The stricter requirements of NAGPRA should be implemented in addition to Section 106 requirements when an undertaking has the possibility of impacting American Indian cultural resources; however, the two Acts are overlapping at times and need coordinating efforts. NAGPRA gives individuals and certain groups considerable decision-making authority in the excavation, removal, and repatriation of American Indian cultural items and burials. Excavation of American Indian cultural items and consultation with the appropriate federally recognized American Indian tribal groups should be undertaken as appropriate to NAGPRA legislation. Guidelines for procedures to follow upon unexpected discovery of American Indian human remains are set forth in implementing regulations of 43 CFR Part 10.4-6.

Federal Communications Commission Programmatic Agreements

Cultural resources activities associated with the proposed Project will also be conducted in accordance with two extant programmatic agreements (PAs) and the underlying laws and regulations upon which they are based. The two PAs apply specifically to wireless and broadcast facilities but do not apply on Tribal or federal lands (DeSordo 2011: 7). The two PAs are:

- National Programmatic Agreement for the Collocation of Wireless Antennas (FCC 2001) (Collocation Agreement), which was formulated to streamline the process for collocating antennas on existing towers and other structures to reduce the need for the construction of new towers. The Collocation Agreement constitutes a substitute for the FCC's compliance with the Advisory Council on Historic Preservation's regulations implementing Section 106 of the NHPA for the collocation of antennas as defined in the Collocation Agreement
- Nationwide Programmatic Agreement for Review of Effects on Historic Properties for Certain Undertakings Approved by the FCC (FCC 2004) (Nationwide Agreement). The Nationwide Agreement was formulated to further streamline the NHPA's Section 106 process for facilities that were not excluded from Section 106 review under the Collocation Agreement.

Both of the PAs were developed through consultation among, and approved by, the FCC, the Council, and the National Conference of State Historic Preservation Officers.

Other Federal Agency Participation and Environmental Compliance

In addition to state, county, and municipal land owners, other federal agencies have jurisdiction over several of the proposed Project sites. Typically, towers that are constructed “on federal land require other agency permits with that agency taking the lead on environmental compliance” (DeSordo 2011: 13); however, agencies can also defer their compliance responsibilities to a single federal lead agency. Federal agencies associated with proposed Project sites include the U.S. Forest Service and the National Park Service (NPS). As Grantor, the Federal Emergency Management Agency (FEMA) is the federal lead agency under the National Historic Preservation Act. Coordination among all of these agencies and the FCC is ongoing.

Secretary of the Interior’s Standards. The Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards) and the Secretary of the Interior's Guidelines for the Treatment of Historic Properties (Guidelines), are found on the National Park Service's website at <http://www.nps.gov/tps/standards.htm> and <http://www.nps.gov/tps/standards/four-treatments/standguide/index.htm> respectively. The Standards are a series of practices for maintaining, repairing, and replacing historic materials, as well as designing new additions or making alterations. The Guidelines assist in applying the complementary Standards to a specific property. Together, they provide a framework and guidance for decision-making about work or changes to a historical resource.

Paleontological Resources

If any federal funding is used to wholly or partially finance a project, a project occurs on federal lands, involves a federal permit, and/or includes a perceived federal impact, federal laws and standards apply and an evaluation of potential impacts on paleontological resources may be required. The management and preservation of paleontological resources on public and federal lands are prescribed under various laws, regulations, and guidelines.

The National Park Service Organic Act

The National Park Service Organic Act (16 United States Code (U.S.C.) | 2 3, and 4) states that national parks and monuments are to be managed “to conserve the scenery and the natural and historic objects... therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations.” The statute also provides that “no natural curiosities, wonders, or objects of interest shall be leased, rented, or granted to anyone on such terms as to interfere with free access to them by the public.” Enforcement measures include a fine of up to \$500 or imprisonment not exceeding six months, or both. It has been U.S. Forest Service (USFS) policy since roughly 1998 to use the Organic Act for the permitting authority. This decision was based on the present case law that claims the Antiquities Act is vague with regard to paleontological resources because it does not explicitly define fossils as “objects of antiquity.” The Forest Service Training Guide for the Management of Paleontological Resources (USFS 2005) states that this act authorizes the use of National Forest System lands to qualified institutions and individuals for the collection of paleontological resources involving the excavation or removal of vertebrate fossil and significant invertebrate and plant

fossil resources when these activities are in the public interest for administrative, scientific or educational purposes.

Antiquities Act of 1906

In addition to the protection of cultural resources, the Antiquities Act of 1906 also has implications for paleontological resources. The Act states, in part:

That any person who shall appropriate, excavate, injure or destroy any historic or prehistoric ruin or monument, or any object of antiquity, situated on lands owned or controlled by the Government of the United States, without the permission of the Secretary of the Department of the Government having jurisdiction over the lands on which said antiquities are situated, shall upon conviction, be fined in a sum of not more than five hundred dollars or be imprisoned for a period of not more than ninety days, or shall suffer both fine and imprisonment, in the discretion of the court.

Although there is no specific mention of natural or paleontological resources in the Act itself, or in the Act's uniform rules and regulations (Title 43 Part 3, Code of Federal Regulations [43 CFR 3]), the term “objects of antiquity” has been interpreted to include fossils by NPS, BLM, USFS, and other federal agencies. Permits to collect fossils on lands administered by federal agencies are authorized under this Act; however, due to the large gray areas left open to interpretation due to the imprecision of the wording, agencies are hesitant to interpret this act as governing paleontological resources.

The National Environmental Policy Act

As with cultural resources, NEPA recognizes the continuing responsibility of the Federal Government to “preserve important historic, cultural, and natural aspects of our national heritage ...” (Sec. 101 [42 U.S.C. § 4321] (#382). With the passage of the Paleontological Resources Preservation Act (PRPA) (2009), paleontological resources are considered to be a significant resource, and it is therefore now standard practice to include paleontological resources in NEPA studies in all instances where there is a possible impact.

Federal Land Management and Policy Act of 1976

The Federal Land Management and Policy Act of 1976 (FLMPA) (43 U.S.C. 1712[c], 1732[b]); sec. 2) recognizes the value of our Nation's public lands and provides a framework in which those lands are managed in perpetuity for the benefit of present and future generations. This law defines significant fossils as unique, rare, or particularly well-preserved; an unusual assemblage of common fossils; being of high scientific interest; or providing important new data concerning [1] evolutionary trends, [2] development of biological communities, [3] interaction between or among organisms, [4] unusual or spectacular circumstances in the history of life, or [5] anatomical structure.

Paleontological Resources Preservation, Omnibus Public Lands Act

The Paleontological Resources Preservation, Omnibus Public Lands Act (PRPA 2009) (Public Law 111-011, Title VI, Subtitle D) directs the Secretaries of Interior and Agriculture to manage and protect

paleontological resources on federal land using “scientific principles and expertise.” PRPA incorporates most of the recommendations of the report of the Secretary of the Interior entitled Assessment of Fossil Management on Federal and Indian Lands (2000) in order to formulate a consistent paleontological resources management framework. In passing the PRPA, Congress officially recognized the scientific importance of paleontological resources on some federal lands by declaring that fossils from these lands are federal property that must be preserved and protected. The PRPA codifies existing policies of the BLM, NPS, USFS, Bureau of Reclamation, and U.S. Fish and Wildlife Service (USFWS), and provides the following:

- Uniform criminal and civil penalties for illegal sale and transport, and theft and vandalism of fossils from federal lands
- Uniform minimum requirements for paleontological resource-use permit issuance (terms, conditions, and qualifications of applicants)
- Uniform definitions for “paleontological resources” and “casual collecting”
- Uniform requirements for curation of federal fossils in approved repositories

Federal legislative protections for scientifically significant fossils applies to projects that take place on federal lands (with certain exceptions such as Department of Defense), involve federal funding, require a federal permit, or involve crossing state lines. This document does not specifically trigger any paleontological requirements, other than those under NEPA for project impact evaluations if there is a federal nexus.

United States Codes of Federal Regulations

7 CFR 3100.41(a). This section provides for the protection of paleontological resources under the authority of the Antiquities Act of 1906 (16 U.S.C. 431 et seq.).

36 CFR, Part 251, Subpart B. This subpart provides direction for special uses management on National Forest System lands, including paleontological resources.

36 CFR, Part 261, Subpart A. This subpart defines “paleontological resources.” It prohibits damaging or removing any natural feature, excavating, damaging, or removing any vertebrate fossil or removing any paleontological resource for commercial purposes without a special use permit; or excavating, damaging, or removing any cave resource from a cave without a special use authorization, or removing any cave resource for commercial purposes. When provided in an order, it is prohibited to go into any area closed for the protection of objects or areas of paleontological interest. Regulations may be issued by the Regional Forester, if delegated by the Chief, prohibiting acts or omissions within all or any part of the area over which he has jurisdiction for protection of objects or places of paleontological interest.

3.4.3.2 State Regulatory Setting

Cultural Resources

California Environmental Quality Act

CEQA applies to projects undertaken by, financially supported by, or involving the issuance of a lease, permit, or other approval by any state, regional, or local public agency. Guidelines for determining the significance of impacts on archaeological and historical resources are set forth in CEQA Guidelines Section 15064.5(b), which establishes rules for determining whether a project may have a substantial adverse effect on resources listed in, or meeting the criteria for listing in, the California Register of Historical Resources (CRHR) (i.e., “historical resources” as defined in California PRC section 21084.1 and CEQA Guidelines Section 15064.5(a)). As described in the CEQA Guidelines a resource shall be considered by the lead agency to be “historically significant” if the resource:

- 1) Is associated with events that have made a significant contribution to the broad patterns of California’s history and cultural heritage;
- 2) Is associated with the lives of persons important in our past;
- 3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- 4) Has yielded, or may be likely to yield, information important in prehistory or history.

Resources included in a local register of historical resources (pursuant to PRC Section 5020.1(k)), or identified as significant in an historical resources survey (meeting the criteria in PRC Section 5024.1(g)), also are considered “historical resources” for the purposes of CEQA.

The fact that a resource is not already listed in, or eligible for listing in the CRHR, not included in a local register of historical resources, or identified in an historical resources survey, does not preclude an agency from determining that the resource may be an historical resource for the purposes of CEQA environmental review.

California Assembly Bill No. 52

California Assembly Bill (AB) 52 was signed into law on September 25, 2014, and applies to projects with an NOP issued on or after July 1, 2015. AB 52 adds Tribal cultural resources as an additional category of cultural resources that must be considered under CEQA. Tribal cultural resources are defined as either 1) “sites, features, places, cultural landscapes, sacred places and objects with cultural value to a California Native American tribe” that are included in the state register of historical resources or a local register of historical resources, or that are determined to be eligible for inclusion in the state register; or 2) resources determined by a lead agency, in its discretion, to be significant based on the criteria for listing in the state register. Under AB 52, a project that may cause substantial adverse changes in the significance of a tribal cultural resource is defined as a project that may have a significant effect on the

environment. The NOP for the proposed Project was issued on August 19, 2014; therefore, the requirements of AB 52 do not apply; however, Native American consultation was undertaken as described in the following sections.

Native American Heritage Commission

The California Native American Heritage Commission (NAHC) was contacted on August 29, 2014, to request a search of their Sacred Lands Files and to acquire a list of Tribes that might be interested in the proposed Project sites. The NAHC responded on September 15, 2014, indicating that their records search failed to indicate the presence of Native American cultural resources in the immediate Project area. The NAHC also provided a list of nine Native American Tribes, organizations, or individuals who might have interest in the proposed Project sites, and each of these were contacted on June 29, 2015. One response was received from the Kizh Gabrieleño indicating that the entire Project area is within their Tribal territory. The Tribe requested to have one of their experienced and certified Native American monitors on site during any and all project-related ground disturbance.

FCC's Tower Construction Notification System

The FCC's Tower Construction Notification System (TCNS) was utilized to notify Tribes about each proposed Project site. Through the TCNS system, 14 Tribes were notified, and the appropriate path for consultation was provided by all but four Tribes. Additional TCNS responses were received from three Tribes. The Santa Ynez Band of Mission Indians (Chumash) deferred interest in all of the proposed Project sites to Tribes more local to Los Angeles County. Responses were also received from the Soboba Band of Luiseño Indians and Eastern Shoshone Tribes to whom follow-up information was provided. Coordination with the Soboba and Eastern Shoshone Tribes was completed as of December 3, 2015. The Soboba requested that an archaeologist or Native American monitor local to the Los Angeles County area provide archaeological monitoring during ground-disturbing activities at three project locations (AGH, ENT, and LEPS). The outcome of Tribal consultation and coordination is provided in Appendix B-4.

Paleontological Resources

California Environmental Quality Act

One of the questions listed in the CEQA Environmental Checklist is: "Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?" (Appendix G, Section V, Part C.)

State of California Public Resources Code

The State of California Public Resources Code (Chapter 1.7), Sections 5097.5 and 30244, includes additional state level requirements for the assessment and management of paleontological resources. These statutes require reasonable mitigation of adverse impacts to paleontological resources resulting from development on state lands, define the removal of paleontological "sites" or "features" from state lands as a misdemeanor, and prohibit the removal of any paleontological "site" or "feature" from State

land without permission of the jurisdictional agency. These protections apply only to State of California land, and thus apply only to portions of the project, if any, which occur on state lands.

3.4.3.3 Local Regulatory Setting

Cultural Resources

Los Angeles County

The County of Los Angeles Draft General Plan Conservation and Open Space Element (2014) contains goals and policies regarding historic and cultural resources. This Draft General Plan is currently under public review. The Conservation and Open Space Element establishes the goals of preserving and protecting sites of historical, archaeological, and scientific values, and defines the following policies relative to historic, cultural, and paleontological resources:

- Policy C/NR 14.1: Mitigate all impacts from new development on or adjacent to historic, cultural, and paleontological resources to the greatest extent feasible.
- Policy C/NR 14.2: Support an inter-jurisdictional collaborative system that protects and enhances historic, cultural, and paleontological resources.
- Policy C/NR 14.3: Support the preservation and rehabilitation of historic buildings.
- Policy C/NR 14.4: Ensure proper notification procedures to Native American tribes in accordance with Senate Bill 18 (2004).
- Policy C/NR 14.5: Promote public awareness of historic, cultural, and paleontological resources.
- Policy C/NR 14.6: Ensure proper notification and recovery processes are carried out for development on or near historic, cultural, and paleontological resources.

The County of Los Angeles is also drafting an Historic Preservation Ordinance amending Title 22 - Planning and Zoning of the Los Angeles County Code to adopt regulations and conditions to preserve, protect, and enhance buildings, structures, and areas of historic interest and importance within the unincorporated territory of the County of Los Angeles, as authorized by Section 25373 of the California Government Code, for the purposes of perpetuating and preserving historic resources for the educational, cultural, economic and general welfare of the public.

Santa Monica Mountains Local Coastal Program

The Santa Monica Mountains Local Coastal Program (2014) is currently in the process of being approved by the State of California. As it is written, the Local Coastal Program Conservation and Open Space Element includes two goals (CO-8 and CO-9) and nine policies relating to historic and cultural resources. Goal CO-8 requires that the County engage in active preservation of the area's rich and diverse archaeological, paleontological and historic cultural resources in the Coastal Area. The nine policies within this document relate to this goal and the preservation of archaeological and historic resources.

- CO-199: Protect and preserve archaeological, historical, and paleontological resources from destruction, and avoid impacts to such resources where feasible. Where avoidance is not feasible, minimize impacts to resources to the maximum extent feasible.
- CO-200: Where development would adversely impact archaeological or paleontological resources as identified by the State Historic Preservation Officer, reasonable mitigation measures shall be required. Mitigation shall be designed to accord with guidelines of the State Office of Historic Preservation and the State of California Native American Heritage Commission.
- CO-201: Regulate landform alteration to ensure minimal disturbance of known archaeological and historic cultural sites. New development on sites identified as archaeologically sensitive shall include onsite monitoring of all grading, excavation, and site preparation that involve earthmoving operations by a qualified archaeologist(s) and appropriate Native American consultant(s).
- CO-202: The County should coordinate with appropriate agencies, such as the Southern California Indian Center (SCIC) and the University of California, Los Angeles (UCLA) Archaeological Center, to identify archaeologically sensitive areas. Such information should be kept confidential to protect archaeological resources.
- CO-203: New development within archaeologically-sensitive areas shall implement appropriate mitigation measures, designed in accord with guidelines of the State Office of Historic Preservation and the State of California Native American Heritage Commission (NAHC).
- CO-204: Preserve and protect cultural resources and traditions that are of importance to Native Americans, including the Chumash and Gabrielino/Tongva People.
- CO-205: Prohibit the unauthorized collection of paleontological and historic cultural artifacts.
- CO-206: Notify all appropriate agencies, including Native American tribes, and the Department of Regional Planning of archaeological or paleontological resources discovered during any phase of development construction to ensure proper surface and site recordation and treatment.
- CO-208: New development shall, where feasible, protect significant historical buildings, landmarks, and districts because of their unique characteristics and contribution to the cultural heritage of the area.

Goal CO-9 requires that the County engage in increased public awareness of the history and cultural heritage of the Santa Monica Mountains. Two policies within this document relate to this goal and the preservation of archaeological and historic resources.

- CO-209: Support the development of resource-dependent uses designated to educate the public on the history and cultural heritage of the Santa Monica Mountains, where appropriate.
- CO-210: Provide to new residents and other persons seeking development approvals under this LUP, information on the history and cultural heritage of the Santa Monica Mountains.

Santa Catalina Island. The Santa Catalina Island Local Coastal Plan (1983) has four policies regarding cultural resources. The County of Los Angeles is to protect and restore all significant cultural resources, require archaeological studies and appropriate mitigation measures when cultural sites are encountered during development, require archaeological survey prior to ground disturbance by a qualified archaeologist, and prohibit the casual collection of cultural artifacts.

Incorporated Cities in the Project Area

City of Agoura Hills. The City of Agoura Hills has two goals regarding historic and archaeological resources in the General Plan (City of Agoura Hills 2010). Goal HR-1 requires the protection and maintenance of historic resources to foster stewardship and civic pride, which contributes to the unique identity and character of Agoura Hills. Three policies support this objective:

- HR-1.1: Enhance community appreciation of the importance of the City's historic sites and buildings and protect and preserve significant historical resources, to the extent feasible.
- HR-1.2: Ensure the maintenance of the physical quality of significant historic resources, particularly those elements contributing to their identity and role in the community.
- HR-1.3: Utilize Agoura Hill's historic resources as opportunities to educate and engage the community in cultural and civic activities.

Goal HR-3 requires the protection of significant archaeological and paleontological resources in Agoura Hills. Three policies support this objective:

- HR-3.1: Requires that the potential for archaeological and paleontological resources be considered prior to development of a property.
- HR-3.2: Requires that significant archaeological and paleontological resources be preserved in situ if feasible and that data recovery mitigation is implemented in the event that avoidance of impacts is not possible. Requires that excavation of deposits of Native American origin be coordinated with and monitored by recognized Chumash representatives.
- HR-3.3: Requires that if human remains or funerary objects are discovered and unearthed during any soil disturbing activity, the discoveries shall be treated in compliance with applicable state and federal laws, including notifying the County Coroner and the California Native American Heritage Commission, as appropriate, and following relevant procedures.

City of Beverly Hills. The City of Beverly Hills has two goals regarding historic preservation in the General Plan (City of Beverly Hills 2010) Historic Preservation Element. HP 1 states that the City will value and preserve significant cultural resources. The following eight policies relating to historic and archaeological resources support this goal:

- HP 1.1: Establish a local register of historic resources and develop criteria for locally significant resources that have local importance but which may not meet NRHP criteria.
- HP 1.2: Maintain an updated historic resources inventory.

- HP 1.3: Promote national, state, and local designation of historic resources.
- HP 1.4: Develop incentives to protect significant historic resources
- HP 1.5: Consider a tiered approach for regulating residential and non-residential historic resources.
- HP 1.6: Consider imposing penalties for illegal demolition of historic structures.
- HP 1.7: Explore options to establish a formally-funded historic archive
- HP 1.8: Temporarily suspend all earth disturbing activities within 100 feet of a potential resource to assess the significance of the find, and require appropriate mitigation before work resumes.

HP 2 states the City will promote the City's historic resources. In support of this, Policy HP 2.1 will develop educational programs on local historic resources.

The City of Beverly Hills also has a Historic Preservation Ordinance (Title 10-3-3201). The intent and purpose of this ordinance is to provide the ability to acknowledge, honor, and encourage the continued maintenance and preservation of those select properties in the City that, through exceptional architecture, contribute to the city's cultural history.

City of Calabasas. The City of Calabasas General Plan 2030, Cultural Resources Element (City of Calabasas 2009) states several objectives and policies. These are:

- Policy XI-1 ensures proper treatment of archaeological resources before development occurs at a site where such resources are present
- Policy XI-2 preserves significant archaeological and paleontological resources in-situ, when feasible. When avoidance of impacts is not possible, the policy requires data recovery mitigation for all significant resources. All forms of excavation in deposits of Native American origin shall be coordinated and monitored by representatives of the Chumash Nation.
- Policy XI-3 ensures proper treatment of historic resources before development occurs at a site where such resources are present, through enforcement of the City's Historic Preservation Ordinance.
- Policy XI-4 emphasizes preservation and adaptive reuse as the preferred approach to the management of historic properties. Where preservation or adaptive reuse is not possible, new development is required to reflect the character and historic/cultural references of the original features in their site context. Finally, facilitate the relocation of historic features if the preferred preservation in place is not possible.

City of Cerritos. The City of Cerritos has two goals regarding historic and cultural resources in the General Plan (City of Cerritos 2004) Conservation Element. CON-7 states that the City will promote community knowledge and appreciation for the heritage of the City. In support of this are two policies:

- CON-7.1 provides access to information on Cerrito's history.

- CON-7.2 encourages the involvement of the community in learning about the historic and cultural resources.

Goal CON-8 states that the City will enhance, preserve, and protect the City's historic and cultural resources. In support of this goal are two policies:

- CON-8.1 ensures that all items of historic and cultural significance are preserved for the enjoyment by all Cerritos residents.
- CON-8.2 requires all potential historic and cultural resources within the City be identified, recorded, mapped, and evaluated.

