prepared in accordance with and meet the requirements of the County of Los Angeles Department of Public Works (LACDPW) Manual for Preparation of Geotechnical Reports, July 1, 2013. c. Specify liquefaction mitigations that shall use proven methods generally accepted by professional engineers to reduce the risk of liquefaction to a less than significant level such as: <ul style="list-style-type: none"> i. subsurface soil improvement ii. deep foundations extending below the liquefiable layers iii. structural slabs designed to span across areas of non-support iv. soil cover sufficiently thick over liquefaction soil to bridge liquefaction zones v. dynamic compaction vi. compaction grouting vii. jet grouting viii. mitigation for liquefaction hazards suggested in the California Geological Survey's (CGS) Geology Guidelines for Evaluating and Mitigating Seismic Hazards (CGS Special Publication 117, 1997) including edge containment structures (berms, dikes, sea walls, retaining structures, compacted soil zones), removal or treatment of liquefiable soils, modification of site geometry, lowering the groundwater 	Contractor	Prior to construction	Authority

1.0 Introduction

1.1 Certification

FINDINGS OF FACT AND STATEMENT OF OVERRIDING CONSIDERATIONS REGARDING THE FINAL ENVIRONMENTAL IMPACT REPORT FOR THE LOS ANGELES REGIONAL INTEROPERABILITY COMMUNICATIONS SYSTEM (LA-RICS) LAND MOBILE RADIO (LMR) SYSTEM (STATE CLEARINGHOUSE NUMBER 2014081025)

The LA-RICS Board hereby certifies the EIR for the LA-RICS LMR System, State Clearinghouse Number 2014081025. The EIR consists of the Draft EIR, dated January 2016 and Final EIR, dated March 2016. The EIR has been completed in compliance with the California Environmental Quality Act (CEQA) and the State CEQA Guidelines. The LA-RICS Board has received, reviewed, and considered the information contained in the Final EIR, all hearings, and submissions of testimony from officials representing the County of Los Angeles, as well as from other agencies, organizations, and private individuals with a particular vested interest in the ordinances.

In accordance with CEQA Guidelines Section 15090, the Governing Board of the LA-RICS Joint Powers Authority, as lead agency pursuant to CEQA, certifies the following:

- (a) The Final EIR has been completed in compliance with CEQA;
- (b) The Final EIR was presented to the LA-RICS Board, and the LA-RICS Board, as the decision-making body for the LA-RICS Joint Powers Authority, reviewed and considered the information contained in the Final EIR prior to approving the Project;
- (c) The Final EIR reflects the LA-RICS Joint Powers Authority's independent judgment and analysis.

The LA-RICS Joint Powers Authority has exercised independent judgment in accordance with Public Resources Code (PRC) Section 21082.1(c) in retaining its own environmental consultant; directing the consultant in preparation of the EIR; and reviewing, analyzing, and revising material prepared by the consultant. These Findings of Fact (Findings) and Statement of Overriding Considerations have been prepared in accordance with CEQA (Public Resources Code Division 13 Sections 21000-21178) and the State CEQA Guidelines (Title 14 California Code of Regulations section 15000 et seq.). The purpose of these Findings is to satisfy the requirements of PRC Section 21081 and Title 14 California Code of Regulations (CCR) Sections 15090, 15091, 15092, 15093, and 15097 of the State CEQA Guidelines, in connection with the approval of an alternative to construct and operate the LMR System.

Having received, reviewed, and considered the foregoing information and recommendations of the LA-RICS staff, as well as any and all other information in the record and Chapter 1 herein, the LA-RICS Board for the Joint Powers Authority hereby makes Findings pursuant to and in accordance with Section 21081

of the Public Resources Code as presented in Chapters 2 through 6 of these Findings of Fact and Statement of Overriding Considerations.

1.2 Project

The proposed Project as described in the Draft EIR is the installation, and operation of LMR facilities at up to 90 sites; however, the Authority considered a total of 94 sites to provide alternate site locations if some sites subsequently were determined not to be viable during site feasibility assessments, system engineering, geotechnical evaluations, and permitting process or in lease agreement discussions with the property owner. Of these 94 sites, the Authority previously determined that 40 sites are statutorily exempt from CEQA under PRC Section 21080.25, the statutory CEQA exemption adopted specifically for LA-RICS, which, as discussed in Section 1.3.2 of the Draft EIR, exempts certain elements of LMR System from CEQA review so long as they meet certain criteria set forth in the exemption. The Draft EIR includes the remaining 54 sites that did not qualify for the statutory CEQA exemption.

Following publication of the Draft EIR and consideration of all comments received on the Draft EIR, and in light of additional feasibility determinations and design considerations, the Authority has identified 73 sites, out of the 94 originally under consideration, for construction as part of the LMR system. Twenty-nine (29) of these sites are among those statutorily exempt sites already approved by the Authority. The remaining forty four (44) sites analyzed in the EIR, listed in Table 1-1, are the subject of these Findings.

2.0 LA RICS – Land Mobile Radio System Project

2.1 Project Objectives

The Los Angeles region is designated as a high-threat area by the Department of Homeland Security (DHS). The LMR system would provide emergency responders with an improved communications system for an efficient and coordinated response to incidents and emergencies that presently is not possible in Los Angeles County.

Effective radio communication is critical in helping police officers prevent and respond to crimes, keeping firefighters safe as they fight blazes, facilitating life-saving exchanges of information between emergency medical service professionals and hospitals, and allowing public works and utility providers the opportunity to coordinate responses to disasters and special events. LMR would support a rapid, safe, and effective response during daily operations. Additionally, it would support a faster, better-coordinated, large-scale response to emergencies such as wildfires, earthquakes, civil disturbance, or other disasters. It would replace the existing aging patchwork of LMR systems with a single county-wide network and would improve overall system capacity and coverage for first and second responders region-wide.

In addition, most public safety entities currently use a portion the radiofrequency spectrum (ultra-high frequency [UHF] T-Band frequency spectrum at 470 to 512 megahertz [MHz]) that the Federal Communications Commission (FCC) has mandated be vacated by 2023. The LMR system would allow for phase-out of use of the UHF T-Band and transition to the use of the 700-MHz spectrums.

The objectives of the LMR Project are:

- 1) provide day-to-day voice and narrowband data radio communications for first and second emergency responders in the Los Angeles region;
- 2) enable interoperability among member agencies and mutual aid providers ;
- 3) support communication with regional, state, and federal agencies in the event of a natural or man-made disaster;
- 4) improve emergency communications within Los Angeles County;
- 5) add capacity, replace existing aging infrastructure with infrastructure that meets current building codes and telecommunications industry standards that better support modern technology, and provide for more technologically advanced equipment;
- 6) lessen the amount of interference resulting from multiple systems on the same tower by providing greater separation of different radio frequencies;
- 7) provide greater frequency flexibility and increase overall system coverage and capacity by providing greater separation of different radio frequencies; and

- 8) allow for transition from use of the UHF T-Band to the 700-MHz spectrum as mandated by the FCC.

2.2 Project Overview

The LMR system would consist of sites located in Los Angeles County and in adjacent portions of San Bernardino County in southern California that would contain the infrastructure and equipment necessary to provide voice communications coverage throughout Los Angeles County for emergency responders. The LMR Project would be a modern, integrated wireless voice and narrowband data communications system to serve law enforcement, fire service, health service, and public works professionals throughout Los Angeles County. The new system would provide day-to-day communications within and among agencies and allow seamless interagency communications for responding to routine, emergency, and catastrophic events. The LMR system would be composed of four different subsystems:

- 1) Digital Trunked Voice Radio System — provides first responders with radio communications utilizing digital technology. It seamlessly operates on two bands of spectrum (700 MHz and UHF)
- 2) Analog Conventional Voice Radio System — provides first responders with radio communications utilizing conventional analog technology
- 3) Los Angeles Regional Tactical Communications System — consists of local, state, and federal interoperability channels in four different bands of the spectrum in order to allow outside agencies responding to events in the County to have designated channels for communications
- 4) Narrowband Mobile Data Network — a data system that provides critical dispatch communications

The LMR system was designed to provide voice coverage throughout the Authority’s service area, which extends throughout Los Angeles County, with the fewest number of sites possible. Some LMR sites are outside Los Angeles County at locations with sufficient elevation and clear line of sight to achieve increased coverage within Los Angeles County. Locations were selected within or adjacent to existing communications facilities to the maximum extent feasible. The sites include a variety of types (e.g., water tanks, rooftops, police and fire stations, hospitals, mountain peaks, etc.). Most of these locations have existing communications equipment but do not necessarily have communication towers.

The LMR Project would include one or more network operations centers (NOCs) to provide for LMR system monitoring. The NOCs would have the capability of assessing equipment performance and remotely or locally managing the equipment and network to prevent degradation or failure of performance. The NOC(s) would operate 24 hours per day, seven days per week. NOC equipment would be installed internally in an existing facility, such as an existing commercial or public safety facility.

A detailed description of the site components, types, construction, and operation and maintenance is provided in Chapter 2 of the Draft EIR.

2.3 Summary of CEQA Compliance

A Notice of Preparation (NOP) of a Draft EIR accompanied by an Initial Study was distributed to the California State Clearinghouse and to other public agencies on August 26, 2014. The review period for the Initial Study was from August 26 to September 24, 2014. Scoping meetings were held September 11 through September 18, 2014, at the following California communities: Diamond Bar, Lancaster, Woodland Hills, San Pedro, and Lynwood.

Comments received on the Initial Study and during the scoping meetings were addressed in the Draft EIR where applicable.

The Authority published a Notice of Availability (NOA) for the Draft EIR on January 11, 2016, initiating a 45-day public review and comment period that ended on February 25, 2016. The State Agency review period ended on February 28, 2016. The NOA was published on the LA-RICS website (<http://www.la-rics.org/wp-content/uploads/2016/01/LA-RICS-LMR-DEIR-NOA-FINAL.pdf>). The availability of the Draft EIR and the dates of public meetings were advertised in the *Los Angeles Times* and other local newspapers.

Public meetings were hosted by the LA-RICS Authority from January 25 through February 16 in the following communities in California:

- Walnut: Walnut Senior Center, Assembly Room
21215, La Puente Road, Walnut CA
Monday January 25, 2016, 6:30 p.m.
- Canoga Park: Canoga Park Branch Library, Meeting Room
20939 Sherman Way, Canoga Park, CA 91303
Tuesday January 26, 2016, 6:30 p.m.
- Culver City: Culver City Veterans Memorial Building, Multipurpose Room
4117 Overland Ave., Culver City, CA 90230
Wednesday January 27, 2016, 6:30 p.m.
- Lancaster: Jane Reynolds Activity Center, Activity room
716 Oldfield St., Lancaster CA 93534
Thursday January 28, 2016, 6:30 p.m.
- San Pedro: Peck Park Community center, Auditorium
560 N. Western Ave. San Pedro, CA 90732
Tuesday February 2, 2016, 6:30 p.m.

- Avalon: Catalina Country Club, Dining Room
1 Country Club Drive, Avalon CA 90704
Monday February 16, 2016, 4:00 p.m.

A Final EIR for the project has been prepared in compliance with CEQA. The Final EIR includes the Draft EIR, incorporates and responds to comments received on the Draft EIR, and includes corrections and clarifications to the Draft EIR.

3.0 CEQA Findings

3.1 Findings Regarding Environmental Impacts Determined to be Less Than Significant or No Impact

3.1.1 Aesthetics

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Sites: AGH, AJT, ASD, BJM, BUR1, CPK, DPK, ENC1, FRP, FTP, GMT, GRM, H-17A, JPK, LACF072, LACFCP11, LARICSHQ, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PDC, PHN, PMT, PWT, RIH, SDW, SGH, SIM, SPN, SUN, TOP, TPK, TWR, VPK, WAD, WMP, WS1, WTR, ZHQ

Finding: At the sites identified above, the Project would result in no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.1 and applicable site summary forms in Chapter 4 of the Draft EIR, which is incorporated by reference herein. Construction and operation of the Project at these sites would not have a substantial adverse effect on scenic vistas.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.1 and applicable site summary forms in Chapter 4 of the Draft EIR, which is incorporated by reference herein. Construction and operation of the Project at all sites would not substantially damage scenic resources.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Sites: AGH, AJT, ASD, BJM, BUR1, CPK, DPK, ENC1, FRP, FTP, GMT, GRM, H-17A, JPK, LACF072, LACFCP11, LARICSHQ, LEPS, LPC, MMC, MML, MTL2, OAT, PDC, PHN, PMT, PWT, RIH, SDW, SGH, SIM, SPN, SUN, TOP, TPK, TWR, VPK, WAD, WMP, WS1, WTR, ZHQ

Finding: At the sites identified above, the Project would result in no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.1 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not substantially degrade existing visual quality or character at these sites or their surroundings.

AES-4: Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in less than significant impacts.

Rational for Finding: The above finding is made based on the analysis in Draft EIR Section 3.1 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at all sites would not create a new substantial source of light or glare.

3.1.2 Air Quality

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Sites: FRP, MMC

Finding: At the sites identified above, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.2 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not conflict with or obstruct implementation of the applicable air quality plan.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Sites: FRP, MMC

Finding: At the sites identified above, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.2 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by

reference herein. Construction and operation of the Project at these sites would not violate any air quality standard or contribute substantially to any air quality violation.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Sites: FRP, MMC

Finding: At the sites identified above, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.2 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not result in cumulatively considerable net increases of any criteria pollutant.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.2 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at all sites would not expose sensitive receptors to substantial pollutant concentrations.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.2 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at all sites would not result in objectionable odors that would affect a substantial number of people.

3.1.3 Biological Resources

BIO-1. Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in

local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service, or on any species that meets the criteria in CEQA Guidelines Section 15380 for endangered, rare or threatened?

Sites: ASD, LARICSHQ, PDC, SIM, WS1

Finding: At the sites identified above, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.3 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would have no impact either directly or through habitat modifications on any species identified as a candidate, sensitive, or special status by the California Department of Fish and Wildlife (CDFW) or U.S. Fish and Wildlife Service (USFWS) or any species meeting criteria in CEQA guidelines 15380 for endangered, rare, or threatened.

BIO-2. Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Sites: ASD, BJM, BUR1, CPK, DPK, ENC1, FRP, GMT, JPK, LARICSHQ, MMC, MTL2, PASPD01, PDC, PMT, PWT, SGH, SIM, SPN, SUN, TOP, TWR, VPK, WAD , WS1, WTR

Finding: At the sites identified above, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.3 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not have a substantial adverse effect on riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by CDFW or USFWS.

BIO-3. Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.3 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by

reference herein. Construction and operation of all sites would not result in substantial adverse effects on federally protected wetlands.

BIO-4. Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.3 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or impeded the use of native wildlife nursery sites.

BIO-5. Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Sites: AGH, ASD, FTP, H-17A, LARICSHQ, MMC, PASPD01, PDC, SDW, SGH, SIM, VPK, WAD , WS1

Finding: At the sites identified above, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.3 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not conflict with local policies or ordinances protecting biological resources.

BIO-6. Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.3 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would not conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other local, regional or state habitat conservation plan.

3.1.4 Cultural Resources

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in CCR §15064.5?

Sites: AGH, AJT, ASD, BJM, BUR1, CPK, DPK, FRP, FTP, GMT, GRM, H-17A, JOP, JPK, LACF072, LACFCP11 LARICSHQ, LEPS, MMC, MML, MTL2, OAT, PDC, PHN, PMT, RIH, SDW, SGH, SIM, SPN, SUN, TPK, TWR, VPK, WMP, WS1, WTR,

Finding: At the sites identified above, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.4 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not cause a substantial adverse change in the significance of a historical resource.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to CCR § 15064.5?

Sites: AGH, AJT, ASD, BJM, BUR1, CPK, DPK, FRP, FTP, GMT, GRM, H-17A, JOP, JPK, LACF072, LACFCP11 LARICSHQ, LEPS, MMC, MML, MTL2, OAT, PASPD01, PDC, PHN, PMT, RIH, SDW, SGH, SIM, SPN, SUN, TPK, TWR, VPK, WAD ,WMP, WS1, WTR,

Finding: At the sites identified above, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.4 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not cause a substantial adverse change in the significance of an archaeological resource.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Sites: BJM, BUR1, DPK, ENC1, FRP, FTP, GMT, JOP, JPK, LACF072, LACFCP11, LPC, MMC, MML, MTL2, PMT, SUN, TPK, TWR, VPK, WAD ,WMP, WTR,

Finding: At the sites identified above, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.4 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would have no impact on unique paleontological resources or unique geologic features.

CUL-4: Would the project disturb any human remains, including those interred outside formal cemeteries?

Sites: AGH, AJT, ASD, BJM, BUR1, CPK, DPK, FRP, FTP, GMT, GRM, H-17A, JOP, JPK, LACF072, LACFCP11, LARICSHQ, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PDC, PHN, PMT, RIH, SDW, SGH, SIM, SPN, SUN, TPK, TWR, VPK, WAD, WMP, WS1, WTR

Finding: At the sites identified above, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.4 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would have no impacts on any human remains, including those interred outside formal cemeteries.

CUL-5: Would the project cause a substantial adverse change in the significance of a Tribal cultural resource as defined in PRC Section 21074?

Sites: AGH, AJT, ASD, BJM, BUR1, CPK, DPK, FRP, FTP, GMT, GRM, H-17A, JOP, JPK, LACF072, LACFCP11, LARICSHQ, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PDC, PHN, PMT, RIH, SDW, SGH, SIM, SPN, SUN, TPK, TWR, VPK, WAD, WMP, WS1, WTR

Finding: At the sites identified above, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.4 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not impact Tribal cultural resources as defined in PRC Section 21074.

3.1.5 Geology / Soils

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving: Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Strong seismic ground shaking?

Seismic-related ground failure, including liquefaction?

Landslides?

Sites: AJT, LARICSHQ, PDC, SIM, WS1

Finding: At the sites identified above, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.5 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not expose people or structures to potential substantial adverse effects, including risk of loss, injury, or death, associated with faults, strong seismic shaking, seismic-related ground failure, or landslides.

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.5 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at all sites would not result in substantial soil erosion or loss of topsoil.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

Sites: AGH, AJT, BJM, BUR1, DPK, ENC1, FRP, GMT, JOP, LACF072, LARICSHQ, LPC, MMC, MML, OAT, PASPD01, PHN, PMT, PWT, SGH, SIM, SUN, TPK, TWR, WMP, WS1, WTR

Finding: At the sites identified above, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.5 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not be located on a geologic unit or soil that is unstable or would become unstable as a result of the project.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.5 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not create substantial risks to life and property due to expansive soils identified in Table 18-1-B of the Uniform Building Code (UBC).

3.1.6 Green House Gases

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.6 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would not directly or indirectly generate greenhouse gases (GHGs) that would result in a significant impact on the environment.

GHG-2: Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.6 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would not conflict with any plan, policy, or regulation adopted for the purposes of reducing GHG emissions.

3.1.7 Hazards and Hazardous Materials

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.7 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by

reference herein. Construction and operation of all Project sites would not create a significant hazard to the public or environment through routine transport, use, or disposal of hazardous materials.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.7 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions resulting in a release of hazardous materials into the environment.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school.

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.7 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Only two sites (LARICSHQ and PSDPD01) are located within 0.25 mile of an existing or proposed school. Construction and operation of all sites would not emit hazardous emissions. The use, transport, and disposal of hazardous materials, substances, or wastes will comply with federal, state, and local regulations.

HAZ-4: Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Sites: AGH, AJT, ASD, BJM, BUR1, CPK, DPK, ENC1, FRP, FTP, GMT, GRM, H-17A, JOP, JPK, LACF072, LACFCP11, LARICSHQ, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PHN, PMT, PWT, RIH, SDW, SGH, SIM, SPN, SUN, TOP, TPK, TWR, VPK, WAD, WMP, WS1, WTR, ZHQ

Finding: At the sites identified above, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.7 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. The Project, at the sites identified above, would not be constructed or operated on hazardous material sites listed pursuant to Government Code Section 65962.5.

HAZ-5: For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Sites: AGH, AJT, ASD, BJM, BUR1, CPK, DPK, ENC1, FRP, FTP, GMT, GRM, H-17A, JOP, JPK, LACF072, LACFCP11, LARICSHQ, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PDC, PHN, PMT, PWT, RIH, SGH, SIM, SPN, SUN, TOP, TPK, TWR, VPK, WAD, WMP, WS1, WTR, ZHQ

Finding: At the sites identified above, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.7 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not result in a safety hazard for people because the sites are not located within 2 miles of a public airport or public use airport.

HAZ-6: For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.7 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would not result in a safety hazard for people because the sites are not within the vicinity of a private airstrip.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.7 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would not impair

implementation of or physically interfere with an adopted emergency response or evaluation plan.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Sites: ASD, LARICSHQ, PASPD01, PDC, SGH, WS1

Finding: At the sites identified above, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.7 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not would not expose people or structures to a significant risk of loss, injury, or death involving wildland fires.

3.1.8 Hydrology / Water Quality

WQ-1: Would the project violate any water quality standards or waste discharge requirements?

Sites: AJT, LARICSHQ, PDC, SGH, SIM WAD, WS1

Finding: At the sites identified above, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.8 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not violate any water quality standard or waste discharge requirement.

WQ-2: Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of preexisting nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.8 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge.

WQ-3: Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on or off site?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.8 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation at all Project sites would not substantially alter existing drainage patterns of the site or area that would result in substantial erosions or siltation on or off site.

WQ-4: Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.8 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation at all Project sites would not substantially alter existing drainage patterns of the site or area that would substantially increase surface runoff in a manner that would result in flooding on or off site.

WQ-5: Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.8 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation at all Project sites would not create or contribute to runoff water which would exceed capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.

WQ-6: Would the project otherwise substantially degrade water quality?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.8 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation at all Project sites would not otherwise substantially degrade water quality.

WQ-7: Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.8 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation at all Project sites would not place structures within a 100-year flood hazard area that would impede or redirect flood flows.

WQ-8: Would the project expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.8 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation at all Project sites would not expose people or structures to a significant risk or loss, injury, or death involving flooding.

WQ-9: Would the project expose people or structures to a significant risk of loss, injury, or death from inundation by seiche, tsunami, or mudflow?

Sites: AGH, AJT, ASD, BJM, BUR1, CPK, DPK, FRP, FTP, GMT, GRM, H-17A, JOP, JPK, LACF072, LACFCP11, LARICSHQ, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PDC, PHN, PMT, RIH, SDW, SGH, SIM, SPN, SUN, TOP, TPK, TWR, VPK, WAD, WMP, WS1, WTR, ZHQ

Finding: At the sites identified above, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.8 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation at these Project sites would not expose people or structures to a significant risk of loss, injury, or death from inundation by seiche, tsunami, or mudflow.

3.1.9 Land Use

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.9 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would not conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the , adopted for the purpose of avoiding or mitigating an environmental effect.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.9 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would not conflict with any applicable HCP or NCCP.

3.1.10 Noise

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.10 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation at all Project sites would not expose persons to generation of noise levels in excess of standards established in the local general plan or noise ordinance or applicable standards of other agencies.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Sites: AGH, AJT, ASD, BJM, BUR1, CPK, DPK, FRP, FTP, GMT, GRM, H-17A, JOP, JPK, LACFCP11, LARICSHQ, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PHN, PMT, PWT, RIH, SIM, SPN, SUN, TOP, TPK, TWR, VPK, WMP, WTR

Finding: At the sites identified above, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.10 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation at these Project sites would not expose persons to or the generation of excessive groundborne vibration or noise levels.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Sites: AGH, AJT, ASD, BJM, BUR1, CPK, DPK, FRP, FTP, GMT, GRM, H-17A, JOP, JPK, LACFCP11, LARICSHQ, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PHN, PMT, PWT, RIH, SIM, SPN, SUN, TOP, TPK, TWR, VPK, WMP, WTR

Finding: At the sites identified above, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.10 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation at these Project sites would not result in a substantial temporary or periodic increase in ambient noise levels above levels existing without the project.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.10 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation at all Project sites would not expose people residing or working in the area to excessive noise levels.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.10 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation at all Project sites would not expose people residing or working in the area to excessive noise levels.

3.1.11 Recreation

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.11 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would not increase the use of existing neighborhood or regional parks or other recreational facilities.

3.1.12 Transportation / Traffic

TRANS-1: Would the project conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and nonmotorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.12 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would not conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system.

TRANS-2: Would the project conflict with an applicable congestion management program, including, but not limited to, level of service standards and travel demand measures or other standards established by the county congestion management agency for designated roads or highways?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.12 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would not conflict with an applicable congestion management program.

TRANS-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Sites: AGH, AJT, ASD, BUR1, CPK, ENC1, FRP, FTP, GMT, GRM, H-17A, JOP, JPK, LACF072, LACFCP11, LARICSHQ, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PDC, PHN, PMT, PWT, RIH, SIM, SPN, SUN, TOP, TPK, TWR, VPK, WAD, WMP, WS1, WTR, ZHQ

Finding: At the sites identified above, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.12 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not result in a change in air traffic patterns.

TRANS-4: Would the project result in inadequate emergency access?

Sites: AGH, AJT, BJM, BUR1, CPK, DPK, ENC1, FRP, FTP, GMT, GRM, H-17A, JOP, JPK, LACF072, LACFCP11, LEPS, LPC, MMC, MML, MTL2, OAT, PHN, PMT, PWT, RIH, SDW, SPN, SUN, TOP, TPK, TWR, VPK, WAD, WMP, WTR

Finding: At the sites identified above, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.12 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not result in inadequate emergency service.

3.1.13 Utilities / Service Systems

UTL-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Sites: AJT, LARICSHQ, PDC, SGH SIM, WAD, WS1

Finding: At the sites identified above, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.13 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of the Project at these sites would not exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board (RWQCB).

UTL-2: Would the project require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.13 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would not require or result in construction of new or expansion of existing stormwater drainage facilities.

UTL-3: Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in either no impact or less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.13 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would have sufficient water supplies based on existing entitlements and resources and would not require new or expanded entitlements.

UTL-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in less than significant impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.13 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation at all Project sites would be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs.

UTL-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Sites: All sites identified in Table 1-1.

Finding: At all sites identified in Table 1-1, the Project would result in no impacts.

Rationale for Finding: The above finding is made based on the analysis in Draft EIR Section 3.13 and applicable site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. Construction and operation of all Project sites would comply with federal, state, and local solid waste statutes and regulations.

3.2 Findings Regarding Environmental Impacts Determined to Be Significant but Would Be Mitigated to a Less Than Significant Level

3.2.1 Aesthetics

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Sites: PASPD01 (discussed at Draft EIR, Pg. 4-1219)¹

Site PASPD01 is within the City of Pasadena’s historic civic center area. The project includes a new 70-foot monopole with attached antennas, along with the associated equipment and equipment shelter. These elements would not be compatible with the civic center’s distinctive Beaux Arts architectural style and feeling. The new structures would represent another “abandonment of architectural standards” that would not be consistent with the setting that led to formation of the historic district. Impacts would be significant.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in the Section 3.1 of the Final EIR and site summary form in Chapter 4 of the DEIR. These changes are set forth in **Mitigation Measure CUL MM 5: Architectural Resources Protection and Camouflage (see Section 3.2.4).**

Rationale for Finding: Architectural Resources Protection and Camouflage shall be sympathetic to the existing landscape, and visually compatible with the surrounding architecture, and acceptable to the property owner and/or host community and minimizing degradation of the character and quality of the site and surrounds. Implementation of CUL MM 5 would mitigate degradation of the existing visual character and quality associated with the construction and operation of the PASPD01 to below the level of significance.

3.2.2 Air Quality

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Sites: AGH (Pg. 4-1), AJT (Pg. 4-38), ASD (Pg. 4-74), BJM (Pg. 4-110), BUR1 (Pg. 4-185), CPK (Pg. 4-296), DPK (Pg. 4-335), ENC1 (Pg. 4-372), FTP (Pg. 4-490), GMT (Pg. 4-528), GRM (Pg. 4-566), H-17A (Pg. 4-604), JOP (Pg. 4-682), JPK (Pg. 4-721), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915), LARICSHQ (Pg. 4-954), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MML (Pg. 4-1104), MTL2 (Pg. 4-1142), OAT (Pg. 4-1181), PASPD01 (Pg. 4-1219), PDC (Pg. 4-1256), PHN (Pg. 4-1294), PMT (Pg. 4-1332), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SGH (Pg. 4-1487), SIM (Pg. 4-1526), SPN

¹ Unless otherwise noted, all page numbers refer to pages in the Draft EIR that contain relevant site-specific analysis, which is incorporated by reference herein.

(Pg. 4-1563), SUN (Pg. 4-1603), TOP (Pg. 4-1722), TPK (Pg. 4-1762), TWR (Pg. 4-1799), VPK (Pg. 4-1836), WAD (Pg. 4-1872), WMP (Pg. 4-1913), WS1 (Pg. 4-1952), WTR (Pg. 4-1990), ZHQ (Pg. 4-2026)

Simultaneous construction of all these Project sites located in the South Coast Air Basin (SCAB) would exceed significance thresholds for nitrogen oxides (NO_x), a precursor for ozone (O₃), and could conflict with or obstruct implementation of the South Coast Air Quality Management District (SCAQMD) Plan. Impacts would be significant.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.2 and in the site summary forms in Chapter 4 of the Draft EIR. These changes are set forth in **Mitigation Measure AQ MM 1** below.

AQ MM 1: No later than 12:00 p.m. on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NO_x emissions from all construction activities at all Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) if combined NO_x emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which USEPA regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NO_x emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

Rationale for Finding: The contractor will be required to forecast Project emissions based on actual equipment that would be operating. Data would be provided and verified by the Authority, and no exceedance of NO_x standards will be permitted. Implementation of AQ MM 1 would mitigate air emission from Project site construction so that the Project would not conflict or obstruct implementation with the SCAQMD Plan. Implementation of Mitigation Measure AQ MM 1 would reduce construction emissions to below the level of significance.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Sites: AGH (Pg. 4-1), AJT (Pg. 4-38), ASD (Pg. 4-74), BJM (Pg. 4-110), BUR1 (Pg. 4-185), CPK (Pg. 4-296), DPK (Pg. 4-335), ENC1 (Pg. 4-372), FTP (Pg. 4-490), GMT (Pg. 4-528), GRM (Pg. 4-566), H-17A (Pg. 4-604), JOP (Pg. 4-682), JPK (Pg. 4-721), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915), LARICSHQ (Pg. 4-954), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MML (Pg. 4-1104), MTL2 (Pg. 4-1142), OAT (Pg. 4-1181), PASPD01 (Pg. 4-1219), PDC (Pg. 4-1256), PHN (Pg. 4-1294), PMT (Pg. 4-1332), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SGH (Pg. 4-1487), SIM (Pg. 4-1526), SPN (Pg. 4-1563), SUN (Pg. 4-1603), TOP (Pg. 4-1722), TPK (Pg. 4-1762), TWR (Pg. 4-1799), VPK (Pg. 4-1836), WAD (Pg. 4-1872), WMP (Pg. 4-1913), WS1 (Pg. 4-1952), WTR (Pg. 4-1990), ZHQ (Pg. 4-2026)

Simultaneous construction of these sites located in the SCAB would exceed significance thresholds for NO_x, a precursor for O₃, and would result in violation of the SCAQMD threshold for daily NO_x emissions during construction and would contribute to the SCAB nonattainment status for O₃. Impacts would be significant.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.2 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure AQ MM 1** previously discussed above under AQ-1.

Rationale for Finding: The contractor will be required to forecast Project emissions based on actual equipment that would be operating. Data would be provided and verified by the Authority; and no exceedance of NO_x standards will be permitted, which would ensure NO_x emissions do not violate any air quality standard or contribute substantially to an existing or projected air quality violation. Implementation of Mitigation Measure AQ MM 1 would reduce construction emissions to below the level of significance.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Sites: AGH (Pg. 4-1), AJT (Pg. 4-38), ASD (Pg. 4-74), BJM (Pg. 4-110), BUR1 (Pg. 4-185), CPK (Pg. 4-296), DPK (Pg. 4-335), ENC1 (Pg. 4-372), FTP (Pg. 4-490), GMT (Pg. 4-528), GRM (Pg. 4-566), H-17A (Pg. 4-604), JOP (Pg. 4-682), JPK (Pg. 4-721), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915), LARICSHQ (Pg. 4-954), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MML (Pg. 4-1104), MTL2 (Pg. 4-1142), OAT (Pg. 4-1181), PASPD01 (Pg. 4-1219), PDC (Pg. 4-1256), PHN (Pg. 4-1294), PMT (Pg. 4-1332), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SGH (Pg. 4-1487), SIM (Pg. 4-1526), SPN

(Pg. 4-1563), SUN (Pg. 4-1603), TOP (Pg. 4-1722), TPK (Pg. 4-1762), TWR (Pg. 4-1799), VPK (Pg. 4-1836), WAD (Pg. 4-1872), WMP (Pg. 4-1913), WS1 (Pg. 4-1952), WTR (Pg. 4-1990), ZHQ (Pg. 4-2026)

Simultaneous construction of these sites located in the SCAB would exceed significance thresholds for NO_x, a precursor for O₃, and would result in cumulatively considerable net increases in O₃ from the NO_x emissions. Impacts would be significant.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.2 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure AQ MM 1** previously discussed above under AQ-1.

Rationale for Finding: The contractor will be required to forecast Project emissions based on actual equipment that would be operating. Data would be provided and verified by the Authority, and no exceedance of NO_x standards will be permitted; therefore, the Project would not result in a cumulatively considerable net increase in any pollutant for which the SCAB is in nonattainment. Implementation of Mitigation Measure AQ MM 1 would reduce construction emissions to below the level of significance.

3.2.3 Biological Resources

BIO-1. Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service, or on any species that meets the criteria in CEQA Guidelines Section 15380 for endangered, rare or threatened?

Sites: AGH (Pg. 4-1), AJT (Pg. 4-38), BJM (Pg. 4-110), BUR1 (Pg. 4-185), CPK (Pg. 4-296), DPK (Pg. 4-335), ENC1 (Pg. 4-372), FTP (Pg. 4-490), GMT (Pg. 4-528), GRM (Pg. 4-566), H-17A (Pg. 4-604), JOP (Pg. 4-682), JPK (Pg. 4-721), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MML (Pg. 4-1104), MTL2 (Pg. 4-1142), OAT (Pg. 4-1181), PASPD01 (Pg. 4-1219), PHN (Pg. 4-1294), PMT (Pg. 4-1332), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SGH (Pg. 4-1487), SPN (Pg. 4-1563), SUN (Pg. 4-1603), TOP (Pg. 4-1722), TPK (Pg. 4-1762), TWR (Pg. 4-1799), VPK (Pg. 4-1836), WAD (Pg. 4-1872), WMP (Pg. 4-1913), WTR (Pg. 4-1990), ZHQ (Pg. 4-2026)

The analysis included the review of 112 special status plant species and 74 special status wildlife species to determine potential impacts due to construction or operations at any of these Project sites. Impacts to special status species would be significant.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.3 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measures BIO MM 1 through BIO MM 24** below.

BIO MM 1 Mitigation Monitoring and Reporting Plan

Prior to construction, the Authority shall develop and implement or require the system contractor to develop and implement a mitigation monitoring and reporting plan (MMRP) for the Project. The MMRP would serve to organize environmental compliance requirements identified in best management practices, mitigation measures, permit requirements, real property agreement conditions, coordination with the land management agency(s), and other applicable sources. The MMRP shall contain an organization chart and communication plan for environmental compliance as it relates to the Project.

BIO MM 2 Worker Environmental Awareness Program

Prior to construction, the Authority shall develop and implement, or require the system contractor to develop and implement, including coordination with the respective land management agency, a Worker Environmental Awareness Program (WEAP) for the Project. This mitigation measure would serve to institute and formalize an education program to increase awareness of environmental resources and measures and rules that are in place to help minimize impacts to those resources.

- a) A WEAP shall be developed and shall be required for all construction employees prior to placement of Project equipment, construction, or any ground-disturbing activities at the Project site. Training of additional workers, contractors, and visitors shall be provided, as needed.
- b) The WEAP is to inform on-site workers of the possible presence of special status species, the measures to be taken to protect these species, and the importance of minimizing impacts to the natural environment through the protection of native vegetation, adhering to required buffers and protection zones, staying on existing roads, and implementing best management practices that include containment of any spills, disposal of trash, and management of runoff and sediment transport.

- c) To assure long-term implementation of mitigation measures, an information sheet listing potential sensitive species and what to do if any are encountered shall be prepared, distributed to workers, and posted on site.

BIO MM 3 Biological Compliance Reporting

A biological monitor shall visit all active construction sites at least once weekly to document compliance and provide reports to the Project administrator on a weekly basis.

BIO MM 4 Site Sanitation

- a) The contractor shall keep a regulated work area free of litter and trash. Trash and discarded food items shall be contained within an appropriate receptacle and removed daily to avoid attracting wildlife to the construction site, contribute to habituation of wildlife to the presence of humans, or to attract avian or mammalian predators to the area.
- b) All construction debris (including nuts, bolts, small pieces of wire, etc.) shall be cleaned up (e.g., trash removed, scrap materials picked up) each day that work is conducted to minimize the likelihood of wildlife visiting the site and consuming microtrash, discarded food, or other substances.

BIO MM 5 Hazardous Materials Management

- a) A toxic substance management and spill response plan shall be prepared by the contractor for review and approval by the Authority.
- b) Hazardous materials shall be contained; spills shall be prevented; and any spills at the Project site or along access roads shall be contained and cleaned up immediately.
- c) All construction vehicles are required to carry at least one spill response kit.
- d) Any spills shall be accounted for in reports prepared by the biological/environmental monitor.

BIO MM 6 Anti-perch Devices

Anti-perch devices shall be affixed to any elevated, horizontal structure (this includes the top quarter-arc of disc antennas) suitable for perching or nesting by

raptors, ravens, vultures, gulls, or other large birds to deter the use of these facilities as perch or nest sites to avoid attracting avian predators to the area, and so as not to contribute to the habituation of condors to the presence of humans. Anti-perch devices shall be inspected annually and repaired as needed.

BIO MM 7 California Condor Protection

- a) As part of BIO MM 4 Site Sanitation, a written list of procedures shall be established and posted on site and/or kept in a site binder at all times. Specifically, the protocol shall list requirements including: all trash of any size shall be placed and contained in covered containers; and no trash of any kind shall be released to the environment. This includes any food items, small or large pieces of plastic or wire, and any small metallic objects (i.e., nuts, bolts, wire nuts).
- b) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of California condors. A qualified biologist shall prepare an informational handout to be presented at WEAP instruction. This program and handout shall provide, at a minimum, information concerning the biology and distribution of the California condor, legal status, and possible occurrence in the vicinity; measures to avoid impacts to condors; procedures to be implemented to eliminate microtrash from the site; and what to do in case of California condor encounters. The informational handout shall be posted at the Project site for continued reference by construction and maintenance workers.
- c) During construction and operations of the facility, all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the Project site. If condors are on site, USFWS would be contacted immediately (Ventura office: 805-644-1766) following internal chain-of-command communications protocol. Once condors leave on their own accord or as a result of techniques employed by permitted USFWS personnel, on-site work may continue.
- d) If condors are known to be present in the area and found roosting within 0.5 mile of the Project site, no construction activity shall occur between one hour before sunset and one hour after sunrise or until the condors leave the area.
- e) If condors are documented nesting within 1.5 miles of a Project site (as determined by nesting bird surveys, observations by the biological monitor, and/or information from USFWS condor program), no

construction activity shall occur until further authorization is received from USFWS.

- f) The Project site shall be maintained in a clean condition at all times.
- g) All wires, cables, and other items, either temporary or permanent, that could entangle a condor are to be securely fastened down or removed from site. No permanent guy wires will be used.
- h) As part of BIO MM 3 Biological Compliance Reporting, the environmental monitor shall verify at least once a week during active construction and upon completion of construction activities that the Project site is maintained in a clean condition.

BIO MM 8 Biological Monitoring

A qualified biological monitor shall be present at the site during construction activities that result in ground disturbance or removal of vegetation to ensure all mitigation measures are met. Duties of the biological monitor include checking for the presence of wildlife on the construction site, inspecting trenches or holes for trapped wildlife, surveying for the presence of nesting birds and adherence to nesting bird protection buffers, monitoring construction site boundaries, and checking that vegetation flagged for protection is not disturbed.

BIO MM 9 Protect Native Vegetation and Common Wildlife

- a) Minimize disturbance to native perennial plants; new ground disturbance shall be the minimum necessary and established and delineated prior to any earth-moving activities.
- b) If native perennial vegetation cannot be avoided and would be impacted or destroyed, the disturbance area is to be surveyed for the presence of special status plants and to remove common species of wildlife prior to destruction of the vegetation.
- c) At no time shall protected species be handled or moved. If a protected species is found within the construction area, all work that may impact that animal shall cease and the appropriate agency(s) shall be contacted (e.g., USFWS, CDFW, land management agency). The animal shall be allowed to leave the site on its own accord.

- d) Prior to construction or any ground-disturbance activities, mark the construction disturbance limits and monitor for adherence to these boundaries.
- e) Stay on existing roads.
- f) Do not remove native trees; construction limits shall be established to avoid walnuts, oaks, and any other sensitive species habitat and the limits shall be flagged by a biological monitor.
- g) Protect tree root systems by precluding paving, trenching, or other ground disturbing activities; and preclude heavy equipment from driving, parking, or staging within the tree's dripline.
- h) Any loss of native perennial vegetation, whether planned or unintentional, is to be accounted for in reports prepared by the biological monitor.

BIO MM 10 No Pets

Construction and maintenance workers shall be prohibited from bringing pets (especially dogs) to non-urban Project sites, as the domestic animal may harass or kill native wildlife present at the site.

BIO MM 11 Site Access

- a) On access roads operate all vehicles within the posted speed limits.
- b) If access road speed limits are not posted, do not exceed 15 miles per hour (mph).
- c) Adjust vehicle speed as appropriate to road conditions; avoid causing ruts and gullies; and minimize dust.
- d) Watch for wildlife on roads (including amphibians, snakes, rodents, and tortoises), especially during rainy periods, and avoid running them over.
- e) Look under parked vehicles for the presence of wildlife (especially desert tortoise) before pulling away to avoid running over wildlife.
- f) Do not park on or drive over native perennial vegetation.
- g) Avoid cutting corners on access roads and impacting vegetation when large equipment and trailers are brought to the Project site.

- h) Do not drive off the designated roadway or make any modifications to the road or road shoulders.

BIO MM 12 Coastal California Gnatcatcher Protection

- a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of coastal California gnatcatchers in the area and the importance of maintaining coastal sage scrub vegetation.
- b) As part of BIO MM 9 Protect Native Vegetation and Common Wildlife, disturbance to native perennial vegetation, especially coastal sage scrub vegetation (e.g., California sagebrush, sage, laurel sumac, and California buckwheat), would be minimized. Surveys shall be conducted by a qualified biologist for the presence of coastal sage scrub perennial vegetation, and plants not identified for removal within or near the construction zone shall be marked for protection.
- c) As part of BIO MM 3 Biological Compliance Reporting, the environmental monitor shall verify at least once a week during active construction and upon completion of construction activities that habitat protection measures have been followed.
- d) At Project sites H-17A, PHN, and RIH, a higher level of protection is required to ensure that gnatcatchers are not present when construction activities would occur and adverse effects would be avoided. For Project sites that include known or suspected gnatcatcher nesting or otherwise include suitable nesting habitat where the bird is expected to be present, the following mitigation measure is to ensure the highest level of protection to the bird. All the above measures (BIO MM 1 through BIO MM 3, and BIO MM 8 through BIO MM 12) apply as well as:

BIO MM 13 Coastal California Gnatcatcher Breeding Season Restrictions

Construction activities that include loud noises (e.g., trenching, drilling, concrete cutting), the use of large equipment (e.g., booms, cranes, drills, concrete pouring), or the removal of perennial vegetation shall be precluded between February 15 and August 30. This measure is applicable to identified Project sites where coastal California gnatcatchers are known to be or likely would be present, and construction activities may result in disturbance to the bird.

BIO MM 14 Coastal California Gnatcatcher Protocol Surveys

- a) To determine if coastal California gnatcatchers are present within 500 feet of specified Project sites and if breeding season restrictions would be required, surveys following the most recent version of the USFWS Coastal California Gnatcatcher Presence/Absence Survey Protocol (current revision issued by USFWS Carlsbad Office 1997) shall be conducted prior to initiating any construction activities that may result in ground disturbance or loud noises during the gnatcatcher breeding season (February 15 through August 30). This protocol requires call-playback surveys by a permitted biologist, conducting a minimum of six surveys at least one week apart between March 15 and June 30 (additional survey requirements are presented in the protocol).
- b) If adult, nesting, or fledgling gnatcatchers are detected even once within 500 feet of the Project site, or if surveys are not completed in compliance with the protocol, BIO MM 13 Coastal California Gnatcatcher Breeding Season Restrictions shall apply to the site, precluding any construction activities that include loud noises (e.g., trenching, drilling, concrete cutting), the use of large equipment (e.g., booms, cranes, drills, concrete pouring), or the removal of perennial vegetation between February 15 and August 30.
- c) If no adult, nesting, or fledgling gnatcatchers are detected within 500 feet of the Project site, construction activities may commence beginning July 1 through February 14.
- d) Survey requirements shall be applied each year that construction activities take place at the Project site.

BIO MM 15 Southwestern Willow Flycatcher Protection

- a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of southwestern willow flycatchers in the area and the importance of maintaining riparian vegetation.
- b) As part of BIO MM 9 Protect Native Vegetation and Common Wildlife, disturbance to native perennial vegetation, especially riparian species (e.g., sycamore, cottonwood, willow), would be minimized; no ground-disturbing activities or removal of vegetation would occur within stream corridors or floodplains. Prior to construction, surveys for the presence of riparian vegetation shall be conducted by a qualified biologist, and

those plants within or near the construction zone not identified for removal shall be marked for protection and monitored for adherence to these boundaries.

BIO MM 16 Snowy Plover Protection

- a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of western snowy plover in the area and the importance of not disturbing nesting birds.
- b) If construction occurs between February 1 and July 31, prior to beginning construction a biological monitor shall verify through coordination with USFWS and on-site surveys that no breeding western snowy plovers are using the Project site or are within 500 feet of any Project activity.
- c) If plovers are nesting in the vicinity, BIO MM 8 Biological Monitoring would apply, and a 500-foot protection buffer shall be required where no construction activities may occur while birds remain in the area.

BIO MM 17 Raptor Protection

- a) If construction activities occur during the American peregrine falcon, bald eagle, golden eagle, long-eared owl, or burrowing owl breeding period, January 1 through July 31, preconstruction surveys would be conducted in all suitable habitats within 500 feet of the Project site as well as within a species-appropriate distance beyond the 500-foot buffer based on line of sight between potential nesting habitat and the construction site.
- b) If construction takes place during the breeding period, the biological monitor shall contact appropriate land management and resource agencies to ascertain if they have any current information on raptor nesting activities in the general vicinity of the Project sites.
- c) If an active American peregrine falcon, bald eagle, golden eagle, long-eared owl, or burrowing owl nest is discovered within 500 feet of the construction site, work shall not be undertaken at that site until the nest is no longer active, with an additional five days to allow the fledging birds to disperse. An active nest is defined as one that is attended, built, maintained, or used by a pair of birds during a given breeding season, whether or not eggs are laid; a nest is considered inactive if not attended to for a period of 10 days or longer.

- d) If an active American peregrine falcon, bald eagle, golden eagle, long-eared owl, or burrowing owl nest is discovered between 500 feet and 0.5 mile of the construction site, the potential for disturbance of the nesting birds would be evaluated based on line-of-sight, degree of potentially disturbing activities, and other site-specific factors. If the CDFW and land management agency concur, the protection buffer distance may be reduced.

BIO MM 18 Nesting Bird Protection

- a) It is preferred that removal of trees or large tree limbs and other vegetation removal activities such as grubbing or shrub clearing avoid the typical bird nesting season of January 1 through September 15.
- b) If construction activities occur during the bird nesting season, and to prevent disturbance to or destruction of nests of protected native bird species that could occur as a result of vegetation removal, disturbance, or other on-site construction activities, preconstruction surveys for nesting birds shall be conducted by a qualified biological monitor within 10 calendar days prior to on-site construction-related disturbance activities from March 1 through September 15 for non-raptors, and January 1 through July 31 for raptors.
- c) If nesting protected non-raptor species are detected, a 300-foot avoidance buffer shall be implemented; a 500-foot avoidance buffer would be applied to any active nest of a raptor or other species of special status bird.
- d) Appropriate site-specific buffers may be established with the approval of a Project designated avian expert, based in part on the species of nesting bird present, location of nest, nesting phenology, magnitude of potential disturbance, and other site conditions (e.g., levels of ambient noise; line-of-sight).
- e) If construction activities would occur within the general buffer distances for active nests (300 feet for non-raptors, 500 feet for raptors, and up to 1.5 miles for condors and eagles), a Biological Monitor must be present during those activities.
- f) No active nests may be destroyed; inactive bird nests may be destroyed as part of vegetation removal but may not be reduced to possession.

- g) Between September 16 and December 30, grubbing, shrub clearing, and tree/limb removal activities are not subject to restrictions based on the protection of migratory birds.
- h) Comply with the USFWS Office of Migratory Birds voluntary guidelines (USFWS 2013a) for communications tower placement, construction, and operation.
- i) For any towers that must exceed 199 feet in height, lighting requirements would be designed in cooperation with FAA and USFWS Office of Migratory Birds to minimize attraction and resulting mortality of migratory birds.

BIO MM 19 Trenches and Holes Management

- a) The contractor shall cover or backfill all trenches the same calendar day they are opened, where practicable.
- b) If trenches or holes cannot be closed the same day they are made, covers shall be firmly secured at ground level in such a way that small wildlife cannot slip beneath. At sites that require the presence of a biological monitor, trench covers shall be approved by the monitor.
- c) Open trenches shall be inspected regularly throughout the day and prior to filling to remove any trapped common wildlife (e.g., small mammals, reptiles, amphibians) and to check for the presence of protected wildlife species (e.g., arroyo toad) at Project sites that require the presence of a biological monitor.
- d) If a protected wildlife species is present in the trench, the on-site Biological Monitor shall contact USFWS immediately, ensure the protected species is not in immediate danger, and wait for instruction by USFWS.
- e) Covered trenches and holes at sites where biological monitors are present are to be inspected by the monitor at the end of the work day and prior to initiating construction activities the next day.
- f) In locating trenches or holes, disturbance to natural vegetation, including plant root systems shall be minimized.
- g) Prior to trenching, the construction disturbance limits and monitor for adherence to these boundaries shall be marked.

BIO MM 20 Santa Catalina Island Fox Protection

- a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of the Santa Catalina Island fox and the measures to be taken to avoid impacts to the fox.
- b) Prior to initiation of construction activities, the Project site plus a 250-foot buffer shall be inspected by a qualified biologist for the presence of Santa Catalina Island fox dens; if a den is located, no construction activities may be initiated and USFWS and CDFW shall be contacted.
- c) As part of the BIO MM 8 Biological Monitoring, the biological monitor shall inspect the work area, including equipment storage sites and staging areas, for the presence of foxes each day prior to initiation of on-site work. Construction equipment that may be used as hiding cover by a fox (e.g., open pipes, equipment piles) shall be inspected prior to moving.

BIO MM 21 Protected Amphibian Protection

- a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of protected amphibians (i.e., arroyo toad, California red-legged frog, mountain yellow-legged frog - southern California DPS) in the area and along access roads, and the measures to be taken to avoid impacts to these amphibians.
- b) As part of BIO MM 1 Biological Monitoring, the Biological Monitor shall be present during site preparation and placement of Project equipment. The monitor shall inspect the work area, including equipment storage sites and staging areas, for the presence of protected amphibians each day prior to initiation of on-site construction work following a measureable rain event (≥ 0.01 inch) while construction is ongoing.
- c) To protect dispersing frogs and toads, no Project-related on-site ground-disturbing activities or construction-related travel on access roads shall occur during the night or during rainy periods (within 24 hours of a measureable [≥ 0.01 inch] precipitation event or within 48 hours of a major [≥ 0.1 inch] precipitation event).
- d) To protect dispersing frogs and toads during normal site operations (non-emergency situations), these Project sites shall not be accessed by maintenance workers during the night or during rainy periods (within 24 hours of a measureable [≥ 0.01 inch] precipitation event or within 48

hours of a major [≥ 0.1 inch] precipitation event) (emergency situations are exempted).

- e) If a protected amphibian (i.e., arroyo toad, California red-legged frog, mountain yellow-legged frog - southern California DPS) is found within 50 feet of the construction site, all work that involves moving vehicles or ground disturbance shall cease until the animal moves on its own accord.
- f) If protected amphibians are present on the road, vehicles shall stop until the individual(s) move out of harm's way on their own accord.

BIO MM 22 Monarch Butterfly Protection

- a) Preconstruction surveys by a qualified biologist shall provide for a thorough examination of suitable roost trees to determine if butterflies are using the site for roosting; surveys shall be repeated once a week throughout the construction period.
- b) If butterflies are found roosting in the area, a protection buffer of 50 feet shall be established around each roost; and no construction activities would be undertaken within the buffer area while butterflies are roosting.
- c) Loss of trees or removal of large limbs on trees that may provide suitable roost habitat for monarch butterflies shall be avoided.

BIO MM 23 Prevent the Spread of Nonnative Vegetation

- a) All ground disturbed by construction activities that would not be paved, landscaped, or otherwise permanently stabilized (e.g., graveled, soil compaction) shall be seeded using species native to the Project vicinity.
- b) To prevent the introduction of invasive species seeds, all earthmoving and hauling equipment shall be inspected at the equipment storage facility to remove soil and vegetation; and the equipment shall be washed prior to entering the construction site.
- c) To prevent invasive species seeds from leaving the site, all construction equipment shall be inspected, and all attached plant/vegetation and soil/mud debris shall be removed prior to leaving the construction site.

BIO MM 24 Special Status Plants Surveys and Protection

- a) As part of BIO MM 2 WEAP, construction crews shall be informed prior to the onset of construction activities of the possible presence of special status plants in the area and the importance of maintaining native vegetation.
- b) At identified sites, surveys for special status plants shall be conducted by a qualified botanist prior to ground-disturbing activities, in the proper season and in suitable habitat surrounding the Project site or any area subject to ground disturbance, including access roads.
- c) If a special status plant is found to be present or if surveys are determined to be inconclusive, the areas requiring special protection would be marked prior to construction to provide a buffer to maintain the ecological context of the location at which the plant was found.
- d) Mitigation measure BIO MM 8 Biological Monitoring shall apply at Project sites where special status plants or their habitat are present, and protection buffers would be monitored for compliance.

Rationale for Finding: As described in detail in Section 3.3 of the Draft EIR, the Project would avoid substantial adverse effects on species and habitat through worker education, species and habitat identification, avoidance, and monitoring. Implementation of Mitigation Measures BIO MM 1 through BIO MM 24 would reduce construction and operational impacts to below the level of significance.

BIO-2. Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Sites: AGH (Pg. 4-1), AJT (Pg. 4-38), FTP (Pg. 4-490), GRM (Pg. 4-566), H-17A (Pg. 4-604), JOP (Pg. 4-682), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MML (Pg. 4-1104), OAT (Pg. 4-1181), PHN (Pg. 4-1294), RIH (Pg. 4-1410), SDW (Pg. 4-1448), TPK (Pg. 4-1762), WMP (Pg. 4-1913), ZHQ (Pg. 4-2026)

Riparian habitat or sensitive communities occur within the study area of these sites, as recorded in the California Natural Diversity Database (CNDDB) and/or verified during reconnaissance surveys of each study area. Impacts to these sensitive communities and associated species would be significant.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.3 and

in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measures BIO MM 1, BIO MM 3, BIO MM 5, BIO MM 6, BIO MM 8 through BIO MM 12, BIO MM 19, BIO MM 23, and BIO MM 24**, previously discussed above under BIO-1.

Rationale for Finding: As described in detail in Section 3.3 of the Draft EIR, the Project would avoid substantial adverse effects on riparian or other sensitive natural communities identified in local or regional plans, policies regulations or by CDFW and USFWS through worker education and species and habitat identification, avoidance, and monitoring. Implementation of BIO MM 1, BIO MM 3, BIO MM 5, BIO MM 6, BIO MM 8 through BIO MM 12, BIO MM 19, BIO MM 23, and BIO MM 24 would reduce construction and operational impacts to below the level of significance.

BIO-5. Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Sites: AJT (Pg. 4-38), BJM (Pg. 4-110), BUR1 (Pg. 4-185), CPK (Pg. 4-296), DPK (Pg. 4-335), ENC1 (Pg. 4-372), FRP (Pg. 4-452), GMT (Pg. 4-528), GRM (Pg. 4-566), JOP (Pg. 4-682), JPK (Pg. 4-721), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MML (Pg. 4-1104), MTL2 (Pg. 4-1142), OAT (Pg. 4-1181), PHN (Pg. 4-1294), PMT (Pg. 4-1332), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SPN (Pg. 4-1563), SUN (Pg. 4-1603), TOP (Pg. 4-1722), TPK (Pg. 4-1762), TWR (Pg. 4-1799), WMP (Pg. 4-1913), WTR (Pg. 4-1990), ZHQ (Pg. 4-2026)

Development of these Project sites would impact biological resources protected by local policies or ordinances; impacts would be significant.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.3 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measures BIO MM 1 through BIO MM 24**, previously discussed above under BIO-1.

Rationale for Finding: As described in detail in Section 3.3 of the Draft EIR, the Project would avoid biological resources protected by local policies or ordinances through worker education and species and habitat identification, avoidance, and monitoring. Implementation of **BIO MM 1 through BIO MM 24** would reduce construction and operational impacts to below the level of significance.

3.2.4 Cultural Resources

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in PRC §15064.5?

Sites: ENC1 (Pg. 4-372), PASPD01 (Pg. 4-1219), PWT (Pg. 4-1371), TOP (Pg. 4-1722), WAD (Pg. 4-1872), ZHQ (Pg. 4-2026)

Construction of monopoles would cause adverse impacts on archaeological resources located within the vicinity of these Project sites.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.4 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measures CUL MM 1, CUL MM 3, CUL MM 4, and CUL MM 5** below.

CUL MM 1: Archaeological or Native American Monitoring – Prehistoric Resources

At Project sites with known or potential presence of prehistoric archaeological material (artifacts and/or features) within the defined APEs, qualified archaeological or Native American monitors shall be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations. Monitors will also be responsible for restricting access by construction personnel to any identified archaeological resources as noted in Draft EIR Section 3.4 or Chapter 4. The direct and indirect APEs are defined in Section **Error! Reference source not found.**

The archaeological monitor will, at a minimum, have a B.A. in anthropology or related field or will have successfully completed an archaeological field methods school. The monitor will work under the supervision of an archaeologist who meets the Secretary of the Interior's Professional Qualifications Standards (Project Archaeologist). The standards are published in CFR 36 Part 61 and found on the National Park Service website at http://www.nps.gov/history/local-law/arch_stnds_9.htm.

In the event that prehistoric archaeological material is unexpectedly discovered within the APE, the procedures set forth in CUL MM 3 shall be followed.

CUL MM 3: Unexpected Discovery of Archaeological Materials

In the event that previously unidentified prehistoric or historic-age archaeological resources are uncovered, the following actions shall be taken:

- 1) All ground-disturbing work within 165 feet (50 meters) of the discovery shall be halted. The qualified archaeological monitor will mark the immediate area with highly visible flagging and immediately notify the Project Archaeologist.

- 2) The Project Archaeologist shall inspect the discovery and determine whether further investigation is required. If the discovery can be avoided and no further impacts will occur, the resource shall be documented on California State Department of Parks and Recreation cultural resource record forms, and no further effort shall be required.
- 3) If the resource cannot be avoided and may be subject to further impact, the Project Archaeologist shall evaluate the resource and determine whether it is (1) eligible for inclusion in the NRHP and is thus a historic property for the purposes of the NHPA and NEPA; (2) eligible for the CRHR and thus a historical resource for the purposes of CEQA; (3) a “unique” archaeological resource as defined by CEQA; (4) a Tribal resource as defined by AB 52. If the resource is determined not to be significant under any of these four categories, work may commence in the area following collection (as appropriate) and recording, including mapping and photography, of the archaeological materials or features.
- 4) If the resource meets the criteria for any or all of the categories described in CUL MM 3, work shall remain halted, and the Project Archaeologist shall consult with LA-RICS Authority staff regarding methods to ensure that no substantial adverse changes occur. Preservation in place (i.e., avoidance) is the preferred method of ensuring no substantial adverse impacts occur on historic properties/historical resources and shall be required unless other equally effective methods are agreed upon among the Project Archaeologist, the Authority, and any other stakeholders.

If the archaeological material appears to represent a site – defined as three or more artifacts and/or features in an intact deposit – an archaeological test program (Phase II) may be necessary. Associated mitigation measures include, but are not limited to, collection of the archaeological materials, recordation (e.g., DPR Primary Record and Site Forms), and analysis of any significant cultural materials in accordance with a Data Recovery Plan, and curation of artifacts at an approved curation facility. A curation agreement for this Project is already in place with the University of California, Los Angeles, Archaeological Collections Facility at the Fowler Museum. At the completion of the appropriate mitigation measures, a professional-level technical report shall be filed with the appropriate California Historical Resources Information System (CHRIS) Information Center (IC).

- 5) Work at the Project location may commence upon completion of the appropriate mitigation treatment(s).

CUL MM 4: Unexpected Discovery of Human Remains

In the event that human remains are unexpectedly encountered, the following procedures shall immediately be followed. This guidance is also provided on the Native American Heritage Commission (NAHC) website at <http://nahc.ca.gov/resources/discovery-of-native-american-human-remains-what-to-do/>.

- 1) All construction activity shall stop immediately, and the Project Archaeologist shall be notified. The Project Archaeologist will contact the Los Angeles (or applicable) County Coroner. The list of California Coroners can be found on the NAHC website at <http://nahc.ca.gov/2015/06/implementation-of-ab52-sample-letters-request-for-formal-notification-and-request-for-consultation/>.
- 2) The Coroner has two working days to examine human remains after being notified by the responsible person. If the remains are Native American, the Coroner has 24 hours to notify the NAHC.
- 3) The NAHC will immediately notify the person it believes to be the most likely descendent of the deceased Native American.
- 4) The most likely descendent has 48 hours to make recommendations to the owner, or representative, for the treatment or disposition, with proper dignity, of the human remains and grave goods.
- 5) If the descendent does not make recommendations within 48 hours the owner shall reinter the remains in an area of the property secure from further disturbance, or;
- 6) If the owner does not accept the descendant's recommendations, the owner or the descendent may request mediation by the NAHC.

CUL MM 5: Architectural Resources Protection and Camouflage

Attachment of Equipment to Historic Buildings and Structures

For historic buildings or structures where communications-related equipment will be attached, the following preservation practices shall be employed, as applicable, to ensure that impacts are less than significant:

- 1) When running new exterior wiring to a historic building, existing entry points shall be utilized. If a new entry point is required, the entry shall be placed at the rear of the building or in an area on the side of the building where it will be hidden by an existing architectural feature.
- 2) When wireless nodes, antennas, microwave or satellite dishes, etc. are installed on historic buildings, existing mounting points shall be utilized. For new mounts, non-penetrating mounts shall be used.
- 3) Equipment shall be placed where it does not detract from the building's overall appearance; roof-mounted equipment shall be placed where it will not be visible from accessible locations at grade. Adequate structural support for the new equipment and design shall be ensured, and a system that minimizes the number of cutouts or holes in structural members and historic material shall be installed. Existing building features shall be used to conceal equipment.
- 4) New equipment installations on a historic building that will be visible shall be painted or color-matched to the surrounding building materials. Concealment with color-matched FRP (fiberglass reinforced plastic) shrouds (boxes) is acceptable.
- 5) Any supports or brackets for new equipment shall be color-matched to the existing materials.
- 6) The installation of exterior wiring shall be minimized; where unavoidable, the wiring will be color-matched to the original building material to reduce the visual impact.
- 7) Equipment shall not be directly anchored into stone or brick; mortar joints for anchoring the equipment will be utilized.
- 8) Rust-resistant mounts to prevent staining of the building materials shall be used.
- 9) Reversible mounting techniques shall be used to avoid damage to building materials.
- 10) Installation of underground cable or conduit at a historical resource shall be undertaken in a manner that considers the stability of the historic building, including limiting any new excavations adjacent to historic foundations that could undermine the structural stability of the

building and avoiding landscape or other changes that could alter drainage patterns and cause water-related damage to the building.

- 11) New interior wiring shall utilize space in existing chases, closets, or shafts.
- 12) Equipment and systems shall be installed to cause the least alteration possible to the building's floor plan and the least damage to the historic building material.
- 13) Vertical runs of conduit and cables shall be placed in closets, service rooms, and wall cavities to create the least intrusion into the historic fabric of the building and to avoid major intervention into the wall and floor systems.

Architectural Camouflage

All new towers and monopoles or an increase in the height of existing towers and monopoles that would cause adverse visual impacts on historical resources that are adjacent to or within the viewshed shall be camouflaged. All camouflage implemented for the Project shall be sympathetic to the existing landscape (<http://www.generalcode.com/codification/sample-legislation/cell-towers>) and/or in accordance with applicable municipal codes (http://clkrep.lacity.org/onlinedocs/2009/09-2645_RPT_ATT_06-07-11.pdf).

Tower disguises may include, but are not limited to, painting and various types of concealments, including clock/water towers, flag/light poles, silos, trees, and unique site-specific designs. Such measures must be consistent with the Secretary of the Interior's Standards/Guidelines for the Treatment of Historic Properties (see Attachment of Equipment discussion above).

Rationale for Finding: As described in detail in Section 3.4 of the Draft EIR, Project visual impacts on historical resources within the APE would be minimized by disguising or camouflaging monopoles using paint or architectural screening. Additionally, monitoring during ground disturbing activities would ensure subsurface prehistoric archaeological resources are not disturbed. Implementation of **CUL MM 1**, **CUL MM 3**, **CUL MM 4**, and **CUL MM 5** would reduce construction and operational impacts to below the level of significance.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to PRC § 15064.5

Sites: ENC1 (Pg. 4-372), PWT (Pg. 4-1371), TOP (Pg. 4-1722), ZHQ (Pg. 4-2026)

Based on the location and type of Project activities and the extent of resources at these Project sites, construction impacts would be significant.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.4 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measures CUL MM 1, CUL MM 3, and CUL MM 4**, previously discussed above under CUL-1.

Rationale for Finding: As described in detail in Section 3.4 of the Draft EIR, monitoring during ground disturbing activities ensures that subsurface prehistoric archaeological resources are not disturbed. Implementation of **CUL MM 1, CUL MM 3, and CUL MM 4** would reduce construction and operational impacts to below the level of significance.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Sites: AGH (Pg. 4-1), AJT (Pg. 4-38), ASD (Pg. 4-74), CPK (Pg. 4-296), GRM (Pg. 4-566), H-17A (Pg. 4-604), LARICSHQ (Pg. 4-954), LEPS (Pg. 4-989), OAT (Pg. 4-1181), PASPD01 (Pg. 4-1219), PDC (Pg. 4-1256), PHN (Pg. 4-1294), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SGH (Pg. 4-1487), SIM (Pg. 4-1526), SPN (Pg. 4-1563), TOP (Pg. 4-1722), WS1 (Pg. 4-1952), ZHQ (Pg. 4-2026)

Project activities at these Project sites would have a significant impact on paleontological resources.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.4 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measures CUL MM 6 and CUL MM 7**, below:

CUL MM 6: Paleontological Resources Monitoring Plan

A Paleontological Resources Monitoring Plan shall be developed and approved prior to construction to guide the activities of monitors during ground-disturbing activities. The plan would include, but not be limited to, a description of the Project location, the regulatory framework, site-specific impact mitigation requirements designed to reduce impacts to less than significant, specific locations and construction activities requiring monitoring and/or spot checking, and procedures to follow for construction monitoring and fossil discovery and recovery, and a repository agreement with the Natural History Museum of Los Angeles County or other accredited repository. Mitigation measures that may

be implemented to ensure that impacts to paleontological resources would be reduced to less than significant may include but are not limited to the following:

- a) Worker awareness training on paleontological resources presented to construction personnel prior to the start of construction. The training should include at minimum, the following:
 - The types of fossils that could occur at the Project site
 - The procedures that should be taken in the event of a fossil discovery
 - Laws protecting paleontological resources
 - Penalties for destroying or removing paleontological resource
- b) Paleontological monitoring during ground disturbance at all sites with moderate/unknown or high paleontological potential
- c) Salvage of significant fossil resources
- d) Screenwashing of matrix samples for microfossils
- e) Laboratory preparation of recovered fossils to the point of identification and curation
- f) Identification of recovered fossils to the lowest possible taxonomic order
- g) Curation of significant fossils at the Natural History Museum of Los Angeles County or other accredited repository
- h) Preparation of a final monitoring report that includes at a minimum the dates of field work, results of monitoring, fossil analyses, significance evaluation, conclusions, locality forms, and an itemized list of specimens.

The Plan shall be submitted to the Authority for review and approval and finalized at least 14 days prior to the start of construction.

CUL MM 7: Paleontological Resources Monitoring

Paleontological monitoring shall be conducted by a qualified paleontological monitor who has demonstrated experience in the collection and salvage of fossil materials. An undergraduate degree in geology or paleontology is preferable but is less important than documented experience performing paleontological

monitoring and mitigation. The monitor will work under the supervision of a Principal Paleontologist.

The qualified professional paleontological monitor shall be present during ground disturbance at all sites with moderate/unknown or high paleontological potential, and as specified in the Paleontological Resources Monitoring Plan prepared in accordance with CUL MM 6. The monitor shall be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations. Any sites that require monitoring or mitigation within the Angeles National Forest will require a qualified paleontologist to have a U.S. Department of Agriculture Forest Service-Temporary Special-Use Permit for paleontology. Based on the specific site conditions observed during monitoring (type of sediment impacted, previous disturbances, nature of site conditions), the Principal Paleontologist may reduce or increase monitoring efforts in consultation with the Agency.

In the event that a previously unidentified paleontological resource is uncovered, the following actions shall be taken:

- 1) All ground-disturbing work within 50 feet of the discovery shall be halted. A qualified paleontologist shall divert or direct construction activities in the area of an exposed fossil in order to facilitate evaluation and, if necessary, salvage of the exposed fossil. Work shall not resume in the discovery area until authorized by the qualified paleontologist.
- 2) The paleontologist shall inspect the discovery and determine whether further investigation is required. If the discovery can be avoided and no further impacts will occur, no further effort shall be required.
- 3) If the resource cannot be avoided and may be subject to further impact, the paleontologist shall evaluate the resource and determine whether it is "unique" under CEQA, Appendix G, Part V. If the resource is determined not to be unique, work may commence in the area.
- 4) If the resource is determined to be a unique paleontological resource, work shall remain halted, and the paleontologist shall consult with LA-RICS Authority staff regarding methods to ensure that no substantial adverse change would occur to the significance of the resource. Preservation in place (i.e., avoidance) is the preferred method of ensuring that no substantial adverse impacts occur to the

resource and shall be required unless other equally effective methods are available. Other methods include ensuring that the fossils are scientifically recovered, prepared, identified, catalogued, and analyzed according to current professional standards.

- 5) Due to the small nature of some fossils, a fine mesh screen may be used at the discretion of the paleontologist to screen matrix test samples on-site during monitoring. Additionally, bulk matrix samples may be collected and transported to a laboratory facility for processing.
- 6) Provisions for preparation and identification of any fossils collected shall be made before donation to a suitable repository.
- 7) All recovered fossils shall be curated at the Natural History Museum of Los Angeles County, or a local accredited and permanent scientific institution according to Society of Vertebrate Paleontology standard guidelines standards. Work may commence upon completion of the appropriate treatment and the approval from the Authority.

Rationale for Finding: As described in detail in Section 3.4 of the Draft EIR, paleontological monitoring during ground-disturbing activities to ensure that any paleontological resources identified during are appropriately identified, characterized, and, as applicable, collected ensures that subsurface paleontological resources are not destroyed. Implementation of **CUL MM 6** and **CUL MM 7** would reduce construction and operational impacts to below the level of significance.

CUL-4: Would the project disturb any human remains, including those interred outside formal cemeteries?

Sites: ENC1 (Pg. 4-372), PWT (Pg. 4-1371), TOP (Pg. 4-1722), ZHQ (Pg. 4-2026)

Based on the location and type of Project activities and the extent of resources at these Project sites, construction impacts would be significant.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.4 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measures CUL MM 1, CUL MM 3, and CUL MM 4**, previously discussed above under CUL-1.

Rationale for Finding: As described in detail in Section 3.4 of the Draft EIR, monitoring during ground-disturbing activities is required to ensure that any human remains identified during ground-disturbing activities are appropriately identified, characterized, and reported to the

appropriate authorities. Implementation of **CUL MM 1**, **CUL MM 3**, and **CUL MM 4** would reduce construction and operational impacts to below the level of significance.

CUL-5: Would the project cause a substantial adverse change in the significance of a Tribal cultural resource as defined in Public Resources Code Section 21074?

Sites: ENC1 (Pg. 4-372), PWT (Pg. 4-1371), TOP (Pg. 4-1722), ZHQ (Pg. 4-2026)

Based on the potential for tribal resources to occur and type of Project activities and the extent of resources at these Project sites, construction impacts would be significant.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.4 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measures CUL MM 1**, **CUL MM 3**, and **CUL MM 4**, previously discussed above under CUL-1.

Rationale for Finding: As described in detail in Section 3.4 of the Draft EIR, monitoring during ground-disturbing activities ensures that any tribal resources identified are appropriately protected. Implementation of **CUL MM 1**, **CUL MM 3**, and **CUL MM 4** would reduce construction and operational impacts to below the level of significance.

3.2.5 Geology / Soils

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Strong seismic ground shaking?

Seismic-related ground failure, including liquefaction?

Landslides?

Sites: AGH (Pg. 4-1), ASD (Pg. 4-74), BJM (Pg. 4-110), BUR1 (Pg. 4-185), CPK (Pg. 4-296), DPK (Pg. 4-335), ENC1 (Pg. 4-372), FRP (Pg. 4-452), FTP (Pg. 4-490), GMT (Pg. 4-528), GRM (Pg. 4-566), H-17A (Pg. 4-604), JOP (Pg. 4-682), JPK (Pg. 4-721), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MMC (Pg. 4-1069), MML (Pg. 4-1104), MTL2 (Pg. 4-1142), OAT (Pg. 4-1181), PASPD01 (Pg. 4-1219), PHN (Pg. 4-1294), PMT (Pg. 4-1332), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SGH (Pg. 4-1487), SPN (Pg. 4-1563), SUN (Pg. 4-1603), TOP

(Pg. 4-1722), TPK (Pg. 4-1762), TWR (Pg. 4-1799), VPK (Pg. 4-1836), WAD (Pg. 4-1872), WMP (Pg. 4-1913), WTR (Pg. 4-1990), ZHQ (Pg. 4-2026)

These sites include new monopoles, new towers, and existing monopoles and towers that would be extended. Seismic shaking impacts would be significant at these sites without an evaluation of site-specific soils, geology, and seismic shaking probability.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.5 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure GEO MM 1**, below.

GEO MM 1 Prior to or concurrently with submittal of the application for a building permit for any portion of the Project site, the Contractor shall:

- 1) Submit to the appropriate municipality (County of Los Angeles or city having jurisdiction over the site) a site-specific, design-level geotechnical report reviewed and approved by both an engineering geologist licensed in the State of California and a civil engineer licensed in the State of California. The report shall comply with all applicable state and local code requirements and shall:
 - a) Include an analysis of the expected ground motions at the site from known active faults using accepted methodologies
 - b) Include an analysis of all potential geologic hazards including but not limited to, landslides, mudslides, liquefaction potential, identification of active faults, land spreading, and land subsidence. The report shall be prepared in accordance with and meet the requirements of the County of Los Angeles Department of Public Works (LACDPW) Manual for Preparation of Geotechnical Reports, July 1, 2013.
 - c) Specify liquefaction mitigations that shall use proven methods generally accepted by professional engineers to reduce the risk of liquefaction to a less than significant level such as:
 - i) subsurface soil improvement
 - ii) deep foundations extending below the liquefiable layers
 - iii) structural slabs designed to span across areas of non-support
 - iv) soil cover sufficiently thick over liquefaction soil to bridge liquefaction zones

- v) dynamic compaction
 - vi) compaction grouting
 - vii) jet grouting
 - viii) mitigation for liquefaction hazards suggested in the California Geological Survey's (CGS) Geology Guidelines for Evaluating and Mitigating Seismic Hazards (CGS Special Publication 117, 1997) including edge containment structures (berms, dikes, sea walls, retaining structures, compacted soil zones), removal or treatment of liquefiable soils, modification of site geometry, lowering the groundwater table, in-situ ground densification, deep foundations, reinforced shallow foundations, and structural design that can withstand predicated displacements
- d) Determine structural design requirements as prescribed by the most current version of the California Building Code, including applicable local county and local city amendments, to ensure that structures can withstand ground accelerations expected from known active faults
 - e) Determine the final design parameters for walls, foundations, foundation slabs, utilities, roadways, parking lots, sidewalks, and other surrounding improvements
- 2) Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigations in the site specific investigations.
 - 3) The Project structural engineer shall review the site specific investigations, provide any additional necessary mitigation to meet Building Code requirements, and incorporate all applicable mitigations from the investigation in the structural design plans and shall ensure that all structural plans for the Project meet current Building Code requirements.
 - 4) Site construction shall not begin until:
 - a) The registered geotechnical engineer representing the applicable permitting municipality for the Project site (county or city), or third party registered engineer retained to review the geotechnical reports, has reviewed each site specific geotechnical investigation, approved the final report, and required compliance with geotechnical mitigations contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure and other relevant construction permits; and

- b) The applicable permitting municipality for the Project site (county or city) has reviewed all Project plans for grading, foundations, structural, infrastructure and other relevant construction permits to ensure compliance with the applicable geotechnical investigation and other applicable Code requirements

Rationale for Finding: As described in detail in Section 3.5 of the Draft EIR, a geotechnical report will be prepared for each of these sites. The report will be prepared in accordance with applicable regulations for the applicable jurisdiction for the location of the Project sites. The geotechnical report will assess site-specific seismic ground-shaking conditions to be considered and make recommendations on the design of the foundation to minimize seismic hazards. Implementation of **GEO MM 1** would reduce construction and operational impacts to below the level of significance.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse?

Sites: ASD (Pg. 4-74), CPK (Pg. 4-296), FTP (Pg. 4-490), GRM (Pg. 4-566), H-17A (Pg. 4-604), JPK (Pg. 4-721), LACFCP11 (Pg. 4-915), LEPS (Pg. 4-989), MTL2 (Pg. 4-1142), PDC (Pg. 4-1256), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SPN (Pg. 4-1563), TOP (Pg. 4-1722), VPK (Pg. 4-1836), WAD (Pg. 4-1872), ZHQ (Pg. 4-2026)

These sites are located within a designated potential landslide area or designated potential liquefaction zone. The ground under these sites has the potential for soils to become unstable; construction impacts would be significant.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.4 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure GEO MM 1**, discussed above under GEO-1.

Rationale for Finding: As described in detail in Section 3.5 of the Draft EIR, a geotechnical report will be prepared for each of these sites. The report will evaluate subsurface soil and groundwater condition and make recommendations to ensure soil stability and make recommendations to minimize potential for lateral spreading subsidence, liquefaction, or collapse. Implementation of **GEO MM 1** would reduce construction and operational impacts to below the level of significance.

3.2.6 Hazards and Hazardous Materials

HAZ-4: *Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?*

Site: PDC (Pg. 4-1256)

Only Site PDC is located within an area identified as a hazardous materials site. Construction at this facility may include placement of new equipment structure and/or trenching for utilities that will disturb the ground. If potential contamination is not appropriately located and characterized prior to disturbance, disposal of excavated soil could result in a significant impact and create a significant hazard to the public or the environment at Site PDC and, thus, result in a significant impact.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.7 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure HAZ MM 1**, below.

HAZ MM 1: Prior to construction activity, the construction contractor prepare a Phase I Environmental Site Assessment meeting the standards outlined in the American Society for Testing and Materials (ASTM), Practice for Limited Environmental Due Diligence: Transaction Screen Process E 1528.

- Phase I documents shall be reviewed to determine if the lateral and vertical extent of impacted soil and/or groundwater will be encountered by construction activities.
- If construction activities will not encounter impacted soil or groundwater based on the documented vertical and lateral extent, no further action will be required.
- If it is determined that the construction footprint will encounter impacted soils or encounter impacted groundwater, the contractor shall prepare a site-specific Health and Safety Plan that meets the requirements of 29 CFR 1910 for worker safety.
- If the lateral and vertical extent or the nature of the impacted soil cannot be determined from available documents, a Phase II investigation shall be completed to determine if the soils and/or groundwater that may be encountered during construction (within the footprint any excavation) are impacted. The Phase II investigation shall also determine the nature of contaminations that may be encountered.

- The Phase II report should also address appropriate and available disposal alternatives and procedures for any impacted soil that may be encountered or groundwater which may need to be removed.

Rationale for Finding: As described in detail in Section 3.7 of the Draft EIR, prior to construction activities, a Phase I Environmental Assessment will be prepared for the site. Based on the Phase I recommendations, additional sampling, testing, and characterization may be required to ensure proper worker notification, handling, and disposal of contaminated material. Implementation of **HAZ MM 1** would reduce construction and operational impacts to below the level of significance.

HAZ-5: For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Site: SDW (Pg. 4-1448)

Site SDW lies within Area E land use, as defined in the Airport Land Use Compatibility Plan (ALUCP) for Brackett Field. The approved Airport Land Use Plan (ALUP) indicates that structures more than 100 feet tall within Area E need to be evaluated by the Federal Aviation Administration (FAA) to determine if the structure creates an air navigation hazard. Construction of the tower may result in a significant navigational hazard.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.7 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure HAZ MM 2**, below.

HAZ MM 2 Prior to issuance of building permits, the Contractor shall submit Form 7460–1 (Notice of Construction or Alteration) to the FAA, in the form and manner prescribed in 14 CFR Part 77. The Contractor shall also provide documentation to the appropriate city or county planning agency demonstrating that the FAA has issued a “Determination of No Hazard to Air Navigation.”

The FAA regulates objects affecting navigable airspace according to 14 CFR Part 77. The federal and state Departments of Transportation also require the proponent to submit FAA Form 7460–1, Notice of Construction or Alteration. According to 14 CFR Part 77, notification allows the FAA to identify potential aeronautical hazards in advance, thus preventing or minimizing any adverse impacts on the safe and efficient use of navigable airspace.

Per 14 CFR Part 77, notification requirements include sending one executed form set (four copies) of FAA Form 7460–1, Notice of Construction or Alteration,

to the Manager, Air Traffic Division, of the FAA Regional Office having jurisdiction over the area within which the construction or alteration will be located. The notice required must be submitted at least 45 days before the earlier of the following dates: (1) the date the construction or alteration is to begin, or (2) the date an application for a construction permit is to be filed.

Rationale for Finding: As described in detail in Section 3.7 of the Draft EIR, completion of the FAA process for notice of alteration or construction and, as applicable, incorporating all FAA recommendations into the Project would prevent or minimize any adverse impacts on the safe and efficient use of navigable airspace. Implementation of **HAZ MM 2** would reduce construction and operational impacts to below the level of significance.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Sites: AGH (Pg. 4-1), AJT (Pg. 4-38), BJM (Pg. 4-110), BUR1 (Pg. 4-185), CPK (Pg. 4-296), DPK (Pg. 4-335), ENC1 (Pg. 4-372), FRP (Pg. 4-452), FTP (Pg. 4-490), GMT (Pg. 4-528), GRM (Pg. 4-566), H-17A (Pg. 4-604), JOP (Pg. 4-682), JPK (Pg. 4-721), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MMC (Pg. 4-1069), MML (Pg. 4-1104), MTL2 (Pg. 4-1142), OAT (Pg. 4-1181), PHN (Pg. 4-1294), PMT (Pg. 4-1332), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SIM (Pg. 4-1526), SPN (Pg. 4-1563), SUN (Pg. 4-1603), TOP (Pg. 4-1722), TPK (Pg. 4-1762), TWR (Pg. 4-1799), VPK (Pg. 4-1836), WAD (Pg. 4-1872), WMP (Pg. 4-1913), WTR (Pg. 4-1990), ZHQ (Pg. 4-2026)

These Project sites are either located within or, in the case of sites on federal land, presumed to be within a Very High Fire Hazard Severity Zone. Construction activities in these areas represent an elevated significant risk of igniting a wildland fire.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in the Draft EIR Section 3.7 and site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure HAZ MM 3**, below.

HAZ MM 3: Fire Management Plan. Prior to construction activity, the Authority must work with the agency responsible for fire protection in the jurisdiction where the site is located to develop and implement a fire management plan for use during construction activity. The plan will identify Project locations, Project descriptions, anticipated construction activities, limitation of activities during periods of elevated fire risk (e.g., “red flag” days), level of suppression equipment required on site, training requirements, and points of contact.

Rationale for Finding: As described in detail in Section 3.7 of the Draft EIR, construction in these zones will comply with local municipal code, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. The fire management plan will document procedures for both fire prevention and response. Implementation of **HAZ MM 3** would reduce construction and operational impacts to below the level of significance.

3.2.7 Hydrology /Water Quality

WQ-1: Would the project violate any water quality standards or waste discharge requirements?

Sites: AGH (Pg. 4-1), ASD (Pg. 4-74), BJM (Pg. 4-110), BUR1 (Pg. 4-185), CPK (Pg. 4-296), DPK (Pg. 4-335), ENC1 (Pg. 4-372), FRP (Pg. 4-452), FTP (Pg. 4-490), GMT (Pg. 4-528), GRM (Pg. 4-566), H-17A (Pg. 4-604), JOP (Pg. 4-682), JPK (Pg. 4-721), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MMC (Pg. 4-1069), MML (Pg. 4-1104), MTL2 (Pg. 4-1142), OAT (Pg. 4-1181), PASPD01 (Pg. 4-1219), PHN (Pg. 4-1294), PMT (Pg. 4-1332), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SPN (Pg. 4-1563), SUN (Pg. 4-1603), TOP (Pg. 4-1722), TPK (Pg. 4-1762), TWR (Pg. 4-1799), VPK (Pg. 4-1836), WMP (Pg. 4-1913), WTR (Pg. 4-1990), ZHQ (Pg. 4-2026)

At these sites, groundwater may also be encountered during excavation of deep foundations. Dewatering of an excavation would constitute a significant impact if the water is not discharged properly.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.8 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure UTL MM 1**, discussed below in Section 3.2.10.

Rationale for Finding: As described in detail in Section 3.8 of the Draft EIR, the Authority will comply with all conditions and stipulations specified in the dewatering permit at each of these sites, as applicable. Implementation of **UTL MM 1**, would reduce construction and operational impacts to below the level of significance.

WQ-9: Would the project expose people or structures to a significant risk of loss, injury, or death from inundation by seiche, tsunami, or mudflow?

Sites: ENC1 (Pg. 4-372), PWT (Pg. 4-1371)

ENC1 and PWT are located in areas that may be subject to mudflows. Mudflows could result in loss and impacts that are significant at these sites.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.8 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure GEO MM 1**, discussed above in Section 3.2.5.

Rationale for Finding: As described in detail in Section 3.8 of the Draft EIR, the geotechnical report will evaluate if a site is at risk for a mudflow and provide recommendations to be implemented to reduce the risk to the facility from mudflows. Implementation of **GEO MM 1** would reduce construction and operational impacts to below the level of significance.

3.2.8 Noise

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Sites: ENC1 (Pg. 4-372), LACF072 (Pg. 4-799)

Impacts from construction of these sites would expose sensitive receiver locations to excessive groundborne vibration, and impacts of the Project would be significant.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.10 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure NOI MM 1**, below.

NOI MM 1 Prior to commencement of construction at sites ENC1 and LACF072, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction vibration impacts to less than significant levels. Such measures may include, but are not limited to the following:

- Route heavily-loaded trucks away from residential streets, if possible, selecting streets with the fewest homes if no other alternatives are available.
- Operate earth moving equipment including excavators/mini excavators and dump trucks as far away from vibration-sensitive locations as possible.
- Phase demolition and earth-moving operations so as not to occur simultaneously. Total vibration could be significantly less when each vibration event occurs separately.

Rationale for Finding: As described in detail in Section 3.10 of the Draft EIR, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction

vibration perceivable motion velocity to less than 0.01 peak particle velocity (ppv) over the range of 1 to 100 Hertz at the receiver sites. Implementation of **NOI MM 1** would reduce construction and operational impacts to below the level of significance.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Sites: ENC1 (Pg. 4-372), LACF072 (Pg. 4-799), PDC (Pg. 4-1256), SDW (Pg. 4-1448), SGH (Pg. 4-1487), WAD (Pg. 4-1872), WS1 (Pg. 4-1952), ZHQ (Pg. 4-2026)

Construction noise at site WS1 would exceed the City of Santa Monica noise ordinance that sets a maximum 20-dBA temporary increase above acceptable exterior ambient noise levels. If night construction is required at sites ENC1, LACF072, PDC, SDW, or SGH, construction noise would exceed the 80-dBA threshold during nighttime hours. Construction noise at these sites would be significant.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.10 of the Draft EIR and site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure NOI MM 2**, below. Measure NOI MM 2 would be required at sites ENC1, LACF072, PDC, SDW, and SGH if nighttime construction were to occur, and at Site WS1 at all times.

NOI MM 2 Prior to commencement of construction, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction noise impacts below the levels specified in the Federal Transit Administration (FTA) nighttime threshold or applicable ordinance. Such measures may include but are not limited to the following:

- Use noise blankets or other muffling devices on equipment and quiet-use generators at noise-sensitive receivers.
- Use well-maintained equipment and have equipment inspected regularly.
- Operate construction equipment for periods of fewer than 15 consecutive minutes when possible.

Rationale for Finding: As described in detail in Section 3.10 of the Draft EIR, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction noise below the levels specified in the FTA nighttime threshold and Santa Monica noise ordinance at the receiver sites. Implementation of **NOI MM 2** would reduce construction and operational impacts to below the level of significance.

3.2.9 Transportation / Traffic

TRANS-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Sites: BJM (Pg. 4-110), DPK (Pg. 4-335), SDW (Pg. 4-1448), SGH (Pg. 4-1487)

Based on distance, runway length, and TOWAIR results, these Project sites require FCC registration and FAA notification. Their construction would be a significant impact on navigation that could affect air traffic patterns or pose a substantial safety risk.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.12 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure HAZ MM 2**, previously discussed above in Section 3.2.6

Rationale for Finding: As described in detail in Section 3.12 of the Draft EIR, completion of the FAA process for notice of alteration or construction and, as applicable, incorporating all FAA recommendations into the Project would prevent or minimize any substantial safety risks. Implementation of **HAZ MM 2** would reduce construction and operational impacts to below the level of significance.

TRANS-4: Would the project result in inadequate emergency access?

Sites: ASD (Pg. 4-74), LARICSHQ (Pg. 4-954), PASPD01 (Pg. 4-1219), PDC (Pg. 4-1256), SGH (Pg. 4-1487), SIM (Pg. 4-1526), WS1 (Pg. 4-1952), ZHQ (Pg. 4-2026)

At these Project sites, construction-related activities may require lane narrowing at a driveway or detours in the parking lots of existing facilities. These activities would have temporary significant impacts associated with impairing access on adjacent roadways, creating traffic hazards and limiting emergency access.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.12 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measures TRANS MM 1 and TRANS MM 2**, below.

TRANS MM 1: The construction contractor shall maintain a minimum of one open lane of traffic at all site access roads during Project construction. Use of standard construction traffic control practices such as flagmen, warning signs, and other measures shall be implemented as necessary to ensure that traffic flow remains uninterrupted at all times.

TRANS MM 2: Any temporary road or lane closures that may affect state highways shall be coordinated with Caltrans prior to commencement of construction at the site that will require the road or lane closures. If construction requires temporary road or lane closures on roads and streets managed by local entities, a traffic management plan shall be prepared and submitted to the relevant county and/or city public works department or other appropriate department for approval prior to commencement of construction at the site. Encroachment permits would be obtained where applicable.

Rationale for Finding: As described in detail in Section 3.12 of the Draft EIR, the contractor shall maintain a minimum of one open lane of traffic at all site access roads and prepare a traffic management plan for approval by the appropriate jurisdiction prior to any lane closures during Project construction. Implementation of **TRANS MM 1** and **TRANS MM 2** would reduce construction and operational impacts to below the level of significance.

3.2.10 Utilities / Service Systems

UTL-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Sites: AGH (Pg. 4-1), ASD (Pg. 4-74), BJM (Pg. 4-110), BUR1 (Pg. 4-185), CPK (Pg. 4-296), DPK (Pg. 4-335), ENC1 (Pg. 4-372), FRP (Pg. 4-452), FTP (Pg. 4-490), GMT (Pg. 4-528), GRM (Pg. 4-566), H-17A (Pg. 4-604), JOP (Pg. 4-682), JPK (Pg. 4-721), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MMC (Pg. 4-1069), MML (Pg. 4-1104), MTL2 (Pg. 4-1142), OAT (Pg. 4-1181), PASPD01 (Pg. 4-1219), PHN (Pg. 4-1294), PMT (Pg. 4-1332), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SPN (Pg. 4-1563), SUN (Pg. 4-1603), TOP (Pg. 4-1722), TPK (Pg. 4-1762), TWR (Pg. 4-1799), VPK (Pg. 4-1836), WMP (Pg. 4-1913), WTR (Pg. 4-1990), ZHQ (Pg. 4-2026)

During construction of deep foundations associated with new monopole or new tower locations, groundwater may be encountered during excavation activities at these Project sites. Perched groundwater that may be encountered could be contaminated, have high levels of turbidity, or generally not meet other requirements for discharge to the environment. Unpermitted discharges to the environment could exceed treatment requirements of the RWQCBs and would be considered a significant impact.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.13 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure UTL MM 1**, below.

UTL MM 1: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit shall be obtained from the applicable RWQCB

prior to construction; and removal or discharge of water would be in accordance with the terms and conditions of the permit.

Rationale for Finding: As described in detail in Section 3.13 of the Draft EIR, the Authority will comply with all conditions and stipulations specified in the dewatering permit at each of these sites, as applicable. Implementation of **UTL MM 1**, would reduce construction and operational impacts to below the level of significance.