City of Chino Hills. The City of Chino Hills is situated within the southwestern-most corner of San Bernardino County. One proposed Project site, AJT, is situated within the jurisdiction of this city. The City of Chino Hills has one goal and two policies regarding historical and archaeological resources in the General Plan Update Conservation Element (City of Chino Hills 2014). Goal CN-2 is to protect Chino Hills' Cultural Resources and Policy CN-2.1 is to protect the City's archaeological resources. In support of this policy, Actions CN-2.1.1, CN-2.1.2, CN-2.1.3 and CN-2.1.4 require appropriate archaeological surveys during the environmental review process, on-site inspections by a qualified archaeologist during grading in areas where archaeological resources may be present, preservation of identified archaeological resources, and consultation with local Native American tribes.

Policy CN-2.3 is to protect the City's potential historical resources. In support of this policy, there are five actions:

- CN-2.3.1: Prior to a change of land use or other action on the Boys Republic property that could disturb a potential historic resource, require a historic resource survey of the property by a qualified historic resource consultant and consider incorporating any recommendations as requirements into subsequent development approval.
- CN-2.3.2: Prior to a change of land use or other action on the Tres Hermanos property that could disturb a potential historic resource, require a historic resource survey of the property by a qualified historic resource consultant and consider incorporating any recommendations as requirements into subsequent development approval.
- CN-2.3.3: Prior to grading on site of the original clubhouse of the 1925 Los Serranos County Club, require an appropriate archaeological survey to determine the presence of artifacts associated with the former Bridger/Gird Adobe site and consider incorporating any recommendations as requirements into subsequent development approval.
- CN-2.3.4: Consider placement of markers to acknowledge the local importance to Chino Hills' history of the Carbon Canyon and English Road equestrian communities.
- CN-2.3.5: For structures over 45 years old, review available City building records and make a determination regarding the structure's potential historical significance prior to permitting its demolition or substantial alteration.

City of Glendale. The City of Glendale's Open Space and Conservation Element of the City of Glendale General Plan (2005) has one policy regarding cultural resources. Policy 3 requires that the City recognize and maintain cultural and paleontological resources and structures, and that cultural resources be subject to judicious management.

The City's Historic Preservation Element has two goals regarding historic resources. Goal 1 is to preserve historic resources which define Glendale's community character. The following 12 policies support this goal:

- 1-1: Encourage support for the importance of history and historic preservation.
- 1-2: Recognize archaeological and historic resources as links to community identity.
- 1-3: Encourage the protection and preservation of archaeological sites and cooperate with institutions of higher learning and interested organizations to record, preserve, or excavate sites.
- 1-4: Require that archaeological surveys and/or monitoring be conducted prior to the issuance of construction permits in archaeologically sensitive areas of the city.
- 1-5: Temporarily suspend construction work when archaeological sites are discovered; establish procedures which allow for the timely investigation and/or excavation of such sites by qualified professionals as may be appropriate.
- 1-6: Discourage demolition of historic resources.
- 1-7: Encourage the preservation and maintenance of historic landscaped areas.
- 1-8: Encourage the preservation of individual historic resources and historic thematic and historic geographic districts.
- 1-9: Support the creation of historic districts of representative land use types such as residential, commercial, and industrial.
- 1-10: Support the preservation and maintenance of historic street furniture including street lights.
- 1-11: Ensure protection of historic resources through enforcement of existing codes.
- 1-12: Support comprehensive studies to discover unrecorded historic resources.

Goal 2 is to create and continue programs and practices which enable an appreciation of Glendale's history and historic preservation. The following 33 policies support this goal:

- 2-1: Identify representative architectural types and styles from various periods in history.
- 2-2: Survey all potential historic resources in Glendale.
- 2-3: Whenever indicated by research and authorized by the property owner, list significant historic resources in the Glendale Register of Historic Resources.

- 2-4: Develop a program to list all significant historic resources in the Glendale Register of Historic Resources.
- 2-5: Promote the use of the State Historical Building Code.
- 2-6: Provide historic preservation incentives for resource protection and continue to add more incentives as opportunities arise.
- 2-7: Establish and maintain a comprehensive inventory of Glendale's historic resource surveys.
- 2-8: Establish a program jointly with the Glendale Unified School District which will provide a curriculum which recognizes the importance of historic preservation.
- 2-9: Seek listing for appropriate properties on the National Register of Historic Places and the California State Register of Historical Resources.
- 2-10: Encourage the establishment of a city history museum.
- 2-11: Memorialize historic people, places, and events through a plaque program.
- 2-12: Complete historic resource surveys for the entire city targeting the most critical areas first.
- 2-13: Expand the base of historic information through the continued collection of anecdotal information in oral history interviews.
- 2-14: Conduct public information sessions to inform the public about the availability of incentives for designated historic resources in Glendale.
- 2-15: Develop a public outreach program which will demonstrate the benefits of historic preservation.
- 2-16: Establish a program which will preserve portions of historic resources, including façade features at their original sites.
- 2-17: Reuse existing historic architectural elements in new construction when preservation of historic resources is not feasible.
- 2-18: Support the preservation of street furniture in its original location.
- 2-19: Support the reuse of historic street furniture in historically appropriate settings when its original location is not feasible.
- 2-20: Develop an archive for historically important documents and artifacts.
- 2-21: Establish a program to recognize private efforts to preserve Glendale's history by proclamation.
- 2-22: Continue to consult with the state's Historical Resources Information Center by periodically updating the archaeological records search prepared for the city in 1997.
- 2-23: Encourage funding of historic preservation projects.

- 2-24: Establish a program for disseminating information of the provisions of the Historic Preservation Ordinance.
- 2-25: Establish a program for disseminating information of the restoration, rehabilitation, and renovation of historic resources.
- 2-26: Revise and update the Historic Preservation Element and the Glendale Register of Historic Resources at least every five years and review the implementation of policy objectives every two years.
- 2-27: Discourage relocation of historic resources.
- 2-28: Establish a program which will allow the relocation of historic resources within the city when onsite retention is not feasible.
- 2-29: Recognize achievements in historic preservation by individuals and groups through appropriate award programs.
- 2-30: Establish a program which requires mitigation monitoring to include payments of fees to subsidize preservation of historic resources a storage space for artifacts.
- 2-31: Participate in the statewide mitigation monitoring fund which would be used for the preservation of local resources.
- 2-32: Encourage the creation of a community based endowment fund which would benefit historic preservation.
- 2-33: Encourage sensitivity to Native American concerns and values involving aboriginal archeological sites; consult with representative Native American groups when prehistoric archaeological sites are discovered.

The City of Glendale also has a Historic Preservation Ordinance (Chapter 15.20), the purpose of which is to promote the health, prosperity, cultural enrichment, and general welfare of the people through the identification, designation, protection, enhancement, perpetuation, and use of historic resources that reflect significant aspects of the city's heritage. In addition, the City provides for the designation of historic districts in Chapter 30.25 through a change of zone that establishes a Historic District Overlay Zone.

City of Glendora. The City of Glendora's General Plan 2025 (City of Glendora 2008) Conservation Element (Chapter 8) provides an inventory of historic and cultural resources in the city and provides direction regarding the conservation, development, and utilization of these resources and the policies and programs to achieve them.

In addition, the City of Glendora's Municipal Code Section 21.03.050 promotes the identification, protection, enhancement, perpetuation, and use of improvements and areas within the city that reflect special elements of historical, architectural, archaeological, cultural, or aesthetic heritage (Subsection A). Subsections B through D of the Municipal Code state criteria for survey and establish criteria for

designating historic resources and landmarks. Requirements for the permitting of historic resources repairs and rehabilitation are found in Subsections E through I.

City of Los Angeles. The City of Los Angeles in Section 3 and Section 5 of the Conservation Element of the General Plan (City of Los Angeles 2001) contains objectives and policies regarding archaeological resources and cultural and historical resources. Section 3 requires that measures be taken to protect the city's archaeological and paleontological resources for historical, cultural, research and/or educational purposes. One policy and one program support this requirement. This policy requires that the City continue to identify and protect significant archaeological and paleontological sites and/or resources known to exist or are identified during land development, demolition or property modification activities. Section 5 requires that measures be taken to protect important cultural and historical sites and resources for historical, cultural, research, and community educational purposes. One policy and four programs support this requirement. This policy requires that the City continue to protect historic and cultural sites and/or resources potentially affected by proposed land development, demolition or property modification activities. The four programs include:

- Program 1: development permit processing, monitoring, enforcement and periodic revision of regulations and procedures.
- Program 2: prepare the Historic Preservation and Cultural Resources Element of the general plan.
- Program 3: continue to survey buildings and structures of any age in neighborhoods throughout the City in order to develop a record that can be used in the present and future for evaluating their historic and cultural value as individual structures and within the context of surrounding structures.
- Program 4: continue to establish Historical Preservation Overlay Zones throughout the City.

The City of Los Angeles also has Historical Preservation Overlay Zones (HPOZ), Ordinance number 175891, found in Section 12.20.3 of the Los Angeles Municipal Code, the purpose of which describes the procedures for creation of new HPOZs, the powers and duties of HPOZ Boards, and the review processes for projects within HPOZs.

City of Malibu. The City of Malibu General Plan Conservation Element (1995) has one goal, one objective, and three policies and multiple implementation measures regarding historic, cultural and archaeological resource preservation. Con Goal 2 and Con Objective 2.1 are to preserve and protect cultural resources for future generations and scientific study. In support of this, Con Policies 2.1.1, 2.2.2, and 2.2.3 require that the City identify, designate, protect and preserve areas and sites of historic, cultural, and/or archaeological significance, that destruction of resources be avoided, and that the City provide incentives to property owners of historical structures to encourage preservation of designated cultural resources. Con Implementation Measures 76-84 outline specific actions to implement the policies, including, but not limited to, impact assessments, archaeological surveys, and formulation and implementation of project mitigation measures.

City of Monterey Park. The City of Monterey Park's General Plan (City of Monterey Park 2001) recognizes cultural resources as an important part of the community. The following goal and policies support the preservation of cultural resources for future generations:

Goal: To preserve the historical resources of Monterey Park

- Policy 3.1 – to support the efforts of the Historical Society, Historical Heritage Commission, and the Arts and Cultural Commission
- Policy 3.2 – to raise awareness about Monterey Park's history and cultural resources

City of Palmdale. The City of Palmdale has one goal, one objective, and eight policies regarding paleontological resources in the General Plan's Environmental Resources element (City of Palmdale 1993). Goal ER7 requires that the City protect historical and culturally significant resources which contribute to the community's sense of history. Objective ER7.1 states that the City shall promote the identification and preservation of historic structures, historic sites, archaeological sites, and paleontological resources in the City. The following eight policies support this objective:

- Policy ER7.1.1: Identify and recognize historic landmarks from Palmdale's past.
- Policy ER7.1.2: Promote maintenance, rehabilitation, and appropriate reuse of identified landmarks where feasible.
- Policy ER7.1.3: Require that new development protect significant historic, paleontological, or archaeological resources, or provide for other appropriate mitigation.
- Policy ER7.1.4: Develop and maintain a cultural sensitivity map. Require special studies/surveys to be prepared for any development proposals in areas reasonably suspected of containing cultural resources, or as indicated on the sensitivity map.
- Policy ER7.1.5: When human remains, suspected to be of Native American origin are discovered, cooperate with the Native American Heritage Commission and any local Native American groups to determine the most appropriate disposition of the human remains and any associated grave goods.
- Policy ER7.1.6: Cooperate with private and public entities whose goals are to protect and preserve historic landmarks and important cultural resources.
- Policy ER7.1.7: Promote recognition, understanding, and enjoyment of unique historical resources within the community by identifying resources through the use of landmark designation plaques, directional signage, self-guided tours, school curriculum, programs and event.
- Policy ER7.1.8: Discourage historic landmark properties from being altered in such a manner as to significantly reduce their cultural value to the community.

City of Pasadena. The General Plan of the City of Pasadena Land Use Element (City of Pasadena 2004) has one objective and one policy regarding archaeological resources. Objective 19 requires that the City

protect and enhance areas of the city containing important biological resources; protect and minimize disturbance of any important paleontological and/or archaeological resources that might remain in the city. Policy 19.3, Paleontological/ Archaeological Resources Survey, requires that project proponents proposing substantial grading or earthmoving in areas that might contain important paleontological and/or archaeological resources shall conduct a pre-excavation field assessment and literature search to determine the potential for disturbance of paleontological and/or archaeological resources. If warranted, grading and other earthmoving activities shall be monitored by a qualified professional who, if necessary, shall undertake salvage and curation. Any paleontological or archaeological resources recovered shall be documented and archived appropriately.

The City's General Plan Draft EIR (City of Pasadena 2015) Environmental Analysis Element has one goal and nine policies regarding historic preservation. Goal 8 requires the City's preservation and enhancement of Pasadena's cultural and historic buildings, landscapes, streets, and districts as reminders of its past and a source of community identity, and social, ecological, and economic vitality. Nine policies support this goal:

- LU 8.1: Identify and protect historic resources that represent significant examples of the City's history.
- LU 8.2: Provide assistance and support for applicants applying for designation of a historic resource through a clear, thorough, and equitable process that identifies if monuments, individuals, or landmark districts, historic signs or landmark trees are eligible for designation based on adopted evaluation criteria.
- LU 8.4: Encourage sensitive adaptive re-use
- LU 8.5: Promote an architecturally sensitive approach to new construction in Landmark and Historic districts.
- LU 8.6: Encourage street design, public improvements, and utility infrastructure that preserves and is compatible with historic resources.
- LU 8.7: Identify, protect, and maintain cultural and natural resources associated with a historic event, activity, or person or exhibiting other cultural or aesthetic values.
- LU 8.8: Continue to implement practices for historic preservation consistent with community values and conformance with the Secretary of the Interior's Standards for the Treatment of Historic Properties, California Historical Building Code, state laws, and best practices.
- LU 8.9: Support maintenance and upkeep of historic resources to avoid the need for major rehabilitation and to reduce the risk of demolition, loss through fire, deterioration by neglect, or impacts from natural disasters.
- LU 8.10: Ensure that City enforcement procedures and activities comply with local, state, and federal historic preservation requirements and fosters the preservation of historic resources.

The City of Pasadena also has a Historical Preservation Ordinance found in Chapter 17 Section 62 of the Municipal Code. The purpose of which is to specify significance criteria for the designation of historic resources, procedures for designation, and review procedures.

City of San Dimas. The City of San Dimas has one goal, one objective, and one policy regarding paleontological resources in the General Plan Conservation Element (City of San Dimas 1991). Goal CN-2 is to conserve the historical and cultural resources of the City (including paleontological resources). Objective 2.1 is to promote the conservation of resources through programs and policies to both identify and protect resources. Policy 2.1.1 requires preservation of significant paleontological sites and evaluation of significance on a case-by-case basis.

City of Santa Monica. The City of Santa Monica General Plan (2010) Land Use and Circulation Element address Historic Preservation with four goals and associated policies regarding historic preservation. Goal LU12 encourages historic preservation citywide by preserving buildings and features which characterize and represent the City's rich heritage. The four policies include integrating the preservation of historic buildings into land use and planning practices, preserving and protecting historic resources through the development of preservation programs and economic incentives, promoting adaptive reuse of historic structures and sensitive alterations where changes are proposed, and recognizing adaptive reuse as a sustainable policy (Policy LU12.1 to 12.4).

Goal HP1 is to preserve and protect historic resources in Santa Monica through the land use decision-making process. The following ten policies support this goal.

- HP1.1: Follow policies for historic preservation contained in the Historic Preservation Element when making land use decisions.
- HP1.2: Maintain and regularly update the Historic Resources Inventory.
- HP1.3: Ensure that new development, alterations or remodeling are sensitive to historic resources and are compatible with the surrounding historic context.
- HP1.4: Continue to support Landmarks Commission review and public input for all structures proposed for demolition that are more than 40 years old.
- HP1.5: Support rehabilitation and restoration of historic resources through flexible zoning policies and modifications to development standards
- HP1.6: Promote awareness of adopted historic preservation policies and the greenhouse gas reduction value of historic preservation and adaptive reuse.
- HP1.7: Develop tools to address the conservation of unique and valued character-defining features in residential neighborhoods to preserve and enhance the existing architecture, scale, landscape and context.
- HP1.8: Encourage the preservation and regular maintenance of mature trees and landscaping that contribute to the unique character of a neighborhood.

- HP1.9: Promote the availability of financial incentives for historic preservation.
- HP1.10: Review proposed developments for potential impacts on unique archaeological resources, paleontological resources, and incorporate appropriate mitigation measures to protect or document the resource.

Goal HP2 is to preserve and protect historic resources through the development of economic incentives and neighborhood conservation approaches. In support of this goal are the following four policies.

- HP2.1: Establish a program for the Transfer of Development Rights for specified categories of significant historic resources and character defining structures, which will be considered a community benefit. Identify receiving areas such as boulevards, transit corridors, activity centers, and Districts.
- HP2.2: Pursue and support a conservation easement program to allow owners of historic properties to earn a one-time income tax deduction through the donation of a property easement to a qualified preservation organization.
- HP2.3: Establish a Neighborhood Conservation Overlay Districts where appropriate.
- HP2.4: Continue to encourage the preservation of homes with historic and architectural significance.

Goal HP3 is to integrate historic preservation practices into sustainable development decisions. In support of this goal are the following four policies.

- HP3.1: Develop incentives to encourage preservation and adaptive reuse of historic buildings as a means of reducing the use of raw materials and realizing sustainable development goals.
- HP3.2: Ensure that the promotion of sustainability technologies, such as solar panel installations and sustainable retrofitting are incorporated in such a way as to not adversely impact historic resources.
- HP3.3: Incorporate conservation of historic resources located within the boundaries of specific plans into the Plan's overall design.
- HP3.4: Support the inclusion of historic preservation as a community benefit in development above the base.

The City of Santa Monica also has a Landmark and Historic District Ordinance found in Chapter 9 Section 36 of the Municipal Code, the purpose of which is to (a) Protect improvements and areas which represent elements of the City's cultural, social, economic, political and architectural history; (b) Safeguard the City's historic, aesthetic and cultural heritage as embodied and reflected in such improvement areas; (c) Foster civic pride in the beauty and noble accomplishments of the past; (d) Protect and enhance the City's aesthetic and historic attractions to residents, tourists, visitors, and others; and (e) Promote the use of Landmarks, Structures of Merit, and Historic Districts for the education, pleasure, and welfare of the people of this City.

City of Signal Hill. The City of Signal Hill General Plan (1989) Environmental Resources Element has one goal and two policies regarding cultural and historic areas. Goal 2 requires the City to maintain and enhance the City's unique cultural, aesthetic, and historic areas. The two policies supporting this goal include protecting and enhancing the State Historical Landmark at the Alamitos Well Site #1 and protecting and enhancing architectural resources in the City consistent with their significance and importance.

City of West Hollywood. The City of West Hollywood General Plan (2011) Historic Preservation Element has six goals and 24 policies regarding historic preservation. Goal HP-1 expands the base of information on the City's history by working with partners to program, curate, and support the West Hollywood Room and to protect and preserve its heritage, develop an archival policy and archive of historic documents, and maintain an internal resource center containing a collection of relevant historic documents.

Goal HP-2 continues to identify and evaluate cultural resources by revising and updating the West Hollywood Historic Resources Survey, seeking designation of eligible properties as West Hollywood Cultural Resources and/or Historic Districts, and provide assistance in applications for designated West Hollywood Cultural Resources to be nominated as properties in the CRHR and NRHP.

Goal HP-3 protects cultural resources from demolition and inappropriate alterations. This is accomplished through the following policies:

- HP-3.1: Revise and update the Historic Preservation Element of the West Hollywood General Plan on a regular basis.
- HP-3.2: Ensure the protection of cultural resources through enforcement of existing codes.
- HP-3.3: Continue to coordinate Section 10 procedures with other environmental review procedures.
- HP-3.4: Continue to allow for the adaptive reuse of cultural resources.
- HP-3.5: Develop post-disaster policies and plans for designated cultural resources to encourage preservation of damaged cultural resources.
- HP-3.6: Suspend development activity when archaeological resources are discovered during construction. The project will be required to retain a qualified archaeologist to oversee the handling of resources in coordination with appropriate local and state agencies and organizations and local Native American representatives, as appropriate.
- HP-3.7: Continue to coordinate with the City staff from various fields so that historic preservation goals are recognized.

Goal HP-4 increases the public's awareness of the City's history and cultural resources by educating the public about the history of West Hollywood; memorializing significant people, places, and events through plaques and public art; and maintaining information on cultural resources on the City website.

Goal HP-5 promotes the preservation of cultural resources through maintenance and rehabilitation incentives and technical assistance. This is accomplished through the following policies:

- HP-5.1: As feasible, maintain a resource library that includes technical information on the treatment of historic properties.
- HP-5.2: Consider providing relief from some taxes and fees for preservation projects.
- HP-5.3: Explore new sources of revenue such as grants and loans that can be used for the maintenance, rehabilitation, or restoration of cultural resources or operating the City's preservation program.
- HP-5.4: As feasible, evaluate City programs for opportunities to underwrite the maintenance, rehabilitation, or restoration of cultural resources.
- HP-5.5: Consider reevaluating the usefulness of the Transfer of Development Rights Program.
- HP-5.6: Consider directing capital improvements funds towards the preservation and enhancement of cultural resources and historic districts.

Goal HP-6 uses historic preservation concepts as tools for economic development by seeking opportunities to work with business and professional groups to incorporate cultural resources into their promotions of business and tourism and incorporates goals and objects related to cultural resources into public and private plans for economic development.

The City of West Hollywood also has a Cultural Preservation Ordinance found in Chapter 19 Section 58 which provides a high level of protection to designated cultural resources.

City of Whittier. The City of Whittier has three goals and eight policies regarding cultural resources in the General Plan Historic Resources Element (City of Whittier 1993). Goal 1 is to determine the nature and extent of the City's cultural heritage by identifying buildings, sites, objects, neighborhoods, landscaped areas, and gardens which have special significance to the history and/or character of Whittier and requiring evaluation of the potential for archaeological and paleontological resources during the environmental review phase of development projects (Policy 1.1 and 1.2).

Goal 2 is to develop an historic resources preservation program, recognizing that effective utilization of the City's historic resources supports community identity and appeal, social and economic vitality, and neighborhood stability. In support of this goal are the following four policies.

- Policy 2.1: Update the City's historic resources ordinance as needed to protect identified historic buildings, sites, trees, gardens, and neighborhoods.
- Policy 2.2: Establish Historic Districts, as appropriate, to protect Whittier's historic neighborhoods and to preserve and enhance the distinctive visual and functional image of Whittier.

- Policy 2.3: Encourage new development near historic structures, sites, or districts to be compatible with the existing significant structures in scale, material, and character.
- Policy 2.4: Encourage the preservation of open areas around historic buildings.

Goal 3 is to promote public awareness of Whittier's history and heritage by promoting, encouraging, and assisting efforts to educate the public about the history, heritage, and resources of Whittier and provide information to the public on tax incentives and financing available for historic preservation activities (Policy 3.1 and 3.2).

The City of Whittier also has the Historic Resources Ordinance found in Chapter 18 Section 84 which provides a high level of protection to designated cultural resources.

Paleontological Resources

Los Angeles County

The County of Los Angeles General Plan Conservation and Open Space Element (1980) contains goals and policies regarding paleontological resources. This general Plan is currently under revision and is expected to have more specific guidance regarding paleontological resources in the updated version. The Conservation and Open Space Element establishes the goals of preserving and protecting sites of historical, archaeological, and scientific values and defines the following policies relative to paleontological resources:

- Protect cultural heritage resources, including historical, archaeological, paleontological, and geological sites
- Encourage public use of cultural heritage sites consistent with the protection of these resources
- Promote public awareness of cultural resources
- Encourage private owners to protect cultural resources

Santa Monica Mountains Local Coastal Program

The Santa Monica Mountains Local Coastal Program (2014) is currently in the process of being approved by the State of California. As it is written, the Local Coastal Program Conservation and Open Space Element includes one goal and four policies relating to paleontological resources. Goal CO-8 requires that the County engage in active preservation of the area's rich and diverse archaeological, paleontological, and historic cultural resources in the Coastal Area. Four policies within this document relate to this goal and the preservation of paleontological resources. The goals require that the County in the Coastal Area protect and preserve archaeological, historical, and paleontological resources from destruction and avoid impacts to such resources where feasible. Where avoidance is not feasible, minimize impacts to resources to the maximum extent feasible. Where development would adversely impact archaeological or paleontological resources as identified by the State Historic Preservation Officer, reasonable mitigation measures shall be required. Mitigation shall be designed to accord with guidelines of the State Office of Historic Preservation and the State of California Native American

Heritage Commission. This document also prohibits the unauthorized collection of paleontological and historic cultural artifacts. Finally, the County must notify all appropriate agencies, including Native American tribes, and the Department of Regional Planning of archaeological or paleontological resources discovered during any phase of development construction to ensure proper surface and site recordation and treatment.

Incorporated Cities in the Project Area

City of Agoura Hills. The City of Agoura Hills has one goal and two policies regarding paleontological resources in the General Plan (City of Agoura Hills 2010). Goal HR-3 requires the protection of significant archaeological and paleontological resources in Agoura Hills. In support of this objective, Policy HR-3.1 requires that the potential for archaeological and paleontological resources be considered prior to development of a property. Policy HR-3.2 requires that significant archaeological and paleontological resources be preserved in situ if feasible and that data recovery mitigation is implemented in the event that avoidance of impacts is not possible.

City of Beverly Hills. Policy HP 1.9 of the City of Beverly Hills General Plan (2010) Historic Preservation Element states that in the event excavation reveals paleontological resources, earth-disturbing work will be suspended until the resource is evaluated; and work can resume only after the find has been appropriately mitigated.

City of Calabasas. The City of Calabasas has two objectives and one policy regarding paleontological resources in the General Plan (City of Calabasas 2008). The City's objectives are to enhance the community's appreciation of the importance of archaeological and paleontological resources and to protect significant resources. In support of this, Policy XI-2 requires that significant archaeological and paleontological resources be preserved in situ if feasible and that data recovery mitigation is implemented in the event that avoidance of impacts is not possible.

City of Cerritos. The City of Cerritos General Plan Conservation Element (City of Cerritos 2004) has one goal and two policies regarding cultural resource preservation. Per the City's General Plan EIR (2004), cultural resources include both archaeological and paleontological resources. Goal CON-8 is to enhance preserve and protect the City's historic and cultural resources by ensuring that all items of historic and cultural significance are preserved (Policy CON-8.1) and that all potential resources are identified, recorded, mapped, and evaluated (Policy CON-8.2).

City of Chino Hills. The City of Chino Hills has one goal, one policy, and three actions regarding paleontological resources in the General Plan Update (City of Chino Hills 2014). Goal CN-2 is to protect Chino Hills' Cultural Resources and Policy CN-2.2 is to protect the City's paleontological resources specifically. In support of this objective, Actions CN-2.2.1, CN-2.2.2, and CN-2.2.3 require appropriate paleontological surveys during the environmental review process, on-site inspections by a qualified paleontologist during grading in areas where paleontological resources may be present, and that identified paleontological material be preserved.

City of Glendale. The City of Glendale's Open Space and Conservation Element of the City of Glendale General Plan (2005) has one policy regarding paleontological resources. Policy 3 requires that the City recognize and maintain cultural and paleontological resources and structures and that cultural resources should be subject to judicious management.

City of Los Angeles. The City of Los Angeles (City of Los Angeles 2001) in Section 3 of the Conservation Element of the General Plan requires that measures be taken to protect the city's archaeological and paleontological resources for historical, cultural, research and/or educational purposes. One policy and one program support this requirement. This policy requires that the City continue to identify and protect significant archaeological and paleontological sites and/or resources known to exist or are identified during land development, demolition, or property modification activities.

City of Malibu. The City of Malibu General Plan Conservation Element (1995) has one goal, one objective, two policies, and multiple implementation measures regarding paleontological resource preservation. Con Goal 2 and Con Objective 2.1 are to preserve and project cultural resources for future generations and scientific study. In support of this, Con Policies 2.1.1 and 2.2.2 require that the City identify, designate, protect, and preserve areas and sites of paleontological significance and that destruction of resources be avoided. Con Implementation Measures 77-79 and 82-84 outline specific actions to implement the policies, including, but not limited to, impact assessments, paleontological surveys, and formulation and implementation of project mitigation measures.

City of Palmdale. The City of Palmdale has one goal, one objective, and two policies regarding paleontological resources in the General Plan's Environmental Resources element (City of Palmdale 1993). Goal ER7 requires that the City protect historical and culturally significant resources which contribute to the community's sense of history. Objective ER7.1 states that the City shall promote the identification and preservation of historic structures, historic sites, archaeological sites, and paleontological resources in the City. In support of this objective, Policy ER7.1.3 requires that new development protect significant historic, paleontological, or archaeological resources or provide for other appropriate mitigation. Additionally, Policy ER7.1.4 states that the City shall develop and maintain a cultural sensitivity map and require special studies/surveys to be prepared for any development proposals in areas reasonably suspected of containing cultural resources, or as indicated on the sensitivity map.

City of Pasadena. The General Plan of the City of Pasadena Land Use Element (City of Pasadena 2004) has one objective and one policy regarding paleontological resources. Objective 19 requires that the City protect and enhance areas of the city containing important biological resources; protect and minimize disturbance of any important paleontological and/or archaeological resources that might remain in the city. Policy 19.3, Paleontological/Archaeological Resources Survey, requires that project proponents proposing substantial grading or earthmoving in areas that might contain important paleontological and/or archaeological resources shall conduct a pre-excavation field assessment and literature search to determine the potential for disturbance of paleontological and/or archaeological resources. If warranted, grading and other earthmoving activities shall be monitored by a qualified professional who,

if necessary, shall undertake salvage and curation. Any paleontological or archaeological resources recovered shall be documented and archived appropriately.

City of San Dimas. The City of San Dimas has one goal, one objective, and one policy regarding paleontological resources in the General Plan Conservation Element (City of San Dimas 1991). Goal CN-2 is to conserve the historical and cultural resources of the City (including paleontological resources). Objective 2.1 is to promote the conservation of resources through programs and policies to both identify and protect resources. Policy 2.1.1 requires preservation of significant paleontological sites and evaluation of significance on a case-by-case basis.

City of Santa Monica. Goal HP 1 and Policy HP 1.10 of the City of Santa Monica General Plan (2010) Land Use and Circulation Element address paleontological resources. Goal HP 1 is to preserve and protect historic resources (including paleontological resources) through the land use decision-making process by reviewing proposed potential impacts on unique paleontological resources from proposed developments and incorporating appropriate mitigation measures to protect or document resources.

City of Whittier. The City of Whittier has one goal and one policy regarding paleontological resources in the General Plan Historic Resources Element (City of Whittier 1993). Goal 1 is to determine the nature and extent of the City's cultural heritage (including paleontological heritage) by requiring evaluation of the potential for archaeological and paleontological resources during the environmental review phase of development projects (Policy 1.2). The General Plan also calls for preservation of cultural resources and states that individual preservation measures shall be established based on the significance, need, and available support.

3.4.3.4 Cultural and Paleontological Resources Planning and Methods

Cultural Resources

Identifying Historical Resources

Identifying historical resources within each proposed Project site included a records search and literature review for significant or unique archaeological, architectural, and Native American resources. These records searches were undertaken at various local and regional archives, including the applicable California Historical Resources Information System (CHRIS) center and the Native American Heritage Commission Sacred Lands Files, and through public outreach efforts to appropriate municipalities for local historical resources listings. Various federal and state databases were also consulted, including the National Register of Historic Places, the CRHR, California Historical Landmarks listings, California Points of Historical Interest listings, and the California Office of Historic Preservation's (OHPs) Historic Properties Directory. The records search encompassed a 0.5-mile radius around the construction footprint at each proposed Project site.

Field surveys were also conducted at each proposed Project site to identify or confirm the status of historical resources. Each field survey was conducted by both a professional archaeologist and

architectural historian and included ground-level photography and data entry on tablet computers. Results of the survey for each proposed Project site are found in Chapter 4.

Areas of Potential Effects

For the proposed Project, each proposed Project site has two areas of potential effects (APEs). The direct APE is defined as the maximum extent of ground disturbance required for facility and utility installation and construction, including the project footprint and any needed equipment staging areas or access corridors. The direct APE also includes a depth of construction up to 36 feet below grade, which is the maximum depth usually required for installation of a monopole. The direct APE coincides with the proposed Project site boundary (footprint of construction activities) but also includes a 50-foot buffer in the event of potential inadvertent disturbance adjacent to the site. Excluded areas include those occupied by existing permanent buildings and structures, and/or where it is known that no ground disturbance would occur during Project activities. The direct APE also includes areas where antenna support structures or other infrastructure has been proposed for attachment directly to a building or structure.

The indirect APE encompasses the viewshed within which visual effects on historical resources may occur from newly constructed features within the direct APE, up to a maximum of 0.5 mile around the direct APE. The 0.5-mile radius is based on guidance provided in the FCC's Nationwide PA for the maximum distance that a 200-foot or less communications tower can be seen. The indirect APE does not apply to paleontological resources. Table 3.4-1 shows the types of cultural resources identified within each of the proposed Project sites. Additional information about each proposed Project site is also found in Chapter 4. The APE for cultural resources is not applicable to paleontological resources.

Assessment of Effects

Impact assessment on cultural resources is based on a correlation of the identified historical resources and the location of project activities within the APE. When ground-disturbing project activities overlap with known historical resources sites, or historical buildings or structures are altered during construction, direct adverse impacts can occur. Indirect adverse effects can occur when project activities or out-of-character elements are introduced nearby or within line-of-sight but are not located directly on identified historical resources. The assessment of effects for this Project was determined through the literature review, a review of aerial images, and the on-the-ground site visits. Under CEQA, the determination of effects on historical resources uses four assessment categories: No Impact; Less than Significant Impact; Less than Significant Impact with Mitigation; and Potentially Significant Impact, which would require the development of mitigation measures.

Paleontological Resources

Identifying Paleontological Resources

Identifying the locations and likelihood of occurrence of surface and subsurface paleontological resources involves a review of published geological maps, a literature search of both published and

unpublished scientific literature, an institutional records search, and consultation with local technical experts. For this Project the institutional records search was conducted at the Natural History Museum of Los Angeles County. The procedures used to analyze existing paleontological data are consistent with best practices in mitigation paleontology (Murphey et al. 2014).

Assessment of Effects

The assessment of project effects on paleontological resources uses the Society of Vertebrate Paleontology's (SVPs) "Standard Procedures for Assessment and Mitigation of Adverse Impacts to Paleontological Resources." This guidance (SVP 2010) recognizes four categories of paleontological potential. These are:

High Potential

Rock units from which vertebrate or significant invertebrate, plant, or trace fossils have been recovered are considered to have a high potential for containing additional significant paleontological resources. Rock units classified as having high potential for producing paleontological resources include, but are not limited to, sedimentary formations, some volcanic formations, some low-grade metamorphic rocks containing significant paleontological resources anywhere within their geographical extent, and sedimentary rock units that are suitable for the preservation of fossils. Project activities potentially affecting rock units with a high potential to contain significant paleontological resources require paleontological resource impact mitigation.

Moderate/Unknown Potential

Rock units for which little information is available concerning their paleontological content, geologic age, and depositional environment are considered to have undetermined potential. Further study, typically through field survey, is necessary to determine if these rock units have high or low potential to contain significant paleontological resources. Once these studies are complete, an assessment of potential project effects is determined; and, if necessary, a paleontological resource impact mitigation program can be developed.

Low Potential

Reports in paleontological literature or field surveys by a qualified professional paleontologist may allow determination that some rock units have low potential for yielding significant fossils. Low potential rock units are usually poorly represented by fossil specimens in institutional collections as well. Rock units with low potential to contain significant paleontological resources typically will not require impact mitigation measures to protect fossils.

No Potential

Some rock units have no potential to contain significant paleontological resources. These include, but are not limited to, high-grade metamorphic rocks and plutonic igneous rocks. Rock units with no potential to contain significant paleontological resources require no protection or impact mitigation measures.

Additional information about paleontological resources within each proposed Project site is found in Chapter 4 and Appendix B-4.

3.4.4 Significance Criteria

3.4.4.1 *CEQA Guidelines*

Criteria outlined in the CEQA Guidelines were used to determine the level of significance of identified impacts on cultural resources. Based on Appendix G of the CEQA Guidelines, a project would have a significant cultural resources impact if it were to:

- 1) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5

Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5

Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature

Disturb any human remains, including those interred outside formal cemeteries

Cause a substantial adverse change in the significance of a Tribal cultural resource as defined in Public Resources Code Section 21074

3.4.5 Impact Analysis

3.4.5.1 *Proposed Project*

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?

Threshold: The Project would result in a substantial adverse change if construction and/or operational activities would result in the physical demolition, destruction, relocation, or alteration of a historical resource, including locally significant resources, or its immediate surroundings such that the significance of the resource would be materially impaired. A historical resource would be materially impaired if the Project:

- 1) Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources;

Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to PRC section 5020.1(k) or its identification in a historical resources survey meeting the requirements of PRC section 5024.1(g), unless the public agency reviewing the effects of the Project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA.

Impacts on historical resources at all 54 proposed Project sites are described below and shown in Table 3.4-3. Additional information is also provided in Chapter 4 and Appendix B-4.

No Impact on Historical Resources

Construction Impacts

Activities at 26 of the Proposed Project sites would have no impact on historical resources because these sites either have no identified historical resources within the direct or indirect APEs, or the resources are situated at a distance from the Project site such that Project construction activities would not directly (through construction/ground disturbance) or indirectly (visually) affect any identified resources. Therefore, no mitigation measures are required (see Table 3.4-3).

Operation Impacts

As described in Section 2.1.4, operations and maintenance at the proposed Project sites would consist of inspections, maintenance, testing, and minor repairs. Ground disturbance would be minimal. Because no historical resources are within the direct or indirect APEs, or the resources are situated at a distance from the Project site such that Project activities would not directly (through construction/ground disturbance) or indirectly (visually) affect any identified resources, no mitigation measures are required (see Table 3.4-3). Therefore, there would be no impact on historical resources from operational activities.

Less Than Significant Impact on Historical Resources

Activities at the 18 proposed Project sites listed below would have less than significant impacts on historical resources (see Table 3.4-3).

BUR	BUR1	BUR2	BUR3	FRP	GMT	JOP	JPK	JPK2
LACFCP11	MML	MTL2	PMT	SUN	SUN2	TMT	WMP	WTR

Construction Impacts

The 18 proposed Project sites listed above are situated wholly or partially within Resource No. P-19-186535 and/or Resource No. P-19-187829. P-19-186535 is the Los Angeles National Forest/San Gabriel Mountains National Monument. The resource is considered a historical resource under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Resource No. P-19-187829, is eligible for inclusion in the NRHP as the San Dimas Experimental Forest Historic District. This resource encompasses 17,161 acres of buildings, structures, sites, and landscapes that date to between 1933 and 1952. Included among the contributing landscape elements are the major topographical features found on the forest, because

without this particular topography of streams and canyons forming isolated watersheds, Resource No. P-19-187829 would not have been selected as a location for an experimental forest. The Experimental Forest is the only such forest in southern California and is believed to be the most significant within the U.S. Forest system. Given the enormous size of these two overlapping resources, the small footprint associated with each proposed Project site, and the lack of resource-associated historical buildings, structures, or sites within the 18 APEs, impacts on archaeological or Native American resources would be less than significant; and no mitigation measures are required. Because all 18 of these Project sites are situated on federal land, consultation and coordination with the appropriate agencies is in progress.

Operation Impacts

Operations and maintenance at the 18 proposed Project sites listed above would consist of inspections, maintenance, testing, and minor repairs. Ground disturbance would be minimal (e.g., periodic brush clearance as needed). Given the enormous size of the two overlapping resources, the small footprint associated with each proposed Project site, and the lack of resource-associated historical buildings, structures, or sites within the 18 APEs, indirect (visual) impacts would be less than significant; and no mitigation measures are required. Because all 18 of these Project sites are situated on federal land, consultation and coordination with the appropriate agencies is in progress.

Significant Impacts on Historical Resources

Two of the 54 Project sites (PASPD01 and WAD) would be adversely impacted by Project activities (see Table 3.4-3), and impacts would be significant. Site PASPD01 and Site WAD are described and analyzed below, and mitigation measures to reduce or avoid significant impacts are provided later in this section.

Construction Impacts

Project activities at Site PASPD01 involve construction of a proposed 70-foot monopole (plus 15-foot lightning rod) and associated infrastructure features. Project activities at Site WAD involve the extension of an existing 120-foot monopole to 140 feet and associated infrastructure features. No archaeological or Native American resources have been identified within these Project locations; therefore, there will be no impacts from ground-disturbing activities at these Project locations.

Operation Impacts

Operations and maintenance at Site PASPD01 would consist of inspections, maintenance, testing, and minor repairs; and ground disturbance would be minimal (e.g., periodic brush clearance as needed). Historical resources (architectural) have been identified within each indirect APE. Because these resources are within direct line-of-sight of the proposed monopole, one or more of the historical resources at each proposed Project site would be adversely affected. Proposed activities at Site WAD involve the extension of an existing 120-foot monopole to 140 feet to accommodate additional antennas. This extension would make the monopole visible to historical resources identified within the indirect APE. Based on the proximity of Project activities to identified historical resources at each of the proposed Project sites within this impact category, impacts would be significant.

Project sites ENC1, PWT, TOP, and ZHQ

Construction Impacts

Archaeological resources have been identified within the vicinity of proposed Project sites ENC1, PWT, TOP, and ZHQ; and impacts could occur during ground-disturbing activities. In accordance with the CEQA Guidelines Section 15120(d), FOIA, NHPA Section 304, and ARPA Section 9, the locations and nature of sensitive resources are protected; therefore, specific details about the archaeological resources identified at these proposed Project sites are not provided within this EIR, however, impacts would be significant.

Operation Impacts

Operations and maintenance at proposed Project sites ENC1, PWT, TOP, and ZHQ would consist of inspections, maintenance, testing, and minor repairs. Ground disturbance would be minimal (e.g., periodic brush clearance as needed). Given the nature of the operational activities, impacts on archaeological resources would be less than significant.

Project Site H-69B

Construction Impacts

Proposed Project Site H-69B is situated at an elevation of approximately 2,406 feet above mean sea level (amsl) in an unincorporated area of Los Angeles County. The direct APE is approximately 2.4 acres in size and encompasses mountainous, undeveloped open space. Various portions of the direct APE are forest, patchy low vegetation, and recently graded bare earth; numerous rocky outcrops are present. The southern boundary of the direct APE is crossed by a modern paved road that provides access to large, sparsely scattered residences and undeveloped parcels situated within the indirect APE.

No previously recorded historical resources are within the direct or indirect APEs for this proposed Project site; however, during field surveys, prehistoric archaeological sites and features were newly identified that would meet the criteria for historical resources and an archaeological/ethnographic landscape under the CEQA Guidelines. In accordance with the CEQA Guidelines Section 15120(d), FOIA, NHPA Section 304, and ARPA Section 9, the locations and nature of sensitive resources are protected; therefore, specific details about the archaeological resources identified at this proposed Project site are not provided within this EIR. The condition and status of this proposed Project site were confirmed by a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian during a field survey in January 2015.

Project activities at Site H-69B include attachment of whip antennas and microwave dishes on a proposed 180-foot lattice tower and construction of a new equipment shelter, backup generator, and fuel tank. Construction of a 180-foot lattice tower with a 15-foot lightning rod and the associated antennas and infrastructure features would materially alter surface and subsurface archaeological materials at this proposed Project site and would be visually out of character with the archaeological landscape; therefore, impacts at this proposed Project site would be significant.

Operation Impacts

Operations and maintenance at Project Site H-69B would consist of inspections, maintenance, testing, and minor repairs. Ground disturbance would be minimal (e.g., periodic brush clearance as needed). Given the nature of operation activities, impacts on archaeological and Native American resources would be less than significant.

A 180-foot lattice tower with a 15-foot lightning rod would be visually out of character within this Project site; therefore, indirect (visual) impacts would be significant.

Site LACFCP08

Construction Impacts

Site LACFCP08 is a fire camp situated at an elevation of approximately 1,552 feet amsl in an unincorporated, mountainous area of Los Angeles County. The direct APE is approximately 1.7 acres in size and encompasses developed and undeveloped areas of a Cold War-era military facility that extends into the indirect APE. Within the direct APE, features include two buildings, paved surfaces, sparsely vegetated areas with several mature trees, and a dirt and gravel road. The indirect APE encompasses numerous buildings associated with past military and present Camp 8 activities, residential communities, and several paved and unpaved access roads.