3.3 Findings Regarding Environmental Impacts Determined to Be Significant that Cannot be Mitigated to a Less Than Significant Level

3.3.1 Aesthetics

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Site: JOP (Pg 4-682)

Site JOP includes installation of a new 180-foot lattice tower mounted with whip and microwave antennas, an equipment shelter, and generator. Existing solar panels at the site would be replaced with larger panels. The new facilities would be located in an area with no existing tall structures. Given the height of Josephine Peak in relation to the surrounding national forest, the new structure would intrude upon scenic vistas in the area. Because the new lattice tower would introduce a new vertical intrusion onto the landscape, a substantial impact to scenic vistas would occur, resulting in a significant impact.

Finding: Specific economic, legal, social, technological, or other considerations make it infeasible to reduce this impact to a less than significant level.

Rationale for Finding: As discussed in Final EIR Section 2.3, there is no alternative site for JOP. As discussed in Section 3.1 of the Final EIR and site summary forms in Chapter 4 of the DEIR, the only potential measure to mitigate adverse effects on scenic vistas would be painting the towers to blend with their visual settings. However, this measure is infeasible because FAA guidelines (FAA Advisory Circular 70/7460-1L) require certain paint colors to be used on towers for aviation safety purposes. Additionally, the visual impact of the towers would remain significant if they were painted to blend with the site's visual setting. As such, no feasible mitigation measures exist to reduce the impacts to less than significant levels. Therefore, impacts are significant and unavoidable at site JOP.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Site: JOP (Pg 4-682)

Site JOP is located in the Angeles National Forest and the existing scenic attractiveness is designated B, which is considered typical. The new tower would contrast and be incompatible with the visual character of the landscape, which is primarily forested. The result would be a degradation of the visual character surrounding the site resulting in a significant impact.

Finding: Specific economic, legal, social, technological, or other considerations make it infeasible to reduce this impact to a less than significant level.

Rationale for Finding: As discussed in Final EIR Section 2.3, there is no alternative site for JOP. As discussed in Section 3.1 of the Final EIR and site summary forms in Chapter 4 of the DEIR, the only potential measure to mitigate adverse effects on scenic vistas would be painting the towers to blend with their visual settings. However, this measure is infeasible because FAA guidelines (FAA Advisory Circular 70/7460-1L) require certain paint colors to be used on towers for aviation safety purposes. Additionally, the visual impact of the towers would remain significant if they were painted to blend with the site's visual setting. As such, no feasible mitigation measures exist to reduce the impacts to less than significant levels. Therefore, impacts are significant and unavoidable at site JOP.

3.3.2 Cultural Resources

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in PRC §15064.5?

Site: LPC (Pg. 4-1029)

Site LPC has two historical resources located within the direct and indirect Areas of Potential Effect (APEs). The first of these two resources is P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. The second of these two resources is U.S. Forest Service (USFS) Resource No. 05015500237. This resource consists of two of three separate loci of the Los Pinetos Nike Missile Site, which was constructed in 1955-1956 and deactivated in 1968. The loci are the locations of the administrative area (barracks and support structures) and the radar control facility; the third locus (the launch control facility) is situated just outside the southeast boundary of the indirect APE. The direct APE is completely encompassed by one of the Nike missile loci, and the remaining two are approximately 1,650 to 2,900 feet to the east. The

complex of Nike facilities was formally evaluated in 1987 and determined eligible for inclusion in the NRHP. Based on the Project activities, direct and indirect (visual) impacts from construction and operation of the 70-foot monopole and the associated infrastructure features would be significant.

Finding: Changes or alterations have been incorporated into the Project that substantially lessen the significant environmental effect, as identified in Draft EIR Section 3.4 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measures CUL MM 2, CUL MM 3, and CUL MM 5**, below. Although **Mitigation Measures CUL MM 2, CUL MM 3, and CUL MM 5** (below) would minimize Project impacts, specific economic, legal, social, technological, or other considerations make it infeasible to reduce this impact to a less than significant level.

CUL MM 2: Archaeological Monitoring – Historic-Age Resources

At proposed Project sites with known or potential presence of historic-age archaeological material (artifacts and/or features) within the defined APEs, a qualified archaeological monitor shall be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations. Monitors will also be responsible for restricting access by construction personnel to any identified archaeological resources as noted in Draft EIR section 3.4 or Chapter 4. The direct and indirect APEs are defined at the beginning of this EIR section.

The archaeological monitor will, at a minimum, have a B.A. in anthropology or related field or will have successfully completed an archaeological field methods school. The monitor will work under the supervision of an archaeologist who meets the Secretary of the Interior’s Professional Qualifications Standards (Project Archaeologist). The standards are published in CFR 36 Part 61 and found on the National Park Service website at http://www.nps.gov/history/local-law/arch_stnds_9.htm.

CUL MM 3: Unexpected Discovery of Archaeological Materials

In the event that previously unidentified prehistoric or historic-age archaeological resources are uncovered, the following actions shall be taken:

- 1) All ground-disturbing work within 165 feet (50 meters) of the discovery shall be halted. The qualified archaeological monitor mark the immediate area with highly visible flagging and immediately notify the Project Archaeologist.

- 2) The Project Archaeologist shall inspect the discovery and determine whether further investigation is required. If the discovery can be avoided and no further impacts will occur, the resource shall be documented on California State Department of Parks and Recreation cultural resource record forms, and no further effort shall be required.
- 3) If the resource cannot be avoided and may be subject to further impact, the Project Archaeologist shall evaluate the resource and determine whether it is (1) eligible for inclusion in the NRHP and is thus a historic property for the purposes of the NHPA and NEPA; (2) eligible for the CRHR and thus a historical resource for the purposes of CEQA; (3) a “unique” archaeological resource as defined by CEQA; (4) a Tribal resource as defined by AB 52. If the resource is determined not to be significant under any of these four categories, work may commence in the area following collection (as appropriate) and recording, including mapping and photography, of the archaeological materials or features.
- 4) If the resource meets the criteria for any or all of the categories described in CUL MM 3, work shall remain halted, and the Project Archaeologist shall consult with LA-RICS Authority staff regarding methods to ensure that no substantial adverse changes occur. Preservation in place (i.e., avoidance) is the preferred method of ensuring no substantial adverse impacts occur on historic properties/historical resources and shall be required unless other equally effective methods are agreed upon among the Project Archaeologist, the Authority, and any other stakeholders.

If the archaeological material appears to represent a site – defined as three or more artifacts and/or features in an intact deposit – an archaeological test program (Phase II) may be necessary. Associated mitigation measures include, but are not limited to, collection of the archaeological materials, recordation (e.g., DPR Primary Record and Site Forms), and analysis of any significant cultural materials in accordance with a Data Recovery Plan, and curation of artifacts at an approved curation facility. A curation agreement for this Project is already in place with the University of California, Los Angeles, Archaeological Collections Facility at the Fowler Museum. At the completion of the appropriate mitigation measures, a professional-level technical report shall be filed with the appropriate California Historical Resources Information System (CHRIS) Information Center (IC).

- 5) Work at the Project location may commence upon completion of the appropriate mitigation treatment(s).

CUL MM 5: Architectural Resources Protection and Camouflage

Attachment of Equipment to Historic Buildings and Structures

For historic buildings or structures where communications-related equipment will be attached, the following preservation practices shall be employed, as applicable, to ensure that impacts are less than significant:

- 1) When running new exterior wiring to a historic building, existing entry points shall be utilized. If a new entry point is required, the entry shall be placed at the rear of the building or in an area on the side of the building where it will be hidden by an existing architectural feature.
- 2) When wireless nodes antennas, microwave or satellite dishes, etc. are installed on historic buildings, existing mounting points shall be utilized. For new mounts, non-penetrating mounts shall be used.
- 3) Equipment shall be placed where it does not detract from the building's overall appearance; roof-mounted equipment shall be placed where it will not be visible from accessible locations at grade. Adequate structural support for the new equipment and design shall be ensured, and a system that minimizes the number of cutouts or holes in structural members and historic material shall be installed. Existing building features shall be used to conceal equipment.
- 4) New equipment installations on a historic building that will be visible shall be painted or color-matched to the surrounding building materials. Concealment with color-matched FRP (fiberglass reinforced plastic) shrouds (boxes) is acceptable.
- 5) Any supports or brackets for new equipment shall be color-matched to the existing materials.
- 6) The installation of exterior wiring shall be minimized; where unavoidable, the wiring will be color-matched to the original building material to reduce the visual impact.
- 7) Equipment shall not be directly anchored into stone or brick; mortar joints for anchoring the equipment will be utilized.

- 8) Rust-resistant mounts to prevent staining of the building materials shall be used.
- 9) Reversible mounting techniques shall be used to avoid damage to building materials.
- 10) Installation of underground cable or conduit at a historical resource shall be undertaken in a manner that considers the stability of the historic building, including limiting any new excavations adjacent to historic foundations that could undermine the structural stability of the building and avoiding landscape or other changes that could alter drainage patterns and cause water-related damage to the building.
- 11) New interior wiring shall utilize space in existing chases, closets, or shafts.
- 12) Equipment and systems shall be installed to cause the least alteration possible to the building's floor plan and the least damage to the historic building material.
- 13) Vertical runs of conduit and cables shall be placed in closets, service rooms, and wall cavities to create the least intrusion into the historic fabric of the building and to avoid major intervention into the wall and floor systems.

Architectural Camouflage

All new towers and monopoles, or an increase in the height of existing towers and monopoles that would cause adverse visual impacts on historical resources that are adjacent to or within the viewshed, shall be camouflaged. All camouflage implemented for the Project shall be sympathetic to the existing landscape (<http://www.generalcode.com/codification/sample-legislation/cell-towers>) and/or in accordance with applicable municipal codes (http://clkrep.lacity.org/onlinedocs/2009/09-2645_RPT_ATT_06-07-11.pdf).

Tower disguises may include, but are not limited to, painting and various types of concealments, including clock/water towers, flag/light poles, silos, trees, and unique site-specific designs. Such measures must be consistent with the Secretary of the Interior's Standards/Guidelines for the Treatment of Historic Properties (see Attachment of Equipment discussion above).

Rationale for Finding: As discussed in Section 3.4 of the Draft EIR, site summary forms in Chapter 4 and Appendix B-4 of the Draft EIR, the mitigation measures described above would require the presence of archaeological monitors during all ground-disturbing activities at Site LPC. In

addition, camouflage of the monopole would be required because the monopole would be out of character with the Cold War-era Los Pinetos Nike Missile Site landscape. With implementation of **CUL MM 2**, **CUL MM 3**, and **CUL MM 5**, impacts would be minimized; however, given the magnitude of the ground disturbance and the extent of the resources present at this site, even with implementation of the required mitigation discussed above, impacts would not be reduced to less than significant levels. There are no other feasible mitigation measures that could reduce impacts at Site LPC below the level of significance. Therefore, impacts at Site LPC would be significant and unavoidable.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to PRC § 15064.5?

Site: LPC (Pg. 4-1029)

As discussed above under CUL-1 above, USFS Resource No. 05015500237 is within both the direct and indirect APEs. This resource consists of two of three separate loci of the Los Pinetos Nike Missile Site, which was constructed in 1955-1956 and deactivated in 1968. The loci are the locations of the administrative area (barracks and support structures) and the radar control facility; the third locus (the launch control facility) is situated just outside the southeast boundary of the indirect APE. The direct APE is completely encompassed by one of the Nike missile loci, and the remaining two are approximately 1,650 to 2,900 feet to the east. The complex of Nike facilities was formally evaluated in 1987 and determined eligible for inclusion in the NRHP. Based on the Project activities, direct and indirect (visual) impacts from construction and operation of the 70-foot monopole and the associated infrastructure features would be significant.

Finding: Changes or alterations have been incorporated into the Project that substantially lessen the significant environmental effect as identified in Draft EIR Section 3.4 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measures CUL MM 2** and **CUL MM 3**, previously discussed above under CUL-1. Although these mitigation measures would minimize Project impacts, specific economic, legal, social, technological, or other considerations make it infeasible to reduce this impact to a less than significant level.

Rationale for Findings: As discussed in Section 3.4, site summary forms in Chapter 4, and Appendix B-4 of the Draft EIR, the presence of archaeological monitors would be required during all ground-disturbing activities at Site LPC. With implementation of **CUL MM 2** and **CUL MM 3**, impacts would be minimized; however, based on the historical significance of this site and the extent and location of the resources, even with implementation of the required mitigation discussed above, impacts would not be reduced to less than significant levels. There are no other feasible mitigation measures that could reduce impacts at Site LPC below the level

of significance. Therefore, impacts at Site LPC on historic archeological resources would be significant and unavoidable.

3.4 Findings Regarding Cumulatively Considerable Impacts

3.4.1 Findings Regarding Cumulatively Considerable Impacts That Would Be Mitigated to a Less Than Significant Level

3.4.1.1 Air Quality

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Sites: AGH (Pg. 4-1), AJT (Pg. 4-38), ASD (Pg. 4-74), BJM (Pg. 4-110), BUR1 (Pg. 4-185), CPK (Pg. 4-296), DPK (Pg. 4-335), ENC1 (Pg. 4-372), FTP (Pg. 4-490), GMT (Pg. 4-528), GRM (Pg. 4-566), H-17A (Pg. 4-604), JOP (Pg. 4-682), JPK (Pg. 4-721), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915), LARICSHQ (Pg. 4-954), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MML (Pg. 4-1104), MTL2 (Pg. 4-1142), OAT (Pg. 4-1181), PASPD01 (Pg. 4-1219), PDC (Pg. 4-1256), PHN (Pg. 4-1294), PMT (Pg. 4-1332), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SGH (Pg. 4-1487), SIM (Pg. 4-1526), SPN (Pg. 4-1563), SUN (Pg. 4-1603), TOP (Pg. 4-1722), TPK (Pg. 4-1762), TWR (Pg. 4-1799), VPK (Pg. 4-1836), WAD (Pg. 4-1872), WMP (Pg. 4-1913), WS1 (Pg. 4-1952), WTR (Pg. 4-1990), ZHQ (Pg. 4-2026)

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.2 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure AQ MM 1**.

Rationale for Finding: The construction contractor will be required to forecast Project emissions based on actual equipment that would be operating. Data would be provided and verified by the Authority, and no exceedance of NOx standards will be permitted. With implementation of **Mitigation Measure AQ MM 1**, NOx emission would be reduced below the level of significance and would not result in a cumulatively considerable significant impact that would conflict or obstruct implementation of the AQMP.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Sites: AGH (Pg. 4-1), AJT (Pg. 4-38), ASD (Pg. 4-74), BJM (Pg. 4-110), BUR1 (Pg. 4-185), CPK (Pg. 4-296), DPK (Pg. 4-335), ENC1 (Pg. 4-372), FTP (Pg. 4-490), GMT (Pg. 4-528), GRM (Pg. 4-566), H-17A (Pg. 4-604), JOP (Pg. 4-682), JPK (Pg. 4-721), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915),

LARICSHQ (Pg. 4-954), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MML (Pg. 4-1104), MTL2 (Pg. 4-1142), OAT (Pg. 4-1181), PASPD01 (Pg. 4-1219), PDC (Pg. 4-1256), PHN (Pg. 4-1294), PMT (Pg. 4-1332), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SGH (Pg. 4-1487), SIM (Pg. 4-1526), SPN (Pg. 4-1563), SUN (Pg. 4-1603), TOP (Pg. 4-1722), TPK (Pg. 4-1762), TWR (Pg. 4-1799), VPK (Pg. 4-1836), WAD (Pg. 4-1872), WMP (Pg. 4-1913), WS1 (Pg. 4-1952), WTR (Pg. 4-1990), ZHQ (Pg. 4-2026)

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.2 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measure AQ MM 1**.

Rationale for Finding: With implementation of Mitigation Measure AQ MM 1, NOx emission would be reduced below the level of significance and would not result in cumulatively considerable net increase in any criteria pollutants.

3.4.1.2 Biological Resources

BIO-1. Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Sites: AGH (Pg. 4-1), AJT (Pg. 4-38), BJM (Pg. 4-110), BUR1 (Pg. 4-185), CPK (Pg. 4-296), DPK (Pg. 4-335), ENC1 (Pg. 4-372), FTP (Pg. 4-490), GMT (Pg. 4-528), GRM (Pg. 4-566), H-17A (Pg. 4-604), JOP (Pg. 4-682), JPK (Pg. 4-721), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MML (Pg. 4-1104), MTL2 (Pg. 4-1142), OAT (Pg. 4-1181), PASPD01 (Pg. 4-1219), PHN (Pg. 4-1294), PMT (Pg. 4-1332), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SGH (Pg. 4-1487), SPN (Pg. 4-1563), SUN (Pg. 4-1603), TOP (Pg. 4-1722), TPK (Pg. 4-1762), TWR (Pg. 4-1799), VPK (Pg. 4-1836), WAD (Pg. 4-1872), WMP (Pg. 4-1913), WTR (Pg. 4-1990), ZHQ (Pg. 4-2026)

Potential project-related impacts to special status wildlife and plant species were evaluated at the proposed Project sites evaluated in the Draft EIR. Continued habitat loss, mortality of wildlife, or disturbance to wildlife as a result of any project included on the cumulative projects list (see Draft EIR Table 2.7-1) would constitute a cumulatively considerable significant impact.

Finding: Changes or alterations have been incorporated into the Project that avoid or substantially lessen the significant environmental effect as identified in Draft EIR Section 3.3 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measures BIO MM 1 – BIO MM 24**.

Rationale for Finding: As described in detail in Section 3.3 of the Draft EIR, the Project would avoid substantial adverse effects on species and habitat through worker education, species and habitat identification, avoidance, and monitoring. Implementation of Mitigation Measures BIO MM 1 through BIO MM 24 would reduce cumulatively considerable construction and operational impacts to below the level of significance.

3.4.1.3 Cultural Resources

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

Sites: AGH (Pg. 4-1), AJT (Pg. 4-38), ASD (Pg. 4-74), CPK (Pg. 4-296), GRM (Pg. 4-566), H-17A (Pg. 4-604), LARICSHQ (Pg. 4-954), LEPS (Pg. 4-989), OAT (Pg. 4-1181), PASPD01 (Pg. 4-1219), PDC (Pg. 4-1256), PHN (Pg. 4-1294), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SGH (Pg. 4-1487), SIM (Pg. 4-1526), SPN (Pg. 4-1563), TOP (Pg. 4-1722), WS1 (Pg. 4-1952), ZHQ (Pg. 4-2026)

Finding: These Project sites are within geologic units with moderate to high paleontological potential, either at the surface or at depth. Each site, considered in combination with the specified projects listed in Draft EIR Table 2.7-1, would result in significant cumulative impacts and, given the location of each site within geologic units of moderate to high paleontological potential, the incremental contribution from each identified site would be cumulatively considerable.

Rationale for Finding: Paleontological monitoring implemented under mitigation measures **CUL MM 6** and **CUL MM 7** would ensure the protection of any unexpectedly encountered paleontological resources and to reduce the potential for cumulatively considerable paleontological impacts to less than significant levels.

CUL-5: Would the project cause a substantial adverse change in the significance of a Tribal cultural resource as defined in Public Resources Code Section 21074.

Site: ENC1 (Pg. 4-372), PWT (Pg. 4-1371), TOP (Pg. 4-1722), ZHQ (Pg. 4-2026)

Finding: Proposed Project site PWT has the potential for containing Tribal resources (see Draft EIR **Error! Reference source not found.** and **Error! Reference source not found.**), and these types of resources have been noted within the 0.5-mile radius of this Project site. If Tribal cultural resources lay within the direct APE (project ground-disturbing areas) of this Project site, construction impacts would be significant. However, implementation of mitigation measures **CUL MM 1**, **CUL MM 3**, and **CUL MM 4** at site PWT would ensure that any unexpectedly encountered Tribal resources are protected and to reduce the potential for cumulatively considerable impacts to less than significant levels.

Rationale for Finding: Implementation of mitigation measures **CUL MM 1**, **CUL MM 3**, and **CUL MM 4** at site PWT would ensure that any unexpectedly encountered Tribal resources are protected and to reduce the potential for cumulatively considerable impacts on tribal resources to less than significant levels.

3.4.2 Findings Regarding Cumulatively Considerable Impacts That Cannot Be Mitigated to a Less Than Significant Level

3.4.2.1 Biological Resources

BIO-1. Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Sites: AGH (Pg. 4-1), AJT (Pg. 4-38), BJM (Pg. 4-110), BUR1 (Pg. 4-185), CPK (Pg. 4-296), DPK (Pg. 4-335), ENC1 (Pg. 4-372), FRP (Pg. 4-452), FTP (Pg. 4-490), GMT (Pg. 4-528), GRM (Pg. 4-566), H-17A (Pg. 4-604), JOP (Pg. 4-682), JPK (Pg. 4-721), LACF072 (Pg. 4-799), LACFCP11 (Pg. 4-915), LEPS (Pg. 4-989), LPC (Pg. 4-1029), MMC (Pg. 4-1069), MML (Pg. 4-1104), MTL2 (Pg. 4-1142), OAT (Pg. 4-1181), PASPD01 (Pg. 4-1219), PHN (Pg. 4-1294), PMT (Pg. 4-1332), PWT (Pg. 4-1371), RIH (Pg. 4-1410), SDW (Pg. 4-1448), SGH (Pg. 4-1487), SPN (Pg. 4-1563), SUN (Pg. 4-1603), TOP (Pg. 4-1722), TPK (Pg. 4-1762), TWR (Pg. 4-1799), VPK (Pg. 4-1836), WAD (Pg. 4-1872), WMP (Pg. 4-1913), WTR (Pg. 4-1990), ZHQ (Pg. 4-2026)

The Migratory Bird Treaty Act of 1918 (MBTA) protects species of native migratory birds listed under the MBTA. The American Bird Conservancy reports an estimated 6.8 million birds annually are killed by collision with communication towers in the United States and Canada. The Department of Interior Office of the Secretary (2014) reports that impacts from non-ionizing electromagnetic radiation emitted by communication towers could be significant for birds, and that cell tower radiation could be a threat to nearby nesting birds. To address these concerns, the USFWS Office of Migratory Birds has issued voluntary guidelines for communications tower placement, construction, and operation. Guidelines emphasize collocation wherever possible, height limitations of 199 feet above ground level, designs that avoid guy wires, unlighted structures if FAA regulations permit, and avoidance of migratory pathways.

Finding: Changes or alterations have been incorporated into the Project that substantially lessen the significant environmental effect as identified in Draft EIR Section 3.3 and in the site summary forms in Chapter 4 of the Draft EIR, which are incorporated by reference herein. These changes are set forth in **Mitigation Measures BIO-6** and **BIO MM 18**. Although these mitigation measures would minimize Project impacts, specific economic, legal, social, technological, or other considerations make it infeasible to reduce this cumulatively considerable impact to a less than significant level.

Rationale for Finding: The addition of LMR structures, as well as the vast array of existing towers and high rise buildings across Los Angeles County contributes to the cumulative loss of migratory birds. This loss would be less substantive for tower structures that implement the USFWS voluntary guidelines for communications towers. This incremental impact of bird mortality due to Project implementation is “cumulatively considerable”. Though the applicable standards for the construction of communication towers are being fully met (with the exception of Site DPK 200 feet tall vs. 199 feet tall), no additional mitigation measures are available to reduce the Project’s contribution to cumulative impacts on migratory birds to less than significant.

3.5 Findings Regarding Responses to Comments on the Draft EIR and Revisions to the Final EIR

The LMR Final EIR does not identify any new significant environmental impacts that were not already identified by the Draft EIR. No new mitigation measures were imposed on the Project that could result in a new significant environmental impact. The Final EIR also does not identify any increases in the severity of any environmental impacts discussed in the Draft EIR. In addition, public comment on the Draft EIR did not identify any new alternatives to the Project that are considerably different from those evaluated in the EIR and that would clearly lessen the significant environmental impacts of the Project.

Responses to comments made on the LMR Draft EIR and revisions made in the LMR Final EIR merely clarify and amplify the analyses presented in the Draft EIR document and do not amount to significant new information that changes the EIR in a way that deprives the public of a meaningful opportunity to comment on a substantial adverse environmental effect of the Project or a feasible way to mitigate or avoid such an effect that the Authority has declined to implement. Therefore, the Authority finds that recirculation of the LMR EIR is not required pursuant to CEQA Guidelines §15088.5(b).

4.0 Findings on Alternatives to the Project

4.1 Alternatives Considered and Eliminated from Further Consideration

4.1.1 Collocation

This alternative would consist of limiting installation of LMR antennas to existing structures, including roof tops, monopoles, and towers, i.e., “collocation.”

Finding: Specific economic, legal, social, technological, or other considerations make this alternative infeasible, and the Authority rejects this alternative because it would not meet the objectives of the Project.

Rationale for Finding: Where feasible to support system performance and reduce the number of sites, the Authority included site design documentation and plans to support collocation and/or utilization of existing telecom tower/sites; however, installing the LMR antennas on existing structures is not possible at each potential LMR site (Draft EIR Section 2.6.1). LMR sites were identified at locations that would provide the maximum countywide coverage using the minimum number of sites. Existing structures for mounting LMR antennas are not present at all locations that are required to achieve countywide coverage. At some locations where towers are present, space is not sufficient on the existing tower to mount the LMR antennas. Therefore, construction of new lattice towers and monopoles would be required to complete the LMR system. Limiting the LMR locations to only those where collocation is possible would not provide the desired coverage; therefore, an alternative consisting entirely of collocation sites would not meet the Project objectives and was not considered further.

4.1.2 Use of Cell on Wheels

Cell on Wheels (COWs) are mobile, portable cell towers with self-contained equipment and generators, typically used to provide expanded cellular network coverage and/or capacity for temporary, short-term demands. COWs are not tall enough to provide the required line of sight at most LMR sites, especially those where new lattice towers are proposed, nor do they provide the type of permanent emergency communications capability envisioned for the proposed Project.

Finding: Specific economic, legal, social, technological, or other considerations make this alternative infeasible. On this basis, the Authority has eliminated this alternative from further consideration because it would not meet the objectives of the Project.

Rationale for Finding: Although they are comparable in height to many of the monopoles for various LMR sites, most of which would be 70 feet tall, COWs are intended for temporary use and not large enough to support all the antennas required at LMR sites (Draft EIR Section 2.6.2). Therefore, use of COWs, either for all sites or at select sites, would not meet the Project objectives and, therefore, this alternative was not considered further.

4.1.3 Use of Satellites

LMR communication could be conducted by using a satellite-based system.

Finding: Specific economic, legal, social, technological, or other considerations make this alternative infeasible. On this basis, the Authority has eliminated this alternative from further consideration because it would not meet the objectives of the Project.

Rationale for Finding: Satellite systems experience a significant lag time between sender and receiver that does not allow the quick communication required during an emergency response (Draft EIR Section 2.6.3). Therefore, use of a satellite system would not meet Project objectives and was not considered further.

4.1.4 Alternative Systems

As the governing board for the LA-RICS telecommunications system, the Authority reviewed various telecommunications options and worked with industry experts to modernize their systems and ease transition from the existing network to a hybrid of digital and analog networks to provide a mobile data system.

Finding: Specific economic, legal, social, technological, or other considerations make this alternative infeasible. On this basis, the Authority has eliminated this alternative from further consideration because it would not meet the objectives of the Project.

Rationale for Finding: In November 2011, requests for proposals were developed to support the hybrid system. In January 2012, proposals were received and a vendor was chosen. Alternative systems to the hybrid system were not identified (Draft EIR Section 2.6.4). Therefore, use of a hybrid communication system would not meet Project objectives and was not considered further.

4.2 Alternatives Analyzed in the Draft EIR

As discussed in Section 2.1.2 of the Draft EIR, the Authority considered more sites than would ultimately be constructed. By considering more sites than would ultimately be constructed, the Authority effectively considered numerous alternative locations for the Project. Specific groups of sites considered alternates to each other were identified. Within each group, only one site would be constructed.

Sites BUR, BUR1, BUR2, and BUR3

These sites are alternate locations within the same telecommunications site complex within the Angeles National Forest. As analyzed in the Draft EIR and summarized in Table ES-1 of the Draft EIR, environmental impacts at each of these sites would be similar; and no one site is environmentally superior to the others. At sites BUR, BUR2 and BUR3 the FAA has imposed limitations on tower heights. Of these sites the Authority has selected BUR1.

Finding: Specific economic, legal, social, technological, or other considerations make Sites BUR, BUR2, and BUR3 infeasible.

Rationale for Finding: BUR2 and BUR3 are proximate to the FAA beacon at the site. When originally submitting a tower notification request, the FAA determined that no tower that went above the height of the beacon would be permitted. BUR1's elevation is substantially lower (almost 200 feet) than the elevation of the beacon and thus allows the construction of a larger antenna support structure. Additionally, BUR1 is located next to an existing lattice tower. Therefore, due to the limitations imposed by the FAA at the other sites, the Authority has determined it is infeasible to construct at Sites BUR, BUR2 and BUR3, and has selected Site BUR1 as the Project Site.

Sites ENT, LACFCP08, and TOP

These sites are located in the Santa Monica Mountains. Although they cover similar geographic areas, these sites do not provide comparable communication area coverage. Specifically, if the TOP site is not constructed, the Authority would need to consider building both ENT and LACFCP08 to achieve similar communication area coverage. Of these three sites, the Authority has selected Site TOP.

Finding: Specific economic, legal, social, technological, or other considerations make Sites ENT and LACFCP08 infeasible.

Rationale for Finding: Of these three sites, Site LACFCP08 is the only site that would result in significant and unavoidable impacts. Specifically, at Site LACFCP08, significant and unavoidable impacts would occur to cultural resources. Selection of either Site ENT or Site TOP would avoid these significant and unavoidable impacts and would not result in any other significant and unavoidable impacts. Additionally, Site LACFCP08 would not achieve the Project objectives to any greater extent than Sites ENT and TOP. Therefore, Site LACFCP08 has been eliminated from consideration because it is the least environmentally preferable among the three alternative sites.

As analyzed in the Draft EIR, impacts at Sites ENT and TOP would be similar. However, while no impacts would occur at either site that could not be reduced to less than significant with mitigation, Site TOP would require more mitigation measures for biological and cultural resources than Site ENT to reduce impacts to less than significant. Therefore, Site ENT is considered environmentally superior to Site TOP by a small margin. However, Site ENT would not provide communication coverage to an area as large (both geographically and by population) as Site TOP, and would provide coverage to an area that generally is served by other Project sites. Additionally, selection of Site ENT instead of Site TOP would leave portions of the Malibu area without LMR coverage. Therefore, Site ENT would not meet the Project objective of providing day-to-day voice and narrowband data radio communications for first and second emergency responders in the Los Angeles region to the same extent as Site TOP. Additionally, within that geographic area, there would be

- no interoperability among member agencies and mutual aid providers

- no support of communications with federal state and local agencies in emergencies
- no improvement of emergency communications
- no additional capacity created or replacement of aging infrastructure that meets current public safety requirements
- no ability to increase separation of antennas on support structures to reduce interference
- no provision of increased frequency flexibility to increase system coverage or capacity
- no ability to transition from existing T-Band (where it exists) to 700 MHz systems.

The sites proposed in the Santa Monica Mountains National Recreation Area and Topanga State Park provide coverage to serve population centers, transportation corridors, and areas of highest wildland fire, among other concerns. Physical, land use, and other constraints to development within these areas of concern within the Santa Monica Mountains National Recreation Area and Topanga State Park substantially limit suitable sites that serve these areas, hence eliminating the availability of alternatives in many locales.

Sites FRP and TMT

Sites FRP and TMT are both within Angeles National Forest. Site FRP is south of Highway 2, and Site TMT is north of Highway 2, but the settings are relatively similar. As analyzed in the Draft EIR, there is no distinction between the two sites in terms of anticipated environmental impacts. Neither is environmentally superior to the other. Site FRP has been selected as the Project site from this group.

Finding: Specific economic, legal, social, technological, or other considerations make Site TMT infeasible.

Rationale for Finding: The FRP site would provide superior communication area coverage in comparison to TMT. Additionally, the site contains larger existing structures for mounting Project components than TMT. Further, selection of Site FRP would avoid the environmental impacts and required mitigation at Site TMT. Therefore, from a Project implementation standpoint, and because FRP fulfills Project objective more effectively, the Authority has selected site FRP as the Project site.

Sites LACFCP09 and LPC

Sites LACFCP09 and LPC are both within Angeles National Forest and about 0.25 mile apart from one another. The environmental impacts of the two sites are similar for most resources. Of these two sites, the Authority has selected Site LPC.

Finding: Specific economic, legal, social, technological, or other considerations make Sites LACFCP09 infeasible.

Rationale for Finding: Significant and unavoidable impacts to cultural resources would occur at both sites. While environmental impacts at the two sites would be similar, impacts to biological resources and

geology and soils would be slightly greater at Site LPC. Therefore, although impacts would be similar between the two sites, Site LACFCP09 is considered the environmentally superior site. However, Site LACFCP09 is not within a USFS-designated communication site. By contrast, Site LPC is within a USFS-designated communication site. To enhance compatibility with the Forest Land Management Plan governing land use on the Angeles National Forest, the USFS has encouraged the Authority to select the site that is within an existing designated communications site. Selection of site LPC would maintain project consistency with the Forest Management Plan, thereby ultimately reducing impacts. Therefore, the Authority has selected Site LPC for its consistency with the Forest Management Plan.

Sites H-69B and SPN

Site H-69B is on an undeveloped ridgeline. Implementation of the Project at Site H-69B would result in significant and unavoidable impacts to aesthetics (AES-1, AES-3) and cultural resources (CUL-1, CUL-2, CUL-4, CUL5) as described in DEIR Sections 3.1 and 3.4, respectively. Additionally Site H69-B would result in significant impacts to Air Quality, Biological Resources, Cultural Resources and Geology/Soils which require implementation of mitigation measures to reduce these impacts to below the level of significance. SPN is an existing communications site with at least five separate installations and towers on the site. Site SPN would also result in significant impacts to Air Quality, Biological Resources, Cultural Resources and Geology/Soils, also requiring implementation of mitigation measures to reduce these impact to below the level of significance; however, Site SPN would not result in any significant unavoidable impacts. Of these two sites, the Authority has selected Site SPN.

Finding: Specific economic, legal, social, technological, or other considerations make Sites H-69B infeasible.

Rationale for Finding: Significant and unavoidable impacts would occur at site H-69B to aesthetics and cultural resources. Selection of Site SPN would avoid these significant and unavoidable impacts and would not result in any other significant and unavoidable impacts; therefore, Site SPN is the environmentally superior alternative. Site SPN has been selected by the Authority as the Project site from this group.

Sites JPK and JPK2

These sites are alternate locations within the same telecommunications site complex in the Angeles National Forest. As summarized in Table ES-1 of the Draft EIR, environmental impacts at each of these sites would be similar. Neither site is environmentally superior to the other. Site JPK is closer to the existing LA County Communications facility and is located closer to power than JPK-2.

Finding: Specific economic, legal, social, technological, or other considerations make Site JPK2 infeasible.

Rationale for Finding: The Authority has selected Site JPK, because Site JPK is closer to the existing LA County Communications facility and is located closer to power than JPK-2. Further, selection of Site JPK

would avoid the slightly greater biological resource impacts and required mitigation associated with construction of Site JPK2. Therefore, the Authority has selected site JPK as the Project site.

Sites SUN and SUN2

These sites are alternate locations within the same telecommunications complex in the Angeles National Forest. Site SUN is closest to the existing facility. As summarized in Table ES-1 of the Draft EIR, environmental impacts at each of these sites would be similar; and neither site is environmentally superior to the other. Site SUN has been selected as the Project site from this group.

Finding: Specific economic, legal, social, technological, or other considerations make Site SUN2 infeasible.

Rationale for Finding: Although these locations are very close to each other, the SUN site is the closest to the existing facility and would allow the new site to mimic the existing coverage from this location as closely as possible. In addition, selection of Site SUN would avoid the environmental impacts and required mitigation at Site SUN2. Therefore, from a Project implementation standpoint, and because Site SUN fulfills Project objective more effectively, the Authority has selected site SUN as the Project site.

No Project Alternative:

Under the No Project Alternative, none of the LMR wireless voice and narrowband data communications system sites evaluated in the Draft EIR would be constructed.

Finding: Specific economic, legal, social, technological, or other considerations make this alternative infeasible. On this basis, the Authority has eliminated this alternative from further consideration because it would not meet the objectives of the Project.

Rationale for Finding: Without the proposed Project, public safety agencies and emergency responders would continue to utilize their current radio systems, which increasingly are inadequate and/or antiquated and have exceeded their technologically useful life. In addition, most of the region's public safety telecommunications infrastructure (equipment shelters and communications towers) do not meet the technical or operational needs of the agencies that utilize them and do not provide the necessary coverage that all users need. Therefore, the No Project Alternative would not meet any of the Project objectives.

4.3 Alternatives and Mitigation Measures Identified in Public Comments

No feasible alternatives that were not already considered in the EIR were identified in public comments to the Draft EIR. Several comments requested that alternate sites be considered, but no specific sites were identified for consideration by the Authority.

The City of Agoura Hills requested that alternatives to the construction of a new 70-foot monopole at Site AGH be considered. These alternatives included collocation on an existing structure at the site and installation of a shorter monopole. The Authority has determined that the existing towers at Site AGH do not meet current building codes. Therefore, collocation on existing towers at Site AGH is not feasible under existing conditions and would require retrofitting to ensure the existing towers meet current building codes, which would add extra expense and may not ultimately be possible. Even if upgrade of the tower were feasible, collocation on existing towers at Site AGH would require the Authority to upgrade another entity's infrastructure without compensation and would put the Authority in a position of a lessee on that tower, which would very likely increase the cost of the site to the Authority and by extension, the tax payers. Additionally, it would not be technically feasible to collocate equipment on existing towers at Site AGH because the lower height of the existing towers would limit the amount of equipment the Authority could place on the towers and lower the coverage performance, which would result in a decreased ability to meet the project objectives in this geographic area. Installation of a new monopole shorter than 70 feet would also be infeasible for the same reasons (i.e., the lower height would limit the amount of equipment the Authority could place on the monopole and lower the coverage performance).

The Catalina Island Conservancy requested that the Authority consider whether the existing towers at sites BJM, DPK, and TWR could be removed and replaced by larger towers than proposed (i.e., larger than the 180 foot towers proposed for sites BJM and TWR and the 200 foot tower proposed for Site DPK). The Authority has determined that the addition of existing antennas onto a new larger tower at each of the sites would require a substantially taller and larger tower to accommodate the minimum 25 antennas to be added to each site. The larger and taller towers would create a greater visual intrusion than the proposed addition of a second tower at each site, where from many vantage points one tower would block the other from view. The Authority also determined that the installation of a much larger tower would be seen from a greater distance at each of the three sites. For these reasons, the Authority has determined that placement of equipment on a larger tower would not reduce or avoid the visual impacts of the proposed project at these sites.

The Catalina Island Conservancy also requested that the Authority consider whether a new tower is required at each of the three proposed Project sites on Santa Catalina Island. The Authority determined that it would not be feasible to locate all the existing and proposed equipment on the existing towers and that new towers would be required for each of the three sites to accommodate the LMR equipment.

No new mitigation measures were identified in the public comments. The Catalina Island Conservancy did identify enhancements to existing mitigation measures and where appropriate, the Authority accommodated the Conservancy's comments. These enhanced measures included additional coordination between the Authority and the Conservancy during the permitting process, and the inclusion of sites BJM, DPK, and TWR among those sites where archaeological monitors would be

present during ground disturbing activity. These revisions resulted in no changes to the impact significant conclusions made in the Draft EIR.

5.0 Custodian of Records

The documents and other materials that constitute the record of proceedings on which the Project findings are based are located at the LA-RICS Headquarters, 2525 Corporate Place, Suite 100, Monterey Park, California 91754. The custodian for these documents is the LA-RICS Authority. This information is provided in compliance with Public Resources Code § 21081.6(a)(2) and CEQA Guidelines § 15091(e).

6.0 Statement of Overriding Considerations

CEQA requires a public agency to balance the benefits of a Project against its unavoidable, adverse environmental impacts in determining whether to approve the project.

Section 15093 of the State CEQA Guidelines provides the following:

- (a) *CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits of a proposed project against its unavoidable environmental risks when determining whether to approve the project. If the specific economic, legal, social, technological, or other benefits of a proposed project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered “acceptable.”*
- (b) *When the lead agency approves a project which will result in the occurrence of significant effects which are identified in the Final Environmental Impact Report (Final EIR) but are not avoided or substantially lessened, the agency shall state in writing the specific reasons to support its action based on the Final EIR and/or other information in the record. The statement of overriding considerations shall be supported by substantial evidence in the record.*
- (c) *If an agency makes a statement of overriding considerations, the statement should be included in the record of the project approval and should be mentioned in the notice of determination. This statement does not substitute for, and shall be in addition to, findings required pursuant to Section 15091.*

6.1 Project Significant Impacts

Of the 44 sites analyzed in the Draft EIR and identified for construction (Table 1-1) as part of the LMR system, Sites JOP and LPC are the only sites with significant and unavoidable impacts on a project level. These impacts would occur to aesthetics and cultural resources. Cumulatively considerable and unavoidable impacts would occur at all project sites to biological resources.

6.1.1 Aesthetics

Site JOP includes installation of a new 180-foot lattice tower mounted with whip and microwave antennas, an equipment shelter, and generator. Existing solar panels at the site would be replaced with larger panels. The new facilities would be located in an area with no existing tall structures. Given the height of Josephine Peak in relation to the surrounding national forest, the new structure would intrude upon scenic vistas in the area. Because the new lattice tower would introduce a new vertical intrusion onto the landscape, a substantial impact to scenic vistas would occur, resulting in a significant impact.

Site JOP is located in the Angeles National Forest and the existing scenic attractiveness is designated B, which is considered typical. The new tower would contrast and be incompatible with the visual

character of the landscape, which is primarily forested. The result would be a degradation of the visual character surrounding the site resulting in a significant impact.

No feasible mitigation measures exist to reduce these impacts to less than significant levels at Site JOP. Therefore, impacts to scenic vistas and visual character would be significant and unavoidable.

6.1.2 Biological Resources

The addition of LMR structures, as well as the vast array of existing towers and high rise buildings across Los Angeles County contributes to the cumulative loss of migratory birds protected by the MBTA. This loss would be less substantive for tower structures that implement the USFWS voluntary guidelines for communications towers. These applicable standards for the construction of communication towers would be met for all project sites (with the exception of not exceeding the height limitations of 199 feet above ground level at Site DPK which would be 200 feet tall). Although changes or alterations set forth in **Mitigation Measures BIO-6** and **BIO MM 18** have been incorporated into the Project that substantially lessen the significant environmental effect, the incremental impact of bird mortality due to Project implementation would still be cumulatively considerable and significant. No additional feasible mitigation measures are available to reduce the Project's contribution to cumulative impacts on migratory birds to less than significant.

6.1.3 Cultural Resources

Site LPC includes installation of a 70-foot monopole with a 15-foot lightning rod, construction of a new equipment shelter, and installation of a backup generator and fuel tank on a concrete pad. Two historical resources are located within the direct and indirect APEs of Site LPC. The two resources are P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. In addition, USFS Resource No. 05015500237 is within both the direct and indirect APEs. Impacts from construction of the monopole and associated infrastructure features at this Project site would directly and indirectly (visually) impact the existing Cold War-era resources associated with the Los Pinetos Nike Missile Site, which is eligible for inclusion in the NRHP. The Project site is completely encompassed by one of three discontinuous areas associated with the Nike site (westernmost locus), and installation of the monopole would both directly and visually impact the Nike landscape. With implementation of **CUL MM 2**, **CUL MM 3**, and **CUL MM 5**, impacts would be minimized; however, based on the historical significance of this site and the extent and location of the resources, even with implementation of the required mitigation discussed above, impacts (CUL-1 and CUL-2) would not be reduced to below significant levels. Therefore, impacts of construction and operation at Site LPC on historical and historical archeological resources would be significant and unavoidable.

6.2 Overriding Considerations

The Project offers numerous benefits that outweigh the unavoidable adverse environmental effects of the Project. The LA-RICS Board recognizes that significant and unavoidable impacts will result from implementation of the Project, as discussed above. Having (1) adopted all feasible mitigation measures, (2) recognized all significant, unavoidable impacts, and (3) balanced the benefits of the Project against the Project's significant and unavoidable impacts, the LA-RICS Board finds that there are specific overriding economic, legal, social, technological, or other benefits of the Project that outweigh those impacts and provide sufficient reasons for approving the Project. These overriding considerations justify adoption of the Project and certification of the Final EIR. Each of the benefits set forth below constitutes an overriding consideration warranting approval of the Project, independent of the other benefits, despite each and every unavoidable impact. These benefits are as follows:

The new system will enhance safety and emergency response for 10 million Los Angeles County residents and the over 40 million Los Angeles County tourists. The LMR system will provide emergency responders with an improved communications system that will enable efficient and coordinated response to incidents and emergencies that is currently not possible in Los Angeles County. The improved communications could reduce response times and ultimately save lives. The LMR system will support a rapid, safe, and effective response during daily operations. The new system will facilitate effective radio communication to prevent and respond to crimes, keeping firefighters safe as they fight blazes, facilitating life-saving exchanges of information between emergency medical service professionals and hospitals, and allowing third responders such as public works and utility providers the opportunity to coordinate responses to disasters and special events. Additionally, the Los Angeles region is disaster prone and is designated as a high-threat area by the Department of Homeland Security (DHS). The Los Angeles area is subject to 13 of 16 disaster types. The LMR system will support faster, better-coordinated, large-scale multi-agency response to emergencies such as terrorist attacks, earthquakes, civil disturbance, wildfire or other disasters, improving overall system capacity and coverage for first and second responders region-wide.

The new system will replace an outdated proprietary system with a standards-based communication system. The LA-RICS LMR system is a standards-based system that is designed to facilitate the use of standards-based radio equipment regardless of manufacturer. Legacy systems are proprietary; and, as such, each proprietary system must use proprietary equipment that is specific to that model and/or version of network. Interoperability with other vendors' systems and, in many cases, different models of networks by the same manufacturer requires third party equipment to "patch" the systems together. This patch introduces a potential point of failure during times of critical communications and does not solve the problem of proprietary equipment (radios) communicating directly on a different proprietary network. The LA-RICS network will provide first and secondary responders using standards-based equipment, regardless of model or manufacturer, the ability to communicate directly with each other and remove the point of failure that is introduced with a patch. Additionally, the LA-RICS network will

provide for a **standards-based interface with other manufacturers' standards-based networks, thus preserving direct interoperability within a system-of-system environment.**

The new system will meet the FCC mandate to vacate UHF T-Band frequency spectrum at 470 to 512 MHz for members of the LA-RICS Joint Powers Authority. The LA-RICS LMR system will provide a modern, integrated wireless voice and narrowband data communications system designed and built to serve law enforcement, fire service, health service, and public works professionals throughout Los Angeles County. The system does not operate on the FCC-mandated vacated spectrum. It seamlessly operates on two bands of spectrum, 700 MHz and UHF.

The new system will replace 40 aging radio networks with one state-of-the-art network, solely dedicated to emergency responders, that increases overall capacity for and speed of communication during local emergencies, special events, and disasters. The new system will provide day-to-day communications within and among agencies and allow seamless interagency communications for responding to routine, emergency, and catastrophic events. The system is composed of four different subsystems:

- 1) Digital Trunked Voice Radio System — provides first responders with radio communications utilizing digital technology. It seamlessly operates on two bands of spectrum (700 MHz and UHF)
- 2) Analog Conventional Voice Radio System — provides first responders with radio communications utilizing conventional analog technology
- 3) Los Angeles Regional Tactical Communications System — consists of local, state, and federal interoperability channels in four different bands of spectrum in order to allow outside agencies responding to events in the County to have designated channels for communications
- 4) Narrowband Mobile Data Network — a data system that provides critical dispatch communications

DRAFT
ENVIRONMENTAL IMPACT REPORT

Executive Summary

Introduction/Background

Public safety services in Los Angeles County are provided by more than 80 public safety agencies represented by approximately 34,000 first responders and 17,000 secondary responders serving more than 10 million residents, as well as tourists and commuters. These agencies cover large tracts of the county, and their current radio systems are inadequate and/or antiquated and have exceeded their technologically useful life (i.e., equipment and programming are no longer supported by vendors). Most of the region's public safety telecommunications infrastructure (equipment shelters and communications towers) does not meet the technical or operational needs of the agencies that utilize them and do not provide the necessary coverage that all users need.

Without adequate capacity on the radio system, even on a daily basis, first responders often struggle to acquire the necessary resources to communicate. The issue is exacerbated on large incidents where a shortage of radio resources greatly impacts operations due to the need for multiple command, tactical, and mutual aid channels. For example, first responders may not be able to request additional resources to assist them in life-threatening situations, hear evacuation orders, or hear broadcasted warning messages from dispatchers. Without adequate capacity to dedicate individual radio channels to individual incidents, the likelihood of interference between units responding to separate incidents is high.

In April 2005, the Regional Interoperable Steering Committee was formed to explore the development of a single, shared communications system for all public safety agencies in the greater Los Angeles region. As a result, the County of Los Angeles (County), 82 municipalities, and 3 other public sector entities in the region drafted a Joint Powers Agreement that established the Los Angeles Regional Interoperable Communications System (LA-RICS) Joint Powers Authority (Authority) to create a regional, area-wide, interoperable public safety communications network.

This Environmental Impact Report (EIR) discloses the potential environmental impacts associated with construction and operation of the of the public safety communication network through the implementation of a Land Mobile Radio (LMR) system. The LMR system is a wireless communications system for mobile and portable devices such as walkie-talkies and two-way radios. The LMR system would consist of installation of LMR antennas on the rooftops of existing buildings or on existing or new monopoles and lattice tower support structures and support equipment at up to 90 sites, located primarily in Los Angeles County. The LMR sites would contain the infrastructure and equipment necessary to provide day-to-day voice and narrowband data radio communications coverage for emergency responders throughout the County.

The objectives of the LMR Project are:

- 1) Provide day-to-day voice and narrowband data radio communications for first and secondary emergency responders in the Los Angeles region
- 2) Enable interoperability among member agencies and mutual aid providers
- 3) Support communication with regional, state, and federal agencies in the event of a natural or man-made disaster
- 4) Improve emergency communications within Los Angeles County
- 5) Add capacity, replace existing aging infrastructure with infrastructure that meets current building codes and telecommunications industry standards that better support modern technology, and provide for more technologically advanced equipment
- 6) Lessen the amount of interference resulting from multiple systems on the same tower by providing greater separation of different radio frequencies
- 7) Provide greater frequency flexibility and increase overall system coverage and capacity by providing greater separation of different radio frequencies
- 8) Allow for transition from use of the ultra-high-frequency T-Band to the 700-megahertz spectrum as mandated by the Federal Communications Commission (FCC)

Project and Alternatives

The LMR Project consists of the construction and operation of up to 90 LMR sites out of 94 sites under consideration. These 90 sites may be a combination of sites previously found statutorily exempt from CEQA (see Section 1.3.2) and sites addressed in this EIR as the proposed Project (see Section 2.1.2). By considering more sites than would ultimately be constructed, the Authority is effectively considering numerous alternative locations for the proposed Project. The ultimate selection of which sites will be constructed will be determined based on the conclusions of the Draft EIR, as well as whether some of the 94 potentially feasible sites ultimately prove infeasible due to economic, environmental, legal, social, or technological factors, including system engineering, geotechnical evaluations, and permitting process or in lease agreement discussions with the property owner.

In 2012, the California Legislature, in recognition of the urgent need of the LA-RICS, granted the Authority a limited statutory exemption from the California Environmental Quality Act (CEQA) (Public Resource Code [PRC] § 21080.25.). PRC section 21080.25 exempts the design, site acquisition, construction, operation, and maintenance of the LA-RICS LMR system from CEQA review so long as each individual project site meets the following criteria:

- The site is publicly owned and already contains an antenna support structure and/or is a police, sheriff, or fire station, or other public facility that transmits or receives public safety radio signals.
- Construction and implementation at the project site would not have a substantial adverse impact on wetlands, riparian areas, or habitat of significant value and would not harm any

species protected by the federal Endangered Species Act of 1973 (16 United States Code [U.S.C.] Section 1531 et seq.), the Native Plant Protection Act (Chapter 10, commencing with Section 1900, of the Fish and Game Code), or the California Endangered Species Act (Chapter 1.5 [commencing with Section 2050] of Division 3 of the Fish and Game Code), or the habitat of those species.

- Construction and implementation at the project site would not have a substantial adverse impact on historical resources pursuant to PRC Section 21084.1
- Operation of LMR facilities at the site would not exceed the maximum permissible exposure standards established by the FCC, as set forth in Sections 1.1307 and 1.1310 of Title 47 of the Code of Federal Regulations (CFR).
- The LMR antenna support structures at the site would comply with applicable state and federal height restrictions, and any height restrictions mandated by an applicable comprehensive land use plan adopted by an airport land use commission. Any new lattice towers shall not exceed 180 feet in height without appurtenances and attachments, and any new monopoles shall not exceed 70 feet in height without appurtenances and attachments.
- Each new central system switch is located within an existing enclosed structure at a publicly owned project site or housed at an existing private communications facility.
- None of the sites are located on a school or sacred cultural site.

On November 13, 2014, February 5, 2015, and December 17, 2015, the Authority determined, based on substantial evidence, that a number of the potential LMR sites meet all of the required criteria for exemption from CEQA and authorized project construction, implementation, and operation at these sites.

All proposed LMR sites that are not exempt from CEQA under the statutory exemption in PRC section 21080.25 are evaluated at a project level in this EIR. Construction and implementation of LMR infrastructure at these non-CEQA-exempt sites would occur only if the Authority certifies the EIR and approves construction of LMR facilities at these sites. As with the CEQA-exempt sites, certification of the EIR does not commit the Authority to construct all the sites addressed as part of the proposed Project in this EIR. The sites evaluated in this EIR are listed in Table 2.1-1.

The EIR also considers a No Project Alternative. The No Project alternative represents the anticipated conditions if construction and operation of the proposed Project were not implemented. Under the No Project Alternative, the LMR wireless voice and narrowband data communications system sites that are the subject of this EIR would not be constructed; however, the existing facilities at the communication sites identified for LMR use in this EIR would continue to be inspected, maintained, and repaired as part of ongoing activities.

Areas of Controversy

Known areas of controversy are briefly summarized below and are addressed in within Chapter 3 of this EIR.

- **Aesthetics:** Impacts to scenic resources and visual character are a concern to the public. The visual effects of the Project are addressed in Section 3.1, Aesthetics.
- **Land Use:** Compatibility with local land use planning and zoning is a concern to municipalities. Land use impacts from the Project are addressed in Section 3.9, Land Use.
- **Radiofrequency Exposures:** Potential health issues associated with radiofrequency (RF) exposures from LMR facilities is a concern to the public. The potential for radiofrequency exposures associated with the proposed Project is addressed in Section 5.3.

Impact Summary Table

Table ES-1 summarizes the CEQA significance determinations for each significance criteria for every site discussed within the EIR. Findings of no impact (also shown as NI in the table) are made in green and findings less than significant impacts (LTS) are in light green. Yellow (LTSM) indicates a finding of significant impact that was determined reduced to less than significant with application of mitigation measures. Findings of significant and unavoidable impacts (SU) are identified in red.

Proposed environmental mitigation measures for significant impacts are discussed in detail in Chapter 3 in the following Sections: 3.1.4 (Aesthetics), 3.2.4 (Air Quality), 3.3.4 (Biological Resources), 3.4.5 (Cultural Resources), 3.5.4 (Geology/Soils), 3.7.4 (Hazards and Hazardous Materials), 3.8.4 (Hydrology/Water Quality), 3.9.4 (Land Use/Planning), 3.10.4 (Noise), 3.12.4 (Transportation/Traffic), and 3.13.4 (Utilities). Table ES-2 provides a list of mitigation measures and identifies to what impacts and at what sites they apply. Implementation of the mitigation measures for LMR sites selected and approved for construction will be monitored and enforced by the Authority in accordance with CEQA Guidance Section 15097. Specific mechanisms are in place to assure all mitigation measures included in this EIR are implemented and that the provisions are enforceable. A Mitigation Monitoring and Reporting Program is being prepared and includes all mitigation measures and implementation details.

Issues to be Resolved

This Draft EIR identifies the No Project Alternative as the Environmentally Superior Alternative; however, the No Project Alternative does not meet the Project objectives. As discussed previously, more sites are proposed than would be constructed. Some groups of one or more proposed Project sites analyzed in this EIR are specifically identified as alternatives to each other where only one would be constructed. Table ES-1 shows known alternative/replacement sites. These sites are listed next to each other and grouped by a heavy line to allow easy comparison of the environmental impacts among them.

Among these sites, where an environmentally superior alternative can be determined, it is identified within each group.

Upon consideration of this EIR, as well as other relevant factors, the Authority will resolve the issue of the choice among these alternative/replacement sites.

NI = No Impact
 LTS = Less than Significant Impact
 LTSM = Significant Impact Reduced to Less than Significant with Mitigation Incorporated
 SU = Significant and Unavoidable Impact

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
Aesthetics	AES-1: Significant and Unavoidable	There are no mitigation measures that could feasibly reduce the significant impacts of the project.	H-69B & JOP
	AES-2: Less Than Significant	None required	All Sites
	AES-3: Significant and Unavoidable	There are no mitigation measures that could feasibly reduce the significant impacts of the project.	H-69B & JOP
	AES-3: Less Than Significant with Mitigation	CUL MM 5: Architectural Resources Protection and Camouflage: See Below	PASPD01
	AES-4: Less Than Significant	None required	All Sites
Air Quality	AQ-1: Less than Significant with Mitigation	AQ MM 1: No later than 12:00 p.m. on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NO _x emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) if combined NO _x emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which USEPA regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NO _x emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week’s report.	All Sites In SCAQMD
	AQ-2: Less than Significant with Mitigation	AQ MM 1: See Above	All Sites In SCAB
	AQ-3: Less than Significant with Mitigation	AQ MM 1: See Above	All Sites In SCAB
	AQ-4: Less Than Significant	None Required	All Sites
	AQ-5: Less Than Significant	None Required	All Sites
Biological Resources	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	BIO MM 1 Conservation Monitoring and Reporting Plan: Prior to construction, the Authority shall develop and implement or require the system contractor to develop and implement a mitigation monitoring and reporting plan (MMRP) for the proposed Project. The MMRP would serve to organize environmental compliance requirements identified in best management practices, mitigation measures, permit requirements, real property agreement conditions, and other applicable sources. The MMRP shall contain an organization chart and communication plan for environmental compliance as it relates to the proposed Project.	AGH, AJT, BJM, BUR, BUR1, BUR2, BUR3, CPK, DPK, ENC1, ENT, FRP, FTP, GMT, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACF072, LACFCP08, LACFCP09, LACFCP11, LEPS, LPC, MMC, MML, MTL2, OAT,

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
	<p>BIO-1: Significant Impact Reduced to Less than Significant with Mitigation</p>	<p>BIO MM 2 Worker Environmental Awareness Program: Prior to construction, the Authority shall develop and implement or require the system contractor to develop and implement a Worker Environmental Awareness Program (WEAP) for the proposed Project. This mitigation measure would serve to institute and formalize an education program to increase awareness of environmental resources and measures and rules that are in place to help minimize impacts to those resources.</p> <ul style="list-style-type: none"> a) A WEAP shall be developed and shall be required for all construction employees prior to placement of Project equipment, construction, or any ground-disturbing activities at the proposed Project site. Training of additional workers, contractors, and visitors shall be provided, as needed. b) The WEAP is to inform on-site workers of the possible presence of special status species, the measures to be taken to protect these species, and the importance of minimizing impacts to the natural environment through the protection of native vegetation, adhering to required buffers and protection zones, staying on existing roads, and implementing best management practices, that include containment of any spills, disposal of trash, and management of runoff and sediment transport. c) To assure long-term implementation of mitigation measures, an information sheet listing potential sensitive species and what to do if any are encountered shall be prepared, distributed to workers, and posted on site. 	<p>PASPD01, PHN, PMT, PWT, RIH, SDW, SGH, SPN, SUN, SUN2, TMT, TOP, TPK, TWR, VPK, WAD, WMP, WTR, ZHQ</p> <p>AGH, AJT, BJM, BUR, BUR1, BUR2, BUR3, CPK, DPK, ENC1, ENT, FRP, FTP, GMT, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACF072, LACFCP08, LACFCP09, LACFCP11, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PHN, PMT, PWT, RIH, SDW, SGH, SPN, SUN, SUN2, TMT, TOP, TPK, TWR, VPK, WAD, WMP, WTR, ZHQ</p>

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	BIO MM 3 Biological Compliance Reporting: A biological monitor shall visit all active construction sites at least once weekly to document compliance and provide reports to the Project administrator on a weekly basis.	AGH, AJT, BJM, BUR, BUR1, BUR2, BUR3, CPK, DPK, ENC1, ENT, FRP, FTP, GMT, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACF072, LACFCP08, LACFCP09, LACFCP11, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PHN, PMT, PWT, RIH, SDW, SGH, SPN, SUN, SUN2, TMT, TOP, TPK, TWR, VPK, WAD, WMP, WTR, ZHQ
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	BIO MM 4 Site Sanitation: a) The contractor shall keep a regulated work area free of litter and trash. Trash and discarded food items shall be contained within an appropriate receptacle and removed daily to avoid attracting wildlife to the construction site, contribute to habituation of wildlife to the presence of humans, or to attract avian or mammalian predators to the area. b) All construction debris (including nuts, bolts, small pieces of wire, etc.) shall be cleaned up (e.g., trash removed, scrap materials picked up) each day that work is conducted to minimize the likelihood of wildlife visiting the site and consuming microtrash, discarded food, or other substances.	BJM, BUR, BUR1, BUR2, BUR3, CPK, DPK, ENT, FRP, GMT, H-17A, H-69B, JOP, JPK, JPK2, LACFCP09, LACFCP11, LPC, MMC, MML, MTL2, OAT, PMT, RIH, SPN, SUN, SUN2, TMT, TOP, TPK, TWR, VPK, WMP, WTR
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	BIO MM 5 Hazardous Materials Management: a) A toxic substance management and spill response plan shall be prepared by the contractor. b) Hazardous materials shall be contained; spills shall be prevented; and any spills at the Project site or along access roads shall be contained and cleaned up immediately. c) All construction vehicles are required to carry at least one spill response kit. d) Any spills shall be accounted for in reports prepared by the biological/environmental monitor.	BJM, BUR, BUR1, BUR2, BUR3, DPK, FRP, GMT, JOP, JPK, JPK2, LACFCP09, LACFCP11, LPC, MMC, MML, MTL2, OAT, PMT, SUN, SUN2, TMT, TPK, TWR, VPK, WMP, WTR

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
	<p>BIO-1: Significant Impact Reduced to Less than Significant with Mitigation</p>	<p>BIO MM 6 Anti-perch Devices: Anti-perch devices shall be affixed to any elevated, horizontal structure (this includes the top quarter-arc of disc antennas) suitable for perching or nesting by raptors, ravens, vultures, gulls, or other large birds to deter the use of these facilities as perch or nest sites to avoid attracting avian predators to the area, and so as not to contribute to the habituation of condors to the presence of humans. Anti-perch devices shall be inspected annually and repaired as needed.</p>	<p>BJM, BUR, BUR1, BUR2, BUR3, DPK, FRP, FTP, GMT, JOP, JPK, JPK2, LACFCP09, LACFCP11, LPC, MMC, MML, MTL2, OAT, PMT, SUN, SUN2, TMT, TPK, TWR, VPK, WAD, WMP, WTR, ZHQ</p>
	<p>BIO-1: Significant Impact Reduced to Less than Significant with Mitigation</p>	<p>BIO MM 7 California Condor Protection:</p> <ul style="list-style-type: none"> a) As part of BIO MM 4 Site Sanitation, a written list of procedures shall be established and posted on site and/or kept in a site binder at all times. Specifically, the protocol shall list requirements including: all trash of any size shall be placed and contained in covered containers; and no trash of any kind shall be released to the environment. This includes any food items, small or large pieces of plastic or wire, and any small metallic objects (i.e., nuts, bolts, wire nuts). b) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of California condors. A qualified biologist shall prepare an informational handout to be presented at WEAP instruction. This program and handout shall provide, at a minimum, information concerning the biology and distribution of the California condor, legal status, and possible occurrence in the vicinity; measures to avoid impacts to condors; procedures to be implemented to eliminate microtrash from the site; and what to do in case of California condor encounters. The informational handout shall be posted at the Project site for continued reference by construction and maintenance workers. c) During construction and operations of the facility, all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the Project site. If condors are on site, USFWS would be contacted immediately (Ventura office: 805-644-1766) following internal chain-of-command communications protocol. Once condors leave on their own accord or as a result of techniques employed by permitted USFWS personnel, on-site work may continue. d) If condors are known to be present in the area and found roosting within 0.5 mile of the Project site, no construction activity shall occur between one hour before sunset and one hour after sunrise or until the condors leave the area. e) If condors are documented nesting within 1.5 miles of a proposed Project site (as determined by nesting bird surveys, observations by the biological monitor, and/or information from USFWS condor program), no construction activity shall occur until further 	<p>BUR, BUR1, BUR2, BUR3, FRP, GMT, JOP, JPK, JPK2, LACFCP09, LACFCP11, LPC, MMC, MML, MTL2, OAT, PMT, SUN, SUN2, TMT, TPK, VPK, WMP, WTR</p>

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		authorization is received from USFWS. f) The Project site shall be maintained in a clean condition at all times. g) All wires, cables, and other items, either temporary or permanent, that could entangle a condor are to be securely fastened down or removed from site. No permanent guy wires will be used. h) As part of BIO MM 3 Biological Compliance Reporting, the environmental monitor shall verify at least once a week during active construction and upon completion of construction activities that the Project site is maintained in a clean condition.	
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	BIO MM 8 Biological Monitoring: A qualified biological monitor shall be present at the site during construction activities that result in ground disturbance or removal of vegetation to ensure all mitigation measures are met. Duties of the biological monitor include checking for the presence of wildlife on the construction site, inspecting trenches or holes for trapped wildlife, surveying for the presence of nesting birds and adherence to nesting bird protection buffers, monitoring construction site boundaries, and checking that vegetation flagged for protection is not disturbed.	AGH, AJT, BJM, BUR, BUR1, BUR2, BUR3, CPK, DPK, ENC1, ENT, FRP, FTP, GMT, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACFP072, LACFCP08, LACFCP09, LACFCP11, LEPS, LCP, MMC, MML, MTL2, OAT, PASPD01, PHN, PMT, PWT, RIH, SDW, SGH, SPN, SUN, SUN2, TMT, TOP, TPK, TWR, VPK, WAD, WMP, WTR, ZHQ
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	BIO MM 9 Protect Native Vegetation and Common Wildlife: a) Minimize disturbance to native perennial plants; new ground disturbance shall be the minimum necessary and established and delineated prior to any earth-moving activities. b) If native perennial vegetation cannot be avoided and would be impacted or destroyed, the disturbance area is to be surveyed for the presence of special status plants and to remove common species of wildlife prior to destruction of the vegetation. c) At no time shall protected species be handled or moved. If a protected species is found within the construction area, all work that may impact that animal shall cease and the appropriate agency(s) shall be contacted (e.g., USFWS, CDFW, land management agency). The animal shall be allowed to leave the site on its own accord. d) Prior to construction or any ground-disturbance activities, mark the construction disturbance limits and monitor for adherence to these boundaries. e) Stay on existing roads. f) Do not remove native trees; construction limits shall be established to avoid walnuts, oaks, and any other sensitive species habitat and the limits shall be flagged by a biological monitor.	AGH, AJT, BJM, CPK, DPK, ENC1, ENT, FRP, FTP, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACFP072, LACFCP08, LACFCP09, LACFCP11, LEPS, LPC, MMC, MML, MTL2, OAT, PHN, PMT, PWT, RIH, SDW, SPN, SUN, SUN2, TMT, TOP, TPK, TWR, VPK, WAD, WMP, WTR

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		<ul style="list-style-type: none"> g) Protect tree root systems by precluding paving, trenching, or other ground disturbing activities; and preclude heavy equipment from driving, parking, or staging within the tree’s dripline. h) Any loss of native perennial vegetation, whether planned or unintentional, is to be accounted for in reports prepared by the biological monitor. 	
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	BIO MM 10 No Pets: Construction and maintenance workers shall be prohibited from bringing pets (especially dogs) to non-urban Project sites, as the domestic animal may harass or kill native wildlife present at the site. 		<p>vegetation, and plants not identified for removal within or near the construction zone shall be marked for protection.</p> <p>c) As part of BIO MM 3 Biological Compliance Reporting, the environmental monitor shall verify at least once a week during active construction and upon completion of construction activities that habitat protection measures have been followed.</p>	
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	BIO MM 13 Coastal California Gnatcatcher Breeding Season Restrictions: Construction activities that include loud noises (e.g., trenching, drilling, concrete cutting), the use of large equipment (e.g., booms, cranes, drills, concrete pouring), or the removal of perennial vegetation shall be precluded between February 15 and August 30. This measure is applicable to identified Project sites where coastal California gnatcatchers are known to be or likely would be present, and construction activities may result in disturbance to the bird.	H-17A, PHN, RIH, SDW
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	<p>BIO MM 14 Coastal California Gnatcatcher Protocol Surveys:</p> <p>a) To determine if coastal California gnatcatchers are present within 500 feet of specified Project sites and if breeding season restrictions would be required, surveys following the most recent version of the USFWS Coastal California Gnatcatcher Presence/Absence Survey Protocol (current revision issued by USFWS Carlsbad Office 1997) shall be conducted prior to initiating any construction activities that may result in ground disturbance or loud noises during the gnatcatcher breeding season (February 15 through August 30). This protocol requires call-playback surveys by a permitted biologist, conducting a minimum of six surveys at least one week apart between March 15 and June 30 (additional survey requirements are presented in the protocol).</p> <p>b) If adult, nesting, or fledgling gnatcatchers are detected even once within 500 feet of the proposed Project site, or if surveys are not completed in compliance with the protocol, BIO MM 13 Coastal California Gnatcatcher Breeding Season Restrictions shall apply to the site, precluding any construction activities that include loud noises (e.g., trenching, drilling, concrete cutting), the use of large equipment (e.g., booms, cranes, drills, concrete pouring), or the removal of perennial vegetation between February 15 and August 30.</p> <p>c) If no adult, nesting, or fledgling gnatcatchers are detected within 500 feet of the proposed Project site, construction activities may commence beginning July 1 through February 14.</p> <p>e) Survey requirements shall be applied each year that construction activities take place at the Project site.</p>	LEPS, PWT
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	<p>BIO MM 15 Southwestern Willow Flycatcher Protection:</p> <p>a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of southwestern willow flycatchers in the area and the importance of maintaining riparian vegetation.</p>	LACFCP11

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		<p>b) As part of BIO MM 9 Protect Native Vegetation and Common Wildlife, disturbance to native perennial vegetation, especially riparian species (e.g., sycamore, cottonwood, willow), would be minimized; no ground-disturbing activities or removal of vegetation would occur within stream corridors or floodplains. Prior to construction, surveys for the presence of riparian vegetation shall be conducted by a qualified biologist, and those plants within or near the construction zone not identified for removal shall be marked for protection and monitored for adherence to these boundaries.</p>	
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	<p>BIO MM 16 Snowy Plover Protection:</p> <p>a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of western snowy plover in the area and the importance of not disturbing nesting birds.</p> <p>b) If construction occurs between February 1 and July 31, prior to beginning construction a biological monitor shall verify through coordination with USFWS and on-site surveys that no breeding western snowy plovers are using the Project site or are within 500 feet of any Project activity.</p> <p>c) If plovers are nesting in the vicinity, BIO MM 8 Biological Monitoring would apply, and a 500-foot protection buffer shall be required where no construction activities may occur while birds remain in the area.</p>	ZHQ
	BIO-1: Significant Impact Reduced to Less than Significant with Mitigation	<p>BIO MM 17 Raptor Protection:</p> <p>a) If construction activities occur during the American peregrine falcon, bald eagle, golden eagle, long-eared owl, or burrowing owl breeding period, January 1 through July 31, preconstruction surveys would be conducted in all suitable habitats within 500 feet of the Project site as well as within a species-appropriate distance beyond the 500-foot buffer based on line of sight between potential nesting habitat and the construction site.</p> <p>b) If construction takes place during the breeding period, the biological monitor shall contact appropriate land management and resource agencies to ascertain if they have any current information on raptor nesting activities in the general vicinity of the proposed Project sites.</p> <p>c) If an active American peregrine falcon, bald eagle, golden eagle, long-eared owl, or burrowing owl nest is discovered within 500 feet of the construction site, work shall not be undertaken at that site until the nest is no longer active, with an additional five days to allow the fledging birds to disperse. An active nest is defined as one that is attended, built, maintained, or used by a pair of birds during a given breeding season, whether or not eggs are laid; a nest is considered inactive if not attended to for a period of 10 days or longer.</p> <p>d) If an active American peregrine falcon, bald eagle, golden eagle, long-eared owl, or burrowing owl nest is discovered between 500 feet and 0.5 mile of the construction site, the potential for disturbance of the nesting birds would be evaluated based on line-of-sight,</p>	AGH, AJT, BJM, CPK, DPK, ENC1, ENT, FTP, GMT, H-17A, H-69B, JOP, LACFCP08, OAT, PWT, SPN, TOP, TPK, TWR, VPK, WTR

Cultural Resources	CUL-1: Significant and Unavoidable	<p>CUL MM 1: Archaeological or Native American Monitoring – Prehistoric Resources At Project sites with known or potential presence of prehistoric archaeological material (artifacts and/or features) within the defined APEs, qualified archaeological or Native American monitors shall be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations. Monitors will also be responsible for restricting access by construction personnel to any identified archaeological resources as noted in this EIR section or Chapter 4. The direct and indirect APEs are defined in Section 3.4.3.4. The archaeological monitor will, at a minimum, have a B.A. in anthropology or related field or will have successfully completed an archaeological field methods school. The monitor will work under the supervision of an archaeologist who meets the Secretary of the Interior’s Professional Qualifications Standards (Project Archaeologist). The standards are published in CFR 36 Part 61 and found on the National Park Service website at http://www.nps.gov/history/local-law/arch_stnds_9.htm. In the event that prehistoric archaeological material is unexpectedly discovered within the APE, the procedures set forth in CUL MM 3 shall be followed.</p> <p>CUL MM 2: Archaeological Monitoring – Historic-Age Resources At LMR sites with known or potential presence of historic-age archaeological material (artifacts and/or features) within the defined APEs, a qualified archaeological monitor shall be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations. Monitors will also be responsible for restricting access by construction personnel to any identified archaeological resources as noted in this EIR section or Chapter 4. The direct and indirect APEs are defined at the beginning of this EIR section. The archaeological monitor will, at a minimum, have a B.A. in anthropology or related field or will have successfully completed an archaeological field methods school. The monitor will work under the supervision of an archaeologist who meets the Secretary of the Interior’s Professional Qualifications Standards (Project Archaeologist). The standards are published in CFR 36 Part 61 and found on the National Park Service website at http://www.nps.gov/history/local-law/arch_stnds_9.htm.</p> <p>CUL MM 3: Unexpected Discovery of Archaeological Materials In the event that previously unidentified prehistoric or historic-age archaeological resources are uncovered, the following actions shall be taken:</p>	H-69B, LACFCP08, LACFCP09, LPC

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		<ol style="list-style-type: none"> 1) All ground-disturbing work within 165 feet (50 meters) of the discovery shall be halted. The qualified archaeological monitor will mark the immediate area with highly visible flagging and immediately notify the Project Archaeologist. 2) The Project Archaeologist shall inspect the discovery and determine whether further investigation is required. If the discovery can be avoided and no further impacts will occur, the resource shall be documented on California State Department of Parks and Recreation cultural resource record forms, and no further effort shall be required. 3) If the resource cannot be avoided and may be subject to further impact, the Project Archaeologist shall evaluate the resource and determine whether it is (1) eligible for inclusion in the NRHP and is thus a historic property for the purposes of the NHPA and NEPA; (2) eligible for the CRHR and thus a historical resource for the purposes of CEQA; (3) a “unique” archaeological resource as defined by CEQA; (4) a Tribal resource as defined by AB 52. If the resource is determined not to be significant under any of these four categories, work may commence in the area following collection (as appropriate) and recording, including mapping and photography, of the archaeological materials or features. 4) If the resource meets the criteria for any or all of the categories described in CUL MM3 (3), work shall remain halted, and the Project Archaeologist shall consult with LA-RICS Authority staff regarding methods to ensure that no substantial adverse changes occur. Preservation in place (i.e., avoidance) is the preferred method of ensuring no substantial adverse impacts occur on historic properties/historical resources and shall be required unless other equally effective methods are agreed upon among the Project Archaeologist, the Authority, and any other stakeholders. If the archaeological material appears to represent a site – defined as three or more artifacts and/or features in an intact deposit – an archaeological test program (Phase II) may be necessary. Associated mitigation measures include, but are not limited to, collection of the archaeological materials, recordation (e.g., DPR Primary Record and Site Forms), and analysis of any significant cultural materials in accordance with a Data Recovery Plan, and curation of artifacts at an approved curation facility. A curation agreement for this Project is already in place with the University of California, Los Angeles, Archaeological Collections Facility at the Fowler Museum. At the completion of the appropriate mitigation measures, a professional-level technical report shall be filed with the appropriate California Historical Resources Information System (CHRIS) Information Center (IC). 5) Work at the project location may commence upon completion of the appropriate mitigation treatment(s). 	

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		<p>CUL MM 4: Unexpected Discovery of Human Remains In the event that human remains are unexpectedly encountered, the following procedures shall immediately be followed. This guidance is also provided on the NAHC's website at http://nahc.ca.gov/resources/discovery-of-native-american-human-remains-what-to-do/.</p> <ol style="list-style-type: none"> 1) All construction activity shall stop immediately, and the Project Archaeologist shall be notified. The Project Archaeologist will contact the Los Angeles (or applicable) County Coroner. The list of California Coroners can be found on the Native American Heritage Commission's website at http://nahc.ca.gov/2015/06/implementation-of-ab52-sample-letters-request-for-formal-notification-and-request-for-consultation/. 2) The Coroner has two working days to examine human remains after being notified by the responsible person. If the remains are Native American, the Coroner has 24 hours to notify the Native American Heritage Commission. 3) The Native American Heritage Commission will immediately notify the person it believes to be the most likely descendent of the deceased Native American. 4) The most likely descendent has 48 hours to make recommendations to the owner, or representative, for the treatment or disposition, with proper dignity, of the human remains and grave goods. 5) If the descendent does not make recommendations within 48 hours the owner shall reinter the remains in an area of the property secure from further disturbance, or; 6) If the owner does not accept the descendant's recommendations, the owner or the descendent may request mediation by the Native American Heritage Commission. <p>CUL MM 5: Architectural Resources Protection and Camouflage Attachment of Equipment to Historic Buildings and Structures Exterior antennas, wiring, towers, and other LMR equipment that are proposed to be attached to buildings, structures, objects, and other features that are listed, eligible, or potentially eligible for inclusion in the NRHP or CRHR, or are locally-designated landmarks under CEQA may cause an adverse direct and/or visual effect. Mitigation measures to offset potential effects would include review of the Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards) and the Secretary of the Interior's Guidelines for the Treatment of Historic Properties (Guidelines), which can be found on the National Park Service's website at http://www.nps.gov/tps/standards.htm and http://www.nps.gov/tps/standards/four-treatments/standguide/index.htm respectively. The Standards are a series of practices for maintaining, repairing, and replacing historic materials, as well as designing new additions or making alterations. The Guidelines assist in applying the complementary Standards to a specific</p>

Resource Area	Impact	Mitigation Measure	Sites
		<p>property. Together, they provide a framework and guidance for decision-making about work or changes to a historical resource.</p> <p>For historic buildings or structures where communications-related equipment will be attached, the following preservation practices would shall be employed, as applicable, to ensure that impacts are less than :significant:</p> <ol style="list-style-type: none"> 1) When running new exterior wiring to a historic building, existing entry points shall be utilized. If a new entry point is required, the entry shall be placed at the rear of the building or in an unobtrusive area on the side of the building, i.e., an area that [insert language characterizing what it means to be “unobtrusive” for purposes of this measure to ensure no impact]. 2) When wireless nodes, antennas, microwave or satellite dishes, etc. are installed on historic buildings, existing mounting points shall be utilized. For new mounts, nonpenetrating mounts shall be used. 3) Equipment shall be placed where it does not detract from the building's overall appearance; roof-mounted equipment shall be placed where it will not be visible from accessible locations at grade. Adequate structural support for the new equipment and design shall be ensured, and a system that minimizes the number of cutouts or holes in structural members and historic material shall be installed. Existing building features shall be used to conceal equipment. 4) New equipment installations on a historic building that will be visible shall be painted or color-matched to the surrounding building materials. Concealment with color-matched FRP (fiberglass reinforced plastic) shrouds (boxes) is acceptable. 5) Any supports or brackets for new equipment shall be color-matched to the existing materials. 6) The installation of exterior wiring shall be minimized; where unavoidable, the wiring will be color-matched to the original building material to reduce the visual impact. 7) Equipment shall not be directly anchored into stone or brick; mortar joints for anchoring the equipment will be utilized. 8) Rust-resistant mounts to prevent staining of the building materials shall be used. 9) Reversible mounting techniques shall be used to avoid damage to building materials. 10) Installation of underground cable or conduit at a historical resource shall be undertaken in a manner that considers the stability of the historic building, including limiting any new excavations adjacent to historic foundations that could undermine the structural stability of the building and avoiding landscape or other changes that could alter drainage patterns and cause water-related damage to the building. 	

Table ES-2: Environmental Impacts and Mitigation Measures

Resource Area	Impact	Mitigation Measure	Sites
		11) New interior wiring shall utilize space in existing chases, closets, or shafts. 12) Equipment and systems shall be installed to cause the least alteration possible to the building's floor plan and the least damage to the historic building material. 13) Vertical runs of conduit and cables shall be placed in closets, service rooms, and wall cavities to create the least intrusion into the historic fabric of the building and to avoid major intervention into the wall and floor systems. Architectural Camouflage All new towers and monopoles or a proposed increase in the height of existing towers and monopoles may that would cause adverse visual impacts on historical resources that are adjacent or within the viewshed shall be camouflaged. All Camouflage implemented for the proposed Project designs would shall be sympathetic to the existing landscape, and visually compatible with the surrounding architecture, and acceptable to the property owner and/or host community. Tower disguises may include, but are not limited to, painting and various types of concealments, including (e.g., clock/water towers, flag/light poles, silos, trees, and unique site-specific designs). Such measures must also be consistent with the Secretary of the Interior's Standards/Guidelines for the Treatment of Historic Properties (see Attachment of Equipment discussion above). As noted within the required mitigation measures for some Project sites, the painting of towers of certain heights is controlled by FAA Advisory Circulars 47 CFR § 17.21-17.58 to prevent aviation hazards; therefore, painting would not, be a feasible mitigation at those sites.	
	CUL-1: Less Than Significant with Mitigation	CUL MM 1: Archaeological or Native American Monitoring – Prehistoric Resources CUL MM 3: Unexpected Discovery of Archaeological Materials CUL MM 4: Unexpected Discovery of Human Remains CUL MM 5: Architectural Resources Protection and Camouflage	ENC1, PASPD01, PWT, TOP, WAD, ZHQ
	CUL-2: Significant and Unavoidable	CUL MM 1: Archaeological or Native American Monitoring – Prehistoric Resources CUL MM 2: Archaeological Monitoring – Historic Resources CUL MM 3: Unexpected Discovery of Archaeological Materials CUL MM 4: Unexpected Discovery of Human Remains	H-69B, LACFCP08, LACFCP09, LPC
	CUL-2: Less Than Significant with Mitigation	CUL MM 1: Archaeological or Native American Monitoring – Prehistoric Resources CUL MM 3: Unexpected Discovery of Archaeological Materials CUL MM 4: Unexpected Discovery of Human Remains	ENC1, PWT, TOP, ZHQ
	CUL-3: Less than Significant with Mitigation	CUL MM 6: Potential Paleontological Resources Proposed Project sites with the potential for paleontological resources would require preparation of a paleontological monitoring plan and a qualified paleontological monitor to be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations. 		<p>In the event that a previously unidentified paleontological resource is uncovered, the following actions shall be taken:</p> <ol style="list-style-type: none"> 1) All ground-disturbing work within 165 feet (50 meters) of the discovery shall be halted. A qualified paleontologist shall divert or direct construction activities in the area of an exposed fossil in order to facilitate evaluation and, if necessary, salvage of the exposed fossil. 2) The paleontologist shall inspect the discovery and determine whether further investigation is required. If the discovery can be avoided and no further impacts will occur, no further effort shall be required. 3) If the resource cannot be avoided and may be subject to further impact, the paleontologist shall evaluate the resource and determine whether it is “unique” under CEQA, Appendix G, Part V. If the resource is determined not to be unique, work may commence in the area. 4) If the resource is determined to be a unique paleontological resource, work shall remain halted, and the paleontologist shall consult with LA-RICS Authority staff regarding methods to ensure that no substantial adverse change would occur to the significance of the resource. Preservation in place (i.e., avoidance) is the preferred method of ensuring that no substantial adverse impacts occur to the resource and shall be required unless other equally effective methods are available. Other methods include ensuring that the fossils are scientifically recovered, prepared, identified, catalogued, and analyzed according to current professional standards. 5) Due to the small nature of some fossils, a fine mesh screen may be used at the discretion of the paleontologist at project-specific inspections to collect matrix samples for processing. 6) Provisions for preparation and identification of any fossils collected shall be made before donation to a suitable repository. 7) All recovered fossils shall be curated at a local accredited and permanent scientific institution according to Society of Vertebrate Paleontology standard guidelines standards. Work may commence upon completion of the appropriate treatment and the approval from the Authority. 	TOP, WS1, ZHQ

1.0 Introduction

1.1 Project History/Background and Summary of Proposed Project

1.1.1 Project History

In April 2005, the Regional Interoperable Steering Committee was formed to explore the development of a single, shared communications system for all public safety agencies in the greater Los Angeles region. Initial feasibility studies indicated that by leveraging various agency efforts, a shared regional communications system would not only be possible but would also best meet and exceed the needs of the entire regional public safety community and the general public. As a result, the County of Los Angeles (County), 82 municipalities, and three other public sector entities in the region drafted a Joint Powers Agreement that established the Los Angeles Regional Interoperable Communications System (LA-RICS) Joint Powers Authority (Authority) to create a regional, area-wide, interoperable public safety communications network. Community safety institutions anchoring the Authority include police, sheriff, and fire departments, as well as hospitals.

1.1.2 Project Background

Los Angeles County experiences many man-made and natural incidents that require a rapid, coordinated response among the region's first and secondary responders. Public safety services in Los Angeles County are provided by more than 80 public safety agencies represented by approximately 34,000 first responders and 17,000 secondary responders serving more than 10 million residents, as well as tourists and commuters. Many of these agencies use systems that have exceeded their natural useful life (i.e., equipment and programming are no longer supported by vendors). Due to the numerous systems in use and the number of agencies, interagency communication is challenging.

Most of the region's public safety telecommunications infrastructure (equipment shelters and communications towers) does not meet the technical or operational needs of the agencies that utilize them. Many of the aging communications system sites were built to older and now obsolete industry standards and building codes. Structures at these sites no longer meet the more stringent performance and survivability requirements in current industry standards and codes. This causes performance issues that hamper public safety and emergency response operations. Most of the current infrastructure has not undergone a significant rebuild in several decades. Besides the overall age of many structures, most do not provide space (inside a shelter and/or on a tower) to add equipment; and, in many cases, the towers cannot be cost-effectively retrofitted to support additional antennas because they lack structural capacity and/or retrofitting would impact existing operations. Some towers do not have sufficient space to maintain adequate separation between existing and new antennas to minimize physical and electromagnetic interference.

Additionally, the communication systems deployed by agencies in Los Angeles County do not provide the necessary coverage that all users need. These agencies cover large tracts of the county, and their current radio systems are inadequate and/or antiquated. Separate but simultaneous incidents require

coordinated emergency responses to ensure adequate and appropriate personnel are dispatched to each incident. The lack of complete coverage sometimes results in the departments not being able to dispatch the nearest team to the incident because of communication problems.

Without adequate capacity on the radio system, even on a daily basis, first responders often struggle to acquire the necessary resources to communicate. The issue is exacerbated on large incidents where a shortage of radio resources greatly impacts operations due to the need for multiple command, tactical, and mutual aid channels. For example, first responders may not be able to request additional resources to assist them in life-threatening situations, hear evacuation orders, or hear broadcasted warning messages from dispatchers. Without adequate capacity to dedicate individual radio channels to individual incidents, the likelihood of interference between units responding to separate incidents is high.

1.1.3 Project Summary

1.1.3.1 *Land Mobile Radio Project*

The Land Mobile Radio (LMR) system is a wireless communications system for mobile and portable devices such as walkie-talkies and two-way radios. The LMR system would consist of antennas and support equipment at up to 90 sites, narrowed from a pool of 94 potential sites, located primarily in Los Angeles County. LMR antennas would be installed on the rooftops of existing buildings or on existing or new monopoles and lattice tower support structures. The LMR sites would contain the infrastructure and equipment necessary to provide day-to-day voice and narrowband data radio communications coverage for emergency responders throughout the County. These sites are widely dispersed across the County in both urban and rural settings and include mountain peaks and coastal and high desert locations, as well as downtown Los Angeles.

1.1.3.2 *Relationship to Long Term Evolution Project*

The Long Term Evolution (LTE) broadband communications system is a separate project being carried out by the LA-RICS Authority. The LTE system will provide wireless day-to-day broadband data communications service. The Authority approved sites in the LTE project in 2014 and 2015 and determined that all LTE sites were exempt from review under the California Environmental Quality Act (CEQA) pursuant to Public Resources Code section 21080.25, the statutory CEQA exemption specifically adopted for the LA-RICS. The environmental impacts from the installation and operation of the LTE Project were analyzed under the National Environmental Policy Act (NEPA) in the Broadband Technology Opportunities Program (BTOP) Environmental Assessment (EA) (October 2014) and two supplemental EAs released in July 2015 and August 2015. Construction of LTE sites began in December 2014 and was completed in December 2015.

LMR system infrastructure is proposed at some of the previously-approved LTE sites. Where feasible, the proposed LMR system design makes use of LTE and other existing communications support infrastructure.

1.2 Environmental Review Process

1.2.1 California Environmental Quality Act

The overall intent of the California Environmental Quality Act, Public Resources Codes (PRC) Section 21000 et seq. (CEQA) is to:

- Identify the significant effects to the environment of a proposed project, identify possible ways to avoid or minimize those significant effects, where feasible, and identify reasonable alternatives
- Disclose the Project's environmental effects to the public, the agency decision-makers who would approve or deny the Project, and the responsible and trustee agencies charged with managing resources (e.g., wildlife, air quality) that may be affected by the Project
- Provide a forum for public participation in the decision-making process with respect to environmental effects

This Draft Environmental Impact Report (EIR) was prepared in accordance with CEQA and the CEQA Guidelines (14 California Code of Regulations [CCR] § 15000 et seq.) and is intended to provide the environmental information necessary for the Authority to make final decisions on the construction and operation of the LMR Project. The Authority is identified as the Lead Agency for the proposed Project in accordance with CEQA. This Draft EIR is also intended to support discretionary reviews and decisions related to the Project by other agencies that are listed in Section 1.5. Implementation of the Project will require other discretionary actions by other government agencies, as described in Section 1.6.

CEQA has detailed requirements for the environmental review process for an EIR, which are summarized in this section.

A Notice of Preparation (NOP) accompanied by an Initial Study was distributed to the California State Clearinghouse and to other public agencies, and these are included in Appendix A of this document. The review period for the Initial Study was from August 27 to September 26, 2014. Scoping meetings were held at the following locations:

Table 1.2-1: Scoping Meeting Locations and Dates

Location	Date
South Coast Air Quality Management District Building Room GB, 21865 Copley Drive, Diamond Bar, California (CA)	September 11, 2014
Stanley Kleiner Activity Center 43011 10th Street West, Lancaster, CA	September 15, 2014
El Camino Real Charter High School Auditorium 5440 Valley Circle Boulevard, Woodland Hills, CA	September 16, 2014
Peck Park Community Center Auditorium 560 N. Western Avenue, San Pedro, CA	September 17, 2014
City of Lynwood, Bateman Hall Room 2 11331 Ernestine Avenue, Lynwood CA	September 18, 2014

Comments received on the Initial Study and during the scoping meetings have been considered and addressed in this document where applicable.

This Draft EIR will be subject to a 45-day public review and comment period as mandated by CEQA (Guidelines §15105). During this time, interested parties may prepare and submit written comments on the Draft EIR, which will be considered and incorporated into the Final EIR as appropriate.

During the public review and comment period, the Authority will hold a series of public meetings at the same locations where the scoping meetings were held. The purpose of the meetings is to provide opportunity to take public testimony on the Draft EIR. Responses will be prepared for all oral and written comments on environmental issues received at the public meetings, as well as for all written comments on environmental issues received during the public comment period. Responses to comments will be included as part of the Final EIR. As required by CEQA, proposed responses to comments submitted by responsible public agencies will be distributed to those agencies for review at least 10 days prior to consideration of the Final EIR by the Authority.

Prior to taking action on the proposed Project, the LA-RICS Authority Board will consider the adequacy of the Final EIR. If the Authority Board decides to approve the proposed Project, it will certify the Final EIR; make all required environmental findings; adopt a Mitigation Monitoring and Reporting Program; and, if necessary, adopt a Statement of Overriding Considerations.

1.2.2 National Environmental Policy Act

The U.S Department of Homeland Security, Federal Emergency Management Agency (FEMA) is proposing to support funding of the construction of the LMR facilities. As a federal agency, FEMA is subject to the NEPA and is required to complete NEPA analysis before taking action, including allocating Federal funds used to support LMR construction. NEPA analysis for the LMR project is currently ongoing separately from the CEQA process.

1.3 Scope of the EIR

Based on the analysis undertaken in the Initial Study, the Authority determined that the proposed Project may have a significant effect on the environment and that the preparation of an EIR is required for compliance with CEQA. As a result of the analysis undertaken in the Initial Study (see Appendix A-2), it was determined that the proposed Project would not result in impacts to Agriculture and Forestry Resources, Mineral Resources, Population and Housing, and Public Services (see Section 1.3.1). These resource areas will receive no further analysis in this document. The analysis in the Initial Study concluded that the Project has the potential to result in significant impacts related to 13 environmental topics identified in the Appendix G checklist to the CEQA Guidelines, which are the subject of the detailed evaluation undertaken in this EIR. These are:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise
- Recreation
- Transportation/Traffic
- Utilities and Service Systems

In addition, the EIR addresses the cumulative impacts of the proposed Project, in connection with other past, present, and reasonably foreseeable projects, on these resources. The EIR also addresses the potential growth-inducing impacts of the proposed Project and CEQA mandatory findings of significance.

1.3.1 Environmental Issues Determined Not to be Significant

The Initial Study determined that the proposed Project would not result in potentially significant impacts to some environmental resource areas and that no further analysis of these resource areas is warranted. A summary of the findings of the Initial Study for these resources is provided below.

Agriculture and Forestry Resources. None of the proposed Project sites are in areas mapped as farmland or are currently used for agriculture or forestry or are forest land. The Project would not involve any activities that would convert farmland or forest land to other uses.

Mineral Resources. None of the proposed Project sites are currently being used for mineral resource extraction. All of the sites are proposed at locations where existing facilities and structures preclude use of the area for mineral resource extraction; therefore, implementation of the Project would not result in a change in site conditions that would affect availability of mineral resources.

Population and Housing. The proposed Project is intended to improve and facilitate communications among emergency responders and would not provide infrastructure that could induce population growth. The Project would result in a short-term increase in construction employment spread throughout Los Angeles County that could be met by the existing work force in the area. It would not result in an increase in long-term employment. It would not displace housing or people.

Public Services. The proposed Project would not result in the need for additional fire and police facilities, would not increase school populations, would not affect development or use of parks, and would not result in significant impacts to other public facilities.

1.3.2 Statutory Exemption

In 2012, the California Legislature, in recognition of the urgent need for the LA-RICS, granted the Authority a limited statutory exemption from CEQA (PRC § 21080.25.) for both LMR and LTE system sites. PRC section 21080.25 exempts the design, site acquisition, construction, operation, and maintenance of the LA-RICS LMR system from CEQA review so long as each individual project site meets the following criteria:

- The site is publicly owned and already contains an antenna support structure and/or is a police, sheriff, or fire station, or other public facility that transmits or receives public safety radio signals.
- Construction and implementation at the project site would not have a substantial adverse impact on wetlands, riparian areas, or habitat of significant value and would not harm any species protected by the federal Endangered Species Act of 1973 (16 United States Code [U.S.C.] Section 1531 et seq.), the Native Plant Protection Act (Chapter 10, commencing with Section 1900, of the Fish and Game Code), or the California Endangered Species Act (Chapter 1.5 [commencing with Section 2050] of Division 3 of the Fish and Game Code), or the habitat of those species.
- Construction and implementation at the project site would not have a substantial adverse impact on historical resources pursuant to PRC Section 21084.1
- Operation of LMR facilities at the site would not exceed the maximum permissible exposure standards established by the Federal Communications Commission (FCC), as set forth in Sections 1.1307 and 1.1310 of Title 47 of the Code of Federal Regulations (CFR).

- The LMR antenna support structures at the site would comply with applicable state and federal height restrictions, and any height restrictions mandated by an applicable comprehensive land use plan adopted by an airport land use commission. Any new lattice towers shall not exceed 180 feet in height without appurtenances and attachments, and any new monopoles shall not exceed 70 feet in height without appurtenances and attachments.
- Each new central system switch is located within an existing enclosed structure at a publicly owned project site, or is housed at an existing private communications facility.
- None of the sites are located on a school or sacred cultural site.

On November 13, 2014, the Authority determined, based on substantial evidence, that 26 potential LMR sites meet all of the required criteria for exemption from CEQA and authorized project construction, implementation, and operation at these sites. On February 5, 2015, and on December 17, 2015, the Authority determined respectively that an additional 13 and an additional 12 LMR sites meet the criteria for exemption from CEQA and authorized project construction, implementation, and operation at these sites. Of these 51 sites previously exempted, 11 are no longer being considered for development.

Table 1.3-1 identifies all of the sites at which the Authority has previously determined that LMR activities are statutorily exempt from CEQA. All of the previously-approved, statutorily exempt LMR sites have independent utility from the LMR system as a whole. Specifically, construction and implementation of LMR facilities at these sites would provide significant improvements to the emergency responder communication system within the County. This is true regardless of whether additional LMR system facilities are constructed. The LMR facilities proposed for a site can function independently of other LMR facilities. Construction and implementation of LMR infrastructure at these sites does not commit or compel the Authority to construct any additional LMR facilities or infrastructure (i.e., those sites addressed in this EIR). Conversely, a determination that a site is statutorily exempt does not commit the Authority to construct that site; therefore, the sites listed in Table 1.3-1 may not all be constructed.²

All proposed LMR sites that are not exempt from CEQA under the statutory exemption in PRC section 21080.25 are evaluated at a project level in this EIR. Construction and implementation of LMR infrastructure at these non-CEQA-exempt sites would occur only if the Authority certifies the EIR and approves construction of LMR facilities at these sites. As with the CEQA-exempt sites, certification of the EIR does not commit the Authority to construct all the sites addressed as part of the proposed Project in this EIR. The sites evaluated in this EIR are listed in Table 2.1-1. Although the statutorily exempt sites are not included in the project-level analysis in this EIR, they are considered in the cumulative impact analysis.

² A number of the sites that were exempted from CEQA have subsequently been removed from further consideration for LMR and are not listed in Table 1.3-1.

1.4 Organization of the EIR

The Draft EIR is organized as follows:

Section 1 – Introduction: The Introduction provides the project history, background, and summary of the LMR Project; a discussion of the environmental review process; and the scope of the EIR including environmental issues determined not to be significant. It also discusses areas of known controversy. It identifies the responsible and trustee agencies and the intended uses of this EIR

Section 2 – Description of the Project: This section provides a detailed description of the proposed Project and an overview and the Project objectives. Project alternatives are also discussed.

Section 3 – Affected Environment, Environmental Impacts, and Mitigation Measures: This section provides a description of the environmental setting and the applicable regulatory setting for the Project. It identifies the CEQA significance thresholds and includes a project-level impact analysis for each CEQA resource listed in Section 1.3. It also identifies mitigation measures and discusses cumulative impacts for each resource.

Section 4 –Site Summary Forms: This section provides a site-specific environmental impact analysis for each proposed Project site.

Section 5 – Other CEQA Considerations: This section describes the growth-inducing impacts, significant environmental effects of the Project, the mandatory findings of significance, and potential energy impacts of the proposed Project.

Section 6 – Agencies and Persons Contacted: This section lists the people, regulatory agencies, and organizations that were consulted during preparation of this document.

Section 7 –List of Acronyms and Abbreviations.

Section 8 – List of Preparers: This section identifies individuals who were involved in the preparation and/or review of this document.

Section 9 – References.

Appendix C – Construction Best Management Practices

1.5 Areas of Known Controversy

Section 15123 of the CEQA Guidelines requires that an EIR provide a brief summary of areas of controversy known to the lead agency, including issues raised by agencies or the public during the EIR process, and identify ways in which these issues have been or are being resolved. Areas of known controversy are:

- Aesthetics
- Land Use
- Radiofrequency Exposure

Impacts to scenic resources and visual character are a concern to the public. The visual effects of the Project are addressed in Section 3.1, Aesthetics.

Compatibility with local land use planning and zoning is a concern to municipalities. Land use impacts from the Project are addressed in Section 3.9, Land Use.

Potential health issues associated with radiofrequency (RF) exposures from LMR facilities is a concern to the public. RF exposures are addressed in Section 5.3, Radiofrequency Exposures.

Implementation of the mitigation measures for LMR sites selected and approved for construction will be monitored and enforced by the Authority in accordance with CEQA Guidance Section 15097. Specific mechanisms are in place to assure all mitigation measures included in this EIR are implemented and that the provisions are enforceable. A Mitigation Monitoring and Reporting Program is being prepared and includes all mitigation measures and implementation details.

1.6 Responsible and Trustee Agencies

The responsible and trustee agencies for the Project are listed below.

1.6.1 State and Regional

- California Coastal Commission
- California Department of Fish and Wildlife
- California State Historic Preservation Officer
- Antelope Valley Air Quality Management District
- South Coast Air Quality Management District
- Lahontan Regional Water Quality Control Board
- Los Angeles Regional Water Quality Control Board
- Santa Ana Regional Water Quality Control Board

1.6.2 Local Agencies

- | | |
|-------------------------|--------------------------|
| • Los Angeles County | • City of Monterey Park |
| • City of Agoura Hills | • City of Palmdale |
| • City of Beverly Hills | • City of Pasadena |
| • City of Calabasas | • City of San Dimas |
| • City of Cerritos | • City of Santa Monica |
| • City of Chino Hills | • City of Signal Hill |
| • City of Glendale | • City of West Hollywood |

- City of Los Angeles
- City of Malibu
- City of Whittier

1.7 Intended Uses of This EIR

The Authority is the lead agency for the proposed Project, pursuant to CEQA. The intended uses of this EIR include compliance with CEQA and to provide information needed by the Authority Board to make decisions regarding Project approvals and conditions.

This EIR is also intended to support federal, state, and regional and/or local government discretionary approvals that may be required to develop the proposed Project. The agencies and a list of their respective approval authorities are listed below.

1.7.1 Federal Agencies³

- U.S. Fish and Wildlife Service – Compliance with Section 7 of the Federal Endangered Species Act
- U.S. Army Corps of Engineers – Clean Water Act Section 404 compliance.

1.7.2 State Agencies

- California Coastal Commission – Coastal Consistency Determination, Coastal Development permit
- California Department of Fish and Wildlife – State Endangered Species Act consultation: Incidental take authorization/concurrence and compliance with the California Fish and Game Code
- California State Historic Preservation Officer – Consultation under Section 106 of the National Historic Preservation Act
- Antelope Valley Air Quality Management District (AVAQMD) and South Coast Air Quality Management District (SCAQMD) – Compliance with air pollution regulations
- State Water Resources Control Board (SWRCB) – Discharge Requirements: Porter-Cologne Water Quality Act, Clean Water Act Section 401 Water Quality Certification
- Lahontan Regional Water Quality Control Board (RWQCB), Los Angeles RWQCB, and Santa Ana RWQCB– Clean Water Act (CWA) Section 402 National Pollutant Discharge Elimination System (NPDES) Permit; Water Quality Certification; Discharges to Surface Water: Regional General Permits; Report of Waste Discharge/Waste
- California Department of Transportation (Caltrans) – highway encroachment permits

³ Federal land management agencies may not rely on the EIR to approve LMR sites located on federal land and would have to conduct or rely on separate NEPA analysis. LMR sites statutorily exempted from CEQA (see Table 1.3-1) may require additional federal approvals.

- Counties and Cities – conditional use permits (CUP); zone change; Airport Land Use Commission (ALUC) determinations; grading permits; building permits; franchise agreements or licenses; road encroachment permits

Additional permits and agency approvals may be required as the Project moves through the regulatory process.

2.0 Description of the Project

2.1 Proposed Project

2.1.1 Project Overview

The LMR system would consist of sites located primarily in Los Angeles County and in adjacent portions of Orange and San Bernardino counties in southern California that would contain the infrastructure and equipment necessary to provide voice communications coverage throughout the County for emergency responders. The proposed LMR Project would be a modern, integrated wireless voice and narrowband data communications system to serve law enforcement, fire service, health service, and public works professionals throughout Los Angeles County. The new system would provide day-to-day communications within and among agencies and allow seamless interagency communications for responding to routine, emergency, and catastrophic events. The system would be composed of four different subsystems:

- 1) Digital Trunked Voice Radio System – provides first responders with radio communications utilizing digital technology. It seamlessly operates on two bands of spectrum (700 megahertz [MHz] and ultra-high frequency [UHF])
- 2) Analog Conventional Voice Radio System – provides first responders with radio communications utilizing conventional analog technology
- 3) Los Angeles Regional Tactical Communications System – consists of local, state, and federal interoperability channels in four different bands of spectrum in order to allow outside agencies responding to events in the County to have designated channels for communications
- 4) Narrowband Mobile Data Network – a data system that provides critical dispatch communications

2.1.2 Proposed Project Sites

The LMR system would consist of installation and operation of LMR facilities at up to 90 sites; however, the Authority is considering 94 sites to provide alternate site locations if some sites are determined to be unviable and are removed from further consideration during site feasibility assessments, system engineering, geotechnical evaluations, and permitting process or in lease agreement discussions with the property owner. Of these 94 sites, the Authority has previously determined that 40 sites are statutorily exempt from CEQA under PRC section 20180.25, as discussed in Section 1.3.2. This EIR analyzes the remaining 54 sites that do not qualify for the statutory CEQA exemption. The 54 LMR sites evaluated in this EIR are listed in Table 2.1-1 and shown on Figure 2.1-1. Although potential LMR sites are located in Los Angeles County and adjacent portions of Orange and San Bernardino counties, the sites evaluated in this EIR (i.e., the sites not subject to statutory CEQA exemption) are all located within Los Angeles County with the exception of one site in San Bernardino County, as shown in Figure 2.1-1.

The LMR system was designed to provide voice coverage throughout the Authority's service area, which extends throughout Los Angeles County, with the fewest number of sites possible. Some LMR sites have been proposed outside Los Angeles County at locations with sufficient elevation and clear line of sight to achieve increased coverage within Los Angeles County. Locations were selected within or adjacent to existing communication facilities to the maximum extent feasible. The sites include a variety of types (e.g., water tanks, rooftops, police and fire stations, hospitals, mountain peaks, etc.). Most of these locations have existing communications equipment but do not necessarily have communication towers.

The LMR project would include one or more network operations centers (NOCs) to provide for LMR system monitoring. The NOC would have the capability of assessing equipment performance and remotely or locally managing the equipment and network to prevent degradation or failure of performance. The NOC(s) would operate 24 hours per day, seven days per week. NOC equipment would be installed internally in an existing facility, such as an existing commercial or public safety facility. Each NOC would be equipped with antennas and infrastructure in a configuration similar to that described below for building mount facilities. No ground-disturbing activities are associated with development of the NOCs.

2.1.2.1 Project Site Components

The Authority proposes to install new multiple fiberglass collinear whip antennas (up to 15 feet long), microwave dishes (up to 3 feet in diameter), and new radio equipment at each LMR site. The number of antennas would vary by site. Components common to the LMR sites include:

- the support structure for the antennas, such as a lattice tower, monopole, or building mounts
- an equipment shelter
- an emergency generator

Antennas

The types of antennas that would be installed at LMR sites would depend on the extent of radio coverage, availability in market, operating frequency, and other factors. The primary types are whip antennas and microwave antennas. Whip antennas are used to provide two-way radio communications. These are cylindrical structures designed to provide 360-degree radio signal patterns. They are typically 10 to 15 feet in length. Microwave antennas are parabolic dishes that direct line-of-sight signals between sites and form a network that would provide connectivity to all sites in the LMR project. Microwave antennas typically range from 2 to 6 feet in diameter.

Antenna Support Structures

Four types of antenna support structures may be used:

- Building mount
- Existing lattice tower or monopole

- New monopole
- New lattice tower

Existing lattice towers and monopoles at the proposed LMR sites may be used if the weight and configuration of the proposed whip and microwave antennas are compliant with applicable building codes for structural and seismic stability, if space is sufficient for the new equipment, and if the existing structure can provide the required lines of sight. At LMR sites where a new antenna support structure is proposed, either a new monopole or a new lattice tower, would be constructed.

Building Mounts

At a few LMR sites, antennas and ancillary equipment would be installed on existing multi-story buildings. At these sites, antennas would be mounted to a penthouse façade or rooftop. Examples of roof-mounted antennas are shown in Figure 2.1-2.

Existing Lattice Towers or Monopoles

At some LMR sites, equipment would be mounted to existing lattice towers and monopoles (this is referred to as collocation). An additional lightning rod up to 15 feet tall may be installed on the existing lattice tower or monopole to protect the LMR project equipment from lightning strikes. Collocation activities for the LMR project may require modifications to increase the height or strength of existing antenna support structures to allow for installation of additional LMR antennas.

Figure 2.1-2: Typical Roof-Mounted Antenna Installation

New Lattice Towers

New lattice towers would generally be 180 feet in height without appurtenances. Lightning rods up to 15 feet high may be installed on the top of the tower. A typical 180-foot new lattice tower would require installation of a concrete pad up to 50 feet by 50 feet. New lattice towers would be free-standing and would not require use of guy anchors and guyed wires. A typical lattice tower is shown in Figure 2.1-3 and typical site plan for a new lattice tower site is shown in Figure 2.1-4.

New Monopoles

New monopoles would generally be 70 feet in height without appurtenances. Lightning rods up to 15 feet high may be installed on the top of the monopole. Monopoles are free-standing structures with a single footing and would be installed by drilling a caisson. Width of the monopole and depth of the caisson would vary based on monopole height and site conditions. In general, a typical 70-foot monopole would have a diameter at ground level of approximately 6.5 feet and require a caisson at least 36 feet deep. A typical monopole is shown in Figure 2.1-5, and typical site plan for a new monopole site is shown in Figure 2.1-6.

Equipment Shelter

Each LMR site would require installation of new radio communication equipment. At some locations, existing equipment shelters have space to accommodate the new equipment, or an existing shelter would be modified or expanded. At other sites, a new, up to 600-square foot shelter would be required because a shelter does not currently exist or one is present but it does not have sufficient available space to accommodate the LMR equipment. New equipment shelters would either be concrete masonry unit construction (CMU) constructed on site or prefabricated shelters delivered to the site. New shelters would be one or two stories. All new shelters would be installed on concrete pads up to 600 square feet in area and up to 18 inches deep. Shelters would require heating, ventilation, and air conditioning (HVAC) to maintain interior temperature and humidity. Equipment shelters generally would require exterior security lighting equivalent to a 100-watt light bulb. Shelters would have a valve-regulated (sealed) gel cell, or absorbed glass mat type lead-acid battery, or fuel cell battery emergency power system. The shelter roof would be designed so that burning embers will not collect under eaves. All shelters would be constructed in accordance with applicable building codes for each jurisdiction.

Emergency Generators

LMR sites would require backup power. At many sites this would be supplied by a new emergency diesel generator up to 85 kilowatts (kW). An evaluation of existing backup power at all sites would be completed prior to final design and construction. For purposes of impact analysis in this document, it is assumed that each site would include a new emergency generator.

New emergency generators would generally be mounted outdoors on a concrete pad, potentially with curbs. A CMU wall would be installed around most outdoor generators. In some cases, the generator may be installed within its own shelter or building enclosure.

Figure 2.1-3: Typical Lattice Tower Installation

Figure 2.1-4: Typical Site Plan for a New Lattice Tower Site

Figure 2.1-5: Typical Monopole Installation

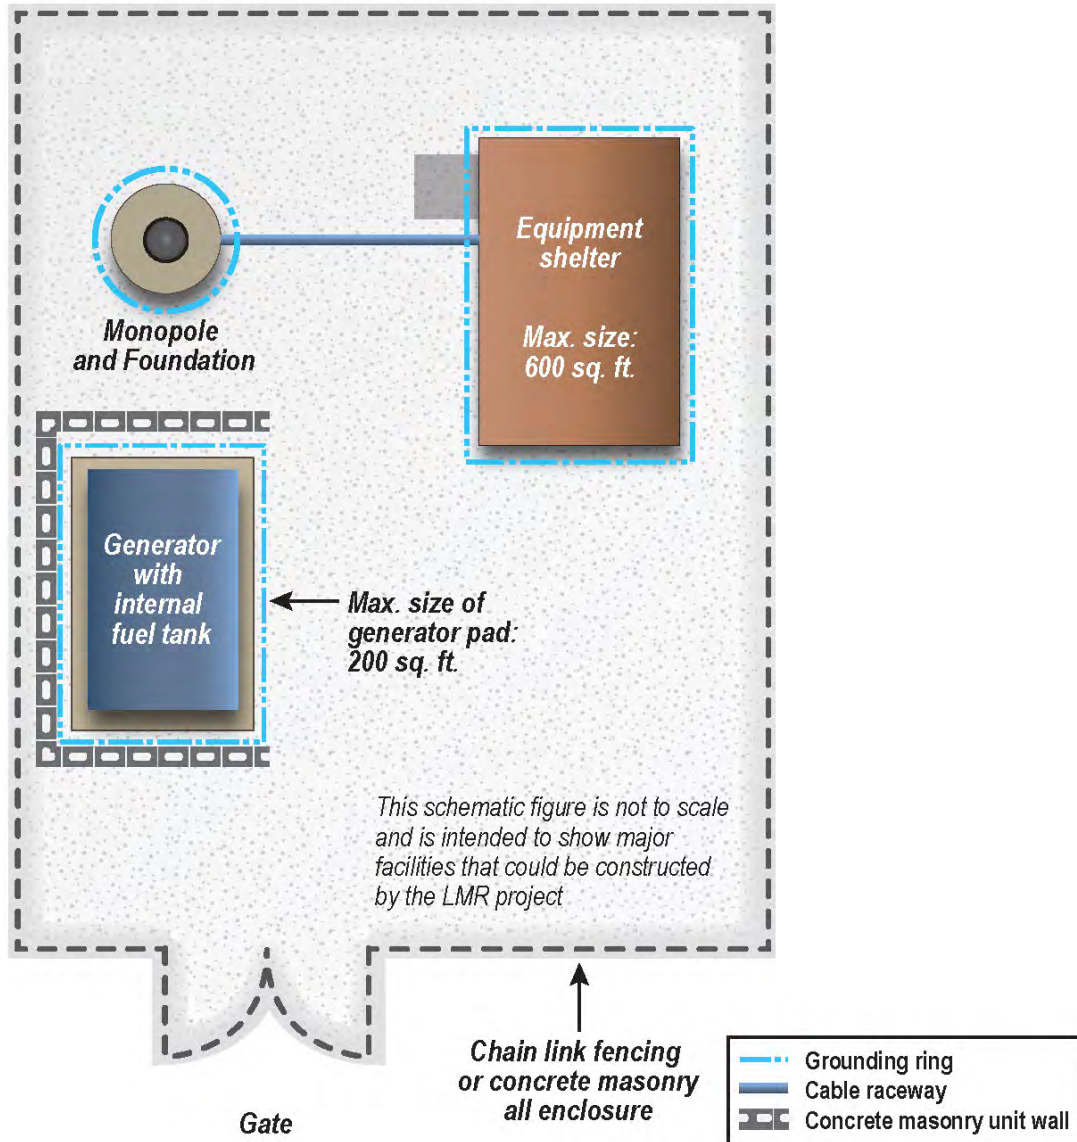

Figure 2.1-6: Typical Monopole Site Plan

New generator foundation sizes would not exceed 200 square feet. Emergency generators would be equipped with spark arrestors and cooling and heating mechanisms. Automatic transfer switches would be installed to accommodate remote monitoring of the system and would allow automatic transfer of power sources in the event of an electrical utility outage and would be capable of being monitored remotely. Generators would have a remote start function. The generators would be fueled by up to 1,500-gallon, double-walled diesel fuel tanks that are integrated into the generator design. All tanks would be constructed in accordance with current codes and standards, and installation would include secondary containment where applicable. Generator fuel tanks would be sized to allow for up to 168 hours of operation at full-rated load at most sites. At dispatch centers, remote sites on mountains, and on Santa Catalina Island, fuel tanks would be sized to provide up to 336 hours of operation. Routine testing of emergency generators would occur during scheduled maintenance of the LMR sites.

Other Components

Grounding

The LMR facilities would require grounding to protect persons and equipment from power surges and lightning strikes. The new constructed structure foundations for the towers or monopoles, equipment shelters, and emergency generators would be surrounded by a subsurface ground ring installed in a trench approximately 30 inches below grade.

Cable Raceway

Communications cables that connect the antennas and the radio equipment in a shelter typically would be routed via an aboveground cable tray supported by steel posts at regular intervals or via underground conduits in a trench typically about 36 inches below grade. The aboveground cable raceway may be covered with a metallic mesh to protect the cables against ice falling from the monopole or lattice tower at locations subject to snow and ice. At proposed sites where antennas would be mounted directly on a building, the antennas would be connected to indoor radio equipment via surface-mounted conduit and the building weatherhead.

Utilities

Electricity is generally available at individual LMR sites. At some sites sufficient electrical power is present on the site. At other sites, power delivery improvements may be required between the LMR facility and the nearest existing interconnection point at a transformer or utility pole off site. Similarly, connection to commercial fiber may be required at urban sites between the LMR facility (the communications equipment within an existing or new shelter or building) and the nearest fiber point of presence or equipment vault. The electrical or fiber connection may be an overhead or an underground line and may extend beyond the perimeter of the telecommunications site. At most sites, underground electrical conduit would be installed between new emergency generators and the equipment shelter. This would occur within the boundary of the communications site. The total amount of trenching required to install electrical conduit (both between the generator and the shelter and between the site and a power source) and to install the communications conduit for fiber connection (between the utility

source and the LMR equipment and between the LMR antennas and the indoor radio equipment), would vary by site but is not expected to exceed 800 linear feet at any site. The electrical and communications underground conduits would be laid in the same trench where the conduit paths coincide, to the greatest extent possible.

At a few remote sites where electrical utilities are not available, solar panels may be installed to provide power. At these sites, new solar arrays of up to 1,500 square feet would be installed to supplement the existing solar arrays.

No other utilities infrastructure would be installed as part of the proposed Project. The LMR sites would not require water or natural gas, and no wastewater would be generated.

Fencing

Some LMR sites may require fencing. LMR facilities may be installed within existing CMU walls or chain link fencing at a site or may require expansion of an existing walled or fenced area or construction of a new walled or fenced area adjacent to an existing enclosure. In a few cases the LMR site may be installed in a new fenced facility near to but not contiguous with an existing fenced facility. Up to 800 linear feet of new chain link fencing or CMU wall up to 12 feet high may be required at a site. In general, new fencing would include swing gates to accommodate access for maintenance vehicles and would enclose an area of 5,000 square feet. Aggregate may be applied to the fenced area of the facility to minimize dust and erosion at the LMR site.

Access

No new roads or off-site improvements are anticipated to be required to access the LMR sites. Some improvements within an LMR site boundary to existing access roads may be required to allow for creation of vehicle turn around and parking areas, as long as these improvements do not result in total permanent disturbance at the site exceeding the disturbance footprint identified in Table 2.1-3. Aggregate may be applied to access roads, turnarounds, and parking areas.

Lighting

The sites would have security lighting. New equipment shelters would generally require exterior security lighting equivalent to a 100-watt light bulb. Where required by the FAA, new antenna support structures would be lighted and/or marked consistent with FAA Advisory Circular, AC 70/7460-1L Obstruction Marking and Lighting, for visibility to aircraft, as applicable, based on proposed structure height and location. FAA lighting is not generally required for towers less than 200 feet in height above ground level; however, lighting for air navigation safety may be required at specific locations for shorter structures, depending on site conditions. If tower obstruction lighting is installed on a tower, it may include red or white light-emitting diode (LED) lamps or strobe lights that are steady and/or flashing.

2.1.2.2 Project Site Types

As described in Section 2.1.2.1, the LMR antennas may be installed on existing or new structures. The sites are described based on the four general types of proposed antenna support structure. These are:

- Building mount
- Existing tower or monopole
- New lattice tower
- New monopole

Table 2.1-2 lists the sites addressed in this EIR by these four general site types. More detailed descriptions of the components proposed at each LMR site are provided in Chapter 4.

Building Mount

Building mount sites would consist of whip and/or microwave antennas mounted to a façade or rooftop. Up to 20 whip antennas and 4 microwave antennas would be installed. Alteration of the building may be required to install the antennas (e.g., structural upgrade to a roof). Indoor equipment racks would be installed within a room in the existing building or in a new shelter either on the building roof or on the ground adjacent to the building. Installation of a new emergency generator is not currently anticipated at any building mount site; however, as noted in Section 2.1.3, it is assumed in this EIR that each site would include a new emergency generator for purposes of impact analysis. If required, a new generator would be constructed on the ground adjacent to the building. Although most construction activities would generally be confined to the building, some ground disturbance may occur adjacent to the building.

Existing Tower or Monopole

These sites are existing telecommunications facilities where LMR antennas would be mounted on an existing lattice tower or monopole. Collocation on these types of existing antenna support structures is proposed for existing telecommunications facilities where space on an existing lattice tower or monopole is sufficient for mounting the LMR antennas, where the weight and configuration of the proposed antennas are compliant with applicable building codes for structural and seismic stability, where radiofrequency (RF) interference would not occur, and where the existing structure can provide the required line(s) of sight. Up to 40 whip antennas and 9 microwave antennas would be installed on an existing tower. Up to 20 whip antennas and 5 microwave antennas would be installed on an existing monopole. Indoor equipment racks would be installed in an existing equipment shelter, or a new shelter would be constructed if the existing shelter cannot accommodate new equipment. A new emergency generator may be required.

New Lattice Tower

New lattice towers could be installed at existing communication facilities but would also be necessary at LMR sites where antenna support structures do not exist or where the current infrastructure is inadequate. Inadequate infrastructure would include existing antenna support structures with insufficient space for installation of LMR equipment, where the weight and configuration of the LMR antennas would not comply with applicable building codes for structural and seismic stability, or where the existing structure does not offer the line(s) of sight. Up to 40 whip antennas and 9 microwave

antennas would be installed on a new lattice tower. The new lattice tower may require flight obstruction lighting that may include red or white light-emitting diode (LED) lamps that are steady and/or flashing. Indoor equipment racks would be installed in an existing equipment shelter, or a new shelter would be constructed. A new emergency generator may be required.

New Monopole

New monopoles are generally proposed for locations such as police or fire stations where an existing lattice tower or monopole is not present; or an existing structure is present but it cannot support the LMR antennas because space is insufficient for installation of LMR equipment, the weight and configuration of the proposed whip and microwave antennas would not comply with applicable building codes for structural and seismic stability, or the existing structure would not provide the required line(s) of sight. Up to 20 whip antennas and 5 microwave antennas would be installed on the monopole. A new monopole may require flight obstruction lighting that may include red or white LED lamps that are steady and/or flashing. Indoor equipment racks would be installed in an existing equipment shelter, or a new shelter would be constructed.

Table 2.1-2: Project Sites by Antenna Support Structure Type

Site ID	Site Name	Site Type				Notes
		Building Mount	Existing Tower or Monopole	New Tower	Lattice New Monopole

2.1.3 Construction

Construction at the proposed LMR sites would be phased and would be expected to begin in spring-summer-2016 and be completed in 2017. Construction phasing is based on an average duration of six weeks of construction activity at each LMR site.

Table 2.1-3 summarizes the construction activities associated with the four types of LMR sites. Some sites may result in substantially less disturbance or excavation than the maximum quantities listed in the table, but the analysis assumes maximum disturbance to be conservative.

Table 2.1-3: Anticipated Construction Activities by Site Type

Disturbance Type	Building Mount	Existing Tower or Monopole	New Lattice Tower	New Monopole
Temporary Disturbance (includes staging) ¹	Temporary disturbance area (includes staging on adjacent ground level): Up to 5,000 square feet	Temporary disturbance area (includes staging): Up to 5,000 square feet	Temporary disturbance area (includes staging): Up to 5,000 square feet	Temporary disturbance area (includes staging): Up to 5,000 square feet
Permanent Disturbance	Permanent disturbance area: Up to 3,000 square feet at ground level	Permanent disturbance area: Up to 2,000 square feet	Permanent disturbance area: Up to 4,000 square feet	Permanent disturbance area: Up to 3,000 square feet
Excavation (including geotechnical investigation)	Excavation: Up to 100 cubic yards removed	Excavation: Up to 100 cubic yards removed	Excavation: Up to 600 cubic yards removed	Excavation: Up to 150 cubic yards removed
Trenching	Proposed trenching for underground conduits to accommodate power and/or fiber not to exceed 800 linear feet, up to 48 inches below grade, up to 24 inches wide	Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet, up to 48 inches below grade, up to 24 inches wide.	Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet, up to 48 inches below grade, up to 24 inches wide.	Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet, up to 48 inches below grade, up to 24 inches wide.
Foundation Construction	Proposed foundations include: Up to 600-square foot by 18-inch concrete slab, or raised foundation for equipment shelter Up to 200-square foot by 18-inch concrete slab for generator	Proposed foundations include: Up to 600-square foot by 18-inch concrete slab, or raised foundation for equipment shelter Up to 200-square foot by 18-inch concrete slab for generator	Proposed foundations include: Up to 50-foot by 50-foot by 5-foot concrete slab with up to 10-foot deep by 3-foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6-foot diameter by up to 70-foot deep concrete piers under each	Proposed foundations include: Up to 8-foot diameter by 36-foot deep drilled caisson with concrete cap for monopole support; or up to 16-foot by 16-foot by 10-foot deep concrete mat foundation Up to 600-square foot by 18-inch concrete

Table 2.1-3: Anticipated Construction Activities by Site Type

Disturbance Type	Building Mount	Existing Tower or Monopole	New Lattice Tower	New Monopole
			leg Up to 600-square foot by 18-inch concrete slab, or raised foundation for equipment shelter Up to 200-square foot by 18-inch concrete slab for generator	slab, or raised foundation for equipment shelter Up to 200-square foot by 18-inch concrete slab for generator
Demolition	Demolition of existing pavement and/or structures associated with features such as extensions of power on the ground	Demolition of existing pavement and/or structures	Demolition of existing pavement and/or structures	Demolition of existing pavement and/or structures

¹ At locations where solar power is required, solar panels would be installed and disturbance may be up to 10,000 square feet.

Estimates of construction equipment and duration of use at each LMR site are described in Table 2.1-4, Project Site Construction Equipment Usage. Some equipment may not be needed for each LMR site and would depend on the type of construction activity needed.

Table 2.1-4: Project Site Construction Equipment Usage

Equipment Type	Specification (Brake Horsepower)	No. Per Site	Hours Per Day	Trips To/ From Site	Days on Site ¹	Usage
Personnel and Tool Delivery						
F250 Antenna and Line Truck	306	4	0.067	120	30	Haul equipment
F550 Civil Truck	306	1	0.067	30	30	Haul personnel
Demolition³

Mini Excavator	22.9	1	4	1	1	Cut and fill work
Dump Truck	450	1	8	1	1	Haul off excess material
2,000 Gallon Water Truck	210	1	1	1	1	Dust control
Site Preparation						
Mini Excavator	22.9	1	4	1	15	Cut and fill work
Excavation³						
Auger Drill Rig ²	205 [206] ²	1	3	1	2	Install fences, excavate foundation holes and bores
Excavator ¹	153	1	5	1	10	Trenching

Table 2.1-4: Project Site Construction Equipment Usage

Equipment Type	Specification (Brake Horsepower)	No. Per Site	Hours Per Day	Trips To/ From Site	Days on Site ¹	Usage
Cat Skid Steer	73	1	4	1	10	Move excavated soil on site
2,000 Gallon Water Truck	210	1	1	3	10	Dust control
Pad Construction³						
Concrete Truck	450	1	1	19	19	Pour concrete
Monopole/Shelter/Tower and Equipment Installation³						
3-Ton Flatbed Truck	400	1	3	1	2	Haul materials and equipment
250-Ton Crane	530	1	8	2	4	Monopole/shelter installation, tower assembly
8,000 Pound Reach Fork	60	1	4	2	5	Access structures, string conductor, modify structure arms, tree trimming/ removal, etc.
Portable Generator ²	84 [7] ²	1	6	1	10	Operate power tools
¹ Maximum six week total construction duration. ² Horsepower and usage data referenced from <i>Broadband Technology Opportunities Program Final Environmental Assessment, Los Angeles Regional Interoperable Communications System LTE System (LA-RICS LTE, 2008)</i> . ³ Building Mount and Existing Lattice Tower and Monopole site types would not require all equipment and/or phase.						

Typical construction equipment required would include four-wheel drive vehicles, antenna and line trucks, water trucks, excavators, skidsters, cranes, forklifts, dump trucks, and concrete trucks. Almost all LMR facilities would be constructed within or adjacent to existing telecommunications or other facilities, such as water tanks, or at developed locations that currently have public radio service such as police and fire stations. At facilities such as urban police and fire stations, LMR construction may occur within paved or landscaped areas of the facility property.

Each site would undergo a Phase I hazardous materials assessment prior to construction. If feasible, hazards would be abated prior to initiation of construction. If abatement is infeasible, the site would be eliminated from the proposed system. Geotechnical investigation is a site-specific scientific investigation of soil properties and local geology during project design and would occur prior to project construction activities, primarily at sites where construction of new lattice towers or new monopoles is proposed. Geotechnical investigation would help to verify that foundations designed for the proposed LMR infrastructure comply with applicable building safety codes and system reliability requirements. Minimal ground disturbance is associated with geotechnical investigation activity, which involves drilling an up to 8-inch-diameter hole up to 100 feet deep to allow sampling of a minimal amount of soil for laboratory analysis to determine soil types and properties. The drilled hole would be reinstated and backfilled with bentonite (a soil-concrete mix) to the level of the surrounding surface after soil samples have been taken. Geotechnical investigation would involve use of a drill rig; an additional truck; and, potentially, a

water truck. All geotechnical investigation work at a site would take less than one day. Geotechnical investigation is part of the design phase of the project and would occur well ahead of construction activities. Foundation and soil work would conform to the geotechnical report recommendations.

Construction activities at each site would result in temporary disturbance of a maximum of approximately 5,000 square feet (0.11 acre) of ground surface, except at sites that require installation of solar arrays for power. At these sites, the disturbance footprint may be up to 10,000 square feet (0.23 acre). At sites that require the most new construction (i.e., locations that require installation of new concrete pads for a tower, shelter, and generator), a maximum of approximately 4,000 square feet (0.1 acre) of new impermeable surface would be created. At sites constructed at locations that are currently paved (e.g., at an urban police station parking area), any increase in impermeable surface would be minimal.

The project site would be graded so that water drains away from structures. A minimum of a 2-percent grade would be provided. After completion of construction and grading, the facility sites would be covered in aggregate (gravel) from a permitted local source. Where existing surface cover, such as asphalt, concrete, or gravel is disturbed or removed during construction, the ground surface would be repaired, patched, and reinstated. Areas disturbed during construction that are not to be permanently covered by aggregate would be seeded for erosion prevention.

Excavated material of suitable quality could be used as backfill or fill on site. Unsuitable or excess excavated material would be removed for disposal off site at an appropriate facility.

Site construction may require removal of existing paved surfaces, fencing, towers, and shelters to allow for installation of the LMR facilities. Demolition materials would be reused or recycled to the extent practicable or otherwise properly disposed of.

Included in the proposed Project design are best management practices (BMPs) that have been developed to avoid or minimize impacts to environmental resources that may be present on some potential LMR sites. BMPs represent best professional practices and/or use of accepted technology to ensure desired regulatory compliance is achieved and are often included in building permits, which would be required for all site types, or other regulatory conditions. Examples of BMPs applicable to the proposed Project are provided below. A complete list of BMPs considered in this analysis is presented in Appendix C.

Examples of BMPs applicable to the proposed Project include:

- Apply water to the construction site as needed to comply with Rule 403 of the applicable air quality management district.
- Enclose or water down exposed dirt storage piles.
- Minimize the disturbed area and preserve vegetation to the maximum extent possible.

- Phase construction activities, to the extent possible, to reduce disturbed areas and time of exposure.
- Plan the development to fit the topography, soils, drainage pattern, and natural vegetation of the site.
- Delineate clearing limits, easements, setbacks, sensitive or critical areas, trees, drainage courses, and buffer zones to prevent excessive or unnecessary disturbances and exposure. Minimize the size of staging areas to the extent practical.
- Avoid excavation and grading during wet weather.
- Use berms and drainage ditches to divert runoff around exposed areas. Place diversion ditches across the top of cut slopes.
- Control stormwater flowing to and through the project site.
- Protect slopes by using measures such as erosion control blankets, bonded fiber matrices, turf reinforcement mats, silt fences (for moderate slopes), etc.
- Temporarily protect storm drain inlets until the site is stabilized. Protect drainage courses, creeks, or catch basins with fiber rolls, silt fences, sand/gravel bags, and/or temporary drainage swales if on-site sediment control measures are not adequately preventing stormwater runoff.
- Use appropriate erosion control measures to reduce siltation and runoff of contaminants into wetlands and adjacent ponds, streams, or riparian woodland/scrub.
- Conduct routine inspections of erosion control measures especially before and immediately after rainstorms, and repair if necessary.
- Establish stabilized construction entrances/exits (e.g., large crushed rocks, stone pads, steel wash racks, hose-down systems, and pads).
- Clean up leaks, drips, and other spills immediately to avoid soil or groundwater contamination. Cleanup of a spill on soil would include removing the contaminated soil using the emergency spill cleanup gear. Contaminated soil and disposable gear used to clean up a hazardous materials spill would be properly disposed of following state and federal hazardous material disposal regulations.

2.1.4 Operations and Maintenance

Prior to becoming operational, the LMR system would undergo systems acceptance testing before it is made available to the LA-RICS users. Systems acceptance testing would be conducted after most construction at the LMR sites is complete. LMR system acceptance is anticipated to occur prior to the end of 2018.

No staff would be required at any of the sites to operate the LMR equipment, except at the NOCs, which would be embedded within an existing staffed facility. Operational activities at individual LMR sites would include routine inspections, maintenance, and repairs.

Maintenance activities would involve both routine preventive maintenance and emergency procedure testing, including emergency generator testing, to maintain service continuity. Emergency generators would be tested on a monthly basis. The test run time each month would be approximately one hour. Fuel tanks in the emergency generators would require occasional refilling. LMR structures and equipment would be inspected annually, at a minimum, for corrosion, equipment misalignment, loose fittings, and other common mechanical problems. Maintenance activities may require use of bucket trucks (man-lifts), standard vans, or utility pickup trucks, depending on the scope of maintenance. The LMR components may need to be repaired or replaced to maintain uniform, adequate, safe, and reliable service. Equipment replacement or repair that cannot be diagnosed and performed remotely may require a technician on site, typically in a standard van or utility pickup truck. Where replacement or repair involves installed antennas, a four-person crew with one truck, a boom (aerial lift) truck, and an assist van or sport utility vehicle (SUV) might be required.

Each LMR site would continually draw power for LMR operations and security and safety lighting (including that required by FAA).

As part of site development and maintenance, vegetation on or immediately adjacent to an LMR site would be removed, as needed, in accordance with plans or procedures applicable to the site (i.e., jurisdictional requirements; type of infrastructure to be protected; and site factors including vegetation type, slope, and aspect).

2.2 Project Objectives

The Los Angeles region is designated as a high-threat area by the Department of Homeland Security (DHS). The proposed LMR system would provide emergency responders with an improved communications system for an efficient and coordinated response to incidents and emergencies that presently is not possible in Los Angeles County.

Effective radio communication is critical in helping police officers prevent and respond to crimes, keeping firefighters safe as they fight blazes, facilitating life-saving exchanges of information between emergency medical service professionals and hospitals, and allowing public works and utility providers the opportunity to coordinate responses to disasters and special events. LMR would support a rapid, safe, and effective response during daily operations. Additionally, it would support a faster, better-coordinated, large-scale response to emergencies such as wildfires, earthquakes, civil disturbance, or other disasters. It would replace the existing aging patchwork of LMR systems with a single county-wide network and would improve overall system capacity and coverage for first and second responders region-wide.

In addition, most public safety entities currently use a portion the radiofrequency spectrum (UHF T-Band frequency spectrum at 470 to 512 MHz) that the FCC has mandated be vacated by 2023. The proposed LMR system would allow for phase-out of use of the UHF T-Band and transition to the use of the 700-MHz spectrums.

The objectives of the LMR Project are:

- 1) Provide day-to-day voice and narrowband data radio communications for first and second emergency responders in the Los Angeles region
- 2) Enable interoperability among member agencies and mutual aid providers
- 3) Support communication with regional, state, and federal agencies in the event of a natural or man-made disaster
- 4) Improve emergency communications within Los Angeles County
- 5) Add capacity, replace existing aging infrastructure with infrastructure that meets current building codes and telecommunications industry standards that better support modern technology, and provide for more technologically advanced equipment
- 6) Lessen the amount of interference resulting from multiple systems on the same tower by providing greater separation of different radio frequencies
- 7) Provide greater frequency flexibility and increase overall system coverage and capacity by providing greater separation of different radio frequencies
- 8) Allow for transition from use of the UHF T-Band to the 700 MHz spectrum as mandated by the FCC

2.3 Project Alternatives

As discussed in Section 2.1.2, the LMR Project consists of the construction and operation of up to 90 LMR sites out of 94 sites under consideration. These 90 sites may be a combination of sites previously found statutorily exempt from CEQA (see Section 1.3.2) and sites addressed in this EIR as the proposed Project (see Section 2.1.2).

By considering more sites than would ultimately be constructed, the Authority is effectively considering numerous alternative locations for the proposed Project. The ultimate selection of which sites will be constructed will be determined based on the conclusions of the Draft EIR, as well as whether some of the 94 potentially feasible sites ultimately prove infeasible due to economic, environmental, legal, social, or technological factors, including system engineering, geotechnical evaluations, and permitting process or in lease agreement discussions with the property owner.

Listed below are the groups of two or more proposed Project sites analyzed in this EIR that would be alternatives to each other. Out of the sites in each group below only one site would be constructed.

Sites BUR, BUR1, BUR2, BUR3, and BUR 4

These sites are alternate locations within the same telecommunications site complex in the Angeles National Forest.

Sites ENT, LACFCP08, and TOP

These sites are located in the Santa Monica Mountains and each would provide similar coverage.

Sites FRP and TMT

Sites FRP and TMT are both within Angeles National Forest. Site FRP is south of Highway 2 and Site TMT is north of Highway 2.

Sites LACFCP09 and LPC

Sites LACFCP09 and LPC are both within Angeles National Forest and about 0.25 mile apart from one another.

Sites H-69B and SPN

These sites are located in the Santa Monica Mountains and each would provide similar coverage.

Sites JPK and JPK2

Sites JPK and JPK2 are alternate locations within the same telecommunications site complex in the Angeles National Forest.

Sites SUN and SUN2

Sites SUN and SUN2 are alternate locations within the same telecommunications site complex in the Angeles National Forest.

2.4 No Project Alternative

Under the No Project Alternative, none of the LMR wireless voice and narrowband data communications system sites that are the subject of this EIR would be constructed; however, the existing facilities at the communication sites identified for LMR use in this EIR would continue to be inspected, maintained, and repaired as part of ongoing activities.

The No Project Alternative is analyzed in this document in compliance with CEQA. The No Project alternative represents the anticipated conditions if construction and operation of the proposed Project were not implemented.

2.5 Environmentally Superior Alternative

Based on the analysis in this Draft EIR, the “environmentally superior alternative”, as that term is used in CEQA, is the No Project Alternative. If, as here, the environmentally superior alternative is the No Project Alternative, CEQA Guidelines Section 15126.6(e)(2) requires identification of an environmentally superior alternative among the other alternatives.

As discussed previously, the Draft EIR analyzes more sites than would be constructed. Listed below are the groups of two or more proposed Project sites analyzed in this EIR that would be alternatives to each other. Out of the sites in each group below only one site would be constructed. Table ES-1 in the Executive Summary, which presents a summary of the environmental impacts by site, lists these alternate sites next to each other and groups them by a heavy line to allow easy comparison of the

environmental impacts among them. These groups of sites are listed below with the environmentally superior alternative in each group identified.

Sites BUR, BUR1, BUR2, BUR3, and BUR 4

These sites are alternate locations within the same telecommunications site complex in the Angeles National Forest. As summarized in Table ES-1, environmental impacts at each of these sites would be similar, and no one site is environmentally superior to the others.

Sites ENT, LACFCP08, and TOP

At Site LACFCP08 significant and unavoidable impacts would occur to cultural resources. Selection of either Site ENT or Site TOP would avoid these significant and unavoidable impacts and would not result in any other significant and unavoidable impacts. As summarized in Table ES-1, impacts at Sites ENT and TOP would be similar. While there would be no impacts at either site that could not be reduced to less than significant with mitigation, Site TOP would require more mitigation measures for biological and cultural resources than Site ENT to reduce impacts to less than significant. Therefore Site ENT is considered the environmentally superior site.

Sites FRP and TMT

Sites FRP and TMT are both within Angeles National Forest. Site FRP is south of Highway 2 and Site TMT is north of Highway 2, but the settings are relatively similar. As summarized in Table ES-1, there is no distinction between the two sites in terms of anticipated environmental impacts. Neither is environmentally superior to the other.

Sites LACFCP09 and LPC

Sites LACFCP09 and LPC are both within Angeles National Forest and about 0.25 mile apart from one another. Significant and unavoidable impacts to cultural resources would occur at both sites. The environmental impacts of the two sites are similar for most resources. While environmental impacts at the two sites would be similar, impacts to biological resources and geology and soils would be slightly greater at Site LPC; therefore Site LACFCP09 is considered the environmentally superior site.

Sites H-69B and SPN

Site H-69B is on an undeveloped ridgeline. Significant and unavoidable impacts would occur at site H-69B to aesthetics and cultural resources. Selection of Site SPN would avoid these significant and unavoidable impacts and would not result in any other significant and unavoidable impacts; therefore, Site SPN is the environmentally superior alternative.

Sites JPK and JPK2

These sites are alternate locations within the same telecommunications site complex in the Angeles National Forest. As summarized in Table ES-1, environmental impacts at each of these sites would be similar, and neither site is environmentally superior to the other.

Sites SUN and SUN2

These sites are alternate locations within the same telecommunications site complex in the Angeles National Forest. As summarized in Table ES-1, environmental impacts at each of these sites would be similar, and neither site is environmentally superior to the other.

2.6 Alternatives Considered and Eliminated from Further Consideration

The following alternatives to the Project were eliminated from further consideration in this EIR because they are infeasible. In accordance with CEQA Guidelines Section 15126.6, an EIR is not required to consider alternatives that are infeasible.

2.6.1 Collocation

This alternative would consist of limiting installation of LMR antennas to existing structures, including roof tops, monopoles, and towers, i.e., “collocation.” Where feasible to support system performance and reduce the number of sites, the Authority included site design documentation and plans to support collocation and/or utilization of existing telecom tower/sites; however, installing the LMR antennas on existing structures is not possible at each potential LMR site. LMR sites were identified at locations that would provide the maximum countywide coverage using the minimum number of sites. Existing structures for mounting LMR antennas are not present at all locations that are required to achieve countywide coverage. At some locations where towers are present, space is not sufficient on the existing tower to mount the LMR antennas. Therefore, construction of new lattice towers and monopoles would be required to complete the LMR system. Limiting the LMR locations to only those where collocation is possible would not provide the desired coverage; therefore, an alternative consisting entirely of collocation sites would not meet the Project objectives and was not considered further.

2.6.2 Use of Cell on Wheels

Cell on Wheels (COW) are mobile, portable cell towers with self-contained equipment and generators. COWs are not tall enough to provide the required line of sight at most LMR sites, especially those where new lattice towers are proposed. Although they are comparable in height to many of the monopoles proposed for various LMR sites, most of which would be 70 feet tall, COWs are not large enough to support all the antennas required at LMR sites. Therefore, use of COWs, either for all sites or even at only a few sites, would not meet the Project objectives and was not considered further.

2.6.3 Use of Satellites

LMR communication could be conducted by using a satellite system. However, satellite systems experience a significant lag time between sender and receiver that does not allow the quick communication required during an emergency response. Therefore, use of a satellite system would not meet Project objectives and was not considered further.

2.6.4 Alternative Systems

As the governing board for the LA-RICS telecommunications system, the Authority reviewed various telecommunications options and worked with industry experts to modernize their systems, and ease transition from the existing network to a hybrid of digital and analog networks to provide a mobile data system. In November 2011, requests for proposals were developed to support the hybrid system. In January 2012, proposals were received and a vendor was chosen. Alternative systems to the hybrid system were not identified.

2.7 Projects Considered for Cumulative Impacts Analysis

In accordance with CEQA Guidelines §15130, this EIR presents an analysis of cumulative impacts that may result from construction and operation of the proposed Project. As defined in CEQA Guidelines §15355, cumulative impacts refer to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts.

This EIR addresses 54 potential LMR sites (see Table 2.1-1). Together with the sites previously found to be statutorily exempt from CEQA (listed in Section 1.3.2), this accounts for 94 potential LMR sites, of which up to 90 may be selected for construction and operation. While not all of the statutorily exempt sites may be constructed, the analysis of cumulative impacts considers potential for cumulative impacts associated with the statutorily exempt LMR sites.

The analysis of cumulative impacts also considers the potential for cumulative impacts associated with the LTE system. As discussed in Section 1.1.3.1, the LTE system is a separate project being carried out by the LA-RICS Authority. The LTE system comprises 77 sites, some of which are “collocation” sites (i.e., sites where LTE infrastructure has been collocated on existing towers or other structures), some of which include new monopoles (up to 70 feet in height), and some of which are COW sites. Construction of LTE sites began in December 2014 and was completed in December 2015.

In addition to LMR facilities and LTE facilities, other types of past, current, and reasonably foreseeable projects may contribute to the types of effects that would result from construction and operation of the proposed Project sites. These include other wireless communications structures and transmission lines, as well as other types of projects that could have similar impacts.

A list of projects for consideration for cumulative impact analysis is provided in Table 2.7-1. This list was developed through a review of active projects identified from the FCC Antenna Structure Registration, California Public Utilities Commission, California Energy Commission, the Desert Renewable Energy Conservation Plan websites, and from county and city websites, and from city planning department personnel. A cumulative impact analysis is provided for each of the resource topics analyzed in Chapter 3.0. Table 2.7-1 lists projects identified within 2 miles of the proposed Project sites; however, the cumulative impact analysis for each resource in Chapter 3 considers projects within a distance of each proposed Project site that is appropriate for the resource. For some resources use of a summary of

projections, rather than a list of projects, is more appropriate for assessing cumulative impacts. The applicable approach is described in the cumulative impact analysis for each resource section.

Table 2.7-1: Comprehensive List of Projects within Two Miles of Proposed Project Sites

3.0 Affected Environment, Environmental Impacts, and Mitigation Measures

This chapter contains sections for each of the environmental resource areas that are analyzed in this EIR. Each resource area contains the following general subsection headings:

- Environmental Setting
- Regulatory Setting
- Significance Criteria
- Impact Analysis
- Cumulative Impacts

The Environmental Setting provides relevant background information about the proposed Project's existing conditions. The Regulatory Setting discusses federal, state, and local laws, ordinances, and regulations pertaining to the proposed Project for a given environmental resource. Significance Criteria presents the thresholds for determining whether environmental effects of the Project are significant environmental impacts. The Impact Analysis presents the potential environmental consequences of the construction and operation of the proposed Project and the No Project Alternatives. Mitigation measures describe all reasonable and feasible means to reduce the impact to a level less than significant. Cumulative Impacts discusses potential cumulatively considerable project effects when project impacts are considered with other past, present and/or reasonably foreseeable future projects.

Consistent with CEQA Guidelines Section 1526.2(a), the baseline for the environmental setting used in this EIR is the physical conditions at the time the NOP was issued which was August 2014.

The Chapter 3.0 subsections are listed below:

- 3.1 Aesthetics
- 3.2 Air Quality
- 3.3 Biological Resources
- 3.4 Cultural Resources
- 3.5 Geology/Soils
- 3.6 Greenhouse Gas Emissions
- 3.7 Hazards and Hazardous Materials
- 3.8 Hydrology/Water Quality
- 3.9 Land Use/Planning
- 3.10 Noise
- 3.11 Recreation
- 3.12 Transportation/Traffic
- 3.13 Utilities/Service Systems

This chapter provides a summary of the Project impacts for these resources. Site summary forms containing site-specific analysis for each Project site are provided in Chapter 4.

3.1 Aesthetics

This section addresses existing aesthetic and visual resources in the project area. Visual and aesthetic resources within a landscape are composed of natural and cultural features that can be seen and that contribute to the public's appreciation and enjoyment of them. These resources include physical features that define the visual and aesthetic character of an area, including important natural features or scenic vistas, and can include man-made urban or community visual characteristics (e.g., architecture, skylines, or other elements) that create a visual definition for an area. Visual resources are important because of their uniqueness, and they often provide a sense of community for the inhabitants of an area.

3.1.1 Environmental Setting

Visual conditions can be expressed in terms of their visual character. Visual character is an impartial description of what the landscape consists of and is defined by the relationships between the existing visible natural and built landscape features. These relationships are considered in terms of dominance, scale, diversity, and continuity. Physical resources and features that define visual character include landform types, vegetation types, land uses, height, bulk, scale, and architectural detail of associated buildings and ancillary site uses, overhead utility structures and lighting, open space (e.g., parks, reserves, greenbelts, and undeveloped land), significant viewpoints and scenic views (e.g., views of waterbodies, mountains, historic structures, and downtown skylines), apparent "grain" or texture (e.g., density of development as well as size and distribution of structures and vacant properties or open spaces), and apparent upkeep and maintenance.

The general visual character of proposed Project sites can be categorized based on their locations in urban, rural, or remote areas. Urban areas are characterized by high concentrations of people and activity. Urban areas include the Los Angeles Basin and San Fernando and Santa Clarita valleys, along with developed portions of the Antelope Valley in the Mojave Desert and Santa Monica Mountains. Views typically include residential, commercial, and industrial building facades of varying architectural styles and urban streetscapes where paved streets with curbs and gutters are lined with utility poles, overhead distribution cables, and street lights.

Rural areas are generally located outside cities and towns and are characterized by minimal development and low population density. Within the Project area, such areas commonly occur where city boundaries transition to areas managed by federal land agencies. Views typically include small-scale development, such as single-story structures, views with few human-made obstructions, and few roads with minimal traffic. Signs of infrastructure, such as telephone poles and transmission lines, however, are visible. More views highly sensitive to the public exist in rural areas than urban areas.

Remote areas are more distant from cities and towns and are typically secluded. Remote areas in the study area include roads, trails, campgrounds, beaches, and similar areas in national forests, national recreation areas, and coastal zones. Views are typically natural and consist of few human-made obstructions and are often located within land set aside for protection of natural resources. Natural

features, such as ridgelines, forests, and waterbodies, are predominant. More views highly sensitive to the public exist in remote areas than urban and rural areas.

“Sensitive public views” are those that would be most affected by the Project. The “sensitivity” of a particular view is a function of viewer expectations, activity, awareness, values, and goals. For purposes of this Project, high sensitivity views are defined as:

- Views that are rare, unique, or in other ways special to the region or locale
- Views that are considered to be of local, regional, national, or global importance
- Views that are considered to be of high quality
- Views where the public is more aware and less tolerant of any adverse change
- Views where a small modification may be visually distracting and represent a substantial reduction in visual quality

The availability of certain activities tends to heighten viewer sensitivity of scenic resources (e.g., recreational pursuits), while others tend to focus attention on other aspects of the environment (e.g., commuting to work). Viewer sensitivity may also be heightened where visual resources are formally designated as being of special interest, such as state parks (Headley 2008). For purposes of this analysis, a visual resource with high visual sensitivity is considered a scenic vista⁴ or resource of particularly distinctive character or high quality, sensitive to relatively small changes. A visual resource with medium sensitivity is defined as a scenic vista or resource of moderately valued character or quality and reasonably tolerant of change. Sites with low sensitivity are considered those of low visual character and quality and can tolerate visual change. High visual sensitivity is considered to exist within the following areas:

- Sites located on public land administered by federal and state agencies whose primary mission includes natural resource protection and whose land management goals include protection of scenic resources (i.e., National Park Service [NPS], U.S. Forest Service [USFS], and the California Department of Parks and Recreation [DPR])
- Sites within or adjacent to the California coastal zone
- Sites adjacent to designated scenic highways and regional trails
- Sites within or adjacent to regional and municipal parks, open space, and recreation areas
- Sites within historic districts or at historic landmarks
- Sites at designated significant ridgelines

⁴ CEQA does not define the term “scenic vista.” Local plans can provide guidance as to what is valued as a scenic vista and were used to help identify scenic vistas. Determining whether or not a scenic vista exists can be very subjective if there is no guidance in planning documents. In *Mira Mar Mobile Community v. City of Oceanside*, the Court of Appeal, Fourth District determined that “under CEQA, the question is whether a project will affect the environment of persons in general, not whether a project will affect particular persons.”

No designated wild and scenic rivers were identified that would be affected by the Project.

The urban setting outside or immediately adjacent to the coastal zone does not typically contain sensitive public views; however, certain places such as parks within urban areas are considered to have high or medium sensitivity views.

Figure 3.1-1 shows the location of proposed Project sites within areas containing high or medium viewer sensitivity. Land within these areas constitutes the primary region of influence for aesthetic and visual resources based on their viewer sensitivity. These areas, and terminology used in tables, are described in the following sections. Table 3.1-1 lists the proposed Project sites that are located within high or medium viewer sensitivity areas. Some Project sites fall under multiple categories. Site-specific descriptions of the visual setting at each site and photographs of the sites are provided on the Site Summary Forms in Chapter 4.

While these areas are generally considered to have high or medium viewer sensitivity, site conditions may lower viewer sensitivity for some proposed Project sites.

*High visual sensitivity is defined as an important scenic vista or resource of particularly distinctive character or high quality, sensitive to relatively small changes. Medium visual sensitivity is defined as a scenic vista or resource of moderately valued character or quality and reasonably tolerant of change. Sites with low sensitivity are considered those of low visual character and quality and can tolerate visual change

- SAC Scenic Attractiveness Class
- SIO Scenic Integrity Objectives
- SMMNRA Santa Monica Mountains National Recreation Area
- USFS U.S. Forest Service

3.1.1.1 Federally Administered Lands

The visual resources setting for proposed Project sites located on lands administered by the USFS and NPS are described below.

U.S. Forest Service

USFS developed the Scenery Management System (SMS) as a methodology for classifying the aesthetic values of landscapes based on the scenic attractiveness of the landscape, the landscape's visibility, and the public's concern about changes in the landscape from a natural condition. The SMS recognizes the interdependence of aesthetics and ecological systems and promotes natural-appearing landscapes. Under the SMS, scenic integrity (which measures landscapes' inherent scenic attractiveness and the public's visual expectations for naturalness) is used to evaluate alterations in national forest landscapes (USFS 1995, 2005b).

To ensure that scenic integrity is maintained, the USFS has established six scenic integrity objectives (SIOs) derived from the landscape's attractiveness and the public's expectations or concerns. SIOs represent the minimum levels of scenic integrity to which landscapes are to be managed. Each SIO depicts a level of scenic integrity used to direct landscape management: very high (unaltered), high (appears unaltered), moderate (slightly altered), low (moderately altered), and very low (heavily altered). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels may occur during and immediately following project implementation (USFS 2005a, 2005b).

The SMS also defines "Scenic Attractiveness Classes" (SACs). SACs measure the scenic importance of a landscape based on human perceptions of intrinsic beauty and represent relative landscape value by combining distance zone (foreground, middleground, background, or "seldom seen"), concern level (high, middle, or low), and scenic attractiveness (distinctive, typical, or indistinctive) (USFS 1995).

U.S. Forest Service Assessment Methodology

For project sites located on land administered by the USFS, the agency's approach to visual resource assessment was used.

- 1) Inventory the existing visual resources on USFS land within the Study Area.
 - Define landscape character
 - Define scenic integrity objectives (SIOs): (very high (unaltered), high (appears unaltered), moderate (slightly altered), low (moderately altered), very low (heavily altered))
 - Define scenic attractiveness classes: SAC A – distinctive, SAC B – typical, SAC C – indistinct
- 2) Identify the magnitude of change to visual resource impacts (direct, indirect, cumulative impacts) based on the following indicators:
 - The extent to which existing landscape character would be sustained or changed

- The extent to which SIOs would be met
 - i. Determine if areas of existing scenic integrity would be substantially or irreversibly altered
 - ii. Determine if areas of high SACs would be altered
- 3) Determine whether the impact is significant or less than significant
 - Significant: Would result in a very high or high SIO changing to a moderate or lesser SIO and/or a reduction in SAC A to SAC B or C
 - Adverse but Not Significant: Would result in a moderate SIO changing to a low or very low SIO and/or reduction in SAC B to SAC C
 - Insignificant to No Impact: Would result in a low SIO changing to a very low SIO
- 4) Identify feasible mitigation measures to reduce or avoid significant impacts
- 5) Identify the significance of visual resource impacts with mitigation measures

Angeles National Forest

Several proposed Project sites are located in Angeles National Forest, which is divided into two separate geographic areas. The Santa Clara District is in the northwestern part of the proposed Project area. The Mojave River, Los Angeles River, and San Gabriel River ranger districts comprise one physical area in the east-central part of the Project area. The rugged wildland landscapes of southern California are increasingly valued for the visual contrast they provide in a rapidly urbanizing region. Driving for pleasure and viewing scenery have become some of the more popular national forest activities. Angeles National Forest (ANF) visitors expect a certain level of “naturalness” in the recreation and tourism settings they pursue. As the resident population continues to increase, conserving these remaining scenic landscapes in a natural-appearing condition becomes more important (USFS 2005c).

Within ANF, 24 percent of the landscape is considered “distinctive” (SAC A), 74 percent is considered “typical” (SAC B), and the remaining 2 percent is considered “indistinct” (USFS 2005c). The most attractive landscapes (classified as SAC-A) are located where the highest combination of landform, water form, rock form, and vegetation variety occurs. The more common landscapes (classified as SAC-B) consist of steep chaparral-covered mountains intermixed with foothill and valley areas consisting of oak woodland and grassland. The remaining landscapes (approximately 8 percent of the land base) are less distinctive, or SAC-C (USFS 2005c).

Land Use Zones

The ANF is divided into land use zones, which reflect the level or intensity of public use expected. The type of public use that occurs in an area can affect viewer sensitivity, as described above. The proposed Project sites within ANF will be located within the following ANF land use zones (USFS 2005c):

- Developed Area: Developed areas are adjacent to communities or concentrated use areas and developed sites with more scattered or isolated community infrastructure. The level of human

use and infrastructure is typically higher than in other zones. This zone includes a number of highly popular developed recreation facilities, recreation and non-recreation special-use facilities, and national forest administrative facilities. The level of development varies between areas that are highly developed and areas where no development has occurred.

- **Back Country:** The Back Country zone includes areas that are generally undeveloped with few roads, including most of the ANF's remote recreation and administrative facilities. The level of human use and infrastructure is typically low to moderate. Although this zone allows a range of compatible uses, the management intent is to retain the natural character inherent in this zone and limit the level and type of development.
- **Back Country (Motorized Use Restricted):** The Back Country (Motorized Use Restricted) zone includes areas that are generally undeveloped and have few roads. Few facilities exist, but some may occur in remote locations. A network of low standard National Forest System roads (roads intended only for use by high-clearance vehicles, such as pickup trucks) provides access to this zone for a wide variety of non-motorized dispersed recreation opportunities. The level of human use and infrastructure is typically low. Although this zone allows a range of low intensity land uses, the management intent is to retain the natural character of the zone and limit the level and type of development.
- **Experimental Forest:** The Experimental Forest zone serves as a research and demonstration area and is generally closed to the public except by permit. This zone occurs only on the San Dimas Experimental Forest, which is managed by the Pacific Southwest Research Station.

Santa Monica Mountains National Recreation Area

The NPS jointly manages the Santa Monica Mountains National Recreation Area (SMMNRA) with the DPR and Santa Monica Mountains Conservancy (SMMC). Although NPS oversees the SMMNRA, the agency has direct responsibility for only about 15 percent of the land within the boundary; however, the NPS has “a less direct, but clear duty to support activities on non-NPS lands consistent with the purpose of the [SMM]NRA.” For purposes of identifying visually sensitive areas, proposed Project sites within the boundaries of the SMMNRA, whether administered by the NPS or not, are considered to be in an area of high visual sensitivity. The SMMNRA is to be managed to “preserve and enhance its scenic” and other values (NPS 2002). The Land Protection Plan (LPP) established for the SMMNRA established conservation criteria, including protection of regional scenic values, noting “scenic resources abound in the Santa Monica Mountains and the desire to preserve them was one of the reasons the national recreation area was established. The scenic values inherent in the rugged chaparral-covered mountains and oak-dotted hillsides are a critical component of the southern California experience....” (NPS 1998).

According to the 2014 *Los Angeles County General Plan Update EIR*, the Santa Monica Mountains play a major role in physically defining the topographically and aesthetically diverse communities. These landforms create dramatic backdrops against developed communities and provide extensive benefits to residents (County of Los Angeles 2014a). Similarly, the Santa Monica Mountains North Area Plan (County of Los Angeles 2000) notes that “natural terrain throughout the area is highly visible to residents,

motorists, and recreationists because of topographic features and generally rural conditions,” and “views of natural features are the focus of scenic preservation and enhancement.”

Proposed Project sites within the boundary of the SMMNRA are listed in Table 3.1-1; however, only sites LACFCP08 and PWT are on land administered by NPS.

3.1.1.2 Coastal Zone

Table 3.1-1 lists Project sites located within or adjacent to the designated coastal zone. Project sites within or adjacent to the coastal zone are located within the cities of Los Angeles, Malibu, and Santa Monica, and within Los Angeles County areas on Santa Catalina Island and the Santa Monica Mountains.

A substantial amount of the SMMNRA, which includes approximately 40 miles of shoreline, is within the coastal zone. All proposed Project sites within the Santa Monica Mountains LCP are also within the boundary of the SMMNRA.

3.1.1.3 Scenic Corridors

Areas adjacent to scenic highways and regional trails that contain proposed Project sites are described below.

Angeles Crest Scenic Byway

State Route 2 (SR-2) is a designated state scenic highway. It is also the Angeles Crest Scenic Byway, a 55-mile National Forest Scenic Byway that travels through the San Gabriel Mountains in the ANF and the San Gabriel Mountains National Monument. The goals of the National Forest Scenic Byways program include “showcase[ing] outstanding National Forest scenery” and “contribut[ing] to the nation’s overall scenic byways effort” (USFS n.d.). According to the 2014 *Los Angeles County General Plan Update EIR*, the San Gabriel Mountains play a major role in physically defining the topographically and aesthetically diverse communities. These landforms create dramatic backdrops against developed communities and provide extensive benefits to residents (County of Los Angeles 2014a).

Site TMT is approximately 0.4 mile northeast of the byway at its eastern end. At the western end of the byway, Site JOP is approximately 1.0 mile north of the byway. These sites are administered by USFS. Sensitive viewers include ANF recreationists, visitors, and drivers touring the scenic byway.

Pacific Coast Highway

Pacific Coast Highway (PCH or State Route 1) is a major north-south state highway that travels most of the Pacific coastline in California. PCH is a designated “All-American Road” and is among the nation’s most scenic. All-American Roads, along with National Scenic Byways, define 150 distinct and diverse roads that comprise “America’s Byways” as designated by the U.S. Secretary of Transportation. All of America’s Byways are considered “scenic” (FHWA n.d.) The section of PCH within the SMMNRA is eligible for the State Scenic Highway System designation (NPS 2002).

PCH extends between the Santa Monica Mountains and the Pacific Ocean and is situated immediately behind beaches and beachfront properties. It is the only coastal arterial along the SMMNRA's coastline, generally at an elevation between 5 and 50 feet above sea level. All routes that lead into the mountains to the north connect to PCH. PCH is the sole access route to numerous state beaches and several county beaches and parks. Beaches along PCH receive more than 30 million visitors per year (NPS 2002).

The roadside environment along PCH is diverse. The land side of the road is lined with commercial establishments in many areas, especially from Malibu to the east. Steep hillsides border the land side of PCH in many areas, making the land unsuitable for development in those places (NPS 2002).

Sites WS1 and ZHQ are located along PCH and are also located in the coastal zone. Sensitive viewers include beachgoers, visitors, commuters, and drivers touring the scenic highway.

City of Malibu Scenic Roads

Two sites are located along roads designated scenic by the City of Malibu within the city limits. These sites are located along Encinal Canyon and Kanan-Dume roads. Sensitive viewers include SMMNRA recreationists, visitors, and drivers touring the scenic roads. The city defines scenic roads as those "traversing or providing views of areas of outstanding scenic quality, containing striking views of natural vegetation, geology, and other unique natural features, including the ocean" (City of Malibu 2002).

Site LEPS is located along Encinal Canyon Road, although the site is not currently visible from the road. Site PWT is located along Kanan-Dume Road within the City of Malibu. The site is just below a sparsely vegetated, undeveloped ridgeline that obscures views of the site from this road when approached from the north.

Santa Monica Mountains North Plan Scenic Routes

The Santa Monica Mountains North Plan identifies certain roads as "routes with scenic qualities" (County of Los Angeles 2000). Project Site ENT is located adjacent to Old Topanga Canyon Road, which is a scenic route identified in the Plan.

Santa Monica Mountains Scenic Routes

The Santa Monica Mountains Local Coastal Program (LCP) Land Use Plan designates certain roads as scenic routes (County of Los Angeles 2014b). Project sites located adjacent to scenic routes as designated under this plan are:

- ENC1: Encinal Canyon Road
- H-69B: Saddle Peak Road
- LACF072: Decker Canyon Road
- LACFCP08: Rambla Pacifico Street
- TOP: Saddle Peak Road

Pacific Crest Trail

The Pacific Crest Trail (PCT), one of the country's first National Scenic Trails, spans 2,650 miles from Mexico to Canada through California, Oregon, and Washington and traverses the ANF generally from northwest to the southeast. Thousands of hikers and equestrians use this trail each year. Some travel only a few miles, while others complete every mile in a single season. The Pacific Crest Trail Association (PCTA) strives to protect the trail experience, which includes "wild scenery of the highest caliber and integrity," "refuge from industrialized civilization and its sights," and "therapeutic effects of elevated 'crest' views and naturally open landscapes." The desired condition described in the PCTA 2014-2017 Strategic Plan states, "Public lands within the Foreground Trail Corridor, including lands acquired and managed for the PCT, are managed to maximize a natural appearing landscape where human development does not dominate the viewer's experience..." (PCTA 2013). Sites GMT and FRP are in proximity to the trail.

Backbone Trail

The Backbone Trail is a Santa Monica Mountains ridgeline trail that follows ridges, traverses chaparral-covered hillsides, enters oak woodlands, and crosses creeks and valleys in the SMMNRA. Trail development has occurred piecemeal across a patchwork of public lands; therefore, the trail has different names in some sections, and not all sections are open to all users. When the trail is finished, it will extend more than 65 miles (NPS 2012). At least 43 miles have been completed. The NPS has identified a long-term goal of managing the Backbone Trail as a scenic corridor (NPS 2002). Sites CPK, SPN, and TOP are located in proximity to the trail.

Trans-Catalina Trail

Although it has no official scenic designation, the 37-mile Trans-Catalina trail, completed in 2009, traverses Catalina Island in its entirety and offers "spectacular views across the 43,000-acre Nature Preserve of the Catalina Island Conservancy" (Catalina Island Conservancy 2014). Sites BJM, DPK, and TWR are adjacent to this trail.

3.1.1.4 State and Regional Parks, Open Space, and Recreation Areas

Topanga State Park

Located in the Santa Monica Mountains, Topanga State Park provides 36 miles of trails through open grassland and live oaks and "spectacular" views of the Pacific Ocean. The park is considered the world's largest wildland within the boundaries of a major city. The park is bound on the south by Pacific Palisades and Brentwood, on the west by Topanga Canyon, and on the east by Rustic Canyon. Numerous geologic formations occur in the park, including earthquake faults, marine fossils, volcanic intrusions, and a wide variety of sedimentary formations (California DPR 2011).

Site GRM is located within this park on the Temescal Ridge Trail, as defined in the park's general plan. It is also south of the park's Temescal Lookout. Site TOP is immediately adjacent to the west end of the

park above Saddle Peak Road, which provides access to the park. The site is also adjacent to the park's Fossil Ridge Trail (California DPR 2011). Sensitive viewers include park recreationists and tourists.

Malibu Creek State Park

Malibu Creek State Park has been referred to as the “Yosemite of Los Angeles.” The 7,553-acre park is owned and operated by the California DPR and is bordered and buffered from developed land by other government-owned property. The park is located in the SMMNRA, described above. The Santa Monica Mountains connect this park to other parks and open space areas through a series of trail systems (California DPR 2003).

Site SPN is south of and overlooks Malibu Creek State Park. The Backbone Trail traverses this part of the park from east to west. Site SPN is intermittently visible to park visitors hiking this trail. No other recreational facilities exist in this area of the park.

Santa Monica State Beach

Santa Monica State Beach is 3 miles long, covering 245 acres of sand along Santa Monica Bay. The beach includes broad stretches of sand, bike and walking paths, and views of the Santa Monica Mountains. Santa Monica State Beach is managed by the City of Santa Monica in cooperation with California State Parks. Sensitive viewers include beachgoers, recreationists, and tourists. Site WS1 is located directly across from this beach, separated by Ocean Avenue and PCH.

Santa Monica Mountains Conservancy Lands

The SMMC was established to purchase, preserve, protect, restore, and enhance “treasured pieces of Southern California to form an interlinking system of urban, rural and river parks, open space, trails, and wildlife habitats that are easily accessible to the general public.” The SMMC preserves parkland in both wilderness and urban settings, including more than 114 public recreational facilities throughout southern California (SMMC 2014). Some of the affected SMMC lands are discussed in the SMMNRA, above. Additional lands described below may be affected by the project.

- **Hellman Park and Sycamore Canyon Open Space.** Hellman Park is located in Whittier’s Puente Hills. According to the 2014 *Los Angeles County General Plan Update EIR*, the Puente Hills play a major role in physically defining the topographically and aesthetically diverse communities of this area. These landforms create dramatic backdrops against developed communities and provide extensive benefits to residents (County of Los Angeles 2014a). Hellman Park offers trails into “some of the most beautiful habitat in the area.” A loop trail climbs the ridgeline overlooking Sycamore Canyon, providing “a beautiful view.” The trail follows a large collection of California brittlebush (*Encilia farinosa*), a sunflower family member with large yellow flowers in the spring. On a clear day Catalina Island and downtown Los Angeles are observable (SMMC 2014). Site H-17A is located on a ridgetop along Rattlesnake Ridge Trail in Hellman Park. The site would be visible from Rattlesnake Ridge Trail and Hellman Park Trail to the southeast, as well as from Sycamore Canyon Open Space to the north.

- **Wildwood Canyon Park.** Wildwood Canyon Park is located in Burbank on the south side of the Verdugo Mountains. The Verdugo Mountainway is an extensive trail system that extends from the Sun Valley area south to Glendale's Brand Park and to the northeast leading to Tujunga and La Crescenta. The trails and fire roads lead to "spectacular" views of the San Fernando Valley (SMMC 2014). Site VPK is located on the Verdugo Mountainway on a hilltop in an undeveloped area. The site would be viewed by park visitors using the trails.

Hilltop and Sunset View Parks.

Hilltop and Sunset View are two small parks located near Site SGH in Signal Hill. Hilltop Park is a circular-shaped park located to the west of the site. It includes covered picnic tables, a lawn, and rows of broadleaf and deciduous trees planted in a semi-circle around a circular concrete path. This park also provides broad, distant views to the south. Sunset View Park is south of the site and provides views of the distant horizon to the south. This elongated park parallels a road and consists of low grasses and shrubs, concrete benches, and a concrete path.

3.1.1.5 Historic Districts and Landmarks

City of Pasadena Historic District

Site PASPD01 is located on a vacant lot within the City of Pasadena's historic Civic Center District. This historic district is roughly bounded by Walnut and Green streets to the north and south, and Raymond and Euclid avenues to the west and east. The district is a "nationally significant example of civic art in the 'City Beautiful' style of the 1920s" (NPS 1980). The centerpieces are the Pasadena City Hall, which is fronted by a large, open plaza; Pasadena Public Library; and Pasadena Civic Auditorium. The district is dominated by its 1925 Beaux Arts-style City Hall and other "magnificent 1920s and 1930s buildings of the civic center" (Los Angeles Conservancy 2013).

The Civic Center area is distinct from surrounding neighborhoods both in architectural style and feeling and is less commercial and more park-like. It is a "carefully planned architectural entity" and a "unique collection of buildings and sites whose greatest value and impact arise from the fact that they relate to each other and the environment in a special way" (NPS 1980). The streets are wide and lined with trees, some paved with tile and brick set in decorative patterns. Small parks abound and are planted with trees and flowers (NPS 1980).

Several other buildings located within the historic district, including the Pasadena Public Library and First Baptist Church, incorporate similar design styles. The key buildings were designed in a homogenous style by nationally recognized architects. The site is directly south of the Pasadena Police Department, which was designed to be sensitive to the historic surroundings. The police department building has a 50-foot-high tower with exaggerated scrolled buttress supports. The beige stucco walls, arched windows, and terra cotta tile roof were meant to echo the 1920s-era themes of the civic center. The property is landscaped with a giant sycamore tree and drought-resistant plants (Los Angeles Conservancy 2013).

Newer structures show “an abandonment of architectural standards” that are out of keeping with the Civic Center as a whole (NPS 1980). One such structure is a five-level parking garage directly north of Site PASPD01 and west of the Police Department.

3.1.1.6 Significant Ridgelines

The County of Los Angeles designated significant ridgelines in two planning documents. One is the 2014 Los Angeles County General Plan; the other is the Los Angeles County Santa Monica Mountains North Area Plan. As defined by the Los Angeles County General Plan, a significant ridgeline possesses the following characteristics (County of Los Angeles 2014a):

- Topographic complexity
- Uniqueness of character and location
- Presence of cultural or historical landmarks
- Visual dominance on the skyline or viewshed, such as the height and elevation of a ridgeline
- Environmental significance to natural ecosystems, parks, and trail systems

Los Angeles County has also identified an implementation program to “prepare a Scenic Resources Ordinance that creates a scenic corridor, scenic viewshed, and significant ridgeline program and/or ordinance to protect remaining scenic resources” (County of Los Angeles 2014a). Sites H-69B, LACFCP08, SPN, and TOP are all located on ridgelines designated as “significant” by Los Angeles County in its 2014 General Plan.

The Santa Monica Mountains North Area Plan (2000) includes a directive to “preserve the area's hillside backdrop in its present state to the extent feasible, and control the design of development on ridgelines so that it will not interfere with significant views” (County of Los Angeles 2000). Site ENT is located on a significant ridgeline, according to the County of Los Angeles map for the area (County of Los Angeles 2004).

Site CPK is immediately adjacent to the NPS Castro Crest unit within the SMMNRA, which is a prominent ridgeline that forms part of the Backbone Trail corridor, with “stunning rock formations and views of the ocean and mountains” (NPS 2002).

Photographs of existing conditions at proposed Project sites are included in the site summary forms in Chapter 4.

3.1.2 Regulatory Setting

3.1.2.1 Federal Regulatory Setting

National Forest Management Act

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable

land management plans (LMPs). The ANF LMP includes guidance emphasizing the maintenance of scenic integrity objectives, restoring landscapes to reduce visual effects of nonconforming features, and maintaining the character of key places to preserve their intact nature and valued attributes (USFS 2005a).

National Park Service Land Protection Plan

The 1916 Organic Act established the National Park Service “to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations.” The NPS has not developed visual policies or formal guidance for managing visual resources on park lands; however, NPS units prepare General Management Plans (GMPs) to set long-term goals for individual park units that clearly define conditions to be achieved and maintained over time and the conditions necessary for visitors to enjoy the park’s significant resources (NPS 2006). Relevant information from the SMMNRA’s GMP is included under Scenic Corridors, above.

As mentioned under SMMNRA, above, the Land Protection Plan (LPP) established conservation criteria, including protection of regional scenic values. The plan notes “scenic resources abound in the Santa Monica Mountains and the desire to preserve them was one of the reasons the national recreation area was established” (NPS 1998).

3.1.2.2 State Regulatory Setting

California Scenic Highway Program

In 1963 the California Legislature created the Scenic Highway Program to protect scenic highway corridors from changes that would diminish the aesthetic value of lands adjacent to the highways. The state regulations and guidelines governing the Scenic Highway Program are found in the Streets and Highways Code, Section 260 et seq. A highway may be designated as “scenic” depending on how much of the natural landscape can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes upon the travelers’ enjoyment of the view.

Coastal Act

California participates in the federal Coastal Zone Management Program established under the Coastal Zone Management Act of 1972. Regarding protection of visual resources, Section 30251 of the Coastal Act states:

The scenic and visual qualities of coastal areas shall be considered and protected as a resource of public importance. Permitted development shall be sited and designed to protect views to and along the ocean and scenic coastal areas, to minimize the alteration of natural land forms, to be visually compatible with the character of surrounding areas, and, where feasible, to restore and enhance visual quality in visually degraded areas. New development in highly scenic areas such as those designated in the California Coastline Preservation and Recreation Plan prepared by the Department of

Parks and Recreation and by local government shall be subordinate to the character of its setting.

The act encourages coastal states to develop and implement coastal zone management plans. The California Coastal Act (CCA) of 1976 (PRC 30000 et seq.) requires each city or county within the state's "coastal zone"⁵ to prepare an LCP for certification by the California Coastal Commission (CCC). LCPs contain the ground rules for future development and protection of coastal resources. LCPs specify appropriate location, type, and scale of new or changed uses of land and water. Each LCP includes a land use plan and measures to implement the plan (such as zoning ordinances) (CCC 2012). Once an LCP has been certified, a local government may issue coastal development permits. In the absence of a specific city or county LCP, coastal development permits are issued by the CCC. Coastal development permits issued by local governments are subject to appeal to the Coastal Commission (California Natural Resources Agency 1998).

3.1.2.3 Local Regulatory Setting

Local Coastal Programs

City of Malibu

Development within the City of Malibu is regulated by the certified LCP and Land Use Plan adopted by the city in 2002. Chapter 6 of Malibu's Land Use Plan addresses scenic and visual resources and incorporates Section 30251 of the Coastal Act, as described under State Regulatory Setting, above. Malibu's Land Use Plan states, "Places on and along public roads, trails, parklands, and beaches that offer scenic vistas are considered public viewing areas. Existing public roads where there are views of the ocean and other scenic areas are considered Scenic Roads." Scenic Roads in the proposed Project area, as defined by the City of Malibu, include PCH, Kanan-Dume Road, and Encinal Canyon Road (City of Malibu 2002).

Malibu's LCP limits the height of new structures to 18 feet or 28 feet on beachfront lots. Structures must be set below prominent and other intervening ridgelines that are visible from public areas; if not avoidable, structures are limited to 18 feet. Blufftop development must incorporate a setback from the edge of the bluff that avoids and minimizes visual impacts from the beach and ocean below (City of Malibu 2002). Additional restrictions developed by the city pertaining to PCH are described below.

Unincorporated Los Angeles County within Santa Monica Mountains NRA

Development of the coastal zone in the SMMNRA within unincorporated Los Angeles County is regulated by the Santa Monica Mountains Land Use Plan and LCP adopted by the county in 2014. The plan includes the following elements (County of Los Angeles 2014a):

⁵ Coastal zone is defined by the California Coastal Act as an area extending from the shoreline inland 1,000 yards from the mean high tide. In significant coastal estuarine, habitat, and recreational areas, it extends inland to the first major ridgeline paralleling the sea or five miles from the mean high tide line of the sea, whichever is less, and in developed urban areas the zone generally extends inland less than 1,000 yards.

- Limit the visual and safety impacts of wireless telecommunications facilities to preserve the character and aesthetics of surrounding areas, through careful design, screening, and mitigation requirements. Encourage undergrounding of accessory equipment, co-locating, and clustering wireless telecommunication facilities and structures, wherever possible, to help avert unnecessary proliferation of such facilities (Policy LU-52).
- Communication processing, storage and transmission facilities and lines shall be sited, designed, and operated to avoid or minimize impacts to...scenic resources.... If no feasible alternative can eliminate all impacts, then the alternative that would result in the fewest or least-significant impacts shall be selected (Policy LU-53).
- All facilities and related support structures shall be sited, designed, and operated to avoid when possible the visibility of the facility from public viewing areas, and to preserve the character of surrounding areas by protecting ridgelines by setting facilities below the ridge, and co-locating facilities, where feasible, to avoid proliferation of facilities (Policy LU-54).
- Limit structure heights to ensure protection of scenic resources and compatibility with surrounding settings (Policy LU-38).
- The height of structures shall be limited to minimize impacts to scenic resources (Policy CO-110).
- Site and design new development to minimize adverse impacts on scenic resources to the maximum extent feasible. If there is no feasible building site location on the proposed project site where development would not be visible, then the development shall be sited and designed to minimize impacts on scenic areas through measures that may include, but not be limited to, siting development in the least visible portion of the site, breaking up the mass of new structures, designing structures to blend into the natural hillside setting, restricting the building maximum size, reducing maximum height, clustering development, minimizing grading, incorporating landscape and building material screening elements, and where appropriate, berming (Policy CO-131).
- Avoidance of impacts to scenic resources through site selection and design alternatives is the preferred method over landscape or building material screening. Landscape or building material screening shall not substitute for project alternatives including re-siting or reducing the height or bulk of structures (Policy CO-132).
- Prohibit development on designated Significant Ridgelines and require that structures be located sufficiently below such Ridgelines so as to preserve unobstructed views of a natural skyline. All ridgelines other than Significant Ridgelines that are visible from a Scenic Route, public parkland, public trails, or a beach shall be protecting by siting new development below the ridgeline to avoid intrusions into the skyline where feasible. Where there is no feasible alternative building site...structures shall be limited to one story (18 feet maximum from existing or finished grade, whichever is lower) to minimize visual impacts and preserve the quality of the scenic area (Policy CO-136).

- Maintain dark skies in the Coastal Zone by reducing light pollution and requiring best available Dark Skies technology in all permitted lighting and compliance with Dark Skies principals and best practices to the maximum extent feasible (Policy CO-142).
- Require wireless telecommunication facilities to be designed and sited in such a manner that they minimize impacts to visual resources and blend into the landscape. Such facilities shall be co-located where feasible. This may include requiring one taller pole rather than allow multiple shorter poles. New wireless telecommunication facilities may be disguised as trees of a species that would likely be found in the surrounding area and that blend with the natural landscape when it is not feasible to co-locate on an existing pole (Policy CO-152).

City of Los Angeles

One proposed site – Site GRM – is located within the coastal zone of the City of Los Angeles, in the Pacific Palisades area. The City does not have an approved LCP for the Pacific Palisades area. Therefore, this area is regulated by applicable zoning or municipal codes or uncertified coastal plans. The 2001 Brentwood/Pacific Palisades Community Plan notes a “need to protect environmentally sensitive areas, scenic views and scenic corridors.” The plan includes a policy that states, “the scenic value of natural land forms should be preserved, enhanced and restored. Wherever feasible, development should be integrated with and be visually subordinate to natural features and terrain. Structures should be located to minimize intrusion into scenic open spaces by being clustered near other natural and manmade features such as tree masses, rock outcrops and existing structures.” The plan also includes a goal for “preservation of the scenic and visual quality of coastal areas.” This goal includes a policy to site and design permitted development “to protect views to the ocean and scenic coastal areas, to minimize the alteration of natural land forms, to be visually compatible with the character of surrounding areas, and, where feasible, to restore and enhance visual quality in the visually degraded areas” (City of Los Angeles 2001).

City of Santa Monica

Development in the City of Santa Monica within the coastal zone is regulated by the city’s 1992 LCP; however, this LCP has not been certified by the CCC (City of Santa Monica 1992; CCC 2013). The site is in the city’s Ocean Avenue and Palisades Park Coastal Zone Sub-Area. Public views to, from, and along the ocean are protected by the LCP. Development must be visually compatible with the character of the surrounding area and must restore and enhance visual quality in visually degraded areas and protect public views to the coast. The city has established a height limit for development along Ocean Avenue and requires that views be protected by setbacks and view corridors. Height limits vary by density and range from 40 to 45 feet (City of Santa Monica 1992).

Santa Catalina Island

The Santa Catalina Island LCP was approved by the Los Angeles County Board of Supervisors on March 15, 1983, and was certified by the California Coastal Commission on November 17, 1983. Utilities

are allowed if the placement of such facilities is consistent with the policies of the LCP. Relevant plan policies and recommended actions include (County of Los Angeles 1983a, 1983b):

- The entire island as a whole is considered an important scenic resource.
- Views of ridgelines from water are a priority for viewshed protection.
- Limit new development in scope and carefully design it to be compatible with the unique character of the Island.
- Relate new development to the natural character of the Island by limiting building heights, specifying types of building materials and sensitively reviewing designs and landscaping materials.
- New development...shall be attractively designed to protect highly scenic natural or historical areas. Views of the shoreline, both from the land and water, should also be protected.
- Priority shall be assigned to protection of the land/water interface, ridgelines, distinctive geologic features, native trees and vegetation, natural streams and riparian habitats.
- Plant materials shall be used to integrate the manmade and natural environments, to screen or soften visual impacts of new developments and to provide diversity within developed areas. Native vegetation shall be favored in Easement areas while introduced vegetation from similar climates, such as palm trees and eucalyptus, shall be permitted in the more “urban” environments (e.g., Avalon Canyon, Two Harbors).
- Discourage siting of facilities such as communications facilities in high-visibility locations.

Los Angeles County General Plan Update Environmental Impact Report

The *Los Angeles County 2014 General Plan EIR* includes an ordinance for Hillside Management Areas (HMAs). HMAs were established to ensure that development preserves the physical character and scenic value of areas with a natural slope of greater than 25 percent. “Development” includes construction or expansion of any infrastructure; grading, such as cut, fill, or combination, including off-site grading; and removal of any vegetation. In order to accomplish this, provisions relating to HMAs encourage protecting scenic hillside views and conserving natural hillside character (County of Los Angeles 2014a). Project sites may occur in areas of steep terrain, but the sites themselves are relatively flat (natural slopes of less than 25 percent) and most have been previously developed.

The Los Angeles County Significant Ecological Areas (SEAs) Ordinance regulates areas representing a wide range of biotic communities through the use of environmentally sensitive development standards and designs (County of Los Angeles 2014c). According to the *Los Angeles County 2014 General Plan EIR*, SEA’s “complex ecological relationships are the subject of both aesthetic enjoyment as well as scientific study” (County of Los Angeles 2014a). The ordinance includes guidelines for landscaping, outdoor lighting, fencing, and brush clearance (County of Los Angeles 2014c). Because the focus of SEAs is on

biological communities, SEAs are further discussed in the Biological Resources section. Adhering to this ordinance through the required permitting process will also address visual impacts.

Pacific Coast Highway

As mentioned above, the section of PCH within the SMMNRA is also eligible for the State Scenic Highway System designation (NPS 2002). When a city or county nominates an eligible scenic highway for official designation, it must preserve the scenic quality of the corridor by adopting ordinances, zoning and/or planning policies in a Corridor Protection Program. Such programs protect the scenic corridor from encroachment of incompatible land uses; mitigate activities within the corridor that detract from its scenic quality by proper siting, landscaping, or screening; make development more compatible with the environment and in harmony with the surroundings; and preserve views of hillsides by minimizing development on steep slopes and along ridgelines (Caltrans 2014). The City of Malibu's LCP Land Use Plan (City of Malibu 2002) identifies protections for PCH, specifically stating:

- The Pacific Coast Highway corridor shall be protected as a scenic highway and significant viewshed.
- Any telecommunications facilities approved along Pacific Coast Highway shall place support facilities underground, where feasible.