No previously recorded historical resources are within the direct or indirect APEs at this proposed Project site; however, during field surveys, previously unrecorded technical (engineering elements) and administrative (buildings and structures) features of a Cold War-era Nike missile complex were identified within both the direct and indirect APEs that would meet the criteria for historical resources under the CEQA Guidelines. The complex, historically known as LA-78 (Malibu), is a Nike launch site and is one of two related elements associated with the Nike missile program at this general location. The second element (the LA-78 Integrated Fire Control [IFC]), is situated approximately 1.3 miles to the northwest. Both elements of the complex were among 16 Nike missile facilities constructed in a ring around the greater Los Angeles area to defend against Soviet long-range bomber aircraft. LA-78 was activated in 1963, and the entire Nike system was deactivated in 1974. Although this complex has not been formally evaluated for inclusion in the NRHP or CRHR the history and integrity of the elements would meet the eligibility criteria for inclusion in both. As a result, the Nike complex at LACFCP08 is treated as an eligible single resource consisting of multiple contiguous, interrelated, technical, and administrative elements. The condition and status of this proposed Project site was confirmed through archival research and during a field survey conducted by a SOI-qualified archaeologist and architectural historian in January 2015.

Proposed Project construction at Site LACFCP08 includes the attachment of whip and microwave antennas on a proposed 70-foot monopole with a 15-foot lightning rod, construction of a new equipment shelter, and installation of a new back-up generator and fuel tank on a concrete pad. Construction at Site LACFCP08 would be direct and indirect (visual) on the existing Cold War-era resources associated with Nike launch site LA-78 (Malibu). The proposed Project site is within the Nike

site footprint, and installation of the monopole and the associated infrastructure features would both directly and visually impact the Nike landscape; therefore, impacts would be significant.

Operation Impacts

Operations and maintenance at Site LACFCP08 would consist of inspections, maintenance, testing, and minor repairs. Ground disturbance would be minimal (e.g., periodic brush clearance as needed). Given the nature of operation activities, impacts on archaeological and architectural resources would be less than significant.

A 70-foot monopole with a 15-foot lightning rod would be visually out of character within the Nike missile site landscape; therefore, indirect (visual) impacts would be significant.

Site LACFCP09

Construction Impacts

Site LACFCP09 is a fire camp situated at an elevation of approximately 3,867 feet amsl in an unincorporated mountainous area of Los Angeles County. The direct APE is approximately 0.36 acre in size and encompasses developed and undeveloped areas of a Cold War-era military facility that extends into the indirect APE. The direct APE encompasses paved surfaces, landscaped areas, and mature trees with buildings immediately adjacent on three sides. The indirect APE encompasses primarily undeveloped, mountainous terrain and paved and unpaved access roads, as well as several buildings associated with past military and present Camp 9 activities.

Two historical resources are located within the direct and indirect APEs. The two resources are P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. In addition, USFS Resource No. 05015500237 is within both the direct and indirect APEs at this proposed Project site. This resource consists of three separate loci of the Los Pinetos Nike Missile Site, which was constructed in 1955-1956 and deactivated in 1968. The loci are the locations of the administrative area (barracks and support structures), the radar control facility, and the launch control facility. The direct APE is completely encompassed by one of the Nike missile loci, and the remaining two are approximately 1,500 feet to the east and west. The complex of Nike facilities was formally evaluated in 1987 and determined eligible for inclusion in the NRHP.

Project activities at this proposed Project site include the attachment of whip and microwave antennas on a proposed 70-foot monopole with a 15-foot lightning rod; construction of a new equipment shelter; and installation of a backup generator and fuel tank on a concrete pad. The construction of these proposed facilities would directly and adversely affect the Los Pinetos Nike Missile Site, which is eligible for inclusion in the NRHP. The Project site is completely encompassed by one of three discontinuous areas associated with the Nike site (center locus), and installation of the monopole and associated

infrastructure features would both directly and visually impact the Nike landscape. The condition and status of cultural resources at this proposed Project site were confirmed through archival research and during a field survey conducted by both a SOI-qualified archaeologist and architectural historian in December 2014.

Given the enormous size and scale of Resource P-19-186535, the small footprint of the proposed Project site, and the lack of any resource-associated features associated with Resource P-19-186535 at this proposed Project site, impacts would be less than significant.

USFS Resource No. 05015500237 is within both the direct and indirect APEs and is a NRHP-eligible property. Based on the proposed Project activities, direct and indirect (visual) impacts from construction of the 70-foot monopole and the associated infrastructure features would be significant.

Operation Impacts

Operations and maintenance at Site LACFCP09 would consist of inspections, maintenance, testing, and minor repairs. Ground disturbance would be minimal (e.g., periodic brush clearance as needed). Given the nature of the operational activities, impacts on archaeological and architectural resources would be less than significant.

A 70-foot monopole with a 15-foot lightning rod would be visually out of character within the Nike missile site landscape; therefore, indirect (visual) impacts would be significant.

Site LPC

Construction Impacts

Site LPC is situated at an elevation of approximately 4,025 feet amsl in an unincorporated, mountainous area of Los Angeles County. The direct APE is approximately 0.90 acre in size and encompasses developed and undeveloped portions of a Cold War-era military facility that extends into the indirect APE. The direct APE encompasses paved surfaces, areas of sparse vegetation, and remnants of one of three loci of a former Cold War-era Nike missile site. The indirect APE consists primarily of undeveloped, mountainous terrain. Adjacent to the direct APE is a modern communications site with a lattice tower, and approximately 0.30 mile to the east is a second locus of the same Nike missile site.

Two historical resources are located within the direct and indirect APEs. The two resources are P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. In addition, USFS Resource No. 05015500237 is within both the direct and indirect APEs. This resource consists of two of three separate loci of the Los Pinetos Nike Missile Site, which was constructed in 1955-1956 and deactivated in 1968. The loci are the locations of the administrative area (barracks and support structures) and the radar control facility; the third locus

(the launch control facility) is situated just outside the southeast boundary of the indirect APE. The direct APE is completely encompassed by one of the Nike missile loci, and the remaining two are approximately 1,650 to 2,900 feet to the east. The complex of Nike facilities was formally evaluated in 1987 and determined eligible for inclusion in the NRHP.

Project activities at this site include the attachment of whip and microwave antennas on a proposed 70-foot monopole with a 15-foot lightning rod; construction of a new equipment shelter; and installation of a backup generator and fuel tank on a concrete pad. Impacts from construction of the monopole and associated infrastructure features at this proposed Project site would directly and indirectly (visually) impact the existing Cold War-era resources associated with the Los Pinetos Nike Missile Site, which is eligible for inclusion in the NRHP. The Project site is completely encompassed by one of three discontinuous areas associated with the Nike site (westernmost locus), and installation of the monopole would both directly and visually impact the Nike landscape. This was confirmed through archival research and during a field survey conducted by both a SOI-qualified archaeologist and architectural historian in December 2014.

Given the enormous size and scale of Resource P-19-186535, the small footprint of the proposed Project site, and the lack of any site-associated uniquely definable features at this proposed Project site, impacts would be less than significant.

USFS Resource No. 05015500237 is within both the direct and indirect APEs and is a NRHP-eligible property. Based on the proposed Project activities, direct and indirect (visual) impacts from construction of the 70-foot monopole and the associated infrastructure features would be significant,

Operation Impacts

Operations and maintenance at Site LPC would consist of inspections, maintenance, testing, and minor repairs. Ground disturbance would be minimal (e.g., periodic brush clearance as needed). Given the nature of the operational activities, impacts on archaeological and architectural resources would be less than significant.

A 70-foot monopole with a 15-foot lightning rod would be visually out of character within the Nike missile site landscape; therefore, indirect (visual) impacts would be significant.

Cultural Resources Mitigation Measures

Mitigation measures and the proposed Project sites for which they are required are described below and shown in **Error! Reference source not found.** Requirements for mitigation are determined through a combination of historical records reviews, which occurs during early planning, and finalized upon completion of field surveys and the assessment of impacts on identified historical resources. Construction and operational personnel will be notified well in advance of construction for proposed Project sites with cultural resources constraints and required mitigation measures. Additional information about all 54 proposed Project sites is provided in Chapter 4 and Appendix B-4.

CUL MM 1: Archaeological or Native American Monitoring – Prehistoric Resources

At Project sites with known or potential presence of prehistoric archaeological material (artifacts and/or features) within the defined APEs, qualified archaeological or Native American monitors shall be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations. Monitors will also be responsible for restricting access by construction personnel to any identified archaeological resources as noted in this EIR section or Chapter 4. The direct and indirect APEs are defined in Section 3.4.3.4.

The archaeological monitor will, at a minimum, have a B.A. in anthropology or related field or will have successfully completed an archaeological field methods school. The monitor will work under the supervision of an archaeologist who meets the Secretary of the Interior's Professional Qualifications Standards (Project Archaeologist). The standards are published in CFR 36 Part 61 and found on the National Park Service website at http://www.nps.gov/history/local-law/arch_stnds_9.htm.

In the event that prehistoric archaeological material is unexpectedly discovered within the APE, the procedures set forth in CUL MM 3 shall be followed.

CUL MM 2: Archaeological Monitoring – Historic-Age Resources

At proposed Project sites with known or potential presence of historic-age archaeological material (artifacts and/or features) within the defined APEs, a qualified archaeological monitor shall be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations. Monitors will also be responsible for restricting access by construction personnel to any identified archaeological resources as noted in this EIR section or Chapter 4. The direct and indirect APEs are defined at the beginning of this EIR section.

The archaeological monitor will, at a minimum, have a B.A. in anthropology or related field or will have successfully completed an archaeological field methods school. The monitor will work under the supervision of an archaeologist who meets the Secretary of the Interior's Professional Qualifications Standards (Project Archaeologist). The standards are published in CFR 36 Part 61 and found on the National Park Service website at http://www.nps.gov/history/local-law/arch_stnds_9.htm.

CUL MM 3: Unexpected Discovery of Archaeological Materials

In the event that previously unidentified prehistoric or historic-age archaeological resources are uncovered, the following actions shall be taken:

- 1) All ground-disturbing work within 165 feet (50 meters) of the discovery shall be halted. The qualified archaeological monitor will mark the immediate area with highly visible flagging and immediately notify the Project Archaeologist.
- 2) The Project Archaeologist shall inspect the discovery and determine whether further investigation is required. If the discovery can be avoided and no further impacts will occur, the resource shall be documented on California State Department of Parks and Recreation cultural resource record forms, and no further effort shall be required.
- 3) If the resource cannot be avoided and may be subject to further impact, the Project Archaeologist shall evaluate the resource and determine whether it is (1) eligible for inclusion in the NRHP and is thus a historic property for the purposes of the NHPA and NEPA; (2) eligible for the CRHR and thus a historical resource for the purposes of CEQA; (3) a “unique” archaeological resource as defined by CEQA; (4) a Tribal resource as defined by AB 52. If the resource is determined not to be significant under any of these four categories, work may commence in the area following collection (as appropriate) and recording, including mapping and photography, of the archaeological materials or features.
- 4) If the resource meets the criteria for any or all of the categories described in CUL MM3, work shall remain halted, and the Project Archaeologist shall consult with LA-RICS Authority staff regarding methods to ensure that no substantial adverse changes occur. Preservation in place (i.e., avoidance) is the preferred method of ensuring no substantial adverse impacts occur on historic properties/historical resources and shall be required unless other equally effective methods are agreed upon among the Project Archaeologist, the Authority, and any other stakeholders.

If the archaeological material appears to represent a site – defined as three or more artifacts and/or features in an intact deposit – an archaeological test program (Phase II) may be necessary. Associated mitigation measures include, but are not limited to, collection of the archaeological materials, recordation (e.g., DPR Primary Record and Site Forms), and analysis of any significant cultural materials in accordance with a Data Recovery Plan, and curation of artifacts at an approved curation facility. A curation agreement for this Project is already in place with the University of California, Los Angeles, Archaeological Collections Facility at the Fowler Museum. At the completion of the appropriate mitigation measures, a professional-level technical report shall be filed with the appropriate California Historical Resources Information System (CHRIS) Information Center (IC).

- 5) Work at the project location may commence upon completion of the appropriate mitigation treatment(s).

CUL MM 4: Unexpected Discovery of Human Remains

In the event that human remains are unexpectedly encountered, the following procedures shall immediately be followed. This guidance is also provided on the NAHC's website at <http://nahc.ca.gov/resources/discovery-of-native-american-human-remains-what-to-do/>.

- 1) All construction activity shall stop immediately, and the Project Archaeologist shall be notified. The Project Archaeologist will contact the Los Angeles (or applicable) County Coroner. The list of California Coroners can be found on the Native American Heritage Commission's website at <http://nahc.ca.gov/2015/06/implementation-of-ab52-sample-letters-request-for-formal-notification-and-request-for-consultation/>.
- 2) The Coroner has two working days to examine human remains after being notified by the responsible person. If the remains are Native American, the Coroner has 24 hours to notify the Native American Heritage Commission.
- 3) The Native American Heritage Commission will immediately notify the person it believes to be the most likely descendent of the deceased Native American.
- 4) The most likely descendent has 48 hours to make recommendations to the owner, or representative, for the treatment or disposition, with proper dignity, of the human remains and grave goods.
- 5) If the descendent does not make recommendations within 48 hours the owner shall reinter the remains in an area of the property secure from further disturbance, or;
- 6) If the owner does not accept the descendant's recommendations, the owner or the descendent may request mediation by the Native American Heritage Commission.

CUL MM 5: Architectural Resources Protection and Camouflage

Attachment of Equipment to Historic Buildings and Structures

For historic buildings or structures where communications-related equipment will be attached, the following preservation practices shall be employed, as applicable, to ensure that impacts are less than significant:

- 1) When running new exterior wiring to a historic building, existing entry points shall be utilized. If a new entry point is required, the entry shall be placed at the rear of the building or in an area on the side of the building where it will be hidden by an existing architectural feature.
- 2) When wireless nodes, antennas, microwave or satellite dishes, etc. are installed on historic buildings, existing mounting points shall be utilized. For new mounts, nonpenetrating mounts shall be used.
- 3) Equipment shall be placed where it does not detract from the building's overall appearance; roof-mounted equipment shall be placed where it will not be visible from accessible locations at grade. Adequate structural support for the new equipment and design shall be ensured, and a system that minimizes the number of cutouts or holes in structural members and historic material shall be installed. Existing building features shall be used to conceal equipment.
- 4) New equipment installations on a historic building that will be visible shall be painted or color-matched to the surrounding building materials. Concealment with color-matched FRP (fiberglass reinforced plastic) shrouds (boxes) is acceptable.
- 5) Any supports or brackets for new equipment shall be color-matched to the existing materials.
- 6) The installation of exterior wiring shall be minimized; where unavoidable, the wiring will be color-matched to the original building material to reduce the visual impact.
- 7) Equipment shall not be directly anchored into stone or brick; mortar joints for anchoring the equipment will be utilized.
- 8) Rust-resistant mounts to prevent staining of the building materials shall be used.
- 9) Reversible mounting techniques shall be used to avoid damage to building materials.
- 10) Installation of underground cable or conduit at a historical resource shall be undertaken in a manner that considers the stability of the historic building, including limiting any new excavations adjacent to historic foundations that could undermine the structural stability of the building and avoiding landscape or other changes that could alter drainage patterns and cause water-related damage to the building.

- 11) New interior wiring shall utilize space in existing chases, closets, or shafts.
- 12) Equipment and systems shall be installed to cause the least alteration possible to the building's floor plan and the least damage to the historic building material.
- 13) Vertical runs of conduit and cables shall be placed in closets, service rooms, and wall cavities to create the least intrusion into the historic fabric of the building and to avoid major intervention into the wall and floor systems.

Architectural Camouflage

All new towers and monopoles or a proposed increase in the height of existing towers and monopoles that would cause adverse visual impacts on historical resources that are adjacent or within the viewshed shall be camouflaged. All camouflage implemented for the proposed Project shall be sympathetic to the existing landscape (<http://www.generalcode.com/codification/sample-legislation/cell-towers>) and/or in accordance with applicable municipal codes (http://clkrep.lacity.org/onlinedocs/2009/09-2645_RPT_ATT_Y_06-07-11.pdf). Tower disguises may include, but are not limited to, painting and various types of concealments, including clock/water towers, flag/light poles, silos, trees, and unique site-specific designs. Such measures must be consistent with the Secretary of the Interior's Standards/Guidelines for the Treatment of Historic Properties (see Attachment of Equipment discussion above).

Impacts after Mitigation

Based on historical research and verified through pedestrian surveys conducted between late 2014 and early 2015, no historical resources would be impacted by Project activities at 26 of the 54 proposed Project sites. Project activities at 18 proposed Project sites would have less than significant impacts on historical resources, and 6 proposed Project sites would have adverse effects that can be mitigated to less than significant levels. The remaining four proposed Project sites would have significant unavoidable impacts for which no feasible mitigation would reduce impacts to less than significant levels. The various proposed Project sites associated with these determinations are listed in Table 3.4-3.

Table 3.4-3. Proposed Project Sites by Impact Level – Archaeological and Architectural Resources

Impact Level	No Historical Resources impacted	Less Than Significant Impacts	Adverse Impacts Mitigated to Less than Significant Levels	Significant and Unavoidable Impacts
Sites	AGH**, AJT, ASD, BJM, CPK, DPK, ENT**, FTP, GRM, H-17A, LACF072, LARICSHQ, LEPS**, MMC, OAT, PDC, PHN, RIH, SDW, SGH, SIM, SPN, TPK, TWR, VPK, WS1	BUR*, BUR1*, BUR2*, BUR3*, FRP*, GMT*, JOP*, JPK*, JPK2*, LACFCP11*, MML*, MTL2*, PMT*, SUN*, SUN2*, TMT*, WMP*, WTR*	PASPD01, PWT*, WAD, ENC1, TOP, ZHQ	H-69B, LACFCP08*, LACFCP09*, LPC*

* Proposed Project sites on federal lands require consultation and coordination with the appropriate federal agency.
 ** Based on records searches and field surveys, there are no archaeological sites within the direct APE of this project site and there would be no impacts; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

Mitigation Measures Required to Reduce Impacts to Less than Significant Levels

Mitigation measures required to reduce adverse impacts to less than significant levels are shown by Project site in **Error! Reference source not found.** and described in the following sections.

Sites PASPD01, and WAD

Construction of a monopole at Site PASPD01 and the extension of the existing monopole at the Site WAD would cause adverse visual impacts on one or more identified historical resources within the indirect APE at each site; however, by disguising or camouflaging the monopole using paint or architectural screening, visual effects would be minimized and impacts would be reduced to less than significant levels (CUL MM 5).

Sites ENC1, PWT, TOP, and ZHQ

Construction of proposed monopoles would cause adverse impacts on archaeological resources located within the vicinity of the ENC1, PWT, TOP, and ZHQ Project sites. To ensure that subsurface prehistoric archaeological resources are not disturbed, an archaeologist or Native American monitor will be present during all ground-disturbing activities. Through implementation of CUL-MM 1, CUL MM 3, and CUL MM 4, impacts on archaeological resources would be reduced to less than significant levels.

Table 3.4-4. Mitigation Measures Required to Reduce Adverse Impacts to Less than Significant Levels by Project Site

Mitigation Measure	CUL MM 1 Prehistoric Archaeological Resources - Archaeological or Native American Monitoring**	CUL MM 2 Historic-Age Archaeological Resources - Archaeological Monitoring	CUL MM 3 Unexpected Discovery of Archaeological Materials	CUL MM 4 Unexpected Discovery of Human Remains	CUL MM 5 Architectural Resources Protection and/or Camouflage
AGH***	X	N/A	X	X	N/A
ENC1	X	N/A	X	X	N/A
ENT***	X	N/A	X	X	N/A
LEPS***	X	N/A	X	X	N/A
PASPD01	N/A	N/A	X	N/A	X
PWT*	X	N/A	X	X	N/A
TOP	X	N/A	X	X	N/A
WAD	N/A	N/A	N/A	N/A	X
ZHQ	X	N/A	X	X	N/A
* Proposed Project sites on federal lands require consultation and coordination with the appropriate federal agency. ** May also require restricted access to identified archaeological resources by construction and operational personnel. *** Based on records searches and field surveys, there are no archaeological sites within the direct APE of this project site and there would be no impacts; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.					

Site H-69B

Archaeological monitors would be required during all ground-disturbing activities at Site H-69B. Because of the proximity of archaeological resources to the Project construction area, access to archaeological areas would also be restricted to all construction and operational personnel. With implementation of CUL MM 1, CUL MM 3, and CUL MM 4, impacts would be minimized; however, given the magnitude of the ground disturbance and the location and extent of the resources present at this site, mitigation measures would not reduce impacts to less than significant levels.

Standard approaches to mitigation for towers (painting/camouflage) (i.e., CUL MM 5), particularly for towers of this height, would not be effective and would not reduce the visual impacts to less than significant levels. In addition, the painting of tall telecommunications towers is controlled by FAA Advisory Circulars 47 CFR § 17.21-17.58 to prevent aviation hazards; therefore, painting would not be a feasible mitigation at this Project site.

Even with implementation of the required mitigation measures referenced and discussed above and shown in Table 3.4-5, impacts would not be reduced to less than significant levels. Therefore, impacts at Site H-69B would be significant and unavoidable.

Site LACFCP08

Archaeological monitors would be required during all ground-disturbing activities at Site LACFCP08. In addition, the proposed monopole would be out of character with the Cold War-era Nike landscape; therefore, camouflage of the monopole would be required. With implementation of CUL MM 2, CUL MM 3, and CUL MM 5, impacts on historical resources would be minimized; however, given the magnitude of the ground disturbance and the extent of the resources present at this site, even with implementation of the required mitigation measures referenced and discussed above and shown in Table 3.4-5, impacts would not be reduced to less than significant levels. Therefore, impacts at this Project site would be significant and unavoidable.

Because this site is situated on National Park Service (NPS) land, consultation with this agency is in progress.

Site LACFCP09

Archaeological monitors would be required during all ground-disturbing activities at Site LACFCP09. In addition, the proposed monopole would be out of character with the Cold War-era Los Pinetos Nike Missile Site landscape; therefore, camouflage of the monopole would be required. With implementation of CUL MM 2, CUL MM 3, and CUL MM 5, impacts on historical resources would be minimized; however, given the magnitude of the ground disturbance and the extent of the resources present at this site, even with implementation of the required mitigation measures referenced and discussed above and shown in Table 3.4-5, impacts would not be reduced to less than significant levels. Therefore, impacts at Site LACFCP09 would be significant and unavoidable.

Because this site is situated on USFS land, consultation with this agency is in progress.

Site LPC

Archaeological monitors would be required during all ground-disturbing activities at Site LPC. In addition, the proposed monopole would be out of character with the Cold War-era Los Pinetos Nike Missile Site landscape; therefore, camouflage of the monopole would be required. With implementation of CUL MM 2, CUL MM 3, and CUL MM 5, impacts would be minimized; however, given the magnitude of the ground disturbance and the extent of the resources present at this site, even with implementation of the required mitigation measures referenced and discussed above and shown in Table 3.4-5, impacts would not be reduced to less than significant levels. Therefore, impacts at Site LPC would be significant and unavoidable.

Because this site is situated on USFS land, consultation with this agency is in progress.

Table 3.4-5: Mitigation Measures Identified for Proposed Project Sites

Mitigation Measure	CUL MM 1 Prehistoric Archaeological Resources - Archaeological or Native American Monitoring**	CUL MM 2 Historic-Age Archaeological Resources - Archaeological Monitoring	CUL MM 3 Unexpected Discovery of Archaeological Materials	CUL MM 4 Unexpected Discovery of Human Remains	CUL MM 5 Architectural Resources Protection and/or Camouflage
Mitigation Measures Identified for Proposed Project Sites with Significant and Unavoidable Impacts					
H-69B	X	N/A	X	X	+
LACFCP08*	N/A	X	X	N/A	X
LACFCP09*	N/A	X	X	N/A	X
LPC*	N/A	X	X	N/A	X
* Proposed Project sites on federal lands require consultation and coordination with the appropriate federal agency. ** May also require restricted access to identified archaeological resources by construction and operational personnel. + Infeasible mitigation based on FAA Advisory Circulars 47 CFR § 17.21-17.58					

Impacts after Mitigation

Given the magnitude of the ground disturbance and the extent of the resources present at Project sites H-69B, LACFCP08, LACFCP09, and LPC, even with implementation of the required mitigation measures referenced and discussed above, impacts would not be reduced to less than significant levels. Therefore, impacts at these four Project sites would be significant and unavoidable.

Operation Impacts

As described in Section 2.1.4, operations and maintenance at the proposed Project sites would consist of inspections, maintenance, testing, and minor repairs. Ground disturbance would be minimal; therefore, impacts on historical resources during routine operation at the proposed Project sites would be less than significant.

As described above, construction of either a 70-foot monopole or 180-foot lattice tower at Project sites H-69B, LACFCP08, LACFCP09, and LPC would be a significant visual impact on identified historical resources and historic districts. Mitigation Measures

Mitigation measures as described above (i.e., camouflage for the 70-foot monopoles) would minimize the visual effects but would not reduce the impacts to less than significant levels on the identified historical resources and historic districts. There is no feasible mitigation to avoid the impacts of locating a 180-foot lattice tower at Site H-69B; therefore, even with implementation of the required mitigation measures, impacts would be significant and unavoidable.

Impacts after Mitigation

Given the magnitude of the ground disturbance and the extent of the resources present at Project sites H-69B, LACFCP08, LACFCP09, and LPC, implementation of the required mitigation measures referenced and discussed above would not reduce impacts to less than significant levels. Therefore, impacts at these four Project sites would be significant and unavoidable.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Construction Impacts

Construction impacts on archaeological resources would be the same as those described for the subset of eight proposed Project sites encompassing the prehistoric and historic archaeological sites discussed under CUL-1 (ENC1, H-69B, LACFCP08, LACFCP09, LPC, PWT, TOP, and ZHQ) (see Table 3.4-4 and Table 3.4-5). Based on the location and type of project activities and the extent of resources at these proposed Project sites, construction impacts would be significant. Additional information about these eight sites is provided in the discussion of CUL-1, Chapter 4, and Appendix B-4.

Mitigation Measures

Because prehistoric archaeological materials have been identified within the vicinity of Project sites ENC1, H-69B, PWT, TOP, and ZHQ, archaeological monitoring will be required (CUL MM 1, CUL MM 3, and CUL MM 4) at these five Project sites (see CUL 1, Chapter 4, and Appendix B-4).

Given the potential for historic archaeological resources at Project sites LACFCP08, LACFCP09, and LPC, archaeological monitoring during all ground-disturbing activities (CUL MM 2 and CUL MM 3) would be implemented at these three project sites (see CUL 1, Chapter 4, and Appendix B-4).

Impacts after Mitigation

At sites ENC1, PWT, TOP, and ZHQ impacts on prehistoric archaeological resources would be significant; however, with implementation of mitigation measures CUL MM 1, CUL MM 3, and CUL MM 4, impacts would be reduced to less than significant (see CUL 1, Chapter 4, and Appendix B-4).

At Site H-69B, impacts on prehistoric archeological resources would be significant. Based on the nature of this site, the location of Project activities, and the extent and location of the resources CUL MM 1, CUL MM 3, and CUL MM 4 would be implemented to minimize impacts; however, the impacts would remain significant and unavoidable (see CUL 1, Chapter 4, and Appendix B-4).

At sites LACFCP08, LACFCP09, and LPC, impacts on historic archeological resources would be significant. Based on the historical significance of these project sites and the extent and location of the resources CUL MM 2 and CUL MM 3 would be implemented to minimize impacts; however, the impacts would remain significant and unavoidable (see CUL 1, Chapter 4, and Appendix B-4).

Operation Impacts

As described in Section 2.1.4, operations and maintenance at the proposed Project sites would consist of inspections, maintenance, testing, and minor repairs. Ground disturbance would be minimal; therefore, impacts on archaeological resources during routine operation at the proposed Project sites would be less than significant.

Mitigation Measures

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Construction Impacts

Project activities would have a significant impact on paleontological resources at 24 of the proposed Project sites. No impacts are expected at the remaining 30 proposed Project sites (see Table 3.4-6). Additional details about these proposed Project sites are provided in Chapter 4 and Appendix B-4.

Mitigation Measures

CUL MM 6: Paleontological Resources Monitoring Plan

A Paleontological Resources Monitoring Plan shall be developed and approved prior to construction to guide the activities of monitors during ground-disturbing activities. The plan would include, but not be limited to, a description of the project location, the regulatory framework, site-specific impact mitigation requirements designed to reduce impacts to less than significant, specific locations and construction activities requiring monitoring and/or spot checking, and procedures to follow for construction monitoring and fossil discovery and recovery, and a repository agreement with the Natural History Museum of Los Angeles County or other accredited repository. Mitigation measures that may be implemented to ensure that impacts to paleontological resources would be reduced to less than significant may include but are not limited to the following:

- a) Worker awareness training on paleontological resources presented to construction personnel prior to the start of construction. The training should include at minimum, the following:
 - The types of fossils that could occur at the project site
 - The procedures that should be taken in the event of a fossil discovery
 - Laws protecting paleontological resources
 - Penalties for destroying or removing paleontological resource

- b) Paleontological monitoring during ground disturbance at all sites with moderate/unknown or high paleontological potential
- c) Salvage of significant fossil resources
- d) Screenwashing of matrix samples for microfossils
- e) Laboratory preparation of recovered fossils to the point of identification and curation
- f) Identification of recovered fossils to the lowest possible taxonomic order
- g) Curation of significant fossils at the Natural History Museum of Los Angeles County or other accredited repository
- h) Preparation of a final monitoring report that includes at a minimum the dates of field work, results of monitoring, fossil analyses, significance evaluation, conclusions, locality forms, and an itemized list of specimens.

The Plan shall be submitted to the Authority for review and approval and finalized at least 14 days prior to the start of construction.

CUL MM 7: Paleontological Resources Monitoring

Paleontological monitoring shall be conducted by a qualified paleontological monitor who has demonstrated experience in the collection and salvage of fossil materials. An undergraduate degree in geology or paleontology is preferable but is less important than documented experience performing paleontological monitoring and mitigation. The monitor will work under the supervision of a Principal Paleontologist.

The qualified professional paleontological monitor shall be present during ground disturbance at all sites with moderate/unknown or high paleontological potential, and as specified in the Paleontological Resources Monitoring Plan prepared in accordance with CUL MM 6. The monitor shall be present during all subsurface excavation for tower or monopole foundations and during grading for access roads and structure foundations. Any sites that require monitoring or mitigation within the Angeles National Forest will require a qualified paleontologist to have a U.S. Department of Agriculture Forest Service-Temporary Special-Use Permit for paleontology. Based on the specific site conditions observed during monitoring (type of sediment impacted, previous disturbances, nature of site conditions), the Principal Paleontologist may reduce or increase monitoring efforts in consultation with the Agency.

In the event that a previously unidentified paleontological resource is uncovered, the following actions shall be taken:

- 1) All ground-disturbing work within 50 feet of the discovery shall be halted. A qualified paleontologist shall divert or direct construction activities in the area of an exposed fossil in order to facilitate evaluation and, if necessary, salvage of the exposed fossil. Work shall not resume in the discovery area until authorized by the qualified paleontologist.
- 2) The paleontologist shall inspect the discovery and determine whether further investigation is required. If the discovery can be avoided and no further impacts will occur, no further effort shall be required.
- 3) If the resource cannot be avoided and may be subject to further impact, the paleontologist shall evaluate the resource and determine whether it is “unique” under CEQA, Appendix G, Part V. If the resource is determined not to be unique, work may commence in the area.
- 4) If the resource is determined to be a unique paleontological resource, work shall remain halted, and the paleontologist shall consult with LA-RICS Authority staff regarding methods to ensure that no substantial adverse change would occur to the significance of the resource. Preservation in place (i.e., avoidance) is the preferred method of ensuring that no substantial adverse impacts occur to the resource and shall be required unless other equally effective methods are available. Other methods include ensuring that the fossils are scientifically recovered, prepared, identified, catalogued, and analyzed according to current professional standards.
- 5) Due to the small nature of some fossils, a fine mesh screen may be used at the discretion of the paleontologist to screen matrix test samples on-site during monitoring. Additionally, bulk matrix samples may be collected and transported to a laboratory facility for processing.
- 6) Provisions for preparation and identification of any fossils collected shall be made before donation to a suitable repository.
- 7) All recovered fossils shall be curated at the Natural History Museum of Los Angeles County, or a local accredited and permanent scientific institution according to Society of Vertebrate Paleontology standard guidelines standards. Work may commence upon completion of the appropriate treatment and the approval from the Authority.

Table 3.4-6. Proposed Project Sites by Impact Level – Paleontological Resources

Impact Level	No Impacts	Less Than Significant Impacts with Mitigation
Site IDs	BJM, BUR, BUR1, BUR2, BUR3, DPK, ENC1, FRP, FTP, GMT, JOP, JPK, JPK2, LACF072, LACFCP09, LACFCP11, LPC, MMC, MML, MTL2, PMT, SUN, SUN2, TMT, TPK, TWR, VPK, WAD, WMP, WTR	AGH, AJT, ASD, CPK, ENT, GRM, H-17A, H-69B, LACFCP08, LARICSHQ, LEPS, OAT, PASPD01, PDC, PHN, PWT, RIH, SDW, SGH, SIM, SPN, TOP, WS1, ZHQ

Impacts after Mitigation

With implementation of CUL MM 6 and CUL MM 7, impacts on paleontological resources would be less than significant. Implementation of CUL MM 6 and CUL MM7 would ensure that any paleontological resources identified during ground-disturbing activities are appropriately identified, characterized, and, as applicable, mitigated to reduce impacts to less than significant levels.

Operation Impacts

As described in Section 2.1.4, operations and maintenance at the proposed Project sites would consist of inspections, maintenance, testing, and minor repairs. Ground disturbance from minor repairs or brush clearance would be minimal; therefore, impacts on paleontological resources during routine operation at the proposed Project sites would be less than significant.

Mitigation Measures

No mitigation measures are required.

CUL-4: Would the project disturb any human remains, including those interred outside formal cemeteries?

Construction Impacts

Proposed Project sites having the potential for human remains include ENC1, H-69B, PWT, TOP, and ZHQ (see Table 3.4-4 and Table 3.4-5). Based on the location and type of project activities and the extent of resources at these proposed Project sites, construction impacts would be significant. Additional details about these sites are provided in the discussions of CUL-1 and CUL-2, Chapter 4, and Appendix B-4.

Mitigation Measures

CUL MM 1, CUL MM 3, and CUL MM 4 are proposed for all five Project sites with the potential for human remains (ENC1, H-69B, PWT, TOP, and ZHQ). Additional details about these proposed sites are provided in the discussions of CUL-1 and CUL-2, Chapter 4, and Appendix B-4.

Impacts after Mitigation

With implementation of CUL MM 1, CUL MM 3, and CUL MM 4, impacts at proposed Project sites ENC1, PWT, TOP, and ZHQ would be less than significant. Implementation of the mitigation measures would ensure that any human remains identified during ground-disturbing activities are appropriately identified, characterized, reported to the appropriate authorities, and, as applicable, mitigated to reduce impacts to less than significant levels.

Impacts at proposed Project Site H-69B would remain significant, even with implementation of CUL MM 1, CUL MM 3, and CUL MM 4, given the type of project activities and the extent of archaeological resources at this Project site. Therefore, impacts at Site H-69B would be significant and unavoidable.

Operation Impacts

As described in Section 2.1.4, operations and maintenance at the proposed Project sites would consist of inspections, maintenance, testing, and minor repairs. Ground disturbance from minor repairs or brush clearance would be minimal; therefore, impacts on human remains during routine operation at the proposed Project sites would be less than significant.

Mitigation Measures

No mitigation measures are required.

CUL-5: Would the project cause a substantial adverse change in the significance of a Tribal cultural resource as defined in Public Resources Code Section 21074?

Construction Impacts

Proposed Project sites having the potential for Tribal resources include ENC1, H-69B, PWT, TOP, and ZHQ (see Table 3.4-4 and Table 3.4-5). Based on the location and type of Project activities and the extent of resources at these proposed Project sites, construction impacts would be significant. Additional details about these sites are provided in Chapter 4 and Appendix B-4.

Mitigation Measures

CUL MM 1, CUL MM 3, and CUL MM 4 are proposed for all five Project sites with the potential for Tribal resources (ENC1, H-69B, PWT, TOP, and ZHQ). Additional details about these proposed sites are provided in discussions of CUL-1 and CUL-2, Chapter 4, and Appendix B-4.

Impacts after Mitigation

With implementation of CUL MM 1, CUL MM 3, and CUL MM 4, impacts at proposed Project sites ENC1, PWT, TOP, and ZHQ would be less than significant. Implementation of the mitigation measures would ensure that any Tribal resources identified during ground-disturbing activities are appropriately identified, characterized, and, as applicable, mitigated to reduce impacts to less than significant levels.

Impacts at Site H-69B would remain significant, even with implementation of CUL MM 1, CUL MM 3, and CUL MM 4, given the type of Project activities and the extent of archaeological resources at this site. Impacts would be significant and unavoidable.

Operation Impacts

As described in Section 2.1.4, operations and maintenance at the proposed Project sites would consist of inspections, maintenance, testing, and minor repairs. Ground disturbance from minor repairs or brush clearance would be minimal; therefore, impacts on Tribal resources during routine operation at the proposed Project sites would be less than significant.

Mitigation Measures

No mitigation measures are required.

3.4.5.2 No Project Alternative

Under the No Project Alternative, the proposed Project sites would not be developed as communications sites. As a result, no historical resources would be affected by implementation of this alternative.

3.4.6 Cumulative Impact Analysis of the Proposed Project

3.4.6.1 Geographic Extent

Cultural Resources

The geographic area for the analysis of cumulative impacts on cultural resources (i.e., historical resources as defined in CEQA Guidelines Section 15064.5(a) and Section 3.4.3.2 of this EIR) encompasses 18 project locations situated across a large area of Los Angeles County. The 18 Project sites are a subset of the sites shown in Table 2.7-1 and include AGH, ENT, LARICSHQ, LEPS, MML, OAT, PASPD01, PDC, PHN, PWT, RIH, SDW, SGH, SIM, SUN, SUN2, WS1, and ZHQ.

Cumulative analysis for historical resources was performed on a site-by-site basis and considered the impacts of past, present, and reasonably foreseeable projects undertaken within a 0.5-mile radius of each of the 18 Project sites. There are no other proposed projects identified within 0.5-mile of the remaining Project sites listed in Table 2.7-1 with the potential for related impacts to cultural resources. With the exception of SUN and SUN2, none of the Project sites overlap and only one of those two sites would be constructed. The remaining Project sites are separated from the overlapping SUN and SUN2 and from one another by between 2 and 18 miles, with several Project sites also separated by foothill ridges and mountain ranges.

Direct impacts from construction activities were assessed within each of the Project site's ground-disturbing boundary (i.e., direct APE), which included a 50-foot buffer on all sides and any other areas that would be disturbed (e.g., trenching to tie in to an existing electrical power source). Indirect (visual) impacts were assessed on resources located anywhere within a maximum of 0.5-mile from the proposed

newly constructed elements (e.g., towers, equipment shelters, fuel tanks). The 0.5-mile radius is based on guidance provided in the FCC's Nationwide PA for the maximum distance that a 200-foot or less communications tower can be seen.

Paleontological Resources

The geographic area for the analysis of cumulative impacts on paleontological resources encompasses the same 18 Project sites described above for cultural resources and, based on the distances between the sites, uses the same site-by-site approach. For paleontological resources, there is no statutory requirement for a radius within which to analyze impacts; rather, the radius is project dependent and based on the proposed ground disturbance area plus a buffer. For the LMR Project, a 0.5-mile radius was used to coincide with the identified ground disturbance area for cultural resources and used for the records searches at the Natural History Museum of Los Angeles County (LACM) to identify any fossils within each Project site and nearby geologic units.

3.4.6.2 Existing Cumulative Conditions

Cultural Resources

The 0.5-mile radius for each of the 18 Project sites encompasses a unique cumulative environment based on the range of existing conditions noted below and the specific set of other past, present, and reasonably foreseeable future projects identified in Table 2.7-1:

- dense urbanized built environments in flat or rolling terrain consisting of buildings, structures, parking lots, paved streets, freeways, and other hardened surfaces (LARICSHQ, PASPD01, PDC, SGH, SIM)
- heavily disturbed existing communications sites in hilly or mountainous areas surrounded by undeveloped open space having few or no buildings or structures (MML, OAT, PHN, RIH, SUN, SUN2)
- mixed environments that encompass developed areas (typically residential, commercial, or industrial pockets) surrounded by recreation areas (golf courses, beaches, parks), undeveloped land, or designated open space (AGH, ENT, LEPS, PWT, SDW, WS1, ZHQ).

Paleontological Resources

Existing paleontological resources cumulative conditions are the same as described above for cultural resources.

3.4.6.3 Cumulative Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in §15064.5.

Historical Resources (Archaeological and/or Native American)

Five of the 18 proposed Project sites shown in Table 2.7-1 (LARICSHQ, PDC, SGH, SIM, and WS1) involve the collocation of new or additional antennas on existing buildings or towers. Ground disturbance would be required at some of these Project sites; however, records searches and field surveys indicate that no historical resources (archaeological or Native American) are within ground-disturbing areas at any of these proposed locations; therefore there will be no cumulative impacts on these types of resources at Project sites LARICSHQ, PDC, SGH, SIM, or WS1.

New monopoles would be constructed at six of the 18 proposed Project sites shown in Table 2.7-1 (AGH, ENT, LEPS, PASPD01, PWT, and ZHQ). Records searches and field surveys indicate that no historical resources (archaeological or Native American) are within ground-disturbing areas at any of the six proposed monopole locations; however, these types of resources have been identified within the 0.5-mile radius of PWT and ZHQ, and those two Project sites may be sensitive for them. Based on the nature and location of the other past, present, and reasonably foreseeable future projects listed in Table 2.7-1, in combination with the impacts at Project sites PWT and ZHQ, respectively, cumulative effects would be significant and the contribution of PWT and ZHQ would be cumulatively considerable.

With implementation of archaeological monitoring (CUL MM 1, CUL MM 3, and CUL MM 4) to ensure that any unexpectedly encountered resources are protected, the incremental contribution of Project sites PWT and ZHQ would be reduced to less than significant levels.

Seven of the 18 proposed Project sites shown in Table 2.7-1 (MML, OAT, PHN, RIH, SDW, SUN, and SUN2) involve the construction of a 180-foot lattice tower. At three of the seven Project sites (MML, SUN, and SUN2), historical resources (archaeological) have been identified within the 0.5-mile radius of Project activities; however, as shown in Table 2.7-1, Project site MML is an alternate site for Project site MAM; and only one tower would be constructed. No other projects are proposed within 0.5 mile of this Project site; therefore, there would be no cumulative impacts associated with Site MML.

At the overlapping Project sites of SUN and SUN2, where only one LMR lattice tower will be built, only one other project is proposed. The project involves the construction of a new tower (FCC Application A0906786), which will be a one-for-one replacement for an existing lattice tower that will be dismantled. While historical resources (archaeological) are identified within the SUN and SUN2 Project site, the proposed FCC tower replacement project will be located approximately 1,100 feet southeast of the proposed Project site and within a landscape of approximately 12 communications sites situated along several forest roads, each with existing lattice towers. Because no other projects are proposed at this Project location beyond the one-for-one tower replacement and given the numerous existing lattice towers within the viewshed, there would be no cumulative impacts associated with Project sites SUN and SUN2.

Although Table 2.7-1 lists other past, present, and reasonably foreseeable future projects within a 0.5-mile radius of the remaining four proposed lattice tower Project sites (OAT, PHN, RIH, and SDW), records searches and field surveys indicate that no historical resources (archaeological or Native American) are within each 0.5-mile radius; therefore, there would be no cumulative impacts associated with Project sites OAT, PHN, RIH, and SDW.

Historical Resources (Architectural)

For the five collocated Project sites (LARICSHQ, PDC, SGH, SIM, and WS1), no historical resources (architectural) are within the direct APE; and none are within the indirect APE at Project site LARICSHQ. Based on age and historical research, the antenna support structures themselves are also not historical resources. Historical resources (architectural) have been identified within the 0.5-mile indirect APE of Project sites PDC, SGH, SIM, and WS1. Given the presence of existing communications equipment and/or the location of the new equipment atop non-historic tall buildings where the additional proposed equipment would not be visible at ground level, no out-of-character visual elements would be introduced; and no indirect (visual) effects would occur on the identified architectural resources. As a result, there would be no cumulative effects on historical resources (architectural) associated with Project sites LARICSHQ, PDC, SGH, SIM, and WS1.

No historical resources (architectural) have been identified within the 0.5-mile radius of five of the six proposed new monopole Project sites (AGH, ENT, LEPS, PWT, and ZHQ); therefore, there would be no cumulative impacts on historical resources (architectural) from Project activities at these five Project sites.