3.1.3 Significance Criteria

The proposed Project would result in significant impact to aesthetics if any of the following significance criteria, based on Appendix G of the CEQA Guidelines, are met:

- 1) Would the project have a substantial adverse effect on a scenic vista?
- 2) Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?
- 3) Would the project substantially degrade the existing visual character or quality of the site and its surroundings?
- 4) Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

3.1.4 Impact Analysis

The following methodology was used to identify existing visual resources and to determine the significance of visual impacts that may result from this project:

- 1) Identify the existing visual resources within 0.25 mile of proposed project sites. Visual resources can be described in terms of their visual character. Visual character is an impartial description of what the landscape consists of and is defined by the relationships between the existing visible natural and built landscape features. These relationships are considered in terms of dominance, scale, diversity, and continuity. Physical resources and features that define visual character include landform types; vegetation types; land uses; height, bulk, scale, and architectural detail of associated buildings and ancillary site uses; overhead utility structures and lighting; open

space (e.g., parks, reserves, greenbelts, and undeveloped land); significant viewpoints and scenic views (e.g., views of waterbodies, mountains, historic structures, and downtown skylines); apparent “grain” or texture (e.g., density of development as well as size and distribution of structures and vacant properties or open spaces); and apparent upkeep and maintenance.

- 2) Assess the sensitivity of existing visual resources. This is influenced by whether the visual resource is common or rare within the study area; whether it is considered to be of local, regional, national, or global importance; the quality of the resource; public awareness and tolerance of adverse change; and the ability of the resource to accommodate change. The sensitivity of each visual resource is classified as:
 - High: Important scenic vista or resource of particularly distinctive character or high quality, sensitive to relatively small changes
 - Medium: Scenic vista or resource of moderately valued character or quality, reasonably tolerant to change
 - Low: Scenic vista or resource of a relatively unimportant character or low quality which is largely tolerant to change
- 3) Determine level of change to visual resources as follows:
 - a. Would there be a change to a scenic vista (for purposes of this study, a scenic vista is viewpoint that provides expansive views of a highly valued landscape for the benefit of the general public):
 - i. Does the location meet the definition of a scenic vista?
 1. Is the project located in the scenic view of a local/state/federal-designated scenic vista (e.g., significant ridgeline)?
 2. Is there compelling evidence to show that the view is designated/valued by the local community?
 3. Will the project eliminate or block views of valuable visual resources?
 - b. Would the change to a scenic vista
 - i. perceptibly change existing features of the physical environment so that they no longer appear to be characteristic of the scenic vista?
 - ii. introduce new features to the physical environment that are perceptibly uncharacteristic of the scenic vista?
 - iii. partially or totally block or removes views of the scenic vista?
 - c. Would the change to scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway:
 - i. cause the partial or full removal of a scenic resource?
 - ii. perceptibly change the existing features of a scenic resource so that its visual quality appears degraded?
 - iii. introduce new features to the physical environment that are perceptibly uncharacteristic of a scenic resource?

- a. Would the change to the existing visual character or quality of the site and its surroundings:
 - iv. perceptibly change existing features of the physical environment so that the visual character or quality of the site and its surroundings appear degraded?
 - v. introduce new features to the physical environment that appear incompatible with the site and its surroundings or would contrast noticeably and unfavorably with them?
 - d. Would the change affect day or nighttime views in the study area by introducing new sources of light or glare to the physical environment that:
 - i. perceptibly degrade views in the area?
 - ii. distract from views in the area?
- 4) Determine whether the impact is significant or less than significant. A significant impact would occur if the project would:
- a. have a substantial adverse effect on a scenic vista
 - b. substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway
 - c. substantially degrade the existing visual character or quality of the site and its surroundings
 - d. create a new source of substantial light or glare which would adversely affect day or nighttime views in the area
- 5) Identify feasible mitigation measures to reduce or avoid significant impacts
- 6) Identify the significance of visual resource impacts after mitigation measures

3.1.4.1 Project Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

The following Project sites are located within an area that would be considered a scenic vista:

BJM	BUR	BUR1	BUR2	BUR3
CPK	DPK	ENC1	ENT	FRP
GMT	GRM	H-69B	JOP	JPK
JPK2	LACF072	LACFCP08	LACFCP09	LACFCP11
LEPS	LPC	MMC	MML	MTL2
OAT	PHN	PMT	PWT	SPN
SUN	SUN2	TMT	TOP	TPK
TWR	VPK	WMP	WS1	WTR
ZHQ				

Construction Impacts

Construction impacts would generally be related to construction of the new tower and equipment. Construction activities at individual sites would generally occur over an approximately six-week period and involve a variety of equipment, possibly involving 4-wheel drive trucks making daily trips to and from the site. Some sites will require the use of temporary construction staging areas where construction materials are stored and accessed during construction. The construction activities, construction staging areas, and dust generated by worker and materials transport would temporarily affect the viewshed; however, all construction activities and staging areas are considered temporary and would not result in substantial adverse impacts to any scenic vista. Construction impacts on scenic vistas would be less than significant.

Mitigation Measures

No mitigation measures required.

Operation Impacts

The following proposed Project sites located in areas identified as a scenic vista would include a new monopole or lattice tower collocated on a site with existing monopoles or lattice structures:

BJM	BUR	BUR1	BUR2	BUR3
CPK	DPK	FRP	GMT	GRM
JPK	JPK2	LACFCP09	LPC	MMC
MML	MTL2	OAT	PHN	PMT
SPN	SUN	SUN2	TMT	TOP
TPK	TWR	VPK	WMP	WTR
ZHQ				

When evaluating the significance of a visual change, views of all proposed sites within an approximate 0.25-mile radius were evaluated. For proposed sites with existing towers, if the existing tower is visible within a 0.25-mile radius, the proposed tower was assumed to also be visible and added to the existing visual intrusion, and not blocking or removing the view. This is because existing and proposed facilities are not large, wide structures, such as bridges or buildings that would block or remove views. Rather, they consist of slender towers or see-through lattice structures with various antenna configurations. Therefore, while they create a visual intrusion, they allow viewers to see beyond them and, as such, are not considered to block or remove views. If the existing tower could not be viewed within a 0.25-mile radius, and the proposed tower could be visible, the new tower was considered an added visual intrusion to the view, but not blocking or removing the view for reasons explained previously. Each site's visual setting was a key consideration in the assessment. This included consideration of elements such as linear man-made visual elements in urban areas, more natural vegetation and landforms with less human disturbance in more rural or remote areas, scenic vistas, or proximity to scenic highways. This analysis is reflected in the determinations of significance discussed below. Heights of existing and proposed structures are provided in Chapter 4.

Operational impacts for these sites would primarily result from the installation of monopoles of varying heights along with varying numbers of whip and microwave antennas. Other impacts would include one-story shelters, generators, and fuel tanks, if needed. Many of the sites already have monopoles and/or lattice structures, which create a visual intrusion onto the landscape. The placement of the new facilities generally would not perceptibly change the scenic vista due to the presence of the existing tower(s), which would attenuate the noticeability of the new structure(s). Locating the new tower(s) and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because the sites contain existing lattice towers or monopoles, the presence of a new lattice tower or monopole would not perceptibly change existing features and would not introduce new features that are perceptibly uncharacteristic of the existing scenic vista. In most cases, because the location is on a ridgetop, the new facilities would be added to the scenic vista but would not block or remove views of the scenic vista. Some of the new facilities (SUN, SUN2, and TMT) are located in areas at a lower elevation than the surrounding hillsides and are therefore obscure by surrounding topography. Views of other sites are obscured or intermittently blocked from view by road cuts and tall vegetation. These conditions minimize the sites' visual impact. For all the reasons discussed above, no substantial impacts to scenic vistas would occur; and impacts on scenic vistas would be less than significant for sites list in the above list.

The following Project sites that are located in an area identified as a scenic vista include a new monopole or lattice tower that is not collocated with other telecommunications structures:

ENC1	ENT	H-69B	JOP	LACF072
LACFCP08	LACFCP11	LEPS	PWT	

Operational impacts at Site ENC1 would include installation of a new 180-foot lattice tower, including microwave and whip antennas, an equipment shelter, and generator. Because the site is located in a low area surrounded by hills, including high earthen embankments and tall vegetation that would obscure views of the new tower, no substantial impacts to scenic vistas would occur at Site ENC1; and impacts on scenic vistas would be less than significant.

Site ENT operational impacts include installation of a new 70-foot monopole mounted with whip and microwave antennas, an equipment shelter, and generator. Although not collocated with other towers, it would be installed adjacent to existing water tanks which, given their mass, would help attenuate the presence of the new structure. Collocating the new tower(s) and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. The new facilities would be lower than hikers travelling east on the Calabaras Peak Motorway and of similar height to existing vegetation and therefore would not block or remove views of the scenic vista. For these reasons, no substantial impacts to scenic vistas would occur, and impacts on scenic vistas would be less than significant.

Operational impacts at Site H-69B would include installation of a new 180-foot undisguised lattice tower, including whip and microwave antennas, an equipment shelter, and generator. The facilities would be placed in a location with no existing structures. The new facilities would intrude upon views of the Pacific Ocean from vantage points to the north, including the significant ridgeline upon which the site would be located. Because no structure currently exists on the site, and because the site is located on a designated significant ridgeline and is adjacent to a scenic route, a substantial impact to scenic vistas would occur, resulting in a significant impact.

Site JOP includes installation of a new 180-foot lattice tower mounted with whip and microwave antennas, an equipment shelter, and generator. Existing solar panels at the site would be replaced with larger panels. The new facilities would be located in an area with no existing tall structures. Given the height of Josephine Peak in relation to the surrounding national forest, the new structure would intrude upon scenic vistas in the area. Because the new lattice tower would introduce a new vertical intrusion onto the landscape, a substantial impact to scenic vistas would occur, resulting in a significant impact.

Operational impacts at Site LACF072 include installation of a new 70-foot monopole, mounted with microwave and whip antennas, an equipment shelter, generator, and chain link fence surrounding the site. The new facilities would be constructed along the eastern boundary of the fire station property in an undeveloped moderately wooded area on a low hill. The height of the new monopole would be similar to the surrounding trees and would also be elevated above Decker Canyon Road on a hill that is obscured from view by cut banks. Although the monopole would include antennas and be wider than the telephone poles that line the road and the flagpole at the fire station, the monopole would be similar in height to those existing visual intrusions. As a result, given the stature of the new monopole and its location in the landscape, the site would not interfere with scenic vistas in the SMMNRA. For these reasons, no substantial impacts to scenic vistas would occur; and impacts on scenic vistas would be less than significant.

Site LACFCP08 operational impacts include installation of a new 70-foot monopole with microwave and whip antennas attached, an equipment shelter, and generator. The new facilities would be located within a site that has already been highly disturbed but is not easily visible from the scenic route or other readily accessible viewpoints due to highly varying topography, road curves, and the presence of trees and mature landscaping. The new facilities would not block or remove views, given the degree to which the site is currently obscured by topography and vegetation. In addition, the relatively low height and narrow girth of the monopole would not be sufficient to cause a substantial impact on scenic vistas; and impacts on scenic vistas would be less than significant.

Operational impacts at Site LACFCP11 include installation of a new 70-foot monopole with whip antennas attached, an equipment shelter, and generator. The hilltop with the site is lower than surrounding peaks and ridgelines. Both the new equipment shelter and monopole would be located in a previously cleared area beside the existing 20-foot tall water tank. The new facilities would be only intermittently visible from Soledad Canyon Road, where adjacent telephone poles present an existing human-made visual intrusion. The slender girth of the monopole and its location on a lower hilltop

beside an existing water tank would minimize impacts to scenic vistas, and the water tank would block views of the shelter from the road. Impacts on scenic vistas would be less than significant.

Site LEPS includes the installation of a new 70-foot tall monopole with microwave antennas attached, an equipment shelter, and generator. The new facilities would be located adjacent to a water tank, which is not visible from Encinal Canyon Road. The new facilities would be visible from certain view points in the area, particularly those north of the site toward the ocean; however, the greatly varying topography would obscure some views of the site. For views of the site that are not obscured by topography, the new facilities would create a new visual intrusion in the view but would not block or remove views of the scenic vista. The relatively low height and narrow girth of the structure would make it difficult to see from more distant viewing locations, and the facilities would be below the viewing plane in many instances. Therefore, no substantial impacts to scenic vistas would occur; and impacts on scenic vistas would be less than significant.

Operational impacts at Site PWT include installation of a new undisguised 28-foot monopole with whip antennas attached, an equipment shelter, and generator. The site is adjacent to an existing water tank, in a location occupied by a former water tank. The proposed monopole would be approximately the height of the existing water tank, and the perceptibility of the change to the scenic vista would be minimized. Additionally, the monopole would be at a lower elevation than the Ocean View Trail that curves around the site to the north, so the structure would be below the visual plane of ocean views from the trail. For these reasons, no substantial impacts to scenic vistas would occur; and impacts on scenic vistas would be less than significant.

The following Project site that is located in an area identified as a scenic vista includes roof mounted antennas:

WS1

Operational impacts at Site WS1 include placement of the antennas on the roof of an existing 320-foot-tall building. Due to the relatively short height of the antennas to be installed compared to the building, no substantial impacts to scenic vistas would occur; and impacts on scenic vistas would be less than significant.

Mitigation Measures

No mitigation measures could feasibly reduce the significant impacts of the proposed Project at Sites H-69B and JOP, as explained below.

Impacts after Mitigation

Significant impacts have been identified at sites H-69B and JOP. The only potential measure to mitigate impacts at these sites is painting the towers to blend with their visual settings, but this measure is infeasible because FAA guidelines (FAA Advisory Circular 70/7460-1L) require certain paint colors to be used on towers for aviation safety purposes. Additionally, the visual impact of the towers would remain

significant if they were painted to blend with the site’s visual setting. As such, no feasible mitigation measures exist to reduce the impacts to less than significant levels. Therefore, impacts are significant and unavoidable at sites H-69B and JOP.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

No scenic resources were identified within any Project site boundary. The following Project sites are located adjacent to scenic highways as discussed in Section 3.1.1.3:

ENC1	ENT	H-69B	JOP	LACF072
LACFCP08	LEPS	PWT	TMT	WS1
ZHQ				

Construction Impacts

Each of the proposed Project sites listed above is located in a highly disturbed area, including existing communication sites or in urban locations. Site PWT is located on an asphalt surface, and Site WS1 is located on a high-rise building. For the remaining sites listed above, minimal vegetation exists; and no rock outcroppings, historic buildings, or other scenic resources are present. Although some vegetation such as grasses or shrubs may be disturbed during construction, no elements considered scenic resources would be damaged.

For sites along scenic roads that are located within the coastal zone, which includes sites ENC1, H-69B, LACF072, LACFCP08, LEPS, PWT, WS1, and ZHQ, project construction would not alter natural forms, as required within the coastal zone. Any impacts to historic resources would be precluded during the Section 106 process (see Section 3.4).

No scenic resources would be damaged at any proposed Project site. Therefore, impacts to scenic resources would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Operational impacts would be as described under AES-1 (effects on a scenic vista). Operational impacts on scenic resources would be less than significant.

Mitigation Measures

No mitigation measures are required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impacts

The same construction activities described under AES-1 for scenic vistas and AES-2 for sites within a state scenic highway would apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. For building mount and existing lattice tower or monopole sites, existing antenna support structures would be used; and any additional equipment buildings or fencing that may be required would be consistent with the developed environment of the existing structures. Less than significant impacts would occur at the following sites, and no impacts would occur at the remaining sites.

AGH	AJT	BJM	BUR	BUR1
BUR2	BUR3	CPK	DPK	ENC1
ENT	FRP	FTP	GMT	GRM
H-17A	H-69B	JOP	JPK	JPK2
LACF072	LACFCP08	LACFCP09	LACFCP11	LEPS
LPC	MMC	MML	MTL2	OAT
PASPD01	PHN	PMT	PWT	SPN
SUN	SUN2	TMT	TOP	TPK
TWR	VPK	WAD	WMP	WTR
ZHQ				

Mitigation Measures

No mitigation measures are required.

Operation Impacts

As noted previously, visual impacts can result from the permanent installation, operation, and maintenance of proposed equipment for each site. Proposed equipment can include lattice towers and monopoles of varying heights (from up to 70 to 180 feet tall), microwave antennas, whip antennas, lightning rods, chain link fencing, generators and fuel tanks, and equipment shelters. For building mount and existing lattice tower or monopole sites, existing antenna support structures would be used. Any additional equipment buildings or fencing that may be required would be consistent with the developed environment of the existing structures. Methodology used to assess visual impacts is provided at the beginning of this section. As noted in the methodology, USFS scenic quality ratings and impact assessment methodologies were used for sites located on the agency's lands (see Table 3.1-1). The existing scenic quality ratings for those sites would not be downgraded based on the proposed Project.

The sites listed below would experience less than significant impacts, and sites H-69B, JOP, and PASPD01 would experience significant impacts. The remaining sites would experience no impacts.

AGH	AJT	BJM	BUR	BUR1
BUR2	BUR3	CPK	DPK	ENC1
ENT	FRP	FTP	GMT	GRM
H-17A	JPK	JPK2	LACF072	LACFCP08
LACFCP09	LACFCP11	LEPS	LPC	MMC
MML	MTL2	OAT	PHN	PMT
PWT	SPN	SUN	SUN2	TMT
TOP	TPK	TWR	VPK	WAD
WMP	WTR	ZHQ		

When evaluating the significance of a visual change, views of all proposed sites within an approximate 0.25-mile radius were evaluated. For proposed sites with existing towers, if the existing tower is visible within a 0.25-mile radius, the proposed tower was assumed to also be visible and added to the existing visual intrusion, and not blocking or removing the view. This is because existing and proposed facilities are not large, wide structures, such as bridges or buildings that block or remove views. Rather, they consist of slender towers or see-through lattice structures with various antenna configurations. Therefore, while they create a visual intrusion, they allow viewers to see beyond them and, as such, are not considered to block or remove views. If the existing tower could not be viewed within a 0.25-mile radius, and the proposed taller tower could be visible, the new tower was considered an added visual intrusion to the view, but not blocking or removing the view for reasons explained previously. Each site's visual setting was a key consideration in the assessment. This included consideration of elements such as linear man-made visual elements in urban areas, more natural vegetation and landforms with less human disturbance in more rural or remote areas, scenic vistas, or proximity to scenic highways. This analysis is reflected in the determinations of significance discussed below. Heights of existing and proposed structures are provided in Chapter 4.

Sites BUR, BUR1, BUR2, BUR3, FRP, GMT, JOP, JPK, JPK2, LACFCP09, LACFCP11, LPC, MML, MTL2, PMT, SUN, SUN2, TMT, WMP, and WTR are located on USFS land. The USFS has designated the existing scenic attractiveness for sites FRP and TMT as A, which is considered distinctive, and for the remaining sites as B, which is considered typical. All of these sites, except for Site JOP are already impacted by the presence of existing towers and/or buildings. Although the proposed use would be incompatible with the larger surrounding landscape, it would be consistent with the existing sites. Therefore, the proposed Project use would result in no change to the sites' USFS scenic attractiveness ratings. Although there are no existing towers at Site JOP, this site's scenic attractiveness of B would not change because the site would still be considered to have scenery typical of many other locations in the ANF. This was considered in the evaluation of impacts for each site, as summarized below.

At sites AGH and MMC, the existing visual character and quality of the site is low (assessed as a scenic vista or resource of relatively unimportant character or low quality due to existing site conditions, and which is largely tolerant to change); and its surroundings are impacted by the presence of existing telecommunications facilities. Although the monopole (Site AGH) and tower (Site MMC) and associated

equipment would contrast with and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing use and equipment on site. Impacts would be less than significant.

At site AJT, the existing visual character and quality of the site are low and are already affected by an existing tower. The addition of new antennas to the existing lattice tower would not noticeably alter the site's visual character or quality. Impacts would be less than significant.

Sites BJM, CPK, DPK, GRM, and SPN are within an area of high visual character and quality; however, the existing visual character and quality of these sites and their surroundings have already been degraded by the presence of existing telecommunications equipment and tower(s). Although the new lattice tower and associated equipment at each site would contrast and be incompatible with the visual character of the surrounding landscape, the proposed facilities would be compatible with the telecommunications equipment that already exists at these sites. Impacts would be less than significant.

Sites BUR, BUR1, BUR2, and BUR3 are located in the ANF, which has designated the existing scenic attractiveness for the sites as B, which is considered typical. The existing visual character and quality of the sites and their surroundings are impacted by the presence of existing towers. Although the proposed new lattice towers and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing sites, resulting in no change to each site's scenic attractiveness rating. Impacts would be less than significant.

The existing landscape at Site ENC1 is characterized by the large fire station compound that includes several buildings, driveways, and paved parking areas; however, much of this development is hidden from view due to its location below the roadway that bypasses the compound and the steep topography that surrounds it. Drivers traveling through the area would mostly view the hilly topography and tall evergreen trees. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing compound within which the structures would be located. Impacts would be less than significant.

The existing visual character and quality of Site ENT and its surroundings are already impacted by the presence of two large water tanks. Although the monopole would introduce another man-made feature onto the landscape in the long term, it would not be significantly out of character with the surrounding trees, which are of similar height. The new monopole would also be in character with the telephone poles that currently line the nearby road, as well as the area's semi-residential setting. Impacts would be less than significant.

Sites FRP and TMT have a USFS scenic integrity objective of high; and the SAC rating is A, or distinctive; however, the sites are also identified as a Developed Area zone. In such areas, the level of human use and infrastructure is typically higher than in other zones. This zone includes a number of highly popular developed recreation and non-recreation special-use facilities. This zone is the lowest designation for naturalness. The sites are already impacted by the presence of existing facilities and towers of a similar nature. The surrounding forest also has been developed through the addition of ski area(s). The new

facilities would be compatible with the existing sites and with the surrounding landscape to a lesser extent. Impacts would be less than significant.

The existing visual sensitivity of Site FTP is low. The site is not within a scenic vista, and its visual quality has been degraded by the presence of the existing towers on the site. Although the new tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing use and equipment on the site. Impacts would be less than significant.

Sites GMT, LPC, MTL2, and PMT are located in the ANF, which has designated the scenic attractiveness for these sites as B, which is considered typical. The level of human use and infrastructure in a USFS backcountry zone is typically low to moderate. The backcountry zone allows a range of compatible uses; the management intent is to retain the natural character inherent in this zone and limit the level and type of development. The existing visual character and quality of the sites and their surroundings are impacted by the presence of existing tower(s). Although the proposed new lattice tower (Sites GMT, MTL2, and PMT) or monopole (Site LPC) and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing sites, resulting in no change to each site's scenic attractiveness rating. Impacts would be less than significant.

Site H-17A is within an area of medium visual character and quality. Construction impacts would result from installation of the new tower and equipment, which would be uncharacteristic of the visual character if no structures were already present. However, the new facilities would be located within a site that includes existing towers that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change or noticeably or unfavorably contrast with the existing visual character or quality due to the presence of the existing towers, which would attenuate the noticeability of new structures. In addition, collocating the new tower and equipment with existing structures would concentrate the impacts so that a small area is altered, thereby minimizing impacts to visual character and quality. Impacts would be less than significant.

At site H-69B, the existing visual character and quality is low due to the size of the barren, disturbed area; however, the height of the new tower would contrast and be incompatible with the visual character of the surrounding landscape, which consists primarily of vegetated forests. Although some development, such as estate homes, exists, development is fairly sparse. The result would be a degradation of the visual character surrounding the site. Additionally, this site is along an adopted significant ridgeline within the Santa Monica Mountains LCP where new development is prohibited. Impacts would be significant.

Site JOP is located in the ANF, and the existing scenic attractiveness is designated B, which is considered typical. The proposed new tower would contrast and be incompatible with the visual character of the landscape, which is primarily forested. The result would be a degradation of the visual character surrounding the site. Because the mountaintop location does not currently contain existing towers, this represents a new vertical intrusion onto the landscape. The impacts would be significant.

Sites JPK and JPK2 are located in the ANF; and the existing scenic attractiveness is designated B, which is considered typical. The existing visual character and quality of the sites and their surroundings are impacted by the presence of existing communication sites and large lattice towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. Therefore, no change would occur to the designated scenic attractiveness rating. Impacts would be less than significant.

The existing visual character and quality of Site LACF072 and its surroundings are impacted by the presence of telephone poles and lines that parallel the road. The new monopole would be largely obscured by surrounding vegetation and topography, given the tower's 70-foot height. Therefore, the new facilities would be compatible with the visual character of the surrounding landscape. Impacts would be less than significant.

At Site LACFCP08, the existing visual character and quality is low given the extent of the previous disturbance and current use as a helicopter launch area. Although the monopole and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. In addition, this large disturbed area and the majority of the LACFCP08 facilities are not readily visible from area vantage points and would therefore not affect the area's visual character or quality, or the significance of the ridgeline. Impacts would be less than significant.

Site LACFCP09 is located in the ANF; and the existing scenic attractiveness for the site is designated B, which is considered typical. The new structures would be compatible with the existing site, which is a fire camp with associated facilities. The presence of helicopters also detracts from the existing visual character and quality. The low height of the new monopole would minimize impacts to the surrounding visual character, resulting in no change to the site's scenic attractiveness rating. Impacts would be less than significant.

Site LACFCP11 is located in the ANF; and the existing scenic attractiveness for the site is designated B, which is considered typical. The site is within an area identified as a Developed Area zone. In such areas, the level of human use and infrastructure is typically higher than in other zones. This zone includes a number of highly popular developed recreation facilities, and recreation and non-recreation special-uses facilities. This zone is the lowest designation for naturalness. The site is already impacted by the presence of a water tower and helicopters using the helipad. The new facilities would be compatible with the existing site and would not alter the area's visual character or quality, and no change would occur to the scenic attractiveness rating. Impacts would be less than significant.

The existing visual character and quality of sites LEPS and PWT and their surroundings have already been degraded by grading and the presence of a water tower at each site. The proposed new 70-foot monopole at Site LEPS and 28-foot monopoles at Site PWT, and associated equipment, would be compatible with the existing sites. Monopoles at these heights would blend into the surroundings. Impacts would be less than significant.

Site MML is located in the ANF; and the existing scenic attractiveness for the site is designated B, which is considered typical. The existing visual character and quality of the site and its surroundings have already been degraded by the presence of two lattice towers, shelters, and two water tanks. Although the new tower and associated equipment would contrast and be incompatible with the visual character of the larger area, they would be compatible with the existing site and immediate surrounding landscape, which has been modified for the Nike missile site. Impacts would be less than significant.

At Site OAT, the existing visual character and quality of the site and its surroundings have already been degraded by the presence of two lattice towers, as well as the numerous road cuts for the nearby oil rigs. The new tower and associated equipment would be compatible with the existing site and much of the surrounding landscape. Impacts would be less than significant.

Site PASPD01 is within the City of Pasadena's historic civic center area. The project includes a new 70-foot monopole with attached antennas, along with the associated equipment and equipment shelter. These elements would not be compatible with the civic center's distinctive Beaux Arts architectural style and feeling. The new structures would represent another "abandonment of architectural standards" that would not be consistent with the setting that led to formation of the historic district. Impacts would be significant.

The existing visual character and quality at sites PHN and TPK are low. The existing visual character and quality of the site and its surroundings have already been degraded by the presence of lattice towers (sites PHN and TPK), as well as the Nike missile site radio tower platforms (Site PHN only). The new tower and associated equipment would be compatible with the existing site and adjacent disturbed sites. Impacts would be less than significant.

Sites SUN and SUN2 are located in the ANF; and the existing scenic attractiveness for the site is designated B, which is considered typical. The existing visual character and quality of the sites and their surroundings has already been degraded by the presence of existing buildings and towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing sites. No change would occur to the site's scenic attractiveness rating. Impacts would be less than significant.

The existing visual character and quality at Site TOP is high; however, the existing visual character and quality of the site and its surroundings are impacted by the presence of the existing towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. No substantial change would occur to the visual character or quality of the significant ridgeline, SMMNRA, or Backbone Trail. Impacts would be less than significant.

At Site TWR, the existing visual character and quality of the site are high and are already affected by the existing tower. The new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, although they would be compatible with the existing site. Impacts would be less than significant.

At Site VPK, the existing visual character and quality of the site is medium; and its surroundings are impacted by the presence of existing towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site and its immediate surroundings. Impacts would be less than significant.

Site WAD involves extending the height of the existing tower and adding antennas and other equipment. The new facilities would be compatible with the existing visual character and quality, which is low, and is surrounded primarily by residences. Despite extending the height of the existing tower, the tall trees that currently surround the site and the varying topography of the area would continue to obscure most of the site from view. Impacts would be less than significant.

Sites WMP and WTR are located in the ANF; and the existing scenic attractiveness for the sites is designated B, which is considered typical. The visual character and quality of the sites and their surroundings are impacted by the presence of existing towers. Although the new lattice towers and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the visual character of the existing sites and their immediate surroundings. No change would occur to the site's scenic attractiveness rating. Impacts would be less than significant.

At Site ZHQ, the existing visual character and quality of the site is high; however, the existing visual character and quality of the site and its surroundings are impacted by the presence of existing monopoles. The new monopole and associated equipment would be compatible with the existing site and with the surrounding, predominantly built environment. Impacts would be less than significant.

Mitigation Measures

Significant impacts have been identified at sites H-69B, JOP, and PASPD01. A measure to reduce the significant visual impacts at Site PASPD01 has been identified under Cultural Resources, which is summarized below. No mitigation measures could feasibly reduce the significant impacts of the Project at sites H-69B or JOP, as explained below.

Impacts after Mitigation

Under Cultural Resources, implementation of CUL MM 5 (camouflage) would reduce significant visual impacts to less than significant with mitigation incorporated. This mitigation measure would also reduce significant visual and aesthetic impacts at this site to less than significant with mitigation incorporated. Refer to Section 3.4, Cultural Resources for more information. The only potential mitigation measure available for sites H-69B and JOP is to paint the new facilities to blend with the site's visual setting. This measure is infeasible. FAA guidelines (FAA Advisory Circular 70/7460-1L) require specific paint colors to be used on towers for aviation safety purposes. Additionally, the visual impact of the towers would remain significant if they were painted to blend with the site's visual setting. As such, no feasible mitigation measures were identified to reduce the impacts to less than significant levels. Therefore,

impacts are significant and unavoidable at sites H-69B and JOP. No mitigation measures are required at other proposed Project sites because impacts are less than significant.

AES-4: Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impacts

The same construction activities described in AES-1 for scenic vistas would apply to AES-4. With regard to light or glare impacts, temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. Construction would not result in the creation of a new source of substantial light or glare, and impacts at all proposed Project sites would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

This section provides an assessment of light or glare impacts from operation of proposed Project sites, based on general site locations (urban areas and rural or remote areas).

Urban Areas

The proposed Project sites listed below would be located in urban areas and would include construction of new monopoles or lattice towers. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. The sites listed below are in urban areas where numerous sources of day and nighttime lighting are present, such as vehicle headlights, traffic signals, street lights, and building security lights. Because of the presence of these light sources, tower (monopole) lighting, if required, would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area, resulting in a less than significant impact for all of the proposed sites with new monopoles or lattice towers in urban areas, including the following sites:

AGH	ASD	PASPD01	PWT
SDW	SGH	ZHQ	

The proposed Project sites listed below would also be located in urban areas and would include installation of up to 20 to 25 whip antennas and up to 7 microwave antennas on roof tops of existing buildings. The new facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. No additional lighting would be required. This would not result in a substantial new source

of day or nighttime light or glare that would adversely affect nighttime views of the area, resulting in a less than significant impact for all of the proposed sites that involve installing antennas on building rooftops in urban areas, including the following sites:

LARICSHQ PDC SIM WS1

Site WAD would also be located in an urban area but would include installation of up to 20 whip antennas and up to 5 microwave antennas on an existing 120-foot monopole to be extended up to 140 feet, with additional up to 15 foot lightning rod. The new facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. No additional lighting would be required. This would not result in a substantial new source of day or nighttime light or glare that would adversely affect nighttime views of the area, and impacts at Site WAD would be less than significant.

Rural or Remote Areas

The sites listed below would be located in rural or remote areas and would also include construction of new monopoles or lattice towers with the same safety tower lighting described above. Sites located in rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), proposed Project facilities would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area, resulting in a less than significant impact for all of the proposed sites with new monopoles or lattice towers in rural or remote areas, including the following sites:

BJM	BUR	BUR1	BUR2	BUR3
CPK	DPK	ENC1	ENT	FRP
FTP	GMT	GRM	H-17A	H-69B
JOP	JPK	JPK2	LACF072	LACFCP08
LACFCP09	LACFCP11	LEPS	LPC	MMC
MML	MTL2	OAT	PHN	PMT
RIH	SPN	SUN	SUN2	TMT
TOP	TPK	TWR	VPK	WMP
WTR				

Site AJT would also be located in a rural area but would include installation of up to 40 whip antennas and up to 9 microwave antennas on existing lattice tower. The new facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. No additional lighting would be required. This

would not result in a substantial new source of day or nighttime light or glare that would adversely affect nighttime views of the area, and impacts at Site AJT would be less than significant.

Mitigation Measures

No mitigation measures are required.

3.1.4.2 No Project Analysis

Under the No Project Alternative, no new communications facilities would be constructed at the proposed Project locations. As a result, the visual character and quality of the proposed Project sites would not be affected by implementation of the No Project alternative.

3.1.5 Cumulative Impacts

3.1.5.1 Geographic Extent

As described in the aesthetic resources impact methodology in Section 3.1.4, the impact analysis for aesthetics considers the area within 0.25 mile of each proposed Project site. Table 2.7-1 identifies other projects within 0.25 mile of the following proposed Project sites: ENT, LEPS, MML, PASPD01, PDC, PHN, PWT, RIH, SGH, SUN, SUN 2, WS1, and ZHQ. No other projects were identified within 0.25 mile of other proposed Project sites.

3.1.5.2 Existing Cumulative Conditions

Each of these proposed Project sites is in a location that contains other structures such as other telecommunications tower and facilities, water tanks, and buildings. Sites PASPD01, PDC, SGH, and WS1 are in urban settings where the visual setting consists primarily of man-made landscapes. Other projects identified within 0.25 mile of the proposed Project sites include other telecommunications sites including LTE project facilities (see Section 1.1.3.2) and LMR facilities that have been statutorily exempted as described in Section 1.3.2, as well as other types of projects such as residential developments and mixed-use, commercial, hotel, and cinema developments. Other projects that consist of new telecommunication or other types of similar structures such as transmission lines that introduce vertical elements into the visual setting have been identified in the vicinity of sites MML, PASPD01, PDC, PHN, RIH, SUN, SUN2, and WS1. At sites ENT, PWT, SGH, and ZHQ, adjacent projects consist only of single-family residences, modification to residences, or residential property-related development such as landscaping and a tennis court and equestrian facility modifications.

3.1.5.3 Cumulative Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Of the proposed Project sites listed in Section 3.1.5.1, the following are in areas identified as a scenic vista: ENT, LEPS, MML, PHN, PWT, SUN, SUN 2, WS1, and ZHQ. The remaining sites are not in a scenic vista; therefore, no cumulative impacts to scenic vistas would occur at other proposed Project sites.

At sites ENT and ZHQ, an up to 70-foot monopole and an up to 28-foot monopole respectively are proposed. At both of these sites the only adjacent projects are residential or residential-related. No cumulative impact to scenic vistas is expected because these other projects would be consistent with the existing residential visual settings at these sites. No cumulative impacts to aesthetics would occur at these sites.

At Site LEPS an up to 70-foot monopole is proposed at an existing water tank. Adjacent projects are residential or residential-related and an upgrade to another existing water tank (i.e., it is a different water tank from the one at Site LEPS). No cumulative impact to scenic vistas is expected because these other projects would be consistent with the existing visual setting. No cumulative impacts to aesthetics would occur.

Site MML is an alternate to the statutorily exempt LMR Site MAM. Both are a proposed up to 180-foot lattice tower; however, because only one of these two LA-RICS LMR sites would be developed, no cumulative impact to scenic vistas would occur.

At Site PHN a new up to 180-foot lattice tower is proposed. Site PHN currently contains two lattice towers. The other project identified at this site is the collocation of LTE antennas on one of these existing towers. Collocation of LTE antenna on an existing tower would not affect scenic vistas and both the LTE project and the proposed Project would be consistent with the existing visual setting of the site. No cumulative impacts to scenic vistas would occur.

At Site PWT an up to 28-foot monopole is proposed at an existing water tank. Identified projects in the vicinity of this site are associated with existing residential properties and an equestrian facility. No cumulative impact to scenic vistas is expected because these other projects would be consistent with the existing visual setting. No cumulative impacts to aesthetics would occur.

At sites SUN and SUN2, a new up to 180-foot lattice tower is proposed. Only one LMR tower would be built between these two sites. Other telecommunications tower projects are identified near these sites, including an up to 220-foot tower. Sites SUN and SUN2 currently contain multiple telecommunications towers. The proposed Project and the other projects would be consistent with the existing visual setting of the sites, and no cumulative impacts to scenic vistas would occur.

Site WS1 is a proposed roof mount on an existing 320-foot building located in an urban setting within the coastal zone. Several projects including mixed-use developments and other telecommunications towers are proposed nearby. Development of these types of project in an already developed urban setting would not be expected to result in cumulative impacts to a scenic vista. In addition, the installation of LMR antennas on the roof of this tall building would not be expected to contribute to any cumulative impact to a scenic vista.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

No scenic resources were identified within any Project site boundary. Of the proposed Project sites listed in Section 3.1.5.1, the following are in areas identified as scenic highways: ENT, LEPS, PWT, WS1, and ZHQ. Proposed Project sites MML, PASPD01, PDC, PHN, RIH, SGH, SUN, and SUN2 are not in a scenic highway and would not substantially damage scenic resources; therefore, no cumulative impacts to scenic resources in scenic highways would occur at other proposed Project sites.

Cumulative impacts to scenic resources within scenic highways would be similar to that provided for scenic vistas for each of these sites under cumulative impact AES-1. No scenic resources would be substantially damaged by the proposed Project at any site; therefore, no cumulative impacts would occur.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

No impacts to visual character or quality from the proposed Project were identified at sites PDC, RIH, SGH, and WS1; therefore, no cumulative impacts from the proposed Project would occur. Cumulative impacts to visual character or quality at sites ENT, LEPS, MML, PHN, PWT, SUN, SUN2, and ZHQ, would be similar to those described under cumulative impact AES-1 for scenic vistas. No cumulative impacts to visual character or quality would occur.

One site, PASPD01, was not analyzed as a scenic vista. An up to 70-foot monopole is proposed at this site. Site PASPD01 is in a developed urban area that is a historic district. This site is also an LTE site where antennas were mounted on an existing parking structure which did not substantially degrade the historic visual setting. Other projects would be consistent with the setting of the historic district. Without mitigation, the proposed Project monopole would be out of character with the historic district; however with mitigation to camouflage the monopole, the impacts of this site would not be cumulatively considerable.

AES-4: Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

All of the projects identified within 0.25 mile of the proposed Project sites would likely entail some lighting. Lighting associated with telecommunications facilities and residential and mixed-use, commercial, and hotel development would be expected to be consistent with existing lighting conditions associated with similar structures currently present in areas with those land uses. No cumulative impact from light or glare would occur.

As described under impact AES-1, at Site MML, only this site or its alternate, the statutorily exempt LMR Site MAM, would be developed. No cumulative impact from light or glare would occur.

3.2 Air Quality

This air quality assessment is based on the methodology and results provided in Appendix B. This section describes the existing regulatory framework for air quality management along with existing air quality conditions in the Project vicinity. Air quality emissions impacts associated with construction and operation of the Project are summarized below, along with a determination of their significance in relation to applicable air quality standards. A detailed discussion of each site is provided in Chapter 4.

3.2.1 Environmental Setting

3.2.1.1 Climate and Meteorology

The Project is located within portions of the Mojave Desert Air Basin (MDAB) and the South Coast Air Basin (SCAB) (Figure 3.2-1). The SCAB is almost completely enclosed by mountains to the north and east, resulting in a fairly regular daily reversal of wind direction – offshore at night and onshore during the day. With the concentrated population and industry, pollution products tend to accumulate and remain within this circulation pattern. The MDAB is separated from the southern California coastal and central California valley regions by mountains (highest elevation approximately 10,000 feet).

Summer is a dry period over most of the state due to the semi-permanent Pacific high pressure that deflects most storms far to the north. In winter, the Pacific high pressure weakens and shifts southward. Upwelling ceases, and winter storms become frequent.

According to the Western Regional Climate Center (WRCC), the most representative meteorological monitoring station within the SCAB is in Los Angeles, California. The station (WRCC Station #045115, Los Angeles Civic Center) is considered representative because of its central location within the SCAB, located on the University of Southern California campus, and because of the time span for weather data collection (1877 to 2015). Temperature and precipitation data recorded at this station indicate that average maximum temperatures during the winter and summer months range from 66.4 to 83.1 degrees Fahrenheit, respectively. Annual average precipitation recorded at this station is approximately 15 inches, with over 95 percent of the seasonal rainfall between October and April. Complex terrain and weather patterns within the SCAB make it a natural sink for the accumulation of emissions and sustained high pollution levels. The climate is relatively mild, with cooler temperatures and a pattern of onshore airflow along the coastal area, which improves air quality. In the inland portion of the air basin, however, a combination of abundant sunshine, warm temperatures, and poor vertical air mixing is conducive to the formation of ozone, commonly referred to as “smog.” The problem is worsened by the surrounding mountains that act together with the weather to trap air pollutants.

According to the WRCC, the most representative monitoring station within the MDAB is in Lancaster, California. The station (WRCC Station #0447749, Lancaster William J Fox Airfield) is considered representative because of its central location within the western reaches of the MDAB and because of the time span for weather data collection (1974 to 2015). Temperature and precipitation data recorded at this station indicate that average maximum temperatures during the winter and summer months

range from 57.9 to 96.5 degrees Fahrenheit, respectively. Annual average precipitation recorded at this station is approximately 7 inches, with over 90 percent of the seasonal rainfall between October and April. Key topographical features that define the MDAB are the San Gabriel Mountains to the south, the southern end of the Sierra Nevada Mountains to the north, and the Tehachapi Mountains to the west near the Project area. Temperature has a major effect on vertical air mixing, impacting local pollutant concentrations. The climate of the MDAB is characterized by relatively hot summers, mild winters, large diurnal ranges in temperature, irregular rainfall, low relative humidity, and abundant sunshine.

3.2.1.2 Attainment Status

The U.S. Environmental Protection Agency (USEPA) is responsible for establishing National Ambient Air Quality Standards (NAAQS) for six criteria pollutants including carbon monoxide (CO), ozone (O₃), nitrogen dioxide (NO₂), sulfur dioxide (SO₂), particulate matter (coarse particles less than or equal to 10 microns in diameter (PM₁₀) and fine particles less than or equal to 2.5 microns in diameter (PM_{2.5})), and lead (Pb). Areas can be classified with the NAAQS as nonattainment, maintenance, attainment, or unclassified. The California Environmental Protection Agency Air Resources Board (CARB) is responsible for ensuring that California ambient air quality standards (CAAQS) are met for these pollutants. Similar to the NAAQS, areas are classified as nonattainment, maintenance, attainment, or unclassified with respect to the CAAQS.

Geographic areas that exceed National and/or State Ambient Air Quality Standards (NAAQS and CAAQS) for a criteria pollutant are considered “nonattainment” areas for that pollutant. Conversely, areas that are below a criteria pollutant standard are considered “attainment.” Maintenance areas are defined as previously exceeding the NAAQS or CAAQS (nonattainment) for a criteria pollutant but are presently attaining that standard. Maintenance areas are required to develop a maintenance plan outlining steps for continued attainment over the maintenance period. Table 3.2-1 summarizes the attainment status within the Project area.

Table 3.2-1: Attainment Status within the Project Area

Criteria Pollutant	County	Federal Status	State Status
Mojave Desert Air Basin			
Carbon monoxide (CO)	Los Angeles and San Bernardino	Attainment	Attainment
Lead	Los Angeles and San Bernardino	Attainment	Attainment
Nitrogen dioxide (NO ₂)	Los Angeles and San Bernardino	Attainment	Attainment
Ozone (O ₃)	Los Angeles and San Bernardino	Non-attainment	Non-attainment
Fine Particulate Matter (PM _{2.5})	Los Angeles and San Bernardino	Attainment	Unclassified ¹
Coarse Particulate Matter (PM ₁₀)	Los Angeles and San Bernardino	Unclassified ²	Non-attainment
Sulfur dioxide (SO ₂)	Los Angeles and San Bernardino	Unclassified	Attainment
Particulate sulfate	Los Angeles and San Bernardino	n/a	Attainment
Hydrogen sulfide	Los Angeles and San Bernardino	n/a	Unclassified

Table 3.2-1: Attainment Status within the Project Area

Criteria Pollutant	County	Federal Status	State Status
Visibility-reducing particles	Los Angeles and San Bernardino	n/a	Unclassified
South Coast Air Basin			
Carbon monoxide (CO)	Los Angeles, Orange, and San Bernardino	Maintenance	Attainment
Lead	Los Angeles, Orange, and San Bernardino	Non-attainment ³	Attainment
Nitrogen dioxide (NO ₂)	Los Angeles, Orange, and San Bernardino	Maintenance	Attainment
Ozone (O ₃)	Los Angeles, Orange, and San Bernardino	Non-attainment	Non-attainment
PM _{2.5}	Los Angeles, Orange, and San Bernardino	Non-attainment	Non-attainment
PM ₁₀	Los Angeles, Orange, and San Bernardino	Attainment	Non-attainment
Sulfur dioxide (SO ₂)	Los Angeles, Orange, and San Bernardino	Attainment	Attainment
Particulate sulfate	Los Angeles, Orange, and San Bernardino	n/a	Attainment
Hydrogen sulfide	Los Angeles, Orange, and San Bernardino	n/a	Unclassified
Visibility-reducing particles	Los Angeles, Orange, and San Bernardino	n/a	Unclassified
1. Portions of San Bernardino County within the MDAB located outside the Project area are designated nonattainment for the PM _{2.5} CAAQS. 2. Portions of San Bernardino County within the MDAB located outside the Project area are designated nonattainment for PM ₁₀ NAAQS. 3. Portions of San Bernardino and Riverside counties within the SCAB are designated attainment for the Lead NAAQS.

3.2.1.3 Existing Air Quality Monitoring Data

USEPA, CARB, and local air districts select and maintain a statewide network of monitoring stations that routinely measure pollutant concentrations in the ambient air. These stations provide data to assess compliance with the NAAQS and CAAQS and to evaluate the effectiveness of pollution control strategies. Forty six monitoring stations are located within the MDAB and SCAB. Table 3.2-2 shows summary data of maximum ambient levels of criteria pollutants for which the SCAB is nonattainment/maintenance (e.g., PM_{2.5}, O₃, CO, and NO₂) at selected locations as reported in the *Final 2012 Air Quality Management Plan* (SCAQMD 2013). The locations chosen are those in the monitoring network that are most centrally located within Los Angeles and San Bernardino counties, respectively for which monitoring data was reported.

Table 3.2-2: South Coast Air Basin Monitored Criteria Pollutant Concentrations by County

Criteria Pollutant	County	Monitored Values		% of Standard	Area
		Standard	Maxim		
Fine Particulates (PM _{2.5})	Los Angeles ¹	24-HR Average (35 µg/m ³) ¹	49.5 ²	139 ³	East San Gabriel Valley
		Annual Average (15 µg/m ³) ¹	13.3	89	Central Los Angeles
	San Bernardino	24-HR Average (35 µg/m ³) ¹	65.0	183 ³	Central San Bernardino Valley
		Annual Average (15 µg/m ³) ¹	13.3	89	Southwest San Bernardino Valley
Ozone (O ₃)	Los Angeles	1-HR Average (0.12ppm)	0.144	115	Santa Clarita Valley
		8-HR Average (0.075 ppm)	0.122	162	Central Bernardino Mountains
	San Bernardino	1-HR Average (0.12 ppm)	0.160	128	Santa Clarita Valley
		8-HR Average (0.075 ppm)	0.136	180	Central Bernardino Mountains
Carbon Monoxide (CO)	Los Angeles	1-HR Average (35 ppm)	6.0	17	South Central L.A. County
		8-HR Average (9 ppm)	4.7	49	Central San Bernardino Valley
	San Bernardino	1-HR Average (35 ppm)	1.8	5	South Central L.A. County
		8-HR Average (9 ppm)	1.7	18	Central San Bernardino Valley
Nitrogen Dioxide (NO ₂)	Los Angeles	1-HR Average (100 ppb)	109.6	109	Central L.A. County
		Annual Average (53 ppb)	24.6	46	
	San Bernardino	1-HR Average (100 ppb)	76.4	76	Central San Bernardino Valley
Nitrogen Dioxide (NO ₂)	San Bernardino	Annual Average (53 ppb)	21.1	39	Central San Bernardino Valley

Table 3.2-2: South Coast Air Basin Monitored Criteria Pollutant Concentrations by County

Criteria Pollutant	County	Monitored Values		% of Standard	Area
		Standard	Maxim		
Lead (Pb)	Los Angeles	3-Month Rolling Average (0.15 µg/m ³)	0.46 ⁵	297	Central Los Angeles
	San Bernardino		0.01		6

Source: South Coast Air Quality Management District (SCAQMD) *Final 2012 Air Quality Management Plan* (SCAQMD 2013).
 Notes: micrograms per cubic meter (µg/m³); parts per million (ppm); parts per billion (ppb)

- Based on federal reference method (FRM) data.
- One higher concentration that was recorded due to “Independence Day” firework activities has been flagged for exclusion from NAAQS comparison in accordance with the U.S. EPA Exceptional Events Rule; with this data included, the 2009 – 2011 design value for East San Gabriel Valley would also exceed the federal standard.
- Although maximum 24-hour concentrations exceed the standard, the 98th percentile form of the 2009 – 2011 design value only exceeded the standard at one station in Metropolitan Riverside County (Mira Loma).
- Based on FRM and federal equivalent method (FEM) data.
- This high lead concentration was measured at a site immediately downwind of a lead source.

An exceedance of the concentration standard does not necessarily indicate a violation of the NAAQS because a violation depends on the form of the standard. For instance, the form of the 24-hour average standard for PM_{2.5} is established by the average of 98th percentile values for the most current three monitoring years; however, as shown in Table 3.2-2, violations did occur at the listed stations for monitored values for O₃, PM_{2.5}, NO₂ and Pb, which exceed the form of the federal standard concentration levels at one or more monitoring stations in the SCAB.

Summary data of maximum ambient levels of criteria pollutants for which the MDAB is nonattainment (e.g., O₃) that are monitored within the basin are presented in Table 3.2-3.

Table 3.2-3: Mojave Desert Air Basin Monitored Ozone Concentrations – Lancaster Monitoring Station

Year	Maximum 1-HR Concentration (ppm) ¹	Design Value (ppm) ²	Maximum 8-HR Concentration (ppm) ¹	Design Value (ppm) ²

¹. Notes: parts per million (ppm)

². A design value is a statistic that describes the air quality status of a given location relative to the level of the NAAQS. It is used to designate and classify non-attainment areas and to assess progress towards meeting the NAAQS.

As shown in Table 3.2-3, monitored levels have been trending toward the compliant design values for the 1-hour and 8-hour NAAQS for O₃; however, the basin remains in noncompliance for this criteria pollutant.

3.2.1.4 Fugitive Dust, Particulate Matter and Toxic Air Contaminants

Fugitive dust is particulate matter, which becomes airborne and has the potential to adversely affect human health or the environment. The most common forms of particulate matter are known as coarse particles with a diameter of 10 microns or less (PM₁₀), coarse particles, and fine particles with a diameter of 2.5 microns or less (PM_{2.5}). Fugitive dust is generated mainly from construction activities such as earth-moving, paved road trackout, driving on haul roads, and excavation.

The 2009 USEPA *Integrated Science Assessment for Particulate Matter* (USEPA. EPA/600/R-08/139F) has identified the adverse impacts of particulate matter air pollution on increased illness (morbidity) and increased death rates (mortality). Correlations have been established between elevated ambient particulate matter levels and respiratory infections, asthma attacks, and the number of hospital emissions. PM_{2.5} has been linked in studies to reduction in lifespan, mortality from lung cancer, cardiovascular and respiratory diseases, school and kindergarten absences, and increased asthma medication use by children and adults.

Toxic air contaminants (TACs) include 187 pollutants that are known or suspected to cause cancer or other serious health effects, such as reproductive effects or birth defects, or adverse environmental effects. A wide range of sources, from industrial plants to households emit TACs. Among these TACs are diesel particulates, which, along with 1,3 butadiene and benzene, are one of the top three contributors to the potential cancer risk from motor vehicle emissions.

3.2.1.5 Class I Areas

Construction activities contribute to visibility concerns in nonattainment and maintenance areas primarily through PM_{2.5} and NO_x emissions, which contribute to the formation of secondary PM_{2.5}. Under the provisions of the CAA, USEPA has designated a number of areas in the State of California, including national parks and wilderness areas, as Mandatory Class I Federal Areas where visibility is an important value. These mandatory Class I areas are listed in 40 CFR 81.406. Under the USEPA Regional Haze Rule (RHR), states must establish goals to improve visibility in Class I areas and develop long-term strategies to reduce emissions of air pollutants that cause visibility impairment. These goals are outlined in the state implementation plans.

Of the mandatory Class I areas, San Gabriel Wilderness and Cucamonga Wilderness are the closest to the Project. The nearest boundary of the San Gabriel Wilderness located in Los Angeles County is approximately 1.5 miles north of the Pine Mountain site (PMT). The nearest boundary of the Cucamonga Wilderness located in San Bernardino County is approximately 3 miles northeast from the Sunset Ridge sites (SUN, SUN2). The proposed improvements are not anticipated to have any measurable air quality impact on Class I federal areas. These areas are also shown in Figure 3.2-1.

3.2.2 Regulatory Setting

3.2.2.1 Federal Regulatory Setting

The CAA of 1970, amended in 1990, is the federal law that governs air pollution. As discussed in Section 3.2.1.2, USEPA is responsible for establishing NAAQS for the following six criteria pollutants: CO, O₃, NO₂, SO₂, particulates (PM₁₀ and PM_{2.5}), and Pb. The State of California has developed CAAQS for these criteria pollutants which are more protective of the public health in some cases, such as PM_{2.5/10} and O₃. Table 3.2-4 summarizes the NAAQS and CAAQS for these criteria pollutants.

Table 3.2-4: National and California Ambient Air Quality Standards

Pollutant	Averaging Time	California Standard ¹	National Standard ²	
		Concentration ³	Primary ^{3,4}	Secondary ^{3,5}
Ozone (O ₃)	1 hour	0.09 ppm	–	Same as Primary Standard
	8 hours	0.070 ppm	0.075ppm	
Respirable Particulate Matter (PM ₁₀) ⁶	24 hours	50 $\mu\text{g}/\text{m}^3$	150 $\mu\text{g}/\text{m}^3$	Same as Primary Standard
	Annual	20 $\mu\text{g}/\text{m}^3$	–	
Fine Particulate Matter (PM _{2.5}) ⁶	24 hours	–	35 $\mu\text{g}/\text{m}^3$	Same as Primary Standard
	Annual	12 $\mu\text{g}/\text{m}^3$	12 $\mu\text{g}/\text{m}^3$	
Carbon Monoxide (CO)	1 hour	20 ppm	35 ppm	–
	8 hours	9 ppm	9 ppm	–

Table 3.2-4: National and California Ambient Air Quality Standards

Pollutant	Averaging Time	California Standard ¹	National Standard ²	
		Concentration ³	Primary ^{3,4}	Secondary ^{3,5}
	8 hours (Lake Tahoe)	6 <u>ppm</u>	–	–
Nitrogen Dioxide (NO ₂) ⁷	1 hour	0.18 <u>ppm</u>	100 ppb	–
	Annual	0.03 ppm	0.053 <u>ppm</u>	Same as Primary Standard
Sulfur Dioxide (SO ₂) ⁸	1 hour	0.25 <u>ppm</u>	75 ppb	–
	3 hours	–	–	0.5 ppm
	24 hours	0.04 <u>ppm</u>	0.14 ppm (for certain areas) ¹⁰	–
	Annual	–	0.030 ppm (for certain areas) ¹⁰	–
Lead (Pb) ^{9,10}	30-Day Average	1.5 <u>µg/m³</u>	–	–
	Calendar Quarter	–	1.5 <u>µg/m³</u> (for certain areas) ⁽¹⁰⁾	Same as Primary Standard
	Rolling 3-Month Average	–	0.15 <u>µg/m³</u> ⁽⁶⁾	
Visibility Reducing Particles ¹¹	8 hours	Extinction coefficient 0.23 per kilometer – visibility of ten miles or more (0.07 – 30 miles or more for Lake Tahoe) due to particles when relative humidity is less than 70 percent. Method: Beta Attenuation and Transmittance through Filter Tape.	No National Standard	
Sulfates	24 hours	25 <u>µg/m³</u>		
Hydrogen Sulfide	1 hour	0.03 ppm		
Vinyl Chloride ⁹	24 hours	0.01 ppm		

Sources: CARB 2013a.

Notes: ppm = parts per million; µg/m³ = micrograms per cubic meter; ppb = parts per billion

A dash (-) signifies that there is no standard for this pollutant

1. California standards for ozone, carbon monoxide (except Lake Tahoe), sulfur dioxide (1- and 24-hour), nitrogen dioxide, suspended particulate matter (PM₁₀ and PM_{2.5}), and visibility reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2. National standards (other than ozone, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration in a year, averaged over three years, is equal to or less than the standard. For PM₁₀, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m³ is equal to or less than one. For PM_{2.5}, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact U.S. EPA for further clarification and current

be achieved through district-level air quality management plans that are incorporated into the state implementation plan (SIP).

The CARB traditionally has established state air quality standards, maintained oversight authority in air quality planning, developed programs for reducing emissions from motor vehicles, developed air emission inventories, collected air quality and meteorological data, and approved SIPs.

The California CAA focuses on attainment of CAAQS and requires designation of attainment and nonattainment areas with respect to these standards. The act also requires that local and regional air districts expeditiously adopt and prepare air quality attainment plans (Clean Air Plan) if the district violates CAAQS for O₃, CO, SO₂, or NO₂. No locally prepared attainment plans are required for areas that violate state PM₁₀ standards. CARB is responsible for developing plans and projects that will comply with the state PM₁₀ standards.

USEPA is working with CARB and other state, local, and tribal governments to reduce releases of TACs to the environment. Similar to the federal program, a chemical becomes a regulated TAC after it is identified by CARB's California Air Toxics Program, assessed for its potential for human exposure, and evaluated for its health effects on humans. CARB has listed approximately 200 toxic substances, including those identified by USEPA, which are identified on the California Air Toxics Program's TAC List.

3.2.2.3 Local Regulatory Setting

The proposed Project is located within portions of the MDAB under the jurisdiction of the Antelope Valley Air Quality Management District (AVAQMD) and portions of the SCAB under the jurisdiction of the South Coast Air Quality Management District (SCAQMD) (see Figure 3.2-1). These agencies regulate air pollution and operate air monitoring stations throughout the air basins. The Project would need to adhere to the following AQMD rules and regulations:

AVAQMD

AVAQMD Regulation IV, Rule 403 (2010) – Fugitive Dust

This regulation was promulgated by the AVAQMD to reduce the amount of particulate matter entrained (suspended) in the ambient air as a result of man-made Fugitive Dust sources by prescribing actions to prevent, reduce, or mitigate Fugitive Dust emissions. The rule covers activities that are potential sources of dust such as vehicle track-out from a construction site, earth-moving operations, demolition operations, and disturbed open areas of three or more acres.

AVAQMD Regulation IV, Rule 404 (1986) – Particulate Matter – Concentration

This regulation generally sets concentration limits for the discharge of particulate matter in the air.

AVAQMD Regulation XI, Rule 1110.2 (2003) – Emissions from Stationary, Non-road, and Portable Internal Combustion Engines

This regulation sets general emissions limits on oxides of nitrogen (NO_x), volatile organic compounds (VOCs), and CO for stationary and portable internal combustion engines (ICEs). Owners/operators of ICEs that exceed prescribed limits must be replaced with an electric motor or removed from service.

AVAQMD Regulation XIV, Rule 1401 (2006) – New Source Review for Toxic Air Contaminants

This regulation sets forth the requirements for preconstruction review of all new, modified, relocated or reconstructed facilities which emit or have the potential to emit any Hazardous Air Pollutant, Toxic Air Contaminant, or Regulated Toxic Substance.

AVAQMD Regulation XIV, Rule 1403 (1994) – Asbestos Emissions from Demolition/Renovation Activities

The purpose of this rule is to specify work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials (ACM).

SCAQMD

SCAQMD Regulation IV, Rule 403 (2005) – Fugitive Dust

Similar to the AVAQMD regulation, this regulation intends to reduce the amount of particulate matter entrained in the ambient air from man-made Fugitive Dust sources by prescribing actions to prevent, reduce or mitigate Fugitive Dust emissions.

SCAQMD Regulation IV, Rule 404 (1986) – Particulate Matter – Concentration

Similar to the AVAQMD regulation, this regulation generally sets concentration limits for the discharge of particulate matter in the air.

SCAQMD Regulation XI, Rule 1110.2 – Emissions from Gaseous and Liquid-Fueled Engines

This regulation replaces Rule 1110.1 and regulates general emissions limits on NO_x, VOCs and CO from engines. Owners/operators of engines that exceed prescribed limits must be replaced with an electric motor or removed from service.

SCAQMD Regulation XIV, Rule 1401 (2015) – New Source Review of Toxic Air Contaminants

This rule specifies limits for maximum individual cancer risk (MICR), cancer burden, and noncancer acute and chronic hazard index (HI) from new permit units, relocations, or modifications to existing permit units which emit toxic air contaminants.

SCAQMD Regulation XIV, Rule 1403 (2007) – Asbestos Emissions from Demolition/Renovation Activities

The purpose of this rule is to specify work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of ACM.

3.2.3 Significance Criteria

The following significance criteria were used in the air quality analysis. Significance criteria established by the applicable air quality management or air pollution control district, e.g., AVAQMD and SCAQMD were also relied upon to make the following determinations:

- 1) Would the project conflict with or obstruct implementation of the applicable air quality plan?
- 2) Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?
- 3) Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for O₃ precursors)?
- 4) Would the project expose sensitive receptors to substantial pollutant concentrations?
- 5) Would the project create objectionable odors affecting a substantial number of people?

3.2.3.1 AVAQMD Significance Thresholds

Project air quality impacts within the AVAQMD would be significant if the project triggers or exceeds the following evaluation criteria:

Generates total emissions (direct and indirect) in excess of the thresholds presented in Table 3.2-5

Generates a violation of any air quality standard when added to the local background

Does not conform with the applicable attainment or maintenance plan(s)

Exposes sensitive receptors to substantial pollutant concentrations, including those resulting in a cancer risk greater than or equal to 10 in a million and/or a Hazard Index (HI) (non-cancerous) greater than or equal to 1

In general, the district considers Criterion 1 to be appropriate to the assessment of most projects (AVAQMD 2011); therefore, the significance thresholds presented in Table 3.2-5 were used to determine whether the proposed Project's air quality impacts would be significant, as discussed in greater detail below. Annual and daily emissions thresholds identified in Table 3.2-5 allow for the evaluation of a multi-phased project (one having a construction and an operational phase) with phases less than one year in duration compared to the daily limits. Criterion 4 was evaluated along with the Table 3.2-5 thresholds to determine whether sensitive receptors would be exposed to substantial pollutant concentrations, as discussed in detail under Impact AQ-4.

Table 3.2-5: AVAQMD Significance Thresholds

Pollutant	Tons/Year	
	Annual Threshold (tons)	Daily Threshold (pounds)
CO	100.0	548
NO _x	25.0	137
VOC	25.0	137
SO _x	25.0	137
PM ₁₀	15.0	82
PM _{2.5}	15.0	82
H ₂ S	10.0	54
Pb	0.6	3

3.2.3.2 SCAQMD Significance Thresholds

The SCAQMD has also developed emissions thresholds for projects with air quality impacts. Similar to the analysis of proposed Project sites located within the MDAB under AVAQMD jurisdiction, the thresholds presented in Table 3.2-6 were determined to be appropriate for assessing the significance of both construction and operational air quality impacts for proposed Project sites located within the SCAB and under SCAQMD jurisdiction. The listed thresholds were used to evaluate the Project's impacts on air quality, specifically as they relate to significance criteria 1 through 4 in Section 3.2.3.1.

Table 3.2-6: SCAQMD Significance Thresholds

Pollutant	Mass Daily Thresholds	
	Construction	Operation
NO _x	100 lbs./day	55 lbs./day
VOC	75 lbs./day	55 lbs./day
PM ₁₀	150 lbs./day	150 lbs./day
PM _{2.5}	55 lbs./day	55 lbs./day
SO _x	150 lbs./day	150 lbs./day
CO	550 lbs./day	550 lbs./day
Pb	3 lbs./day	3 lbs./day
Toxic Air Contaminants (TACs), and Odor Thresholds		
TACs (including carcinogens and non-carcinogens)	<ul style="list-style-type: none"> • Maximum Incremental Cancer Risk greater than or equal to 10 in 1 million • Cancer Burden greater than 0.5 excess cancer cases (in areas greater than or equal to 1 in 1 million) • Chronic & Acute Hazard Index greater than or equal to 1.0 (project increment) 	
Odor	Project creates an odor nuisance pursuant to SCAQMD Rule 402	
Ambient Air Quality Standards for Criteria Pollutants ^a

3.2.4 Impact Analysis

Construction emissions were determined using the California Emission Estimator Model (CalEEMod) v 2013.2.2 developed for the California Air Pollution Control Officers Association (CAPCOA) by SCAQMD and other California air districts (EIC 2013). The model quantifies direct emissions from construction for a variety of land use projects. This analysis conservatively assumes a maximum construction activity scenario for each Project site to occur within a six week construction duration at each site.

Operational emissions associated with the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by the CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB and three proposed Project sites in the MDAB. The generator test would last

one hour at each site, and test days would be evenly distributed during each month of the year. For the analysis, an average of 15 trips per week to sites within the SCAB was assumed, with three maintenance trips on five weekdays and one additional weekday trip per month. For sites in the MDAB, the four maintenance trips were assumed to occur on the same day, once per month. Maintenance days are also assumed to coincide with generator test days. Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B.

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

AVAQMD

The AVAQMD air quality plans considered in this analysis include the *AVAQMD 2004 Ozone Attainment Plan (State and Federal) (AVAQMD 2004 Ozone Plan) (AVAQMD 2004)*. The purpose of this plan was to (1) demonstrate that the AVAQMD would meet the primary O₃ NAAQS by the end of 2007; (2) present progress by the AVAQMD toward meeting all state planning milestones including attainment of the O₃ CAAQS; and (3) discuss the 8-hour O₃ NAAQS in preparation for a new nonattainment designation under a revised standard. Also considered in this analysis of Project air quality impacts is the *AVAQMD Federal 8-Hour Ozone Attainment Plan (Western Mojave Desert Nonattainment Area) (AVAQMD 8-Hour Ozone Plan) (AVAQMD 2008)*. The purpose of this plan is to (1) demonstrate that the AVAQMD will attain the primary O₃ NAAQS by June 2021; (2) present progress by the AVAQMD toward meeting all required O₃ planning milestones and NAAQS and CAAQS; and (3) discuss the newest 0.075-ppm O₃ NAAQS in anticipation of a nonattainment designation for this revised standard.

Finally, the analysis considered the *AVAQMD Implementation Schedule for Measures to Reduce PM pursuant to Health and Safety Code 39614(d) (AVAQMD PM Measures Plan) (AVAQMD 2005)*. The purpose of this plan is for the AVAQMD to develop a list of Best Available Control Technologies (BACT) either currently being implemented or for future consideration to control particulate emissions within the district. The rules listed in Section 3.2.2.3 above are included in the list developed in this plan.

SCAQMD

The SCAQMD air quality plan considered in this analysis is the *SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan) (SCAQMD 2013)*. The purpose of this plan is to demonstrate attainment of the PM_{2.5} 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O₃ SIP commitments to the USEPA to achieve emissions reductions from BACT, and to demonstrate attainment of the 1-hour O₃ CAAQS by 2022.

Construction Impacts

AVAQMD

The analysis indicates that emissions from the construction of all the proposed Project sites located in the MDAB would not exceed AVAQMD significance thresholds for the listed criteria pollutants including O₃ precursor NO_x (See Table 3.2-7). Therefore, the Project would not conflict with or obstruct implementation of the *AVAQMD 2004 Ozone Plan*, *AVAQMD 8-Hour Ozone Plan*, or the *AVAQMD PM*

Measures Plan. Construction impacts on the implementation of the AVAQMD plans would be less than significant.

Table 3.2-7: Construction Emissions for Simultaneous Construction of Three Proposed Sites¹ within MDAB

	Maximum Daily Emissions (lbs./day)					Maximum Annual Emissions (tons/year)				
	ROG	NO _x	CO	PM ₁₀	PM _{2.5}	ROG	NO _x	CO	PM ₁₀	PM _{2.5}
Unmitigated Emissions (per site)	0.65	7.13	5.34	0.97	0.30	0.01	0.11	0.08	0.02	<0.01
Total Emission for AVAQMD (3 sites) Unmitigated	2.6	28.5	21.4	3.9	1.2	0.04	0.44	0.32	0.08	<0.01
AVAQMD Threshold	137	137	548	82	82	25	25	100	15	15

1. The analysis conservatively evaluates maximum construction activity at each site.

SCAQMD

The analysis indicates that emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed significance thresholds for NO_x, a precursor for O₃, and could conflict with or obstruct implementation of the SCAQMD *Plan* resulting in a significant impact (see Table 3.2-8). The analysis also indicates that NO_x emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used (Mitigated Scenario). Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined (see Appendix B). The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six-week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin, with up to 28 sites under construction simultaneously without exceeding daily NO_x emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized (mitigated scenario). By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NO_x emissions limits.

Table 3.2-8: Construction Emissions for Simultaneous Construction of 51 Proposed Sites¹ Within SCAB

	Maximum Daily Emissions (lbs./day)				
	ROG	NO _x	CO	PM ₁₀	PM _{2.5}
Unmitigated Emissions (per site)	0.67	7.27	5.54	1.02	0.41
Mitigated Emissions (per site)	0.65	7.14	5.33	0.71	0.34
Total Emission for SCAQMD (51 sites) Unmitigated/Mitigated	40.87/39.65	443.5/435.5	337.9/325.1	62.22/43.31	25.01/20.74
SCAQMD Threshold	75	100	550	150	55
Exceeds Threshold	No	YES	No	No	No

¹. The analysis conservatively evaluates maximum construction activity at each site.

Mitigation Measures

AQ MM 1 No later than 12:00 p.m. on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NO_x emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) if combined NO_x emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which USEPA regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NO_x emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

Impacts After Mitigation

With implementation of Mitigation Measure AQ MM 1, the Project would not conflict or obstruct implementation of the *SCAQMD Plan*; therefore, construction impacts would be less than significant after mitigation.

Operation Impacts

AVAQMD

In general, operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators as described above. Emissions from the operation of all the proposed Project sites located in the MDAB would not exceed AVAQMD significance thresholds for the listed criteria pollutants including O₃ precursor NO_x and particulate matter (See Table 3.2-9). The Project would not conflict or obstruct implementation of the AVAQMD 2004 Ozone Plan, AVAQMD 8-Hour Ozone Plan and AVAQMD PM Measures Plan; therefore, Project impacts in the MDAB would be less than significant.

Table 3.2-9: Operational Emissions for Three Proposed Sites Within MDAB

Emissions Category	Maximum Daily Emissions (lbs.)					Maximum Annual Emissions (tons)				
	ROG	NO _x	CO	PM ₁₀	PM _{2.5}	ROG	NO _x	CO	PM ₁₀	PM _{2.5}
Maintenance	0.016	0.048	0.192	0.008	0.008	<0.01	<0.01	0.024	<0.01	<0.01
Generator Testing	0.016	0.064	0.088	0.008	0.008	<0.01	<0.01	<0.01	<0.01	<0.01
Total	0.032	0.112	0.28	0.016	0.016	<0.01	<0.01	0.032	<0.01	<0.01
AVAQMD Threshold (lbs./day)	137	137	548	82	82					
AVAQMD Threshold (tons/year)						25	25	100	15	15
Exceedance	No	No	No	No	No	No	No	No	No	No

SCAQMD

In general, operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators as described above. Emissions from the operation of proposed Project sites located in the SCAB will not exceed significance thresholds for the listed criteria pollutants (See Table 3.2-10). The Project would not conflict or obstruct implementation of the SCAQMD Plan; therefore, Project impacts in the SCAB would be less than significant.

Table 3.2-10: Operational Emissions for 51 Proposed Sites Within SCAB

Emission Category	Maximum Daily Emissions (lbs.)				
	ROG ¹	NO _x	CO	PM ₁₀	PM _{2.5}
Daily Maintenance	0.24	0.35	1.54	0.06	0.03
Generator Testing	0.18	0.96	1.29	0.10	0.10
Total Daily Emissions	0.42	1.31	2.83	0.16	0.13
SCAQMD Threshold (lbs./day)	55	55	550	150	55
Exceedance	No	No	No	No	No

1. Reactive organic gases are any compound of carbon and are an O₃ precursor regulated under the CAAQS.

Mitigation Measures

No mitigation measures are required.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

The significance thresholds detailed in Table 3.2-5 (for the sites located in the MDAB) and Table 3.2-6 (for the SCAB sites) were used to determine whether the proposed Project would violate any air quality standard or contribute substantially to an existing or projected air quality violation.

Construction Impacts**AVAQMD**

As shown in Table 3.2-7, emissions from the simultaneous construction of the three proposed Project sites located in the MDAB would not exceed AVAQMD significance thresholds for the listed criteria pollutants (see Table 3.2-5). Per AVAQMD guidance (AVAQMD 2011), compliance with these significance thresholds is sufficient to demonstrate that construction of the proposed Project sites in the MDAB would not violate any air quality standards or contribute substantially to an existing or projected air quality violation; therefore, Project construction impacts in the MDAB would be less than significant.

SCAQMD

As shown in Table 3.2-8, emissions from the simultaneous construction of the 51 proposed Project sites located in the SCAB would exceed significance thresholds for NO_x, a precursor for O₃, would result in violation of the SCAQMD threshold for daily NO_x emissions during construction and would contribute to the SCAB nonattainment status for O₃. The Project's construction emissions in the SCAB would be significant.

Mitigation Measures

Implementation of AQ MM 1 at sites within the SCAQMD would be required.

Impacts After Mitigation

With implementation of Mitigation Measure AQ MM 1, the Project would violate any air quality standard or contribute substantially to an existing or projected air quality violation; therefore, construction impacts would be less than significant after mitigation.

Operation Impacts

Operational emissions of the proposed Project sites in the MDAB and SCAB (see Table 3.2-9 and Table 3.2-10, respectively) are less than significant and would not violate any air quality standard or contribute substantially to an existing or projected air quality violation; therefore, Project impacts would be less than significant in the MDAB and SCAB, respectively.

Mitigation Measures

No mitigation measures are required.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O₃ (NAAQS and CAAQS) and PM₁₀ (CAAQS) in the MDAB and O₃, PM_{2.5}, and PM₁₀ (CAAQS) in the SCAB. The significance thresholds detailed in Table 3.2-5 (AVAQMD) and 3.2-6 (SCAQMD) are the air quality standards considered in this analysis.

Construction Impacts

AVAQMD

As shown in Table 3.2-7, emissions from the simultaneous construction of all the proposed Project sites located in the MDAB would not exceed AVAQMD significance thresholds for O₃ and PM₁₀ (see Table 3.2-5). Per AVAQMD guidance (AVAQMD 2011), compliance with these significance thresholds is sufficient to demonstrate that construction of the proposed Project sites in the MDAB would not result in cumulatively considerable net increases in these pollutants; therefore, Project construction emissions in the MDAB would be less than significant.

SCAQMD

As shown in Table 3.2-8, emissions from simultaneous construction of the proposed Project sites located in the SCAB would not exceed significance thresholds for PM_{2.5} or PM₁₀ but would exceed significance thresholds for O₃ precursor NO_x (see Table 3.2-6) and would result in cumulatively considerable net increases in O₃ from the NO_x emissions. Project construction emissions in the SCAB would be considered significant and would require the following mitigation.

Mitigation Measures

See mitigation measure AQ MM 1.

Significance After Mitigation

With implementation of Mitigation Measure AQ MM 1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NO_x from all construction activities at all proposed Project sites will not exceed the SCAQMD 100-pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, construction emissions of O₃ precursor NO_x would not result in cumulatively considerable net increases in O₃ in the SCAB; therefore, Project construction emissions in the SCAB would be less than significant.

Operation Impacts

AVAQMD

As shown in Table 3.2-9, operational emissions of the proposed Project sites in the MDAB would not exceed AVAQMD significance thresholds for O₃ and PM₁₀ (see Table 3.2-5). Per AVAQMD guidance (AVAQMD 2011), compliance with these significance thresholds is sufficient to demonstrate that operation of the proposed Project sites in the MDAB would not result in cumulatively considerable net increases in these pollutants; therefore, Project operational emissions in the MDAB would be less than significant.

SCAQMD

As shown in Table 3.2-10, operational emissions of the proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM_{2.5}, PM₁₀, or O₃ precursor NO_x (see Table 3.2-6). Compliance with these significance thresholds is sufficient to demonstrate that operation of the proposed Project sites in the SCAB would not result in cumulatively considerable net increases in these pollutants; therefore, Project operational emissions in the SCAB would be less than significant.

Mitigation Measures

No mitigation measures are required.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

The AVAQMD considers residences, schools, daycare centers, playgrounds, and medical facilities to be sensitive receptor land uses. Exposure of sensitive receptors to substantial pollutant concentrations as defined above in Section 3.2.3.1, Criterion 4 is required for the following project types: (1) any industrial project within 1,000 feet; (2) a distribution center (40 or more trucks per day) within 1,000 feet; (3) a major transportation project (50,000 or more vehicles per day) within 1,000 feet; (4) a dry cleaner using perchlorethylene within 500 feet; and (5) a gasoline dispensing facility within 300 feet. While the Project

as proposed does not fall within one of these project types, the analysis of sites within the MDAB includes a qualitative assessment of pollutants that impact human health.

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of the pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD (SCAQMD 2011). The LSTs are modifications to the thresholds listed in Table 3.2-6 for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B lists the SRAs within which each of the proposed Project sites would be located, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants. All sites located in the SCAB were evaluated in comparison to the LSTs. The analysis of sites within the SCAB also includes a qualitative assessment of pollutants that impact human health.

Construction Impacts

The use of off-road heavy-duty diesel equipment by the Project for demolition, site grading and excavation, and concrete pad construction activities, as detailed in Appendix B, would result in the generation of diesel particulates (DPM) emissions. DPM were identified as a TAC by CARB in 1998. Other potential TAC sources associated with construction include the demolition of asbestos-containing materials and the excavation of naturally occurring asbestos (NOA) in soils.

According to the Consolidated Table of Office of Environmental Health Hazard Assessment (OEHHA)/CARB Approved Risk Assessment Health Values, the potential cancer risk from the inhalation of DPM outweighs the potential noncancer health impacts (SCAQMD 2015; SMAQMD 2014); therefore, noncancer health impacts of DPM were not assessed further. In addition, the OEHHA Air Toxics Hot Spots Program Guidance Manual does not recommend assessing cancer risk from exposures to a 'maximally exposed individual resident' (sensitive receptor) from activities lasting less than two months, due to the uncertainty in assessing cancer risk from very short-term exposures (OEHHA 2015). As discussed in Appendix B, the maximum construction activity scenario assumed at each site would have a six-week duration; therefore, further assessment of the potential cancer risk of the project is not warranted.

AVAQMD

Demolition of existing structures at proposed Project sites in the MDAB would be subject to AVAQMD Rule 1403. Rule 1403 is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. The rule addresses the national emissions standards for asbestos along with some additional requirements. The rule requires lead agencies and their contractors to notify AVAQMD of any regulated renovation or demolition activity. By complying with AVAQMD Rule 1403, thereby minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the MDAB would lie outside areas within California that are more likely to contain NOA, according to a study completed by the California Department of Conservation, *A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos* (California Department of Conservation 2000); therefore, NOAs are not discussed further in this assessment.

As shown in Table 3.2-7, emissions from construction of a worst-case composite site, which represents a maximum construction scenario, located in the MDAB would not exceed AVAQMD significance thresholds for the listed criteria pollutants. Per AVAQMD guidance (AVAQMD 2011), compliance with the criteria pollutant significance thresholds listed in Table 3.2-5 and the health -based risk assessment significance threshold established by AVAQMD Criterion 4 (Section 3.2.3.1) is sufficient to demonstrate that construction of the proposed Project sites in the MDAB would not result in sensitive receptor exposure to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

SCAQMD

Table 3.2-11 shows the daily construction emissions from a composite site (maximum construction scenario) in the vicinity of a residential and non-residential sensitive receptor in the SCAB where construction emissions would most closely approach the LSTs. All composite sites would comply with the revised thresholds established by the LSTs.

Table 3.2-11: Local Significance Thresholds – Construction and Operations Emissions for Composite Sites within SCAQMD Sensitive Receptor Area

Site ID	Receptor	Distance (feet)	SRA	Local Significance Thresholds (lbs./day)			
				NO _x	CO	PM ₁₀	PM _{2.5}
LASDCSN	Single-Family Home	39	4 - South Coastal LA County	57	585	4	3
PVC	School	417	3 – Southwest Coastal LA County	139	2,228	56	21
SCAQMD Significance Thresholds				100	550	150	55
Construction Emissions (lbs./day)				NO_x	CO	PM₁₀	PM_{2.5}
Composite Site (Maximum Construction Scenario)				7.27	5.54	1.02	0.41
Operation Emissions (lbs./day)				NO_x	CO	PM₁₀	PM_{2.5}
Composite Site				0.016	0.022	< 0.01	< 0.01
Exceeds LST				No	No	No	No

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these

activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA, according to a study completed by the California Department of Conservation (California Department of Conservation 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance (SCAQMD 1993), compliance with the local significance thresholds for criteria pollutants listed in Table 3.2-11 and Table 9 in Appendix B and with the health-based risk assessment significance thresholds listed in Table 3.2-6 is sufficient to demonstrate that construction of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

The monthly one hour test of the backup generator at each proposed Project site would generate DPM emissions. Emergency operation of the backup generators, which is anticipated to have a 200-hour continuous operational capacity, would also generate DPM emissions. No other operational sources of these or other TACs would occur.

According to the OEHHA, the potential cancer risk from the inhalation of DPM outweighs the potential noncancer health impacts (SMAQMD 2014; SCAQMD 2015); therefore, noncancer health impacts of DPM were not assessed further. In addition, the OEHHA Air Toxics Hot Spots Program Guidance Manual does not recommend assessing cancer risk from exposures to a 'maximally exposed individual resident' (sensitive receptor) from activities lasting less than two months, due to the uncertainty in assessing cancer risk from very short-term exposures (OEHHA 2015). The duration of the monthly test and emergency operation of backup generators at each site would be sources of short-term exposure to sensitive receptors; therefore, further assessment of the potential cancer risk of the project is not warranted.

AVAQMD

As shown in Table 3.2-9, operational emissions of the proposed Project sites in the MDAB would not exceed AVAQMD significance thresholds for the listed criteria pollutants (see Table 3.2-5). Per AVAQMD guidance (AVAQMD 2011), compliance with these significance thresholds and with the health-based risk assessment significance threshold established by AVAQMD Criterion 4 (Section 3.2.3.1) is sufficient to demonstrate that operation of the proposed Project sites in the MDAB would not result in sensitive receptor exposure to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

SCAQMD

As shown in Table 3.2-11 and Table 9 in Appendix B, operational emissions of the proposed Project sites in the SCAB would not exceed SCAQMD LSTs for the listed criteria pollutants. Per SCAQMD guidance (SCAQMD 1993), compliance with these LSTs and with the health-based risk assessment significance thresholds listed in Table 3.2-6 is sufficient to demonstrate that operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measures

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?**Construction Impacts**

Project construction emissions of dust from demolition activities and/or excavated soil have the potential to generate objectionable odors; however, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody facilities, foundry/metal processing, wastewater/water treatment, and landfills, which together comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use account for only 3 percent of complaints (Curren 2012). The construction of proposed Project sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to AVAQMD Rule 402 or SCAQMD Rule 402; therefore, impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody facilities, foundry/metal processing, wastewater/water treatment, and landfills, which together comprise approximately 55-percent of all complaints (Curren 2012). The operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to AVAQMD Rule 402 or SCAQMD Rule 402. Impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

3.2.4.1 No Project Alternative

Under the No Project Alternative, none of the 54 proposed Project sites would be constructed. Therefore, no criteria pollutant emissions or impacts to sensitive receptors would occur from

construction equipment, worker commuting vehicles, or material transport trucks. No mitigation measures would be needed to ensure that emission thresholds are not exceeded. Because no new diesel generators would be installed under the No Project Alternative, no increase in diesel combustion emissions from those sources would occur; however, existing communication sites would continue to operate and be inspected, maintained, and repaired.

3.2.5 Cumulative Impacts

The AVAQMD and SCAQMD emission thresholds were set to ensure that individual projects, when combined with other air pollution-emitting activities in their jurisdictions, do not compromise compliance with NAAQS and CAAQS. In developing their attainment plans, the air districts have prepared inventories of emissions for stationary sources and mobile sources and made various assumptions about population growth, housing growth and economic activity to develop future emissions inventories.

AVAQMD

The AVAQMD 2004 Ozone Plan developed emissions inventories for stationary sources, which include large emitters (point sources) of ozone precursors (VOCs, NO_x), and small emitters (area sources) of ozone precursors, which include residential water heaters, architectural coatings, consumer products, etc., distributed across the district. Operational emissions for the Project, resulting from monthly testing of backup generators at all five proposed sites in the MDAB, would contribute to area source emissions within the district. The AVAQMD Ozone 2004 Plan emission inventory was developed for a 2002 baseline year and future plan years (2005, 2007). Subsequently, the AVAQMD 8-Hour Ozone Plan updated these inventories for future plan years (2011, 2014, 2017, and 2020). Calculated emissions for 2014 through 2020 are summarized in Table 3.2-12. The table also shows the contribution of Project emissions to the area source inventories for future years.

Table 3.2-12: Contribution of Emissions for Three Proposed Sites to Area and Mobile Source Emissions within the AVAQMD

Emissions Scenario	Maximum Daily Emissions (tons/day)	
	VOC ¹	NO _x
AVAQMD Area Sources 2014 ²	4.97	0.40
AVAQMD Area Sources 2017 ²	5.27	0.41
AVAQMD Area Sources 2020 ²	5.58	0.42
Project Generator Testing (percent of all areas sources, 2017 & 2020)	<0.01%	<0.01% - 0.01%
AVAQMD Mobile Sources 2014 ^{2,3}	10.01	17.51
AVAQMD Mobile Sources 2017 ^{2,3}	9.46	15.01
AVAQMD Mobile Sources 2020 ^{2,3}	9.19	13.13
Project Construction and Maintenance Trips (percent of all mobile sources, 2017 & 2020) ⁴	<0.01%	<0.01% - 0.01%

Table 3.2-12: Contribution of Emissions for Three Proposed Sites to Area and Mobile Source Emissions within the AVAQMD

Emissions Scenario	Maximum Daily Emissions (tons/day)	
	VOC ¹	NO _x
^{1.} Reactive organic gases are any compound of carbon and are an O ₃ precursor regulated under the CAAQS and are referred to as VOCs at the federal level. ^{2.} Source: AVAQMD Federal 8-Hour Ozone Attainment Plan (Western Mojave Desert Non-attainment Area) (AVAQMD 2008). ^{3.} On-road and off-road emissions combined. ^{4.} Project construction emissions were amortized over 2 years for 2017 projections and 6 years for 2020 projections.		

The AVAQMD 8-Hour Ozone Plan also developed emissions inventories for mobile sources, which include on-road and off-road sources of ozone precursors (VOCs, NO_x) within the district. On-road emissions were calculated from transportation activity data provided by the South Coast Association of Governments (SCAG), and off-road emissions were calculated using CARB's In-Use Off-Road Fleet Inventory model (off-road model) for construction, mining, gardening, and agricultural equipment. Construction emissions for the Project include worker vehicle trips to all five proposed sites and emissions from construction equipment operation. Operational emissions for the Project would result from worker vehicle trips to conduct monthly testing of backup generators and concurrent biannual maintenance at all five proposed sites. Emissions from each of these trips would contribute to mobile source emissions within the district. The AVAQMD 8-Hour Plan updated these inventories for future plan years (2011, 2014, 2017, and 2020). Calculated emissions for 2014 through 2020 are summarized in Table 3.2-12. The table also shows the contribution of Project emissions to the project areas source inventories for future years.

As shown in Table 3.2-12, Project contributions to stationary (area) and mobile source emissions within the AVAQMD are less than 0.01 percent. The contribution of the Project to cumulative stationary and mobile source emissions would not conflict with or obstruct implementation of the AVAQMD 8-Hour Ozone Plan. Furthermore, the Project is not growth-inducing and would not result in an economic activity that would be inconsistent with the assumptions used in forecasting district-wide emissions. Therefore, the Project would have no significant cumulative impacts to air quality within the jurisdiction of the AVAQMD.

SCAQMD

The SCAQMD Plan developed emissions inventories for stationary sources, which include large emitters (point sources) with annual emissions of 4 tons or more of VOCs, NO_x, sulfur oxides (SO_x), and particulates (PM_{2.5}/PM₁₀) or annual emissions of CO over 100 tons (point sources), and small emitters (area sources). Operational emissions for the Project, resulting from monthly testing of backup generators at all 54 proposed sites in the SCAB, would contribute to area source emissions within the district. The SCAQMD Plan emission inventory area source estimates for the 2008 baseline year of the plan and future plan years (2023, 2030) are summarized in Table 3.2-13. The table also shows the potential relative contribution of Project emissions to the area source inventories for future years.

Table 3.2-13: Contribution of Emissions for 54 Proposed Sites to Area and Mobile Source Emissions within the SCAQMD

Emissions Scenario	Maximum Daily Emissions (tons/day)				
	VOC ¹	NO _x	CO	PM ₁₀	PM _{2.5}
SCAQMD Area Sources 2008 ²	109	50	115	--	31
SCAQMD Area Sources 2023 ²	110	35	126	--	36
SCAQMD Area Sources 2030 ²	58	4	11	--	19
Project Generator Testing (percent of all areas sources, 2023 & 2030)	<0.01%	<0.01% - 0.02%	<0.01% - 0.02%	--	<0.01%
SCAQMD Mobile Sources 2008 ^{2,3}	377	634	2,737	--	40
SCAQMD Mobile Sources 2023 ²	180	249	1,425	--	26
SCAQMD Mobile Sources 2030 ²	57	169	936	--	8
Project Construction and Maintenance Trips (percent of all mobile sources, 2023 & 2030) ⁴	<0.01%	<0.01%	<0.01%	--	<0.01%

¹. Reactive organic gases are any compound of carbon and are an O₃ precursor regulated under the CAAQS and are referred to as VOCs at the federal level.

². Source: *SCAQMD 2012 Final Air Quality Management Plan* (SCAQMD 2012).

³. On-road and off-road emissions combined. Construction emissions were amortized over 2 years for 2017 projections and 6 years for 2020 projections.

⁴. Project construction emissions were amortized over 7 years for 2023 projections and 14 years for 2030 projections.

The *SCAQMD Plan* also developed emissions inventories for mobile sources, which include on-road and off-road sources of VOCs, NO_x, sulfur oxides (SO_x), particulates (PM_{2.5}/PM₁₀), and CO within the district. On-road emissions were calculated from transportation activity data provided by the Southern California Association of Governments (SCAG), and off-road emissions were calculated using CARB's off-road model for construction, mining, gardening, and agricultural equipment. Construction emissions for the Project include worker vehicle trips to all 54 proposed sites and emissions from construction equipment operation. Operational emissions for the Project would result from worker vehicle trips to conduct biannual maintenance and monthly testing of backup generators at all 54 proposed sites. Emissions from each of these activities would contribute to mobile source emissions within the district. The *SCAQMD Plan* emission inventory mobile source estimates for the 2008 baseline year of the plan and future plan years (2023, 2030) are summarized in Table 3.2-13. The table also shows the contribution of Project emissions to the project area source inventories for future years.

As shown in Table 3.2-13, Project contributions to stationary (area) and mobile source emissions within the SCAQMD are less than 0.02 percent. Although the contributions could be considered relatively

minor, unmitigated construction emissions have the potential to exceed the SCAQMD significance thresholds. Therefore, the project's contribution to cumulative construction emissions in the SCAB would require the following mitigation.

Mitigation Measures

See mitigation measure AQ MM 1.

Significance After Mitigation

Application of AQ MM 1 would ensure the cumulative contribution of the Project to stationary and mobile source emissions would not conflict with or obstruct implementation of the *SCAQMD Plan*. Furthermore, the Project is not growth-inducing and would not result in an economic activity that would be inconsistent with the assumptions used in forecasting district-wide emissions. Therefore, the Project would have no significant cumulative impacts to air quality within the jurisdiction of the SCAQMD.

All construction projects that may be in progress or may start during the Project construction time frame in the MDAB and SCAB would be subject to BACT to control construction emissions. Emission thresholds were set to ensure that individual projects, when combined with other air pollution-emitting activities in their jurisdictions, do not compromise progress toward attainment of all NAAQS and CAAQS. Although the continued nonattainment status of the MDAB for O₃ (NAAQS/CAAQS) and PM₁₀ (CAAQS) and the continued nonattainment status of the SCAB for O₃ (NAAQS/CAAQS), PM_{2.5} (NAAQS/CAAQS), and PM₁₀ (CAAQS) are an indication of significant cumulative impacts of all projects in these basins, compliance for the Project with air emissions from construction, after implementation of AQ MM 1, and operation of proposed Project sites would remain below significance thresholds; and air emissions from the Project would not be cumulatively considerable.