At one Project site, PASPD01, numerous individual historical resources (architectural) and historic districts have been identified within the 0.5-mile radius of the proposed Project site. The Project site itself is situated within the Pasadena Civic Center Historic District. As shown in Table 2.7-1, 13 other past, present, or reasonably foreseeable future projects have been identified with the 0.5-mile radius of proposed Project site PASPD01. Among these projects are minor activities (painting, new signage, boundary adjustment); building demolitions; one project that involves collocation of additional camouflaged antennas for the LTE project on an existing communications site located on a parking structure rooftop; and four major rehabilitation or construction projects that would be in character with the existing viewshed. Given the location of the Project site within the historic district, the construction of a 70-foot monopole, in combination with past, present and reasonably foreseeable future projects, would result in a significant cumulative impact and the project's contribution would be cumulatively considerable.

With implementation of architectural screening/camouflage (CUL MM 5) to minimize the visual impacts of the monopole within the historic district, the project's incremental contribution to cumulative impacts would be reduced to less than significant.

As noted above, 7 of the 18 proposed Project sites shown in Table 2.7-1 (MML, OAT, PHN, RIH, SDW, SUN, and SUN2) involve the construction of 180-foot lattice towers. At Project sites MML, SUN, and

SUN2, historical resources (architectural) have been identified within the 0.5-mile radius of Project activities. Site MML is an alternate site for Site MAM, and only one tower would be constructed. No other projects are proposed within 0.5-mile of this Project site; therefore, there would be no cumulative impacts on historical resources (architectural) associated with Site MML.

Overlapping Project sites SUN and SUN2 are situated within the boundary of the San Dimas Experimental Forest Historic District. None of the architectural features associated with this historical resource are within the SUN/SUN2 boundary; and the only other buildings and structures located within the entire 0.5-mile radius are communications-related facilities that include approximately 12 lattice towers situated along an unpaved access road, none of which are historical resources. Given the lack of historical resources (architectural) within the 0.5-mile radius of the SUN and SUN2 Project sites, there would be no cumulative impacts on historical resources (architectural) from Project activities when combined with the past, present, and reasonably foreseeable future projects listed in Table 2.7-1.

Although Table 2.7-1 lists other past, present, and reasonably foreseeable future projects within a 0.5-mile radius of the remaining four proposed lattice tower Project sites (OAT, PHN, RIH, and SDW), records searches and field surveys indicate that there are no historical resources (architectural) within each 0.5-mile radius; therefore, there would be no cumulative impacts on architectural resources at Project sites OAT, PHN, RIH, and SDW.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5.

Cumulative impacts on archaeological resources are the same as described in CUL-1, Historical Resources (Archaeological and/or Native American).

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

Of the 18 proposed Project sites, Project activities at three sites (MML, SUN, and SUN2) would have no impacts on paleontological resources or unique geologic features because they are located within geologic units that have no paleontological potential (gabbro, gneiss, and granitics) and therefore there would be no significant cumulative impact to paleontological resources or unique geologic resources associated with these sites. The remaining 15 sites (AGH, ENT, LARICSHQ, LEPS, OAT, PASPD01, PDC, PHN, PWT, RIH, SDW, SGH, SIM, WS1, and ZHQ) are within geologic units with moderate to high paleontological potential, either at the surface or at depth. Each site, considered in combination with the specified projects listed in Table 2.7-1, would result in significant cumulative impacts and, given the location of each site within geologic units of moderate to high paleontological potential, the incremental contribution from each identified site would be cumulatively considerable.

Mitigation measures CUL MM 6 and CUL MM 7 (paleontological monitoring) would be implemented at each Project site to ensure the protection of any unexpectedly encountered paleontological resources.

With implementation of these measures, the incremental contribution of each site would be less than significant.

CUL-4: Would the project disturb any human remains, including those interred outside formal cemeteries.

Of the 18 proposed Project sites, 16 sites (AGH, ENT, LARICSHQ, LEPS, MML, OAT, PASPD01, PDC, PHN, RIH, SDW, SGH, SIM, SUN, SUN2, and WS1) have no potential to encounter human remains. Human remains have not been identified within a 0.5-mile radius of these Project sites; and, based on records searches and field surveys, these Project sites are not sensitive for them. As a result, there would be no cumulative impacts on human remains at these 16 Project sites.

At Project sites PWT and ZHQ, human remains have not been identified with the direct APE (project ground-disturbing areas); however, human remains have been noted within the 0.5-mile radius of these two Project sites. At Site PWT the other proposed projects are located between 0.15 mile and 0.47 mile from the Project site. At Site ZHQ, the other proposed projects are located between 0.16 miles and 0.44 miles from the Project site. Cumulative impacts would be significant and the contribution of sites PWT and ZHQ would be cumulatively considerable.

Mitigation measures CUL MM 1, CUL MM 3, and CUL MM 4 will be implemented at Project sites PWT and ZHQ to ensure that any unexpectedly encountered human remains are protected and to reduce impacts to less than significant levels.

CUL-5: Would the project cause a substantial adverse change in the significance of a Tribal cultural resource as defined in Public Resources Code Section 21074.

Of the 18 LMR Project sites, 16 Project sites (AGH, ENT, LARICSHQ, LEPS, MML, OAT, PASPD01, PDC, PHN, RIH, SDW, SGH, SIM, SUN, SUN2, and WS1) have no potential to encounter Tribal cultural resources. Tribal cultural resources have not been identified within a 0.5-mile radius of these Project sites; and, based on records searches and field surveys, these sites are not sensitive for them. As a result, there would be no cumulative impacts on Tribal cultural resources at these 16 Project sites.

At sites PWT and ZHQ, Tribal cultural resources have not been identified within the direct APE (project ground-disturbing areas); however, these types of resources have been noted within the 0.5-mile radius of these two Project sites. At Site PWT, the other proposed projects are located between 0.15 mile and 0.47 mile from the Project site. At Site ZHQ, the other proposed projects are located between 0.16 mile and 0.44 mile from the Project site. Cumulative impacts to Tribal cultural resources would be significant, and the contribution of sites PWT and ZHQ would be cumulatively considerable.

Mitigation measures CUL MM 1, CUL MM 3, and CUL MM 4 will be implemented at sites PWT and ZHQ to ensure that any unexpectedly encountered Tribal resources are protected and to reduce impacts to less than significant levels.

3.5 Geology/Soils

Geologic formations and soils are the oldest and most common foundation material for man-made structures. Faults, landslides, and underlying geologic formations may affect the stability of overlying structures. Erosion potential may be high in some areas and low in others. This section provides an overview of seismic hazards, landslide hazards, soil erosion potential, and potential impacts to proposed Project sites from liquefaction, unstable soils, and expansive soils.

3.5.1 Environmental Setting

3.5.1.1 *Geology*

Los Angeles County has a complex and unique geology. The Los Angeles Basin is the coastal sediment-filled plain located at the north end of the Peninsular Ranges province in southern California. It contains the central part of the city of Los Angeles as well as its southern and southeastern suburbs (both in Los Angeles and Orange counties). It is approximately 50 miles long and 25 miles wide, bounded on the north by the Santa Monica Mountains and San Gabriel Mountains, on the east by the Santa Ana Mountains, and on the south by the Pacific Ocean and the Palos Verdes Hills along the coast. The confluence of the Los Angeles and Rio Hondo rivers is the center of the basin.

The northern part of Los Angeles County sits in the Mojave geomorphic province, which lies to the north of the San Gabriel Mountains and south of the Tehachapi Mountains at the southern tip of the Sierra Nevada. The Mojave geomorphic province is a broad interior region of isolated mountain ranges separated by expanses of desert plains. It has an interior enclosed drainage and many playas. Two important fault trends control topography in a prominent northwest-southeast trend and a secondary east-west trend (apparent alignment with Transverse Ranges is significant). The Mojave province is wedged in a sharp angle between the Garlock Fault (southern boundary of the Sierra Nevada) and the San Andreas Fault, where it bends west from its northwest trend. The northern boundary of the Mojave province is separated from the prominent Basin and Range province by the eastern extension of the Garlock Fault.

The San Gabriel and Santa Monica mountains are part of the Transverse Ranges geomorphic province. The Transverse Ranges are an east-west trending series of steep mountain ranges and valleys. The east-west structure of the Transverse Ranges is oblique to the normal northwest trend of coastal California, hence the name "Transverse." The province extends offshore to include San Miguel, Santa Rosa, and Santa Cruz islands. The Transverse Ranges are among the most rapidly growing mountain ranges in the world. Great thicknesses of Cenozoic, petroleum-rich, sedimentary rocks have been folded and faulted, making this one of the important oil-producing areas in the United States (California Department of Conservation, California Geological Survey 2002a).

Geologic Hazards

Alquist-Priolo Earthquake Fault Zones occur throughout the Project area. Seismic damage to structures within and adjacent to earthquake fault zones depends on the underlying foundation materials.

Structures on competent geologic formations, such as igneous and metamorphic rock, may experience intense shaking but no liquefaction, whereas structures on unconsolidated hillsides and alluvium would be prone to landslides and liquefaction. Earthquake fault zones, seismic shaking, liquefaction zones, and landslide potential associated with Project sites are discussed below. Figure 3.5-1 provides an overview of mapped faults in the Project area.

Earthquake Fault Zones and Seismic Shaking

All of Los Angeles County lies within a seismically active area and thus is subject to some degree of seismic shaking. Figure 3.5-2 shows the severity, in terms of a percent of acceleration due to gravity and the shaking a location may experience. The map is based on the probable maximum magnitude earthquake that an area may be expected to experience in a 50-year period. Soil type and distance from the epicenter of an earthquake have a significant influence on the amount of shaking a site may experience; the closer to an active fault, the more significant shaking a location may experience. A site set on bedrock would experience shaking that is much less severe at the same distance from a seismic event than if it were above unconsolidated alluvial materials.

Alquist-Priolo Earthquake Fault Zones are special zones designated by the state to have known active traces of faults traversing the site and require special geotechnical investigations to identify the actual fault trace through the property. Figure 3.5-1 provides an overview of mapped faults in the Project area. No sites are within an Alquist-Priolo Zone.

Liquefaction Potential

Liquefaction occurs when vibrations or water pressure within a mass of soil cause the soil particles to lose contact with one another. As a result, the soil behaves like a liquid, has an inability to support weight, and can flow down very gentle slopes. This condition is usually temporary and is most often caused by an earthquake vibrating water-saturated fill or unconsolidated soil. Liquefaction may occur at sites that sit on unconsolidated younger alluvial material and have a high groundwater table (groundwater is within 25 feet of the surface). Figure 3.5-1 shows Project sites that are within areas mapped by the California Geological Survey that may be subject to liquefaction. Table 3.5-1 lists the sites within potential liquefaction zones. Sites that lie within liquefaction areas require special study; and, depending on the results of the study, may require modified foundations (piles driven or deeper foundations below the liquefaction zone) to provide a stable foundation.

Landslides

A landslide, also known as a landslip, is a geological phenomenon that includes a wide range of ground movements, such as rockfalls, deep failure of slopes, and shallow debris flows. Landslides can occur in offshore, coastal, and onshore environments. Although the action of gravity is the primary driving force for a landslide to occur, other contributing factors may affect the original slope stability. Typically, preconditioned factors build up specific subsurface conditions that make the area/slope prone to failure, whereas the actual landslide often requires a trigger before being released. In southern California, two primary causes may trigger a landslide: seismic shaking and/or significant amount of rain. Steep mountainous areas are also subject to debris flows, which may occur in areas that have been recently burned, followed by the significant rain events.

Figure 3.5-1: Mapped Faults within Proposed Project Area

Figure 3.5-2: Potential Seismic Shaking Severity within Proposed Project Area

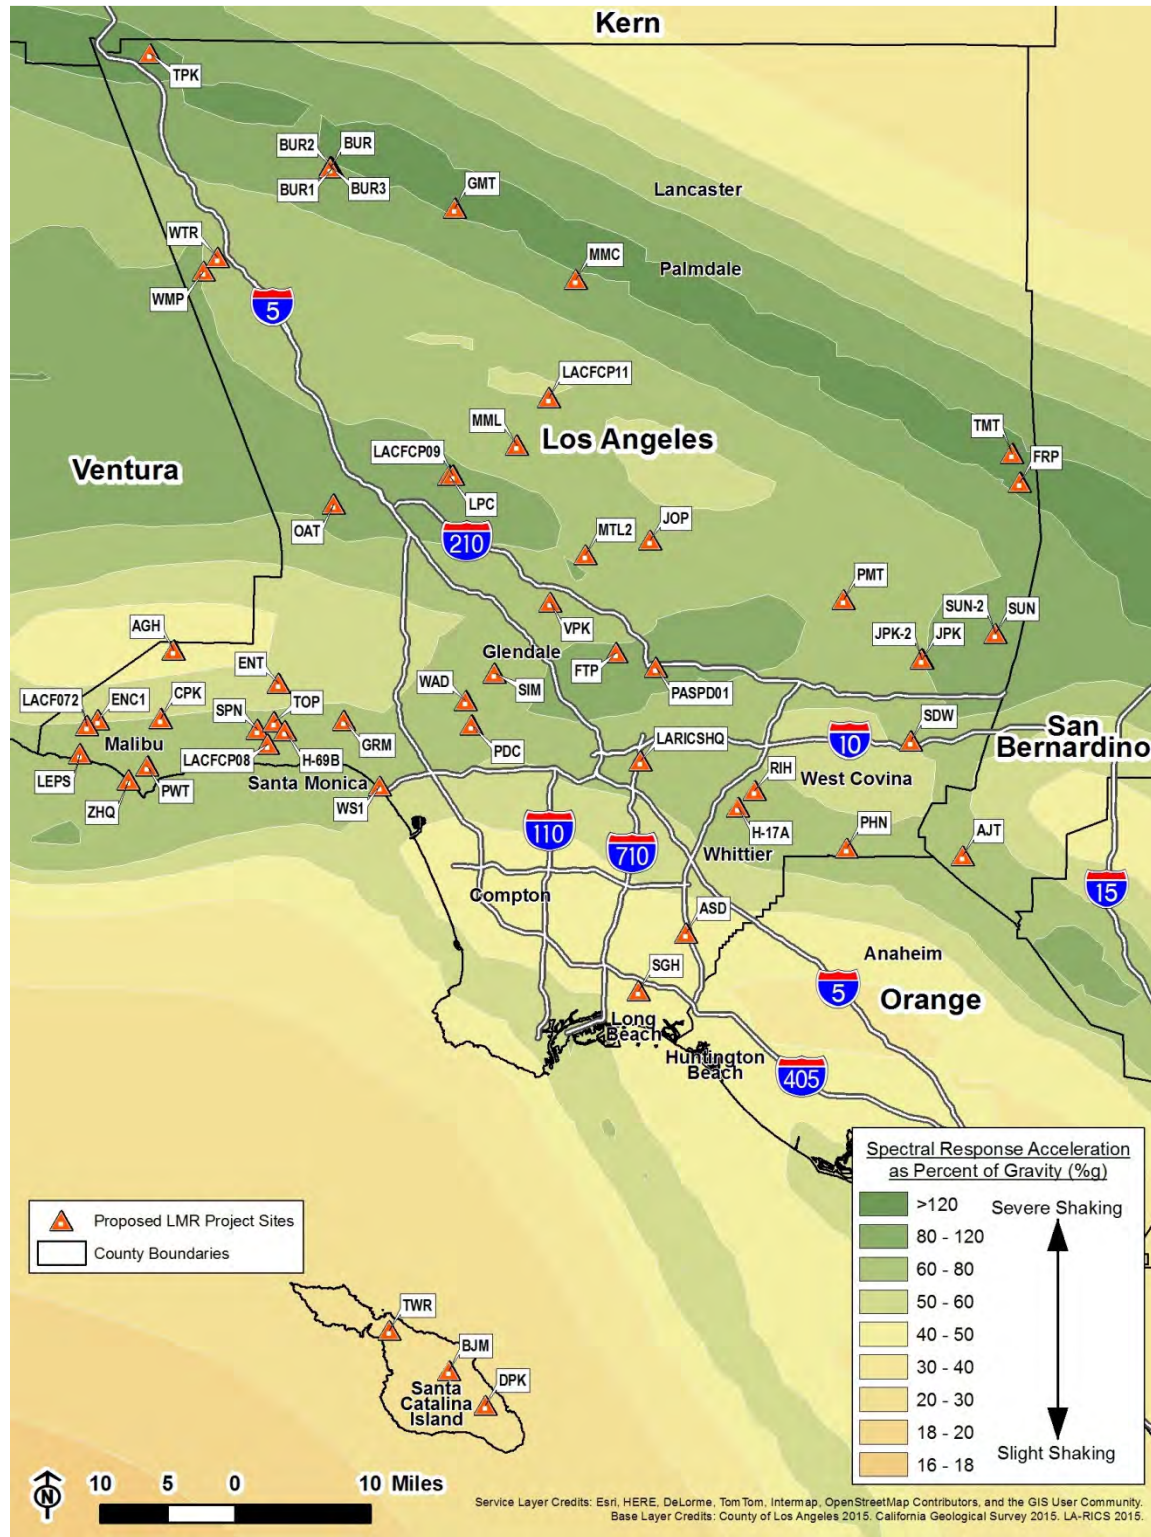

Figure 3.5-3: Geologic Hazards

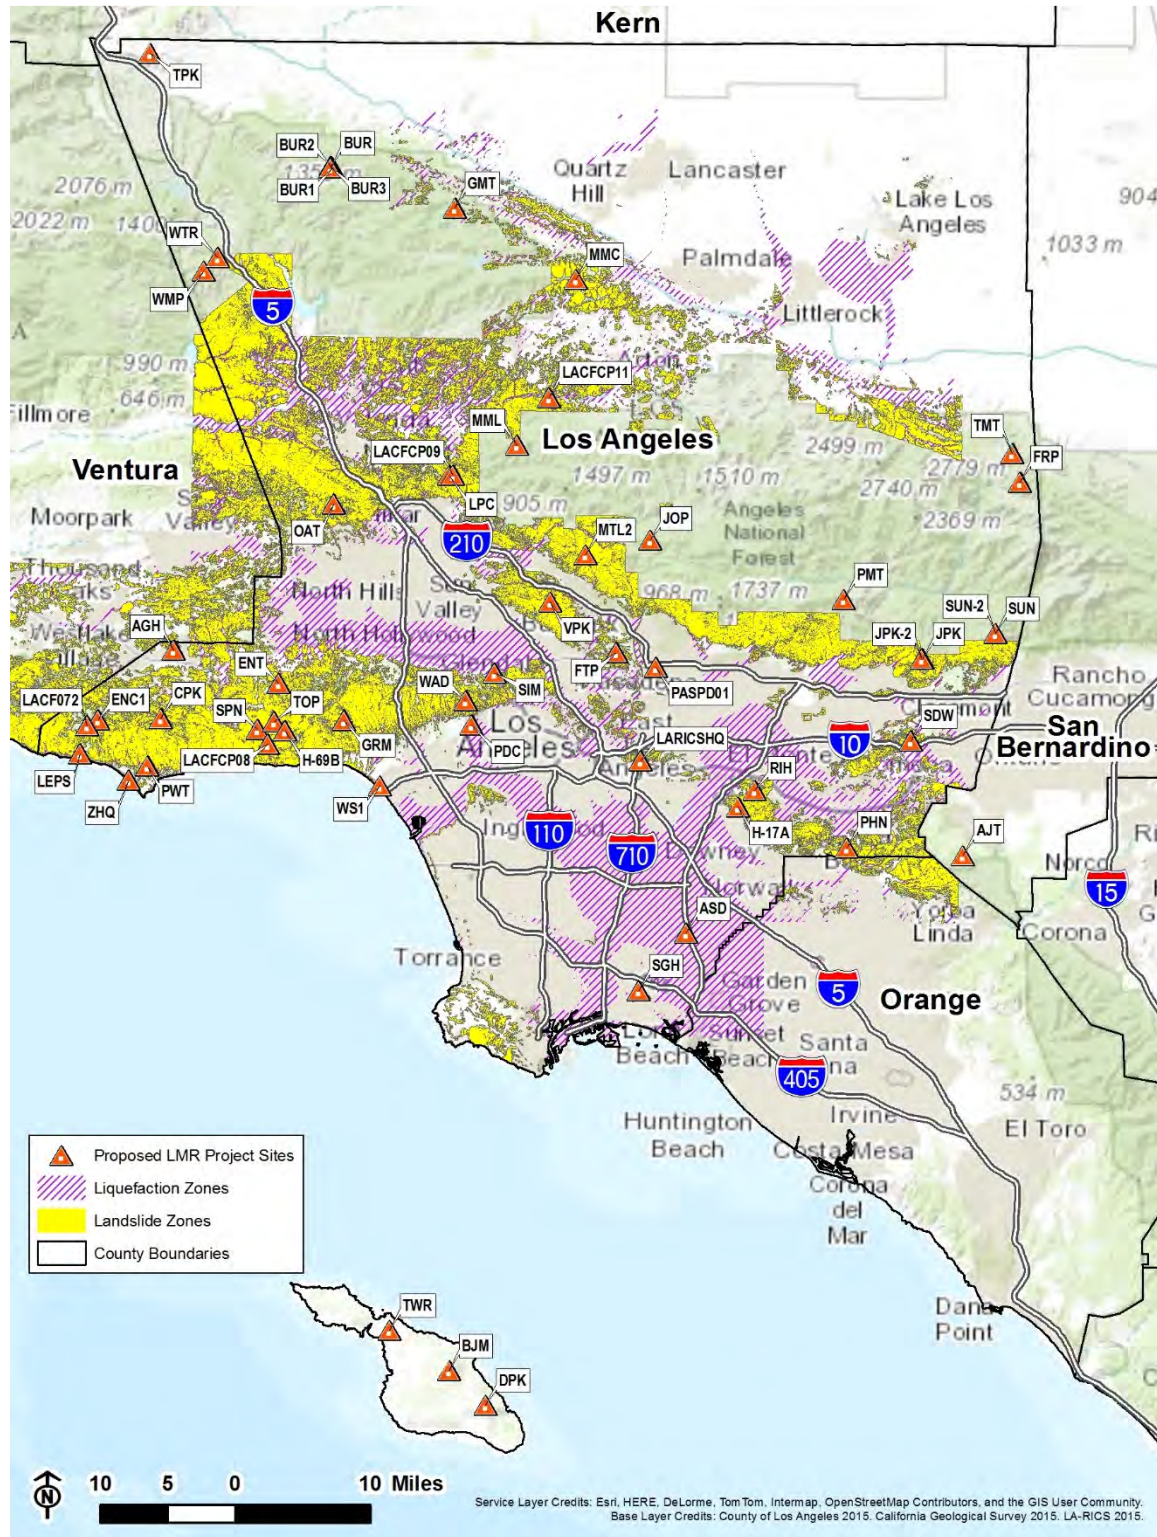

Figure 3.5-3 shows areas mapped by the California Geologic Service that have the potential for a landslide occurrence based on known geologic conditions. Table 3.5-2 lists the sites that lie within a potential landslide area.