3.3 Biological Resources

3.3.1 Environmental Setting

All proposed Project sites are located within the Southern California/Northern Baja Coast Ecoregion III, at an elevation range of approximately 14 to 8,487 feet above mean sea level. This ecoregion is defined by coastal and alluvial plains and mountains that historically were dominated by grasslands, coastal sage scrub, and chaparral vegetation communities, with oak and walnut woodlands dispersed throughout and white fir forest at the highest elevations (USEPA 2015); however, today the region has large-scale human development.

Prior to conducting field visits, biologists acquired ecological data and prepared lists of special status species that have the potential to occur in Los Angeles County or neighboring areas of San Bernardino County (for Site AJT) and may require species-specific impact analysis. Special status species includes any species identified by California Department of Fish and Wildlife (CDFW), U.S. Fish and Wildlife Service (USFWS), or National Marine Fisheries Service (NMFS) as endangered, threatened, proposed, candidate, sensitive, or any other special status under the authorities of state or federal statutes, or as identified in local or regional plans, policies, or regulations; and any species that meets the California Environmental Quality Act (CEQA) Guidelines criteria for endangered, rare, or threatened. For sites located within the Angeles National Forest, U.S. Forest Service (USFS) Sensitive Species Lists were reviewed and incorporated. Local, regional, and state plans, policies, and regulations addressing biological resources, such as habitat conservation plans, natural community conservation plans, and wildlife linkage maps, were reviewed for applicability.

Data was compiled from the CDFW Natural Diversity Database (CNDDDB) (queries from March 17, 2014, March 4, 2015, and October 1, 2015); the CDFW California Rare Plant Ranks (CRPR); the USFWS Information Planning and Conservation (IPaC) System and critical habitat portal; NMFS online resources; and any Project-specific lists provided by USFWS or USFS. From these lists, species listed, proposed, or candidates for listing under the federal Endangered Species Act (ESA) were evaluated for their potential to occur at or near each proposed Project site, as were California fully protected species, California Endangered Species Act (CESA) listed species, rare plants listed under California Native Plant Protection Act (CNPPA), plants with a CRPR of 1 or 2 as identified by CDFW, CDFW species of concern, and sensitive species designated by USFS for sites on national forest lands. From this list of 173 plant species and 120 wildlife species, the potential species to be considered for each proposed Project site were evaluated at two levels: the overall county-wide list of species; and a target list of species recorded within 1 mile or up to 3 miles from each proposed Project site, taking species-specific factors into consideration (e.g., dispersal distance of California red-legged frog, wide-ranging flights by birds of prey, and downstream concerns for aquatic resources). A total of 112 plants and 71 wildlife species were identified for evaluation at the proposed Project sites.

Maps were developed to display general habitat, geographical characteristics, and vegetation communities surrounding each proposed Project site. This study area is defined as an area within an

approximately 500-foot radius projected from the center of the anticipated construction footprint within each proposed Project site. Vegetation communities within each study area were digitized using geographic information system (GIS) and aerial photo interpretation prior to site surveys.

Reconnaissance-level site surveys were conducted within each proposed Project site and study area by Jacobs biologists during the months of August, September, and October 2014. Qualified biologists surveyed each study area, including adjacent areas appropriate to the species potentially occurring in the area. Generally, species-specific protocol surveys were not conducted due to timing restrictions (inappropriate season), although species-specific habitat assessments were completed.

Data was collected using a handheld Trimble Yuma global positioning system (GPS) tablet. Photos and notes were taken at all sites; a plant list was recorded and relative abundance estimated for each species at each site; and plants were identified to the lowest taxonomic level (genus, species, or subspecies/variety) necessary to distinguish common plant species, noxious and invasive weeds, and special status plant species. General wildlife observations and detections of sign were also noted. Biologists field-verified the mapping of vegetation communities previously conducted by remote sensing and evaluated whether possible waters of the United States, other wetland habitats, riparian habitat, or other special habitats or vegetation communities were present in the general vicinity. Vegetation classification followed *A Manual of California Vegetation, Second Edition* (Sawyer et al. 2009). Determination of alliances was made by estimating the percent cover of all woody species and dominant herbaceous species for non-woody plant communities.

3.3.1.1 Vegetation Communities

Many of the proposed Project sites were located in rural areas on mountains, hills, or ridgetops, with one plant community on the xeric south-facing slopes and another community with taller, denser vegetation on the more mesic north-facing slopes or canyons. Other sites were located in urbanized areas and contained ornamental landscaping, bare areas, or ruderal species (weedy fields). All sites contained some level of development that included facilities, fencing, and cleared ground and asphalt, concrete, or bladed roadways. Most areas had some ornamental or nonnative vegetation. At many sites, the vegetation surrounding the developed facility was mowed or treated with herbicides to clear the area for fire fuel breaks. These areas were often mulched with the wood chips from the mower. The sites often contained nonnative species growing in cracks in the asphalt or concrete or in bladed areas. The amount of weeds was noted as light, moderate, or heavy. The weedy species present were also noted, as were any noxious species.

Vegetation within each study area was mapped using the Manual of California Vegetation's classification system (Sawyer et al. 2009). This system creates several hundred specific Alliances representing forests and woodlands, shrublands, and herbaceous vegetation. The alliances are identified by the most common one or two species and are named by the dominant species present. Tree communities are classified as either woodland (sparse) or forest (dense). Dense shrub communities are referred to as chaparral. Sparser shrub communities are referred to as scrub and typically occur along the coast and in the desert. For clarity and simplicity, alliances are grouped below into broader communities of similar

structure when applicable, so they can be easily related to wildlife habitat. Following is a general description of the vegetation communities and/or alliances observed within the study areas.

California Walnut Woodland

The community and alliance for California walnut woodlands/groves is the same. This community is limited to the southern California coast, mountains and valleys. Southern California black walnut (*Juglans californica* var. *californica*) grows as a volunteer in disturbed areas or as a mixed woodland community with coast live oak, white alder, Mexican elderberry, arroyo willow, and toyon. Southern California black walnut primarily grows on north-facing slopes and in mesic canyons. The common understory is nonnative grass, including wild oats, and chaparral shrubs.

Canyon Live Oak Riparian Forest

The community and alliance are the same. Canyon live oak riparian forest is found throughout California along stream benches and terraces in canyon bottoms and along steep, shallow, rocky soils in uplands. Canyon live oak (*Quercus chrysolepis*) was the dominant tree observed in this community. Other common species included Eastwood manzanita, Douglas fir, and California buckwheat. This community was identified along the Santa Clara River floodplain.

Coast Live Oak Woodland

The community and alliance are the same. Coast live oak woodland grows as a mosaic with nonnative grassland, coastal sage scrub, and chaparral. Coast live oak (*Quercus agrifolia*) grows primarily on north-facing slopes, canyons, and valley bottoms. It can grow with other oaks which may grow only as large shrubs. Other commonly observed mesic shrubs include bush monkeyflower, bush penstemon, big-leaf maple, arroyo willow, cottonwood, and canyon live oak. Sycamore and cottonwood dominate the broader more gravelly washes. Willows dominate the riparian areas with permanent water. In mesic canyons with intermittent streams, the oaks form a forest. Seep willow is common in disturbed canyons and washes. Coast live oak intergrades in drier habitat with interior live oak.

Chaparral (Chamise/Mixed/Montane)

The broad chaparral vegetation community includes three sub-communities (Mixed, Chamise, and Montane) and many alliances. Chaparral species have larger leaves and are less drought resistant than coastal sage species. Chaparral is found in varied topography depending on the dominant species and is identified in two-thirds of the study areas. Chaparral is found in disturbed areas, on deep to shallow soils, and/or on steep slopes. The following alliances identified in the study areas fall under the Mixed chaparral vegetation community: big-pod ceanothus, big-berry manzanita, birch-leaf mountain mahogany, California buckwheat scrub, canyon live oak chaparral, coffeeberry scrub, interior live oak, laurel sumac scrub, scrub oak chaparral, thick-leaved yerba santa scrub, and toyon chaparral. Big-berry manzanita is more common at the lower elevations, and Eastwood's manzanita is common at the higher elevations. The most common chaparral species observed during the surveys was laurel sumac.

One alliance fell under the Chamise chaparral community, the Chamise chaparral alliance. Chaparral dominated by chamise (*Adenostoma fasciculatum*) is common at the higher elevations and in mesic canyons. Other chaparral species include Our Lord's candle, toyon, redberry, and holly-leaf cherry. On south-facing and disturbed slopes and in sterile or poor soils, the most common chaparral species is California bush buckwheat. This species grows from the coastal hillsides to the desert valley hillsides.

One alliance, mountain whitethorn chaparral falls under the Montane chaparral community. The upper elevations on mountains are dominated by a tall, dense cover of shrubs dominated by chaparral whitethorn (*Ceanothus leucodermis*). Chaparral whitethorn is common in the San Gabriel Mountains.

Coastal Sage Scrub

The Coastal sage scrub community includes the following alliances: California buckwheat scrub, California sagebrush scrub, California sagebrush-California buckwheat scrub, Coastal prickly pear scrub, Coyote brush scrub, Lemonadeberry scrub, and White sage scrub. Vegetation grows on the drier sites on the hillsides adjacent to the coast. This community is dominated by species that quickly go leafless and dormant in the summer. Study areas were dominated by either California bush buckwheat or coast sagebrush. Coastal sage scrub is a mixed shrub community with white sage, black sage, purple sage, and encelia being the most common. As mentioned previously, the hilly topography creates many different habitats. Coastal sage scrub commonly grows adjacent to oak woodland, chaparral, and grassland communities. In coastal areas that have been heavily grazed, unpalatable species such as prickly pear becomes much more common. The vegetation on Santa Catalina Island and in the San Dimas area displays this cactus-dominated vegetation.

Elderberry Savanna

The community and alliance are the same for Elderberry Savanna/Blue elderberry stands. This community is found along stream terraces and bottomlands on gravelly alluvium that is intermittently flooded. Stands of blue elderberry (*Sambucus nigra*) are typically found in riparian and semi-riparian areas in the Santa Monica Mountains. Common species observed included skunkbrush (*Rhus trilobata*) and canyon live oak.

Jeffrey Pine Forest

The Jeffrey Pine Forest community and alliance are the same. This community is visually dominated by pine trees (*Pinus jeffreyi*) and has an understory of tall and low shrub species including chokecherry, manzanita, and buckwheat. Annuals are usually not frequent. This community is on the drier locations at the highest elevation sites.

Nonnative Grasslands/Semi-natural Herbaceous Stands

The nonnative grassland community includes the following Semi-natural herbaceous stands, a classification that is not quite equivalent to an alliance due to the dominance of non-native plants: annual brome grass, cheat grass, and wild oats grasslands. The grasslands of Los Angeles County have been exposed to frequent fires, disturbance by construction of roads, trails, and heavy grazing by cattle

and sheep. These conditions have resulted in changes in acreage of native grassland, coastal sage scrub, and chaparral. Grasslands in Los Angeles County are dominated by wild oats (*Avena fatua* and *A. barbata*) and brome grass (*Bromus rubens*, *B. diandrus*, *B. mollis*, and *B. tectorum*).

Ruderal

The Ruderal community classification is used to encompass ornamental, ruderal, ruderal/ornamental, and urban or built-up land mapping designations. In areas that have been bladed, the vegetation is dominated by nonnative grasses and forbs. The dominant nonnative grasses include brome grass. The most common forb is red-stemmed filaree. A long list of other forb species were encountered at the proposed Project sites. The most common are cheeseweed, prickly lettuce, bristly ox tongue, tumbleweed, tocolote, and biennial mustard.

Valley Oak Woodland

The community and alliance for Valley oak woodland is the same. Valley oak (*Quercus lobata*) is primarily a Central Valley species that creeps into northern Los Angeles County. In transitional areas, such as Los Angeles County, the southern edge of its range, it occurs with coast live oak, blue oak, and canyon live oak. The primary understory is nonnative grassland with chaparral and coastal sage scrub species in mesic habitats.

White Fir Forest

The community and alliance for White fir forest is the same, and also includes the snowberry shrubland alliance. In southern California, stands occur at higher elevations in the transverse ranges. This community occurs in more mesic sites than Jeffrey pine forest and is visually dominated by white fir (*Abies concolor*). Common understory plants include: whitethorn, golden currant, and snowberry. This community occurs with big cone Douglas fir in mesic north-facing canyons.

Table 3.3-1 identifies which vegetation communities are found within each of the study areas.

Table 3.3-1: Vegetation Communities within the Study Areas¹

Vegetation Community	Vegetation Alliance	Study Area(s)
California walnut woodland	California walnut grove	AGH, AJT, SDW

¹ The study area is defined by a 500-foot radius around each proposed Project site.

3.3.1.2 Special Status Animals and Plants

Special status species receive specific designations based on the federal statutory authorities (e.g., ESA), state statutory authorities (e.g., CESA; California Fish and Game Code [FGC]), or agency regulations and policy (e.g., USFS sensitive species). An accounting of these and other statutes and policies that affect the management of biological resources are provided in the section addressing Regulatory Setting (Section 3.3.2). Typically, species with special designations require species-specific analysis in project evaluation, and agencies maintain records of where these species have been known to occur. The CDFW maintains the CNDDDB as a repository of species occurrence data to be used in project evaluation.

Special status species designations as assigned under state and federal statutory authorities and land and resource management agencies are as follows:

Federal Endangered Species Act (ESA)

- E – Endangered
- T – Threatened
- P – Proposed
- C – Candidate
- CH – Critical Habitat

Bald and Golden Eagle Protection Act (BGEPA)

Magnuson-Stevens Fishery Conservation and Management Act (MSA)

- EFH – Essential Fish Habitat

California Endangered Species Act (CESA)

- E – Endangered
- T – Threatened
- C – Candidate

State of California

- FP – Fully Protected

California Native Plant Protection Act (CNPPA)

- Rare

California Department of Fish and Wildlife (CDFW)

- SSC – Species of Special Concern

CDFW California Rare Plant Ranks⁶ (CRPR)

- 1A – Plants presumed extirpated in California and either rare or extinct elsewhere
- 1B – Plants Rare or Endangered in California and elsewhere
- 2A – Plants presumed extirpated in California but more common elsewhere
- 2B – Plants Rare, Threatened, or Endangered in California, but more common elsewhere

U.S. Forest Service (USFS)

- S – Sensitive – Species that, as determined by qualified professionals, meet the CEQA criteria for endangered, rare or threatened. (CEQA Guidelines §15380.)

A review of the basic ecology and distribution of each of the 186 special status species that may occur in association with study areas is provided in Appendix B. This information was used to support an initial evaluation of which species may be present in each study area and whether that species may be directly or indirectly impacted by Project-related actions.

⁶ CRPR Ranks 3 and 4 are not included here as they are not designated as rare.

Table 3.3-3 provides a description of each study area and the list of special status species documented within 1 mile of each proposed Project site; however, this list does not include the full list of species considered in the evaluation for each study area, since not all special species are tracked by the CNDDDB (e.g., California condor). Some species are more wide-ranging, and greater distances need to be considered (e.g., golden eagle, red-legged frog dispersal distance, downstream concerns for aquatic resources). The distribution of each species is not definitive or fully represented by recorded occurrence data, so on-site evaluations were used to identify habitat for species that have not been recorded from the general vicinity.

Table 3.3-3: Special Status Plant and Animal Species Recorded within One Mile of Proposed Project Sites¹

Site	Study Area Description	Species Recorded Within One Mile ²	Status Designations ³
AGH	Site AGH is located in the city of Agoura Hills at the end of a ridgeline within a largely undeveloped complex of hills surrounded by residential development; slopes are fairly steep, and no washes are present. The vegetation community includes coastal sage scrub, California black walnut woodland on north-facing slopes with a few trees along the edge of the access road, and many weedy grasses and forbs throughout.	none	NA
AJT	Site AJT is located in a mostly rural setting in the city of Chino Hills on rolling hills of heavily grazed nonnative grassland and sparse California Black Walnut (<i>Juglans californica</i>) Woodland. Trees are generally denser on north-facing slopes. Nonnative grasses and herbaceous species dominate the understory with milk-thistle (<i>Silybum marianum</i>), biennial mustard (<i>Hirshfeldia incana</i>), horehound (<i>Marrubium vulgare</i>), coyote melon (<i>Cucurbita foetidissima</i>), and Indian tobacco (<i>Nicotiana glauca</i>).	golden eagle ⁴ (<i>Aquila chrysaetos</i>)	BGEPA CDFW-FP
		long-eared owl (<i>Asio otus</i>)	CDFW-SSC
		western pond turtle (<i>Emys marmorata</i>)	CDFW-SSC
ASD	Site ASD is located in a highly urbanized setting with extensive paved surfaces and minimal lawn and landscape vegetation within the Cerritos Auto Mall.	western yellow-billed cuckoo (<i>Coccyzus americanus occidentalis</i>)	ESA-T CA-E
BJM	Site BJM is located on Black Jack Peak on Santa Catalina Island on a hilltop that has been leveled and mostly paved to support the existing facilities. The vegetation in the area has been heavily impacted by overgrazing and long-term drought, resulting in bare soil and an increase in non-palatable plant species. Adjacent to the site is coastal sage scrub bisected by hiking trails and bike paths. The site contains many native and nonnative mature trees. Diagnostic woody shrubs include coast prickly pear (<i>Opuntia littoralis</i>), laurel sumac (<i>Malosma laurina</i>), toyon (<i>Heteromeles arbutifolia</i>), coyote bush (<i>Baccharis pilularis</i>), bush monkeyflower (<i>Diplacus aurantiacus</i>), lemonadeberry (<i>Rhus integrifolia</i>), and island oak (<i>Quercus pacifica</i>).	Santa Catalina Island fox (<i>Urocyon littoralis catalinae</i>)	ESA-E CA-T
		Townsend's big-eared bat (<i>Corynorhinus townsendii</i>)	CA-PT CDFW-SSC
		two-striped garter snake (<i>Thamnophis hammondi</i>)	CDFW-SSC

ENC1	Site ENC1 is within a large facility with concrete drives, asphalt and unpaved roads, and buildings. It is generally in a canyon setting with hills to the north and a drainage to the south. The hills and canyon slopes are covered with chamise chaparral and coast live oak woodland vegetation. An intermittent stream within the study area includes broadleaf deciduous riparian trees. Common species include purple sage (<i>Salvia leucophylla</i>), mountain mahogany, scrub oak, chamise, redberry (<i>Rhamnus crocea</i>), coast live oak, and bush buckwheat. The canyon bottoms and drainages have a mixture of natives and	western pond turtle <i>(Emys marmorata)</i>	CDFW-SSC

ENT	Site ENT is located on a ridgetop that has been leveled. Large nonnative eucalyptus and pine trees surround the two water tanks. Steep slopes north and east of the site include coastal sage scrub and chaparral vegetation. Common species include purple sage, laurel sumac, sagebrush, scrub oak, California lilac (<i>Ceanothus</i> sp.), redberry, deerweed (<i>Acmispon glaber</i>) and ornamental pines; scattered residences are in the vicinity. (On August 12, 2014, an abandoned raptor nest was observed in a eucalyptus tree at the Project site.)	American peregrine falcon (<i>Falco peregrinus anatum</i>)	CA-FP

H-69B	Site H-69B is located adjacent to a paved road on a hilltop in the San Gabriel Mountains. The site is used as a helicopter landing pad and has been largely leveled and cleared of vegetation, with patches of chaparral on steep slopes. Dense chaparral shrubs are on steep north-facing slopes within the study area. Vegetation includes chamise, big-berry manzanita, laurel sumac, bush buckwheat, purple sage, and chaparral currant (<i>Ribes malvaceum</i>). A private residence and vineyard is within the study area, and other residences are scattered throughout the vicinity.	American peregrine falcon <i>(Falco peregrinus anatum)</i>	CA-FP
		California mountain kingsnake <i>(Lampropeltis zonata)</i>	CDFW-SSC

		monarch butterfly <i>(Danaus plexippus)</i>	ESA-Pet
JOP	Site JOP is located on a mountaintop in the San Gabriel Mountains with sparse chaparral on south-facing slopes and dense canyon live oak forest in the shaded canyons. The bedrock is primarily very old metamorphics, and the vegetation is recovering from a recent burn. The vegetation includes bush buckwheat, Our Lord's candle (<i>Yucca whipplei</i>), poodle plant (<i>Turricula parryi</i>), canyon live oak (<i>Quercus chrysolepis</i>), sulfur buckwheat (<i>Eriogonum umbellatum</i>), bricklebrush (<i>Brickellia californica</i>), ceanothus, blackberry (<i>Rubus ursinus</i>), and prickly phlox (<i>Leptodactylon sp.</i>). LACF072	Site LACF072 is located in a suburban/rural setting on a hillside slope in the Santa Monica Mountains adjacent to a paved road in association with a fire station. The Project site is within an existing fenced facility and landscaped with ornamental vegetation including several large nonnative trees; no native habitats are present on site. The study area includes residences and corrals on neighboring properties. The site contains ornamental oaks, catalpa, pine, and deodar cedar trees. Less disturbed areas include chaparral vegetation east of the fenced area on steep slopes with coast live oak woodlands and patches with coastal sage scrub components, including scattered flattop bush buckwheat, laurel sumac, California sagebrush, and mountain mahogany.	western pond turtle (<i>Emys marmorata</i>)	CDFW-SSC
		monarch butterfly (<i>Danaus plexippus</i>)	ESA-Pet
		Santa Monica dudleya (<i>Dudleya cymosa</i> ssp. <i>ovatifolia</i>)	ESA-T CRPR-1B.1
		Sonoran maiden fern (<i>Thelypteris puberula</i> var. <i>sonorensis</i>)	CRPR-2B.2
LACFCP08	Site LACFCP08 is located on a broad hilltop in the Santa Monica Mountains, adjacent to a large complex of structures, paved areas, and ornamental vegetation. The surrounding slopes are coastal sage scrub/chaparral vegetation community. Some native vegetation is present within the Project site. The vegetation is too dense and the slopes too steep and rocky to walk. The site is located on cut-and-fill slopes with mostly weedy annuals. The south-facing slopes contain coastal sage scrub, and the north facing slopes contain chaparral. The dominant native shrubs are chamise, bush buckwheat, redberry, deerweed, and laurel sumac.	American peregrine falcon (<i>Falco peregrinus anatum</i>)	CA-FP
		monarch butterfly (<i>Danaus plexippus</i>)	ESA-Pet
LACFCP09	Site LACFCP09 is located on a mountain ridge in the San Gabriel Mountains, with montane chaparral on the south-facing slopes and big-cone Douglas-fir (<i>Pseudotsuga menziesii</i>) and yellow pine forest on the	Davidson's bush-mallow (<i>Malacothamnus davidsonii</i>)	CRPR-1B.2

Table 3.3-3: Special Status Plant and Animal Species Recorded within One Mile of Proposed Project Sites¹

Site	Study Area Description	Species Recorded Within One Mile ²	Status Designations ³
	north-facing slopes. The site is long and narrow, as dictated by the topography. The slopes are too steep to survey. A stand of Coulter pines have been planted on the east side.		
LACFCP11	Site LACFCP11 is at a Los Angeles County detention center in association with an existing water tank and helipad located at the end of a ridgeline, above and adjacent to Soledad Canyon Road. The Santa Clara River is on the opposite side of Soledad Canyon Road. Maher Canyon, an ephemeral drainage, passes through the detention facility, crosses under Soledad Canyon Road, and joins the Santa Clara River. Primary vegetation within the study area is chamise chaparral; within the Maher Canyon drainage and Santa Clara River corridor on the opposite side of Soledad Canyon Road is mature riparian forest that includes coast live oak and California sycamore trees. The main facility is located in a wide side canyon with some buildings at the base of the slope and the helipad on a ridge adjacent to Soledad Canyon Road. Vegetation includes coast live oak, bush buckwheat, chamise, coastal sagebrush, buckbrush (<i>Ceanothus greggii</i>), and arroyo willow (<i>Salix lasiolepis</i>).	coast horned lizard (<i>Phrynosoma blainvillii</i>)	CDFW-SSC
		Santa Ana sucker (<i>Catostomus santaanae</i>)	ESA-T CDFW-SSC
		unarmored threespine stickleback (<i>Gasterosteus aculeatus williamsoni</i>)	ESA-E CA-E
LARICSHQ	Site LARICSHQ is located in the city of Monterrey Park. The site is landscaped and made up of buildings asphalt and parking lots.	American badger (<i>Taxidea taxus</i>)	CDFW-SSC
		bank swallow (<i>Riparia riparia</i>)	CA-T
		burrowing owl (<i>Athene cunicularia</i>)	CDFW-SSC
		southwestern willow flycatcher (<i>Empidonax traillii extimus</i>)	ESA-E ESA-CH CA-E
		coast horned lizard (<i>Phrynosoma blainvillii</i>)	CDFW-SSC
LEPS	Site LEPS is located in the Santa Monica Mountains in association with an existing water tank in a fenced and paved compound that has been cut back into the hillside, resulting in an excavated disturbance zone of approximately 100 feet surrounding the water tank. Although coastal sage scrub vegetation is reestablishing in the disturbance zone, it appears the area is mowed as part of site maintenance. A few California walnut trees are adjacent to the Project site. The surrounding vegetation within the study area is coastal sage scrub dominated by California sagebrush, purple sage, and California buckwheat; on the opposite side of the paved Encinal Canyon Road is a shallow canyon with ephemeral drainage that supports riparian vegetation including California sycamore, coast live oak, and arroyo willow.	essential fish habitat	MSA
		monarch butterfly (<i>Danaus plexippus</i>)	ESA-Pet
		Santa Susana tarplant (<i>Deinandra minthornii</i>)	CA-R CRPR-1B.2
		Sonoran maiden fern (<i>Thelypteris puberula</i> var. <i>sonorensis</i>)	CRPR-2B.2
LPC	Site LPC is located on a mountain ridge at 4,025 feet elevation in the San Gabriel Mountains within	Davidson's bush-mallow	CRPR-1B.2

Site	Study Area Description	Species Recorded Within One Mile ²	Status Designations ³
	montane chaparral vegetation. Diagnostic woody vegetation includes interior live oak (<i>Quercus wislizenii</i>), squaw bush, mountain mahogany, deerweed, manzanita, chamise, and laurel sumac.	(<i>Malacothamnus davidsonii</i>)	
MMC	Site MMC is located on a mountaintop in the San Gabriel Mountains. The vegetation had recently burned, and the study area contains mostly cheatgrass. The study area was probably dominated by scrub oak in the past. Seedlings of bush buckwheat, rubber rabbitbrush (<i>Chrysothamnus nauseosus</i>), ceanothus, poodle plant, and scrub oak were observed.	coast horned lizard (<i>Phrynosoma blainvillii</i>)	CDFW-SSC NA
MML	Site MML is located on the top of Magic Mountain in the San Gabriel Mountains. The vegetation consists of chamise chaparral.	none	NA
MTL2	Site MTL2 is located along a ridgeline in the San Gabriel Mountains. The site contains chamise chaparral on north-facing slopes and buckwheat on the south-facing slopes.	coast horned lizard (<i>Phrynosoma blainvillii</i>)	CDFW-SSC
		Davidson's bush-mallow (<i>Malacothamnus davidsonii</i>)	CRPR-1B.2
OAT	Site OAT is one of a series of hilltop communications facilities along the Oat Mountain ridgeline in the Santa Susana Mountains. Valley Oak Woodland occurs in close proximity in the study area. Numerous oil extraction wells and facilities are within 0.5 to 1 mile of the site, with many roads curving along ridgelines. Due to these operations, vegetation is limited on the south side of the Oak Mountain ridgeline (oak forests are on north exposures).	western mastiff bat (<i>Eumops perotis californicus</i>)	CDFW-SSC
		California Orcutt grass (<i>Orcuttia californica</i>)	ESA-E CA-E CRPR-1B.1
		slender-horned spineflower (<i>Dodecahema leptoceras</i>)	ESA-E CA-E CRPR-1B.1
PASDP01	Site PASDP01 is totally urbanized and located in downtown Pasadena. The study area does not contain native vegetation. The structures in the vicinity are very large and old structures. Vegetation is primarily limited to large expanses of lawn with very few trees or shrubs.	pallid bat (<i>Antrozous pallidus</i>)	CDFW-SSC
		western mastiff bat (<i>Eumops perotis californicus</i>)	CDFW-SSC
		American peregrine falcon (<i>Falco peregrinus anatum</i>)	CA-FP

		white rabbit-tobacco (<i>Pseudognaphalium leucocephalum</i>)	CRPR-2B.2
PDC	Site PDC is located at the base of the east side of the Hollywood Hills entirely within an urban setting containing buildings, roads, paved parking areas, and landscaped areas. The Pacific Design Center is a complex of extremely large buildings surrounded by walkways, lawn, and ornamental trees. The site contains a multistory parking structure. The antennas would be placed on the roof on one of the buildings.	monarch butterfly (<i>Danaus plexippus</i>)	ESA-Pet
		Braunton's milk-vetch (<i>Astragalus brauntonii</i>)	ESA-E ESA-CH CRPR-1B.1
PHN	Site PHN is located in the Puente Hills on a hilltop with existing communication towers and associated facilities; the compound is paved and fenced. The immediate area adjacent to the compound is either mowed or treated with herbicide. The study area is primarily nonnative grassland with small patches of coastal sage scrub vegetation on steep slopes to the south; California black walnut woodland and coast live oak are found on slopes and in drainage channels as close as about 150 feet north and below the existing facility.	coastal California gnatcatcher (<i>Polioptila californica californica</i>)	ESA-T ESA-CH CDFW-SSC
PMT	Site PMT is located on a remote mountaintop in the eastern San Gabriel Mountains on Pine Mountain. The study area is within the montane chaparral vegetation community. Diagnostic woody species include bush buckwheat, manzanita, silk tassel bush (<i>Garrya</i> sp.), chaparral whitethorn (<i>Ceanothus leucodermis</i>), redberry, scrub oak (<i>Quercus</i> sp.), big-cone Douglas fir, holly-leaf cherry, and interior live oak. Mesic canyons contain big-leaf maple (<i>Acer macrophyllum</i>).	Rock Creek broomrape (<i>Orobanche valida</i> ssp. <i>valida</i>)	CRPR-1B.2 USFS-Sens
PWT	Site PWT is located on a hillside slope within a cut-slope constructed for the installation of the water tank. The ground surrounding the tank has revegetated with both native and nonnative species, but the perimeter extending up to about 100 feet from the tank is regularly mowed. The Project site is surrounded by fairly extensive stands of coastal sage scrub vegetation with evidence of past fires. The	monarch butterfly (<i>Danaus plexippus</i>)	ESA-Pet

Table 3.3-3: Special Status Plant and Animal Species Recorded within One Mile of Proposed Project Sites¹

		coast horned lizard (<i>Phrynosoma blainvillii</i>)	CDFW-SSC
		intermediate mariposa-lily (<i>Calochortus weedii var. intermedius</i>)	CRPR-1B.2
		many-stemmed dudleya (<i>Dudleya multicaulis</i>)	CRPR-1B.2
SDW	Site SDW is within the city of San Dimas and is located on a ridgeline overlooking Walnut Creek and adjacent to the I-10/I-215 interchange. The Project site is situated at approximately 1,227 feet elevation. The site is fenced and has an asphalt driveway and cleared compacted soils. The site is surrounded on three sides by upscale housing developments. The downslope is part of the watershed for Walnut Creek, which is dry most of the year at this location. Scattered vegetation on the site includes native narrow-leaf milkweed (<i>Asclepias fascicularis</i>) and common weeds such as wild oats (<i>Avena sp.</i>), red-stemmed filaree, coyote melon, biennial mustard, horehound, and telegraph weed (<i>Heterotheca grandiflora</i>). A row of California pepper trees (<i>Schinus molle</i>) stands adjacent to an existing water tank on the site. The study area consists primarily of residential or other developed lands, in ruderal condition or planted with ornamental vegetation. The canyon and drainage to the south of the Project site are the headwaters of Walnut Creek. The area has been impacted by development and past fires and is primarily composed of nonnative grasslands dominated by wild oats and brome grasses (<i>Bromus spp.</i>) with California black walnut trees in the drainage bottoms and scattered shrubs including Mexican elderberry and coast prickly pear. A few steep slopes and road cuts include scattered, small patches of remnant coastal sage	coastal California gnatcatcher (<i>Polioptila californica californica</i>)	ESA-T ESA-CH CDFW-SSC

3.3.1.3 Sensitive Habitats

Sensitive Communities

Sensitive or special status natural communities are vegetation communities that are of limited distribution statewide or within a county or region and are often vulnerable to environmental effects of projects. The most current version of the CDFW List of California Terrestrial Natural Communities (http://www.dfg.ca.gov/biogeodata/vegcamp/natural_comm_list.asp) indicates which natural communities are considered special status. Occurrences of these special status communities are tracked by the CNDDDB. The CNDDDB follows an old state system often referred to as the Holland System that does not correspond directly to the nationwide system used in the current preferred reference of *A Manual of California Vegetation, Second Edition* (Sawyer et al. 2009). Table 3.3-4 provides a list of proposed Project sites located within approximately 1 mile of sensitive communities as designated using the Holland system and recorded in the CNDDDB. The descriptions of all plant communities/ associations/ alliances within each study area were converted to the new system; therefore, there are no gaps in identification of sensitive communities due to nomenclature changes within the vegetation classification system.

Table 3.3-4: Sensitive Plant Communities Located within One Mile of Proposed Project Sites

Sensitive Community	Project Sites
California Walnut Woodland	AJT, ENT, OAT, PHN, SIM
Canyon Live Oak Ravine Forest	FRP, PMT, SUN, SUN2
Southern Coast Live Oak Riparian Forest	ENC1, FRP, JPK, JPK2, LACF072, LACFCP09, LPC, MTL2, VPK, WTR
Southern Cottonwood Willow Riparian Forest	LACFCP11, OAT
Southern Mixed Riparian Forest	OAT
Southern Riparian Scrub	LACFCP11
Southern Sycamore Alder Riparian Woodland	BUR, BUR1, BUR2, BUR3, FTP, GMT, GRM, H-68B, JOP, JPK, JPK2, LACFCP11, MTL2, PMT, SUN, SUN2, VPK, WMP, WTR
Southern Willow Scrub	BUR, BUR1, BUR2, BUR3, WMP
Valley Oak Woodland	OAT, WTR
Wildflower Field	TPK

In general, sensitive habitats listed in the CNDDDB focus on vernal pools and riparian woodland/forest. Some woodland habitats are also considered sensitive communities. The southern California black walnut occurs in Los Angeles County as solid stands or mixed most commonly with live oaks. It is affected by overgrazing and the increase in drought conditions. These conditions also result in less seedling survival. The black walnut community is important as wildlife habitat, with the nuts being eaten by squirrels and the tree utilized by many species of birds. Its range is limited to the Santa Clarita River drainage in the vicinity of Sulphur Mountain; small stands in the Simi Hills and Santa Susana Mountains; the north slope of the Santa Monica Mountains; and the San Jose, Puente, and Chino hills. This community is threatened by loss of habitat due to urbanization and its localized range.

North-facing slopes with canyons often contain woodland or riparian forest. The tree canopy at upper elevations is made up of canyon live oak (*Quercus chrysolepis*), a major component of the Southern Canyon Live Oak Riparian Forest. At lower elevations where the canyons open up to a sandy/gravelly wash, the vegetation is dominated by sycamore (*Platanus racemosa*) and white alder (*Alnus rhombifolia*) that comprise the Southern Sycamore-Alder Riparian Woodland.

On north-facing slopes of hillsides the dominant tree in the foothills of the Central Valley is the valley oak. The Valley Oak Woodland has an understory of chaparral species and nonnative grasses, primarily wild oats (*Avena* sp.). At lower elevations on inland mountains and coastal hills the canyons and north-facing slopes are dominated by coast live oak. This species may occur as a woodland (Southern Live Oak Woodland) or riparian forest (Southern Coast Live Oak Riparian Forest) in the canyons with permanent or ephemeral streams. These two communities were common at one time but have become rare due to the limited acreage of the linear habitat and the level of urbanization in Los Angeles County.

The most common tree species on the desert floor, especially at springs, washes, and rivers, is the Fremont cottonwood (*Populus fremontii*). It is the visually dominant species of the Southern Cottonwood Riparian Woodland. This tree occurs primarily in Los Angeles County on the desert foothills of the San Gabriel Mountains. Although this tree is widespread, wash habitat makes up a small portion of the desert. This tree is important nesting habitat for many species of migratory birds.

The wildflower fields plant community is not dominated by trees or shrubs but is composed of annual grasses and forbs. Grasslands and wetlands are the most disturbed habitats in North America. This community is dominated by nonnative grasslands when rainfall is early and by wildflowers when rains fall after February. The makeup of this community is affected by the frequency of fires and intensity of grazing by large mammals. This community has also been affected by the introduction of nonnative annuals that are better adapted to the increased disturbance. This community is best known by the showy state flower, the California poppy (*Eschscholzia californica*), which is greatly reduced in numbers over the last 100 years. In the spring, large patches of blue lupines and chia, yellow and white flowering composites, and a few perennial species form this community. Today the most common species are nonnative annual grasses (e.g., *Bromus*, *Hordeum*, and *Avena*) and red-stemmed filaree.

Critical Habitat and Essential Fish Habitat

Other sensitive habitats include critical habitat designated by USFWS under the authority of the ESA for threatened or endangered species and essential fish habitat designated by NMFS under the authority of the Magnuson-Stevens Fishery Conservation and Management Act (Section 3.3.2.1). Essential Fish Habitat includes all types of habitat where fish spawn, breed, feed, or grow to maturity and is identified for federally managed species. The term Essential Fish Habitat (EFH) is used as an overarching category. Within the study areas, three subcategories, or guilds of marine life, were identified: West coast highly migratory species (e.g., tuna, shark, swordfish), coastal pelagic species (e.g., krill, finfish, market squid), and Pacific coast groundfish (e.g., rockfish, flatfish, groundfish, sharks). The subcategories include just a

few to almost 100 different species and were therefore not identified individually. Table 3.3-5 lists those proposed Project sites within 1 mile of these sensitive habitats.

Table 3.3-5: Designated Critical Habitat and Essential Fish Habitat within One Mile of Proposed Project Sites

Critical Habitat/Essential Fish Habitat	Project Sites
arroyo toad	LACFCP11
Braunton's milk-vetch	GRM, PWT
California condor	TPK, WMP
California red-legged frog	WMP
coastal California gnatcatcher	H-17A, OAT, PHN, RIH, SDW
essential fish habitat	LEPS, TWR, ZHQ
Santa Ana sucker	MTL2
mountain yellow-legged frog- Southern California DPS	FRP
tidewater goby	ZHQ
western snowy plover	WS1, ZHQ

Critical habitat is a term defined and used in the federal ESA. It describes specific geographic areas essential to the conservation of an endangered or threatened species and that may require special management and protection. Critical habitat may also include areas that are not currently occupied by the species but will be needed for its recovery. Primary constituent elements are those physical and biological features of a landscape that a species needs to survive and reproduce. Only areas that contain the primary constituent elements required by the species are considered critical habitat.

These include:

- Space for individual and population growth and for normal behavior
- Cover or shelter
- Food, water, air, light, minerals, or other nutritional or physiological requirements
- Sites for breeding and rearing offspring
- Habitats that are protected from disturbances or are representative of the historical geographical and ecological distributions of a species

Federal agencies are required to consult with USFWS on actions they carry out, fund, or authorize to ensure that their actions will not destroy or adversely modify critical habitat.

3.3.1.4 Protected Wetlands

Wetlands are protected by federal and state statute (see Section 3.3.2). Protection under these regulations provides for specific permitting if direct or indirect impacts would occur to regulated wetlands. Various types of wetlands occur within the study areas. No wetlands occur within the

boundary of any proposed Project site. Table 3.3-6 identifies the types of wetlands recorded within each of the study areas.

Table 3.3-6: Type of Wetlands Located within Proposed Project Study Areas

Wetland Type	Proposed Project Site Study Area(s)
Freshwater/Forested Shrub Ephemeral and Riverine Ephemeral	AJT, ENC1, GRM, H-17A, JPK, JPK2, LACFCP09, LEPS, LPC, PHN
Riverine Concrete-lined Channel	ASD
Riverine Ephemeral	CPK, LACF072, LACFCP08, LACFCP11, PMT, PWT, SUN, SUN2, TOP, VPK
Freshwater/Forested Shrub Ephemeral	H-69B, OAT, SDW
Estuarine and Deep Water Marine	WS1
Freshwater Pond Ephemeral	SIM
Freshwater Forested/Shrub Wetland and Estuary and Marine	ZHQ

3.3.1.5 Wildlife Corridors and Nurseries

No wildlife nurseries or colonial breeding sites were identified or recorded in the vicinity of any proposed Project site. Wildlife movement corridors/habitat linkage areas have been designated under the authorities of local government, and are identified in Section 3.3.2.3. Those Project sites that are within 1 mile of a designated wildlife movement corridor are identified in Section 3.3.4.

3.3.1.6 Local Biological Resources Policies and Ordinances

Local policies and ordinances that contain protection measures for biological resources are described in this section. Those proposed Project sites that are within the area of jurisdiction for each plan are identified on a plan-by-plan basis.

Federal land management plans, state parks, local coastal plans, and Los Angeles County include protection of at least some biological resources within their general plans and policies, as do many local ordinances. Protection of native habitats may occur under various designations and may not be the primary intent of a particular ordinance or policy (e.g., dust control, protection of viewshed, hillside erosion management) but results in restricting impacts to native vegetation, wildlife, and wildlife habitats.

Angeles National Forest Land Management Plan- Sites BUR, BUR1, BUR 2, BUR3, FRP, GMT, JOP, JPK, JPK2, LACFCP09, LACFCP11, LPC, MML, MTL2, PMT, SUN, SUN2, TMT, WMP, and WTR

Sites located in the Angeles National Forest are under the administration of the U.S.D.A. Forest Service and subject to the Land Management Plan (LMP) for the Angeles National Forest (USDA 2006). A portion of the forest is now also being managed as the San Gabriel Mountains National Monument^[1] under the same plan. The Strategic Goals of the LMP identify goals applicable to biological resources that have potential applicability to proposed Project sites on the Angeles. These include:

^[1] San Gabriel Mountains National Monument was created by proclamation of President Obama on October 10, 2014.

- Goal: 2.1 – Reverse the trend of increasing loss of natural resource values due to invasive species.
- Goal 6.2 – Provide ecological conditions to sustain viable populations of native and desired nonnative species.

Santa Monica Mountains National Recreation Area General Management Plan – Sites LACFCP08 and PWT

The National Park Service finalized the SMNRA General Management Plan and EIS in 2002. Resource management goals in the SMMNRA GMP include protecting and enhancing species, habitat diversity and natural processes, and eradicating alien plant species.

Topanga State Park General Plan – Site GRM

Site GRM lies in Topanga State Park and would be subject to the Topanga State Park General Plan (California State Parks [CSP] 2012), which contains goals and guidelines for the management of natural resources within the park. These include specific guidelines to protect resources under the following topics: native plant communities and sensitive plant species, exotic plant control, wildlife, sensitive wildlife species, exotic animal control, and biocorridors. Specific guidelines applicable to biological resources are discussed below.

Native Plant Communities

- Goal: Promote and restore the sustainability of natural ecosystem processes by actively managing plant community health and development, while maintaining the protection of cultural resources. Efforts also will address the conservation of sensitive and unique species and the control of exotic invasive species
- Guidelines:
 - None identified that would be applicable to the proposed project

Sensitive Plant Species

- Goal: Perpetuate wildlife assemblages by protecting, restoring, and interpreting the native plant communities within the Park
- Guidelines:
 - Protect sensitive plant species, including those that are legally listed under federal and state laws as rare, threatened, or endangered or that are considered rare by the CDFG (now CDFW). In addition, CSP will protect those species that meet the legal requirements for listing but are not listed (i.e., California Native Plant Society List 1B taxa and the federal candidates for listing), and those considered locally sensitive or endemic to the area. Protection may include, but is not limited to, habitat preservation, seed banking, restoration/enhancement, and visitor education

- Avoid or minimize human activities that cause imbalances in the natural ecological system. Additionally, CSP shall conduct management activities, such as habitat restoration, that foster ecological balance

Exotic Plant Control

- Goal: Reduce the presence and further invasion of exotic species in the Park
- Guidelines:
 - None identified that would be applicable to the proposed Project

Wildlife

- Goal: Perpetuate wildlife assemblages by protecting, restoring, and interpreting the native terrestrial and aquatic animals within the Park
- Guidelines:
 - Avoid or minimize human activities that cause imbalances in natural ecological dynamics. Additionally, CSP will conduct management activities, such as habitat restoration, that foster ecological balance.
 - Ensure that the conservation of native wildlife is incorporated into all future developments, management plans, and visitor-use patterns throughout the Park and that the protection of sensitive species and habitats receives high urgency

Sensitive Wildlife Species

- Goal: Protect all sensitive wildlife species occurring in the Park including those legally listed under federal and state law as threatened or endangered, those that are Species of Concern (CDFG), and those considered locally sensitive or endemic to the area
- Guidelines:
 - Preserve sensitive species and habitats to encourage their recovery. Comply with state and federal environmental legislation, Recovery Plans, and Critical Habitat designations enacted to protect this disappearing biota

Exotic Animal Control

- Goal: Work to control exotic animals that are found to upset natural ecological dynamics of native species
- Guidelines:
 - None identified that would be applicable to the proposed project

Santa Catalina Island Local Coastal Plan – Sites BJM, DPK, and TWR

Sites BJM, DPK, and TWR are located on Santa Catalina Island. Biological resources on Santa Catalina Island are protected through the Santa Catalina Island Local Coastal Plan (LACDRP 1983). Under the Local Coastal Plan, biological resources in areas that have been designated as environmentally sensitive habitat areas (ESHAs) are afforded protection. These ESHAs, as identified in the Local Coastal Plan, are located in tidal areas, marine waters, and areas containing rare plants. The Local Coastal Plan also affords ESHA-level protection to lands that are privately owned. Sites BJM, DPK, and TWR are owned by the Santa Catalina Islands Conservancy, a private non-profit entity, and therefore the ESHA-level protection afforded in the Local Coastal Plan is considered applicable to these sites. Underpinning the policies of the Santa Catalina Island Local Coastal Plan, California PRC Section 30240 stipulates that ESHAs be protected against any significant disruption of habitat values, and that only uses dependent on those resources shall be allowed within ESHAs, and that development in areas adjacent to ESHAs shall be sited and designed to prevent impacts which would significantly degrade those areas and shall be compatible with the continuance of those habitat and recreation areas.

Policies protecting biological resources within the Santa Catalina Island Local Coastal Plan include those described below. Some of the policies have been abridged to focus on relevant portions of these policies:

- Policy 3: No further introductions of any nonnative animal including fish, reptiles, amphibians, birds, and mammal should be made to any part of Santa Catalina Island.
- Policy 11: Establish grading and other construction site procedures designed to minimize erosion.
- Policy 20: Control the most threatening nonnative weeds by manual removal and topical application of weed killers on a localized level.

Santa Monica Mountains Local Coastal Program Land Use Plan and Local Implementation Program - Sites CPK, ENC1, H-69B, LACF072, SPN, and TOP

Sites CPK, ENC1, H-69B, LACF072, SPN, and TOP would be subject to the Santa Monica Mountains LCP Land Use Plan (LACDRP 2014b) and Local Implementation Program (LIP) (LACDRP 2014c). Map 2, Biological Resources of the land use plan, identifies at a landscape level Significant Ecological Resource Areas (SERAs) where development is either prohibited or strictly regulated. Policies contained within Goal CO-2 of the plan offer protection of SERAs as a priority over other development standards in the LIP. SERAs are subdivided into two Habitats: H1 Habitat (containing the highest biological significance, rarity, and sensitivity), H2 Habitat (less sensitive). H3 Habitat consists of disturbed or isolated habitat areas that provide some important biological functions, but do not rise to a level of a SERA. A subcategory of H2 habitat is H2 “High Scrutiny” habitat. H2 High Scrutiny habitat contains more sensitive resources and given greater protection than H2 Habitat. Environmental review policies which provide protection to areas within 200 feet of H1 Habitat are also included in the LCP land use plan.

Not included in SERAs but identified on Map 2 as “Other Environmental Resource” are H1 Habitat Quiet Zones (100-foot buffers around H1 Habitat) and H3 Habitat. H3 Habitat is the least sensitive of the habitat types and includes areas where the native vegetation communities have been significantly disturbed or removed as part of lawfully established development, areas of native vegetation that are not significantly disturbed but have been substantially fragmented, and areas containing structures and other existing development.

City of Malibu Local Coastal Program Land Use Plan and Local Implementation Program, and City of Malibu General Plan – Sites LEPS and ZHQ

Sites LEPS and ZHQ are within the corporate limit of the City of Malibu. Biological resources at these sites are managed under the City of Malibu Land Use Plan (City of Malibu 2002a) and Local Implementation Plan (City of Malibu 2002b), and the City of Malibu General Plan (City of Malibu 1995).

The City of Malibu Local Coastal Program consists of an LUP and a Local Implementation Plan. The LUP includes Coastal Act policies and LUP policies. The Coastal Act policies cite specific Coastal Act regulations from the California PRC that include defining environmentally sensitive areas (Section 30107.5) and defining and regulating ESHAs (Section 30240). The Land Use Plan policies include ESHA designation and ESHA protection. It also establishes buffers around certain ESHAs.

The City of Malibu General Plan contains a Conservation Element which, in turn, contains conservation goals. The plan’s CON GOAL 1, Natural Resources Preserved and Protected, includes three objectives applicable to biological resources, each of which contains conservation policies. The objectives and abridged policies from the Conservation Element are provided below.

- CON Objective 1.1: Natural Resources Managed in Accordance with this Comprehensive Natural Resources Protection and Management Plan
 - Con Policy 1.1.1: The city shall minimize disruption of natural systems and areas rich in biodiversity and avoid consumption of ecologically sensitive lands (e.g., Resource Protection Areas including ESHAs, and disturbed sensitive resource areas)
 - Con Policy 1.1.3: The city shall protect and preserve and, where reasonable and feasible, reclaim the delicately balanced ecosystem of the Santa Monica Mountains and adjacent coastline area.
 - Con Policy 1.1.4: The city shall protect Environmentally Sensitive Habitat Areas (ESHAs) as a priority over development and against any significant disruption of habitat values.
 - CON Policy 1.1.5: The city shall protect and reclaim Malibu’s threatened natural resources such as the beaches, estuaries, intertidal zone and marine habitats, estuaries, marine life, ocean, tidepools, streams, waterfalls, wetlands, and wildlife and plant life and their habitats.
 - CON Policy 1.1.6: The city shall restore Disturbed Sensitive Resource Areas (DSRAs), to the extent feasible and ecologically desirable.

- CON Policy 1.1.8: The city shall protect land formations and soils by avoiding vegetation removal in Resource Protection Areas and in other areas of high potential erosion hazard.
- CON Objective 1.2: Wildlife and Biota Resources Preserved, Protected, and Reclaimed.
 - CON Policy 1.2.4: The city shall regulate removal of vegetation in ESHAs.
 - CON Policy 1.2.5: The city shall discourage plant species which are invasive in the Santa Monica biogeographic area where such invasive plant species would degrade native plant communities.
 - CON Policy 1.2.6: The city shall discourage the use of insecticides, herbicides, or toxic chemical substances (excepting non-regulated home pesticides) within the city or if ESHAs, raptors, and other animals could be adversely affected, except in an emergency which threatens wildlife or the habitat itself.
 - CON Policy 1.2.7: The city shall reduce impacts resulting from night lighting so as not to disturb natural habitats.
- CON Objective 1.3: Marine and Beach Resources Preserved, Protected, Enhanced, and Reclaimed
 - CON Policy 1.3.5: The city shall protect all sea birds/shore birds and their nesting and roosting sites in ESHAs.
 - CON Policy 1.3.11: The city shall control surface runoff and associated pollutant loads into coastal waters, wetlands, and riparian areas.

County of Los Angeles General Plan - Sites OAT, PHN, RIH, SIM, and TPK

The Los Angeles County General Plan (LACDRP 2015b) includes a Conservation and Natural Resources Element that guides the long-term conservation of natural resources and preservation of available open space areas in unincorporated Los Angeles County. Goal C/NR3 of this element calls for permanent, sustainable preservation of genetically and physically diverse biological resources and ecological systems including habitat linkages, forests, coastal zone, riparian habitats, streambeds, wetlands, woodlands, alpine habitat, chaparral, shrublands, and Significant Ecological Areas (SEAs). The policies or portions of policies potentially affecting biological resources at Project sites include:

- Policy C/NR 3.1. Conserve and enhance the ecological function of diverse natural habitats and biological resources
- Policy C/NR 3.8. Discourage development in areas with identified significant biological resources such as SEAs
- Policy C/NR 3.9 (abridged). Consider the following in the design of a project that is located within an SEA, to the greatest extent feasible:

- Preservation of biologically valuable habitats, species, wildlife corridors and linkages
- Protection of sensitive resources on the site within open space
- Placement of the development in the least biologically sensitive areas on the site (prioritize the preservation or avoidance of the most sensitive biological resources on site)
- Consideration of the continuity of on-site open space with adjacent open space in project design

City of Chino Hills General Plan – Site AJT

Site AJT is located within the City of Chino Hills in San Bernardino County. The City of Chino Hills General Plan (City of Chino Hills 2015) contains a Conservation Element that includes goals, policies, and actions that protect biological resources. These are discussed below:

- Goal CN-1: Preserve Chino Hills’ Rural Character
 - Policy CN-1.1: Preserve and protect Chino Hills’ rural and natural scenic qualities
 - Action CN-1.1.8: Preserve existing significant trees where feasible and extensively plant new trees consistent with City tree policies
 - Policy CN1-2: Preserve and protect Chino Hills’ biological resources
 - Action CN-1.2.1: Preserve natural open spaces that act as wildlife corridors
 - Action CN-1.2.2: Discourage new development in areas that contain sensitive, rare, or endangered species, oak woodlands, chaparral, and riparian habitats
 - Action CN-1.2.4: Require City approval to remove trees that in the opinion of the City function as an important part of the City’s or a neighborhood’s aesthetic character

Local Land Use Plans and Ordinances

The Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such local plans, policies, and regulations are not applicable to the Project. Nevertheless, in the exercise of its discretion and in the interest in working cooperatively with local jurisdictions, this Draft EIR references, describes, and addresses local land-use plans, policies, and regulations. The Draft EIR takes this approach in recognition that such plans, policies, and regulations reflect the local community’s policy decisions with respect to appropriate uses of land in the area. Consideration of these plans, policies, and regulations assists in determining whether the proposed Project may conflict with nearby land uses, which could affect the analysis of whether the proposed Project would result in potentially significant environmental impacts.

City of Agoura Hills General Plan – Site AGH

Section C of Chapter 4 of the Agoura Hills General Plan (City of Agoura Hills 2010) addresses biological resources. Goal NR-4 includes protection of and enhancement of open space, natural areas, and significant wildlife and vegetation to sustain natural ecosystems that contribute to the quality of life and character of Agoura Hills. Policy NR-4.2 “Conserve Natural Resources,” of the general plan stipulates continuance of enforcement of ordinances in new and existing development at an appropriate distance from ridgelines, oak trees, and other environmental resources to prevent erosion, preserve viewsheds, and protect the natural contours of the land. Oak trees scattered throughout the city are protected by the City of Agoura Hills Oak Tree Ordinance.

City of Beverly Hills General Plan – Site WAD

Site WAD is located in the City of Beverly Hills. The city’s General Plan (City of Beverly Hills 2010) open space element requires new construction to minimize disturbance of native vegetation on slopes. One local regulation goal is to maintain the status quo of native vegetation. Another relevant goal is the protection of heritage and other important trees.

City of Calabasas 2030 General Plan – Site ENT

Site ENT is located in the City of Calabasas. The City of Calabasas 2030 General Plan (2015) contains a Conservation Element, which includes several policies identified at protecting biological resources. These include:

- Policy IV-2. Ensure that new developments, including roads, maintain the biotic habitat value of riparian areas, oak woodlands, habitat linkages, and other sensitive biological habitats. Specifically, the following are unacceptable biological impacts:
 - Net loss of wetlands or riparian vegetation
 - Measurable reduction in species diversity
 - Loss of breeding and roosting areas, foraging areas, habitat linkages, or food sources that will result in a measurable reduction in the reproductive capacity of biotic resources
- Policy IV-3. Require new developments on properties that include sensitive biotic habitats to cluster development in the least sensitive portions of the property and preserve and/or restore the most sensitive resources without creating urban development patterns in rural areas
- Policy IV-6. Require separation of construction activities from sensitive biological resources through the use of buffers, setbacks, and temporary protective fencing
- Policy IV-7. Regulate construction activities to eliminate potentially destructive practices that adversely affect environmentally sensitive areas
- Policy IV-9. Continue to enforce the city’s oak tree ordinance

City of Cerritos General Plan – Site ASD

The City of Cerritos General Plan (2004) does not include specific policies to protect other biological resources associated with the proposed Project.

City of Glendale General Plan – Sites FTP and VPK

Sites FTP and VPK are located within the City of Glendale. Policy 1 of the Conservation Element of the City of Glendale General Plan (City of Glendale 2005) promotes the maintenance and restoration of natural resources.

City of Monterey Park General Plan – Site LARICSHQ

Site LARICSHQ is in the City of Monterey Park. The Monterey Park General Plan’s Resources Element (City of Monterey Park 2015) directs policy toward preserving natural resources such as forests, wildlife habitat, or agricultural lands in the urban environment of Monterey Park. These resources include city parks and other improved open space areas, historic resources, water resources, and air quality. There are no specific policies towards biological resources.

City of Palmdale General Plan – Site MMC

The City of Palmdale’s General Plan (1993, 2014a) is consistent with and implements the West Mojave Habitat Conservation Plan (WEMO). In addition, the city has adopted Ordinance No. 952, referred to as the Native Desert Vegetation Ordinance, which is designed to preserve high quality California juniper and Joshua trees that add to community identity and to encourage the use of native vegetation in new development landscaping. The city hillside ordinance protects hillsides with a 10 percent or greater slope from intensive development. The General Plan’s Environmental Resource Goals include preserving open space areas (Goal ER1) and significant ecological resources (Goal ER2) including sensitive flora and fauna habitat areas. Relevant objectives include preserving SEAs and complying with the state and federal endangered species’ acts.

City of Pasadena General Plan – Site PASPD01

Goals outlined in the City of Pasadena’s General Plan (2004) include protecting, restoring, and maintaining native wildlife, native vegetation, and habitat connectivity. Another relevant biological goal is to protect the urban forest on public and private lands.

City of San Dimas General Plan – Site SDW

Site SDW is within the City of San Dimas. The City of San Dimas General Plan (1991) contains a Conservation Element that contains goals and policies addressing biological resources. Goal Statement 1 “*Manage and Conserve San Dimas’ Natural Resources which Contribute and Enhance the Quality of Life*” is the only goal specifically addressing biological resources not associated with residential development. No specific policies associated with proposed Project activities were identified.

City of Santa Monica General Plan – Site WS1

The City of Santa Monica General Plan includes a Conservation Element (1975) that addresses land acquisition for open space, trail improvements, and protection of known biological resources including sensitive species and riparian habitats. The city’s main open space effort is to improve the quality of parks and open space and link them as corridors when possible.

City of Signal Hill General Plan – Site SGH

The City of Signal Hill’s General Plan’s Environmental Resource Element Goal 5 (City of Signal Hill 1989), promotes minimal degradation to the physical environment from development and operations and requires restoration; particularly focusing on air quality, water quality, and hazardous chemicals. There are no goals specific to biological resources.

City of West Hollywood General Plan – Site PDC

The City of West Hollywood’s General Plan (2011) focuses on water supply and energy conservation as well as green building, climate change, and air quality. There are no goals relating to biological resources as the city is built-up and does not contain native habitat.

City of Whittier General Plan – Site H-17A

Site H-17A lies within the City of Whittier. The City of Whittier General Plan (2014) includes an Environmental Resources Management Element that contains goals and policies addressing biological resources. The Environmental Resources Management Element includes Goal 1 “*Preserve or conserve natural and cultural resources that have scientific, educational, economic, aesthetic, social, and cultural value.*” Policy 1.2 encourages practices that stress soil conservation as a means to retain native vegetation, and Policy 1.3 strives to preserve adequate open space for major habitat types. The site includes a water tower, paved road, and two existing communication towers and an old Nike missile site.

3.3.1.7 Habitat Conservation Plans and Natural Community Conservation Plans

Only one plan has been identified that is within the boundary or study area of proposed Project sites. This is the West Mojave Conservation Management Plan. The main goal of the West Mojave Plan (WEMO) is to protect and manage over 100 listed or sensitive species and puts special emphasis on the desert tortoise and the Mohave ground squirrel. Plan objectives include protecting large habitat blocks, avoiding human impacts on conservation areas, considering habitat specialists in conservation efforts, maintaining biodiversity, and providing a streamlined process for incidental take permits. Site MMC is in the WEMO planning area, specifically within the City of Palmdale. Protections afforded biological resources in the City of Palmdale, a signatory to the WEMO, include conservation measures for several species. Many of these measures are activity-specific (i.e., construction of electrical transmission lines). None of the species protected in the WEMO are known to occur at Site MMC.

3.3.2 Regulatory Setting

3.3.2.1 *Federal Regulatory Setting*

Federal Endangered Species Act (16 United States Code [U.S.C.] § 1531 et seq.)

The federal Endangered Species Act of 1973 (ESA) provides for the protection of plant and wildlife species listed by the federal government as endangered or threatened, and “the ecosystems upon which they depend.” An “endangered” species is one that is “in danger of extinction” throughout all or a significant portion of its range. A “threatened” species is one that is “likely to become endangered” within the foreseeable future (16 U.S.C. §1532.) Pursuant to Section 9 of the ESA (codified at 16 U.S.C. §1538), it is unlawful for any person to “take” a federally listed species. “Take,” as defined by the ESA, “means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct.” This can also include the modification of a species’ habitat. For plants, this statute governs removing, possessing, maliciously damaging, or destroying any listed plant on federal land and removing, cutting, digging up, damaging, or destroying any listed plant on non-federal land in knowing violation of state law (16 U.S.C. § 1538(c)). When non-federal entities such as states, counties, local governments, and private landowners wish to conduct an otherwise lawful activity that might incidentally, but not intentionally, “take” a listed species, an incidental take permit (issued pursuant to ESA § 10(a)(1)(B)) must first be obtained from USFWS (or NMFS), through the development of a habitat conservation plan. Under Section 7 of the ESA, federal agencies involved in the action must consult with USFWS and/or NMFS if the federal agencies determine that their actions may affect listed species or critical habitat. Section 7 and its implementing regulations direct all federal agencies to ensure that any action they authorize, fund, or carry out does not jeopardize the continued existence of an endangered or threatened species, or result in the destruction of adverse modification of designated or proposed critical habitat. The regulations for implementation, 50 CFR Part 402, specify how federal agencies are to fulfill their Section 7 consultation requirements. To accomplish this, federal agencies must request from the USFWS a list of species and critical habitat that may be in the study area; or they can request concurrence with their species list. Once a species list is obtained or verified as accurate, agencies need to determine whether actions may affect any of those species or their critical habitat. This consultation will conclude either informally with written concurrence from USFWS or through formal consultation with a No Jeopardy Biological Opinion provided to the federal agency.

Migratory Bird Treaty Act (16 U.S.C. §§ 703 - 712)

The Migratory Bird Treaty Act of 1918 (MBTA) protects species of native migratory birds listed under the MBTA. Specific provisions in the statute include a federal prohibition, except as allowed under specific conditions, to: “pursue, hunt, take, capture, kill, attempt to take, capture or kill, possess, offer for sale, sell, offer to purchase, purchase, deliver for shipment, ship, cause to be shipped, deliver for transportation, transport, cause to be transported, carry, or cause to be carried by any means whatever, receive for shipment, transportation or carriage, or export ...any migratory bird, included in the terms of the conventions.” The prohibitions apply to migratory birds (including any part, nest, or egg) listed

pursuant to the United States' conventions (treaties) with Great Britain, Mexico, Japan, and the Soviet Union (now Russia) (16 U.S.C. § 703).

Bald and Golden Eagle Protection Act (16 U.S.C. § 668c)

The Bald and Golden Eagle Protection Act of 1940 (BGEPA) provides for the protection of bald and golden eagles. The BGEPA establishes criminal penalties for persons who “take, possess, sell, purchase, barter, offer to sell, purchase or barter, transport, export or import, at any time or any manner, any bald eagle ... or any golden eagle, alive or dead, or any part, nest, or egg thereof.” The BGEPA implementing regulations define “take” as “pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb.”

Clean Water Act of 1972

Enacted in 1972, the federal Clean Water Act (CWA) and subsequent amendments outline the basic protocol for regulating discharges of pollutants to waters of the United States. It is the primary federal law applicable to water quality of the nation's surface waters, including lakes, rivers, and coastal wetlands. Enforced by the U.S. Environmental Protection Agency (USEPA), it was enacted “... to restore and maintain the chemical, physical, and biological integrity of the Nation's waters.” The CWA authorizes states to adopt water quality standards and includes programs addressing both point and non-point pollution sources. The CWA also established the National Pollutant Discharge Elimination System (NPDES), and provides USEPA the authority to implement pollution-control programs, such as setting wastewater standards for industry and water quality standards for surface waters (see below for a discussion of the NPDES program). In California, programs and regulatory authority under the CWA have been delegated by USEPA to the State Water Resources Control Board (SWRCB) and its nine Regional Water Quality Control Boards (RWQCBs). Under Section 402 of the CWA, potential discharges are regulated by the NPDES permit process, which requires projects that disturb one or more acres to obtain NPDES coverage under the General Permit for each state (CWA Section 402). The SWRCB and RWQCBs have also developed numeric and narrative water quality criteria to protect beneficial uses of state waters and waterways.

Section 401 – Water Quality Certification

Section 401 of the CWA specifies that, for any activity that may result in a discharge into waters of the United States, the SWRCB or applicable RWQCB must certify that the discharge will comply with state water quality standards, including beneficial uses (23 CCR 3830, et seq.). Under California's policy of no net loss of wetlands, the SWRCB and RWQCBs require mitigation for dredge and fill impacts to wetlands and waterways. Dredge and fill activities in wetlands and waterways that impact waters of the United States require a federal Section 404 permit from the U.S. Army Corps of Engineers (USACE). Before a Section 404 permit can be issued, a Section 401 certification must first be obtained from the RWQCB.

Section 404 – Permitting for Dredge and Fill Activities in Wetlands and Waters of the United States

USACE is responsible for issuing permits under CWA Section 404 for placement of fill or dredged material in waters of the United States and jurisdictional wetlands. In general, “waters” is a term used to denote the USACE jurisdictional limits under CWA Section 404. “Waters” include oceans, bays, rivers, streams (including non-perennial streams with a defined bed and bank), lakes, ponds, and seasonal and perennial wetlands. Navigable rivers, streams, washes, natural ponds, lakes, bays, wetlands, and certain canals have historically been considered “waters.” New regulations known as the Clean Water Rule recently redefined “waters” and was published in the Federal Register (40 CFR 230.3) on June 29, 2015, effective August 28, 2015. Since its publication, numerous lawsuits have been filed challenging the regulation. The U.S. Court of Appeals for the Sixth Circuit issued a nationwide stay of the new regulation on October 9, 2015. The USEPA and USACE are currently enforcing prior regulations defining “waters” (USEPA 2015a). Project proponents must obtain a permit from USACE for all discharges of fill or dredged material before proceeding with a proposed activity. USACE may issue either an individual permit or a general permit. General permits are preauthorized at the regional or national level and are issued to cover activities expected to result in only minimal adverse environmental effects (e.g., Los Angeles District Regional General Permit No. 63 for Repair and Protection Activities in Emergency Situations). Nationwide Permits (NWP) are a type of general permit issued to cover activities that USACE has determined to have minimal adverse effects, such as routine maintenance (Nationwide Permit 3) or utility line activities (Nationwide Permit 12). Each NWP specifies particular conditions that must be implemented by the permittee, including impact thresholds. NWP are typically limited to projects of less than 0.5 acre of permanent impacts to waters of the United States for each single and complete project. If an NWP does not apply to a project, a project is required to obtain an individual permit.

Magnuson-Stevens Fishery Conservation and Management Act

The Magnuson-Stevens Fishery Conservation and Management Act (MSA), as amended by the Sustainable Fisheries Act of 1996 (Public Law 104-267), requires federal agencies to consider activities that may adversely affect Essential Fish Habitat (EFH) designated for certain marine species (e.g., groundfish [a guild of bottom-dwelling marine fishes], salmonids, pelagic species, and highly migratory species). The objective of an EFH assessment is to determine whether the proposed action(s) “may adversely affect” designated EFH for relevant commercial, federally managed fisheries species. For the proposed Project, these species are identified in the Pacific Coast Groundfish Fishery Management Plan. It also describes conservation measures proposed to avoid, minimize, or otherwise offset any identified potential effects to designated EFH resulting from proposed activities. The coastal Pacific Ocean and several harbors and bays in southern California have been designated as EFH for groundfish by NMFS. Habitat areas of particular concern (HAPCs), a subset of EFH, also occur in southern California. Along coastal Los Angeles County, these include estuarine, sea grass, and rocky reef HAPCs (NMFS 2015).

Coastal Zone Management Act

The federal Coastal Zone Management Act (CZMA) of 1972 applies to federal activities, development projects, permits and licenses, and similar project activities that would be located within coastal

resources or have the potential to affect them. Congress later delegated coastal resource management to states' coastal management programs. See the California Coastal Act under Section 3.3.2.2 State Regulatory Setting.

3.3.2.2 State Regulatory Setting

California Fish and Game Code Sections 1600-1616, Lake and Streambed Alteration Program

Sections 1600-1616 of the FGC protect the natural flow, bed, channel, and bank of any river, stream, or lake designated by the CDFW in which is present, at any time, any existing fish or wildlife resources, or benefit for the resources. CDFW regulates activities that could alter the flow, bed, banks, channel or associated riparian areas of a river, stream or lake—all considered “waters of the State.” The law requires any person, state or local governmental agency, or public utility to notify CDFW before beginning an activity that may substantially modify a river, stream, or lake. A Lake or Streambed Alteration Agreement may be required for any project that would:

- Divert, obstruct, or substantially change a streambed
- Use material from the streambed
- Alter the bed, banks, channel, or the adjacent riparian vegetation of a streambed
- Result in the disposal, or deposition of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can flow into a stream

California Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act of 1967 (Cal. Water Code § 13000, et seq.) requires the SWRCB and the nine RWQCBs to adopt water quality criteria to protect State waters. These criteria include the identification of beneficial uses, narrative and numerical water quality standards, and implementation procedures. The RWQCBs have the responsibility of granting NPDES permits for stormwater runoff from construction sites. In addition, the Porter-Cologne Act also covers non-federal waters of the State that may not be subject to requirements of the CWA, such as isolated waters. For fill or dredging impacts to only isolated waters of the State, the RWQCBs may issue Waste Discharge Requirements; otherwise, the CWA Section 401 Water Quality Certification (described above) typically addresses both waters of the State and waters of the United States.

California Coastal Act

In 1976, the California State Legislature passed the California Coastal Act (CCA), which established a comprehensive coastal protection program and secured the California Coastal Commission's (CCC's) role as the state agency responsible for the protection of coastal resources. The CCA provides for the transfer of most of the authority to local governments through adoption and certification of Local Coastal Programs (LCPs). The LCPs contain the rules for future development and protection of coastal resources, including appropriate location, type, and scale of new or changed uses of land and water.

Each LCP includes a land use plan and measures to implement the plan (such as zoning ordinances) (CCC 2014). Once an LCP has been certified, a local government may issue coastal development permits.

The CCC is tasked with protection of coastal resources, including shoreline public access and recreation, lower-cost visitor accommodations, terrestrial and marine habitat protection, visual resources, landform alteration, agricultural lands, commercial fisheries, industrial uses, water quality, offshore oil and gas development, transportation, development design, power plants, ports, and public works. Development in the coastal zone usually requires a coastal development permit. Development activities include, but are not limited to, construction of buildings, divisions of land, and activities that change the intensity of use of land or public access to coastal waters. The CCC issues coastal development permits, although a local agency takes over this responsibility once an LCP has been certified by the CCC (CCC 2001; Government Printing Office 1977).

California Endangered Species Act (California Fish and Game Code § 2050, et seq.)

The CESA generally parallels the provisions of the federal ESA, and states that “all native species of fishes, amphibians, reptiles, birds, mammals, invertebrates, and plants, and their habitats, threatened with extinction and those experiencing a significant decline which, if not halted, would lead to a threatened or endangered designation, will be protected or preserved.” The CDFW administers the CESA and has committed itself to work with all interested persons, agencies, and organizations to protect and preserve such sensitive resources and their habitats.

Under the CESA, “endangered” is defined as “a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range;” and “threatened” is defined as “a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts.” “Take” is defined as “to hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill” an individual of a species; the definition does not include “harm” or “harass,” as the federal ESA does. As a result, the threshold for a take under the CESA is higher than that under the federal ESA.

Consistent with the CESA, CDFW has established lists of endangered, threatened, and candidate species that may or may not also be included on federal ESA list. Pursuant to FGC Section 2081, CESA allows for incidental take permits to otherwise lawful development projects that could result in the take of a state-listed threatened or endangered species. The application for an incidental take permit under Section 2081(b) has a number of requirements, including the preparation of a mitigation plan. CESA emphasizes early consultation to avoid potential impacts to rare, endangered, and threatened species and to develop appropriate mitigation planning to offset project-caused losses of listed species.

Native Plant Protection Act (California FGC §§ 1900-1913, § 2062 and § 2067)

The CNPPA identifies the types of plant species eligible for state listing. Eligible species include those identified by CRPR 1A, 1B, 2A, and 2B and that meet the definitions of Section 1901, Chapter 10 (CNPPA) or Sections 2062, 2067, and 2068 (CESA) of the FGC. Plants ranked as CRPR 3 or 4 do not necessarily meet the criteria for endangered, rare, or threatened in CEQA Guidelines Section 15380 but can be addressed in CEQA documents depending on the circumstances and professional opinion of the biologist conducting the assessment. CRPR definitions are as follows:

- 1A: Plants presumed to be extinct because they have not been seen or collected in the wild in California for many years. This rank includes plants that are presumed extinct in California as well as those plants that are presumed extirpated in California. A plant is extinct in California if it no longer occurs in or outside of California. A plant that is extirpated from California has been eliminated from California but may still occur elsewhere in its range.
- 1B: Plants are rare throughout their range, with the majority of them endemic to California. Most of the plants of CRPR-1B have declined significantly over the last century.
- 2: Plants that are rare throughout their range in California but are more common beyond the boundaries of California. CRPR 2-recognizes the importance of protecting the geographic range of widespread species.
- 3: A review list for plants for which there is inadequate information to assign them to one of the other lists or to reject them.
- 4: A watch list for plants that are of limited distribution or infrequent throughout a broader area in California and their vulnerability or susceptibility to threat appears relatively low at this time.

California FGC Sections 3500-3516

California FGC Section 3513 furthers the intent of the MBTA by prohibiting any take or possession of birds in California that are designated by the MBTA as migratory non-game birds, except as allowed by federal rules and regulations promulgated pursuant to the MBTA. In addition, FGC Sections 3503, 3503.5, 3511, further protect nesting birds and their parts, including passerine birds, raptors, and state “fully protected” birds. These regulations protect almost all native nesting birds.

California FGC Sections 3511, 4700, 5050, and 5515

California FGC Sections 3511, 4700, 5050, and 5515 list the bird, mammal, reptile, amphibian, and fish species that are identified as “fully protected.” Fully protected wildlife may not be harmed, taken, or possessed. The classification of “fully protected” was California’s initial effort to identify and provide additional protection to those wildlife that were rare or faced possible extinction. Lists were created for fish, amphibians and reptiles, birds, and mammals. Most of the species on these lists have subsequently been listed under the CESA and federal ESA: white-tailed kite, golden eagle, trumpeter swan, northern elephant seal, and ring-tailed cat are the exceptions. The white-tailed kite and the golden eagle are

tracked in the California Natural Diversity Database (CNDDDB); the trumpeter swan, northern elephant seal, and ring-tailed cat are not. Incidental take of fully protected species may be authorized through approved Natural Community Conservation Plans (FGC Sections 2805(e), 2835). California Desert Native Plants Act, Food and Agricultural Code Sections 80071-80075

The California Desert Native Plants Act was passed in 1981 to protect non-listed California desert native plants from unlawful harvesting on both public and privately owned lands. Harvest, transport, sale, or possession of specific native desert plants is prohibited unless a person has a valid permit, or wood receipt, and the required tags and seals. Native plants declared to be rare, endangered, or threatened by federal or state law or regulations are exempt from this act.

3.3.2.3 Local Regulatory Setting

In addition to the federal and state regulations aimed at the protection of biological resources, counties and cities with jurisdiction of Project sites typically acknowledge the values of natural resources and their contributions to the quality of local communities in planning documents or the municipal code. Planning documents may reiterate the importance of coastal resource areas (CRAs) or other special designations (e.g., SEAs) but recognize the state or federal regulatory agency role in implementation and compliance of the laws and regulations. Ordinances and identified permit requirements specific to local jurisdictions and that may apply to the proposed Project are noted below. Applicable local regulations are identified by Project site in Chapter 4.

Los Angeles County

Hillside Management and Significant Ecological Areas Ordinance

A Significant Ecological Area (SEA) designation is given to land that contains irreplaceable biological resources. Individual SEAs include undisturbed or lightly disturbed habitat supporting valuable and threatened species, linkages, and corridors to promote species movement and are sized to support sustainable populations of its component species. The objective of the SEA Program is to preserve the genetic and physical diversity of the county by designing biological resource areas capable of sustaining themselves into the future. The SEA ordinance is the primary mechanism that the County uses to regulate development within the SEAs. Properties mapped within, or partially within, an adopted SEA are subject to the rules in the SEA ordinance, in addition to other applicable regulations of the zoning code. Conditional use permits are required for most development within SEAs to protect resources contained in significant ecological areas and in hillside management areas as specified in the County General Plan from incompatible development (LACDRP 2014, 2015).

City of Agoura Hills

Oak Tree Permit

The policy of the City of Agoura Hills is to require the preservation of all oak trees unless compelling reasons justify the removal of such trees. The regulations specify that no person, partnership, firm, corporation, government agency, or other legal entity shall cut, prune, remove, relocate, endanger or

damage any tree protected by the municipal on any public or private land located within the incorporated areas of the City of Agoura Hills except in accordance with the conditions of a valid oak tree permit. An oak tree permit is required prior to cutting or removing an oak tree with a diameter greater than 2 inches measured at 42 inches above the natural grade (City of Agoura Hills 2015).

City of Glendale

Indigenous (Protected) Tree Permit

City ordinance number 5719 (adopted December 7, 2010) amended Chapter 12.44 of the City Code, which provides for the protection of indigenous oak, bay, and sycamore trees within the city. A permit is required of any person who proposes to cut, remove, encroach upon, or relocate a protected indigenous tree if the trunk of the tree is more than 6 inches in diameter when measured 54 inches above the lowest point where the tree meets the soil (City of Glendale 2015).

City of Lancaster

Biological Impact Fee

To address the incremental effect of new development on biological resources, including loss of habitat and reduction in total numbers of flora and fauna on a regional basis, the City of Lancaster imposes a biological impact fee on new development of land within the city. Chapter 15.66 of the municipal codes establishes the adoption, collection, administration, and use of the biological impact fee (City of Lancaster 2015).

City of Palmdale

Joshua Tree and Native Desert Vegetation Preservation

Chapter 14.04 of the Palmdale municipal code specifies that development projects should strive to protect and maintain the most desirable and significant of the healthy desert vegetation in a manner consistent with the City General Plan and CEQA (Ordinance 952 §2, 1992) (City of Palmdale 2015).

3.3.3 Significance Criteria

The proposed Project would have a significant impact on biological resources if any of the following significance criteria, based on Appendix G of the CEQA Guidelines, are met. Impact thresholds are established for each criterion to determine significance.

- 1) Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS, or on any species that meets the criteria in CEQA Guidelines Section 15380 for endangered, rare or threatened?

Significance Threshold: The project would result in a significant impact if the project construction and/or operational impacts would have a substantial adverse effect on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or

regulations, or by the CDFW, USFWS, or other land administering agency (for lands under its jurisdiction), or any species that meets the CEQA Guidelines criteria for endangered, rare, or threatened. A substantial adverse effect would occur if the proposed Project resulted in injury, loss, or mortality of individuals; disturbance that could result in disruption of life functions; if impact(s) to habitat would result in a local decline in the species' distribution or the suitability of that habitat to support the local population of that plant or animal species at current levels; or for migratory birds, if Project activities are out of compliance with the voluntary guidelines issued by the USFWS Office of Migratory Birds (USFWS 2013a) for communications tower placement, construction, and operation.

- 2) Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by the CDFW or USFWS?

Significance Threshold: The project would result in a significant impact if the project construction and/or operational impacts would have a substantial adverse effect on any riparian or wetland habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the CDFW or USFWS. An adverse effect would include altering the function of or ecological processes associated with these special natural communities; or the loss of an individual mature deciduous riparian tree or the alteration of other natural features (e.g., vernal pool) that would require an extended period of time to replace.

- 3) Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Significance Threshold: The project would result in a significant impact if the project construction and/or operational impacts would cause the direct removal, filling, or hydrological interruption of federally protected wetlands or waters of the United States as defined by Section 404 of the Clean Water Act.

- 4) Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Significance Threshold: The project would result in a significant impact if the project construction and/or operational impacts would result in a new permanent barrier within known migratory and/or wildlife movement corridors; or would interfere substantially with the movement of any native resident or migratory fish or wildlife species, disrupt established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

- 5) Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Significance Threshold: The project would result in a significant impact if the construction and/or operation of the project would result in substantial adverse effects to biological resources protected under local policies or ordinances.

- 6) Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Significance Threshold: The project would result in a significant impact if the construction and/or operation of the project would conflict with an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan as defined by those policies or ordinances. An example of this would be if the action were to have an adverse effect on protected biological resources outlined in the plan.

3.3.4 Impact Analysis

The evaluation of potential impacts to biological resources is based on an assessment of whether a particular resource element (e.g., species, habitat, special community, wildlife linkage zone) occurs within a study area and, where those resources are present, whether impacts to the resource element might occur as a result of proposed Project implementation. The presence of a resource element within a study area does not imply that an impact would necessarily occur to that resource element. Where these resource elements potentially coincide with proposed Project activities, however, focused site-specific evaluations are conducted to identify the potential for impacts. Where a potential for impacts to these resource element(s) exists, specific mitigation measures may be applied on a case-by-case basis.

3.3.4.1 *Proposed Project*

BIO-1. Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service, or on any species that meets the criteria in CEQA Guidelines Section 15380 for endangered, rare or threatened?

Of the 112 special status plant species and 74 special status wildlife species reviewed to determine potential impacts due to construction or operations at any of the 54 proposed Project sites, 44 species were identified that may have potentially suitable habitat generally within 500 feet from one or more of 49 proposed Project sites (Table 3.3-7). In addition, this list includes those species that were evaluated based on a more broad geographic criteria, such as a dispersal distance of up to 2 miles for special status amphibians, and the presence of extensive open space for wide-ranging birds (i.e., California condor, golden and bald eagles, and peregrine falcon). Note that non-special status birds that are protected under the MBTA are addressed below as their own category of protected species. The potential impacts of Project activities to special status species were then addressed on a site-specific basis. The evaluation considered whether Project activities could result in disruption of normal behavior patterns, mortality or injury of individuals, or the loss of occupied or suitable habitat, and included the following elements:

- Proposed Project actions/type of development
- Current facilities and site use
- Habitat present with each proposed Project site
- Habitat present in each study area
- Potential extent of indirect disturbances (e.g., noise, presence of people)
- Sensitivity of individual species to indirect disturbances
- Application of mitigation measures to avoid, minimize impacts

The following discussion includes an analysis of individual species.

California Condor

The California condor is an inquisitive bird and comes in contact with a variety of situations over the large expanse of its range. Condors are known to visit mountaintop communication facilities and perch on towers with suitable structure. Threats to condors include poisoning, predation, power line collision and electrocution, shooting, habitat destruction, consumption of microtrash, and habituation to people and man-made objects. Lead and other chemicals have continued to be a threat to condors. The condor ingests toxic substances (primarily lead bullet fragments) while feeding on contaminated carrion. Small pieces of man-made materials (microtrash), such as plastics, wires, bolts, nuts, and glass, are a significant threat to the California condor (USFWS 2012, 2013b). As natural scavengers, condors are attracted to these types of items within their habitat, often mistaking them as mineral supplements. These items can be ingested by adults or fed to young and result in injury or death. Microtrash was found in six of the seven successful condor nests in 2013 (USFWS 2013b). Presence of trash within the condor diet is a direct result of increased human presence within the condor's range and has been noted particularly in the southern California population of condors (USFWS 2013b). Habituation of condors to human activity and structures can compromise the bird's ability to survive. The interaction with humans can lead to reduced natural survival skills, such as foraging and predator avoidance, or put the bird in greater danger of being shot, ingesting trash, or becoming entangled in cables and other debris at developed facilities. Additionally, these social birds may cause other condors to also become habituated to a situation, thereby increasing the threat to a larger number of birds (USFWS 2012).

Twenty five proposed Project sites provide potentially suitable habitat for the California condor. These sites already include developed facilities and are generally within or adjacent to large expansive open space. Some sites, such as WTR and WMP, are in close proximity to active condor use areas; and suitable nesting habitat such as rocky outcrops and steep canyons may be found in the vicinity surrounding these study areas. No known condor nest sites are in proximity to any proposed Project sites; USFWS closely monitors potential nesting by condors. Condors have an expansive foraging range, and as the reintroduced population grows and birds gain more experience, the condor appear to be flying farther afield (see USFWS GPS data sets at USFWS 2015). Currently, condors rarely take exploratory flights into the San Gabriel Mountains or over desert flats; however, Project sites in these areas are evaluated for impacts to condors to address any future concerns.

Construction Impacts

The proposed site developments include construction of a new communications tower, installation of associated infrastructure, and modification of facilities currently present on site. Construction activities would occur over a period of about six weeks at each individual site, and the increased human activity at the site could draw condors to the area due to their inquisitive nature and contribute to increasing levels of habituation of condors to humans and human-made structures. Though construction activities would not involve any blasting, concrete/asphalt cutting would be required, which could temporarily increase the noise produced at the site and with the disturbance associated with construction could result in condors avoiding foraging in the area. However, the condor utilizes a huge foraging range, flying up to 150 miles a day (<http://www.fws.gov/cno/es/CalCondor/Condor.cfm>; USFWS Pacific SW Region - California condor webpage), and any slight and temporary change in a condor's flight path would be within normal behavior patterns. Conversely, construction activities and the presence of a new communication tower could potentially attract condors to the Project site where trash, discarded food, and other materials could be consumed by condors. All construction would be in association with a developed facility, within or immediately adjacent to previously disturbed areas. At all but two proposed Project sites some type of tower or antenna is present, though at many sites the proposed tower would be the tallest at that site. The two sites that do not currently have towers (LACFCP09 and LACFCP11) have extensive development and many occupied buildings. New monopoles are proposed for these sites. The existing access roads would not be modified, and minimal native perennial vegetation would be removed. Therefore, no Project-related loss or fragmentation of condor foraging habitat would occur.

Impacts to California condors from proposed Project construction would be significant at sites BUR, BUR1, BUR2, BUR3, FRP, FTP, GMT, JOP, JPK, JPK2, LACFCP09, LACFCP11, LPC, MMC, MML, MTL2, OAT, PMT, SUN, SUN2, TMT, TPK, VPK, WMP, and WTR.

Operational Impacts

When erected, the proposed communication towers may or may not include horizontal surfaces (e.g., T-arms on monopoles, or lattice structure) that would be suitable for perching by large birds, thereby facilitating the presence of condors in areas frequented by people and possibly contributing to their habituation to human presence. No guy wires would be used. Towers could present a potential threat of collision to condors; however, no incidents of condors colliding with communication towers have been recorded, though power lines have been an issue. The USFWS has previously concluded that electrical transmission towers are not likely to adversely affect California condors if the appropriate measures are implemented (USFWS 2010b).

In addition to the communication towers, other facilities are present in the vicinity of proposed Project sites, including water tanks, oil rigs and pipelines, power lines and poles, as well as workers that are regularly present at these sites. Many of these other facilities provide elevated horizontal surfaces suitable for condors to perch. Some of these facilities and towers have anti-perch devices, but observations suggest these devices are not consistently placed or maintained. Since the presence of

condors at man-made structures is not desirable from the perspective of management of the condor population, the USFWS Hopper Mountain National Wildlife Refuge monitors the activity patterns of condors via radio and satellite telemetry. If condors are repeatedly converging on developed sites, condor biologists are dispatched to discourage condors from use of those sites.

Impacts to California condor from proposed Project operations would be significant at sites BUR, BUR1, BUR2, BUR3, FRP, FTP, GMT, JOP, JPK, JPK2, LACFCP09, LACFCP11, LPC, MMC, MML, MTL2, OAT, PMT, SUN, SUN2, TMT, TPK, VPK, WMP, and WTR.

Mitigation Measures

The following mitigation measures would be required at proposed Project sites that provide potentially suitable habitat for the California condor (see Table 3.3-7):

BIO MM 1 Conservation Monitoring and Reporting Plan

Prior to construction, the Authority shall develop and implement or require the system contractor to develop and implement a mitigation monitoring and reporting plan (MMRP) for the proposed Project. The MMRP would serve to organize environmental compliance requirements identified in best management practices, mitigation measures, permit requirements, real property agreement conditions, and other applicable sources. The MMRP shall contain an organization chart and communication plan for environmental compliance as it relates to the proposed Project.

BIO MM 2 Worker Environmental Awareness Program

Prior to construction, the Authority shall develop and implement or require the system contractor to develop and implement a Worker Environmental Awareness Program (WEAP) for the proposed Project. This mitigation measure would serve to institute and formalize an education program to increase awareness of environmental resources and measures and rules that are in place to help minimize impacts to those resources.

- a) A WEAP shall be developed and shall be required for all construction employees prior to placement of Project equipment, construction, or any ground-disturbing activities at the proposed Project site. Training of additional workers, contractors, and visitors shall be provided, as needed.
- b) The WEAP is to inform on-site workers of the possible presence of special status species, the measures to be taken to protect these species, and the importance of minimizing impacts to the natural environment through the protection of native vegetation, adhering to required buffers and protection zones, staying on existing roads, and implementing best management practices that include containment of any spills, disposal of trash, and management of runoff and sediment transport.

- c) To assure long-term implementation of mitigation measures, an information sheet listing potential sensitive species and what to do if any are encountered shall be prepared, distributed to workers, and posted on site.

BIO MM 3 Biological Compliance Reporting

A biological monitor shall visit all active construction sites at least once weekly to document compliance and provide reports to the Project administrator on a weekly basis.

BIO MM 4 Site Sanitation

- a) The contractor shall keep a regulated work area free of litter and trash. Trash and discarded food items shall be contained within an appropriate receptacle and removed daily to avoid attracting wildlife to the construction site, contribute to habituation of wildlife to the presence of humans, or to attract avian or mammalian predators to the area.
- b) All construction debris (including nuts, bolts, small pieces of wire, etc.) shall be cleaned up (e.g., trash removed, scrap materials picked up) each day that work is conducted to minimize the likelihood of wildlife visiting the site and consuming microtrash, discarded food, or other substances.

BIO MM 5 Hazardous Materials Management

- (a) A toxic substance management and spill response plan shall be prepared by the contractor.
- (b) Hazardous materials shall be contained; spills shall be prevented; and any spills at the Project site or along access roads shall be contained and cleaned up immediately.
- (c) All construction vehicles are required to carry at least one spill response kit.
- (d) Any spills shall be accounted for in reports prepared by the biological/environmental monitor.

BIO MM 6 Anti-perch Devices

Anti-perch devices shall be affixed to any elevated, horizontal structure (this includes the top quarter-arc of disc antennas) suitable for perching or nesting by raptors, ravens, vultures, gulls, or other large birds to deter the use of these facilities as perch or nest sites to avoid attracting avian predators to the area, and so as not to contribute to the habituation of condors to the presence of humans. Anti-perch devices shall be inspected annually and repaired as needed.

BIO MM 7 California Condor Protection

- a) As part of BIO MM 4 Site Sanitation, a written list of procedures shall be established and posted on site and/or kept in a site binder at all times. Specifically, the protocol shall list requirements including: all trash of any size shall be placed and contained in covered containers; and no trash of any kind shall be released to the environment. This includes any food items, small or large pieces of plastic or wire, and any small metallic objects (i.e., nuts, bolts, wire nuts).
- b) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of California condors. A qualified biologist shall prepare an informational handout to be presented at WEAP instruction. This program and handout shall provide, at a minimum, information concerning the biology and distribution of the California condor, legal status, and possible occurrence in the vicinity; measures to avoid impacts to condors; procedures to be implemented to eliminate microtrash from the site; and what to do in case of California condor encounters. The informational handout shall be posted at the Project site for continued reference by construction and maintenance workers.
- c) During construction and operations of the facility, all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the Project site. If condors are on site, USFWS would be contacted immediately (Ventura office: 805-644-1766) following internal chain-of-command communications protocol. Once condors leave on their own accord or as a result of techniques employed by permitted USFWS personnel, on-site work may continue.
- d) If condors are known to be present in the area and found roosting within 0.5 mile of the Project site, no construction activity shall occur between one hour before sunset and one hour after sunrise or until the condors leave the area.
- e) If condors are documented nesting within 1.5 miles of a proposed Project site (as determined by nesting bird surveys, observations by the biological monitor, and/or information from USFWS condor program), no construction activity shall occur until further authorization is received from USFWS.
- f) The Project site shall be maintained in a clean condition at all times.
- g) All wires, cables, and other items, either temporary or permanent, that could entangle a condor are to be securely fastened down or removed from site. No permanent guy wires will be used.

- h) As part of BIO MM 3 Biological Compliance Reporting, the environmental monitor shall verify at least once a week during active construction and upon completion of construction activities that the Project site is maintained in a clean condition.

Impacts after Mitigation

Mitigation measures specific to California condors (BIO MM 1 through BIO MM 7) include maintaining a clean site during and after construction activities, as well as during normal operations and maintenance of the facility, to prevent consumption of microtrash by condors (BIO MM 4 and BIO MM 7). Requirements include a worker environmental awareness program (BIO MM 2), immediate cleanup of all materials (BIO MM 4), and establishing provisions for how each hazardous substance will be treated in case of leakage or spill (BIO MM 5). Anti-perch devices would be installed as needed (BIO MM 6); all wires, cables, and other items that could entangle a condor are to be securely fastened down (BIO MM 7). Adherence to these measures would be overseen by a biological monitor (BIO MM 1 and BIO MM 3).

With the implementation of these measures (BIO MM 1 through BIO MM 7), the probability of direct effects to condors due to collision with a tower or ingestion of microtrash at a proposed Project facility during construction or operations is highly unlikely because condors would not be inclined to visit the site due to lack of suitable perch sites. If condors would visit the site, any consequences are highly unlikely because the site would be cleared of microtrash that could be ingested by the birds. Also, it is highly unlikely that indirect effects due to the construction or operations of a communication tower placed at an existing facility or the temporary presence of on-site construction workers would contribute to habituation by condors to human structures and activity. Each proposed Project site is within or immediately adjacent to a previously developed facility, and the proposed developments would be consistent with current site usage and would not alter the nature of site impacts.

With implementation of mitigation measures BIO MM 1 through BIO MM 7 the proposed Project would result in less than significant construction or operational impacts to the California condor at sites BUR, BUR1, BUR2, BUR3, FRP, FTP, GMT, JOP, JPK, JPK2, LACFCP09, LACFCP11, LPC, MMC, MML, MTL2, OAT, PMT, SUN, SUN2, TMT, TPK, VPK, WMP, and WTR.

Coastal California Gnatcatcher

Coastal California gnatcatchers are typically found in stands of coastal sage scrub that have moderate shrub canopy cover, generally greater than 50 percent (Beyers and Wirtz 1997). The gnatcatcher tends to occur most frequently within sagebrush-dominated stands on mesas, gently sloping areas, and along the lower slopes of the coastal ranges. More than 80 percent of recorded sightings of coastal California gnatcatchers within the United States were reported to occur below an elevation of 820 feet (Atwood and Bolsinger 1992), with approximately 99 percent of reported occurrences at or below 984 feet in elevation (USFWS 2007a). Higher elevations may be used during dispersal, however.

The gnatcatcher defends breeding territories ranging in size from 2 to 14 acres. The home range size of the gnatcatcher varies seasonally and geographically, with winter season home ranges being larger than

breeding season ranges (Bontrager 1991) and inland populations having larger home ranges than coastal populations (Atwood and Bontrager 2001). The breeding season of the gnatcatcher generally extends from late February through July (sometimes later). Nests are composed of grasses, bark strips, small leaves, spider webs, down, and other materials and are often located in California sagebrush plants about 3 feet above the ground. The average clutch size is four eggs, and incubation takes about 14 days (USFWS 2007a). The gnatcatcher generally disperses short distances within contiguous and undisturbed habitat (USFWS 2010b). Juvenile gnatcatchers can disperse long distances (up to 14 miles) across fragmented and highly disturbed sage scrub habitat such as that found along highway and utility corridors (Bailey and Mock 1998; Famolaro and Newman 1998; Galvin 1998).

The primary threat to coastal California gnatcatchers is the loss and fragmentation of habitat, which includes not only loss of the coastal sage scrub vegetation community where the birds nest, but also loss of non-sage scrub habitats such as chaparral, grassland, and/or riparian areas, in proximity to the sage scrub habitats that provide space for dispersal, foraging, and nesting (USFWS 2007a). Noise has been implicated as a potential source of threats to coastal California gnatcatchers. Noise, vibrations, and other construction-related activities are temporary disturbances that have the potential to impact gnatcatchers. Noise above certain decibel (dB) levels can present a potential impact to the birds, whether from direct damage to hearing, masking of communication signals between birds, or response to predators. Different sound levels can produce different impacts when certain noise thresholds are exceeded. For instance, various studies on highway and construction noise show that continuous noise levels from above 110 A-weighted decibels (abbreviated dBA, A-weighted decibels express the relative loudness of sounds in air as perceived by the human ear by correcting for audio frequency by reducing the values of sounds at low frequencies for which the human ear is less sensitive than high frequencies) sound pressure level (SPL) or a single noise blast over 140 dB SPL (125 dBA SPL for multiple blasts) will likely result in damage to some birds. At a distance from the highway or construction area where noise drops to below 110 dBA, SPL continuous exposure, hearing loss, and permanent hearing sensitivity modifications are unlikely (Dooling and Popper 2007).

Bird response to noise has been shown to be different than human response. Within the average auditory spectrum for bird hearing and vocalization (between 2 kilohertz and 4 kilohertz), the equivalent spectrum noise level is approximately 6 dBs higher relative to background noise for birds compared to human response (Dooling and Popper 2007). The 6-dB difference means that a human can still detect a point source of sound at twice the distance the typical bird can against a background of noise. Therefore, using the dBAs provides a conservative standard of comparison for potential impacts.

Of the seven proposed Project sites that have been identified to provide potentially suitable habitat for the coastal California gnatcatcher within 500 feet of the site, gnatcatchers are known to nest in the vicinity of one site (RIH). Protocol surveys for gnatcatchers were conducted in 2014 at three sites (H-17A, LEPS, and PWT), but no birds were detected. Habitat within the vicinity of these and the other proposed Project sites is considered potentially suitable for nesting, offering from marginal (e.g., PWT

and SDW) to very good conditions (H-17A); Site VPK provides dispersal habitat (i.e., not suitable for nesting).

Construction Impacts

Impacts to the coastal California gnatcatcher due to construction activities would occur from a loss of coastal sage scrub habitat, temporary disturbance to nesting birds at construction sites and along access roads, disturbance to foraging birds, and disturbance to dispersing birds (outside the breeding season). Though construction activities at most Project sites is limited to areas of pre-existing disturbance and would not result in the loss of native perennial shrubs, some Project plans (e.g., H-17A) identify a potential construction footprint that could result in loss of one to several individual shrubs. Even minor habitat loss, depending on the circumstances, could increase fragmentation of habitat patches already separated by roads and possibly increase exposure to predation. CDFW has established a 500-foot protection zone around active nests of special status species of birds.

Construction activities at proposed Project sites would result in noise that could cause disturbance to gnatcatchers that may be nesting in or near the study area if construction activities are conducted during the breeding season. And, since gnatcatchers are present year-round, construction activities at any time could disturb birds. Noise from demolition of existing pavement and structures, including concrete cutting, was determined to result in the highest one-hour average noise exposure. The one-hour average exposure (equivalent continuous noise level; an average of noise events) at 50 feet from the assumed location of the construction activity would be approximately 90 dBA for concrete cutting activities. The second noisiest construction activity, excavation and soil handling for tower foundations, may take more than one day; therefore, it would have a greater potential for annoyance to sensitive species. The one-hour average exposure at 50 feet from the assumed location of the activity would be approximately 81 dBA. Ambient noise levels vary depending on a site's setting, with levels for rural sites typically ranging from 45 to 55 dBA. At sites considered an urban fringe/rural/remote area, the "soft" ground surfaces absorb a substantial amount of noise energy.

The Federal Highway Administration (FHWA) Roadway Construction Noise Model v.1.1 (FHWA 2008) was used to calculate potential noise exposures for coastal California gnatcatchers from construction activity and incorporates the 50-foot reference levels for concrete cutting, excavation, and soil handling activities. Construction activities would occur over a period of about six weeks, with the loudest noises generated over a period of up to a few days. At a distance of 500 feet (the distance of the required disturbance buffer for nesting special status birds) and greater, the predicted noise levels are at or below ambient levels (45 to 50 dBA) and below noise thresholds that typically impact bird species.

Temporary disturbance due to construction activities (e.g., construction vehicle access, presence of people, concrete cutting, boring for geotechnical investigations, trenching, concrete pouring, use of large equipment such as cranes, and other sources of loud noises and activities) during the breeding season (February 1 through August 30) could disrupt gnatcatchers if they are nesting or foraging near

the Project site or along access roads. If these disturbances persist or are at extreme levels, nests could be abandoned.

At three proposed Project sites: H-17A, PHN, and RIH, suitable gnatcatcher nesting habitat is located in close proximity to or within the construction zone; birds are known to nest in the vicinity of Site RIH. Some sage scrub vegetation may be lost due to construction, and construction during the breeding season may result in nest abandonment if birds nest nearby.

Proposed Project sites LEPS and PWT provided apparent high quality habitat, though no observations of the gnatcatcher are recorded within 3 miles. This general area of Los Angeles County is not known to support high numbers of breeding gnatcatchers. Due to the extent of the surrounding habitat, it is possible that gnatcatchers could colonize the area, or territories of birds from outside the boundaries of the study area could overlap with the study area. In either case, gnatcatchers could be disturbed by Project-related activities, especially during the nesting season.

Proposed Project sites SDW and VPK have limited sage scrub vegetation that is generally unsuitable for gnatcatcher nesting (e.g., patch size too small; slopes too steep), although gnatcatchers may forage or disperse through these study areas.

Impacts to coastal California gnatcatchers from proposed Project construction would be significant at sites H-17A, LEPS, PHN, PWT, and RIH.

Impacts to coastal California gnatcatchers from proposed Project construction would be less than significant at sites SDW and VPK.

Operational Impacts

The noise associated with normal operations and maintenance activities would include routine site inspections and use of access roads (approximately one visit per month), weed management, occasional equipment repairs, and monthly running of the backup generator. Emergency diesel generators (35 kilowatts to 100 kilowatts) would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. The diesel generators used for the proposed Project are assumed to have a noise rating of 58 dBA at 21 feet, which is below 60 dBA and would be considered “normally acceptable” for outdoor residential (human) exposure. Noise from the generators would rapidly attenuate with distance to about ambient levels.

Impacts to coastal California gnatcatcher from proposed Project operations would be less than significant at Sites H-17A, LEPS, PHN, PWT, RIH, SDW, and VPK.

Mitigation Measures

The following mitigation measures would be required at proposed Project sites that provide potentially suitable habitat for the California gnatcatcher (see Table 3.3-7) (mitigation measures previously described are listed by name only):

BIO MM 1 Mitigation Monitoring and Reporting Plan

BIO MM 2 WEAP

BIO MM 3 Biological Compliance Reporting

BIO MM 8 Biological Monitoring

A qualified biological monitor shall be present at the site during construction activities that result in ground disturbance or removal of vegetation to ensure all mitigation measures are met. Duties of the biological monitor include checking for the presence of wildlife on the construction site, inspecting trenches or holes for trapped wildlife, surveying for the presence of nesting birds and adherence to nesting bird protection buffers, monitoring construction site boundaries, and checking that vegetation flagged for protection is not disturbed.

BIO MM 9 Protect Native Vegetation and Common Wildlife

- a) Minimize disturbance to native perennial plants; new ground disturbance shall be the minimum necessary and established and delineated prior to any earth-moving activities.
- b) If native perennial vegetation cannot be avoided and would be impacted or destroyed, the disturbance area is to be surveyed for the presence of special status plants and to remove common species of wildlife prior to destruction of the vegetation.
- c) At no time shall protected species be handled or moved. If a protected species is found within the construction area, all work that may impact that animal shall cease and the appropriate agency(s) shall be contacted (e.g., USFWS, CDFW, land management agency). The animal shall be allowed to leave the site on its own accord.
- d) Prior to construction or any ground-disturbance activities, mark the construction disturbance limits and monitor for adherence to these boundaries.
- e) Stay on existing roads.
- f) Do not remove native trees; construction limits shall be established to avoid walnuts, oaks, and any other sensitive species habitat and the limits shall be flagged by a biological monitor.
- g) Protect tree root systems by precluding paving, trenching, or other ground disturbing activities; and preclude heavy equipment from driving, parking, or staging within the tree's dripline.

- h) Any loss of native perennial vegetation, whether planned or unintentional, is to be accounted for in reports prepared by the biological monitor.

BIO MM 10 No Pets

Construction and maintenance workers shall be prohibited from bringing pets (especially dogs) to non-urban Project sites, as the domestic animal may harass or kill native wildlife present at the site.

BIO MM 11 Site Access

- a) On access roads operate all vehicles within the posted speed limits.
- b) If access road speed limits are not posted, do not exceed 15 miles per hour (mph).
- c) Adjust vehicle speed as appropriate to road conditions; avoid causing ruts and gullies; and minimize dust.
- d) Watch for wildlife on roads (including amphibians, snakes, rodents, and tortoises), especially during rainy periods, and avoid running them over.
- e) Look under parked vehicles for the presence of wildlife (especially desert tortoise) before pulling away to avoid running over wildlife.
- f) Do not park on or drive over native perennial vegetation.
- g) Avoid cutting corners on access roads and impacting vegetation when large equipment and trailers are brought to the Project site.
- h) Do not drive off the designated roadway or make any modifications to the road or road shoulders.

BIO MM 12 Coastal California Gnatcatcher Protection

- a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of coastal California gnatcatchers in the area and the importance of maintaining coastal sage scrub vegetation.
- b) As part of BIO MM 9 Protect Native Vegetation and Common Wildlife, disturbance to native perennial vegetation, especially coastal sage scrub vegetation (e.g., California sagebrush, sage, laurel sumac, and California buckwheat), would be minimized. Surveys shall be conducted by a qualified biologist for the presence of coastal sage scrub perennial vegetation, and plants not identified for removal within or near the construction zone shall be marked for protection.

- c) As part of BIO MM 3 Biological Compliance Reporting, the environmental monitor shall verify at least once a week during active construction and upon completion of construction activities that habitat protection measures have been followed.
- d) At proposed Project sites H-17A, PHN, and RIH, a higher level of protection is required to ensure that gnatcatchers are not present when construction activities would occur and adverse effects would be avoided. For proposed Project sites that include known or suspected gnatcatcher nesting or otherwise include suitable nesting habitat where the bird is expected to be present, the following mitigation measure is to ensure the highest level of protection to the bird. All the above measures (BIO MM 1 through BIO MM 3, and BIO MM 8 through BIO MM 12) apply as well as:

BIO MM 13 Coastal California Gnatcatcher Breeding Season Restrictions

Construction activities that include loud noises (e.g., trenching, drilling, concrete cutting), the use of large equipment (e.g., booms, cranes, drills, concrete pouring), or the removal of perennial vegetation shall be precluded between February 15 and August 30. This measure is applicable to identified Project sites where coastal California gnatcatchers are known to be or likely would be present, and construction activities may result in disturbance to the bird.

At proposed Project sites LEPS and PWT, protocol surveys may be conducted to determine that nesting gnatcatchers are not present, or BIO MM 13 would apply. If nesting gnatcatchers are located, a 500-foot protection buffer would be required. The above measures (BIO MM 1 through BIO MM 3 and BIO MM 8 through BIO MM 12) apply as well as:

BIO MM 14 Coastal California Gnatcatcher Protocol Surveys

- a) To determine if coastal California gnatcatchers are present within 500 feet of specified Project sites and if breeding season restrictions would be required, surveys following the most recent version of the USFWS Coastal California Gnatcatcher Presence/Absence Survey Protocol (current revision issued by USFWS Carlsbad Office 1997) shall be conducted prior to initiating any construction activities that may result in ground disturbance or loud noises during the gnatcatcher breeding season (February 15 through August 30). This protocol requires call-playback surveys by a permitted biologist, conducting a minimum of six surveys at least one week apart between March 15 and June 30 (additional survey requirements are presented in the protocol).
- b) If adult, nesting, or fledgling gnatcatchers are detected even once within 500 feet of the proposed Project site, or if surveys are not completed in compliance with the protocol, BIO MM 13 Coastal California Gnatcatcher Breeding Season Restrictions

shall apply to the site, precluding any construction activities that include loud noises (e.g., trenching, drilling, concrete cutting), the use of large equipment (e.g., booms, cranes, drills, concrete pouring), or the removal of perennial vegetation between February 15 and August 30.

- c) If no adult, nesting, or fledgling gnatcatchers are detected within 500 feet of the proposed Project site, construction activities may commence beginning July 1 through February 14.
- d) Survey requirements shall be applied each year that construction activities take place at the Project site.

Impacts after Mitigation

Implementation of mitigation measures BIO MM 1 through BIO MM 3 and BIO MM 8 through BIO MM 12 shall apply to each of the seven proposed Project sites where potentially suitable coastal California gnatcatcher habitat is present within each applicable study area. Though impacts to gnatcatchers at proposed Project sites SDW and VPK would be less than significant without application of mitigation measures, these measures would still apply at these sites regardless of the level of significance and would further reduce the already less than significant impacts. Disturbance due to construction activities would be precluded at the most sensitive sites (i.e., H-17A, PHN, RIH) by restricting these activities during the gnatcatcher nesting season (February 15 through August 30) (BIO MM 13), or requiring preconstruction surveys (BIO MM 14) at proposed Project sites LEPS and PWT. Most native perennial vegetation would be preserved on site (BIO MM 9 and BIO MM 11); however, there would likely be some individual plants at proposed Project sites or along access roads that cannot be avoided and must be trimmed or removed to accommodate Project needs. If this would occur, the impacted vegetation would likely be limited to a few plants at the periphery of developed sites or along roads; therefore, maintaining the integrity of suitable habitat and would not cause an otherwise suitable habitat patch to become unsuitable. The worker environmental awareness program (BIO MM 2) and presence of an on-site environmental monitor (BIO MM 8) would safeguard against mistakes.

Implementation of mitigation measures BIO MM 1 through BIO MM 3 and BIO MM 8 through BIO MM 12 at proposed Project sites SDW and VPK would further reduce the less than significant impacts related to the construction and operations of the proposed Project to the coastal California gnatcatcher.

Implementation of mitigation measures BIO MM 1 through BIO MM 3 and BIO MM 8 through BIO MM 13 at proposed Project sites H-17A, PHN, and RIH would result in less than significant construction or operational impacts to the coastal California gnatcatcher.

With implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 8 through BIO MM 12, and BIO MM 14 at proposed Project sites LEPS and PWT the proposed Project would result in less than significant construction or operational impacts to the coastal California gnatcatcher.

Southwestern Willow Flycatcher

The southwestern willow flycatcher is migratory, arriving in breeding territories by mid-May and then migrating to southern wintering grounds in August and September. It is an obligate riparian nesting bird, typically in association with dense, riparian vegetation that may include high proportions of nonnative salt cedar trees. Current threats to southwestern willow flycatchers include loss of riparian habitat, alteration in stream hydrology (e.g., water withdrawal, impoundments), reservoir management, and brood parasitism by brown-headed cowbirds.

Potentially suitable flycatcher habitat is found within the study area of a single proposed Project site, Site LACFCP11 (see Table 3.3-7). This site is on a low ridgeline above Soledad Canyon Road on the opposite side of the road within the study area of Site LACFCP11, in the floodplain of the Santa Clara River. Primary vegetation within the Santa Clara River corridor is mature riparian forest that includes coast live oak and California sycamore trees, though the stream is not perennial in this portion of the drainage. The river corridor has been highly impacted by heavy equipment, dumping or storage of construction materials, and as a source of water for helicopter bucket dips from a maintained water storage tank; on the opposite side of the river corridor from the Project site is an active railroad line. It is unknown if southwestern willow flycatchers currently utilize the riparian corridor near Site LACFCP11; one southwestern willow flycatcher was observed in 1997 approximately 1 mile west of the study area directly adjacent to the Santa Clara River, but no sightings have been reported since. The next closest flycatcher sighting was reported approximately 35 miles downstream. The riparian habitat within the study area is low quality at best and does not provide suitable nesting habitat due to lack of permanent or semi-permanent water and lack of large patches of dense riparian vegetation with complex vertical structure (though habitat quality may change year to year). Suitable foraging habitat may be present in the study area, but suitable nesting habitat is not.

Construction Impacts

No riparian vegetation is expected to be impacted, and no Project-related activities would occur in the Santa Clara River floodplain; no loss of southwestern willow flycatcher habitat would occur. A potential impact may be a temporary increase in noise during construction of a new monopole; however, nesting flycatchers are not expected to be present, and foraging birds would likely be accustomed to noises due to elevated ambient noise levels associated with highway traffic on Soledad Canyon Road, the railroad line, and helipad on the proposed Project site.

Impacts to the southwestern willow flycatcher from proposed Project construction would be less than significant at Site LACFCP11.

Operational Impact

The noise associated with normal operations and maintenance activities would include routine site inspections and use of access roads (approximately one visit per month), occasional equipment repairs, and monthly running of the backup generator. Emergency diesel generators (35 kilowatts to 100 kilowatts) would operate one hour per month as part of routine maintenance and would operate to

provide backup power in the event of a power outage. The emergency generators would be housed by solid walls, with the resulting noise emissions at 58 dBA at 21 feet. Noise from the generators would rapidly attenuate to about ambient levels. Ongoing operations of the proposed Project site would not result in the loss of riparian vegetation.

No impacts to the southwestern willow flycatcher would result from operations of the proposed Project at Site LACFCP11.

Mitigation Measures

Though impacts to the southwestern willow flycatcher at proposed Project Site LACFCP11 would be less than significant without application of mitigation measures, the following measures would still apply at Site LACFCP11 regardless of the level of significance and would further reduce the already less than significant impacts. The following mitigation measures would be implemented at Site LACFCP11 for the southwestern willow flycatcher (mitigation measures previously described are listed by name only):

BIO MM 1 Mitigation Monitoring and Reporting Plan

BIO MM 2 WEAP

BIO MM 3 Biological Compliance Reporting

BIO MM 8 Biological Monitoring

BIO MM 9 Protect Native Vegetation and Common Wildlife

BIO MM 15 Southwestern Willow Flycatcher Protection

- a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of southwestern willow flycatchers in the area and the importance of maintaining riparian vegetation.
- b) As part of BIO MM 9 Protect Native Vegetation and Common Wildlife, disturbance to native perennial vegetation, especially riparian species (e.g., sycamore, cottonwood, willow), would be minimized; no ground-disturbing activities or removal of vegetation would occur within stream corridors or floodplains. Prior to construction, surveys for the presence of riparian vegetation shall be conducted by a qualified biologist, and those plants within or near the construction zone not identified for removal shall be marked for protection and monitored for adherence to these boundaries.

Impacts after Mitigation

The proposed development of Site LACFCP11, with the implementation of required mitigation measures (BIO MM 1 through BIO MM 3, BIO MM 8, BIO MM 9, and BIO MM 15) would ensure that there would be no loss of riparian habitat.

Implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 8, BIO MM 9, and BIO MM 15 at Site LACFCP11 would further reduce the less than significant construction and operational impacts of implementation of the proposed Project on the southwestern willow flycatcher.

Western Snowy Plover

Western snowy plover nests above the high tide line on coastal beaches, sand spits, dune-backed beaches, sparsely vegetated dunes, beaches at creek and river mouths, and salt pans at lagoons and estuaries. The breeding season is typically from March 1 through September 30. In winter, western snowy plovers may be more widespread, and they may be found on beaches where they do not currently nest. Habitat degradation and loss, disturbance due to human activity, and expanding predator populations (e.g., ravens, gulls, and dogs) have resulted in a decline in nesting birds. The nesting season of the western snowy plover (March through September) coincides with the period of greatest human use (Memorial Day through Labor Day) on beaches of the west coast. Intensive beach use by humans may result in abandonment of nest sites, reductions in nest density, and reductions in nesting success (USFWS 2014a).

Proposed Project Site ZHQ is located at the Zuma Beach lifeguard station within a paved parking lot between the Pacific Coast Highway and the beach. Western snowy plover critical habitat has been designated along the beach within the study area of and adjacent to Site ZHQ. The beach is highly managed (e.g., sand bulldozed and piled) and is a focal area for recreationists, whose presence would preclude nesting by the plover on the beach in the vicinity of Site ZHQ outside protected areas; however, conditions and nesting sites may change year to year. The critical habitat unit extends 3 miles along the coast and is considered occupied and an important wintering area. Paved areas and the land on which structures have been built are excluded from critical habitat (USFWS 2012a).

Construction Impacts

Since site development is limited to the paved parking area, no beach habitat would be removed from western snowy plover habitat due to Project activities. The construction site is in close proximity to designated critical habitat; and, though disturbance associated with construction may be assimilated into the background noise from surf, traffic, and recreationists, Project activities could disturb the birds if they are present nearby.

Temporary disturbance due to construction activities (e.g., construction vehicle access, presence of people, concrete cutting, boring for geotechnical investigations, concrete pouring, use of large equipment such as cranes, and other sources of loud noises and activities) during the breeding season (March 1 through September 30) could disrupt plovers if they are nesting or foraging near the Project site; however, the area is heavily used for recreation during the high season (mid-May through August), so these additional disturbances associated with construction of a new 35-foot tall monopole would not be expected to result in excessive noise levels, potentially causing nest abandonment.

When construction activities are conducted outside the nesting period, the temporary increase in noise could potentially disrupt wintering western snowy plovers if individuals utilize or move through the

study area. During the non-breeding season, however, the birds may more broadly disperse and use sand dunes up and down the beach. Birds can react to temporary disturbances while maintaining normal behavior patterns; however, even minor disturbances may cause a bird to temporarily avoid the area.

Impacts to western snowy plover from construction at proposed Project Site ZHQ would be significant.

Operational Impacts

Predation is a constant threat to western snowy plovers, and the tower may provide perch sites for potential predators such as gulls and ravens to observe the area and locate plovers, their young, or eggs to feed on. With the high level of use in this area by recreationists, plovers have a reduced likelihood to nest nearby, though predatory birds have excellent eyesight and may observe to great distances from an elevated perch. Snowy plovers at Project Site ZHQ may be more vulnerable to predation by predators perching on the monopole during winter when humans are less active at the beach and plovers may use more of the beach.

The noise from maintenance activities, which would include routine site inspections, generator testing, and occasional equipment repairs, would not be substantially different from current levels at Site ZHQ (the site is adjacent to the Pacific Coast Highway and helicopter landing pad).

Impacts to western snowy plover from operations at proposed Project Site ZHQ would be significant.

Mitigation Measures

The following mitigation measures would be required at Site ZHQ for the western snowy plover (mitigation measures previously described are listed by name only):

BIO MM 1 Mitigation Monitoring and Reporting Plan

BIO MM 2 WEAP

BIO MM 3 Biological Compliance Reporting

BIO MM 6 Anti-perch Devices

BIO MM 8 Biological Monitoring

BIO MM 10 No Pets

BIO MM 16 Snowy Plover Protection

- a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of western snowy plover in the area and the importance of not disturbing nesting birds.

- b) If construction occurs between February 1 and July 31, prior to beginning construction a biological monitor shall verify through coordination with USFWS and on-site surveys that no breeding western snowy plovers are using the Project site or are within 500 feet of any Project activity.
- c) If plovers are nesting in the vicinity, BIO MM 8 Biological Monitoring would apply, and a 500-foot protection buffer shall be required where no construction activities may occur while birds remain in the area.

Impacts after Mitigation

The proposed development of Site ZHQ, with the implementation of required mitigation measures BIO MM 1 through BIO MM 3, BIO MM 6, BIO MM 8, BIO MM 10, and BIO MM 16 would avoid or reduce potential effects to the western snowy plover to the level of insignificant. No beach habitat would be lost. If nesting birds could be present, a protection buffer would be applied (BIO MM 16). Potential disturbance to wintering birds would be assimilated into their normal behavior patterns as they can disperse over expansive areas of the beach. The presence of the monopole would not facilitate avian predation on plovers since perching on the tower would be discouraged by the placement of anti-perch devices (BIO MM 6).

With implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 6, BIO MM 8, BIO MM 10, and BIO MM 16 at Site ZHQ the proposed Project would result in less than significant construction or operational impacts to the western snowy plover.

Raptors: American Peregrine Falcon, Bald Eagle, Golden Eagle, Long-eared Owl, Burrowing Owl

Raptors are wide-ranging predatory birds that require large expanses of open space to forage; they generally nest in remote locations and may be easily disturbed by human presence, especially around nest sites. CDFW often establishes a 500-foot buffer around active raptor nests for protection from disturbance, and even larger buffers for eagles. The American peregrine falcon feeds on other birds and typically nests on steep cliffs but has adapted to nesting on ledges of tall high-rise buildings. Bald eagles usually nest on cliffs or large trees near water where they feed on fish, waterfowl, sea birds, and carrion. Golden eagle nesting habitat includes rocky crags and cliffs, and it forages in open habitats (e.g., grasslands, open shrublands), feeding on rabbits, ground squirrels, and carrion. The long-eared owl forages during the night on rodents and nests in large trees. The burrowing owl is often active during the day and frequently is found in highly disturbed and open habitats.

Due to the wide-ranging nature of these raptors, occurrence data on bald and golden eagles within 10 miles of proposed Project sites were reviewed; and on-site evaluation of habitat suitability was not limited to only those raptors recorded in the general vicinity. Each study area of each proposed Project site was considered for both nesting and foraging habitat for these species

Of the 16 proposed Project sites where suitable peregrine falcon foraging habitat is present in the surrounding area, suitable nesting habitat does not occur within the study area. Cliff-face nesting habitat

may be found within 1 mile of eight proposed Project sites, including the three proposed sites on Santa Catalina Island. During 2004, only a single peregrine nest was known on the island, but several other adult pairs were observed (Predatory Bird Research Group 2004). The current status is unclear, but apparently little change has occurred. Additional consideration was provided for peregrine falcons on Santa Catalina Island due to the steep topography of the island and the possibility that other pairs may be nesting.

For the bald eagle, three of the four proposed Project sites that include bald eagle foraging habitat are on Santa Catalina Island. As of 2014, eight recognized bald eagle breeding territories are on Santa Catalina Island (Sharpe 2015). These three Project sites are between 0.5 mile and 1 mile from eagle breeding territories (not the actual nest sites). Bald eagles are also recorded from the general vicinity of Site GMT, which is about 2 miles from eagle-use areas at Lake Elizabeth.

Foraging habitat for golden eagles occurs within the study area of eight proposed Project sites, but none of the sites include steep cliffs and rocky crags used as nest sites within or in proximity to these study areas. Study areas on Catalina Island are not included for consideration of golden eagles because no golden eagles have been seen on the island since the mid-1980s (Catalina Island Conservancy 2015).

The long-eared owl is recorded from the vicinity of Site AJT. This site is a rural/urban interface with controlled human access. Suitable foraging and nesting habitat of the owl may be present within the study area of Site AJT, with potential nesting habitat associated with stands of California black walnut trees.

The burrowing owl was recorded about 0.2 mile west of the proposed Project Site H-17A along Skyline/Fire Ridge Road. The bird was using the cleared firebreak along the road following the ridge. Similar and contiguous habitat is found within Site H-17A and its study area.

Construction Impacts

During construction, temporary (about six weeks) human activity may result in increases in noise, dust, and human presence; all of these would disrupt nesting and foraging behavior of the peregrine falcon, bald eagle, golden eagle, and long-eared owl, if birds are sufficiently close to these activities. This is particularly the case during breeding season if these birds nest within line of sight at almost any distance of a proposed construction site. Based on current data and field review, no nests or nesting habitat for the falcon or eagles are known within any of the study areas; but these birds are very sensitive to human presence, and nesting habitat may occur in the vicinity of some study areas. Long-eared owls could establish a nest within the study area of Site AJT, and it is expected that burrowing owls are nesting in or near the study area of Site H-17A.

Raptors generally have very large home ranges and forage widely, so birds would act within their normal behavior patterns to avoid any localized temporary disturbance. Construction impacts at proposed Project sites due to lost foraging opportunities for peregrine falcon, bald eagle, golden eagle, and long-eared owl would be less than significant.

Burrowing owls typically remain in the vicinity of their burrows and would be more susceptible to disturbance or destruction; impacts to burrowing owl from construction at proposed Project Site H-17A would be significant.

Construction activities would result in significant impacts to nesting peregrine falcon, bald eagle, golden eagle, and long-eared owl at sites AGH, AJT, BJM, CPK, DPK, ENC1, ENT, FTP, GMT, H-17A, H-69B, JOP, LACFCP08, MTL2, OAT, PWT, SPN, TOP, TPK, TWR, VPK, and WTR.

Operational Impacts

When construction of proposed Project facilities is completed at sites that peregrine falcons, bald eagles, golden eagles, long-eared owls, or burrowing owls may pass in flight, no fundamental change would occur to the nature of existing site impacts because these sites currently have some level of development and occasional human presence. The noise associated with normal operations and maintenance activities would include routine site inspections and use of access roads (approximately one visit per month), occasional equipment repairs, and monthly running of the backup generator. Noise from the generators would rapidly attenuate to about ambient levels.

No operational impacts are anticipated to peregrine falcon, bald eagle, golden eagle, long-eared owl, or burrowing owl at sites AGH, AJT, BJM, CPK, DPK, ENC1, ENT, FTP, GMT, H-17A, H-69B, JOP, LACFCP08, MTL2, OAT, PWT, SPN, TOP, TPK, TWR, VPK, and WTR.

Mitigation Measures

The following mitigation measures would be required at proposed Project sites that provide potentially suitable habitat for these raptor species (mitigation measures previously described are listed by name only):

BIO MM 1 Mitigation Monitoring and Reporting Plan

BIO MM 2 WEAP

BIO MM 3 Biological Compliance Reporting

BIO MM 8 Biological Monitoring

BIO MM 17 Raptor Protection

- a) If construction activities occur during the American peregrine falcon, bald eagle, golden eagle, long-eared owl, or burrowing owl breeding period, January 1 through July 31, preconstruction surveys would be conducted in all suitable habitats within 500 feet of the Project site as well as within a species-appropriate distance beyond the 500-foot buffer based on line of sight between potential nesting habitat and the construction site.

- b) If construction takes place during the breeding period, the biological monitor shall contact appropriate land management and resource agencies to ascertain if they have any current information on raptor nesting activities in the general vicinity of the proposed Project sites.
- c) If an active American peregrine falcon, bald eagle, golden eagle, long-eared owl, or burrowing owl nest is discovered within 500 feet of the construction site, work shall not be undertaken at that site until the nest is no longer active, with an additional five days to allow the fledging birds to disperse. An active nest is defined as one that is attended, built, maintained, or used by a pair of birds during a given breeding season, whether or not eggs are laid; a nest is considered inactive if not attended to for a period of 10 days or longer.
- d) If an active American peregrine falcon, bald eagle, golden eagle, long-eared owl, or burrowing owl nest is discovered between 500 feet and 0.5 mile of the construction site, the potential for disturbance of the nesting birds would be evaluated based on line-of-sight, degree of potentially disturbing activities, and other site-specific factors. If the CDFW and land management agency concur, the protection buffer distance may be reduced.

Impacts after Mitigation

With the implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 8, and BIO MM 17, the possibility of disturbance to nesting American peregrine falcons, bald eagles, golden eagles, long-eared owls, or burrowing owls would preclude any potential for nest abandonment or other negative impacts to these species.

Implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 8, and BIO MM 17, would result in less than significant construction or operational impacts to the American peregrine falcon, bald eagle, golden eagle, long-eared owl, and burrowing owl at sites AGH, AJT, BJM, CPK, DPK, ENC1, ENT, FTP, GMT, H-17A, H-69B, JOP, LACFCP08, MTL2, OAT, PWT, SPN, TOP, TPK, TWR, VPK, and WTR.

Migratory Birds

Various species of migratory birds, including raptors, may nest at or in close proximity to proposed Project construction sites. The vast majority of native birds and their nests and young are protected under the Migratory Bird Treaty Act (16 U.S.C. 703– 712); and FGC Sections 3503 and 3503.5 protect birds and nests, and Section 3513 provides for consistency with the Migratory Bird Treaty Act (see Section 3.3.2.1 Migratory Birds), which makes it illegal to destroy any active migratory bird nest. Protected birds may nest in a wide variety of locations, including trees, shrubs, on the ground, and on human-made structures (e.g., buildings, bridges, water tanks, antenna towers). Nesting birds may be found in pristine native habitats, in highly degraded habitat remnants, within landscaped and ornamental plantings, and in ruderal settings.

Project construction activities at some sites may include vegetation removal, which could result in the direct loss of nests, eggs, and/or young. The noise and human presence associated with construction during the breeding season has the potential to disturb nesting birds throughout the Project vicinity and result in a loss of productivity (i.e., reduced number of young raised) due to disruption of foraging activities and care of nestlings by the parent birds, or otherwise lead to the abandonment of nests. The degree of sensitivity to disturbances varies greatly species-by-species and pair-by-pair within a species and is influenced by the stage of the nesting cycle (e.g., nest building, egg laying, age of young). Generally, raptors are the most sensitive to human presence in the vicinity of their nests.

CDFW has provided Project-specific guidelines to protect migratory birds and to avoid disturbance to nests (correspondence to Ms. Nancy Yang, LA-RICS from Ms. Betty Courtney, CDFW, September 23, 2014). If construction and vegetation removal must occur during the nesting season (March 1 through September 15, and January 1 through July 31 for raptors), a minimum protection buffer of 300 feet shall be established and marked in the field around non-raptor nests, and a 500-foot buffer shall be established around raptor and other special status bird species nests; additional buffers may apply to fully protect species such as nesting California condors and eagles. These buffers shall remain in place until the young would no longer be impacted by Project activities. CDFW also allows for the development of a project-specific nesting bird management plan that may propose an alternative method for protecting nesting birds based on site-specific conditions and project activities.

The American Bird Conservancy reports an estimated 6.8 million birds annually are killed by collision with communication towers in the United States and Canada (Longcore et al. 2012). The Department of Interior Office of the Secretary (2014) reports that impacts from non-ionizing electromagnetic radiation emitted by communication towers could be significant for birds, and that cell tower radiation could be a threat to nearby nesting birds. To address these concerns, the USFWS Office of Migratory Birds has issued voluntary guidelines (USFWS 2013a) for communications tower placement, construction, and operation. The guidelines emphasize collocation wherever possible to reduce the total number of towers, and recommend that structures are either a lattice tower or monopole design, that towers be no more than 199 feet above ground level, that construction techniques should not require guy wires (even if a larger footprint is required), that towers are unlighted if FAA regulations permit, and that security lighting is down-shielded and does not exceed the minimum intensity needed. Other considerations include that towers are to be sited to avoid migratory pathways and other bird concentration areas to minimize the loss of habitat, and to consider the presence of state and federally listed species.

Construction Impacts

Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the FGC Sections 3503 and 3503.5 would occur if nesting birds are present as a result of vegetation removal or other on-site construction activities if these activities occur during active nesting season, generally March 1 through September 15 for non-raptors and January 1 through July 31 for raptors. Depending on the type of construction activities and equipment in use, amount of noise, degree

of human presence, and species of bird present, construction activities would result in temporary disturbance to birds attending a nest, increased susceptibility of birds and their nests to predation, nest abandonment, or the direct destruction of nests. Sites ASD, LARICSHQ, PDC, SIM, and WS1 do not provide habitat for nesting birds. Site ASD is in a highly disturbed setting without ornamental vegetation. Sites LARICSHQ, PDC, SIM, and WS1 are roof mounts.

Impacts to migratory birds from proposed Project construction would be significant at all proposed Project sites except sites ASD, LARICSHQ, PDC, SIM, and WS1.

Operational Impacts

The proposed Project tower design complies with the voluntary guidelines for communications towers established by the USFWS Office of Migratory Birds at all sites with the exception of proposed Project Site DPK on Santa Catalina Island, where a new 215-foot tall lattice tower would be constructed (USFWS guidelines limit tower heights to no more than 199 feet). Towers of this height are required by the FAA to be lit, which creates an additional hazard to migratory birds. In keeping with the priority for collocation on existing structures, some antennas would be collocated on guyed towers. Protected native birds may collide with towers, especially to towers with lighting; and birds may be exposed to some level of electromagnetic radiation if they nest or habitually perch close to the antennas. Monopole structures and their associated antennas are shorter in height and ultimately more visible to birds than their lattice tower counterparts and, thus, are more avoidable. While standing monopoles still pose some level of threat to birds in flight, the threat is greater from lattice tower structures.

There would be no impacts to migratory birds from proposed Project operations at sites ASD, LARICSHQ, PDC, SIM, and WS1 due to lack of habitat (Site ASD) and collocation on rooftops (sites LARICSHQ, PDC, SIM, and WS1).

Impacts to migratory birds from proposed Project operations would be less than significant at the following proposed Project sites with monopole structures: AGH, AJT, ENT, LACF072, LACFCP08, LACFCP09, LACFCP11, LEPS, LPC, PASPD01, PWT, SGH, WAD, and ZHQ.

Impacts to migratory birds from proposed Project operations would be significant at the following proposed Project sites with lattice tower structures: BJM, BUR, BUR1, BUR2, BUR3, CPK, DPK, ENC1, FRP, FTP, GMT, GRM, H-17A, H-69B, JOP, JPK, JPK2, MMC, MML, MTL2, OAT, PHN, PMT, RIH, SDW, SPN, SUN, SUN2, TMT, TOP, TPK, TWR, VPK, WMP, and WTR.

Mitigation Measures

The following mitigation measures would be required at all proposed Project sites (mitigation measures previously described are listed by name only):

BIO MM 1 Mitigation Monitoring and Reporting Plan

BIO MM 2 WEAP

BIO MM 3 Biological Compliance Reporting

BIO MM 6 Anti-perch Devices (selected sites)

BIO MM 8 Biological Monitoring

BIO MM 18 Nesting Bird Protection

- a) It is preferred that removal of trees or large tree limbs and other vegetation removal activities such as grubbing or shrub clearing avoid the typical bird nesting season of January 1 through September 15.
- b) If construction activities occur during the bird nesting season, and to prevent disturbance to or destruction of nests of protected native bird species that could occur as a result of vegetation removal, disturbance, or other on-site construction activities, preconstruction surveys for nesting birds shall be conducted by a qualified biological monitor within 10 calendar days prior to on-site construction-related disturbance activities from March 1 through September 15 for non-raptors, and January 1 through July 31 for raptors.
- c) If nesting protected non-raptor species are detected, a 300-foot avoidance buffer shall be implemented; a 500-foot avoidance buffer would be applied to any active nest of a raptor or other species of special status bird.
- d) Appropriate site-specific buffers may be established with the approval of a project designated avian expert, based in part on the species of nesting bird present, location of nest, nesting phenology, magnitude of potential disturbance, and other site conditions (e.g., levels of ambient noise; line-of-sight).
- e) If construction activities would occur within the general buffer distances for active nests (300 feet for non-raptors, 500 feet for raptors, and up to 1.5 miles for condors and eagles), a Biological Monitor must be present during those activities.
- f) No active nests may be destroyed; inactive bird nests may be destroyed as part of vegetation removal but may not be reduced to possession.
- g) Between September 16 and December 30, grubbing, shrub clearing, and tree/limb removal activities are not subject to restrictions based on the protection of migratory birds.
- h) Comply with the USFWS Office of Migratory Birds voluntary guidelines (USFWS 2013a) for communications tower placement, construction, and operation.

- i) For any towers that must exceed 199 feet in height, lighting requirements would be designed in cooperation with FAA and USFWS Office of Migratory Birds to minimize attraction and resulting mortality of migratory birds.

Impacts after Mitigation

Preconstruction surveys for nesting migratory birds would be conducted if construction occurs during the nesting season (generally January 1 through September 15) and protection buffers would be established around active nests (BIO MM 18). An environmental monitor (BIO MM 8) is to be present at each site to identify and address any site-specific concern regarding nesting birds, as applicable. In addition to meeting the voluntary guidelines for communication towers, as established by the USFWS Office of Migratory Birds, anti-perch devices (BIO MM 6) would be installed at specific sites identified on a species-by-species basis (e.g., see California condor) to discourage perching and nesting on tower structures. Compliance with the USFWS voluntary guidelines for communication towers may not preclude all bird mortality due to collision with communication towers at proposed Project sites but is expected to greatly minimize this impact.

There would be no impacts to migratory birds from the proposed Project at sites ASD, LARICSHQ, PDC, SIM, and WS1 and no mitigation measures are required.

Implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 6, BIO MM 8, and BIO MM 18 would result in less than significant impacts to migratory birds due to construction activities at all proposed Project sites (with the exception of sites with no impacts to migratory birds: ASD, LARICSHQ, PDC, SIM, and WS1).

Impacts to migratory birds from proposed Project operations would be less than significant at the following proposed Project sites with monopole structures: AGH, AJT, ENT, LACF072, LACFCP08, LACFCP09, LACFCP11, LEPS, LPC, PASPD01, PWT, SGH, WAD, and ZHQ.

With implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 6, BIO MM 8, and BIO MM 18, there is still some risk of collision by birds in flight during the operational life of the proposed Project. Compliance with the USFWS voluntary guidelines for communication towers is expected to greatly minimize this impact. Impacts to migratory birds from proposed Project operations would be less than significant at the following proposed Project sites with lattice tower structures: BJM, BUR, BUR1, BUR2, BUR3, CPK, DPK, ENC1, FRP, FTP, GMT, GRM, H-17A, H-69B, JOP, JPK, JPK2, MMC, MML, MTL2, OAT, PHN, PMT, RIH, SDW, SPN, SUN, SUN2, TMT, TOP, TPK, TWR, VPK, WMP, and WTR.

Although site DPK exceeds the height recommendations of the USFWS guidelines for communications towers by 15 feet, these guidelines provide for exceptions when necessary and include other suggestions when lighting is required. The specific requirements at Site DPK would be determined through coordination with the FAA and USFWS Office of Migratory Birds (it is expected that regardless of the tower height at Site DPK, the FAA would likely require some lighting). With implementation of

mitigation measures BIO MM 1 through BIO MM 3, BIO MM 6, BIO MM 8, and BIO MM 18, impacts to migratory birds at Site DPK would be less than significant.

Santa Catalina Island Fox

The Santa Catalina Island fox typically is found in dense shrubby vegetation; however, it has been observed using all habitat types present on Santa Catalina Island and could be found anywhere on the island—grasslands, shrublands, coastal marshes, and forests. The fox is omnivorous, eating fruits, insects, birds, eggs, crabs, lizards, and small mammals. Individual foxes tend to move about rather than travel in packs. The fox is generally nocturnal, with peaks of activity at dawn and dusk; it is not intimidated by humans. Santa Catalina Island foxes give birth to young in simple dens, under shrubs, or in the sides of ravines (Laughrin 1973). Young are born from early to late April after a gestation period of approximately 50 to 53 days. Litter size ranges from one to five kits (Moore and Collins 1995).

Major threats to the fox have been canine distemper and predation by golden eagles; however, no golden eagles have been seen on the island since the mid-1980s (Catalina Island Conservancy 2015). Though none of the three proposed Project sites on Santa Catalina Island (BJM, DPK, and TWR) are within what may be considered preferred fox habitat, the area surrounding each of these three sites could be occupied by foxes.

Construction Impacts

The noise and activities associated with construction of proposed Project sites would result in temporary disturbance to fox dens or foraging foxes if present in the area of the Project site or associated access roads. In addition, foxes could seek cover among stockpiled construction equipment, under construction debris, or in trenches; being a small animal, a fox may seek refuge in very small spaces. Moving this equipment could result in death or injury of the fox due to crushing or vehicle collision. Any discarded food or other trash left by construction workers could attract foxes to Project sites, exposing animals to unhealthy food items and possibly contributing to habituation of foxes to humans.

Impacts to Santa Catalina Island fox from proposed Project construction would be significant at sites BJM, DPK, and TWR.

Operational Impacts

The presence of the Project facility, per se, would not result in impacts to Santa Catalina Island fox; and the occasional visit to the site by maintenance workers (generally once a month) would not alter the current level of human presence at the sites or otherwise change the nature of ongoing impacts. Emergency diesel generators would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. The noise would attenuate rapidly and would not be above the levels that the fox would encounter in other areas on the island that have human presence; however, if equipment, debris, trash, or discarded food were left on site, this could compromise foxes that may be present or could pass by the Project sites.

Impacts to Santa Catalina Island fox from proposed Project operations would be significant at sites BJM, DPK, and TWR.

Mitigation Measures

The following mitigation measures would be required at sites on Santa Catalina Island (mitigation measures previously described are listed by name only):

BIO MM 1 Mitigation Monitoring and Reporting Plan

BIO MM 2 WEAP

BIO MM 3 Biological Compliance Reporting

BIO MM 4 Site Sanitation

BIO MM 5 Hazardous Materials Management

BIO MM 8 Biological Monitoring

BIO MM 9 Protect Native Vegetation and Common Wildlife

BIO MM 10 No Pets

BIO MM 11 Site Access

BIO MM 19 Trenches and Holes Management

- a) The contractor shall cover or backfill all trenches the same calendar day they are opened, where practicable.
- b) If trenches or holes cannot be closed the same day they are made, covers shall be firmly secured at ground level in such a way that small wildlife cannot slip beneath. At sites that require the presence of a biological monitor, trench covers shall be approved by the monitor.
- c) Open trenches shall be inspected regularly throughout the day and prior to filling to remove any trapped common wildlife (e.g., small mammals, reptiles, amphibians) and to check for the presence of protected wildlife species (e.g., arroyo toad) at Project sites that require the presence of a biological monitor.
- d) If a protected wildlife species is present in the trench, the on-site Biological Monitor shall contact USFWS immediately, ensure the protected species is not in immediate danger, and wait for instruction by USFWS.

- e) Covered trenches and holes at sites where biological monitors are present are to be inspected by the monitor at the end of the work day and prior to initiating construction activities the next day.
- f) In locating trenches or holes, disturbance to natural vegetation, including plant root systems shall be minimized.
- g) Prior to trenching, the construction disturbance limits and monitor for adherence to these boundaries shall be marked.

BIO MM 20 Santa Catalina Island Fox Protection

- a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of the Santa Catalina Island fox and the measures to be taken to avoid impacts to the fox.
- b) Prior to initiation of construction activities, the Project site plus a 250-foot buffer shall be inspected by a qualified biologist for the presence of Santa Catalina Island fox dens; if a den is located, no construction activities may be initiated and USFWS and CDFW shall be contacted.
- c) As part of the BIO MM 8 Biological Monitoring, the biological monitor shall inspect the work area, including equipment storage sites and staging areas, for the presence of foxes each day prior to initiation of on-site work. Construction equipment that may be used as hiding cover by a fox (e.g., open pipes, equipment piles) shall be inspected prior to moving.

Impacts after Mitigation

With the implementation of mitigation measures BIO MM 1 through BIO MM 5, BIO MM 8 through BIO MM 11, BIO MM 19, and BIO MM 20, construction and operational personnel would be aware of the possible presence of a fox and would avoid actions that could result in impacts to the fox (BIO MM 2). The sites would be maintained in clean condition (BIO MM 4 and BIO MM 5); equipment would be inspected for the presence of the animal prior to moving (BIO MM 8 and BIO MM 20); and trenches would be covered and inspected (BIO MM 19). Therefore, the development of the proposed Project sites would not have a substantial adverse effect, either directly or through habitat modifications, to the Santa Catalina Island fox.

With implementation of mitigation measures BIO MM 1 through BIO MM 5, BIO MM 8 through BIO MM 11, BIO MM 19, and BIO MM 20 the proposed Project would result in less than significant construction or operational impacts to the Santa Catalina Island fox at sites BJM, DPK, and TWR.

Small Animals: California Mountain Kingsnake, Coast Horned Lizard, San Diego Woodrat, Tehachapi Pocket Mouse, Townsend's Big-eared Bat, and Western Mastiff Bat

Each of these six species occurs in different habitats (see Appendix B-2), each is somewhat secretive, often hiding or taking refuge in dense vegetation, under debris, in burrows, or in steep rock crevices and mines. In most cases potentially suitable habitat for a species may be within many of the study areas; but, due to past vegetation clearing, little habitat may be found within many of the proposed Project sites. Considering the mobility of these animals, it is possible any of these species could pass through, forage within, or in some cases maintain burrows on Project sites. Potentially suitable habitat for one or more of these species is assumed to be found within 14 study areas (see Table 3.3-7), with the coast horned lizard and California mountain kingsnake potentially occurring within multiple locations (12 study areas and 3 study areas, respectively). Though not recorded by CDFW in the CNDDDB, the San Diego woodrat was discovered in the study area of Site RIH during surveys for a Southern California Edison project. The Tehachapi pocket mouse has been recorded within the vicinity of Site TPK, with a few additional occurrences (historic and recent) recorded in the Tehachapi Mountains. This is a very rare rodent known only from a few locations in a limited range. Its habitat includes native and nonnative grasslands, where it constructs burrows in loose, sandy soils. The primary threat to the species is thought to be habitat fragmentation, though any type of surface disturbance may cause adverse impacts if the species is present. The elevation of the Site TPK (4,885 feet) is within the elevation range for the species (3,500 to 6,000 feet). Scattered small mammal burrows were observed in the area of Site TPK; and suitable habitat may be present in the study area. No species-specific surveys have been conducted. Townsend's big-eared bat may forage in the study area of Site BJM, as well as other sites on Santa Catalina Island; but no potential roost sites of caves or mines are known to occur in the study area that could be impacted by Project activities. The western mastiff bat requires steep cliff faces with crevices for roosting; no proposed Project activities would impact these habitats. Each of these species is designated a species of concern by CDFW, though none are state or federally listed as threatened or endangered.

Construction Impacts

Construction activities include staging and stocking equipment, driving on access roads, parking vehicles, digging trenches, and clearing the ground surfaces within previously disturbed areas and in some cases removing native vegetation. Both Townsend's big-eared bat and western mastiff bat are nocturnal and would not interface with proposed Project activities. Though expected to flee the area when disturbed, it is possible that individuals of the coast horned lizard, California mountain kingsnake, San Diego woodrat, and Tehachapi pocket mouse would be injured or killed by Project construction activities by being crushed, trapped in burrows, or caused by noise and vibrations to abandon otherwise safe cover sites, possibly resulting to loss of an individual animal but otherwise not affecting the local population.

There would be no impact to Townsend's big-eared bat or western mastiff bat due to construction-related impacts at sites BJM and OAT.

Construction-related impacts to coast horned lizard, California mountain kingsnake, San Diego woodrat, and Tehachapi pocket mouse would be less than significant at sites CPK, ENT, FTP, H-17A, H-69B, LACFCP11, MMC, MTL2, RIH, SPN, TOP, and TPK.

Operational Impacts

The presence of the Project facility would not result in impacts to California mountain kingsnake, coast horned lizard, San Diego woodrat, Tehachapi pocket-mouse, Townsend’s big-eared bat, or western mastiff bat; and the occasional visit to the site by maintenance workers (generally once a month) would not alter the current level of human presence at the sites or otherwise change the nature of ongoing impacts. Emergency diesel generators would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. The noise would attenuate rapidly. The additional use of access roads (expected about once a month for the proposed Project) to conduct on-site maintenance could result in various small animals being run over on access roads or at the Project site.

There would be no impact to Townsend’s big-eared bat or western mastiff bat due to operational activities at sites BJM and OAT.

Operations-related impacts to coast horned lizard, California mountain kingsnake, San Diego woodrat, and Tehachapi pocket mouse would be less than significant at sites CPK, ENT, FTP, H-17A, H-69B, LACFCP11, MMC, MTL2, RIH, SPN, TOP, and TPK.

Mitigation Measures

The following mitigation measures would be implemented for California mountain kingsnake, coast horned lizard, San Diego woodrat, and Tehachapi pocket-mouse at proposed Project sites CPK, ENT, FTP, H-17A, H-69B, LACFCP11, MMC, MTL2, RIH, SPN, TOP, and TPK (see Table 3.3-7) (mitigation measures previously described are listed by name only):

- BIO MM 1** Mitigation Monitoring and Reporting Plan
- BIO MM 2** WEAP
- BIO MM 4** Site Sanitation
- BIO MM 8** Biological Monitoring
- BIO MM 9** Protect Native Vegetation and Common Wildlife
- BIO MM 10** No Pets
- BIO MM 11** Site Access
- BIO MM 18** Nesting Bird Protection

BIO MM 19 Trenches and Holes Management

Impacts after Mitigation

Though impacts to California mountain kingsnake, coast horned lizard, San Diego woodrat, and Tehachapi pocket-mouse at proposed Project sites would be less than significant without application of mitigation measures, these measures would still apply at these sites regardless of the level of significance and would further reduce the already less than significant impacts at sites CPK, ENT, FTP, H-17A, H-69B, LACFCP11, MMC, MTL2, RIH, SPN, TOP, and TPK. Since there would be no impact to Townsend's big-eared bat or western mastiff bat, no mitigation measures for these species apply to Project sites BJM and OAT.

Though the implementation of mitigation measures BIO MM 1, BIO MM 2, BIO MM 4, BIO MM 8 through BIO MM 11, BIO MM 18, and BIO MM 19, would reduce the likelihood of injury and mortality of small wildlife species resulting from Project construction and operations, individual small animals may be impacted or killed by Project construction or operation activities. The anticipated level of mortality is very low, however, and as such would not contribute to elevating the conservation status of any of the species analyzed herein. Therefore, the development of the proposed Project sites would not have a substantial adverse effect, either directly or through habitat modifications, to the California mountain kingsnake, coast horned lizard, San Diego woodrat, Tehachapi pocket mouse, Townsend's big-eared bat, or western mastiff bat.

There would be no impact to Townsend's big-eared bat or western mastiff bat due to construction or operations of the proposed Project.

Implementation of mitigation measures BIO MM 1, BIO MM 2, BIO MM 4, BIO MM 8 through BIO MM 11, BIO MM 18, and BIO MM 19 would further reduce the less than significant impacts related to the construction and operations of the proposed Project to California mountain kingsnake, coast horned lizard, San Diego woodrat, and Tehachapi pocket mouse.

Amphibians: Arroyo Toad, California Red-Legged Frog, Mountain Yellow-Legged Frog – Southern California DPS

Juveniles and adult arroyo toads spend much of their lives in riparian and upland habitats adjacent to breeding locations (USFWS 2011). Adults usually feed during the night, while newly metamorphosed toads may be active during the day. Breeding season extends from March to July, with shallow, slow-moving streams and standing water required for egg-laying. Individual toads have been observed as far as 1.2 miles from the streams where they breed but are most commonly found within 0.3 mile of those streams (USFWS 2001). The dispersal patterns in arroyo toads include the use of upland foraging sites, as well as up- and downstream corridors. Dispersal movements along the stream channel may be over 5 miles, as noted in a USFS record in 1999 and 2000 (USFWS 2001). Although dispersal behavior is not clearly understood, toads often concentrate in upland habitats on alluvial flats and sandy terraces in valley bottoms of active drainages. Sandy, loose soils in upland habitats provide areas for underground burrows during periods of inactivity (USFWS 2001). The extent of arroyo toad movements away from

the stream channel is influenced by rainfall amounts, availability of surface water, width of streamside terraces and floodplains, vegetative cover, and topography.

Populations of California red-legged frogs are most likely to occur where aquatic areas used for breeding (e.g., streams, deep pools, ponds, marshes, or lagoons) are surrounded by dispersal habitat. Adults usually feed during the night, while juveniles may forage during the day or night. Breeding season extends from November to April. Though egg-laying is typically associated with slow-moving water with dense riparian or emergent vegetation, breeding adults have been observed in unvegetated, shallow segments of stream. During the wet season, individual frogs are known to disperse up to 2 miles in a straight-line migration over uplands without regard to topography or vegetation type. They can also persist in areas of dense riparian vegetation up to 100 feet away from water. Dispersal away from breeding sites can occur during the summer when water is scarce and frogs are seeking summer habitat (e.g., under boulders, rocks, logs, or sheds; small mammal burrows; or incised stream channels) (USFWS 2002).

Juvenile and adult mountain yellow-legged frogs are highly aquatic and usually found within 5 to 10 feet of water (California Herps 2015a; Knapp 2012). Individuals are primarily active during the day (California Herps 2015). Breeding occurs as soon as the snow melts; March to May for the populations in southern California, and May to June for the Sierra Nevada populations (California Herps 2015). Shallow waters of streams, lakes, pools, or ponds are required for egg-laying (California Herps 2015; CDFW 2015b). Adults and larvae are thought to hibernate under the ice in deep water during the cold winter months (CDFW 2015b; Knapp 2012). During the active season, adults commonly move hundreds of feet to reach habitats for breeding, feeding, and overwintering (CDFW 2015b; Knapp 2012). Frequently, this movement follows lake shores and streams; however, adults will migrate short distances across dry areas (Knapp 2012).

Roadways and vehicle collisions pose a significant threat to dispersing frogs and toads due to the potential for being run over, causing injury or death. Runoff containing sediments and chemicals from roads and other sources can decrease habitat quality for amphibians.

None of the study areas include suitable habitat for the arroyo toad, California red-legged frog, or mountain yellow-legged frog; however, considering that these amphibians may disperse up to 2 miles across upland habitats, numerous Project sites fall within 2 miles of drainages or designated critical habitat where one or more of these species may occur. In addition, the Santa Monica Mountains National Recreation Area and Angeles National Forest each identified three drainages that provide suitable habitat for the California red-legged frog. Current survey information is unavailable, but these possible frog locations were considered to be occupied in the evaluation of proposed Project sites. Though it is suspected that the mountain yellow-legged frog is less likely to disperse overland to the same extent as the California red-legged frog, due to the lack of thorough dispersal studies the same evaluation standard of 2 miles is used for each of these amphibians in evaluating possible impacts from the construction and operations of proposed Project sites. Three proposed Project sites are within the 2-mile dispersal distance for the arroyo toad; 14 sites are within dispersal distance for the California red-

legged frog; and 8 sites are within dispersal distance of the mountain yellow-legged frog. Multiple species are present at 3 sites; 19 proposed Project sites fall within the 2-mile dispersal distance of one or more of these special status amphibians.

Construction Impacts

Construction of proposed Project sites would not result in any direct impacts to or loss of wetland or riparian habitats that may be occupied by arroyo toad, California red-legged frog, or mountain yellow-legged frog. Even though many of the proposed Project sites are on mountain peaks and ridgelines in steep mountain terrain, frogs, especially the California red-legged frog, may disperse across upland habitats regardless of the topography. If construction actions, including travel on access roads, would occur at night or during or following rain events, dispersing frogs or toads have the potential to be killed if run over by construction vehicles. Also, at the construction site, animals may be trapped or seek refuge in trenches, holes, or depressions that may retain water and subsequently may be killed or injured by on-site construction activities.

Impacts to arroyo toad, California red-legged frog, and mountain yellow-legged frog – Southern California DPS from construction activities associated with the proposed Project would be significant at sites CPK, FRP, GRM, H-69B, JOP, LACFCP08, LACFCP09, LACFCP11, LPC, MML, MTL2, PMT, PWT, SPN, SUN, SUN2, TOP, WMP, and WTR.

Operational Impacts

Once all construction activities are complete and any trenches, ditches, and steep-sided depressions are filled and leveled, amphibians may disperse across the Project site without incident. Since site maintenance activities are not expected to include nighttime access, mortality of frogs and toads along access roads is not considered an issue. If these sites are accessed following rain events, however, and frogs and toads may disperse during the day when maintenance workers could be using access roads, these amphibians could be killed.

Impacts to arroyo toad, California red-legged frog, and mountain yellow-legged frog – Southern California DPS from operations associated with the proposed Project would be significant at sites CPK, FRP, GRM, H-69B, JOP, LACFCP08, LACFCP09, LACFCP11, LPC, MML, MTL2, PMT, PWT, SPN, SUN, SUN2, TOP, WMP, and WTR.

Mitigation Measures

The following mitigation measures would be required at proposed Project sites within 2 miles of drainages or designated critical habitat where one or more of these species may occur (at sites CPK, FRP, GRM, H-69B, JOP, LACFCP08, LACFCP09, LACFCP11, LPC, MML, MTL2, PMT, PWT, SPN, SUN, SUN2, TOP, WMP, and WTR) (mitigation measures previously described are listed by name only):

BIO MM 1 Mitigation Monitoring and Reporting Plan

BIO MM 2 WEAP

BIO MM 3	Biological Compliance Reporting
BIO MM 8	Biological Monitoring
BIO MM 9	Protect Native Vegetation and Common Wildlife
BIO MM 10	No Pets
BIO MM 11	Site Access
BIO MM 19	Trenches and Holes Management
BIO MM 21	Protected Amphibian Protection

- a) As part of BIO MM 2 WEAP, construction crews shall be informed of the possible presence of protected amphibians (i.e., arroyo toad, California red-legged frog, mountain yellow-legged frog - southern California DPS) in the area and along access roads, and the measures to be taken to avoid impacts to these amphibians.
- b) As part of BIO MM 1 Biological Monitoring, the Biological Monitor shall be present during site preparation and placement of Project equipment. The monitor shall inspect the work area, including equipment storage sites and staging areas, for the presence of protected amphibians each day prior to initiation of on-site construction work following a measureable rain event (≥ 0.01 inch) while construction is ongoing.
- c) To protect dispersing frogs and toads, no Project-related on-site ground-disturbing activities or construction-related travel on access roads shall occur during the night or during rainy periods (within 24 hours of a measureable [≥ 0.01 inch] precipitation event or within 48 hours of a major [≥ 0.1 inch] precipitation event).
- d) To protect dispersing frogs and toads during normal site operations (non-emergency situations), these Project sites shall not be accessed by maintenance workers during the night or during rainy periods (within 24 hours of a measureable [≥ 0.01 inch] precipitation event or within 48 hours of a major [≥ 0.1 inch] precipitation event) (emergency situations are exempted).
- e) If a protected amphibian (i.e., arroyo toad, California red-legged frog, mountain yellow-legged frog - southern California DPS) is found within 50 feet of the construction site, all work that involves moving vehicles or ground disturbance shall cease until the animal moves on its own accord.
- f) If protected amphibians are present on the road, vehicles shall stop until the individual(s) move out of harm's way on their own accord.

Impacts after Mitigation

With the implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 8 through BIO MM 11, BIO MM 19, and BIO MM 21 construction and operational personnel would be aware that dispersing amphibians may be present at proposed Project sites or along access roads during rainy periods. Measures precluding vehicle use during rainy periods greatly minimize the possibility of Project-related amphibian mortality.

Impacts associated with construction and operations activities associated with the proposed Project would be reduced to less than significant for the arroyo toad, California red-legged frog, and mountain yellow-legged frog with implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 8 through BIO MM 11, BIO MM 19, and BIO MM 21 at sites at sites CPK, FRP, GRM, H-69B, JOP, LACFCP08, LACFCP09, LACFCP11, LPC, MML, MTL2, PMT, PWT, SPN, SUN, SUN2, TOP, WMP, and WTR.

Unarmored Three-spine Stickleback

The unarmored three-spine stickleback is a small, scaleless, freshwater fish found in slow-moving reaches in streams and rivers (USFWS 2009b), primarily in the headwaters of the Santa Clara River (USFWS 1980). The stickleback is a bottom feeder but will feed on the surface, eating various aquatic, and sometimes terrestrial, invertebrates. Three-spine sticklebacks feed primarily on benthic insects, small crustaceans, and snails and, to a lesser degree, on flatworms and nematodes (USFWS 2009b). Reproduction occurs in areas with adequate aquatic vegetation and slow-moving water where males can establish and vigorously defend territories. The male builds a nest of fine plant debris and algal strands and courts all females that enter his territory; a single nest may contain the eggs of several females. Following spawning, the male defends the nest, including newly hatched fry. The unarmored three-spine stickleback is believed to live for only one year (USFWS 2009b). Threats to the unarmored three-spine stickleback include: stream channelization, urbanization, introduction of predators and competitors, introgression, agricultural impacts, oxygen reduction, groundwater removal, transpiration, off-road vehicles, toxic spills and discharges, addition of too much sewage water to river systems (affecting water quality and velocity), and impoundment of water.

The Santa Clara River in the vicinity of site LACFCP11 is not perennial, though the unarmored three-spine stickleback may recolonize previously dry portions of the stream during wet periods. Based on records in the CNDDDB, stickleback presence in the river is more reliable about 1 mile downstream. The Santa Clara River is on the opposite side of Soledad Canyon Road from Site LACFCP11, as close as 50 feet to the Santa Clara River corridor. Maher Canyon, an ephemeral drainage within the study area of Site LACFCP11, crosses under Soledad Canyon Road and joins the Santa Clara River.

Construction Impacts

Though no aquatic, wetland, or riparian habitat would be removed due to proposed Project activities, the Project site is in close proximity to the Santa Clara River. No disturbance to fish from construction activities would occur even if water would be present in the river during construction because no Project activities would occur within the river corridor (north of Soledad Canyon Road). Construction activities

that involve ground disturbance can result in sediment transport into Maher Canyon and the Santa Clara River. Improperly managed equipment could lead to chemical spills, release of petroleum products, or pollution by other toxic substances that could enter aquatic habitats and possibly impact unarmored three-spine stickleback downstream in the Santa Clara River. Implementation of Project BMPs (Appendix C) as part of proposed Project actions would preclude transport of sediment or toxic substances into unarmored three-spine stickleback habitat. Specifically, BMPs 8 through 16 provide for the following actions:

- 1) Delineate clearing limits, easements, setbacks, sensitive or critical areas, trees, drainage courses, and buffer zones to prevent excessive or unnecessary disturbances and exposure. Minimize the size of staging areas to the extent practical.
- 2) Avoid excavation and grading during wet weather.
- 3) Use berms and drainage ditches to divert runoff around exposed areas. Place diversion ditches across the top of cut slopes.
- 4) Control stormwater flowing to and through the Project site.
- 5) Protect slopes by using measures such as erosion control blankets, bonded fiber matrices, turf reinforcement mats, silt fences (for moderate slopes), etc.
- 6) Retain sediment on site and control dewatering practices by using sediment traps or basins for large areas (> 1 acre) when appropriate.
- 7) Temporarily protect storm drain inlets until the site is stabilized. Protect drainage courses, creeks, or catch basins with fiber rolls, silt fences, sand/gravel bags and/or temporary drainage swales if on-site sediment control measures are not adequately preventing stormwater runoff.
- 8) Use appropriate erosion control measures to reduce siltation and runoff of contaminants into wetlands and adjacent, ponds, streams, or riparian woodland/scrub.
- 9) Conduct routine inspections of erosion control measures especially before and immediately after rainstorms, and repair if necessary.

There would be no impact to unarmored three-spine stickleback due to construction at Site LACFCD11.

Operational Impacts

Ongoing operations at Site LACFCD11 would not result in any actions that could impact unarmored three-spine stickleback or otherwise degrade aquatic habitats.

There would be no impact to unarmored three-spine stickleback due to proposed operations activities at Site LACFCD11.

Mitigation Measures

No mitigation measures are required.

There would be no impact to unarmored three-spine stickleback due to proposed construction or operation activities at Site LACFCD11.

Monarch Butterfly

Monarch butterflies undertake complex migratory behaviors and disperse widely, feeding on various nectar sources. The butterflies overwinter from November through January, roosting in large fir, pine, or eucalyptus trees, often reusing specific roost trees from year to year, with many butterflies roosting at the same site. During migration they will roost in trees for the night in small clusters. While at roost sites, butterflies are susceptible to disturbance from human activities.

Habitat for monarch butterflies may be found within the study area of 15 proposed Project sites (see Table 3.3-7). Of these, eight are within the general dispersal pathways of the monarch (sites CPK, GRM, LACFCP08, PDC, PWT, SPN, WS1, ZHQ), which may pass through the area taking advantage of nectar sources; however, no suitable trees for roosting are located in these eight study areas. Large trees are present within the study area of the other seven proposed Project sites (sites ENC1, ENT, H-69B, LACF072, LEPS, TOP, and WAD), which may be used as temporary roosts.

Construction Impacts

Impacts to the monarch butterfly due to construction activities would result from loss of or damage to trees used as temporary roosts. Construction-related noise or disturbance due to the presence of human activity would prevent butterflies from using roost sites when in close proximity (e.g., 50 feet) to roost trees. These roosts may be used at any time of the year by the monarch butterfly. Upon the loss of a roost tree or disturbance at a roost site, butterflies may simply fly away to another site. However, depending on weather conditions, time of day, and the number of butterflies present, mortality of some butterflies could occur, although not at a level that would be detectable within the local population.

There would be no impacts to monarch butterfly migration pathways from proposed Project construction at sites CPK, GRM, LACFCP08, PDC, PWT, SPN, WS1, and ZHQ.

Impacts to the monarch butterfly from proposed Project construction would be less than significant at sites ENC1, ENT, H-69B, LACF072, LEPS, TOP, and WAD.

Operational Impact

Ongoing operations of the proposed Project sites would not result in the loss of native vegetation, and presence of maintenance workers would be infrequent (approximately one visit a month).

No impact to the monarch butterfly would occur due to proposed Project operations at sites CPK, ENC1, ENT, GRM, H-69B, LACF072, LACFCP08, LEPS, PDC, PWT, SPN, TOP, WAD, WS1, and ZHQ.

Mitigation Measures

The following mitigation measures would be implemented at sites ENC1, ENT, H-69B, LACF072, LEPS, TOP, and WAD which provide potential monarch butterfly roost habitat (mitigation measures previously described are listed by name only):

BIO MM 1 Mitigation Monitoring and Reporting Plan

- BIO MM 2** WEAP
- BIO MM 3** Biological Compliance Reporting
- BIO MM 8** Biological Monitoring
- BIO MM 9** Protect Native Vegetation and Common Wildlife
- BIO MM 22** Monarch Butterfly Protection
- a) Preconstruction surveys by a qualified biologist shall provide for a thorough examination of suitable roost trees to determine if butterflies are using the site for roosting; surveys shall be repeated once a week throughout the construction period.
 - b) If butterflies are found roosting in the area, a protection buffer of 50 feet shall be established around each roost; and no construction activities would be undertaken within the buffer area while butterflies are roosting.
 - c) Loss of trees or removal of large limbs on trees that may provide suitable roost habitat for monarch butterflies shall be avoided.

Impacts after Mitigation

Though impacts to monarch butterflies at seven proposed Project sites would be less than significant without application of mitigation measures, these measures would still apply at these sites regardless of the level of significance and would further reduce the already less than significant impacts at sites ENC1, ENT, H-69B, LACF072, LEPS, TOP, and WAD. With implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 8, and BIO MM 22, impacts to monarch butterfly would be avoided since no trees with roosting butterflies would be removed or damaged; and potential disturbance to butterfly roost trees during construction activities would be precluded.

Implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 8, and BIO MM 22 at seven proposed Project sites would further reduce the less than significant construction and operational impacts to the monarch butterfly at ENC1, ENT, H-69B, LACF072, LEPS, TOP, and WAD.

There would be no impacts to monarch butterflies at sites CPK, GRM, LACFCP08, PDC, PWT, SPN, WS1, and ZHQ, and no recommended mitigation measures.

Special Status Plants: Big Bear Valley woollypod, Braunton's milk-vetch, California dissanthelium, Davidson's bush-mallow, decumbent goldenbush, Greata's aster, grey-leaved violet, intermediate mariposa-lily, island rush-rose, Lyon's pentachaeta, marcescent dudleya, Rock Creek broomrape, round-leaved filaree, San Antonio milk-vetch, Santa Catalina Island bedstraw, Santa Monica dudleya, Santa Susana tarplant, slender mariposa-lily, Santa Cruz Island rockcress, Sonoran maiden fern, Wallace's nightshade, white-veined monardella, Wiggins' cryptantha

Potentially suitable habitat for one or more of 23 species of special status plants may be found within the study area of one or more of 28 proposed Project sites (see Table 3.3-7). Each species has specific habitat requirements and a species-appropriate survey period (see Appendix B-2). The determination that these plant species may be present is based on a review of past collection records and an assessment of habitat in each study area, even if the plants were not observed during the field visit. Generally, loss and degradation of habitat has been the cause of decline for these plant species.

Two species, Davidson's bush mallow and Big Bear Valley woollypod were identified in Project-specific surveys. Davidson's bush mallow was located during the site reconnaissance survey and observed at Site MTL2, adjacent to previous disturbance from construction of the existing facilities; this species has the potential to be found at three additional proposed Project locations. A potential specimen of Big Bear Valley woollypod was observed at Site TMT and for the purposes of analysis is assumed to be this species, but a summer survey is required for definitive species-level identification.

Other species were not identified in surveys but were determined to have a potential to occur within the study area of proposed Project sites. Braunton's milk-vetch, an ESA-listed species, has the potential to occur at 11 proposed Project sites, more than any other special status plant species. Braunton's milk-vetch has a high potential to occur at Site GRM due to the presence of high quality habitat; known occurrences of the plant are within designated critical habitat less than 0.25 mile from the site.

Of the 15 special status plant species recorded within 1 mile of proposed Project Site TWR (see Table 3.3-3) on Santa Catalina Island, 6 species have the potential to occur within the study area (see Table 3.3-7), the greatest potential number of plant species for any site.

Construction Impacts

Each proposed Project site is located with an existing facility. Each location has a unique set of past developments, existing facilities, and ecological conditions. Some level of ground clearing has occurred at each site for the existing facility and access road. Some sites include extensive paved and fenced compounds, dirt and paved roads, buildings, water tanks, and communications towers. Ground clearing associated with past construction, vehicle parking, and ongoing vegetation management programs for protection from wildfire eliminated much of the potential habitat for special status plants on the proposed Project sites. Implementation of Project BMPs as part of proposed Project actions (specifically BMPs 8 through 16; Appendix C) to control water runoff and sedimentation would preclude impacts to special status plants due to potential alterations in drainage patterns.

Generally, most of these locations have been cleared of native vegetation; however, the development at some Project sites could result in the loss of native plants if the proposed Project developments would result in expanding the Project site into areas not already cleared of native vegetation, or if limited space is available for construction activities associated with erecting a new tower or monopole. Vehicles may drive over or park on the edge of the disturbed areas, which may impact native vegetation. Additional ground disturbance may occur due to trenching that may be required for electrical connections, drilling for geotechnical investigations, transporting equipment along access roads, possible alterations to drainage patterns, changes to the fire regime, or contributing to the spread of nonnative plants.

Impacts to 23 species of special status plants from construction activities would be significant at sites AGH, BJM, CPK, DPK, ENC1, ENT, FRP, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACF072, LACFCP08, LACFCP09, LEPS, LPC, MTL2, PMT, PWT, RIH, SPN, TMT, TOP, TWR, VPK, and WTR.

Operational Impacts

The regular maintenance and operations of proposed Project facilities would not alter the context and management of each site because of the collocation with existing facilities. Once all new ground-disturbing activities have been completed, no operational impacts to special status plants would occur.

There would be no impacts to 23 species of special status plants from operations associated with proposed Project sites AGH, BJM, CPK, DPK, ENC1, ENT, FRP, GRM, H-17A, H-69B, JPK, JPK2, JOP, LACF072, LACFCP08, LACFCP09, LEPS, LPC, MTL2, PMT, PWT, RIH, SPN, TMT, TOP, TWR, VPK, and WTR.

Mitigation Measures

The following mitigation measures would be required at proposed Project sites that have potential habitat for these species (AGH, BJM, CPK, DPK, ENC1, ENT, FRP, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACF072, LACFCP08, LACFCP09, LEPS, LPC, MTL2, PMT, PWT, RIH, SPN, TMT, TOP, TWR, VPK, and WTR) (mitigation measures previously described are listed by name only):

BIO MM 1 Mitigation Monitoring and Reporting Plan

BIO MM 2 WEAP

BIO MM 3 Biological Compliance Reporting

BIO MM 8 Biological Monitoring

BIO MM 9 Protect Native Vegetation and Common Wildlife

BIO MM 23 Prevent the Spread of Nonnative Vegetation

- a) All ground disturbed by construction activities that would not be paved, landscaped, or otherwise permanently stabilized (e.g., graveled, soil compaction) shall be seeded using species native to the Project vicinity.

- b) To prevent the introduction of invasive species seeds, all earthmoving and hauling equipment shall be inspected at the equipment storage facility to remove soil and vegetation; and the equipment shall be washed prior to entering the construction site.
- c) To prevent invasive species seeds from leaving the site, all construction equipment shall be inspected, and all attached plant/vegetation and soil/mud debris shall be removed prior to leaving the construction site.

BIO MM 24 Special Status Plants Surveys and Protection

- a) As part of BIO MM 2 WEAP, construction crews shall be informed prior to the onset of construction activities of the possible presence of special status plants in the area and the importance of maintaining native vegetation.
- b) At identified sites, surveys for special status plants shall be conducted by a qualified botanist prior to ground-disturbing activities, in the proper season and in suitable habitat surrounding the proposed Project site or any area subject to ground disturbance, including access roads.
- c) If a special status plant is found to be present or if surveys are determined to be inconclusive, the areas requiring special protection would be marked prior to construction to provide a buffer to maintain the ecological context of the location at which the plant was found.
- d) Mitigation measure BIO MM 8 Biological Monitoring shall apply at proposed Project sites where special status plants or their habitat are present, and protection buffers would be monitored for compliance.

Impacts after Mitigation

In accordance with mitigation measure BIO MM 24, thorough species-specific surveys would be conducted at each proposed Project site that has been identified as potentially providing suitable habitat for a special status plant species and at which any clearing of native vegetation would occur. These surveys would be used to identify occurrences of special status plant species and to mark buffer areas around such occurrences to protect individual plants. These surveys would not include the entire study area but would be focused where potential impacts could occur and so would be inclusive of any new temporary or permanent ground-disturbing activities and would include an appropriate buffer (generally greater than 50 feet). The application of mitigation measures for protection of native vegetation (BIO MM 9) and measures to control the spread of nonnative plants (BIO MM 23) would address potential impacts to special status plants associated with nonnative vegetation.

Implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 8, BIO MM 9, BIO MM 23, and BIO MM 24 would reduce to less than significant any construction impacts to the 23 species

of special status plants identified at proposed Project sites AGH, BJM, CPK, DPK, ENC1, ENT, FRP, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACF072, LACFCP08, LACFCP09, LEPS, LPC, MTL2, PMT, PWT, RIH, SPN, TMT, TOP, TWR, VPK, and WTR.

BIO-2. Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Sensitive Communities

Table 3.3-8 provides a list of sensitive communities which occur within the study area of proposed Project sites, as recorded in the CNDDDB and/or verified during reconnaissance surveys of each study area.

Table 3.3-8: Sensitive Communities Identified in the Field in the Study Areas

Sensitive Community	Study Area
California Walnut Woodland	AGH, AJT, PHN, SDW
Southern California Threespine Stickleback Stream	LACFCP11
Southern Coast Live Oak Riparian Forest and Woodland	JOP, LACF072, LACFCP11, LPC, MML
Southern Cottonwood Willow Riparian Forest	LACFCP11
Southern Mixed Riparian Forest	LEPS, OAT
Southern Riparian Scrub	LACFCP11
Southern Sycamore Alder Riparian Woodland	FTP, GRM, LACFCP11
Wildflower Field	TPK

The California Walnut Woodland, differentiated from scattered black walnut trees, is found in association with several study areas. At the study areas for sites PHN and SDW, walnut stands are represented on north-facing slopes below ridgelines and hilltops. The California Walnut Woodland community occurs within proposed Project sites AGH and AJT. Individual walnut trees are within or directly adjacent to AGH, AJT, and SDW Project sites. Also, established access roads to these sites pass through or near walnut community stands.

Numerous examples of various riparian woodland communities occur in canyons within the study area of several Project locations, as most Project sites are on the top of peaks and ridges where the head of canyons form. One or more of the five riparian communities listed in Table 3.3-8 occur within the study areas of proposed Project sites FTP, GRM, JOP, LACF072, LACFCP11, LEPS, LPC, MML, and OAT.

Site LACFCP11 has the most communities that occur within its study area. This site is on a low ridgeline above Soledad Canyon Road; on the opposite side of the road within the study area of Site LACFCP11 is the floodplain of the Santa Clara River. Maher Canyon, an ephemeral drainage within the study area of Site LACFCP11, crosses under Soledad Canyon Road and joins the Santa Clara River. Vegetation within

the Santa Clara River corridor and within the Maher Canyon drainage corridor includes mature Southern Coast Live Oak Riparian Forest and Woodland, Southern Cottonwood Willow Riparian Forest, Southern Mixed Riparian Forest, and Southern Sycamore Alder Riparian Woodland communities. Though this portion of the Santa Clara River is not perennial, it has been classified as Southern California Three-spine Stickleback Stream Community, with records of the fish occurring about 1 mile downstream. The river corridor has been highly impacted by heavy equipment and by dumping or storage of construction material and is used as a source of water for helicopter bucket dips from a maintained water storage tank; on the opposite side of the river corridor from Site LACFCP11 is an active railroad line.

Other identified sensitive communities in proposed Project study areas include Wildflower Field at Site TPK.

Construction Impacts

Impacts to sensitive communities due to construction activities would occur where components of a community (e.g., individual trees or shrubs) are located where ground-disturbing activities may occur, either due to expansion of the site or activities associated with construction of facilities. At most Project sites, all ground-disturbance activities would be limited to those areas that have previously been impacted and where native vegetation is no longer present or is included in a vegetation management regime to maintain firebreaks surrounding the existing facilities. At sites AGH, AJT, SDW, and TPK, native vegetation within sensitive communities could be impacted by on-site activities. When construction vehicles access a site, they may drive through sensitive woodland communities or cross drainage corridors occupied by riparian communities. Vehicles may brush against vegetation on narrow access roads, park on vegetation, or run over shrubs and other native vegetation while turning and positioning large construction vehicles, resulting in breaking woody stems, crushing vegetation, and compacting soils. Equipment storage sites and laydown areas may include native vegetation and components of sensitive communities. Root systems of native trees and shrubs could be damaged by trenching for power line installation, parking of vehicles, or paving; bucket-lift trucks and cranes used to raise antennas could damage tree limbs.

No Project activities are planned for or would occur within riparian communities found in the drainages and canyons in association with any Project site. At most sites, sensitive riparian communities are downslope and/or across existing roads from the Project site. Site LACFCP11 and its access road are immediately adjacent to the riparian communities of the Maher Canyon drainage and just across Soledad Canyon Road from the Santa Clara River. No direct impact to or removal of mature riparian trees is expected, and potential impacts to these sensitive riparian and stream communities due to surface runoff and erosion would be controlled by BMPs 8 through 16.

The Wildflower Field at Site TPK is dependent on the timing of adequate precipitation to trigger germination and growth. In general, early rains favor nonnative weeds, and late rains result in the germination of wildflowers. The Wildflower Field is largely defined by the seed bank within the nonnative grassland community that dominates the site and study area. Construction activities at Site

TPK could include impacts to nonnative grassland, which extends across the site and is absent only from paved areas or where soils are highly compacted due to past construction activities and repeated vehicle presence.

Impacts from construction activities associated with the proposed Project to sensitive natural communities would be significant at proposed Project sites AGH, AJT, SDW, and TPK.

Impacts from construction activities associated with the proposed Project to sensitive natural communities would be less than significant at proposed Project sites FTP, GRM, JOP, LACF072, LACFCP11, LEPS, LPC, MML, OAT, and PHN.

Operational Impacts

The presence of the Project facility would not result in impacts to sensitive natural communities. The regular maintenance and operations at proposed Project facilities would not alter the context and management of each site because of the collocation with existing facilities. The occasional visit to the site by maintenance workers (generally once a month) would not alter the current level of human presence at the sites or otherwise change the nature of ongoing impacts. Once all new ground-disturbing activities have been completed and limits of vegetation management have been established, there would be no operational impacts to sensitive natural communities.

No impacts to the sensitive natural communities would occur at any of the proposed Project sites due to operations.

Mitigation Measures

The following mitigation measures would be required at proposed Project sites that provide potentially suitable habitat for sensitive natural communities (mitigation measures previously described are listed by name only):

- BIO MM 1** Mitigation Monitoring and Reporting Plan
- BIO MM 2** Worker Environmental Awareness Program
- BIO MM 3** Biological Compliance Reporting
- BIO MM 8** Biological Monitoring
- BIO MM 9** Protect Native Vegetation and Common Wildlife
- BIO MM 11** Site Access
- BIO MM 19** Trenches and Holes Management
- BIO MM 23** Prevent the Spread of Nonnative Vegetation

Impacts after Mitigation

Application of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 8, BIO MM 9, BIO MM 11, BIO MM 19, and BIO MM 23, would reduce the potential for impacts to sensitive communities during construction and operation activities, and would further reduce the already less than significant impacts to riparian communities. These measures apply at the 14 proposed Project sites with sensitive natural communities within or adjacent to the study area: AGH, AJT, FTP, GRM, JOP, LACF072, LACFCP11, LEPS, LPC, MML, OAT, PHN, SDW, and TPK. With the implementation of these mitigation measures most, if not all, perennial vegetation would be preserved on site (BIO MM 9), and parking under the dripline of trees would be precluded to protect against soil compaction (BIO MM 9). No Project construction activities would be conducted within a riparian zone; however, individual plants may be present at the Project site or along access roads that cannot be avoided and must be trimmed or removed to accommodate Project needs. If this were to occur, large trees would still be avoided (BIO MM 9). Any loss of vegetation from sensitive woodland or Wildflower Field communities would be the minimum necessary as demarked by the biological monitor (BIO MM 8). With mitigation, impacts associated with loss of vegetation would occur at the periphery of a developed site and so would not compromise the integrity of the sensitive community. Therefore, the development of the proposed Project sites would not have a substantial adverse effect, either directly or through habitat modifications, to sensitive natural communities.

Construction and operations of 14 identified proposed Project sites would result in less than significant impacts to sensitive natural communities with implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 8, BIO MM 9, BIO MM 11, BIO MM 19, and BIO MM 23.

Critical Habitat

The evaluation of potential impacts to critical habitat includes the assessment of whether primary constituent elements (PCEs) are present, and then the assessment of whether proposed Project-related activities would impact those PCEs. Nine species have designated critical habitat within 1 mile of one or more of 16 proposed Project sites (see Table 3.3-5). Five sites have critical habitat within 1 mile for more than one species. Of the nine species with designated critical habitat within 1 mile of a Project site, five of those species have designated critical habitat within study areas (extended to 800 feet for Braunton's milk-vetch at Site GRM) at one or more of eight sites (Table 3.3-9). For three species, critical habitat is found with the proposed Project site boundary at five sites. Access roads to six sites pass through critical habitat of four species (see Table 3.3-9).

Table 3.3-9: Designated Critical Habitat Near Proposed Project Sites

Designated Critical Habitat	Study Area	Critical Habitat in Proposed Project Site	Approximate Length of Access Road through Critical Habitat (mi)
arroyo toad	LACFCP11	Y	1.00+
Braunton's milk-vetch	GRM (study area extended to	N	0.50 – 1.50

Table 3.3-9: Designated Critical Habitat Near Proposed Project Sites

Designated Critical Habitat	Study Area	Critical Habitat in Proposed Project Site	Approximate Length of Access Road through Critical Habitat (mi)
	800 feet)		
California red-legged frog	WMP	Y	0.50
coastal California gnatcatcher	H-17A	Y	0.15
	PHN	N	0.50
	RIH	Y	1.50
	SDW	Y	0
western snowy plover	ZHQ	N	0

Coastal California Gnatcatcher Critical Habitat

Critical habitat PCEs for the gnatcatcher include various coastal sage scrub vegetation communities and their successional stages; also included are non-sage scrub habitats such as chaparral, grassland, and/or riparian areas in proximity to the sage scrub habitats that provide space for dispersal, foraging, and nesting. Critical habitat does not include man-made structures (such as buildings, aqueducts, airports, roads, and other paved areas and the land on which they are located) existing on the effective date of the critical habitat rule and not containing one or more of the PCEs (USFWS 2007a).

Though designated critical habitat is in close proximity to the construction location of proposed Project sites PHN and SDW, habitat components at these sites are highly compromised or not present due to past human activities and current management at each site. PCEs are present at proposed Project sites H-17A and RIH within the study area and within or adjacent to the proposed Project site boundary.

Site H-17A

The study area and surrounding lands of Site H-17A, including the Project site itself, are within designated critical habitat for the gnatcatcher. The southwestern portion of the study area contains coastal sage scrub vegetation; the eastern portion contains nonnative grassland with scattered blue elderberry and walnut in the draws and north-facing slopes. Site H-17A contains a large area of pavement and other cleared lands. The ridgeline from the site that parallels the access road supports moderate to high quality habitat dominated by California sagebrush, California buckwheat, coast prickly pear cactus, and lemonadeberry. These and other habitat components constitute PCEs. The access road passes through about 0.15 mile of critical habitat with suitable nesting habitat alongside much of the road. Extensive coastal sage scrub habitats are found on surrounding hillsides outside the study area.

Site PHN

At Site PHN, the study area includes designated critical habitat for the coastal California gnatcatcher; the site itself is not within critical habitat. The existing facilities are within a paved and fenced compound. The area surrounding the compound is either mowed or treated with herbicide. The study area is

primarily nonnative grassland with small patches of coastal sage scrub vegetation on steep slopes to the south near the perimeter of the study area within critical habitat. The paved access road leading to Site PHN passes through about 0.5 mile of critical habitat.

Site RIH

The study area for Site RIH includes native and restored coastal sage scrub vegetation and nonnative grassland. At least one pair of gnatcatchers was known to nest in 2014 in or near the study area, based on surveys associated with a Southern California Edison project. The study area is presumed occupied. Coastal sage scrub vegetation and critical habitat PCEs occur within and adjacent to Site RIH as well as throughout the site's study area.

Site SDW

Designated critical habitat and PCE components for coastal California gnatcatcher occur within the study area of Site SDW; an unbuildable portion (steep slope) of the Project site overlaps the designated critical habitat by approximately 20 feet. At an elevation of 1,227 feet, critical habitat within the study area is primarily nonnative grassland, with only minor stands of coastal sage scrub on very steep slopes. The largest of these stands is less than 0.5 acre in extent, and the study area is approximately 250 feet above the predominant maximum elevation range of nesting gnatcatchers (99 percent of all gnatcatcher nesting occurrences are below 984 feet elevation). The study area includes residential or other developed lands in ruderal condition or planted with ornamental vegetation. The canyon and drainage to the south of Site SDW is within designated critical habitat and is the headwaters of Walnut Creek. The area has been impacted by development and past fires and is composed of nonnative grasslands dominated by wild oats and brome grasses with California black walnut trees in the drainage bottoms and scattered shrubs including Mexican elderberry and coast prickly pear cactus. A few steep slopes and road cuts include scattered, small patches of remnant coastal sage scrub vegetation, composed largely of coast prickly pear but also including sparse California sagebrush on the steepest slopes.

Construction Impacts

Impacts to designated critical habitat could occur due to construction activities where PCEs may be affected by ground-disturbing activities, resulting in damage to or loss of native shrubs, or otherwise may result in a reduction of the land surface that may support PCEs. Impacts associated with construction-related noise or human presence are addressed based on effects to the bird species under Impact Criteria 1 rather than as an impact to the physical habitat (i.e., PCEs) addressed under Impact Criteria 2.

Habitat conditions for gnatcatchers in or adjacent to critical habitat at sites PHN and SDW appear marginal, at best, due to the lack of PCEs and the extent of existing ground surface that has been previously cleared of vegetation, is paved over, has compacted soils, or is being maintained with landscaped vegetation. All construction activities at these sites can be accommodated within these previously disturbed areas; no loss of or impacts to PCEs would occur at sites PHN or SDW. The paved, restricted access roadway to Site PHN passes through almost 0.5 mile of critical habitat where PCEs

(scattered shrubs) occur adjacent to the road; vehicles would not need to leave the road through this area.