3.5.1.2 Soils

Surface soils are composed of sands, silts, and clays derived from mechanical and chemical weathering of igneous, metamorphic, and sedimentary rocks. Fine-textured soils that are high in clay have low soil erodibility because the particles are resistant to detachment (cohesive soils). Coarse-textured soils, such as sandy soils, are easily detached but have low soil erodibility potential because water infiltrates them rapidly, resulting in low runoff. Medium-textured soils, such as a silt loam, have moderate soil erodibility potential because they are moderately susceptible to particle detachment and have low infiltration rates. Runoff from medium-textured soils is moderate. Soils having high silt content are especially susceptible to erosion and have a high soil erodibility potential. Silt-size particles are easily detached and tend to crust, producing high runoff rates and large runoff volumes.

Sites for the proposed Project in general fall into two major soil categories: urban and steep, rocky slopes. A large number of sites within the Los Angeles Basin do not have soils data available (Natural Resources Conservation Service 2015). These sites are urbanized and generally have a significant amount of hard surface cover, such as asphalt and concrete.

A large number of sites are characterized by steep rocky loam or steep sandy loam; soils at these sites are generally very shallow and rocky. The sites may have rock outcrops with steep to very steep slopes. The remainder of the sites varies from urban lands to sandy loams and clayey loams. Chapter 4 provides a detailed description of the soil types present at each site.

Soil Erosion

The factors contributing to potential soil erosion include climate, the physical characteristics of soils, topography, land use, and the amount of soil disturbance. In general, the loss of ground cover caused by construction activities is a primary factor contributing to an increase in potential for soil erosion. Erosion potential is also directly related to the steepness of the terrain. Because the footprint of each site is small and limited to flat ground, the potential for erosion is relatively low. The actual potential for erosion is difficult to predict without conducting a geotechnical investigation during preliminary design, as the conditions under which this hazard can occur are site-specific. City building codes regulate grading, excavations, landfill, and other construction activities that might cause or be impacted by slope or ground instability, erosion, or flooding in hillside areas. Chapter 4 provides detailed descriptions of soils for each site and the potential for erosion based on site-specific conditions.

Unstable Soils

Potential for low-level differential settlement is possible at proposed Project sites. This type of hazard primarily results in damage to property when an area settles to different degrees over a relatively short distance. The actual potential for settlement is difficult to predict, without conducting a geotechnical investigation during preliminary design, as the conditions under which this hazard can occur are site-specific. Areas with unstable soils in southern California generally fall into one of two categories: landslides or areas susceptible to liquefaction, as discussed in Section 3.5.1.1. Unstable soils may also be associated with areas with poorly engineered soils. These areas are very difficult to map and need a site-specific study to determine if existing engineered fill is suitable for building.

Expansive Soils

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in moisture content. The ability of clayey soil to change volume can result in uplift or cracking to foundation elements or other rigid structures such as slabs-on-grade and rigid pavements. Expansive soils may be present at proposed Project sites, though the actual potential for expansive soils is difficult to predict, without conducting a geotechnical investigation during preliminary design, as the conditions under which this hazard can occur are site-specific. Chapter 4 provides a detailed description of soil conditions expected at each site and identifies if the soil may be expansive.

3.5.2 Regulatory Setting

3.5.2.1 *Federal Regulatory Setting*

Earthquake Hazards Reduction Act

The Earthquake Hazards Reduction Act of 1977, as amended by Public Laws 101-614, 105-47, 106-503, and 108-360, created the framework for research into seismic safety of buildings and structures. The purpose of this Act as amended is to reduce the risks to life and property from future earthquakes in the United States through the establishment and maintenance of an effective earthquake hazards reduction program. With the Act, Congress established the National Earthquake Hazards Reduction Program (NEHRP). The four primary NEHRP agencies that contribute to earthquake mitigation efforts are FEMA, National Institute of Standards and Technology, National Science Foundation, and U.S. Geological Survey (USGS).

All Project sites lie within seismically active areas and, as such, are subject to the Act, which requires federal preparedness and mitigation activities include “development and promulgation of specifications, building standards, design criteria, and construction practices to achieve appropriate earthquake resistance for new structures.”

Executive Order 12699

Executive Order 12699 requires an examination of alternative provisions and requirements for reducing earthquake hazards at buildings owned or leased by the federal government and those buildings with federally financed construction, grants, loans, loan guarantees, insurance programs, and licenses (42 U.S.C. 7704(f)(3, 4)) and the incorporation of seismic safety requirements into new building construction. The purpose of these requirements is to reduce risks to the lives of occupants of buildings owned by the federal government and to persons who would be affected by the failures of federal buildings in earthquakes, to improve the capability of essential federal buildings to function during or after an earthquake, and to reduce earthquake losses of public buildings, all in a cost-effective manner. A building means any structure, fully or partially enclosed, used or intended for sheltering persons or property.

3.5.2.2 *State Regulatory Setting*

California Geological Survey

Alquist-Priolo Earthquake Fault Zoning Act

The Alquist-Priolo Earthquake Fault Zoning Act was passed in 1972 to mitigate the hazard of surface faulting to homes, commercial buildings, and other structures and to prevent construction of buildings used for human occupancy on active faults with a hazard of surface fault rupture. The Los Angeles County Building Code (Municode 2014) provides standards and requirements for structures from these damaging effects. The most stringent standards and requirements are applied within Alquist-Priolo

Earthquake Fault Zones where faults are known to have ruptured in the past 11,000 years (Holocene time).

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act was passed in 1990 to mitigate other hazards associated with earthquake faults. It is the intent of the State Legislature to provide statewide seismic hazard mapping and a technical advisory program to assist cities and counties in fulfilling their responsibilities for protecting the public health and safety from the effects of strong ground shaking, liquefaction, landslides, ground failure, and other seismic hazards caused by earthquakes.

Seismic hazard zones must be identified and mapped in order for cities and counties to adequately prepare the safety element of their general plans and to encourage land use management policies and regulations to reduce and mitigate those hazards to protect public health and safety. The purpose of the California Division of Mines and Geology is to incorporate information from the earthquake fault zones mapping program, the landslide hazard identification program, and the inundation maps.

Provisions under this law require that a qualified geologist and civil engineer prepare a geotechnical report for each new construction site to evaluate and assess the geologic hazards that may be present. The city and/or county in which a project is located is responsible for reviewing and approving any such report prior to construction (California Department of Conservation, California Geological Survey 1991).

California Building Standards Commission

California Building Code

The proposed Project is subject to the applicable sections of the California Building Code (CBC), which is administered by the California Building Standards Commission, Department of Building Safety. The building departments of each city (or Los Angeles County for unincorporated areas within Los Angeles County) are responsible for ensuring that CBC requirements are met, including provisions for soils and foundations to evaluate the presence of critically expansive soils or other soil problems which, if not corrected, would lead to structural defects.

3.5.2.3 Local Regulatory Setting

Los Angeles County

The Los Angeles County Department of Public Works (LACDPW) requires permittees and their contractors to implement a program to effectively control water pollution, which in turn minimizes potential increases in soil erosion, during all construction projects subject to a permit. This Project shall conform to the requirements of the following County code and permits:

- Los Angeles, California County Code Chapter 12.80 Stormwater and Runoff Pollution Control

- Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles, and the Incorporated Cities Therein, Except the City of Long Beach (Order No. 01-182, National Pollutant Discharge Elimination System [NPDES] No. CAS004001)
- NPDES General Permit No. CAS000002, as amended, Waste Discharge Requirements for Discharges of Storm Water Runoff Associated with Construction Activities

San Bernardino County

Title 3, Division 5, Chapter 1 of the San Bernardino County code of ordinances (American Legal Publishing Corporation 2015) addresses the protection of health and safety of County inhabitants by controlling non-stormwater discharges to the stormwater conveyance system and by reducing pollutants in stormwater discharges. Permits are required for construction or modification of any storm drain. The County requires compliance with the permit requirements associated with construction activity subject to any NPDES permit issued by the USEPA, the State Water Resources Control Board (SWRCB), or the Regional Water Quality Control Board (RWQCB). This includes using BMPs for excavated and stockpiled soil to minimize the amount of soil transported onto adjoining properties and public rights-of-way and to minimize soil releases to the environment to the maximum extent possible.

3.5.3 Significance Criteria

The proposed Project would result in significant impact to geology and soils if any of the following significance criteria, based on Appendix G of the CEQA Guidelines, are met:

- 1) Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
 - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.
 - Strong seismic ground shaking?
 - Seismic-related ground failure, including liquefaction?
 - Landslides?
- 2) Would the project result in substantial soil erosion or the loss of topsoil?
- 3) Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?
- 4) Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Based on the Initial Study (IS) prepared for the proposed LMR Project (Appendix A), it was determined that because the Project would not require use of septic systems, no further analysis of whether the

project would have soils incapable of adequately supporting the use of septic tanks where sewers are not available is warranted within this EIR.

3.5.4 Impact Analysis

3.5.4.1 *Proposed Project*

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Construction Impacts

None of the proposed Project sites is located within an Alquist-Priolo zone, and no active fault associated with any proposed Project site has been identified. As a result, no impact involving rupture of a known fault is anticipated.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

No impacts would be associated with rupture of a known fault during operations.

Mitigation Measures

No mitigation measures are required.

Strong seismic ground shaking?

Construction Impacts

The entire Project area is seismically active and thus is subject to some degree of seismic activity. Design and construction of the site and its elements would be required to conform to the current CBC seismic design provisions and local building codes and would be designed to minimize seismic hazards.

Roof mount site type and antennas collocated on existing towers or monopoles would not require a geotechnical report to be completed to examine existing geologic and soil conditions as no new building structure would be erected. Any new structures added on the roof or existing tower or monopole must meet current CBC seismic design provisions and local building codes to ensure that the design would avoid seismic hazards. Therefore, the impact of roof mount and collocation sites would be less than significant.

New monopoles, new towers, and existing monopoles and towers that would be extended are considered new building structures that would require site-specific seismic hazards to be evaluated during structure and foundation design. These include sites AGH, ASD, BJM, BUR, BUR1, BUR2, BUR3, CPK, DPK, ENC1, ENT, FRP, FTP, GMT, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACF072, LACFCP08, LACFCP09, LACFCP11, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PHN, PMT, PWT, RIH, SDW, SGH, SPN, SUN, SUN2, TMT, TOP, TPK, TWR, VPK, WAD, WMP, WTR, and ZHQ. Seismic shaking impacts would be significant at these sites without an evaluation of site-specific soils, geology, and seismic shaking probability.

Mitigation Measures

Mitigation measure GEO MM 1 will be applied to the following sites: AGH, ASD, BJM, BUR, BUR1, BUR2, BUR3, CPK, DPK, ENC1, ENT, FRP, FTP, GMT, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACF072, LACFCP08, LACFCP09, LACFCP11, LEPS, LPC, MMC, MML, MTL2, OAT, PASPD01, PHN, PMT, PWT, RIH, SDW, SGH, SPN, SUN, SUN2, TMT, TOP, TPK, TWR, VPK, WAD, WMP, WTR, and ZHQ.

GEO MM 1 Prior to or concurrently with submittal of the application for a building permit for any portion of the proposed Project site, the project sponsor shall:

- 1) Submit to the appropriate municipality (County of Los Angeles, County of San Bernardino, or city having jurisdiction over the site) a site-specific, design-level geotechnical report reviewed and approved by both an engineering geologist licensed in the State of California and a civil engineer licensed in the State of California. The report shall comply with all applicable state and local code requirements and shall:
 - a) include an analysis of the expected ground motions at the site from known active faults using accepted methodologies
 - b) include an analysis of all potential geologic hazards including but not limited to, landslides, mudslides, liquefaction potential, identification of active faults, land spreading, and land subsidence. The report shall be prepared in accordance with and meet the requirements of the County of Los Angeles Department of Public Works (LACDPW) Manual for Preparation of Geotechnical Reports, July 1, 2013.
 - c) Specify liquefaction mitigations that shall use proven methods generally accepted by professional engineers to reduce the risk of liquefaction to a less than significant level such as:
 - i. subsurface soil improvement
 - ii. deep foundations extending below the liquefiable layers
 - iii. structural slabs designed to span across areas of non-support

- iv. soil cover sufficiently thick over liquefaction soil to bridge liquefaction zones
 - v. dynamic compaction
 - vi. compaction grouting
 - vii. jet grouting
 - viii. mitigation for liquefaction hazards suggested in the California Geological Survey's (CGS) Geology Guidelines for Evaluating and Mitigating Seismic Hazards (CGS Special Publication 117, 1997) including edge containment structures (berms, dikes, sea walls, retaining structures, compacted soil zones), removal or treatment of liquefiable soils, modification of site geometry, lowering the groundwater table, in-situ ground densification, deep foundations, reinforced shallow foundations, and structural design that can withstand predicated displacements
- d) Determine structural design requirements as prescribed by the most current version of the California Building Code, including applicable local county and local city amendments, to ensure that structures can withstand ground accelerations expected from known active faults
 - e) Determine the final design parameters for walls, foundations, foundation slabs, utilities, roadways, parking lots, sidewalks, and other surrounding improvements
- 2) Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigations in the site specific investigations.
 - 3) The project structural engineer shall review the site specific investigations, provide any additional necessary mitigation to meet Building Code requirements, and incorporate all applicable mitigations from the investigation in the structural design plans and shall ensure that all structural plans for the project meet current Building Code requirements.
 - 4) Site construction shall not begin until:
 - a) The registered geotechnical engineer representing the applicable permitting municipality for the project site (county or city), or third party registered engineer retained to review the geotechnical reports, has reviewed each site specific geotechnical investigation, approved the final report, and required compliance with geotechnical mitigations contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure and other relevant construction permits; and

- b) The applicable permitting municipality for the project site (county or city) has reviewed all project plans for grading, foundations, structural, infrastructure and other relevant construction permits to ensure compliance with the applicable geotechnical investigation and other applicable Code requirements

Impacts after Mitigation

Application of GEO MM 1 requires a geotechnical report be prepared in accordance with applicable regulations for any proposed Project sites where a new monopole or new tower will be constructed, or where an existing monopole or tower would be extended. The geotechnical report will assess site-specific seismic ground-shaking conditions to be considered and make recommendations on the design of the foundation to minimize seismic hazards. Impacts related to seismic shaking during construction of the Project for sites with a new monopole or new tower proposed would be reduced to less than significant with Implementation of GEO MM 1.

Operation Impacts

Seismic stability associated with existing support structures for roof mount or collocation would be less than significant, as discussed above under construction impacts. All new monopoles or towers would be designed and constructed in accordance with CBC seismic design provisions and local building codes to minimize seismic hazards. Operational activities would not increase the risk posed from seismic shaking. Therefore, impacts to proposed Project operations from seismic shaking hazards would be less than significant.

Mitigation Measures

No mitigation measures are required.

Seismic-related ground failure, including liquefaction?

Three proposed Project sites are located in areas with potential for liquefaction. These are sites ASD, PDC, and ZHQ. Site PDC is a proposed roof mount site, while sites ASD and ZHQ are proposed new monopoles.

Construction Impacts

Liquefaction occurs in areas having high groundwater levels and specific underlying soil conditions that may become unstable during a seismic shaking event (earthquake). The California Geological Survey has mapped areas throughout the state that may be subject to liquefaction based on local geology and groundwater conditions. Liquefaction can directly affect the ability of a structure's foundation to remain stable to support the structure during a seismic event.

Site PDC is a proposed roof mount site that was evaluated in accordance with building standards at the time the structure at the site was constructed. Potential effects from liquefaction would also have been considered and mitigated to then-current standards at the time of foundation construction. No change to the foundation of any structure at Site PDC is proposed; therefore, new impacts associated with

liquefaction are not anticipated. The impacts associated with liquefaction at this site are considered less than significant.

At sites ASD and ZHQ, new monopoles and equipment shelters are proposed. Site-specific liquefaction potential and soil conditions would be evaluated for foundation design at new building structures. Liquefaction impacts would potentially be significant without an evaluation of site-specific soils, geology, and seismic shaking probability.

Mitigation Measures

Implementation of GEO MM 1 is required at sites ASD and ZHQ.

Impacts after Mitigation

The geotechnical report will take into account site-specific soil conditions and liquefaction potential as part of the design process for foundations at sites ASD and ZHQ. Included in the geotechnical report, which will be reviewed and approved during the building permit process at these sites, building-specific recommendations will be made to minimize the risk of proposed construction from liquefaction. Since this information will be used in evaluating issuance of a building permit at these sites, the impacts related to liquefaction at sites ASD and ZHQ would be reduced to less than significant by implementation of GEO MM 1.

Operation Impacts

For Project sites located in potential liquefaction zones, any mitigation required to reduce the hazard posed by liquefiable soils would have to be implemented during construction activities in accordance with GEO MM 1. Operational activities would not increase the risk posed from liquefiable soils. Therefore, impacts to the Project operations from potential liquefaction hazards would be less than significant.

Mitigation Measures

No mitigation measures are required.

Landslides?

The following proposed Project sites are located in areas with potential for landslides: CPK, ENT, FTP, GRM, H-17A, JPK, JPK2, LACFCP08, LACFCP11, LEPS, MTL2, RIH, SDW, SPN, TOP, VPK, and WAD. With the exception of Site WAD, all of these involve new caisson excavation associated with new monopole or lattice tower development. At Site WAD, the existing LMR antenna is proposed for extension, and the foundation there could require modification. Minor trenching would likely occur at all sites.

Construction Impacts

Landslides generally occur in steep, hilly terrain and in locations where the underlying geology is such that it may fail and slide down slope, either from natural process (heavy rain, seismic shaking, erosion)

or man-made conditions from site construction. Figure 3.5-3 shows areas mapped by the California Geologic Service that have the potential for a landslide occurrence based on known geologic conditions.

New monopoles and new towers at sites CPK, ENT, FTP, GRM, H-17A, JPK, JPK2, LACFCP08, LACFCP11, LEPS, MTL2, RIH, SDW, SPN, TOP, and VPK would require new caisson excavation as part of construction. The proposed extension of the existing monopole at Site WAD may require additional foundation support as well as deep excavation work. Deep excavation has the potential to trigger a landslide. Landslides triggered by construction activities could result in damage to on-site or off-site people or structures. Construction activities may remove soil that stabilizes the toe of landslide, add soil to the headwall of landslide, or expose pathways to the slide plane that may allow water to migrate down and destabilize the earth, causing a landslide. Though a landslide is unlikely at any site, construction activities have the potential to result in the activation of a landslide causing downslope transport of earth. Slow movement of soil and substrate could potentially damage property, while fast movement could impact both lives and property. Depending on the size and extent of the slide, impacts would extend to the end of the run-out area below the activated landslide.

Mitigation Measures

GEO MM 1 is required at sites CPK, ENT, FTP, GRM, H-17A, JPK, JPK2, LACFCP08, LACFCP11, LEPS, MTL2, RIH, SDW, SPN, TOP, VPK, and WAD.

Impacts after Mitigation

GEO MM 1 requires completion of a geotechnical report in accordance with applicable regulations for sites with a proposed new monopole, extension of a monopole, or new tower. The geotechnical report will assess site-specific potential for landslides and make recommendations on the design of the facility to minimize landslide hazards. The geotechnical investigation will identify whether a landslide potential exists and can help to characterize the size of the potential landslide. The geotechnical report will identify if the proposed Project is at the toe of the slide or top of the slide or whether the proposed grading or foundation could expose a pathway to the slide plane that runoff could access, potentially activating the slide. The report will identify site-specific mitigation recommendations to be made as part of design to reduce or eliminate any landslide hazards. The geotechnical report would be developed for review by approving authorities prior to their issuance of a building permit.

After mitigation, impacts from landslides triggered by construction would be reduced to less than significant at sites CPK, ENT, FTP, GRM, H-17A, JPK, JPK2, LACFCP08, LACFCP11, LEPS, MTL2, RIH, SDW, SPN, TOP, VPK, and WAD.

Operation Impacts

For proposed Project sites located in potential landslide areas, any mitigation required to reduce the hazard posed by landslides would have been implemented during construction in accordance with GEO MM 1. Operational activities would not increase the risk posed from landslides. Therefore, impacts to Project operations from potential landslide hazards would be less than significant.

Mitigation Measures

No mitigation measures are required.

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impacts

Ground-disturbing activities would expose soils and elevate the potential for erosion at all Project sites. All sites have some potential for wind erosion, which would be abated by application of water or other BMPs applicable to the site. The primary potential for erosion from construction of the proposed Project sites would be associated with runoff from sites located on slopes. The building permitting process would include the review of proposed drainage for the sites. Building plans must include positive drainage away from the facility and analyses of current storm drain intakes or projected surface runoff into local natural drainages. LACDPW, Water Resources Division, Hydrology Manual (LACDPW 2006) (or similar document for local municipalities) provides guidance on requirements for drainage at a project site that engineers follow and county and city reviewers refer to, to ensure grading plans maintain proper drainage from a site. Building plans must demonstrate that existing storm drain facilities are capable of receiving any additional runoff in urban areas without exceeding the design capacity. Many urban facilities would be built in areas that are covered in hard surfaces, producing no net change in the amount of runoff with construction of the facility. For those sites on ridges or hilltops, grading plans must include analysis of runoff potential, estimated projected flows of newly constructed hard surfaces, and determination of the potential for erosion at constructed outflow areas. Grading plans, as required, may include features to control runoff and eliminate the potential for erosion at the outflow location. All sites would be constructed using BMPs to prevent erosion and runoff. Impacts associated with all site types would be considered less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Operation of the Project facilities would have no potential for substantial erosion or loss of topsoil. Operation of the proposed facilities would not include any ground-disturbing activities. Therefore, less than significant impacts related to the potential for erosion would be associated with the operation of a proposed Project facility.

Mitigation Measures

No mitigation measures are required

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse?

Construction Impacts

Proposed Project sites have been identified as being within a designated potential landslide area or designated potential liquefaction zones. The ground under these sites has the potential for soils to become unstable from Project site activities.

The risk of landslide increases with the amount of ground-disturbing activities. If the site is located in a landslide-prone area, three activities could increase the risk of landslide occurring: adding additional weight (soil) to the top of a landslide, excavating at the toe of landslide, and introducing subsurface water into a landslide. Sixteen of the 17 sites located in a potential landslide area are either new monopoles or new towers. These conditions need to be evaluated prior to construction of the new monopole or tower and would be a significant impact. One of the 17 sites (Site WAD) is a proposed 20-foot extension of an existing monopole. Should the modified monopole require foundation work, there is a potential to trigger a landslide, and the potential for impact at Site WAD would be considered significant.