There would be no impacts to coastal California gnatcatcher critical habitat associated with Project construction at sites PHN and SDW.

Site development and construction activities at sites H-17A and RIH could impact PCEs and result in damage to or loss of native shrubs. At Site H-17A, patches of native shrubs (i.e., PCEs) within designated critical habitat and suitable for use by gnatcatchers are in close proximity to the existing facilities and within the identified Project boundary of the site, as well as immediately adjacent to about 800 feet of the paved access road leading to Site H-17A. The access road to Site H-17A has a hairpin turn at the top of the ridgeline where the facilities are located. Construction vehicles may attempt to cut across the curve and damage shrubs; other construction activities could damage or destroy native vegetation within or in close proximity to the construction site and equipment storage areas.

Impacts to coastal California gnatcatcher designated critical habitat due to construction activities at Site H-17A would be significant.

Critical habitat PCEs are found throughout the study area at Site RIH, including adjacent to and within the site boundary; and gnatcatchers are known to nest nearby. Development of Project facilities at Site RIH could result in loss of coastal sage scrub vegetation due to expansion of the existing facilities, vehicle parking, equipment storage and staging, construction of a retaining wall, and turnaround space for large construction vehicles. The paved access road passes through critical habitat where scattered patches of vegetation include PCEs.

Impacts to coastal California gnatcatcher designated critical habitat due to construction activities at proposed Project Site RIH would be significant.

Operational Impacts

The presence of the proposed Project facility would not result in impacts to designated critical habitat for the coastal California gnatcatcher. The regular maintenance and operations of Project facilities would not alter the context and management of each site because of the collocation with existing facilities. The occasional visit to the site by maintenance workers (generally once a month) would not alter the current level of human presence at the sites or otherwise change the nature of ongoing impacts. Once all new ground-disturbing activities have been completed and limits of vegetation management established, no operational impacts to critical habitat or its PCEs would occur.

There will be no impact to designated coastal California gnatcatcher critical habitat or identified PCEs due to operations of the proposed Project at sites H17A, PHN, RIH, and SDW.

Mitigation Measures

The following mitigation measures would be required at proposed Project sites that include designated critical habitat for the coastal California gnatcatcher (mitigation measures previously described are listed by name only):

- BIO MM 1** Mitigation Monitoring and Reporting Plan
- BIO MM 2** Worker Environmental Awareness Program
- BIO MM 3** Biological Compliance Reporting
- BIO MM 8** Biological Monitoring
- BIO MM 9** Protect Native Vegetation and Common Wildlife
- BIO MM 11** Site Access
- BIO MM 12** Coastal California Gnatcatcher Protection of Habitat
- BIO MM 19** Trenches and Holes Management
- BIO MM 23** Prevent the Spread of Nonnative Vegetation

Impacts after Mitigation

With the implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO 8, BIO MM 9, BIO MM 11, BIO MM 12, BIO MM 19, and BIO MM 23, most perennial vegetation (i.e., gnatcatcher critical habitat PCEs) would be preserved on site (BIO MM 9 and BIO MM 12); however, individual plants may be present at proposed Project sites or along access roads that cannot be avoided and must be trimmed or removed to accommodate Project needs. Some loss of shrubs is expected at sites H-17A and RIH. Individual native shrubs would be removed only if absolutely necessary (BIO MM 12), and construction limits would be marked and monitored for compliance by the biological monitor (BIO MM 8). These potential impacts at sites H-17A and RIH would be limited to the periphery of developed locations and so would not be expected to compromise the integrity or continued function of critical habitat.

There would be no impacts to designated coastal California gnatcatcher critical habitat due to construction and operations of the proposed Project at sites PHN and SDW.

With implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO 8, BIO MM 9, BIO MM 11, BIO MM 12, BIO MM 19, and BIO MM 23 at proposed Project sites H-17A and RIH the proposed Project would result in less than significant construction and operations impacts to coastal California gnatcatcher critical habitat.

Western Snowy Plover Critical Habitat

Proposed Project Site ZHQ is located at the Zuma Beach lifeguard station, within a paved parking lot between the Pacific Coast Highway and the beach. Western snowy plover critical habitat has been designated along the beach adjacent to and within the study area at Site ZHQ; critical habitat does not occur on the Project site. The Site ZHQ study area is located at about the midpoint of the critical habitat unit that extends almost 3 miles along the coast. This critical habitat unit is considered occupied and an important wintering area.

Western snowy plover critical habitat PCEs (USFWS 2012) are sandy beaches, dune systems immediately inland of an active beach face, salt flats, mud flats, seasonally exposed gravel bars, artificial salt ponds and adjoining levees and dredge spoil sites with:

- 1) Areas that are below heavily vegetated areas or developed areas and above the daily high tides
- 2) Shoreline habitat areas for feeding, with no or very sparse vegetation, that are between the annual low tide or low-water flow and annual high tide or high-water flow, subject to inundation but not constantly under water, that support small invertebrates, such as crabs, worms, flies, beetles, spiders, sand hoppers, clams, and ostracods, that are essential food sources
- 3) Surf- or water-deposited organic debris, such as seaweed (including kelp and eelgrass) or driftwood located on open substrates that supports and attracts small invertebrates and provides cover or shelter from predators and weather and assists in avoidance of detection for nests, chicks, and incubating adults
- 4) Minimal disturbance from the presence of humans, pets, vehicles, or human-attracted predators, providing relatively undisturbed areas for individual and population growth and for normal behavior

Critical habitat does not include man-made structures (such as buildings, roads, paved areas, boat ramps, and other developed areas and the land on which such structures are directly located) existing within the legal boundaries on the effective date of the critical habitat rule.

The beach at proposed Project Site ZHQ is highly managed (e.g., sand is bulldozed and piled) and is a focal area for recreationists, whose presence would likely preclude nesting by the plover on the beach outside protected areas; however, conditions and nesting sites may change from year to year. Plovers may be more prevalent in this area during winter when few recreationists are on the beach. The beach is managed for recreation and kept free of debris and contains low-quality habitat for feeding and for nesting. The only vegetation is found in ornamental gardens near buildings. The only native species are considered weedy volunteers in the gardens or in cracks in the concrete and asphalt. None of the PCEs for critical habitat of western snowy plover are present within the site boundary of Site ZHQ, but PCEs are present within the study area.

Construction Impacts

Designated critical habitat occurs along the beach adjacent to Site ZHQ and within the study area but excludes the paved parking area and the land on which the present structures have been built (USFWS

2012a). All construction activities associated with proposed Project Site ZHQ are restricted to paved and developed areas that are not considered part of critical habitat. Construction activities would not result in loss of or impact to any critical habitat PCEs.

No construction related impacts to western snowy plover designated critical habitat would occur at Site ZHQ.

Operation Impacts

The presence of a monopole could provide perching locations for ravens and gulls from which to observe and locate their prey; these birds are predators of snowy plovers and their nests. The presence of these “human-attracted predators” (see PCE 4, above) may compromise the suitability and function of designated critical habitat.

Impacts to western snowy plover designated critical habitat from operations at proposed Project Site ZHQ would be significant.

Mitigation Measures

The following mitigation measures would be required at proposed Project Site ZHQ that includes designated critical habitat for the western snowy plover (mitigation measures previously described are listed by name only):

- BIO MM 1** Mitigation Monitoring and Reporting Plan
- BIO MM 2** Worker Environmental Awareness Program
- BIO MM 3** Biological Compliance Reporting
- BIO MM 6** Anti-perch Devices
- BIO MM 8** Biological Monitoring

Impacts after Mitigation

Mitigation measures BIO MM 1 through BIO MM 3, BIO MM 6, BIO MM 8, and BIO MM 10 are required at proposed Project Site ZHQ. Implementation of BIO MM 6 would provide for anti-perch devices on any elevated horizontal surface associated with the Project facility that may be suitable as perch or nest sites for raptors, ravens, gulls, or other large birds that are potential predators of western snowy plovers. BIO MM 10 does not allow pets to be brought to the Project sites. These mitigation measures minimize disturbance from the presence of pets and human-attracted predators so as not to compromise the stability and function of critical habitat.

With implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 6, BIO MM 8, and BIO MM 10 at Site ZHQ the proposed Project would result in less than significant operations impacts to the western snowy plover.

Braunton's Milk-vetch Critical Habitat

Braunton's milk-vetch grows in association with disturbances, such as along road edges and fuel breaks, but is most closely associated areas of chaparral vegetation that has previously burned. The plant will persist in bare areas, especially with carbonate bedrock. Critical habitat for Braunton's milk-vetch does not occur within the Project site; critical habitat, however, has been designated in the Santa Monica Mountains and is within 800 feet of Site GRM. Site GRM is located within the chaparral vegetation community; laurel sumac, California bush buckwheat, bush monkeyflower, several species of *Ceanothus*, and deerweed are common throughout the study area. Several unpaved roadways lead up the slope toward the proposed Project site and circle the existing facilities; depending on the route taken to Site GRM, the access road may pass through 0.5 mile or 1.5 miles of designated critical habitat. Several footpaths that could provide potential habitat lead to the existing facility. The plant could also appear within the study area after a fire.

The PCEs for Braunton's milk-vetch (USFWS 2006) are the habitat components that provide:

- 1) Calcium carbonate soils derived from marine sediment
- 2) Low proportion (less than 10 percent) of shrub cover directly around the plant
- 3) Chaparral and coastal sage scrub communities characterized by periodic disturbances that stimulate seed germination (e.g., fire, flooding, erosion) and reduce vegetative cover

Critical habitat does not include man-made structures existing on the effective date of the critical habitat rule and not containing one or more of the PCEs, such as buildings, aqueducts, airports, and roads, and the land on which such structures are located (USFWS 2006).

Construction Impacts

Though Site GRM may include suitable and high quality habitat for Braunton's milk-vetch, all construction activities are fully outside designated critical habitat. However, materials for construction of a 195-foot-tall lattice tower must be transported along access roads through critical habitat. High quality critical habitat PCEs are immediately adjacent to the unpaved roadway. Though no modifications to access roads are planned, several sharp turns in the road within critical habitat could result in construction vehicles cutting across curves and impacting roadside vegetation, including critical habitat PCEs.

Impacts to Braunton's milk-vetch designated critical habitat due to construction activities (i.e., the use of access roads) at proposed Project Site GRM would be significant.

Operational Impacts

The presence of the proposed Project facility at Site GRM would not result in impacts to designated critical habitat for Braunton's milk-vetch. The regular maintenance and operations of Project facilities (generally once a month) would require the use access roads, but heavy or large construction vehicles would not be necessary.

There would be no impact to designated Braunton's milk-vetch critical habitat or identified PCEs due to operations of the proposed Project at Site GRM.

Mitigation Measures

The following mitigation measures would be required at Site GRM and the associated access road that includes designated critical habitat for Braunton's milk-vetch (mitigation measures previously described are listed by name only):

- BIO MM 1** Mitigation Monitoring and Reporting Plan
- BIO MM 2** Worker Environmental Awareness Program
- BIO MM 3** Biological Compliance Reporting
- BIO MM 8** Biological Monitoring
- BIO MM 9** Protect Native Vegetation and Common Wildlife
- BIO MM 11** Site Access
- BIO MM 23** Prevent the Spread of Nonnative Vegetation
- BIO MM 24** Special Status Plants Surveys and Instructions

Impacts after Mitigation

With implementation mitigation measures BIO MM 1 through BIO MM 3, BIO MM 8, BIO MM 9, BIO MM 11, BIO MM 23, and BIO MM 24, use of access roads by large equipment would have oversight by the biological monitor (BIO MM 8) ensuring protection of native vegetation (BIO MM 9) and Braunton's milk-vetch critical habitat PCEs.

Proposed development at Site GRM would result in less than significant construction impacts to designated critical habitat for Braunton's milk-vetch with implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 8, BIO MM 9, BIO MM 11, BIO MM 23, and BIO MM 24.

Arroyo Toad Critical Habitat

Arroyo toads are associated with washes or intermittent streams and occupy valley foothills and desert riparian habitats, usually in small, isolated populations (USFWS 2009a). In 2001, USFWS designated critical habitat for the arroyo toad that was revised in 2005 (USFWS 2001; USFWS 2005). The following habitat features are essential to the conservation of the arroyo toad (USFWS 2005).

The PCEs for the arroyo toad consist of four components:

- 1) Rivers or streams with hydrologic regimes that supply water to provide space, food, and cover needed to sustain eggs, tadpoles, metamorphosing juveniles, and adult breeding toads. Breeding pools must persist a minimum of two months for the completion of larval

development; however, due to the dynamic nature of southern California riparian systems and flood regimes, the location of suitable breeding pools may vary from year to year. Specifically, the conditions necessary to allow for successful reproduction of arroyo toads are:

- a) Breeding pools that are less than 6 inches deep
 - b) Areas of flowing water with current velocities less than 1.3 feet per second
 - c) Surface water that lasts for a minimum of two months during the breeding season (a sufficient wet period in the spring months to allow arroyo toad larvae to hatch, mature, and metamorphose)
- 2) Riparian and adjacent upland habitats, particularly low-gradient (typically less than 6 percent) stream segments and alluvial streamside terraces with sandy or fine gravel substrates that support the formation of shallow pools and sparsely vegetated sand and gravel bars for breeding and rearing of tadpoles and juveniles; and adjacent valley bottomlands that include areas of loose soil where toads can burrow underground, to provide foraging and living areas for juvenile and adult arroyo toads
- 3) A natural flooding regime, or one sufficiently corresponding to natural, that:
- a) Is characterized by intermittent or near-perennial flow that contributes to the persistence of shallow pools into at least mid-summer.
 - b) Maintains areas of open, sparsely vegetated, sandy stream channels and terraces by periodically scouring riparian vegetation.
 - c) Also modifies stream channels and terraces and redistributes sand and sediment, such that breeding pools and terrace habitats with scattered vegetation are maintained.
- 4) Stream channels and adjacent upland habitats that allow for movement to breeding pools, foraging areas, overwintering sites, upstream and downstream dispersal, and connectivity to areas that contain suitable habitat

Critical habitat does not include man-made structures (such as buildings, aqueducts, airports, roads, and other paved areas) and the land on which they are located existing within the legal boundaries on the effective date of the critical habitat rule (USFWS 2005).

Proposed Project Site LACFCP11 is within designated critical habitat for the arroyo toad; dispersal habitat PCEs are present within the Project site. This critical habitat segment includes approximately 11 miles of the Santa Clara River corridor and the lowest segments of tributary drainages. Site LACFCP11 is located about midway along this segment of critical habitat, at a developed county facility; the proposed Project site has an existing water tank and helipad at the end of a ridgeline, above and adjacent to Soledad Canyon Road. The Santa Clara River is on the opposite side of Soledad Canyon Road. Maher Canyon, an ephemeral drainage, passes through the detention facility, crosses under Soledad Canyon Road, and joins the Santa Clara River. About 1,000 feet of Maher Canyon above Soledad Canyon Road is within critical habitat, the length of which is bordered by paved roads and structures associated with the detention facility. Upland vegetation within the study area is chamise chaparral; within the Maher Canyon drainage and Santa Clara River corridor on the opposite side of Soledad Canyon Road is mature riparian forest that includes coast live oak and California sycamore trees. This segment of the

Santa Clara River does not provide permanent flow. The river corridor has been highly degraded by heavy equipment and dumping or storage of construction materials and is used as a source of water for helicopter bucket dips from a maintained water storage tank; on the opposite side of the river corridor from Site LACFCP11 is an active railroad line.

The geographic designation of critical habitat for arroyo toad includes the Santa Clara River corridor and the lower section of Maher Canyon, completely overlapping the study area of Site LACFCP11. Technically, the existing facilities at Site LACFCP11 (water tank and helipad), detention facility roads, and structures along Maher Canyon and Soledad Canyon Road are excluded by rule as critical habitat since they are paved, man-made structures; however, activities associated with these facilities can impact the function of adjacent critical habitat.

Construction Impacts

Construction of Site LACFCP11 would not result in any impacts to or loss of wetland or riparian habitats included as PCEs for arroyo toad critical habitat. Access by construction equipment would be on existing roads that are bordered by toad habitat that meets PCE criteria, including about 5 miles of Soledad Canyon Road and the entrance road to the county facility. PCEs for upland and dispersal habitat may be impacted due to removal of some chaparral vegetation during construction of a retaining wall at the proposed Project site, and temporary trenches may be used to connect to electrical power. Construction activities including vehicle parking and turnaround areas may also result in damage to existing native vegetation and disturbance of rocks and boulders that could be used as cover by toads. Some of the vegetation that may be lost is immediately up the slope from Soledad Canyon Road, which may be a barrier to toad movements or be a source of mortality to dispersing toads. Other impacts from construction could occur as a result of erosion or transfer of sediment or pollutants into aquatic habitat. Implementation of Project BMPs (Appendix C), specifically BMPs 8 through 16, as part of the proposed Project actions would preclude transport of sediment or pollutants into aquatic habitat.

Impacts to arroyo toad critical habitat from proposed construction activities at Site LACFCP11 would be significant.

Operational Impacts

Once all construction activities are complete and any trenches, ditches, and steep-sided depressions are filled and leveled, arroyo toads may utilize the upland habitat and disperse across proposed Project Site LACFCP11 without incident. Development of Site LACFCP11 would not constitute a barrier to toad dispersal. Periodic access to the Project site by maintenance workers (about once a month) would not result in any modification of critical habitat PCEs.

There would be no operational impact to arroyo toad critical habitat at Site LACFCP11.

Mitigation Measures

The following mitigation measures would be required at Site LACFCP11 and its access road that includes designated critical habitat for arroyo toad (mitigation measures previously described are listed by name only):

- BIO MM 1** Mitigation Monitoring and Reporting Plan
- BIO MM 2** Worker Environmental Awareness Program
- BIO MM 3** Biological Compliance Reporting
- BIO MM 5** Hazardous Materials Management
- BIO MM 8** Biological Monitoring
- BIO MM 9** Protect Native Vegetation and Common Wildlife
- BIO MM 11** Site Access
- BIO MM 19** Trenches and Holes Management

Impacts after Mitigation

With the implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 5, BIO MM 8, BIO MM 9, BIO MM 11, and BIO MM 19, the loss of perennial vegetation and disturbance to natural features would be minimized (BIO MM 9 and BIO MM 19) and overseen by a biological monitor (BIO MM 8). Potential impacts to upland habitat PCEs of arroyo toad critical habitat would be limited to the periphery of the developed site and access roads, and restricted to upland areas. The application of BIO MM 5 would protect aquatic habitats from sedimentation and spills.

With implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 5, BIO MM 8, BIO MM 9, BIO MM 11, and BIO MM 19 at proposed Project Site LACFCP11 the proposed Project would result in less than significant impacts to arroyo toad critical habitat.

California Red-legged Frog Critical Habitat

Populations of California red-legged frogs are most likely to occur where aquatic areas used for breeding (e.g., streams, deep pools, ponds, marshes, or lagoons) are surrounded by dispersal habitat. Dispersal away from breeding sites can occur during the summer when water is scarce and frogs are seeking summer habitat (e.g., under boulders, rocks, logs, or sheds; small mammal burrows; or incised stream channels) (USFWS 2002).

Located within designated critical habitat for the California red-legged frog, Site WMP is on a high peak in the San Gabriel Mountains along Whittaker Ridge. Slopes are steep, and the vegetation is primarily recently burned chamise chaparral.

The PCEs for the California red-legged frog consist of four components (USFWS 2010a):

- 1) Aquatic Breeding Habitat. Standing bodies of fresh water (with salinities less than 4.5 parts per thousand), including natural and man-made (e.g., stock) ponds, slow-moving streams or pools within streams, and other ephemeral or permanent waterbodies that typically become inundated during winter rains and hold water for a minimum of 20 weeks in all but the driest of years
- 2) Aquatic Non-Breeding Habitat. Freshwater pond and stream habitats, as described in paragraph (1) of this entry, that may not hold water long enough for the species to complete its aquatic life cycle but which provide for shelter, foraging, predator avoidance, and aquatic dispersal of juvenile and adult California red-legged frogs. Other wetland habitats considered to meet these criteria include, but are not limited to: plunge pools within intermittent creeks, seeps, quiet water refugia within streams during high water flows, and springs of sufficient flow to withstand short-term dry periods.
- 3) Upland Habitat. Upland areas adjacent to or surrounding breeding and non-breeding aquatic and riparian habitat up to a distance of 1 mile in most cases (i.e., depending on surrounding landscape and dispersal barriers) including various vegetational series such as grassland, woodland, forest, wetland, or riparian areas that provide shelter, forage, and predator avoidance for the California red-legged frog. Upland habitat should include structural features such as boulders, rocks and organic debris (e.g., downed trees, logs), small mammal burrows, or moist leaf litter. Upland features are also essential in that they are needed to maintain the hydrologic, geographic, topographic, ecological, and edaphic features that support and surround the aquatic, wetland, or riparian habitat. These upland features contribute to: (a) Filling of aquatic, wetland, or riparian habitats; (b) Maintaining suitable periods of pool inundation for larval frogs and their food sources; and (c) Providing non-breeding, feeding, and sheltering habitat for juvenile and adult frogs (e.g., shelter, shade, moisture, cooler temperatures, a prey base, foraging opportunities, and areas for predator avoidance).
- 4) Dispersal Habitat. Accessible upland or riparian habitat within and between occupied locations within a minimum of 1 mile of each other and that support movement between such sites. Dispersal habitat includes various natural habitats, and altered habitats such as agricultural fields, that do not contain barriers (e.g., heavily traveled roads without bridges or culverts) to dispersal. Dispersal habitat does not include moderate- to high-density urban or industrial developments with large expanses of asphalt or concrete, nor does it include large lakes or reservoirs over 50 acres in size or other areas that do not contain those features identified in paragraphs above.

Critical habitat does not include man-made structures existing on the effective date of this rule and not containing one or more of the PCEs, such as buildings, aqueducts, airports, and roads and the land on which such structures are located.

USFWS has established adverse modification standards for critical habitat. These are activities that would modify critical habitat, alter PCE's, and jeopardize the continued existence of the species. These include:

- Significant alteration of water chemistry or temperatures beyond the tolerance of the species that interrupts their lifecycle
- Significant increase in sedimentation within a stream or pond that would disturb foraging and dispersal and reduce necessary habitat
- Significant alteration of channel or pond morphology that would change the hydrologic functioning of a stream or pond that would alter or degrade California red-legged frog habitat
- Eliminating upland foraging, dispersal or aestivating habitat
- Introducing, spreading, or adding to nonnative aquatic species used by the California red-legged frog
- Altering or eliminating food sources or prey base that directly or indirectly affects the California red-legged frog

Though Site WMP is located on a steep mountain peak and no aquatic/riparian habitat occurs in the study area, PCEs for California red-legged frog include upland habitat, generally within 1 mile of occupied sites. Dispersal habitat PCEs are present within the Project site. California red-legged frogs can disperse distances of up to 2 miles. Frogs are known from Piru Creek, which is more than 1 mile from Site WMP; it is unknown if frogs occur within, or have been surveyed for, in Michael Creek, a tributary of Piru Creek and less than 0.5 mile from Site WMP.

Construction Impacts

Construction of proposed Project Site WMP would not result in any impacts to or loss of wetland or riparian habitats included as PCEs for California red-legged frog critical habitat; however, red-legged frog critical habitat PCEs for upland and dispersal habitat are present. Construction activities including vehicle parking and turnaround, equipment storage and laydown for construction of a 195-foot-tall lattice may result in damage to existing native vegetation and displacement of rocks and boulders. Trenches and ditches that may compromise the suitability of critical habitat would be temporary. Since this site is along a high, steep, and exposed ridgeline, the xeric conditions would be less likely to support frogs utilizing upland habitats; however, during dispersal frogs may cross upland habitats regardless of the topography. Other impacts from construction could occur as a result of erosion or transfer of sediment or pollutants into aquatic habitat. Implementation of Project BMPs (Appendix C), specifically BMPs 8 through 16, as part of the proposed Project actions would preclude transport of sediment or pollutants into aquatic habitat.

Impacts to California red-legged frog critical habitat from construction activities associated with the proposed Project Site WMP would be significant.

Operational Impacts

Once all construction activities are complete and any trenches, ditches, and steep-sided depressions are filled and leveled, California red-legged frogs may utilize the upland habitat and disperse across

proposed Project Site WMP without incident. Development of Site WMP would not constitute a barrier to frog dispersal. Periodic access to the Project site by maintenance workers (about once a month) would not result in any modification of critical habitat PCEs.

There would be no impact to California red-legged frog critical habitat due to proposed operations at Site WMP.

Mitigation Measures

The following mitigation measures would be required at Site WMP and the access road that includes designated critical habitat for California red-legged frog (mitigation measures previously described are listed by name only):

- BIO MM 1** Mitigation Monitoring and Reporting Plan
- BIO MM 2** Worker Environmental Awareness Program
- BIO MM 3** Biological Compliance Reporting
- BIO MM 5** Hazardous Materials Management
- BIO MM 8** Biological Monitoring
- BIO MM 9** Protect Native Vegetation and Common Wildlife
- BIO MM 11** Site Access
- BIO MM 19** Trenches and Holes Management

Impacts after Mitigation

With the implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 5, BIO MM 8, BIO MM 9, BIO MM 11, and BIO MM 19, the loss of perennial vegetation and disturbance to natural features would be minimized (BIO MM 9 and BIO MM 19) and overseen by a biological monitor (BIO MM 8). Potential impacts to upland and dispersal PCEs of California red-legged frog critical habitat would be limited to the periphery of the developed site and access roads and restricted upland areas. The application of BIO MM 5 would protect aquatic habitats from spills.

With implementation of mitigation measures BIO MM 1 through BIO MM 3, BIO MM 5, BIO MM 8, BIO MM 9, BIO MM 11, and BIO MM 19 at Site WMP the proposed Project would result in less than significant construction impacts to California red-legged frog critical habitat.

Essential Fish Habitat

Designated EFH has been established along the Pacific coastline along Los Angeles County up to the high tide line for certain marine species (e.g., groundfish [a guild of bottom-dwelling marine fishes], salmonids, pelagic species, highly migratory species). Site ZHQ and its study area are within designated

EFH. Marine environments are separated from the Project site by sand mounds and recreational beaches. Sites WS1, SCH, and LEPS are within 0.5 mile of EFH, each site being separated from the ocean by upland habitat, roadways, and, often, coastline developments. The designation of EFH primarily addresses fishing gear restrictions, restrictions on sea-bottom trawling activities, and closure of areas to all fishing that contacts the bottom. Since EFH is designated under the Magnuson-Stevens Fishery Conservation and Management Act, any project-related effects to EFH are subject to consultation with the National Marine Fisheries Service, which may provide conservation recommendations to the federal action agency.

Construction Impacts

Project activities at Site ZHQ are restricted to a paved parking lot. Noise, vibration, or the presence of people as part of construction of Site ZHQ would have no impact to designated EFH; however, sediment transport into the ocean or uncontained spills of toxic substances, should this occur, would adversely impact EFH. Implementation of Project BMPs (Appendix C), specifically BMPs 8 through 16, as part of proposed Project activities would preclude transport of sediment or toxic substances into EFH.

Impacts to groundfish from construction activities would be less than significant.

Operational Impacts

Proposed operations at the Site ZHQ would not result in any actions that could impact EFH.

There would be no impacts to EFH at Site ZHQ as a result of operational activities.

Mitigation Measures

No mitigation measures are required.

BIO-3. Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Some of the most sensitive wetland habitats in Los Angeles County include vernal pools; however, this habitat does not occur within the study area of any proposed Project site. Twenty seven study areas include a wetland as mapped by the National Wetland Inventory (USFWS 2015b) (see Table 3.3-6).

Perennial water is not present at any site; however, the concrete-lined drainage channel of the San Gabriel River in a heavily urbanized setting passes within the study area of Site ASD. Water that may be present in the channel is often runoff from dense urban settings. Waterfowl and other birds and wildlife may be attracted to this source of water, though little to no native vegetation is associated with the channel. Local agencies are improving the bike path environment adjacent to canals by adding landscaping in places that someday may slightly mimic riparian habitat. Two Project sites, WS1 and ZHQ, are within 500 feet of marine habitats and beaches. Site SIM is located near a wetland mapped by the National Wetland Inventory as an ephemeral freshwater pond (this is Jaws Lake at Universal Studios).

Ephemeral drainages pass through or near the study areas of the remaining 23 sites. These wetlands and associated riparian vegetation are generally in canyons that occur below Project sites located at the top of peaks or ridges where the heads of canyons form. Site LACFCP11 is the closest of any site to mapped wetland habitats, being sited on a ridgeline just above the ephemeral Maher Canyon before its confluence with the Santa Clara River; the Santa Clara River, ephemeral in this area, is also with 500 feet of Site LACFCP11 (mostly permanent flows are found about 1 mile downstream).

Construction Impacts

At most sites, proposed ground-disturbance activities would be limited to those areas that have previously been cleared of vegetation. No proposed Project activities would occur within designated wetlands. Increased vehicle use and the presence of heavy construction equipment at a site could increase soil compaction that could result in less infiltration of water into the soil and faster flows off the site. Soil disturbance for trenching could loosen soil and allow it to be eroded and washed into ephemeral drainages at a faster rate than would occur normally. Sediment transport or uncontained spills of toxic substances, should this occur, could impact wetlands. Implementation of Project BMPs (Appendix C), specifically BMPs 8 through 16, as part of the proposed Project actions would preclude transport of sediment or toxins into aquatic habitat.

No impacts to wetlands are anticipated associated with proposed construction activities.

Operational Impacts

Upon completion of construction activities, maintenance workers would visit each Project site about once each month, which would not result in any impacts to wetlands.

No impacts to wetlands are anticipated as a result of proposed operations activities at any of the proposed Project sites.

Mitigation Measures

No mitigation measures for protection of wetlands are recommended at sites AJT, ASD, CPK, ENC1, GRM, H-17A, H-69B, JPK, JPK2, LACF072, LACFCP08, LACFCP09, LACFCP11, LEPS, LPC, OAT, PHN, PMT, PWT, SDW, SIM, SUN, SUN2, TOP, VPK, WS1, and ZHQ.

BIO-4. Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Multiple agencies and jurisdictions across Los Angeles County have recognized important wildlife habitat through special land designations or have established other land use restrictions or land use plans and policies that directly or indirectly benefit wildlife. These designations may be overlapping and often are referred to using various terminology and classifications. For example, the term “wildlife corridor” may be referred to as wildlife linkage, connectivity area, ecological area, landscape block, open space, and movement corridor. California Assembly Bill 2785 passed in 2008 required CDFW to map essential

wildlife corridors. This was accomplished through the California Essential Habitat Connectivity Project (Spencer et al. 2010) as part of the state-wide infrastructure planning process. The Los Angeles County General Plan uses the term habitat linkage and defines it as an area within the overall range of a species or suite of species that possesses sufficient cover, food, forage, water, and other essential elements to serve as a movement pathway between two or more larger areas of habitat. Depending on the species, linkages vary in size. Wildlife corridors can be applied at a landscape level or at a very fine species-specific scale, depending on the size and ecological requirements of the species being considered. For this reason, wildlife corridor boundaries have not been officially designated. Linkages are estimated wildlife routes most commonly taken between open space areas that serve as core habitat. This open space (and associated linkage zones) may include designated Natural Landscape Blocks; National Forests; Natural Community Conservation Plan/Habitat Conservation Plan areas; Significant Ecological Areas; or city, state, or national parks. Land ownership patterns, future growth predictions, and existing and planned roadways were essential considerations by Spencer et al. (2010) in determining the long-term effectiveness of wildlife movement corridors among Natural Landscape Blocks and other open space. No wildlife nurseries or colonial breeding sites were identified or recorded in the vicinity of any proposed Project site.

Most of coastal Los Angeles County is located within the planning boundaries of the South Coast Ecoregion, with a small portion of the Mojave Desert Ecoregion within Los Angeles County (Spencer et al. 2010). An ecoregion represents a natural planning unit and contains Natural Landscape Blocks, Essential Connectivity Areas, urban space, choke points, and Missing Linkages. Natural Landscape Blocks are connected by Essential Connectivity Areas. Most Natural Landscape Blocks are in mountainous areas with high biological value and conservation status. Essential Connectivity Areas are often riparian drainages and canyons connecting Natural Landscape Blocks. Missing Linkages are Essential Connectivity Areas identified in the South Coast Missing Linkage Project that have not been completely protected through land ownership. Choke points are narrow, impacted, or otherwise tenuous habitat linkages. The South Coast Ecoregion contains 116 Natural Landscape Blocks connected by 27 Essential Connectivity Areas. Native vegetation is present within 82 percent of the land in the Essential Connectivity Areas, with 12 percent of the land being urbanized and 6 percent as roadways. Because of the extensive urbanization, together with a high level of biological endemism, the South Coast Ecoregion is the most highly studied area and considered the most threatened hotspot of biodiversity in the United States, with over 400 plant and wildlife species at risk. Almost every Project site located in a non-urban area is likely to be within an open space block or wildlife movement corridor (Figure 3.3-1).

Figure 3.3-1: Natural Landscape Blocks and Potential Wildlife Movement Corridors in Project Vicinity

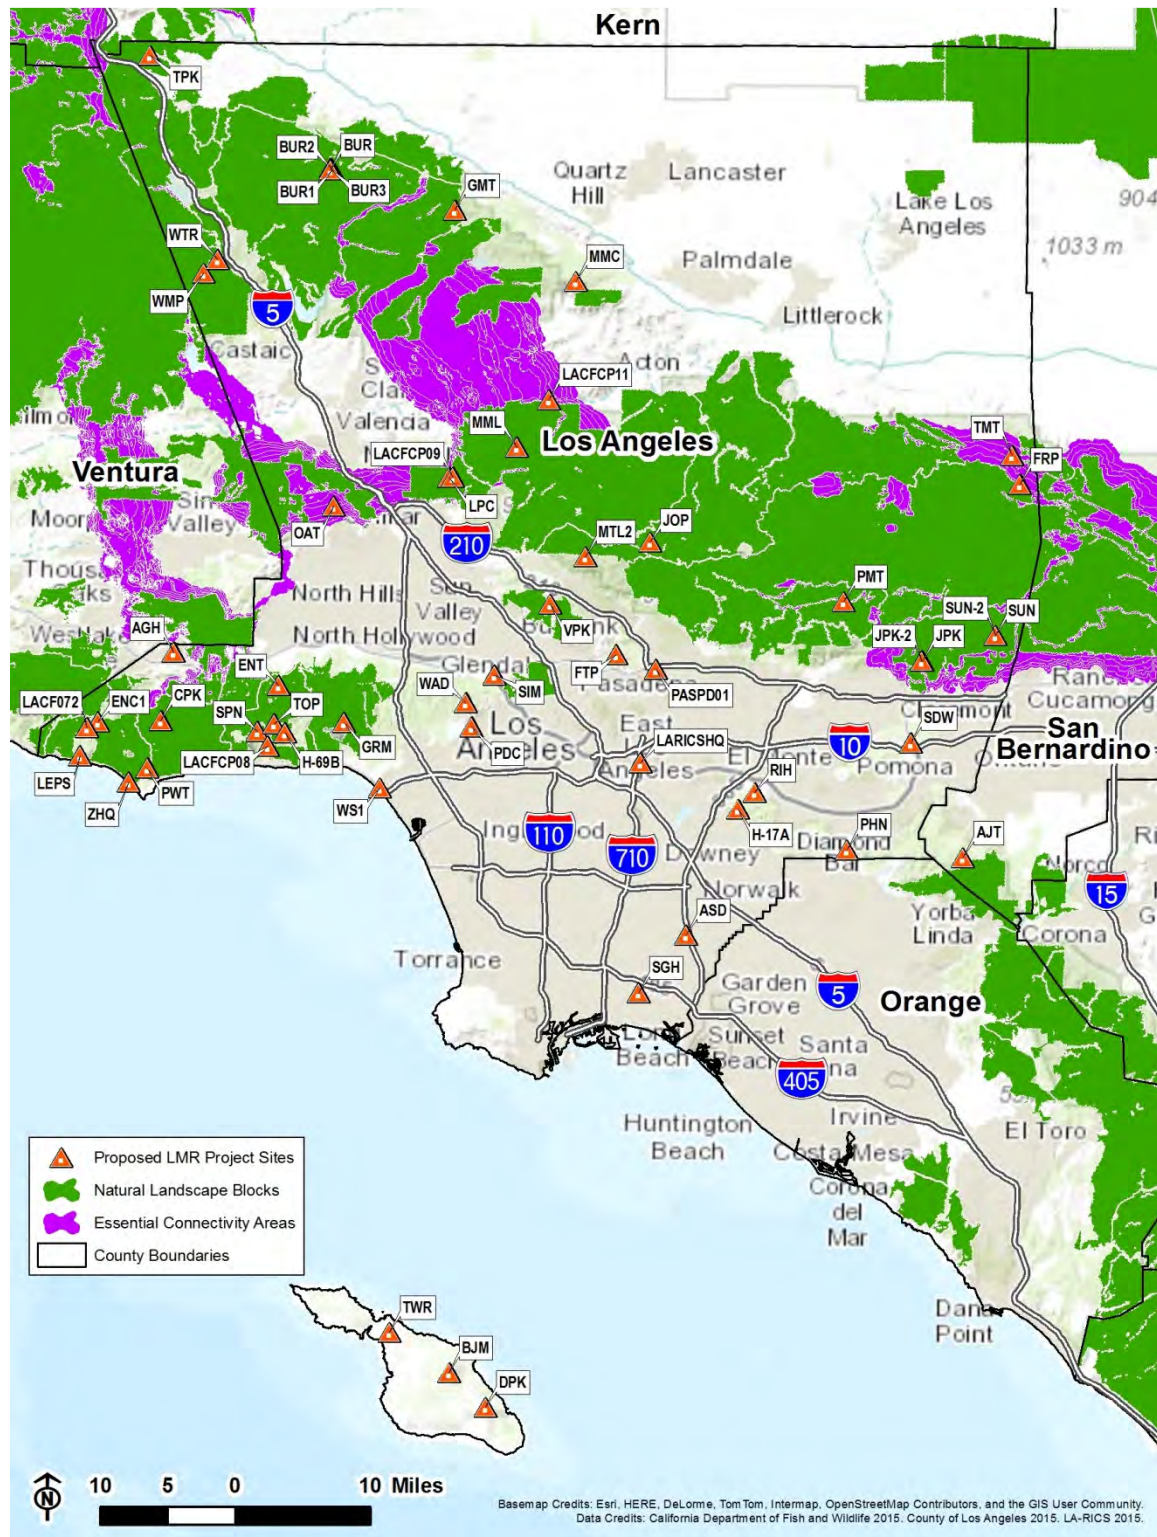

Table 3.3-10 provides a listing of land use designations, plans and delineated natural areas applicable to the management of biological resources for each Project site. The information presented in this table is relevant to this discussion under Biological Resources Significance Criteria 4 (wildlife movement), as well as Biological Resources Significance Criteria 5 (local plans and ordinances) and Biological Resources Significance Criteria 6 (HCPs). Each of these designations was considered in the landscape level analysis of potential Project impacts on wildlife movement patterns. For consistency, however, special focus was placed on the Los Angeles County General Plan that established Significant Ecological Areas (SEAs) and Coastal Resource Areas (CRAs), Missing Linkages analyzed and mapped by Penrod et al. (2001) of Southcoast Wildlands, National Forest System lands, and Natural Landscape Blocks and Essential Connectivity Areas designated by CDFW. Southern California Association of Governments (SCAG) zoned open space, parks, and wildlife preserves were considered; but these are broad designations not specific to wildlife habitat connectivity and movement.

Natural Landscape Blocks and Essential Connectivity Areas

Natural Landscape Blocks and Essential Connectivity Areas were identified by the CDFW during the California Essential Habitat Connectivity Project (Spencer et al. 2010) (Figure 3.3-1). These areas are not jurisdictional boundaries and were created at a broad scale for the purpose of general planning level analysis. National Forest System Lands constitute the core of these landscape blocks. Natural Landscape Blocks and Essential Connectivity Areas were scored based on ecological integrity using the ecological condition index (Spencer et al. 2010). The index scores resource quality at 100-meter resolution, using the following components: land conversion, residential housing impact, road effects, and forest structure. Other important factors, including conservation status (protected lands), known high biological value, and ecoregion variability, were considered in the final index value. The ecological condition index is scaled from 0 to 100, with higher numbers correlating to better ecological conditions.

The South Coast region is a very high-contrast landscape, with the Natural Landscape Blocks located in rugged, mountainous areas separated by dense urbanization and agricultural lands. Natural Landscape Blocks and Essential Connectivity Areas in the South Coast ecoregion have the lowest average ecological condition index ratings, 52 and 26 respectively, of all the ecoregions in California. Due to the large human population and intense urbanization, the Essential Connectivity Areas in the ecoregion include some of the least natural areas in the state, as well.

Essential Connectivity Areas are extremely important in supporting wildlife movement across regions, thus maintaining genetic diversity in certain species' populations. Proposed Project sites located within identified Essential Connectivity Areas are presented in Table 3.3-11.

Table 3.3-11: Proposed Project Sites Located within Essential Connectivity Areas

Essential Connectivity Area (ECA)	Proposed Project Site(s)	Geographical Connectivity	Ecological Condition Index
Castro Peak/Santa Monica Mountains - Pine Mountain/Sespe Condor (119,050 acres)	CPK	Connects Santa Monica Mountains at Castro Peak northward through Simi Hills to Santa Susana Mountains and Topatopa Mountains (Pine Mountain). Four major roads intersect this ECA.	23
Contract Point - Santa Susanna Mountains (29,349 acres)	LACFCP09, LPC, OAT	Connects the Santa Susanna Mountains eastward to the San Gabriel Mountains through Contract Point. Three major roads intersect this ECA; numerous threats associated with land ownership patterns and oil and gas drilling.	14
San Gabriel Mountains West - San Francisquito (98,705 acres)	LACFCP11, MML	Connects San Gabriel Mountains through Soledad Canyon Northwest to Liebre/Sawmill Mountains. One major road intersects this ECA.	43
Sugarloaf Mountain/Keller Peak - San Gabriel/Cucamonga	FRP, JPK, JPK2, PMT,	Connects San Gabriel Mountains from Pleasant View Ridge eastward through Table Mountain	51

Table 3.3-11: Proposed Project Sites Located within Essential Connectivity Areas

Essential Connectivity Area (ECA)	Proposed Project Site(s)	Geographical Connectivity	Ecological Condition Index
(289,348 acres)	SUN, SUN2, TMT	to San Bernardino Mountains. Five major roads intersect this ECA.	

Twenty-six proposed Project sites are located across 15 Natural Landscape Blocks, described in more detail below.

Calabasas Peak/Santa Monica Mountains Natural Landscape Block

Sites ENT and TOP are found within the 13,100-acre Calabasas Peak/Santa Monica Mountains Natural Landscape Block. It is in the South Coast Ecoregion and includes portions of the Los Angeles River and Santa Monica Bay watersheds. This landscape block overlaps the ranges of approximately 276 amphibian, reptile, mammal, and bird species and has a very low ecological condition index rating of 6. Approximately 12 CNDDDB special animal species have been reported in this block.

Castro Peak/Santa Monica Mountains Natural Landscape Block

Site CPK is located within the 19,846-acre Castro Peak/Santa Monica Mountains Natural Landscape Block. It is in the South Coast Ecoregion and falls within the Santa Monica Bay watershed, which overlaps the ranges of approximately 277 amphibian, reptile, mammal, and bird species and has a relatively low ecological condition index rating of 24. Approximately 14 CNDDDB special animal species have been reported in this block.

Contract Point Natural Landscape Block

Sites LACFCP09 and LPC are located within the 9,714-acre Contract Point Natural Landscape Block. It is in the South Coast Ecoregion and falls within the Los Angeles River and Santa Clara–Calleguas watersheds. This landscape block overlaps the ranges of approximately 268 amphibian, reptile, mammal, and bird species and has a relatively high ecological condition index rating of 86. Approximately three CNDDDB special animal species have been reported in this block.

Las Flores/Santa Monica Mountains Natural Landscape Block

Site LACFCP08 is within the 3,465-acre Las Flores/Santa Monica Mountains Natural Landscape Block. It is in the South Coast Ecoregion and falls within the Santa Monica Bay watershed. The ranges of approximately 302 amphibian, reptile, mammal, and bird species overlap this block; and it has a relatively low ecological condition index rating of 17. Approximately four CNDDDB special animal species have been reported in this block.

Liebre/Sawmill Mountains Natural Landscape Block

The four Project sites within the Liebre/Sawmill Mountains Natural Landscape Block (BUR, BUR1, BUR2, and BUR3) are located at the same mountaintop communications site complex, and only one would be constructed (the other three being alternate sites). The 93,328-acre Liebre/Sawmill Mountains Natural Landscape Block is located in the South Coast and Mojave Desert ecoregions and falls within the Antelope and Santa Clara–Calleguas watersheds. This block overlaps the ranges of approximately 242 amphibian, reptile, mammal, and bird species and has a high ecological condition index rating of 92. Approximately 11 CNDDDB special animal species have been reported in this block.

Oso Canyon Natural Landscape Block

Site TPK is located within the 13,916-acre Oso Canyon Natural Landscape Block. It is in the South Coast and Mojave Desert ecoregions and falls within the Antelope, Grapevine, and Santa Clara–Calleguas watersheds. The block overlaps the ranges of approximately 266 amphibian, reptile, mammal, and bird species and has a high ecological condition index rating of 89. Approximately seven CNDDDB special animal species have been reported in this block.

Pine Mountain/Sespe Condor Natural Landscape Block

Sites WMP and WTR are located within the 437,040-acre Pine Mountain/Sespe Condor Natural Landscape Block. It is in the South Coast Ecoregion and includes portions of the Grapevine, Santa Clara–Calleguas, Santa Maria, and Ventura River watersheds. This block overlaps the ranges of approximately 246 amphibian, reptile, mammal, and bird species; and it has a high ecological condition index rating of 93. Approximately 19 CNDDDB special animal species have been reported in this block.

Pleasant View Ridge Natural Landscape Block

Site JOP is located within the 97,425-acre Pleasant View Ridge Natural Landscape Block. It is in the South Coast and Mojave Desert ecoregions and spans across the Antelope, Los Angeles River, San Gabriel River, and Santa Clara–Calleguas watersheds. The block overlaps the ranges of approximately 257 amphibian, reptile, mammal, and bird species and has a relatively high ecological condition index rating of 86. Approximately 11 CNDDDB special animal species have been reported in this block.

San Dimas Natural Landscape Block

Sites JPK, JPK2, SUN, and SUN2 are located within the 25,420-acre San Dimas Natural Landscape Block. This block is in the South Coast ecoregion and falls within the San Gabriel River and Santa Ana River watersheds. This block falls within the ranges of approximately 272 amphibian, reptile, mammal, and bird species and has a moderate to high ecological condition index rating of 75. Approximately nine CNDDDB special animal species have been reported in this block.

San Francisquito Natural Landscape Block

Site GMT is located within the 30,354-acre San Francisquito Natural Landscape Block. It is in the South Coast ecoregion and falls within the Santa Clara–Calleguas watershed. The ranges of approximately 237

amphibian, reptile, mammal, and bird species overlap this area; and it has a high ecological condition index rating of 87. Approximately five CNDDDB special animal species have been reported in this block.

San Gabriel Mountains West Natural Landscape Block

Site MML is located in the 94,584-acre San Gabriel Mountains West Natural Landscape Block. It is in the South Coast Ecoregion and spans the Los Angeles River and Santa Clara-Calleguas watersheds. The ranges of approximately 274 amphibian, reptile, mammal, and bird species overlap this block; and it has a high ecological condition index rating of 91. Approximately 11 CNDDDB special animal species have been reported in this block.

San Gabriel/Cucamonga Natural Landscape Block

Site PMT is located within the 241,279-acre San Gabriel/Cucamonga Natural Landscape Block. It is in the South Coast and Mojave Desert ecoregions and includes portions of the Antelope, Los Angeles River, Mojave, San Gabriel River, and Santa Ana River watersheds. It overlaps the ranges of approximately 261 amphibian, reptile, mammal, and bird species; and it has a high ecological condition index rating of 88. Approximately 22 CNDDDB special animal species have been reported in this block.

Topanga Canyon/Santa Monica Mountains Natural Landscape Block

Site GRM is located within the 20,042-acre Topanga Canyon/Santa Monica Mountains Natural Landscape Block, which is in the South Coast ecoregion and falls within the Los Angeles River and Santa Monica Bay watersheds. The block overlaps the ranges of approximately 275 amphibian, reptile, mammal, and bird species and has a moderate ecological condition index rating of 47. Approximately five CNDDDB special animal species have been reported in this block.

Verdugo Mountains Natural Landscape Block

Site VPK is located within the 7,265-acre Verdugo Mountains Natural Landscape Block. It is in the South Coast ecoregion and is located in the Los Angeles River watershed. This block overlaps the ranges of the approximately 230 amphibian, reptile, mammal, and bird species. It has the lowest possible ecological condition index rating of 0. The ecological condition index score is likely a model error and a direct result of the small size of the block and the surrounding urbanization and development on all sides, which is skewing the Index model's results. In this case, the score should be considered inaccurate and is likely not a completely accurate representation of the on-site conditions. One CNDDDB special animal species has been reported.

Zuma/Trancas Canyons/Santa Monica Mountains Natural Landscape Block

Sites ENC1 and PWT are located within the 10,129-acre Zuma/Trancas Canyons/Santa Monica Mountains Natural Landscape Block. It is in the South Coast ecoregion and is in the Santa Monica Bay watershed. The block overlaps with the ranges of approximately 297 amphibian, reptile, mammal, and bird species and has a low to moderate ecological condition index rating of 39. Approximately four CNDDDB special animal species have been reported in this block.

Significant Ecological Areas

Site TPK is located in unincorporated Los Angeles County within a Los Angeles County-designated SEA (the San Andreas SEA). SEAs often provide core habitat to support wildlife movement within large open spaces, within bottleneck areas surrounded by urban development, and within fragmented landscapes of scattered open space within rural settings.

Wildlife Linkages

Wildlife Linkages were identified during a multi-agency, multi-disciplinary workshop in 2000 entitled “Missing Linkages: Restoring Connectivity to the California Landscape” (Penrod et al. 2001). Critical at-risk habitat linkages were mapped throughout the state. Two proposed Project sites are located within 1 mile of identified wildlife linkages corridors.

The San Gabriels-Tehachapis Wildlife Linkage is identified as a “missing linkage” that would connect the San Gabriel Mountains to the north across Mojave Desert habitat in the Antelope Valley to the Tehachapi Mountains. This corridor is listed as a missing linkage because the Antelope Valley is primarily private property, and most of the native vegetation has been removed for farming. This potential wildlife corridor is identified for general wildlife and birds, but its future is not protected. Site MMC is located on the north/northeast side of the San Gabriel Mountains at the southern end of the identified missing linkage and within a large open space landscape block.

The Puente-Chino Hills Wildlife Linkage provides fragile connections for wildlife across a landscape of scattered open space. The continued presence of large mammals is dependent on retaining linkage corridors among the open space blocks. This area is considered a choke point where opportunities for wildlife movement across the landscape are limited. Site PHN is located at an abandoned Nike missile site near the interface between expansive urban development and open space within the Puente Hills SEA. Site PHN is surrounded by nonnative grassland with scattered woodlands on north facing slopes. A water tank and communications tower is within a paved and fenced enclosure; access is by a gated, asphalt road. The SEA and wildlife corridor consists of a series of relatively small open spaces with limited linkages (i.e., missing links) and wildlife movement choke points.

Wildlife Nursery Sites

No occurrences of wildlife nursery sites or colonial bird nesting sites are recorded in the CNDDDB within 1 mile of any Project site.

Construction Impacts

All proposed Project sites are located within existing developments that may include water tanks, communications towers, or other facilities; existing access roads are present at each site. At almost all sites, site development would be within the existing disturbance footprint, with minimal (if any) loss of native vegetation. Construction activities at a site would be completed in about six weeks.

Proposed construction activities at Project sites may cause temporary impacts to wildlife movements (including deer, mountain lion, small mammals, reptiles, birds, and insects) in the vicinity of a site due to increased human presence and noise associated with construction activities. These impacts would be minor since it would be within the normal behavior patterns of the animal to avoid areas of localized disturbance by continuing travels by an alternate path. Open trenches could temporarily impede small mammals, reptiles, and ground-dwelling insects moving within or through the site. Increased use of roads, even on a temporary basis for construction-related activities, could impede or cause injury/mortality to various species of wildlife. However, at each site where habitat connectivity may be a concern, the existing and proposed facilities represent a small point within a larger landscape having extensive opportunity for wildlife to move around the facility. Development of Site PHN in association with the existing facilities at the Puente-Chino Hills Wildlife Linkage neither contributes to nor resolves the issues associated with this missing linkage. Construction of Project facilities may have temporary (up to six weeks) and minor effects to wildlife movement on a very fine scale but would have no impact at a landscape level.

There would be less than significant impacts to wildlife movement corridors and habitat linkage areas due to construction of proposed Project facilities at sites CPK, FRP, JPK, JPK2, LACFCP09, LACFCP11, LPC, MML, OAT, PMT, SUN, SUN2, and TMT.

Operational Impacts

Due to development of Project facilities at existing sites, resulting impacts to movement of wildlife across the landscape would be minimal. Upon completion of construction activities, Project sites may be visited by maintenance personnel approximately once a month, with minimal disturbance to resident or migratory wildlife along roadways or at the site. The presence of new towers, extending up to 180 feet, may contribute to mortality of birds passing through the area, especially during nighttime migration; however, this would not constitute a barrier to bird migration across the landscape. This potential mortality is considered minimal because the proposed lattice towers or monopoles would not have guy lines—the causative factor for most avian mortality at communication sites. Flashing lights may occur on some towers if required by FAA; however, flashing lights are less of an attractant to nighttime migrating birds than steady lights, resulting in a reduction in avian mortality due to collision.

Additionally, operations would not result in a reduction to the ecological condition index rating identified for sites located within Natural Landscape Blocks and Essential Connectivity Areas. Parameters considered in the index model include land conversion, residential housing impacts, road effects, and forest structure within forested areas, none of which will be altered due to Project activities. Land will not be converted from a natural use to a developed use, additional housing will not be created, existing roads will not be upgraded in road-class, and a minimal amount of natural vegetation (if any) will be removed without causing any change in forest stand structure or condition.

Impacts to wildlife movement corridors and habitat linkage areas due to operations of proposed Project facilities would be less than significant.

Mitigation Measures

Although impacts from construction and operations activities to wildlife movement corridors and habitat linkage areas would be less than significant without application of mitigation measures, to further reduce the already less than significant impacts, the following measures would still apply at sites CPK, LACFCP09, LPC, OAT, LACFCP11, MML, FRP, JPK, JPK2, PMT, SUN, SUN2, and TMT. Each of these sites is within 1 mile of Essential Connectivity Areas, which are extremely important in supporting wildlife movement across regions (mitigation measures previously described are listed by name only):

- BIO MM 1** Mitigation Monitoring and Reporting Plan
- BIO MM 2** Worker Environmental Awareness Program
- BIO MM 3** Biological Compliance Reporting
- BIO MM 4** Site Sanitation
- BIO MM 5** Hazardous Materials Management
- BIO MM 8** Biological Monitoring
- BIO MM 9** Protect Native Vegetation and Common Wildlife
- BIO MM 10** No Pets
- BIO MM 11** Site Access
- BIO MM 19** Trenches and Holes Management

Impacts after Mitigation

With the implementation of mitigation measures BIO MM 1 through BIO MM 5, BIO MM 8 through BIO MM 11, and BIO MM 19 at sites CPK, LACFCP09, LPC, OAT, LACFCP11, MML, FRP, JPK, JPK2, PMT, TMT, SUN, and SUN2, wildlife movement across the landscape would not be impeded by the proposed Project. Mitigation measures provide for the protection of native vegetation and wildlife habitats (BIO MM 8); keeping each site free of trash, discarded food, and other items that may compromise wildlife (BIO MM 4); controlling hazardous substances (BIO MM 5); and providing oversight by a biological monitor (BIO MM 8).

Although the addition of a new communications tower or monopole, even where towers or monopoles already exist, could contribute to avian mortality, each proposed Project site is in conjunction with existing development and would not alter the character of the open space or otherwise exacerbate the existing challenges for wildlife movements. No occurrences of wildlife nursery sites or colonial bird nesting sites are recorded in the CNDDDB within 1 mile of any Project site. Therefore, the development of the proposed Project sites would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors

and would not impede the use of native wildlife nursery sites. Implementation of mitigation measures BIO MM 1 through BIO MM 5, BIO MM 8 through BIO MM 11, and BIO MM 19 at sites CPK, LACFCP09, LPC, OAT, LACFCP11, MML, FRP, JPK, JPK2, PMT, TMT, SUN, SUN2 would further reduce the less than significant impacts related to the construction and operations of the proposed Project to wildlife movement area and habitat linkages.

BIO-5. Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

The Project area includes several jurisdictions that regulate biological resources. These include federal, state, county, conservancy, and incorporated city jurisdictions. Management of biological resources varies with each of the 54 sites, as does the existence of managed resources. As such, the potential for conflict with local policies or ordinances that protect these resources varies by site and is discussed below.

Four sites occur within jurisdictions with land use plans that do not have specific policies or ordinances protecting biological resources. In each of these instances, because there are no local ordinances or policies protecting biological resources, no conflict would occur; and these sites are not discussed further. These four sites include:

ASD	LARICSHQ	PDC	SGH
-----	----------	-----	-----

Five sites occur within jurisdictions that have specific policies or ordinances protecting biological resources; however, no biological resources are present at these sites that are protected by these local ordinances or policies; therefore, no conflicts would occur, and these sites are not discussed further. These five sites include:

MMC	PASPD01	SIM	WAD	WS1
-----	---------	-----	-----	-----

Development of the following 45 proposed Project sites has the potential to impact biological resources protected by local policies or ordinances:

AGH	AJT	BJM	BUR	BUR1
BUR2	BUR3	CPK	DPK	ENC1
ENT	FRP	FTP	GMT	GRM
H-17A	H-69B	JOP	JPK	JPK2
LACF072	LACFCP08	LACFCP09	LACFCP11	LEPS
LPC	MML	MTL2	OAT	PHN
PMT	PWT	RIH	SDW	SPN
SUN	SUN2	TOP	TMT	TPK
TWR	VPK	WMP	WTR	ZHQ

The applicable plans potentially affected at these sites include a two federal land management plans (for the Angeles National Forest and the SMMNRA), a state park plan, local coastal programs in the City of Malibu, the County of Los Angeles (Santa Monica Mountains and Santa Catalina Island), the Los Angeles County General Plan, and the City of Chino Hills General Plan. These plans are not subject to intergovernmental immunity. Following discussion of these applicable plans is a discussion of impacts that could occur at sites within incorporated cities in Los Angeles County that do not have an applicable policy or ordinance.

A discussion of underlying local plans and ordinances that affect biological resources associated with these sites is provided below.

Angeles National Forest Land Management Plan – Sites BUR, BUR1, BUR2, BUR3, FRP, GMT, JOP, JPK, JPK2, LACFCP09, LACFCP11, LPC, MML, MTL2, PMT, SUN, SUN2, TMT, WMP and WTR

Sites located in the Angeles National Forest are under the administration of the U.S.D.A. Forest Service and subject to the Land Management Plan (LMP) for the Angeles National Forest (USDA 2006). Included in the Strategic Goals are several goals applicable to biological resources. These include:

- Goal: 2.1 – Reverse the trend of increasing loss of natural resource values due to invasive species.
- Goal 6.2 – Provide ecological conditions to sustain viable populations of native and desired nonnative species.

Construction Impacts

Final determinations of consistency with the Angeles National Forest LMP would be made by the U.S.D.A. Forest Service.

Construction activities could result in ground disturbance which could increase the potential for introduction of invasive species, as identified in Impact BIO 1. This would be in conflict with Goal: 2.1 of the Angeles National Forest LMP. The impact of introduction of weedy species into the forest is considered significant.

Construction activities at several proposed Project sites in the Angeles National Forest were determined to have the potential to impact species, which would be a conflict with Goal 6.2 of the Angeles National Forest LMP. The site-specific impact analysis showed impacts ranging up to significant. For specifics on the potential impacts to sensitive biological resources, refer to Section 3.3.4.1 BIO-1 Impact Analysis.

Mitigation Measures

Implementation of BIO MM 23, Prevent the Spread of Nonnative Vegetation, would be required at all sites on the Angeles National Forest.

Mitigation measures for potential for impacts to species and habitat are identified for each of the sites on the Angeles National Forest in Impact BIO 1.

Impacts After Mitigation

Implementation of the BIO MM 23 would reduce the potential for spread of weeds on the forest, thereby reducing conflicts with Goal 2.1. Impacts would be reduced to less than significant.

As described under Impact BIO 1, all impacts to species identified on the forest would be reduced to less than significant with implementation of mitigation. As a result, conflicts with Goal 6.2 would be reduced. Impacts would be reduced to less than significant.

Operational Impacts

Operations would not introduce weedy species into the forest, nor impact species or habitat. No conflict with the Angeles National Forest LMP has been identified, therefore no impact would occur.

Mitigation Measures

No mitigation measures are required.

Santa Monica Mountains National Recreation Area General Management Plan - Sites LACFCP08 and PWT

Two sites, LACFCP08 and PWT, are under National Park Service administration in the SMMNRA. Resource management goals included in the SMMNRA GMP include protecting and enhancing species, habitat diversity and natural processes, and eradicating alien plant species.

Construction Impacts

Final determinations of consistency with the SMMNRA GMP would be made by the National Park Service.

Implementation of the proposed Project may conflict with the goals of the GMP, specifically protecting and enhancing species and habitat diversity and eradication of alien plant species.

Construction activities at sites LACFCP08 and PWT were determined in Impact BIO 1 to have the potential to impact species, which would be a conflict with the SMMNRA GMP goal to protect species and habitat diversity. For specifics on the potential impacts to sensitive biological resources, refer to Section 3.3.4.1 BIO-1 Impact Analysis.

Construction activities could result in in ground disturbance which could increase the potential for introduction of invasive species, as identified in Impact BIO 1. This would be in conflict with the GMP goal to eradicate alien plant species. The impact of introduction of weedy species into the SMMNRA is considered significant.

Mitigation Measures

Mitigation measures for potential for impacts to species and habitat are identified for each of the sites on the SMMNRA in Impact BIO 1.

Implementation of BIO MM 23, Prevent the Spread of Nonnative Vegetation, would be required at sites LACFCP08 and PWT.

Impacts After Mitigation

Implementation of the BIO MM 23 would reduce the potential for spread of weeds, thereby reducing conflicts with the GMP goal to eradicate alien plant species. Impacts would be reduced to less than significant.

As described under Impact BIO 1, all impacts to species at sites LACFCP08 and PWT would be reduced to less than significant with implementation of mitigation. As a result, conflicts with the GMP goal to protect species and habitat diversity would be reduced. Impacts would be reduced to less than significant.

Operational Impacts

Operations would not introduce weedy species or substantially impact native species or habitat diversity in the SMMNRA. No conflict with the SMMNRA GMP has been identified, therefore no impact would occur.

Mitigation Measures

No mitigation measures are required.

Topanga State Park General Plan- Site GRM

Site GRM lies in Topanga State Park and would be subject to the Topanga State Park General Plan (California State Parks [CSP] 2012), which contains goals and guidelines for the management of natural resources within the park. Site GRM is located on a previously disturbed site that is bordered by dirt roads and contains one existing lattice tower, but also contains native vegetation.

Construction Impacts

Construction activities may remove chaparral vegetation which could increase the likelihood for exotic plants to occupy the site. Additionally, the site is adjacent to critical habitat for the special status Braunton's milk-vetch. Construction activities may have significant impacts on biological resources protected under the Topanga State Park General Plan, resulting in conflicts with guidelines that protect sensitive plant species, wildlife, and sensitive wildlife. For specifics on the potential impacts to sensitive biological resources, refer to Section 3.3.4.1 BIO-1 Impact Analysis.

Operation Impacts

With the placement of an additional communication tower at a Project site, the new structure increases the probability of a bird strike hazard, even if other towers are present. Permanent removal of vegetation decreases, although minimally, the size of habitat available for protected biological resources. Temporary disturbance of vegetation increases the chances of permanently spreading nonnative weed species into unaffected areas. Maintenance of the sites is expected to occur

approximately once a month; this increase in road use could result in mortality for some wildlife. These impacts may occur to a few individual animals, however, without impacts at a landscape level. In addition, the Project site development would be within, or involve a slight expansion of, existing facilities, and so would not change the character or magnitude of existing impacts. Due to the potential for protected species in nearby areas, operations of the proposed Project could have a significant impact on biological resources protected by the Plan.

Mitigation Measures

Mitigation measures to reduce construction and operations impacts associated with conflicts with the Topanga State Park General Plan are provided in Table 3.3-12.

Impacts after Mitigation

With the implementation of the mitigation measures identified in Table 3.3-12, the proposed Project would have a less than significant impact on biological resources protected by the Topanga State Park General Plan.

Santa Catalina Island Local Coastal Plan - Sites BJM, DPK, and TWR

Sites BJM, DPK and TWR are owned by the Santa Catalina Islands Conservancy, a private non-profit entity; therefore, the ESHA-level protection afforded in the Local Coastal Plan is considered applicable to these sites. Site DPK is located adjacent to an existing lattice tower and contains coastal sage scrub and chaparral vegetation. Site BJM is located on a leveled hilltop that is predominantly paved and has an existing communication tower. Site TWR is located on a peak with existing communications facilities, surrounded by disturbed coastal sage scrub.

Construction Impacts

Construction activities could include removal of vegetation, which would temporarily degrade habitat values in ESHAs, in conflict with California PRC 30240. Conflict with this underpinning of ESHA protection contained in the Santa Catalina Island Local Coastal Plan would constitute a significant impact. Workers bringing pets to the site could result in an increase in feral mammal populations, creating a conflict with Policy 3. Although this is not considered likely, it could be significant if feral populations were established or increased on Santa Catalina Island. BMPs in place for the Project are the procedures designed to minimize erosion; therefore, the proposed activity is considered consistent with Policy 11. There is a potential to increase nonnative vegetation to the site during construction, resulting in a potential for conflict with Policy 20, and thus result in a significant impact. For specifics on the potential impacts to sensitive biological resources, refer to Section 3.3.4.1 BIO-1 Impact Analysis.

Operation Impacts

Sites BJM, DPK, and TWR are existing communications facilities. Maintenance, repair, and operations at the sites are not expected to result in effects to habitat at sites BJM, DPK, and TWR. In addition, the Project site development would be within, or involve a slight expansion of, existing facilities, and so

would not change the character or magnitude of existing impacts. Operations at these three sites would not be in conflict with existing policies or ordinances; therefore, any impacts would be less than significant.

Mitigation Measures

Mitigation measures that would be implemented to reduce impacts on biological resources at sites BJM, DPK, and TWR are provided in Table 3.3-12.

Impacts after Mitigation

Implementation of the mitigation measures provided in Table 3.3-12 would reduce or eliminate significant reduction of habitat values, prevent the release of stray pets, prevent erosion, and prevent introduction of nonnative species to the areas at and surrounding sites BJM, DPK, and TWR. With the implementation of the above mitigation measures, the proposed Project will have a less than significant impact on biological resources protected by the Santa Catalina Island Coastal Plan and the Los Angeles County General Plan at these sites.

Santa Monica Mountains Local Coastal Program Land Use Plan and Local Implementation Program - Sites CPK, ENC1, H-69B, LACF072, SPN, and TOP

Sites CPK, ENC1, H-69B, LACF072, SPN, and TOP would be subject to the Santa Monica Mountains LCP Land Use Plan and Local Implementation Program (LIP). Map 2, Biological Resources of the land use plan identifies at a landscape level, Significant Ecological Resource Areas (SERAs) where development is either prohibited or strictly regulated. Based on a review of Map 2, Biological Resources of the Santa Monica Mountains Land Use Plan, it appears that portions of at least four sites could contain H1 or H2 habitat. Habitat at each of the six sites, as designated on Map 2, is discussed below.

- Most of Site CPK comprises H3 Habitat, although a small area within the eastern site boundary of Site CPK is designated as H2 Habitat. The larger study area for Site CPK includes an H1 Quiet Zone.
- Site ENC1 contains H3 Habitat but also contains H1 Habitat, H2 High Scrutiny Sub-Area Habitat, and H1 Quiet Zone. The larger study area for Site ENC1 also includes H1 Habitat.
- Most of Site H-69B is delineated as H3 Habitat, but the north portion of the site includes H2 Habitat. The study area surrounding Site H-69B includes H1 Habitat and H1 Quiet Zone.
- Most of Site LACF072 contains H3 Habitat, but a small portion in the southwestern side of Site LACF072 contains H2 Habitat. The northern portion of the study area for Site LACF072, across from Decker Canyon Road, as well as a small portion of the southwest border, is designated as H2 Habitat.
- Site SPN contains only H3 Habitat; the study area for Site SPN includes H2 Habitat and an H1 Quiet Zone.

- Site TOP contains only H3 Habitat; the study area for Site TOP includes H2 Habitat and an H1 Quiet Zone.

Construction Impacts

With very limited exceptions, development in and adjacent to H1 Habitat is prohibited. These exceptions include resource-dependent activities (e.g., low-impact campgrounds and trails for non-motorized use), public works projects required to protect existing public roads (where no alternative is feasible and where impacts are mitigated), and for access roads to lawfully permitted new development that meet specific criteria. New development or disturbance of H2 Habitat is also strictly regulated, with mitigation requirements identified for some limited allowable uses. Areas designated as H3 Habitat can be developed with certain restrictions, including a requirement to preserve native vegetation on site.

Although many of the above sites have areas designated as H1, H2, or H2 High Scrutiny Habitat, site-specific conditions including existing development and disturbance occur at each of the sites, essentially removing specific portions of the site (i.e., those not containing native vegetation meeting the criteria of H1 or H2 Habitat). Additionally, nearly all sites adjoin H1, H2, or H2 High Scrutiny Sub-Area Habitat; and development of areas adjacent to these SERAs is strictly regulated.

Activities associated with proposed construction at proposed Project sites within or adjacent to H1, H2, or H2-High Scrutiny Sub-Area Habitat (i.e., SERAs) may be prohibited by and are therefore in conflict with the Santa Monica Mountains LCP Land Use Plan policies CO-40, CO-41, CO-42, and CO-44. Because development at sites CPK, ENC1, H-69B, LACF072 (because on-site SERAs occur), and all sites (because adjacent SERAs occur) would potentially impact resources protected by these policies, there is a potential for conflict with these policies. As development at these sites would impact underlying resources, this is considered a significant impact.

Development within sites containing H3 Habitat could occur, although impacts to existing native vegetation within H3 Habitat would constitute a conflict with Policy CO-44, which requires in-site development to avoid sensitive biological resources where these occur. The potential for construction impacts at these sites is discussed in Section 3.3.4.1 BIO-1 Impact Analysis and BIO-2 Impact Analysis. Construction impacts at sites CPK, ENC1, H-69B, LACF072, SPN, and TOP would be in conflict with this policy. As a result of impact to the underlying resources protected by this policy, this would in turn constitute a significant impact.

Operation Impacts

With the placement of an additional communications tower at a Project site, the new structure increases the probability of a bird strike hazard, even if other towers are present. Temporary disturbance of vegetation increases the chances of permanently spreading nonnative weed species into unaffected areas. Maintenance of the sites is expected to occur approximately once a month; this increase in road use could result in mortality for some wildlife. These impacts may occur to a few individual animals, however, without impacts at a landscape level. In addition, the Project site

development would be within, or involve a slight expansion of, existing facilities and so would not change the character or magnitude of existing impacts. Due to the proximity to designated SERAs, operations of the proposed Project could have a significant impact on biological resources protected by the Plan.

Mitigation Measures

Mitigation measures that would be implemented to reduce impacts on biological resources at sites CPK, ENC1, H-69B, LACF072, SPN, and TOP are provided in Table 3.3-12.

Impacts after Mitigation

Substantial disturbed vegetation and developed areas within individual proposed Project sites are available for development. Using the measures identified in Table 3.3-12 to avoid destruction or disturbance of native vegetation would preclude disturbance to native vegetation and would help to prevent conflicts with the Santa Monica Mountains LCP Land Use Plan policies. As a result, with mitigation, impacts associated with construction at sites CPK, ENC1, H-69B, LACF072, SPN, and TOP would be less than significant.

City of Malibu Local Coastal Program Land Use Plan and Local Implementation Program, City of Malibu General Plan – Sites LEPS and ZHQ

Sites LEPS and ZHQ are within the corporate limit of the City of Malibu. Biological resources there are managed under the City of Malibu LCP, Land Use Plan, LIP, and the City of Malibu General Plan. Goal 3.4.1 of the General Plan is to protect and preserve natural resources through policies such as minimizing disruptions to ecologically sensitive lands, wildlife linkages, and disturbed sensitive resource areas; protect and preserve the ecosystems of the Santa Monica Mountains and adjacent coastline; and reclaim Malibu's threatened natural resources including the beaches, wildlife, plant life, and their habitats. A western portion of the study area for Site ZHQ (but not the site proper) covers the Malibu coastline and the Pacific Ocean, which is an ESHA under the Plan. Additionally, critical habitat for the western snowy plover is located within the study area and abuts the proposed Project site. The site boundary, however, is on the developed Zuma Beach Lifeguard headquarters, which is predominantly paved and includes a small sand garden with native plants adjacent to the building. Site LEPS includes a paved road, water tank, and a border of coastal sage scrub habitat that is mowed regularly. It is also bounded on three sides by paved roads.

Construction Impacts

Construction activities could result in the loss of native vegetation, the introduction of invasive species, or an impact to the federally protected western snowy plover (at Site ZHQ). Therefore, development of sites LEPS and ZHQ would have a significant impact on biological resources protected in the Malibu LCP, by Con Policies 1.1.1, 1.1.3, 1.2.4, and 1.2.5. For specifics on the potential impacts to sensitive biological resources, refer to Section 3.3.4.1 BIO-1 Impact Analysis.

Operation Impacts

With the placement of an additional communications tower at a Project site, the new structure increases the probability of a bird strike hazard, even if other towers are present. Permanent removal of vegetation decreases, although minimally, the size of habitat available for protected biological resources. Temporary disturbance of vegetation increases the chances of permanently spreading nonnative weed species into unaffected areas. Maintenance of the sites is expected to occur approximately once a month; this increase in road use could result in mortality for some wildlife. These impacts may occur to a few individual animals, however, without impacts at a landscape level. In addition, the Project site development would be within, or involve a slight expansion of, existing facilities and so would not change the character or magnitude of existing impacts. Due to the potential for protected species in nearby areas, operations of the proposed Project could have a significant impact on biological resources protected by the Malibu LCP.

Mitigation Measures

The Project will implement mitigation measures that provide for preservation of biological resources including sensitive wildlife species, which are goals of the Malibu General Plan. The mitigation measures that will be implemented to reduce impacts on biological resources to less than significant at sites LEPS and ZHQ are provided in Table 3.3-12.

Impacts after Mitigation

With the implementation of the mitigation measures, the proposed Project will have a less than significant impact on biological resources protected by the City of Malibu's LCP and General Plan.

County of Los Angeles General Plan - Sites OAT, PHN, RIH, and TPK

Policy C/NR 3.1 is considered for sites OAT, PHN, RIH, and TPK. Policies C/NR 3.8 and C/NR 3.9 are considered for Site TPK, which is the only site in this group that lies within an SEA (the San Andreas SEA). The San Andreas SEA includes several important linkages for wildlife movement. The San Andreas Fault Zone connects with the Santa Clara River drainage in the Lake Hughes area, linking with this large watershed that extends to the Pacific Ocean in Ventura County. The foothills and grassland in the westernmost segment of the SEA are part of an important linkage between the San Gabriel Mountains and the Tehachapi Mountains. This linkage to the Tehachapi Mountains is important because it connects the southernmost extent of the Sierra Nevada Mountains with the San Gabriel Mountains and the southern Coast Ranges. The Tehachapi Mountains are the only mountain linkage between the Transverse Ranges and the southern Coast Ranges to the Sierra Nevada Range. This largely natural area is an important topographic reference for migrating birds and bats, functioning as essential high elevation foraging grounds along their migration route.

Construction Impacts

Construction activities at sites OAT, PHN, RIH, and TPK could result in removal of vegetation and human disturbance at each site and, therefore, could result in conflict with the Los Angeles County General

Plan's Policy C/NR 3.1. Each of the sites includes an existing tower facility, related infrastructure, and access road along with disturbed native scrub vegetation. The current use at each of the sites is as a communications facility. Ground disturbance associated with proposed construction at the site would not exceed 5,000 square feet, and substantive removal of native vegetation is not expected. A description of the potential for impact to these sites is provided in Section 3.3.4.1 BIO-1 Impact Analysis and BIO-2 Impact Analysis. Because these activities could impact species protected by the County of Los Angeles General Plan Policy C/NR 3.1, a potential for conflict would occur. Construction impacts on resources protected by the Plan at sites OAT, PHN, RIH, and TPK would be significant.

Site TPK is an already disturbed site adjacent to at least nine other communications towers and is approximately 1 mile northeast of I-5. It is also located at the far northwestern section of the almost 100,000-acre San Andreas SEA, so migration within the SEA will not be significantly impacted due to construction activities. Its location at the convergence of the Coastal Ranges into the San Gabriel Mountains, Antelope Valley, and Tehachapi Mountains provides for an important wildlife corridor; however, due to its already developed nature, construction activities will not significantly impact migration corridors or wildlife linkages between metapopulations of species. Additionally, the site is dominated by nonnative grassland habitat, which is not the pristine headwaters, riparian habitat, marshes and sinks, or diverse vegetation communities unique to this SEA. Because Site TPK is already a developed communications site, there is no conflict with Policy C/NR 3.8, and impacts associated with construction at the site would be less than significant.

Proposed construction of Site TPK does have the potential to impact biological resources within the SEA, as described in Section 3.3.4.1 BIO-1 Impact Analysis and BIO-2 Impact Analysis; and design could potentially fail to prioritize avoidance of the most sensitive biological resources on site. Because these activities could impact resources in the SEA, a potential for conflict with Policy C/NR 3.9 would occur. Construction impacts on resources protected by Policy C/NR 3.9 at Site TPK would be significant.

Operation Impacts

With the placement of an additional communications tower at each of these proposed Project sites, the new structure increases the probability of a bird strike hazard, even if other towers are present. Temporary disturbance of vegetation increases the chances of permanently spreading nonnative weed species into unaffected areas. Maintenance of the sites is expected to occur approximately once a month; this increase in road use could result in mortality for some wildlife. These impacts may occur to a few individual animals, although without impacts at a landscape level. In addition, the Project site development would be within, or involve a slight expansion of, existing facilities and so would not change the character or magnitude of existing impacts. Operations at each of the Project sites would not conflict directly with any of the identified Los Angeles County General Plan policies, and the proposed activities would have a less than significant impact on the resources protected by the plan policies identified.

Mitigation Measures

Mitigation measures intended to reduce construction impacts associated with conflicts with County of Los Angeles General Plan policies C/NR 3.1 and 3.9 at sites OAT, PHN, RIH, and TPK are provided in Table 3.3-12.

Impacts after Mitigation

Implementation of these mitigation measures would reduce the potential for impacts associated with construction activities at sites OAT, PHN, RIT, and TPK, thus reducing the potential for conflict with policies C/NR 3.1 and C/NR 3.9 of the Los Angeles County General Plan. With implementation of these measures, construction impacts associated with conflicts to the plan's policies at sites OAT, PHN, RIT, and TPK would be reduced to less than significant.

City of Chino Hills General Plan – Site AJT

Construction Impacts

Site AJT would be constructed at an existing communications facility containing a tower within highly disturbed open space. The site is mostly devoid of vegetation, but the study area contains nonnative grasses and scattered shrubs and walnut trees. The site is surrounded by open space, and the proposed construction would not inhibit wildlife movement in the area. The study area could serve as low-quality foraging habitat for golden eagle or long-eared owl. No trees occur within the site proper. Minimal conflict could occur with Action 1.2.2, associated with construction impacts on the two raptor species identified. Impacts from proposed Project construction on Action 1.2.2 would be less than significant, and no impact associated with the City's tree policies would occur.

Operations Impacts

The proposed new antenna support structure at Site AJT increases the probability of a bird strike hazard, even if other towers are present. Workers accessing the site during operations for maintenance and repair activities would slightly increase the traffic count, which could increase the potential to injure or kill wildlife. These operations impacts may occur to a few individual animals, however, without impacts at a landscape level. Due to the history of disturbance on site, the lack of protected species known to occur near the sites, and the minimal activity associated with maintenance and repair activities, operations of the proposed Project would have a less than significant impact on biological resources protected by the City of Chino Hills General Plan. For specifics on the potential impacts to sensitive biological resources, refer to Section 3.3.4.1 BIO-1 Impact Analysis.

Mitigation Measures

Although no significant impacts were identified, mitigation measures were identified that would further reduce the potential for impacts associated with construction activities at Site AJT, thus further reducing the potential for conflict with Action 1.2.2 of the City of Chino Hills General Plan. With implementation of the mitigation measures provided in Table 3.3-12 for site AJT, impacts associated with conflicts with

local policies or ordinances associated with proposed construction and operations at Site AJT would remain less than significant.

Incorporated Cities in Los Angeles County

The following is a discussion of potential impacts within incorporated cities in Los Angeles County. At these municipalities, the Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such local plans, policies, and regulations are not applicable to the Project. Nevertheless, in the exercise of its discretion and in the interest of working cooperatively with local jurisdictions, this Draft EIR references, describes, and addresses local land use plans, policies, and regulations. The Draft EIR takes this approach in recognition that such plans, policies, and regulations reflect the local community's policy decisions with respect to appropriate uses of land in the area. Consideration of these plans, policies, and regulations assists in determining whether the proposed Project may conflict with nearby land uses, which could affect the analysis of whether the proposed Project would result in potentially significant environmental impacts.

City of Agoura Hills General Plan - Site AGH

Construction Impacts

Site AGH would be constructed at an existing communications facility containing three towers within open space designated by the city. The site is mostly bladed and contains nonnative grasses and a few scattered walnut trees, which are not specified for protection under the policy. In addition, BMPs identified to prevent runoff from the site would prevent potential erosion from the site. No conflict with Policy NR-4.2 has been identified. Construction would not result in conflict with the city's oak tree ordinance, as no oak trees are present on site. Impacts from proposed Project construction on Policy NR-4.2 would be less than significant, and no impact would be associated with the city's oak tree ordinance.

Operation Impacts

The proposed new antenna support structure at Site AGH increases the probability of a bird strike hazard, even if other towers are present. Workers accessing the site during operations for maintenance and repair activities would slightly increase the traffic count, which could increase the potential to injure or kill wildlife. These operations impacts may occur to a few individual animals, however, without impacts at a landscape level. Due to the history of disturbance on site, the lack of protected species known to occur near the site, and the minimal activity associated with maintenance and repair activities, operations of the proposed Project would have a less than significant impact on biological resources protected by the Agoura Hills General Plan. For specifics on the potential impacts to sensitive biological resources, refer to Section 3.3.4.1 BIO-1 Impact Analysis and BIO-2 Impact Analysis.

Mitigation Measures

No mitigation measures are required.

City of Calabasas General Plan - Site ENT

Construction Impacts

Proposed construction activities have a potential to impact biological resources at Site ENT. Proposed construction would occur within an existing communications site; and the potential for measureable losses of species diversity or habitats is low, since any ground disturbance would occur within an area already disturbed and containing low quality habitat. The site contains no wetlands or riparian areas. No oak trees occur on site. There is a potential to impact sensitive biological resources during construction, due to increased traffic, noise, motion, and dust generation. These impacts are discussed under Section 3.3.4.1 BIO-1 Impact Analysis. Because the Authority is exercising intergovernmental immunity, the plan is not applicable, and no conflict with the City of Calabasas General Plan exists.

Operations Impacts

The proposed new antenna support structure at Site ENT would increase the probability of a bird strike hazard. Workers accessing the site during operations for maintenance and repair activities would slightly increase the traffic count on the access road and public roads leading to the site, which could increase the potential to injure or kill wildlife. These operations impacts may occur to a few individual animals, however, without impacts at a landscape level. Because the Authority is exercising intergovernmental immunity, the plan is not applicable, and no conflict with the City of Calabasas General Plan exists.

Mitigation Measures

No mitigation measures are required.

City of Glendale General Plan - Sites FTP and VPK

Construction Impacts

While native vegetation occurs in the study area of sites FTP and VPK, only disturbed vegetation and development occurs within the actual site boundary of either of the two sites. Ground disturbance associated with construction at each site would not exceed 5,000 square feet, and substantive removal of native vegetation is not expected at either site. As a result, any conflicts with the City of Glendale General Plan associated with construction activities at sites FTP and VPK would be minor, and construction impacts at the sites would be less than significant. Because the Authority is exercising intergovernmental immunity, the plan is not applicable, and no conflict with the City of Glendale General Plan exists.

Operation Impacts

The proposed new antenna support structure at sites FTP and VPK increase the probability of a bird strike hazard, even if other towers are present. Workers accessing the site during operations for maintenance and repair activities would slightly increase the traffic count, which could increase the potential to injure or kill wildlife. These operations impacts may occur to a few individual animals, however, without impacts at a landscape level. Due to the history of disturbance on these sites, the lack

of protected species known to occur near the sites, and the minimal activity associated with maintenance and repair activities, operations associated with the proposed Project at sites FTP and VPK would have a less than significant impact on biological resources protected by the City of Glendale General Plan. Because the Authority is exercising intergovernmental immunity, the plan is not applicable, and no conflict with the City of Glendale General Plan exists. For specifics on the potential impacts to sensitive biological resources, refer to Section 3.3.4.1 BIO-1 Impact Analysis and BIO-2 Impact Analysis.

Mitigation Measures

No mitigation measures are required.

City of San Dimas General Plan - Site SDW

Construction Impacts

No Project-related policies within the City of San Dimas General Plan were identified, and no impact would occur to resources protected by the City of San Dimas General Plan from the proposed construction activities associated with Site SDW. Further, because the Authority is exercising intergovernmental immunity, the plan is not applicable, and no conflict with the City of San Dimas General Plan exists.

Operation Impacts

As no Project-related policies within the City of San Dimas General Plan were identified, no conflicts would occur, and there would be no impact from the proposed operations activities associated with resources protected by the City of San Dimas at Site SDW. Further, because the Authority is exercising intergovernmental immunity, the plan is not applicable, and no conflict with the City of San Dimas General Plan exists.

Mitigation Measures

No mitigation measures are required.

City of Whittier General Plan - Site H-17A

Construction Impacts

Construction activities could remove vegetation and, therefore, could result in conflict with the City of Whittier General Plan. Site H-17A includes an existing tower facility and road but also includes disturbed native scrub vegetation. The use of the site is as a communications facility, and most of the buildable (flat) portion of the site is developed. Ground disturbance associated with proposed construction at the site would not exceed 5,000 square feet, and substantive removal of native vegetation is not expected. As a result, any impacts to biological resources protected by the City of Whittier General Plan at Site H-17A would be minor. Because the Authority is exercising intergovernmental immunity, the plan is not applicable, and no conflict with the City of Whittier General Plan exists.

Operation Impacts

With the placement of an additional communications tower at a Project site, the new structure increases the probability of a bird strike hazard, even if other towers are present. Temporary disturbance of vegetation increases the chances of permanently spreading nonnative weed species into unaffected areas. Maintenance of the sites is expected to occur approximately once a month; this increase in road use could result in mortality for some wildlife. These impacts may occur to a few individual animals, however, without impacts at a landscape level. In addition, the Project site development would be within, or involve a slight expansion of, existing facilities and so would not change the character or magnitude of existing impacts. Due to the potential for protected species in nearby areas, operations of the proposed Project could have a significant impact on biological resources protected by the City of Whittier General Plan (as well as other applicable protections which are in force and discussed under Section 3.3.4.1 BIO-1 Impact Analysis). However, because the Authority is exercising intergovernmental immunity, the plan is not applicable, and no conflict with the City of Whittier General Plan exists.

Mitigation Measures

No mitigation measures are required.

BIO-6. Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Plans and regulations that provide protection of native habitats fall under various designations including habitat conservation plans (HCPs) established under the federal Endangered Species Act (ESA) and Natural Community Conservation Plans (NCCPs) established by the State of California. Only one proposed Project site, Site MMC, is included within the boundaries of an HCP or NCCP.

West Mojave Plan – Habitat Conservation Plan

Construction Impacts

Because no WEMO protected species occur on Site MMC, no conflicts have been identified, and no impacts are anticipated.

Operations Impacts

Because no WEMO protected species occur on Site MMC, no conflicts have been identified, and no impacts are anticipated.

Mitigation Measures

No mitigation measures are required.

Summary of Project-related Impacts to Biological Resources and Mitigation Measures by Proposed Project Site

Special biological resources associated with each proposed Project site are summarized in Table 3.3-12, which also identifies the required mitigation measures at a proposed Project site and the resulting impact determination for each species potentially occurring at a proposed Project site.

3.3.5 Cumulative Impact Analysis of the Proposed Project

Consideration of cumulative effects to biological resources from the proposed Project is based on the incremental impacts of the proposed Project, combined with the effects of past, present, and probable future projects that may have impacts similar to the proposed Project (see Table 2.7-1). Potential Project-related impacts are identified in Section 3.3.4.1 on a species-by-species basis. The analysis also includes a discussion of loss of native vegetation that provides habitat for special status species; mortality of small species of wildlife (e.g., snakes, frogs and toads, small mammals) on roads used by project vehicles; loss of special status plants as a result of vegetation clearing; disturbance to wildlife due to construction related noise; use of inappropriate perch sites by raptors and condors; consumption of hazardous materials by wildlife (e.g., microtrash consumed by condors); exposure of birds to radio frequency (RF) microwave transmissions at communications towers; and collision with tower structures by migratory birds.

3.3.5.1 Geographic Extent

The geographic extent for consideration of cumulative impacts associated with the proposed Project varies by species, up to all of Los Angeles County and the portion of San Bernardino County that surrounds Site AJT, located in the city of Chino Hills. Included in Table 2.7-1 are over 700 past present or future projects that may contribute to cumulatively significant impacts to biological resources. The projects listed in Table 2.7-1 are within 2 miles of one of the 54 proposed Project sites. These include LMR sites that have previously been determined exempt from CEQA under PRC §21080.25. Of the 54 sites analyzed in this EIR, proposed facilities include 35 new towers, 12 new monopoles, 4 building mounts, and 3 collocations on existing structures. The geographic scope of analysis for cumulative impacts related to biological resources focuses within 2 miles of each proposed Project site but also considers the entire region defined by Los Angeles County and portions of all neighboring counties to address wide-ranging species (e.g., California condor, golden eagle, migratory birds).

The geography associated with cumulative impact analysis for Impact BIO 5 and Impact BIO 6 is limited to the geography associated with the plans potentially affected by construction and operation of each of the proposed Project sites identified within planning boundaries.

3.3.5.2 Existing Cumulative Conditions

The proposed Project vicinity includes a large expanse of the Los Angeles County region. The area has seen extensive development, both private and federal, over the past century, resulting in loss and fragmentation of wildlife habitat and native plant communities and ultimately leading, in part, to various species of plants and animals being listed under the ESA, or other species receiving status designations by resource management agencies indicating concerns with declining populations. Though there are many environmental compliance requirements placed on current developments, future growth and development will likely accelerate continued habitat loss and other impacts to biological resources.

Reasonably foreseeable projects that could contribute to the cumulative effects to biological resources are listed in Table 2.7-1. The potential construction and operation of over 750 identified known and anticipated cumulative projects in the vicinity of proposed LMR Project sites would generally be expected to result in similar types of impacts to biological resources as the development of proposed LMR Project sites. Many of the projects identified in Table 2.7-1 are small scale and within urban settings, with few anticipated impacts to the natural environment. Other projects such as electrical transmission lines and communication towers would result in temporary and permanent losses of native habitat and disturbance to wildlife. These projects in combination with the proposed Project have the potential to contribute to a cumulative impact on the environment. However, the existing conditions at each of these cumulative project sites are unknown, including the existing levels of disturbance; the quality of habitat for special status species; geographic extent of developments; the availability of existing access roads; the design of towers (e.g., whether guy wires or lights would be required) and facilities; or the requirements for on-site habitat restoration and species protection measures. Most of the projects listed in Table 2.7-1 that may have a significant impact on the environment have, are, or will be required to undergo their own independent review for environmental compliance.

Special biological resources associated with each proposed Project site is summarized in Table 3.3-12, which also identifies the required mitigation measures at a proposed Project site and the resulting impact determination for each species potentially occurring at a proposed Project site.

3.3.5.3 Cumulative Impact Analysis

BIO-1. Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Potential project-related impacts to 23 special status wildlife species and 23 special status plant species were evaluated at one or more of the 54 proposed Project sites evaluated in this EIR. Species of plants and wildlife that are designated as special status species are already considered to be compromised as a result of past and continued human activity and development throughout the region. Therefore, continued habitat loss, mortality of wildlife, or disturbance to wildlife as a result of any project included on the cumulative projects list (see Table 2.7-1) would constitute a significant cumulative impact on the environment as a result of the proposed Project in combination with other past, present, and future projects causing related impacts. The development of proposed Project sites would minimally contribute to cumulative effects to special status wildlife or plant species because proposed Project facilities are located in association with a previously developed site, habitat loss is minimized through the application of mitigation measures, species-specific protection measures would be implemented, and potential disturbance is of short duration and minimized by the rapid attenuation of noise from construction activities. The proposed Project would alter neither the decline nor recovery of these species. In each case where proposed Project actions could result in impacts to a special status species, mitigation measures were incorporated into the proposed Project to ensure that impacts would be reduced to a level of less than significant (see Section 3.3.4.1, BIO1-1 Impact Analysis). The list of analyzed species and the required mitigation measures at specific proposed Project sites is summarized in Table 3.3-12. Implementation of mitigation measures would minimize the incremental environmental effect of the development of proposed Project sites such that its contribution to a significant cumulative impact to special status species would not be cumulatively considerable.

Many of the identified cumulative projects would include some type of elevated structures, similar to the developments at proposed Project sites. At 34 proposed Project sites new lattice towers up to 180 feet tall would be constructed (sites BJM, BUR, BUR1, BUR2, BUR3, CPK, ENC1, FRP, FTP, GMT, GRM, H-17A, H-69B, JOP, JPK, JPK2, MMC, MML, MTL2, OAT, PHN, PMT, RIH, SDW, SPN, SUN, SUN2, TMT, TOP, TPK, TWR, VPK, WMP, and WTR); at one site (DPK) a 200-foot-tall tower is proposed. All elevated structures (e.g., communication towers, high-rise buildings, bridges, transmission lines and towers) have the potential to kill or injure migratory birds due to collision, especially during nighttime migration with low-cloud-ceiling conditions (Manville 2000). The American Bird Conservancy reports an estimated 6.8 million birds of up to 350 species are killed annually by collision with communication towers in the

United States and Canada (Longcore et al. 2012). A large proportion of this mortality is attributed to extremely tall, lighted towers with guy lines, often located in bird concentration areas or migration pathways (Manville 2014). In addition, microwave communication towers can expose birds that may nest on the structure to RF radiation. As of 2000, an estimated 75,000 communications towers were licensed in the United States by the FCC, of which some 46,000 were lighted and exceeded 200 feet in height (Manville 2000). By 2011 an estimated 110,228 towers were in the United States, with 13,329 constructed in California alone (<http://wirelessestimator.com/community/threads/of-cell-tower-sites-per-state-in-the-usa.1299/>)

In addition to communications towers, transmission towers and lines can also result in bird mortality through electrocution, and collision with towers and lines (USFWS 2000). California has 43,143 miles of electrical transmission lines (not including distribution lines) with generally four to five towers per mile (http://www.energy.ca.gov/maps/infrastructure/transmission_lines.html). This data is not specific to Los Angeles County but provides context for the analysis. Rioux et al. (2013) estimate losses from transmissions lines at between 2.5 to 25.6 million birds a year (USFWS 2000). Modern transmission towers are designed to discourage nesting by large birds and have various protections to minimize the risk of bird electrocutions. The Audubon Society reports that 365 million to 988 million birds in the United States are killed annually by collisions with windows. Overall, unguyed communications towers are a relatively minor component of total bird losses attributed to towers (Longcore et al. 2012; Rioux et al. 2013). Nonetheless, mass mortalities (more than several hundred birds per night) have been documented at unguyed, unlit monopole and lattice towers (DOI 2014). The placement and operation of communication towers, including unguyed, unlit, monopole or lattice-designed structures, impact protected migratory birds in significant ways (DOI 2014).

The proposed Project would include construction of approximately 90 communication towers throughout Los Angeles County. All of these are collocated at existing developed facilities, and all but one tower would not exceed 199 feet in height (site DPK at 200 feet). Though these towers are below the general height recommendations for lighted towers (i.e., 199-feet-tall), the FAA may require lights on some or all proposed Project towers. At least one of these towers on the cumulative project list may be over 200 feet in height, and likely several would require lighting. In addition, during migration birds interact with their environment at a landscape-level, and local impacts may have long-distance consequences. The construction of up to 90 LMR Project antennas would be in addition to the existing 1,193 cell towers in Los Angeles County registered by the FCC (City-Data.com 2015), representing a 7.5-percent increase in licensed communication towers in Los Angeles County over current conditions. It is unknown how many additional towers may be constructed within Los Angeles County or across the vast distances traveled by migratory birds.

To address concerns over bird mortality at communications towers, the USFWS Office of Migratory Birds has issued voluntary guidelines for communication towers (USFWS 2013a) for tower placement, construction, and operation. These guidelines emphasize collocation wherever possible to reduce the total number of towers and recommend that structures are either a lattice tower or monopole design,

that towers be no more than 199 feet above ground level, that guy wires are not required, that towers are unlighted if FAA regulations permit, and that security lighting is down-shielded and the minimum intensity needed. Other considerations include that towers are to be sited to avoid migratory pathways and other bird concentration areas, to minimize the loss of habitat, and to consider the presence of state and federally listed species. Little data is available concerning the level of bird mortality at towers that comply with USFWS guidelines.

The proposed Project fully complies with the voluntary guidelines for communications towers established by the USFWS Office of Migratory Birds at all sites with the exception of proposed Project site DPK on Santa Catalina Island, where a new 200-foot tall lattice tower would be constructed (USFWS guidelines recommend that tower height not exceed 199 feet). Monopole structures and their associated antennas are shorter in height and ultimately more visible to birds than their lattice tower counterparts and, thus, are more avoidable. While standing monopoles still pose some level of threat to birds in flight, the threat is greater from lattice tower structures. Forty seven new lattice towers are proposed for the LMR program (35 of which are directly addressed in this EIR and the remaining considered under the evaluation of cumulative impacts). In addition to the voluntary guidelines, anti-perch devices to discourage perching and nesting on tower structures would be installed as required mitigation measures on both lattice towers and monopoles at specific sites identified on a site-by-site basis (see Table 3.3-12). Despite these efforts, the current situation concerning the cumulative mortality of migratory birds at communication sites and other elevated structures is considered significant. It is expected that at least a low level of mortality would be associated with the presence of new lattice towers at 35 proposed Project sites plus new lattice towers at an additional 12 LMR project sites, and that operations of each Project facility would make a minimal contribution to the overall cumulative effects to mortality of migratory birds. The addition of about 90 LMR structures, 47 of which would be new lattice towers, along with other towers and elevated structures identified on the cumulative projects list (see Table 2.7-1) as well as the vast array of existing towers and high rise buildings across Los Angeles County contributes to the cumulative loss of migratory birds. This loss would be less substantive for tower structures that implement the USFWS voluntary guidelines for communications towers. This incremental impact of bird mortality due to proposed Project implementation is “cumulatively considerable” (Gordon and Herson 2011). Though the applicable standards for the construction of communication towers are being fully met (with the exception of Site DPK), no additional mitigation measures are available to reduce the proposed Project’s contribution to cumulative impacts to migratory birds to less than cumulatively considerable.

BIO-2. Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Potential project-related impacts to sensitive communities and habitats were evaluated at 19 proposed Project sites (see Table 3.3-12). These sensitive communities and ESA critical habitat have been so designated because they are considered to be rare or degraded as a result of past and continued human

activity and development throughout the region. Therefore, continued habitat loss of sensitive communities and habitats as a result of any project included on the cumulative projects list (see Table 2.7-1) would constitute a significant impact on the environment. The development of proposed Project sites would minimally contribute to cumulative effects to sensitive communities or habitats because proposed Project facilities are located in association with a previously developed site, and habitat loss is minimized through the application of mitigation measures. In each case where proposed Project actions could result in impacts to a sensitive community or habitat, mitigation measures are incorporated into the proposed Project to ensure that impacts would be reduced to a level of less than significant (see Section 3.3.4.1, BIO-2 Impact Analysis). The analyzed sensitive communities and habitats and the required mitigation measures at specific proposed Project sites are summarized in Table 3.3-12. Implementation of mitigation measures would minimize the incremental environmental effect of the development of each proposed Project site such that its contribution to a significant cumulative impact to a sensitive community or habitat would not be cumulatively considerable. .

BIO-3. Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

No sites were identified that would result in construction- or operation-related impacts to wetlands. The proposed project would not contribute to cumulative impacts to these resources associated with construction or operational activities.

BIO-4. Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Potential Project-related impacts to wildlife linkages were evaluated at 13 proposed Project sites (see Table 3.3-12). These wildlife connectivity corridors have been so designated because movement of wildlife across the landscape has been hindered by past and continued human activity and development throughout the region, and these corridors are identified in order to preserve and improve remaining habitat connectivity. Therefore, continued disruption of wildlife linkage corridors as a result of any project included in Table 2.7-1 would constitute a significant impact on the environment. The development of proposed Project sites would minimally contribute to cumulative effects to wildlife linkages because proposed Project facilities are located in association with a previously developed site, and habitat loss is minimized through the application of mitigation measures. Further, all potential Project-related impacts to wildlife linkages were determined to be less than significant. In each case where proposed Project actions may result in even this minor level of impact, mitigation measures were incorporated into the proposed Project to ensure that impacts would be further reduced (see Section 3.3.4.1, BIO-4 Impact Analysis). The analyzed wildlife linkages and the required mitigation measures at specific proposed Project sites are summarized in Table 3.3-12. Implementation of mitigation measures would minimize the incremental environmental effect of the development of proposed Project sites

such that its contribution to a significant cumulative impact to wildlife linkages would not be cumulatively considerable.

BIO-5. Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Of the 54 sites evaluated to determine potential for conflict with local policies and ordinances that could affect biological resources, 9 sites were determined not to have potential conflicts; and these sites are not discussed further. Forty five sites were evaluated where conflicts resulting in less than significant impacts could occur. A discussion of the plans affecting each of these sites is discussed below.

Angeles National Forest Land Management Plan. Sites GMT, JOP, JPK, JPK2, MML, SUN/SUN2, and TMT each have a single project identified on Table 2.7-1 as being proposed or constructed within 2 miles. These include communication tower projects near sites GMT, MML, SUN, SUN2, and TMT, electrical transmission lines (the Tehachapi Renewables Transmission Project, near site JOP), and a housing development near sites JPK and JPK 2.

Significant cumulative impacts to the species and habitat resources (discussed in Impact BIO-1 and Impact BIO-2) protected under the Angeles National Forest LMP were identified, but the proposed Project's contribution was determined less than considerable, with the exception of potential impacts to migratory birds where the proposed Project was considered to add a cumulatively considerable contribution to a significant cumulative impact.

Santa Monica Mountains National Recreation Area General Management Plan. The SMMNRA GMP includes sites LACFCP08 and PWT. Sixty two projects were identified near Site LACFCP08. Most of these involved new, remodel, repair or add-on to single-family residences.

A total of 153 projects were identified within 2 miles of Site PWT. Nearly all were residential development or improvement projects.

Significant cumulative impacts to the species and habitat resources (discussed in Impact BIO-1 and Impact BIO-2) protected under the SMMNRA GMP were identified, both the proposed Project's contribution was determined less than considerable, with the exception of potential impacts to migratory birds where the proposed Project was considered to add a cumulatively considerable contribution to a significant cumulative impact.

Topanga State Park General Plan. No additional projects were identified within the plan boundary or in the vicinity of Site GRM. Cumulative impacts to the species and habitat resources (discussed in Impact BIO-1 and Impact BIO-2) protected under the Topanga State Park General Plan were determined less than considerable, with the exception of potential impacts to migratory birds where the proposed Project was considered to add a cumulatively considerable contribution to a significant impact.

Santa Catalina Island Local Coastal Program. Fourteen projects were identified on Table 2.7-1 as occurring on Santa Catalina Island. All 14 projects were within the limits of the City of Avalon, which is

not under the purview of the Santa Catalina Island Local Coastal Program. Cumulative impacts to the species and habitat resources (discussed in Impact BIO-1 and Impact BIO-2) protected under the Santa Catalina Island Local Coastal Program were determined less than considerable, with the exception of potential impacts to migratory birds where the proposed Project was considered to add a cumulatively considerable contribution to a significant impact.

Santa Monica Mountains Local Coastal Program. No additional projects were identified within 2 miles of sites CPK, H-69B, SPN, and TOP. Site ENC1 and LACF072 each had two projects identified. Both identified the proposed Malibu Institute, a mixed-use development that includes a retreat facility and golf course. Each also identified single-family residences being built at distances of 1.18 miles and 0.75 mile, respectively. Cumulative impacts to the species and habitat resources (discussed in Impact BIO-1 and Impact BIO-2) protected under the Santa Monica Mountains LCP LUP and LIP were determined less than considerable, with the exception of potential impacts to migratory birds where the proposed Project was considered to add a cumulatively considerable contribution to a significant impact.

Los Angeles County General Plan. Sites containing biological resources that are governed by the Los Angeles County General Plan include OAT, PHN, RIH, and TPK. The Los Angeles County General Plan covers specific unincorporated areas within Los Angeles County and is generally not applicable within incorporated cities.

One project was identified within 2 miles of Site OAT; the LA-RICS LTE monopole that was constructed at LTE Site ONK in 2015, located approximately 1.25 miles distant from Site OAT, and within the boundary of the Los Angeles County General Plan. Site PHN had one project identified, the LA-RICS LTE collocation that occurred at LTE Site PHN in 2015, located immediately adjacent. In both instances, the LTE development did not involve removal of native vegetation or take of sensitive species. No impacts to the underlying resources associated with Policy C/NR 3.1 would occur; therefore, no contribution to cumulative would occur from development of sites OAT and PHN. Sites RIH and TPK had no other projects identified within the boundary of the Los Angeles County General Plan within 2 miles of the proposed Project site.

The proposed project's contribution to significant cumulative impacts to the species and habitat resources (discussed in Impact BIO-1 and Impact BIO-2) protected under the Los Angeles County General Plan were determined less than considerable, with the exception of potential impacts to migratory birds where the proposed Project was considered to have a cumulatively considerable contribution to a significant cumulative impact.

City of Malibu Local Coastal Program. The City of Malibu Local Coastal Program includes sites LEPS and ZHQ. A total of 47 projects were identified near Site LEPS. Most of these involved new, remodel, repair or add-on to single-family residences (the two closest within 0.25 mile of LEPS); along with some municipal work (water tank and water line improvements located at 0.13 mile from Site LEPS).

A total of 122 projects were identified within 2 miles of Site ZHQ. Nearly all were residential development or improvement projects, but nearby improvements at Zuma Beach such as new or remodeled restrooms were also included.

Significant cumulative impacts to the species and habitat resources (discussed in Impact BIO-1 and Impact BIO-2) protected under the City of Malibu Local Coastal Program were determined less than considerable, with the exception of potential impacts to migratory birds where the proposed Project was considered to add a cumulatively considerable contribution to a significant cumulative impact.

City of Chino Hills General Plan. Three projects that lie within the boundaries of the City of Chino Hills General Plan were identified within 2 miles of Site AJT. Based on a desktop review of existing site conditions, two of these appear to be residential or small commercial development activities that are in developed areas. The third, identified as Hidden Oaks Country Club, is a proposed 537-acre new golf course development that includes approximately 427 acres of open space. An EIR has not yet been prepared for this project, but it is assumed the loss of habitat associated within the development would constitute a significant impact to biological resources. Construction and operations as part of the proposed Project for Site AJT would not result in habitat loss. Therefore, the proposed Project activities at Site AJT would not constitute a cumulatively considerable contribution to significant impacts to biological resources in the area.

Incorporated Cities in Los Angeles County. General plans were reviewed for the cities of Agoura Hills, Calabasas, Glendale, San Dimas, and Whittier. At these municipalities, the Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such local plans, policies, and regulations are not applicable to the Project. Nevertheless, in the exercise of its discretion and in the interest of working cooperatively with local jurisdictions, this Draft EIR references, describes, and addresses local land use plans, policies, and regulations. Consideration of these plans, policies, and regulations assists in determining whether the proposed Project may conflict with nearby biological resources, which could affect the analysis of whether the proposed Project would result in potentially significant environmental impacts. In all instances, impacts to underlying biological resources were determined to be less than significant once mitigation protecting those resources was employed. Because the Authority is exercising intergovernmental immunity, no impacts were identified to be associated with conflicts with these plans. Because no impact would occur, no cumulative impacts would result to the individual general plans that cover sites AGH, ENT, FTP, SDW, H-17A, and VPK.

BIO-6. Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

No sites were identified that would result in conflicts with provision of HCPs or NCCPs. No contribution to cumulative impacts to these resources associated with construction or operational activities are anticipated due to implementation of the proposed Project.

3.4 Cultural Resources

3.4.1 Environmental Setting – Cultural Resources

This section provides a brief prehistory and history of the area within which proposed Project activities would occur. The section also presents the existing setting in the vicinity of the Project and the regulatory environment that guides the identification and assessment of cultural resources, includes a discussion of the methods used during analysis, and summarizes impacts resulting from Project activities. The types of resources identified within a 0.5-mile radius of each proposed Project site are shown in Table 3.4-1 and further discussed in Chapter 4 (a summary of environmental data by Project site) and Appendix B-4 (Tables 1 through 4, which provide additional cultural resources data).

CEQA Guidelines Section 15120(d) prohibits an EIR from including information about the location of archaeological sites or sacred lands: “No document prepared pursuant to this article that is available for public examination shall include ... information about the location of archaeological sites and sacred lands.” Therefore, the specific locations of archaeological sites are not included in this chapter.

Table 3.4-1: Cultural Resources Identified within a 0.5-Mile Radius of Each Proposed Project Site

Site ID	Site Name	Prehistoric or Historic Archaeology or Native American Resources	Historic Buildings or Structures or District
AGH	Agoura Hills	X	N/A

* N/A indicates that the type of resources indicated in the column heading do not occur within a 0.5-mile radius of the Project site.

3.4.1.1 Prehistory (Pre-1769)

Early Man Period

Perhaps more than any comparable area of North America, prehistoric California was biotically rich, heavily populated, and culturally diverse (Aikens 1978:133). Evidence is scant, but archaeologists generally believe that the earliest human occupation of southern California spans the time frame from approximately 12,500 to 6,000 years Before the Present (BP) (Wallace 1978: 214-230; Moratto 1984: 110-113; Altshul et al. 1984: 33; Glentis 2013: 8). Although the chronological sequences differ by researcher, the cultural chronology proposed by William J. Wallace (1955: 214-230) in "A Suggested Chronology for Southern California Coastal Archaeology" is still widely accepted today.

Using Wallace's chronology, the earliest of the cultural periods is known as the Early Man Period, or Horizon I. The Indians of this period (Paleo-Indians) were highly mobile hunters; lived in small, widely separated groups; and hunted with large stone projectile points fashioned from locally available materials. Technologies associated with ocean resource gathering were also utilized by coastal groups; however, because the sea level during this period was lower than today, most of the shoreline sites that could provide archaeological information regarding Paleo-Indian lifeways are under water (Chartkoff and Chartkoff 1984: 37-69). Nonetheless, upland sites around springs and caves on California's Channel Islands have produced some of the earliest evidence of seafaring and maritime adaptations in the Americas and reveal the diversity of Paleo-Indian lifeways (Smithsonian Science 2011). These include a fluted point from the western Santa Barbara Channel coast and deep, shell-filled deposits from a site north of Point Conception. Both of those finds date to before 10,000 years ago (Arnold and Walsh 2010).

Wherever Paleo-Indians lived, throughout the Western Hemisphere, they followed similar ways of life, hunted similar kinds of animals, and used similar kinds of tools. Pioneering economies kept the Paleo-Indian way of life simple but effective century after century (Chartkoff and Chartkoff 1984: 46).

Compared to other locations in the American West, few Paleo-Indian sites have been recorded in California, and most of those have been recorded along the shorelines of what were once large lakes of the interior desert valleys of southern California. These locations were desirable for their proximity to reliable water supplies as well as for the animals that they attracted (Smith 1999). The sites that have been identified comprise five basic types (Chartkoff and Chartkoff 1984: 50-57; NRHP Branch 2007):

- Occupation sites – locations where people lived for short periods of time. This site type is characterized by the remains of various activities, including tool making, food preparation, and sometimes cooking areas (hearths).
- Workshops – sites where the primary activity was tool manufacture. Workshops can be found as discreet areas of occupation sites but are also seen as separate sites near the source of raw materials.
- Butchering stations – specialized sites where large animals were killed and dismembered. Because of the size of some of the animals, the carcasses were not often relocated to the occupation site; rather, members of the group temporarily moved to the kill area.
- Burial sites – specialized sites where the primary feature is the interment of human remains.
- Isolated artifact sites – Isolates are individual artifacts. They are typically not associated with known sites; however, they can mimic a site if widely distributed over a large area. Within the Paleo-Indian context, isolated finds are critical for research purposes and are viewed as a specific property type for recording purposes (NRHP Branch 2007).

While thousands of isolated artifacts have been found across California, those most convincingly attributed to Paleo-Indians are fewer. Artifacts not associated with other datable materials (e.g., charcoal or the bones of extinct animals) are difficult to date, and items uniquely identifiable with the Paleo-Indian culture are limited in number. The only unambiguous exception is the fluted stone point,

which is universally associated with the end of the Paleo-Indian Period and, in some Western sites, has been found in association with extinct mammals of the Pleistocene Epoch (the most recent of the geologic ice ages).

More than 40 Paleo-Indian fluted points have been found across areas of southern California (Rondeau and Taylor 2003: 45); one rare find has been found at Crystal Cove State Park in coastal Orange County (Fitzgerald and Rondeau 2012). Inasmuch as the fluted points found in California have been recorded in every environmental setting (Fitzgerald and Rondeau 2012), there is little reason to assume that this site type might not be found at other locations in southern California.

As the Pleistocene Epoch came to a close, the climate warmed and the large herds of grazing animals that had been the center of the Paleo-Indian economy dwindled; some species became extinct. For the Paleo-Indians, these changes meant that previous ways of life could not continue; and subsistence patterns necessarily shifted from big game hunting to reliance on smaller animals and plant collection. For this reason, the end of the Pleistocene Epoch is typically used to mark the close of the Paleo-Indian Period (Chartkoff and Chartkoff 1984: 47; Altshul et al. 1984: 33-34).

Millingstone Period

The period between 6,000 BP and about 3,000 BP in southern California is most commonly known as the Millingstone Period (Horizon II). A shift in food procurement and processing practices occurred in this period that is reflected in the archaeological record. Plants and seeds were exploited to a much greater extent than before; but groups remained small and mobile and, based on the distribution of Millingstone sites, utilized mountain, coastal, and/or valley residences according to the season (known as seasonal rounds) (Glentis 2013). In this semi-sedentary pattern, a base camp would have been occupied for a portion of the year, but small population groups would occupy subsidiary camps seasonally in order to exploit resources not generally available near the base camp.

The Millingstone Period is characterized by ground stone milling tools, such as deep basin metates and manos used to grind seeds, nuts, and other hard plant materials into meal (Moratto 1984). Choppers, scrapers, and shell and bone artifacts are also found in Millingstone sites; however, projectile points are generally lacking, and faunal remains are scarce until later in the period (California Energy Commission 2007). Nearly 40 sites dating to Horizon II have been discovered, mainly in locations near the coast (Arnold and Walsh 2010). Evidence suggests that collecting shellfish and plant resources became more important than hunting during this period (Moratto 1984).

Intermediate Period

Dating to between 3,000 and 1,250 years BP, the Intermediate Period (Horizon III) represents a transitional period. Excavated sites retain many attributes of the preceding Millingstone Period but exhibit more elaborate and diverse artifact types in the deposits. Intermediate Period sites also can contain large-stemmed, small-notched projectile points suggestive of bow and arrow use and new technologies consisting of circular shell fishhooks and stone net weights (Arnold and Walsh 2010),

especially near the end of the Period. Intensive use of mortars and pestles signaled the special processing of acorns (leaching to make them edible) as the primary vegetative staple as opposed to a mixed diet of seeds and acorns (Chartkoff and Chartkoff 1984; Glentis 2013; NPS 2013b).

Due to a general lack of data, neither the settlement and subsistence systems nor the cultural evolution of this Period are well understood; but it is very likely that nomadic ways continued. It has been proposed that sedentism increased with the exploitation of storable food resources, such as acorns; but coastal sites from the period exhibit higher fishing activity than in previous periods. The first permanently occupied villages make their appearance during this period (Chartkoff and Chartkoff 1984). Habitation structures in most parts of southern California were simple but well-designed houses made of pole-and-thatch (Arnold and Walsh 2010).

Late Prehistoric Period

Extending from about 1,250 BP to European permanent settlement (ca. 1769), the Late Prehistoric Period (Horizon IV) is “the final episode in the development of Native California cultures before the settlement of Europeans” (Chartkoff and Chartkoff 1984: 203, 247). The period is marked by increased trade across landscapes, suggesting greater sociocultural complexity and interconnectedness (Glentis 2013). This period is also characterized by a slight increase in technological sophistication and diversity and, along the coast, greater exploitation of marine resources (Chartkoff and Chartkoff 1984; Moratto 1984).

Assemblages from this period characteristically contain projectile points. Toward the end of the period, the size of the points decreases and notched and stemmed bases appear, implying greater reliance on the bow and arrow. The presence of shell-bead money and personal shell-bead ornaments widely distributed well east of the coast (as far as New Mexico) suggests an organized trade network between coastal groups and inland villages (Chartkoff and Chartkoff 1984: 231). Village size increases during this period, with some of the settlements having as many as 1,500 or more persons. Analyses of human skeletons show that the first signs of malnutrition appear in this period as well, possibly signaling greater competition for food resources (Fagan 2003a).

With the arrival of the Europeans came an end to the autonomous Native California way of life. Starting with occasional contacts by land and sea in 1539-40, and then with permanent settlement in 1769, the foreigners brought with them new technology, new diseases, new religions and new economies, resulting in a loss of former lifeways (Chartkoff and Chartkoff 1984: 242).

3.4.1.2 *Historical Period (1769 to the Present)*

Native American Tribes at the Time of European Contact

The Los Angeles Basin is within the indigenous territory of the *Tongva*, who occupied the fertile lowland portions of southern California during protohistoric and historic times (Kroeber 1925; Arnold and Walsh 2010). The *Tongva* have been described as one of the most complex Native American societies in southern California (Bean and Smith 1978).

The *Tongva* may have entered the Los Angeles Basin as recently as 1500 BP. At the time of European contact, their land encompassed about 4,000 square miles of Los Angeles and Orange counties, encompassing the watersheds of the Los Angeles, Santa Ana, and San Gabriel rivers. Their territory also extended to the four southern Channel Islands – Santa Barbara, San Nicolas, Santa Catalina, and San Clemente (Bean and Smith 1978). Trade routes extended as far east as the Colorado River; and their trading partners included the Chumash to the north; the Cahuilla, Serrano, and Mojave to the east; and the Juaneños, Cupeño, and Luiseños to the south. Several other Native American groups including the Kawaiisu, Chemehuevi, Alliklik, Kitanemuk, Vanyume, and Serrano occupied the high desert portion of Los Angeles County. Those groups were fairly small, numbering between 500 and 1,000 people at the time of European contact (Kroeber 1925).

When the Spanish began to colonize southern California and construct missions in the late 1700s, the Tongva were forcefully relocated to Catholic mission lands. Some of the Tongva relocated to the Mission San Gabriel Archángel (established in 1771) and others to Mission San Fernando Rey de España, which was established in 1797. Because of this, the Tongva are also known variously by their Europeanized names – Gabrieliño, Fernandeano, or Nicoleño (those who lived on San Nicolas Island).

From the time of Spanish colonization forward the Tongva population decreased rapidly because of introduced diseases, the forceful relocations, changes in diet, and their resistance to Spanish rule. By 1900, “the Tongva had ceased to exist as a culturally identifiable group” (Bean and Smith 1978: 540). In 1994, the state of California recognized the Tongva as the aboriginal tribe of the Los Angeles Basin, but none of the four currently active Tongva groups are federally-recognized Tribes (Bureau of Indian Affairs 2014). As of December 2014, the Tongva population is approximately 1,700 members.

European Settlement

The first known European expedition to visit the southern California region was made in 1542 by Captain Juan Rodriguez Cabrillo, who was sailing up the coast looking for a new passage to Asia. Sixty years later, Captain Sebastián Vizcaíno, dropped anchor near San Pedro and at Santa Catalina Island. Europeans would not visit the region again until the Spaniard Gaspar de Portolá and a group of Catholic missionaries camped on what is now the banks of the Los Angeles River in 1769 (Kroeber 1925).

In September 1771, a Spanish colony that included Father Junipero Serra founded the Mission San Gabriel Archángel. The mission became the center of the first southern California community. At the time, the area was inhabited by small bands of Tongva Indians. Ten years later the Pobladores [townspeople] – a group of 11 families recruited from Mexico by Captain Rivera y Moncada – traveled from the San Gabriel Mission to a spot selected by Alta California Governor Felipe de Neve to establish a new pueblo. The settlement was named El Pueblo de la Reyna de Los Angeles (The Pueblo of the Queen of the Angels). The settlement was little more than a small, isolated cluster of adobe-brick houses; however, over time, it grew to be Ciudad de Los Angeles, “the City of Angels” (Cruz 1988; Nelson 1977; Weber 1982).

In September 1797, Franciscan monks established the Mission San Fernando Rey de España in the northern San Fernando Valley; and, by 1800, American ships began arriving at San Pedro and other ports along the California coast. The first English-speaking permanent residents settled near Los Angeles in 1818.

Alta California was ruled by Spain until 1822, when Mexico rebelled against Spain and established the Mexican Republic. The new Republic encompassed California and most of the southwestern United States. Under Mexican control, operation of the former mission properties transferred from the friars to civil authorities (Beattie and Beattie 1939); and, to encourage immigration to California, Mexico began granting land to private citizens. Huge land-grant ranches were established by 1834, with most of the Indians working on them as farm hands or herdsmen (Smith 1939). Trade between Mexico and the United States increased dramatically during this period; and by the 1840s, Los Angeles was the largest settlement in southern California. Cattle ranching dominated the economy, and cattle hides and tallow were valuable trade items (Pitt 1970).

By 1846, diplomatic relations had broken down between Mexico and the United States; and the U. S. Congress declared war on Mexico. The short war (1846-1848), ended with the signing of the Treaty of Guadalupe-Hidalgo, making California a territory of the United States. On September 10, 1850, California was admitted to the Union as a state (Beattie and Beattie 1939).

The California Gold Rush, Incorporation, and the Civil War

Both the annexation of California and the discovery of gold – most notably at Sutter’s Mill in 1848 – brought adventurers and immigrants to the West by the thousands. Gold strikes were also made, both in the Antelope Valley (as early as 1842) and in the mountains north of Los Angeles, all of which created a rapid increase in the population and a booming market for various goods and services – primarily beef, which was plentiful on the great Mexican ranchos (County of Los Angeles 2014a).

In 1850, the County of Los Angeles was formally established as one of the 27 original California counties. That same year, the City of Los Angeles was incorporated as the county’s first city and designated the County Seat. Because of its original enormous size, Los Angeles County was reconfigured three times, with a portion transferred to Kern County in 1851, a second portion transferred to San Bernardino County in 1853, and a final portion transferred to Orange County in 1889.

With the high demand for gold, silver, and copper during the Civil War (1860-1865), the area around Soledad Canyon became active; and Fremont’s Pass (today’s Newhall Pass, which connects the San Fernando and Santa Clarita valleys) was developed to speed up ore shipments. After the Civil War ended, many of the miners moved into the Los Angeles area, where several of the large Mexican ranches were subdivided into small farms. Among the transformed areas are what is known today as Compton, Downey, Norwalk, San Fernando, Santa Monica, and Pasadena.

Completion of the Transcontinental Railroad to the Pacific

Between 1880 and 1890, the population of Los Angeles County grew from approximately 11,000 to 50,000. This was due, in part, to the completion of the Southern Pacific and Santa Fe Railroad routes to the Pacific Coast and the settlement of hundreds of Chinese railroad workers hoping to start a new life in the area. With a huge investment in their new coast-to-coast rail lines and large Los Angeles land holdings, the railroads were able to promote tourism and support an emerging agriculture industry that included citrus, wheat, olives and dozens of other Mediterranean climate crops, most of which are still produced today (Moehring 2004; County of Los Angeles 2014a). Towns began to spring up along the new train routes, land speculators raced to the West, and land values boomed. After the railroad was completed between Los Angeles and Long Beach, the San Pedro and Long Beach harbors propelled Los Angeles into the international trade market.

In 1889, when some of the early speculation proved to be overly ambitious, the economy of the region dipped; but the slowdown was short-lived and led to other opportunities and innovations – most notably the creation of the Los Angeles Chamber of Commerce, which began a worldwide advertising campaign to attract new citizens and businesses. It also was during this period that several local irrigation districts were established and a number of civic improvements undertaken (County of Los Angeles 2014a).

The best known of the civic improvement projects was the completion of the Los Angeles aqueduct between the Owens Valley and Los Angeles. With periods of drought and a rapidly increasing population, the aqueduct became Los Angeles' solution to a growing need for water. The ambitious plan to channel water from the eastern slopes of the Sierra Nevada to Los Angeles was undertaken by William Mulholland, chief engineer of the Los Angeles Water Department, and J.B. Lippincott, of the United States Reclamation Service. The design phase began in 1899, and the voters of Los Angeles approved bonds for its construction in 1905 and 1907. Construction of the aqueduct took six years (1908-1913). When complete it was the world's longest aqueduct – 233 miles between Owens Lake and Los Angeles – and the largest single water project ever undertaken in the world (History Channel 2010; LADWP 2013).

The Oil Boom

Although oil was discovered near San Fernando as early as 1850, the commercial boom did not begin until 1892, when Edward Doheny and Samuel Canfield drilled their first successful well at the corner of West State and Patton Streets near the Second Street Park in downtown Los Angeles (Redpath 1900: 37-39; Valenzuela 2010). By 1897 the area had 500 derricks; and by 1910, the oil boom had tripled the population of Los Angeles from 50,000 to more than 319,000 (Testa 2005: 79-80). Drilling activity in the county reached new heights in the 1920s when major finds were also made in Whittier, Montebello, Compton, Torrance, and Inglewood. Among the strikes, the richest were in Huntington Beach in 1920 and Santa Fe Springs and Signal Hill in 1921 (County of Los Angeles 2014a). Between 1952 and 1988 more than 1,000 wells pumped 375 million barrels of oil from the Los Angeles derricks.

The oil industry continues to be a major part of the southern California economy, with approximately 19 oil fields operating within the Los Angeles City limits (Testa 2005; Masters 2011). Los Angeles is the most urban oil field in the United States, “operating in cracks, corners, and edges, hidden behind fences, and camouflaged into architecture, pulling oil out from under our feet” (Center for Land Use Interpretation 2010).

A Mecca for Immigrants

Since its initial settlement by the Spanish, southern California has been a cosmopolitan environment that has depended on long-distance immigration for its growth. Early Californios, Native American groups, and Anglo Americans of the 1800s were soon joined by settlers drawn to the area from across the globe; and by the early twentieth century, immigration was rising. By 1990, 27 percent of the region’s population and 33 percent of all those living in Los Angeles County had immigrated from Europe, Asia, and Central or South America, all contributing to the enormous cultural, economic, and social diversity of the region and the development of unique ethnic neighborhoods. By 2000, Los Angeles had become America’s major immigration port of entry, supplanting New York City (Waldinger and Bozorgmehr 1996; County of Los Angeles 2014a).

The Entertainment Industry

The first motion picture studio in Hollywood was housed in an old building at the southeast corner of Sunset Boulevard and Gower Street. At that time (1911), Hollywood had a population of about 500 and was little more than a post office, one hotel, and two grocery stores. What drew movie makers to the Los Angeles area, and ultimately Hollywood, was the varying terrain, the year-round good weather for filming, and a way to avoid penalties imposed on independent filmmakers by Thomas Edison’s Motion Picture Patents Company (located in New Jersey) (Hollywood Sign Trust 2014a). Film studios soon started popping up all over the Los Angeles area, including one for Cecil B. DeMille in 1913 and the Charlie Chaplin Studio in 1917. By the 1920s, millions of Americans were going to the movies each week, and the small town of Hollywood was growing rapidly. Whimsically-designed movie-set-inspired hotels and apartments were built along its broad boulevards, and movie stars were building elegant residences in the most prestigious areas. The rise of “the film aristocracy also meant suave new restaurants and nightclubs up and down Hollywood and Sunset Boulevards. Extravagant movie palaces completed the iconic Hollywood landscape” (Hollywood Sign Trust 2014b). Between 1927 and the mid-1950s – the “golden age of Hollywood” – there were five major studios: Paramount, RKO, 20th Century Fox, Metro-Goldwyn-Mayer, and Warner Brothers. Each had its own theater for showing films made only by their studios and only with actors who had exclusive contracts with those studios (Hollywood Movie Memories 2010).

With the advent of motion picture film sound, the movie industry reinvented itself; and “talkies” replaced silent films. When the stock market crashed in 1929 and the country fell into the depths of the Great Depression, Hollywood continued to boom as millions of Americans flocked to theaters to escape the grim news of the day.

The Hollywood Sign. When first erected in 1923, the famous Hollywood sign was an advertisement for a new residential development known as “Hollywoodland.” The sign was built by *Los Angeles Times* publisher Harry Chandler for \$21,000 and designed to last only about a year. The original design of the sign used four thousand 20-watt light bulbs to illuminate the perimeter of each of the 13 letters. At night the sign blinked on and off – first Holly, then Wood, then Land with an enormous period at the end of the word (Hollywood Sign Trust 2014e).

In the late 1930s, when television was just beginning to challenge big movie productions and radio, Don Lee – a local entrepreneur – constructed a broadcast network station on a 20-acre site just behind the Hollywoodland sign. Lee needed his station to be on high ground for line-of-sight communications; and, when completed in 1939, the facility had state-of-the-art filming facilities, a swimming pool, and a 300-foot lattice tower that was the “highest elevation television transmission tower in the world” (Hollywood Sign Trust 2014f). The original facility above the Hollywood sign, including the large radio tower, is still visible; and Hollywood continues to pay tribute to that important time in its history by calling the famous ridge “Mount Lee” (Hollywood Sign Trust 2014f).

World War II

When America entered World War II in 1941, Hollywood and its residents mobilized to support every aspect of war-time life. Studio trucks transported troops instead of movie sets, and some of Hollywood’s biggest stars – Clark Gable, Jimmy Stewart, Victor Mature – enlisted in the Army. On the big screen the light-hearted comedies and musicals of the previous decade were replaced with patriotic themes, and Film Noir was born. In later years of the war, Hollywood welcomed its returning soldiers home and worked together to feed, shelter, and entertain them (Hollywood Sign Trust 2014c).

Cold War Paranoia

When World War II ended, southern California in general and Hollywood in particular, underwent dramatic changes both politically and economically. The high-profile nature of the entertainment industry made it especially vulnerable to Cold War paranoia, and many of America’s favorite movie stars became the target of Senator Joseph McCarthy’s famous war on communist subversion. As many as 400 actors, writers, directors, and producers were “blacklisted” during this period; and some were even sentenced to prison. Combined with the growing popularity of television, box office receipts plummeted by almost half from the war years and film studios had to “slash payrolls, back lots sprouted weeds, and sound stages went dark.” In typical Hollywood fashion, the tight-knit community bounced back by adapting to the small screen; and by the mid-1950s, Hollywood had reinvented itself again (Hollywood Sign Trust 2014d).

During the Cold War Years, the U.S. Military also protected the Los Angeles area from Russian bombers by constructing a ring of 16 Cold War-era NIKE missile facilities, nine of which concealed missiles tipped with nuclear warheads. Active between 1954 and 1974, most of these military posts were unknown to the southern Californians, who lived among them as they silently protected their neighborhoods from

mountain peaks such as Mt. Disappointment and San Vicente Peak (*Los Angeles Times* 2000; Fort MacArthur Museum 1994-2013).

The Mid-Century Modern Movement

The Mid-Century Modern movement in architecture, arts, and science spanned the period from immediately after World War II (1945) through the 1970s (Randel 2013). During this period of rapid economic growth, new materials and bold and unusual colors, patterns, and designs affected almost everything that was built. The new contemporary approach was used in everything from furniture to housewares to clothing to residential, commercial, and industrial buildings (Achica Living 2015).

Always at the forefront of change, the Los Angeles area eagerly adopted this movement; and Los Angeles County produced some of the most prominent architects and artists in the history of design. Among these were Joseph Eichler, Frank Lloyd Wright, Richard Neutra, and Ray and Charles Eames, who married modern design with elements of nature to create some of the most iconic and enduring buildings and structures in the southern California landscape. Both in valley suburbs and the surrounding hills, the greater Los Angeles area still displays some of the most beautiful Mid-Century Modern designs produced during that era (Johnston 2014). Among these are the Los Angeles International Airport theme building; Dodger Stadium; the Faculty Center at the University of California, Los Angeles; the Capitol Records Tower; Century Plaza Towers; the Pacific Bell Telephone Building (AT&T Tower); and numerous individual homes and residential communities scattered across the Los Angeles basin (Roadside Architecture 2014).

3.4.1.3 Modern Los Angeles County

In 2015, more than 10.5 million people reside in Los Angeles County. The county encompasses 88 cities (Los Angeles County, Public Affairs, Chief Executive Office 2010) and approximately 140 unincorporated areas; it is one of the most culturally and ethnically diverse communities in the world. Additional information about the prehistory and history of the Project area can be found in the numerous documents cited at the end of this section.

3.4.2 Environmental Setting – Paleontological Resources

3.4.2.1 Geologic Overview

In general, the entire western margin of North America is very rich paleontologically. This is because the border of the North American continent is active tectonically, thus creating various marine embayments that received large amounts of sediment from the adjacent land mass. Each such embayment can have a sequence of stacked marine and terrestrial sediments containing the fossils documenting its natural history, and the completeness of the record can vary among different embayments. The Los Angeles Basin is a relatively important site for geological and paleontological studies of the western margin of North America because the stratigraphic sequence of its sediments is very complete; there are few gaps in a nearly continuous sequence of deposits from the Early Miocene (approximately 23 million years old) to the latest part of the Pleistocene (approximately 11,000 years old) (USGS 2007).

3.4.2.2 Geologic Units and Paleontological Resources

A brief description of the geologic units located within a 1-mile radius of each individual proposed Project site is provided below. The units are in approximate stratigraphic order from youngest to oldest. Table 3.4-2 indicates whether or not unique paleontological or geological resources are within the 1-mile radius of each proposed Project site. Additional information about paleontological resources is provided in Chapter 4 and Appendix B-4.

* N/A indicates that the project site is not sensitive for paleontological resources.

Artificial Fill (af)*Resource Potential – None*

Artificial fill is Holocene in age (11,000 years old or less) and consists of previously disturbed sediment that has been transported by humans (USGS 2007). It is commonly used in construction projects (structures, roadways, concrete channels, railway embankments, etc.). The depth and extent of these sediments within the proposed Project sites are unknown. By their very nature, fossils found in artificial fill have lost their native provenience and therefore have marginal scientific value. Based on the Society of Vertebrate Paleontology's (SVP) (2010) procedural guidelines, artificial fill is generally considered to have no potential to produce significant paleontological resources.

Quaternary Alluvium (Qa, Qg, Qf, Qs, Qbs, Qds, Qya, Qyf, Qc, Qos, Qae, Qof, Qop, Qoa, Qol, Qog, Qls)

Resource Potential – Low (Moderate/Unknown below 5 feet). Should be considered high potential in areas with previously recorded fossil localities.

Undifferentiated Quaternary alluvial deposits are laid down by fluvial processes (transported by water) and can be further subdivided by age into younger alluvium (Holocene age) and older alluvium (Pleistocene age). Holocene units have low paleontological potential within the initial 5 feet, and increase to moderate/unknown paleontological potential below 5 feet in depth below the ground surface based on SVP (2010) procedural guidelines and high potential in areas with previously recorded fossil localities. Pleistocene alluvium exposed at the surface or otherwise has moderate to high potential to produce significant paleontological resources, depending upon proximity in relation to known paleontological localities of the same age. These deposits are described in detail below.

Younger alluvium (Qa) includes surficial deposits that are Holocene in age (11,000 years old or less) and may overlie older units (USGS 2007). They occur as fan or fluvial deposits in all canyons and drainages as well in the lowest lying inland areas. These may also be described in literature and on maps as ‘axial channel deposits,’ ‘alluvial fan’ or ‘alluvial wash’ deposits. Composed of poorly consolidated alluvial gravel, sand, silts, and clay, they comprise valleys and floodplains and may be of variable color, though they are often tan to brown. In general, these deposits were laid down by the ephemeral streams that seasonally occupy drainages. Younger alluvium is typically assigned low paleontological potential; however, it may shallowly cover units of higher paleontological importance (Jahns 1954; McLeod 2014a). Quaternary alluvial-type units are found throughout the Project area.

Fossils are generally unknown from the younger alluvial deposits, although a few exceptions are mentioned in the records search results (McLeod 2014a). It should be noted that “this unit typically does not contain significant vertebrate fossils, at least in the uppermost layers, but it overlies older rocks that may contain significant vertebrate fossils at varying depths” (McLeod 2014a). Because of the young age and/or disturbed nature of these deposits, they have low potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Quaternary older alluvial deposits (Qos, Qae, Qof, Qop, Qoa, Qol, Qog) were formed during the Pleistocene (~2.68 million years [Ma] to 11,000 years old), and typically consist of river and stream derived sediments (USGS 2007). The sediments are composed of unsorted clay to pebble-sized clasts that may be oxidized to a reddish brown color and may contain reworked clasts of formations shed from adjacent hills, including igneous and metamorphic rocks. Taxonomically diverse and locally abundant Pleistocene animals and plants have been collected from older alluvial deposits throughout southern California and include mammoth, mastodon, camel, horse, bison, giant ground sloth, peccary, cheetah, lion, saber-toothed cat, capybara, dire wolf, and numerous taxa of smaller mammals (Jahns 1954; Cooper and Eisentraut 2002). Numerous Pleistocene fossil trackways have been documented in northern San Diego County. Older alluvial sediments are found throughout the Project area. These deposits may contain fossils of Pleistocene age. Older alluvium has moderate to unknown potential for

producing significant paleontological resources based on SVP (2010) procedural guidelines. The potential is elevated to moderate/high in areas of close proximity to known paleontological resource localities.

Landslide deposits (Qls) are formed by gravity-induced movement of sediment in areas with moderate to high terrain relief. They are formed from Quaternary or older sediments on unstable slopes and on older landslide deposits, and are generally unstratified. Lithologies of landslide deposits vary and are dependent upon the type of source rock. In general, landslides (and debris flows) are much less likely to contain well-preserved fossils than intact native sediments. Landslide sediments are often subjected to increased groundwater percolation, which tends to have a negative effect on the preservation of fossils; and gravitationally-induced movements of sediment can also destroy fossil remains through abrasion and breakage. Additionally, when the original stratigraphic position of the sediments is disturbed, varying degrees of information are lost in relation to the severity of changes to the slide mass. While paleontological resources may be found in these sediments, they have lost their native geologic context and, as such, are generally not considered scientifically significant (Jahns 1954; Cooper and Eisentraut 2002). These units are found throughout the Project area. Quaternary Landslide deposits have low potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Quaternary Shallow Marine Sediments (Qom, Qsp, Qtp, Ql, Qi, Qfu)

Resource Potential – High

These are nearshore marine deposits that range in age from Holocene (recent) to late Pleistocene (less than 125,000 years old) (USGS 2007). They commonly overlie wave-cut bedrock surfaces above the present sea level (Campbell et al. 2014). Older, Pleistocene-age deposits within these marine sequences have the potential to yield fossils. These include the late Pleistocene (Qom) deposits that have been known to preserve mollusks (Addicott 1964). Both terrestrial mammal remains that have been washed in and preserved within these deposits and marine mammals have been documented from age-equivalent deposits, including a mammoth and whale skeletons recovered from project sites located in southern California (Rugh 2009; Deméré 2013). These deposits have high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Saugus Formation (QTs, Tsr, Ts)

Resource Potential – High

The Saugus Formation is a nonmarine to shallow marine rock unit of Pleistocene age (approximately 2.5 Ma to 0.7 Ma; USGS 2007). It overlies the latest Miocene to Pliocene age Pico Formation (approximately 4 to 2 Ma; USGS 2007). The Saugus Formation is overlain by alluvial deposits in the Simi Valley region, where it reaches a thickness of 2,130 feet (Uhen 2014). It has been informally subdivided into an upper fluvial and deltaic facies and a lower shallow-marine facies (Squires 1997). The lower marine sandstone beds are known to have produced fossil marine mollusks, echinoderms, chondrichthyans (cartilaginous fish such as sharks and rays), aves (birds), mysticetes (baleen-bearing

whales), and odontocetes (toothed whales). The upper, terrestrial sandstone and conglomerate beds have yielded the fossilized remains of Pleistocene megafauna including tapir, horse, deer, and mastodon from the northwestern portion of the San Fernando Valley (Squires 1997; Hazzard 1940). The Saugus Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Hungry Valley Formation (Thvs)

Resource Potential – High

The terrestrial Pliocene age (approximately 5 Ma) Hungry Valley Formation, named by Crowell (1950), is an approximately 4,000-foot-thick sequence of gray to brown shale and coarse-grained sandstone (Miller and Downs 1974; Uhen 2014; USGS 2007). As part of the Ridge Basin Group, the Hungry Valley Formation (sandstone and conglomerate), the Peace Valley Formation (mudstone), the Ridge Route Formation (sandstone), and the Violin Breccia Formation (conglomerates) are located within the pull-apart basin between the San Andreas Fault to the northeast and the San Gabriel fault to the southwest (Dyer 2004; Crowell 2003b). There is a gradational contact between the Hungry Valley Formation and the underlying Peace Valley and Ridge Route formations (Crowell 2003a). The Hungry Valley Formation (sometimes not distinguished from the Peace Valley and Ridge Route Formation in the Project area) has been known to produce fossil mammals of Blancan North American Land Mammal “Age.” (NALMA) (Bass 1951; Miller and Downs 1974; McLeod 2014a).

Vertebrate fossils were initially reported in the Hungry Valley Formation by Chester Stock, former curator at the Natural History Museum of Los Angeles County, and were later described by Crowell (1950) (e.g., horse, tapir, rhinos, camel, and antelope). Additional vertebrate taxa were detailed in an unpublished Master’s thesis by Bass (1952) which included fish, turtle, rodent, and proboscidean fossilized remains. The Kinsey Ranch local fauna of Hemphillian age featured in the Miller and Downs (1974) publication was collected from the upper Peace Valley beds and the lower Hungry Valley Formation in northwestern Los Angeles County. This local fauna included the fossilized remains of reptiles, carnivores, proboscideans, horses, tapirs, rhinos, camels, and a new species of antilocaprid (Miller and Downs 1974). The Hungry Valley Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Peace Valley Formation (Tpv)

Resource Potential – High

The Miocene age Peace Valley Formation has five members, as named by Link (1982), listed here from oldest to youngest: Marple Canyon sandstone, Paradise Ranch shale, Osito Canyon shale, Cereza Peak shale, Posey Canyon shale, and Alamos Canyon siltstone (Crowell 2003a). The formation occurs in the southwestern portion of the fault-bounded Ridge Basin in northwestern Los Angeles County (Crowell 2003a). The Peace Valley beds are similar to and possibly correlative with those of the Anaverde Formation (Dibblee 1967). The Peace Valley Formation is composed of lacustrine shale and siltstone

lithologies representing depositional environments ranging from deep to shallow freshwater and deep brackish water (Smith 1982).

This unit is known to produce trace fossils, well-preserved fossil leaves, and mollusks, as well as vertebrate specimens, including the following taxa: cat, horse, camel, proboscidean, antelope, and turtle (Smith 1982; Miller and Downs 1974; Uhen 2014). The molluscan assemblage present within the upper Peace Valley Formation was determined to be 9 Ma (Crowell 2003a). The Peace Valley and the Ridge Route are age-equivalent and intertongue (Crowell 2003a). The Peace Valley Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Ridge Route Formation (Trr)

Resource Potential – Moderate/Unknown

The Miocene age Ridge Route Formation was named by Clements (1937) and is exposed in the northeastern portion of the Ridge Basin (Crowell 2003a). It has five members, listed here from oldest to youngest: Marple Canyon sandstone, Fisher Spring sandstone, Frenchmans Flat sandstone, Piru Gorge sandstone, and Apple Canyon sandstone (Crowell 2003a). The Ridge Route Formation consists of sandstone and conglomerate deposited by alluvial fans (Crowell 2003a). The beds within the Ridge Route and correlative Peace Valley formations dip more steeply than those of the overlying Hungry Valley Formation; however, in the vicinity of the San Andreas Fault, all of these beds are highly deformed and truncated (Link 1982). Fossils recovered from the Ridge Route Formation include mollusks, ostracods, plants, and trace fossils (Link et al. 1978; Uhen 2014). As this formation is age-equivalent to the Peace Valley Formation (described above) and could be difficult to distinguish from it in the field, the potential for adversely impacting paleontological resources is high. The Ridge Route Formation has moderate to unknown potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Anaverde Formation (Tas)

Resource Potential – High

The Late Miocene to early Pliocene age (approximately 9 to 5 Ma) Anaverde Formation consists of fluvial and lacustrine sedimentary deposits that occur north of the San Andreas Fault (Dibblee and Ehrenspeck 2001a; USGS 2007). Two informal members are recognized. They are the upper conglomeratic member and the lower calcareous sandstone member (Axelrod 1950; Dibblee and Ehrenspeck 2001a; and Noble 1953).

Paleontological resources recovered from the Anaverde Formation include well-preserved plant remains which are important paleoenvironmental indicators (Axelrod 1950; Wallace 1949). Fossils from University of California, Berkeley locality UCMP P4139 were featured in a publication by Axelrod (1950) which details the late Miocene flora of the Antelope Valley. Fossil plant impressions in the assemblage represent live oak woodland, chaparral, coastal sage, grassland, desert border, and arid sub-tropical communities (Axelrod 1950; SWCA 2008). The plant fossils occur in siltstone beds within the upper

portion of the formation (Wallace 1949). Two additional localities from the Antelope Valley have also yielded extensive plant and terrestrial vertebrate (e.g., horse, bird, carnivore, rabbit, rodent, and mastodon) fossils (McLeod 2008; Erwin 2008; City of Palmdale 1993; Axelrod 1950; Uhen 2014; Wallace 1949).

Although few resources for this formation have been published and it has a limited local extent, it has been assigned a high potential based on documented Los Angeles County Museum (LACM) localities in the Antelope Valley of Los Angeles County (SWCA 2008). Other unpublished paleontological mitigation reports for projects in the Los Angeles County area list the Anaverde Formation as having high potential to yield paleontological resources (SWCA 2008). Based on the above information, the Anaverde Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Fernando Formation (Tfsc, Tfp, Tfs, Tf, Tfr)

Resource Potential – High

The Pliocene to Pleistocene (3 to 1.8 Ma) is present in the eastern Puente Hills and much of the northeastern Los Angeles basin (USGS 2007). The formation has been divided into two members which are separated by an erosional unconformity. The lower member generally consists of a light grayish-brown to olive-brown siltstone and is massive to poorly bedded and micaceous. Several thin, lenticular pebble conglomerate beds are interbedded with the fine-grained strata and form prominent outcrops. The presence of this coarse-grained sediment within generally fine-grained strata suggests that the coarse basin margin sediments were transported to the deeper basin center by turbidity currents. While microfossils (foraminifers) are abundant, megafossils are comparatively rare in this member and consist primarily of gastropods, pelecypods, and brachiopods (Durham and Yerkes 1964).

The upper member is composed of light gray sandstone, pebbly sandstone, and interbedded sandy conglomerate consisting of sub-rounded to well-rounded pebbles of igneous and metamorphic rocks. The well-cemented matrix of the conglomerate is composed of white to yellowish brown coarse sandstone. The sandstone lithologies are poorly consolidated, fine- to coarse-grained, rarely well bedded, and sometimes graded; and they weather to yellowish-brown or reddish-brown. Numerous fossil localities have been documented within this member and consist of mollusks such as gastropods, bivalves, and scaphopods (Durham and Yerkes 1964).

Vertebrate fossils recovered from the Fernando Formation during construction of the Puente Hills Landfill include fossil fish (e.g., great white, *Carcharodon carcharias*; herring, *Ganolytes* sp.; hake, *Merluccius* sp.; lanternfish, *Diaphus* sp.; lanternfish, *Lampanyctus* sp.; swordfish, *Coelorhynchus scaphopsis*; mackerel, Scombridae; flounder, Pleuronectidae) and whale specimens (LACM localities 6350-6361; McLeod 2009; Gust and Scott 2009). Additional marine specimens of pinnipeds and dolphins, as well as mollusks and brachiopods have also been published from the Fernando Formation (Kellogg 1925; Koch et al. 2004; Uhen 2014). Terrestrial vertebrates include: ground sloth, *Paramylodon*; mastodon, *Mammuthus*; mammoth, *Mammuthus*; horses, *Plesippus* and *Equus*; camel, *Camelops*; the

pronghorn antelope, *Antilocapra americana*; and turkey, *Meleagris californica* (Koch et al. 2004; McLeod 2005). The Fernando Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Pico Formation (Tp, Tps)

Resource Potential – High

This marine latest Miocene to Pliocene (approximately 4 to 2 Ma) rock unit is informally subdivided into an upper and lower member (USGS 2007). The upper member is characterized by silty claystone, while the lower member is comprised of claystone, sandstone, and conglomerate (Cartwright, Jr. 1928). The Pico Formation, where it occurs in the vicinity of the Santa Susana Mountains near the Ventura and Los Angeles County line, is approximately 5,550 meters thick (Squires et al. 2006). Marine mollusk fossils are commonly preserved within the finer-grained units of the formation. Typical fossils include marine microfossils (e.g., *foraminifera*), invertebrates (e.g., pelecypods, gastropods, echinoderms, and the brachiopod *Terabratalia smithi*), and terrestrial and marine vertebrates (e.g., fish, seal, whale, and camel) (Kew 1930; Stewart and Stewart 1930; Blake 1973; Uhen 2014). Although vertebrate specimens are not well known, any vertebrate discoveries within the Pico Formation would be scientifically significant (McLeod, personal communication, September 8, 2014). Fossil assemblages described from the Valencia area have yielded a diverse molluscan fauna (Squires et al. 2006; Winterer and Durham 1962). The Pico Formation unit has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Towsley Formation (Ttog, Ttos, Ttoc)

Resource Potential – High

The late Miocene and Pliocene age (approximately 4 to 2 Ma) Towsley Formation includes siltstone, sandstone, and conglomerate (CGS 2009; Yerkes and Campbell 2005; USGS 2007). It represents a deep-water marine turbidite sequence and has been known to yield scientifically significant invertebrate and vertebrate fossils (Minch 1999; Uhen 2014). As with the Pico Formation described above, although vertebrate specimens are not well documented from the Towsley Formation, any additional vertebrate fossil discoveries from this formation would be of great scientific importance (McLeod, personal communication, September 8, 2014). The Towsley Formation unit has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Sycamore Canyon Formation (Tsc, Tscs, Tscg)

Resource Potential – High

This marine late Miocene rock unit, also known as the Sycamore Canyon Member of the Puente Formation, occurs in the elevated terrain of the Puente Hills near Whittier and Hacienda Heights (McLeod 2014a; Uhen 2014; USGS 2007). The Sycamore Canyon Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines. See below

for a description of the Sycamore Canyon Member of the Puente Formation and its paleontological resources.

Puente Formation (see Monterey Formation Tmlv, Tmps, Tmpy, Tmsc)

Resource Potential – High

Miocene and early Pliocene (approximately 13.5 to 3 Ma) marine rocks of the Puente Formation from oldest to youngest are as follows: La Vida Member (Tplv; Tmlv of Dibblee), Soquel Member (Tps; Tmps of Dibblee), Yorba Member (Tpy; Tmpy of Dibblee), and Sycamore Canyon Member (Tpsc; Tmsc of Dibblee; Dibblee and Ehrenspeck 2001b). The Puente is thought to be locally time-equivalent to the Monterey Formation (Cooper 1981; Critelli et al. 1995). Individual members of the Puente Formation are mapped by Dibblee within the County of Los Angeles as the Monterey Formation. The La Vida Member, the basal unit of the Puente Formation, is late Miocene in age (approximately 13.5 to 10 Ma) and consists of light gray to black, friable, massive to well-bedded siltstone (USGS 2007). This unit is up to 3,800 feet thick in the central portion of its range and is interpreted to be marine basin slope to outer submarine fan facies. This is part of the basal turbidite ‘megasequence’ that also contains the lower Mohnian-aged foraminifera (single-celled amoeboid protist) commonly found in the La Vida Member (Cooper 1981; Critelli et al. 1995; Uhen 2014).

Overlying the La Vida Member is the Soquel Member, the second member in the basal ‘megasequence’ of turbidite beds. This unit is late Miocene in age (approximately 13.5 to 7.5 Ma) and is generally composed of gray to yellowish-gray sandstone and siltstone (USGS 2007). Variable in texture and bedding size, poorly sorted sandstone beds are interbedded with matrix-supported pebble conglomerate beds. Thin interbeds of siltstone, ranging from yellow to gray, occur throughout this sequence. The Soquel Member is up to 3,100 feet thick at the center of its range, although it is thinner at its outer limits; and it is interpreted to represent a marine turbidite sequence of a middle to inner submarine fan facies. Fossils are scarce in this member; but foraminifera, fragments of fossilized wood, mollusks, bony fish, and shark teeth have been reported (Cooper 1981; Critelli et al. 1995; Durham and Yerkes 1964; Uhen 2014).

The Yorba Member is late Miocene in age (approximately 10 to 7.5 Ma), and generally consists of white to gray siltstone and sandstone with some gray-white to brick-red diatomaceous mudstone (USGS 2007). This unit is up to 3,000 feet thick at its center and is thought to consist of basin slope and basin plain facies. Fossils include benthic and pelagic foraminifera that indicate ocean depths of greater than 2,000 feet and numerous fish taxa (Cooper 1981; Cooper and Eisentraut 2002; Uhen 2014).

The youngest unit, the Sycamore Canyon Member, is late Miocene to Pliocene in age (approximately 7.5 to 2.9 Ma), and consists of several mappable subdivisions (USGS 2007). This member consists of light gray, massive to well-bedded silty gray shale, medium- to coarse-grained, white to rusty-brown sandstone, brownish-gray massive conglomerate, and light gray bedded pebble and cobble arkosic conglomerate. This member is up to 3,600 feet thick and is chiefly interpreted to represent basin slope to middle/inner submarine fan facies. Fossils from this portion of the formation include marine

invertebrates, marine and terrestrial vertebrates, and terrestrial plant remains (Cooper 1981; Cooper and Eisentraut 2002; Uhen 2014). At the Vellano Golf Course development located in the City of Chino Hills, a new species of kentriodontid dolphin was recovered during mass grading (Barnes et al. 2005). A replica of the relatively complete skeleton is now on display at the City of Chino Hills. Also preserved with the skeleton were stomach contents of its last meal, the extinct croaker fish *Lompoquia*. Over 1,000 fossil fish specimens were also recovered from the Vellano project site (Barnes et al. 2005). The entire Puente Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Sisquoc Shale/Modelo Formation (Tsq, Tsqs, Tud, Tuss, Tush)

Resource Potential – High

The Sisquoc Shale (also known as Sisquoc Formation or Modelo Formation) is a late Miocene and Pliocene age (approximately 6 to 4 Ma) marine sedimentary rock unit (Barron and Baldauf 1986; USGS 2007). This marine rock unit occurs in the elevated terrain of the Santa Susana Mountains region and is sometimes referred to as the Modelo Formation.

The Modelo Formation is the equivalent marine sedimentary rock unit exposed to the south (USGS 2007). It is approximately 1,970 feet thick and overlies the Calabasas Formation in the Simi Valley region. The lowest portion of the Modelo Formation is described as a silty sandstone indicative of a shallow marine environment. Benthic foraminiferal tests are preserved in this portion of the formation. The remaining upper portion of the Modelo Formation consists of diatomite derived from the siliceous tests of floating algae (diatoms) and is characteristic of a deeper water regime. Marine vertebrate (e.g., shark, bony fish, marine mammal, and terrestrial mammal) specimens have been recovered north of the Lompoc Hills and San Clemente Island from within the Sisquoc Shale. For example, desmostylian (*Paleoparadoxia*) fossils were recovered from localities LACM 1164 and 1676 from exposures of Sisquoc Shale on San Clemente Island (McLeod 2014a; Uhen 2014). Although whale specimens have also been recovered from the Modelo Formation, they have not been published (McLeod, personal communication, September 8, 2014). The Sisquoc Shale/Modelo Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Monterey Formation (Tmg, Tmv, Tma, Tmat, Tmy, Tm, Tmsh, Tmss, Tms, Tmsc, Tmc, Tml, Tmlv)

Resource Potential – High

The Monterey Formation is a well-studied rock unit that was deposited in a deep-marine environment and consists chiefly of mudstone, shale, diatomite, biogenic siltstone, and chert (Garrison and Douglas 1981). It ranges from 300 to 1,500 feet thick. The Monterey Formation is said to represent a condition rather than a laterally contiguous deposit – the condition being the opening of rift basins along the continental margin of coastal California during the Miocene (approximately 10 to 15 Ma) as the San Andreas Fault was forming and lengthening (Fritsche and Behl 2008; USGS 2007). The Monterey formation has been subdivided into three members by Woodring et al. (1946). From oldest to youngest,

these are: the Altamira Shale (15.5 to 13 Ma), the Valmonte Diatomite (13 to 6.9 Ma), and the Malaga Mudstone (6.9 to 3.5 Ma) (Brown et al. 2006; USGS 2007). The Monterey Formation has produced a wide variety of exquisitely preserved fossils of plants, invertebrates, and vertebrates, most which are of marine origin (Cooper and Eisentraut 2002). These include whales, dolphins, desmostylians, sea cows, sharks, bony fishes, marine and terrestrial plants, and diverse assemblages of marine invertebrates (Uhen 2014). A comprehensive list of taxa recovered from the Monterey Formation in the eastern Santa Monica Mountains is included in the records search results letter. Numerous publications are relevant to any consideration of the geology and paleontology of the Monterey Formation (Garrison and Douglas 1981; Schoellhamer et al. 1981; Raschke 1984a, 1984b; Raschke et al. 1988). The Monterey Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Castaic Formation (Tc)

Resource Potential – High

The Castaic Formation is a late Miocene age (approximately 11 to 25 Ma), marine sedimentary rock unit consisting of 7,000 feet of interbedded mudstone, siltstone, sandstone, and conglomerate that formed in a shallow-marine embayment northeast of the San Gabriel Fault at the eastern end of the Ventura Basin (Crowell 1954; Stanton 1982, 1966; Woodburne 1975; USGS 2007; Appendices B and C). The Castaic Formation, where it is mapped near Castaic Lake, consists of thickly bedded gray-tan-brown, fine-grained to coarse-grained sandstones. In this area, the Castaic Formation unconformably overlies strata of the Mint Canyon Formation and is overlain by strata of the Saugus Formation (Stanton 1982). According to Stanton (1966): “the sediments of the Castaic Formation were deposited at the margin of the transgressing late Miocene sea” and extend from central to southern California.

A diverse assemblage of fossil marine invertebrates, dominated by gastropods and bivalves, has been collected from the Castaic Formation (Govean 1993). Invertebrate fossils include foraminifers, sponges, bryozoans, barnacles, crustaceans, brachiopods, mollusks, and echinoids. Fossil marine vertebrates are rare but include sharks, rays, bony fish, and marine mammals (Stanton 1982; Uhen 2014). Additional fossils found in the Castaic Formation include fossil wood and leaves (Govean 1993). Other documented LACM localities have produced pinniped, sea turtle, and baleen whale specimens (McLeod 2013). North of Santa Clarita, a specimen of fossil tapir was discovered in a marine shell bed (McLeod 2013). Also in the nearby area, the Castaic Formation produced an exceptional carapace of leatherback turtle and a sea cow specimen (McLeod 2013). The Castaic Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Miocene Volcanics (Mva)

Resource Potential – None

These middle to late Miocene (approximately 11 to 5 Ma) extrusive volcanic rocks are non-sedimentary rock units that occur on Catalina Island, and have little potential to contain recognizable fossil remains

(Jennings 1962; USGS 2007). The composition of these rocks is andesitic (Jennings 1962). Extrusive igneous rocks such as volcanics have no potential for significant paleontological resources based on SVP (2010) procedural guidelines.

Igneous Rocks (db)

Resource Potential – None

These are middle Miocene (approximately 16 to 12 Ma) mafic intrusive igneous (diabase) rocks that formed deep within the Earth's surface at high temperature and high pressure and were then uplifted and exhumed by erosion (USGS 2007; Dibblee 1993). Intrusive igneous rocks have no potential for significant paleontological resources based on SVP (2010) procedural guidelines.

Glendora Volcanics (Tgva, Tgvf)

Resource Potential – None

These extrusive igneous rocks flows are Miocene in age (approximately 15-16 Ma) nonsedimentary rock units and have little potential to preserve recognizable fossil remains (Nourse 2002; Shelton 1955; Nourse et al. 1998; USGS 2007). They include massive rhyolitic to basaltic lavas with pyroclastic and volcanoclastic deposits (Shelton 1955). Extrusive igneous rocks such as volcanics have no potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Trancas Formation (Ttrc, Ttrs)

Resource Potential – Moderate/Unknown

The early Miocene Trancas Formation includes claystone, shale, sandstone, and breccia. The Trancas Formation is found only west of Point Dume on the coast south of Malibu (Yerkes and Campbell 1979; McCulloh and Beyer 2004). As it occurs, the Trancas Formation is approximately 950 feet thick and “bears some resemblance to parts of the Vaqueros and lower Topanga Canyon Formations exposed...near Point Mugu” (McCulloh and Beyer 2004; Dibblee and Ehrenspeck 1990; Yerkes and Campbell 1979). Saucian to Luisian Stage (approximately 22 to 13.5 Ma) microfossils (e.g., foraminifera) have been recovered from siltstone beds within this formation (Dibblee 1982; Koch et al. 2004; Uhen 2014; USGS 2007). Coastal sandstone deposits located southwest of Point Dume have yielded marine mollusks, including the gastropod *Turritella ocoyana* (Yerkes and Campbell 1979; McCulloh and Beyer 2003; Koch et al. 2004). The Trancas Formation has moderate to unknown potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Detrital Sediment of Lindero Canyon (Tlvc, Tlsc)

Resource Potential – Low

These sedimentary deposits are middle Miocene age (approximately 16 to 12 Ma) and correlative with a portion of the Topanga Formation (Weber 1984; USGS 2007). The conglomeratic facies (Tlsc) is described by Dibblee (1993) as “granitic detritus: light gray, composed of rounded pebbles, cobbles, and

small boulders of granitic and lesser metavolcanic rocks in incoherent sandstone matrix, and is massive to poorly bedded.” The lower, or basal conglomerate (Tlvc) consists of “detritus derived from the Conejo Volcanics.” (Dibblee 1993). According to Dibblee and Ehrenspeck (1993b) few fossils are documented from these deposits except for some shallow marine molluscan fossils. The Detrital Sediments of Lindero Canyon have low potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Topanga Formation (Ttui, Ttusi, Ttuc, Ttus, Ttusc, Ttush, Ttub, Ttucg, Ttbs, Ttsi, Ttsl, Ttc, Ttcg, Tts, Ttlc, Ttls, Ttlcv, Ttlsc, Ttlgvc)

Resource Potential – High

The Topanga Formation is a moderate to deep water marine deposit, consisting mainly of siltstone and sandstone. It has been divided into three distinct members: the lower Bommer (Ttlc, Ttls, Ttlcv, Ttlsc, Ttlgvc), the middle Los Trancos (Ttbs, Ttsi, Ttsl, Ttc, Ttcg, Tts), and the upper Paularino (Ttui, Ttusi, Ttuc, Ttus, Ttusc, Ttush, Ttub, Ttucg). The Bommer (Ttb) member is a thick sandstone unit, containing locally extensive crossbedding and preserving some marine invertebrate fossils and trace fossils. It is olive-gray to yellowish-brown and is generally thick-bedded, although thinner beds may be locally present. The sandstone beds tend to be moderately well indurated, although localized finer-grained beds may be softer (Miller and Tan 1976). The Los Trancos member is finer-grained, with interbedded sandstone and siltstone and mudstone beds that are generally gray to tan-brown, and with some trace fossils and abundant fossil plant remains. The siltstone and mudstone lithologies are not well indurated, but localized beds of sandstone may be more resistant (Miller and Tan 1976). The Paularino Member is a finer-grained deposit than either the Los Trancos or Bommer members and consist of siltstone and shale beds of varying colors with some finer sandstone. Tuffaceous beds are locally present, and some volcanoclastic sediments also occur locally and include andesite flows and andesite flow breccias in particular. The Paularino Member is generally well indurated, and the breccias and flows are well indurated (Miller and Tan 1976).

This formation has produced numerous significant fossil resources, including invertebrates and plants, as well as shark teeth, whales, sea cows, Desmostylus, sea lions, and others (Cooper and Eisentraut 2002; Uhen 2014). The basal conglomerate is described as being a distinct fossiliferous indicator bed in some areas (Fritsche and Behl 2008). The Topanga Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Conejo volcanics (aci, ai, Tcva, Tcvab, Tcvb, Tcvbp, Tcvbz)

Resource Potential – None

The Conejo volcanics are middle Miocene (approximately 14 Ma) in age and are “composed of extrusive igneous basaltic rocks exposed in the elevated terrain of the Santa Monica Mountains region” (McLeod 2014a; USGS 2007). This nonsedimentary rock unit has little potential to preserve recognizable fossil

remains. Extrusive igneous rocks such as volcanics have no potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Volcanics (Tva)

Resource Potential –None

These volcanic rocks are middle Miocene (approximately 16 to 12 Ma) in age and are similar to the Conejo Volcanics in the Encino Reservoir area (Dibblee and Ehrenspeck 1992b; USGS 2007). This nonsedimentary rock unit has little potential to preserve recognizable fossil remains. Extrusive igneous rocks such as volcanics have no potential for producing scientifically significant paleontological resources based on SVP (2010) procedural guidelines.

Intrusive rocks (bi)

Resource Potential – None

These middle Miocene (approximately 16 to 12 Ma) intrusive igneous rocks were formed deep within the Earth’s surface at high temperature and high pressure and were then uplifted and exhumed by erosion (USGS 2007). They consist of basalt-andesite dikes that have intruded into the Santa Monica Slate in this region (Dibblee and Ehrenspeck 1992b). Intrusive igneous rocks have no potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Basalt flows (Tb)

Resource Potential – None

This nonsedimentary rock unit has little potential to preserve recognizable fossil remains. Extrusive igneous rocks such as basalt flows have no potential for producing scientifically significant paleontological resources based on SVP (2010) procedural guidelines.

Simmler Formation (Tsi)

Resource Potential – Moderate/Unknown

The Simmler Formation is Oligocene to early Miocene in age. In the type area within the Caliente Range, it is characterized by a sandstone facies representing alluvial plain deposition. A conglomeratic facies represents alluvial fan deposition. The Simmler Formation is conformably overlain by the younger, middle Miocene-age Vaqueros Formation (Bartow 1974). The Caliente Formation (this report, Hill et al. 1958; Vedder 1968) is lithologically similar to the Simmler Formation. Few fossils have been recovered from this formation; but those include trace fossils, ostracods, plant remains, and very rare bone fragments (Bartow 1978; James 1963; Hill et al. 1958; Uhen 2014). The Simmler Formation has moderate/unknown potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Sespe Formation (Tsp, Tspc)*Resource Potential – High*

The middle Eocene and early Miocene age Sespe Formation (approximately 45 to 17 Ma) in northwestern Los Angeles County is a thick deposit (approximately 4,000 feet) of generally reddish sandstone, conglomerate, and siltstone, although parts of it are also described as gray sandstone and siltstone (Kew 1924; USGS 2007). It is non-marine, but it interfingers with the marine Vaqueros Formation (Belyea 1984; Belyea and Minch 1989; Lander 2002; Minch et al. 1989; Whistler and Lander 2003; and Calvano et al. 2003, 2008; USGS 2007). A large unconformity, or gap in stratigraphic continuity, exists within this formation, and represents a loss of approximately 7 Ma between the late Eocene and early Oligocene (Calvano et al. 2008). Moderately well-bedded, the sandstone often contains crossbedding and the siltstone and claystone are generally massive. This formation is generally poorly indurated, poorly sorted, and the sandstones are arkosic (Miller and Tan 1976). This formation reflects a major global drop in sea level and underlies or is mapped as undifferentiated from the Vaqueros Formation.

The land mammal assemblages are representative of the Uintan (late middle Eocene) and Arikarean to Hemingfordian (late Oligocene to early Miocene) NALMA (Calvano et al. 2008). Scientifically significant marine mammals (e.g., desmostylians, primitive whales, and the oldest sea cows) are well documented within the Sespe Formation (Calvano et al. 2008). As a result of construction development projects to the south in Orange County, the Sespe Formation has produced relatively diverse assemblages of land mammals including hedgehogs, canids, rabbits, rodents, horses, oreodonts, camels, and chevrotains (Calvano et al. 2008; Cooper and Eisentraut 2000; Fritsche and Behl 2008; Raschke 1984a; Uhen 2014). The Sespe Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Vasquez Formation (Tvb, Tvcd, Tvcg, Tvcs)*Resource Potential – Low*

The Vasquez Formation (late Oligocene to early Miocene; approximately 25 Ma) was formed by the deposition of prehistoric alluvial fans on mountain ranges that have now since eroded away (Harden 2004; USGS 2007). In Escondido Canyon, the Vasquez Formation has a composite thickness of approximately 8,800 feet (Noble 1953). Conglomerate, breccia, and basaltic flows are present in the lower portion of the section (CSULB 2014). Other published and unpublished paleontological reports on the Los Angeles County area list the Vasquez Formation as not being known to yield paleontological resources (Hendrix and Ingersoll 1987; SWCA 2008; Uhen 2014). The Vasquez Formation has low potential for producing paleontological resources based on SVP (2010) procedural guidelines.

Llajas Formation (Tll, Tlls, Tllg)*Resource Potential – High*

The marine Llajas Formation (early Eocene in age, approximately 54 to 50 Ma) lies stratigraphically below Neogene age sedimentary deposits (e.g., Topanga Formation, Monterey Formation, and Sisquoc Shale/Modelo Formation) that occur within the Project area (USGS 2007). The Llajas Formation contains gray, micaceous claystone and siltstone, some sandstone beds, and a cobble conglomerate composed of granitic, metavolcanic, and quartz clasts (Koch et al. 2004). The total thickness of the stratigraphic section first described by Cushman and McMasters (1936) is 1,720 feet. As mapped and described by Dibblee and Ehrenspeck (1992), the Llajas Formation is a “gray micaceous claystone-siltstone” with “some interbeds of light gray to tan soft sandstone.”

The Llajas Formation has yielded middle Eocene age fossils in the Santa Susana Mountains region (McLeod 2014b; Uhen 2014). One locality, LACM 7310, produced a specimen of bonito shark, *Isurus praecursor*, on the western side of Devil’s Canyon, as documented by Squires (1984). Another locality, LACM 6952, located on the east side of Las Llajas Canyon and west of locality LACM 7310, produced a specimen of ragged-toothed shark, *Odontaspis* (Squires 1984). Additional specimens from locality LACM 6952 were reported on by Squires in his later publication in 2001 and included a sand shark, *Striatolamia macrota*. Additional exposures of the Llajas Formation at the southern extent of Meier Canyon south of Simi Valley have produced specimens of the eagle ray *Myliobatis* (LACM locality 6953) (McLeod 2014b). The Llajas Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Juncal Formation (Tjsh)*Resource Potential – Moderate/Unknown*

The Juncal Formation is an early Eocene age (approximately 50 Ma) marine sedimentary rock unit (Squires 2008; USGS 2007). Approximately 5,500 feet in thickness, the type section for the Juncal Formation is located northeast of the Santa Ynez River and east of Agua Caliente Creek in Santa Barbara County (Vedder 1972; Page et al. 1951). Lithologies include siltstone, sandstone and conglomerate. The Juncal Formation is known for yielding well-preserved traces of annelid worms and fossils of a diverse collection of marine mollusks (e.g., gastropods and bivalves), crabs, cnidarians (jellyfish and their relatives), and microfossils (e.g., foraminifera) (Squires 1988, 2008; Uhen 2014; Vedder 1972). The Juncal Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Santa Susana Formation (TsuL, Tsu, Tsus, Tsur, Tsug, Tsl)*Resource Potential – Moderate/Unknown*

The Santa Susana Formation is a late Paleocene to early Eocene (approximately 65 to 56 Ma) marine rock unit. The overall thickness of the formation is 1,000 to 1,500 feet thick, composed of siltstone and

pebble conglomerate (Clark 1924; USGS 2007). At the base of the formation is a coarser cobble conglomerate with thin red claystone lenses (Koch et al. 2004). Preserved within the lower Paleocene strata of the Santa Susana Formation are planktonic and benthic foraminifera and mollusks (Heitman 1983; Koch et al. 2004; Yerkes and Campbell 1979; Uhen 2014). Also reported have been calcium carbonate lenses containing the turret snail, *Turritella pachecoensis* (Dibblee 1993; Dibblee and Ehrenspeck 1993b). Although fossil vertebrates are rare within the Santa Susana Formation, not much is known about this transitional Paleocene and Eocene period within California; thus, any vertebrate discoveries would be scientifically significant (McLeod, personal communication, September 8, 2014). The Santa Susana Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Tertiary Intrusive (Ti)

Resource Potential – None

These Tertiary (approximately 65 to 3 Ma) intrusive igneous rocks were formed deep within the Earth's surface at high temperature and high pressure and were then uplifted and exhumed by erosion. These rocks range from mafic (basalt) to felsic (rhyolite) in composition where they occur on Catalina Island, and their distribution within the project area is listed under Non-Sedimentary Rocks in Jennings (1962). These rocks have no potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Dike Rocks (TI)

Resource Potential – None

These possibly pre-Tertiary age (emplacement prior to 65 Ma) intrusive igneous rocks are andesitic and were formed deep within the Earth's surface at high temperature and high pressure and then uplifted and exhumed by erosion (Dibblee and Ehrenspeck 1991b; USGS 2007). Intrusive igneous rocks have no potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Chatsworth Formation (Kcg, Kcr, Kcs, Kss)

Resource Potential – High

The late Cretaceous age (75 to 70 Ma) Chatsworth Formation is approximately 6,000 feet thick in the Simi Valley region where it is unconformably overlain by the Simi Conglomerate (Squires 1997; USGS 2007). It is composed primarily of fluviially derived sandstone originating in the mountains to the south. The sandy sediments were then transported from the shoreline into deeper waters where they accumulated as submarine fan deposits (Squires 1997). Characterized by gray sandstone with mudstone interbeds, this formation weathers to a brown to reddish brown color (Squires 1997). The Chatsworth Formation is known to produce marine mollusks (e.g., bivalves, gastropods, ammonites, and scaphopods) (Squires 1981; Uhen 2014). The ammonites are reported to measure 2 feet in diameter (Squires 1997). Calcareous microfossils and nannofossils are also known to occur within this formation

and are useful paleoecological indicators. Trace fossils are also common (Squires 1981). The Chatsworth Formation has high potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Mixed Igneous (qd, gqd, ml, qm)

Resource Potential – None

These Mesozoic age (251 to 65 Ma) intrusive igneous rocks were formed deep within the Earth’s surface at high temperature and high pressure and were then uplifted and exhumed by erosion (Dibblee 1991, 1998; Dibblee and Ehrenspeck 1989, 1990, 1991a, 1991c, 1993a, 1993b, 1997, 1998; Dibblee and Minch 2002a, 2002b, 2002c, 2002d, 2002e, 2002f, 2002g, 2002h; USGS, 2007). Intrusive igneous rocks such as these units have no potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Franciscan Formation (KJf)

Resource Potential – None

The Franciscan Complex (Mesozoic) is the name for a suite of extremely deformed metasedimentary rocks located within the western portion of the Coast Range Province (Harden 2004). Due to the deformation and low grade metamorphism of this rock unit, it does not preserve scientifically significant fossil remains. The Franciscan Complex has no potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Santa Monica Slate (sms)

Resource Potential – None

This Jurassic-age metamorphic marine rock unit has been deformed by contact metamorphism (Koch et al. 2004). Although marine invertebrates resembling the pelecypod (marine mollusk) *Buchia* are reported by Imlay (1963), the records search results from the Natural History Museum of Los Angeles County determined that “this metamorphosed rock unit will be devoid of any recognizable vertebrate fossil remains” (McLeod 2014a). The Santa Monica Slate has no potential for producing significant paleontological resources based on SVP (2010) procedural guidelines.

Granitic Rocks (gr, grd)

Resource Potential – None

These leucocratic plutonic rocks are late Triassic (approximately 245 Ma) and older and were formed deep within the Earth’s surface at high temperature and high pressure and then uplifted and exhumed by erosion (Dibblee and Ehrenspeck 1998; USGS 2007). They range in composition from granite to granodiorite in composition (Dibblee and Ehrenspeck 1998). Intrusive igneous rocks such as granite have no potential for producing significant paleontological resources based on SVP (2010) procedural guidelines. Descriptions of the geological units listed above and their paleontological content.

3.4.3 Regulatory Setting

Because several of the 54 proposed Project sites are situated on federal lands and administered by different federal agencies, a brief discussion of the federal-level cultural resources and paleontological resources regulatory environment is provided within this EIR section.

3.4.3.1 *Federal Statutes and Regulations*

Cultural Resources

Numerous federal statutes, regulations, Executive Orders, Presidential Memoranda, and other directives outline the responsibilities of federal agencies for the protection of cultural resources and provide procedural guidelines for the management of federally owned or controlled properties, projects that are wholly or partially funded through federal mechanisms, or projects that require federal permits. Among the various federal mandates are the Antiquities Act, the National Historic Preservation Act (NHPA), the National Environmental Policy Act (NEPA), the American Indian Religious Freedom Act (AIRFA), the Archaeological Resources Protection Act (ARPA), and the Native American Graves Protection and Repatriation Act (NAGPRA).

Antiquities Act of 1906

The Antiquities Act of 1906 [16 U.S.C. Part 431-433] authorizes the President to designate historic and natural resources located on federally owned or controlled land as National Monuments. The Act provides protection for prehistoric and historic ruins and objects by providing criminal sanctions against excavation, injury, or destruction of those resources. The Secretaries of the Interior, Agriculture, and Defense can issue permits to recognized educational and scientific institutions for archaeological investigations to professionally gather data of scientific value. Regulations for implementing the Antiquities Act can be found in 43 CFR Part 3. Antiquities Act permits (issued per 43 CFR Part 3) are rarely used today; this responsibility has been largely subsumed under permits issued per ARPA.

National Historic Preservation Act

The National Historic Preservation Act (NHPA) of 1966, as amended (54 U.S.C. Part 300101 et seq. [formerly 16 U.S.C. Part 470 et seq.]), is the cornerstone of federal cultural resources management law. The Act establishes a national historic preservation program that includes elements for identification, evaluation, and protection of cultural resources. The NHPA also encourages the conservation of historic properties – the term used to refer to “any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places (NRHP) including artifacts, records, and material remains related to such a property or resource” – by directing federal agencies to assume responsibility for those cultural resources under federal jurisdiction judged to be significant.

The NHPA also authorizes the Secretary of the Interior (Secretary) to expand and maintain the NRHP, which is composed of historic properties – consisting of buildings, districts, sites, structures, and objects – determined significant in American history, architecture, archaeology, engineering, and culture. The

act directs the Secretary to set forth procedures for nominating historic properties to the NRHP by establishing criteria to determine those cultural resources that are eligible for inclusion. The term eligible for inclusion in the NRHP encompasses those properties formally determined as eligible and all other properties that meet the NRHP criteria as defined by 36 CFR Part 60.4. Properties that have not been formally evaluated under these criteria are treated as eligible until a final determination can be made. The Department of the Interior has issued guidelines [36 CFR Part 60] that describe identification and evaluation procedures for federal agencies to request determinations of eligibility [36 CFR Part 63].

The NHPA authorized the establishment of the Advisory Council on Historic Preservation (Council) as well, which acts as an independent federal agency to advise the President, Congress, and other federal agencies on historic preservation matters; to review the policies and programs of federal agencies; and to inform and educate federal agencies on matters relating to historic preservation. The NHPA also established the function of the State Historic Preservation Officer (SHPO) with duties including statewide inventory of historic properties, nominating properties to the NRHP, maintaining a statewide preservation plan, and reviewing undertakings for impacts on historic properties. In addition, the 1992 amendments to the NHPA established the potential for federally recognized American Indian tribes to designate a Tribal Historic Preservation Officer (THPO) who acts in the same capacity as the SHPO but has jurisdiction over tribal lands.

Section 106 of the NHPA [54 U.S.C. Part 306108, formerly 16 U.S.C. Part 470f] ensures that cultural resources are properly considered in the planning stage of any federal agency activity. Federal agencies are required to consider the effects of their undertakings on any properties eligible for inclusion in, or listed in, the NRHP during the planning stage and to provide the Council an opportunity to comment. This process is detailed in implementing regulation 36 CFR Part 800 (Protection of Historic Properties). Section 106 does not require that an undertaking be stopped, but reasonable efforts must be made to resolve adverse effects to eligible properties.

The reissued 36 CFR Part 800 regulation (effective January 11, 2001, and amended August 5, 2004) requires increased involvement with consulting parties. These consulting parties include the SHPO; the THPO when applicable; American Indian tribes; local governments; applicants for federal permits or licenses; and the public, including individuals and organizations which have a demonstrated interest in the outcome of any undertaking [36 CFR Part 800.2(c)]. The SHPO, in particular, has an important role because this agency is the first line of external review on federal actions requiring compliance with Section 106.

Section 110 of the NHPA states that the federal agency must assume responsibility for the preservation of historic properties that are owned or controlled by the agency and that the federal agency should use, to the maximum extent possible, historic structures that are available. Section 110 reinforces the responsibilities of the federal agency to inventory, evaluate, and preserve historic properties. It is the responsibility of the agency to establish a program to locate, inventory, and nominate to the Secretary all cultural resources that appear to qualify for inclusion in the NRHP. Each agency is required to ensure that no NRHP-eligible historic property is inadvertently transferred, sold, demolished, substantially

altered, or allowed to deteriorate significantly. If federal actions will substantially alter or destroy a NRHP-eligible property, sufficient time and effort must be expended to properly record the property. Additional planning and actions necessary to minimize harm to all National Historic Landmark sites must also be undertaken when a project may adversely affect such sites.

Section 111 of the NHPA complements the directives of Section 110 by addressing the responsibilities of a federal agency to implement appropriate adaptive uses, leases, exchanges, or management procedures for federal historic properties. Agencies are encouraged to implement adaptive uses for historic properties that are not needed for current or projected agency purposes. After consultation with the Council/SHPO, agencies may lease or exchange historic properties if the action is compatible with preservation.

Section 112 of the NHPA requires that all research, preservation, and protection activities be conducted by persons meeting professional standards developed by the Secretary of the Interior, including both agency and contractor personnel. Personnel responsible for the management of historic properties are not required to meet the Secretary's standards. All data produced by the research are to be maintained permanently in appropriate databases.

Section 304 of the NHPA authorizes the head of a federal agency to withhold from public disclosure any information about the location, character, or ownership of a NRHP-eligible property if that disclosure might cause invasion of privacy, might cause harm to the resource, or might impede the use of a traditional religious site by practitioners. Only a Freedom of Information Act (FOIA) filing can make such information available. It should be noted, however, that the release of any information requires consultation with the Secretary of the Interior and the Council.

National Environmental Policy Act

The National Environmental Policy Act (NEPA) of 1969 [42 U.S.C. Part 4321 et seq.] establishes a national policy that encourages harmony between humans and the environment. The act states that the Federal Government shall use all practicable means to preserve the productive harmony of the environment while fulfilling the social, economic, and other requirements of generations of Americans. Included in preserving the environment is the preservation of important historic and cultural aspects of our national heritage. The act requires all federal agencies to prepare a document, most commonly an environmental assessment (EA), which assesses the potential impacts of any proposed action on the environment. If impacts are judged potentially significant, an environmental impact statement (EIS) must be prepared. An EIS identifies any unavoidable adverse environmental effects, as well as alternatives to the proposed action and mitigation measures, prior to its implementation. NEPA's implementing regulations [40 CFR Parts 1500-1508] clarify that the act in no way directs, replaces, or supersedes the NHPA. However, an agency may decide to use the NEPA process for Section 106 purposes. If an agency decides that it will use the NEPA process for Section 106 purposes [36 CFR Part 800.8(c)], the agency must notify the SHPO/THPO and the Council that it will be doing so and meet the Standards for Developing Environmental Documents to Comply with Section 106 [36 CFR Part 800.8(c)(1)].

American Indian Religious Freedom Act

The American Indian Religious Freedom Act (AIRFA) of 1978 [42 U.S.C. Part 1996] states that it is the policy of the United States to “protect and preserve for American Indians their inherent right of freedom to exercise the traditional religions of the American Indian, Eskimo, Aleut, and Native Hawaiians, including but not limited to access to sites, use and possession of sacred objects, and the freedom to worship through ceremonials and traditional rites.” The provisions of AIRFA guarantee access to traditional sites on federal lands and noninterference with religious practices. Consultation under AIRFA with American Indian groups can simultaneously satisfy the requirements of NEPA as well.

Archaeological Resources Protection Act

The Archaeological Resources Protection Act (ARPA) of 1979 [16 U.S.C. Part 470aa et seq.] establishes that archaeological resources on public lands are part of the nation's heritage and should be preserved for the benefit of the American people. Unauthorized excavation, removal, damage, alteration, or defacement of archaeological resources on public lands is prohibited. ARPA sets forth criminal and civil penalties for such violations. The act requires a permit for any excavation or removal of archaeological resources from public lands that is not sponsored by the federal agency [16 U.S.C. Part 470cc (a)]. Such excavations must be of a scientific nature and must be conducted by qualified applicants. Individuals should comply with the Secretary's professional qualifications standards (48 Federal Register [FR] 44737-44740). All archaeological resources removed from public lands under the permit remain the property of the Federal Government.

The permit-granting authority usually belongs to the land manager responsible for the property. Although permits are not required for work contracted by the facility, a permit might be required for work conducted in investigations related to NAGPRA (e.g., recovery of American Indian human remains from a vandalized site). Acquiring a permit under ARPA regulations does not constitute compliance with Section 106 of the NHPA.

Federal agencies may withhold any information pertaining to the location of archaeological sites if the agency determines that disclosing such information would put the resource at risk (Section 304 of NHPA). This procedure, by itself, provides limited protection of such information. The use of Section 304 of the NHPA and ARPA to exclude the release of sensitive information on all archaeological sites, archaeological sites with a NAGPRA component, and sacred sites with an archaeologically defined component is the most effective procedural strategy [32 CFR Part 800 229.18(a)(1-2)].

ARPA's implementing regulations (32 CFR Part 229) specify that protected resources must be at least 100 years old and of archaeological interest. Surface collection of rocks, coins, bullets, and minerals, which are not located in an archaeological context, are excluded from protection. Paleontological specimens found outside archaeological contexts are not considered archaeological resources under ARPA and are similarly excluded from protection.

Native American Graves Protection and Repatriation Act

The purpose of the Native American Graves Protection and Repatriation Act (NAGPRA) of 1990 (25 U.S.C. Part 3001-3013) is to set forth the rights of federally recognized American Indian tribal groups and Native Hawaiian organizations with respect to ownership of human remains, funerary objects, sacred objects, and objects of cultural patrimony with which they can demonstrate lineal descent or cultural affiliation. The act protects American Indian burial sites and controls the removal of human remains, funerary objects, sacred objects, and objects of cultural patrimony on federal, American Indian, or Native Hawaiian lands during planned or unanticipated excavations. NAGPRA requires that federal agencies and museums receiving federal funds inventory holdings for such remains and objects, and work with the tribal groups in a consultation process to reach agreements on the repatriation or other disposition of the remains and objects.