Three sites (sites ASD, PDC, and ZHQ) are located in potential liquefaction zones. Site PDC is a roof mount site and no new foundation structure are required. At sites ASD and ZHQ, new monopoles are proposed. Conditions at these sites would need to be evaluated prior to construction of the new monopole or tower and therefore there is potential for a significant impact. Liquefaction zones are closely related to land spreading areas or have areas of subsidence; however, areas of subsidence and land spreading do occur outside liquefaction areas. Proposed Project activities would not contribute to the risk of liquefaction. Potential for land subsidence or land spreading could be increased with substantial withdrawal of groundwater, but proposed Project site activities do not include substantial withdrawal of groundwater. Groundwater withdrawal at any site would be limited to dewatering activities associated with caisson drilling at some sites and would not approach a substantial level that could trigger subsidence or land spreading. Therefore, proposed Project activities have little potential to increase the potential for lateral spreading, subsidence, or collapse; and impacts would be less than significant.

All remaining proposed Project sites are not located in areas identified as having unstable soils; and, therefore, no impact from construction would occur.

Mitigation Measures

Implementation of GEO MM 1 would be required at sites CPD, ENT, FTP, GRM, H-17A, JPK, JPK2, LACFCP08, LACFCP11, LEPS, MTL2, RIH, SDW, SPN, TOP, VPK, and WAD due to potential landslide issues. Implementation of GEO MM 1 would also be required at sites ASD and ZHQ due to potential issues associated with liquefaction.

Impacts after Mitigation

Impacts associated with unstable geologic soil conditions at sites ASD, CPK, ENT, FTP, GRM, H-17A JPK, JPK2, LACFCP08, LACFCP11, LEPS, MTL2, RIH, SDW, SPN, TOP, VPK, WAD, and ZHQ would be adequately characterized after implementation of GEO MM 1 to reduce potential issues associated with landslides and liquefaction. Impacts at these sites would be reduced to less than significant after implementation of the measure.

Operation Impacts

Any potential impacts associated with on- or off-site landslides, lateral spreading, subsidence, liquefaction, or collapse would have been evaluated and mitigated during the design, planning, and permitting process. Operational activities would not contribute or increase the risk of these impacts. Therefore, impacts from Project operational activities would be less than significant.

Mitigation Measures

No mitigation measures are required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impacts

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. No proposed Project sites exhibit these soil characteristics, and this hazard has no impact on construction at any site. Design of the proposed Project sites with new monopoles and new towers would be based on site-specific geotechnical analysis of the soils and would consider the potential for expansive soils. No impact relative to expansive soil-related hazards would result.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

As noted above for construction, no proposed Project sites have been identified as having expansive soils. Construction design would be based on geotechnical analysis of the soils at the site and would consider the potential for expansive soils. No impact relative to expansive soil-related hazards would result.

Mitigation Measures

No mitigation measures are required.

3.5.4.2 No Project Alternative

Under the No Project Alternative, no Project structures would be constructed, and no new equipment would be installed. No new activity would occur within or near Alquist-Priolo Earthquake Fault Zones. No ground-disturbing activities that could cause soil erosion or result in unstable geology or soils would occur. No new structures would be built that could be subject to seismic shaking, unstable soils, landslides, liquefaction, expansive soils, subsidence, or other geologic hazards. No impacts related to geology or soils would occur.

3.5.5 Cumulative Impacts

3.5.5.1 Geographic Extent

The geographic extent for consideration of geology/soils impacts is limited to the perimeter of each proposed Project site. Only two proposed Project sites were identified as having additional projects (as identified on Table 2.7-1) located within the proposed Project site boundary. This occurred at Site PDC, which is clustered with LA-RICS LTE Site WHD, and at Site PHN, which is clustered with LA-RICS LTE Site PHN. Both LTE sites were constructed in 2015. LA-RICS LTE Site PHN involved collocation of LTE and microwave antennas to an existing lattice tower, and LA-RICS LTE Site WHD involved construction of a new 70-foot monopole at the Pacific Design Center property.

3.5.5.2 Existing Cumulative Conditions

The primary concerns with geology and soils are those associated with seismicity and unstable soil conditions. Neither Site PDC nor Site PHN has been identified as having elevated conditions associated with these concerns, as discussed in the cumulative impact analysis below.

3.5.5.3 Cumulative Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

- ***Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.***

No projects were identified as within an Alquist-Priolo zone or other sources as being within an area near a known earthquake fault. No evidence exists that people or structures would potentially be exposed to substantial adverse effects. Since no impacts were identified, there would be no cumulative impacts.

- ***Strong seismic ground shaking?***

Impacts associated with strong seismic ground shaking would be related to equipment falling and striking people or property. At Site PDC, the proposed work involves construction of a roof-mounted antenna and supporting infrastructure. The only other project identified on site is LA-RICS LTE Site WHD, which is a constructed monopole and supporting infrastructure. Other than being within the same

parcel, the two do not relate to each other; and neither would contribute to a cumulative seismic impact. At Site PHN, the proposed work involves construction of a new lattice tower that could potentially fall into the same area. PHN is an unmanned facility, and the chances of this occurring are considered remote. Cumulative impacts would be less than significant.

- ***Seismic-related ground failure, including liquefaction?***

Neither Site PDC nor Site PHN is located in an Alquist-Priolo zone or in an area identified as having an elevated liquefaction potential. Additionally, the cumulatively-contributing projects (LA-RICS LTE Site WHD and LA-RICS LTE Site PHN, respectively) do not relate to these Project activities; and neither would contribute to a cumulative ground failure impact. Cumulative impacts would be less than significant.

- ***Landslides?***

Neither Site PDC nor Site PHN is located in an area identified as having the potential for landslides. Since no impact would occur, neither site has potential for a cumulative impact to occur.

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

As noted above, at Site PDC the proposed work involves construction of a roof-mounted antenna and supporting infrastructure; and this is clustered with an already-built LA-RICS LTE monopole (LA-RICS LTE Site WHD). Conversely at Site PHN, the proposed work involves construction of a new lattice tower that is clustered with LA-RICS LTE Site PHN, a collocation project that has already been built. All project work would have BMPs in place to prevent soil erosion at each site. Additionally, construction activity at Site PDC would not coincide with activity at LTE Site WHD; and construction activity at Site PHN would not coincide with construction at LA-RICS LTE Site PHN. This further reduces the chance for any soil erosion. As a result, the potential for cumulative impacts at either site is considered less than significant.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse?

Neither Site PDC nor Site PHN is located on a geologic unit or soil that has been identified as being unstable or that would become unstable as a result of Project construction. No impacts would occur from construction of either proposed Project site; therefore, no cumulative impacts would be associated with unstable geological units or soils.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Neither Site PDC nor Site PHN is located in an area identified as having expansive soils. No impacts would occur at either site; therefore, no cumulative impacts would be associated with unstable geological units or soils.

3.6 Greenhouse Gas Emissions

3.6.1 Environmental Setting

Climate change refers to global and regional variations in the normal weather of the earth (wind patterns, storm intensity, precipitation, and temperature) that occur over time. While the earth has gone through many natural changes in climate in its history, there is general agreement that the earth's climate is currently changing at an accelerated rate and will continue to do so for the foreseeable future. Anthropogenic (human-caused) greenhouse gas (GHG) emissions contribute to this rapid change. Carbon dioxide makes up the largest component of these GHG emissions, stemming mostly from fossil-fuel combustion. Other prominent sources of GHGs include methane (CH₄) and nitrous oxide (N₂O), which are primarily transportation related.

Many GHGs occur naturally. Water vapor is the most abundant GHG and makes up approximately two-thirds of the natural greenhouse effect; however, burning of fossil fuels and other human activities are adding to the concentration of GHGs in the atmosphere. Many GHGs remain in the atmosphere for time periods ranging from decades to centuries.

3.6.2 Regulatory Setting

3.6.2.1 Federal Regulatory Setting

Climate change is associated with long-term changes in temperature, precipitation, wind patterns, and other elements of the earth's climate system. An ever-increasing body of scientific research attributes these climatological changes to GHG emissions, particularly those generated from the production and use of fossil fuels.

While climate change has been a concern for several decades, the establishment of the Intergovernmental Panel on Climate Change by the United Nations and World Meteorological Organization in 1988 has led to increased efforts devoted to GHG emissions reduction and climate change research and policy. These efforts are primarily concerned with the emissions of GHGs generated by human activity, including carbon dioxide, methane, nitrous oxide, tetrafluoromethane, hexafluoroethane, sulfur hexafluoride, HFC-23 (fluoroform), HFC-134a (s, s, s, 2-tetrafluoroethane), and HFC-152a (difluoroethane).

Although climate change and GHG reduction are concerns at the federal level; no federal regulations or legislation have been enacted that specifically address GHG emissions reductions and climate change at the project level. Climate change and its associated effects are being addressed through various efforts at the federal level to improve fuel economy and energy efficiency, such as the "National Clean Car Program" and Executive Order 13514 — Federal Leadership in Environmental, Energy and Economic Performance.

Executive Order 13514 is focused on reducing GHGs internally in federal agency programs and operations but also directly through federal agencies participating in the interagency Climate Change Adaptation Task Force, which is engaged in developing a U.S. strategy for adaptation to climate change.

On April 2, 2007, in *Massachusetts v. EPA*, 549 U.S. 497 (2007), the Supreme Court found that greenhouse gases are air pollutants covered by the Clean Air Act and that the EPA has the authority to regulate GHGs. The Court held that the EPA Administrator must determine whether or not emissions of GHGs from motor vehicles cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision.

On December 7, 2009, the EPA Administrator signed two distinct findings regarding GHGs under section 202(a) of the Clean Air Act:

- **Endangerment Finding:** The Administrator found that the current and projected concentrations of the six key well-mixed greenhouse gases — carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride — in the atmosphere threaten the public health and welfare of current and future generations.
- **Cause or Contribute Finding:** The Administrator found that the combined emissions of these well-mixed greenhouse gases from motor vehicle engines contribute to the greenhouse gas pollution, which threatens public health and welfare.

Although these findings did not themselves impose any requirements on industry or other entities, this action was a prerequisite to finalizing the EPA's Proposed Greenhouse Gas Emission Standards for Light-Duty Vehicles, which was published on September 15, 2009 (USEPA OTAQ 2009). On May 7, 2010, the final Light-Duty Vehicle Greenhouse Gas Emissions Standards and Corporate Average Fuel Economy Standards was published in the Federal Register.

EPA and the National Highway Traffic Safety Administration (NHTSA) are taking coordinated steps to enable the production of a new generation of clean vehicles with reduced GHG emissions and improved fuel efficiency from on-road vehicles and engines. These next steps include developing the first-ever GHG regulations for heavy-duty engines and vehicles as well as additional light-duty vehicle GHG regulations. These steps were outlined by President Obama in a memorandum on May 21, 2010 (White House 2010).

The final combined EPA and NHTSA standards that make up the first phase of this national program apply to passenger cars, light-duty trucks, and medium-duty passenger vehicles, covering model years 2012 through 2016. The standards require these vehicles to meet an estimated combined average emissions level of 250 grams of carbon dioxide per mile, equivalent to 35.5 miles per gallon (mpg) if the automobile industry were to meet this carbon dioxide level solely through fuel economy improvements. Together, these standards are estimated to reduce GHG emissions by 960 million metric tons and 1.8 billion barrels of oil over the lifetime of the vehicles sold under the program (model years 2012-2016).

On January 24, 2011, the EPA along with the U.S. Department of Transportation and the State of California announced a single time frame for proposing fuel economy and GHG standards for model years 2017-2025 cars and light-trucks. Shortly thereafter (November 16, 2011), the new standards were proposed to be implemented during the same model year time frame, which signals continued collaboration that could lead to an extension of the current National Clean Car Program.

3.6.2.2 State Regulatory Setting

With the passage of several pieces of legislation, including State Senate and Assembly Bills and Executive Orders, California launched an innovative and proactive approach to dealing with GHG emissions and climate change at the state level.

Executive Order S-3-05

Executive Order S-3-05, signed in June 2005 by Governor Arnold Schwarzenegger, states that California is vulnerable to the impacts of climate change and that increased temperatures could reduce the Sierra Nevada snowpack, further exacerbate California's air quality problems, and potentially cause a rise in sea levels. To address those concerns, the Executive Order established the state's first GHG emissions targets:

- Reduce GHG emissions to 2000 levels by 2010
- Reduce GHG emissions to 1990 levels by 2020
- Reduce GHG emissions to 80 percent below 1990 levels by 2050

This Executive Order requires biannual reports on progress made toward meeting these targets and the global warming impact on California.

Global Warming Solutions Act of 2006

In September 2006, the State Legislature passed, and Governor Schwarzenegger signed, Assembly Bill (AB) 32 (Chapter 488, States of 2006), the Global Warming Solutions Act of 2006, which set the 2020 GHG emissions reduction goal into law. It directed the California Air Resources Board (CARB) to begin developing discrete early actions to reduce GHG emissions while also preparing the Climate Change Scoping Plan, which outlines a framework of measures that would eventually be adopted and implemented to reach AB 32 goals (CARB 2014b). CARB approved the Climate Change Scoping Plan in 2008 and updated it in May 2014. Regulations are being phased in over time. Adopted regulations include the 33 percent Renewable Portfolio Standard, the Cap-and-Trade Program, and the Low Carbon Fuel Standard. Relevant recommended actions of the updated Climate Change Scoping Plan are generally related to transportation/goods movement and gases with a high potential to result in global warming.

Reporting of GHG emissions by major sources is required by AB 32. In 2007, CARB established the Regulation for the Mandatory Reporting of Greenhouse Gas Emissions. Revisions to this GHG reporting regulation were approved by the California Office of Administrative Law, which became effective on

January 1, 2012. Facilities that emit 10,000 metric tons of carbon dioxide equivalents⁷ (MTCO₂e) or more of GHG emissions per year are required to submit annual reports to CARB.

Senate Bill 97

Senate Bill (SB) 97 was passed by the State Legislature and approved by Governor Schwarzenegger in August 2007. SB 97 acknowledges that climate change is a prominent environmental issue that requires analysis under the California Environmental Quality Act (CEQA). The California Natural Resources Agency adopted amendments to the CEQA Guidelines to address the analysis and mitigation of GHG emissions. The amendments to the CEQA Guidelines implementing SB 97 became effective on March 18, 2010.

Executive Order B-16-2012

Executive Order B-16-2012, signed in March 2012 by Governor Edmund G. Brown, ordered CARB, the California Energy Commission, the California Public Utilities Commission (CPUC), and other relevant agencies to establish benchmarks to achieve a myriad of goals set for 2015, 2020, and 2025 to reduce GHG emissions in California. Goals include accommodation of zero-emission vehicles in major metropolitan areas, expansion of manufacturing capabilities of zero-emission vehicles, accessibility of zero-emission vehicles to mainstream consumers, and integration of electrical vehicle charging into the electricity grid. Governor Brown also set a target such that GHG emissions from the transportation sector would be reduced to 80 percent less than 1990 levels by 2050.

Executive Order B-30-15

In April 2015, Governor Brown signed Executive Order B-30-15, establishing a new interim statewide GHG emission reduction target of 40 percent below 1990 levels by 2030. The interim reduction target was established in order to ensure California meets its goal of reducing GHG emissions to 80 percent below 1990 levels by 2050. Executive Order B-30-15 requires state agencies to consider climate change in their planning and investment decisions, giving priority to actions that reduce GHG emissions.

3.6.2.3 Local Regulatory Setting

The Project is located within portions of the Mojave Desert Air Basin (MDAB) under the jurisdiction of the Antelope Valley Air Quality Management District (AVAQMD) and portions of the South Coast Air Basin (SCAB) under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). The Project would need to adhere to the following AVAQMD and SCAQMD regulations:

- AVAQMD Regulation XXX, Rule 3011 (2011) – Greenhouse Gas Provisions of Federal Operating Permits (FOPs)
 - Provides a mechanism for the AVAQMD to incorporate requirements for the regulation of GHGs into FOPs

⁷ A metric used to compare emissions of various greenhouse gases. It is the mass of carbon dioxide that would produce the same estimated radiative forcing as a given mass of another greenhouse gas. Carbon dioxide equivalents are computed by multiplying the mass of the gas emitted by its global warming potential.

- Under federal Tailoring Rule (Federal Register Vol. 75, No. 106, p. 31514) only the largest GHG emitters are covered: power plants, refiners, cement production facilities
- SCAQMD Regulation XXVII, Rule 2701 & 2702 (2010) – Climate and Greenhouse Gases
 - Rule 2701 establishes a voluntary program to encourage, quantify, and certify voluntary, high-quality certified GHG reductions in the SCAQMD
 - Rule 2702 creates a program for GHG emission reduction in the SCAQMD, which funds reduction projects or purchases them from other parties

In addition, the Project includes sites within the jurisdictions of Los Angeles County, San Bernardino County, and 16 cities. GHGs and climate change are managed through land use and development planning practices, which are implemented through the cities' general planning processes. The following are county and city plans applicable to GHGs:

- City of Agoura Hills – 2035 General Plan Environmental Impact Report (2010), Chapter 4.15 Climate Change
 - A lead agency is required to make a good faith effort, based on available information, to describe, calculate, or estimate the amount of GHGs associated with a project, including those emissions associated with energy consumption and vehicular traffic.
- City of Burbank – 2035 General Plan (2013), Chapter 2 Air Quality and Climate Change Element, Goal 3 -Reduction of GHGs and Goal 4 - Climate Change
 - Goal 3: Develop and adopt a binding, enforceable reduction target and mitigation measures and actions to reduce communitywide GHG emissions within Burbank by 15 percent and 30 percent from current levels in 2020 and 2035, respectively.
 - Goal 4: Evaluate the potential effects of climate change on Burbank's human and natural systems and develop strategies for the City to respond appropriately.
- City of Chino Hills – 2025 General Plan (2010), Chapter 9 Open Space and Conservation Element, Goal OSC-5 Reduce GHG emissions by 15 percent below 2005 levels by 2030
 - The City will work with business owners to support their efforts to reduce GHG emissions in achievement of this goal.
- City of Los Angeles – GreenLA, An Action Plan to Lead the Nation In Fighting Global Warming, Adaptation – Climate Proof Los Angeles
 - Improve capacity to respond to an emergency through education and outreach among other adaptive measures.
- City of West Hollywood – 2035 General Plan (2011), Climate Action Plan

The plan identifies seven mitigation strategies to reduce 2035 communitywide GHG emissions by 20 percent to 25 percent below 2008 levels including: community leadership and engagement, land use

and community design, transportation and mobility, energy use and efficiency, water use and efficiency, waste reduction and recycling, and green space strategy.

- Unincorporated Los Angeles County (ULAC) - Community Climate Action Plan 2020

To reduce the impacts of climate change, the County has set a target to reduce GHG emissions from community activities in the unincorporated areas of Los Angeles County by at least 11 percent below 2010 levels by 2020.

3.6.3 Significance Criteria

Appendix G of the CEQA Guidelines and Guidelines Section 15064.4 provide criteria for evaluating the significance of a project's environmental impacts on GHGs. For the purposes of this EIR, implementation of the proposed Project would have a significant GHG impact if any of the following significance criteria are met:

- 1) Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?
- 2) Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

3.6.3.1 AVAQMD

The AVAQMD has established the following significance threshold for GHG emissions: projects generating total emissions (direct and indirect) in excess of 100,000 tons annually or 548,000 pounds daily (AVAQMD 2011) would result in a significant impact.

3.6.3.2 SCAQMD

The SCAQMD has established a significance threshold of 10,000 metric tons per year for CO₂ equivalents (MTCO₂e) including nitrogen dioxide and methane from industrial facilities (SCAQMD 2008).

3.6.4 Impact Analysis

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction and Operation Impacts

Detailed analysis for each site is provided in Chapter 4. Direct emissions of GHGs in terms of CO₂e from construction of the proposed Project sites were determined using the California Emission Estimator Model (CalEEMod) v. 2013.2.2 developed for the California Air Pollution Control Officers Association (CAPCOA) by SCAQMD and other California air districts (EIC 2013). The model quantifies direct emissions from construction for a variety of land use projects. A composite site representing a maximum construction activity scenario was assumed for each proposed Project site.

Direct emissions of GHGs associated with the operation of the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB and 3 proposed Project sites in the MDAB. The generator test would last one hour at each site, and test days would be evenly distributed during each month of the year. For the analysis, an average of 11.75 trips per week to sites within the SCAB was assumed, with three maintenance trips on four weekdays per week and three additional weekday trips per month. For sites in the MDAB, the three maintenance trips were assumed to occur on the same day, once per month. It is also assumed that maintenance days coincide with generator test days. Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis. The CalEEMod emissions model provides power rating data on the project summary input screen (EIC 2013).

Total annual GHG emissions for all 54 proposed Project sites, 51 in the SCAB and 3 located in the MDAB, are shown in Table 3.6-1. Per guidance provided by the SCAQMD (SCAQMD 2008), construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. As shown in Table 3.6-1, the estimated annual emissions of GHG resulting from the construction and operation of all 54 proposed Project sites is substantially below all AVAQMD and SCAQMD GHG thresholds. Direct emissions of GHGs from the project construction and direct and indirect emissions of GHGs from the project operation would have a less than significant impact on the environment.

Table 3.6-1: Construction and Operational GHG Emissions for all Sites within SCAB and MDAB

GHG Emission Source	Annual Emissions (metric tons)
Construction (Amortized over 30-year facility life) ¹	220.13
Routine Maintenance	32.12
Generator Testing	16.44
Indirect (Electricity Generation)	2,074.79
Total	2,343.48

¹ Amortization over 30 years is suggested by the South Coast Air Quality Management District in its draft guidance for CEQA analysis of GHG emissions (SCAQMD 2008).

Mitigation Measures

No mitigation measures are required.

GHG-2: Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction and Operation Impacts

The CARB 2015 Edition of the California GHG Emission Inventory; *California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators* summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances (CARB 2015). Trends in GHGs indicate a 1.5-million MTCO₂e decrease from 2012 to 2013 and 7 percent decrease since peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants⁸. During the period from 2000 to 2013, California per capita GHG emissions continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles in 2010 were estimated at 7.9 million MTCO₂e (Unincorporated Los Angeles County 2015). Of these total emissions, building energy use is the largest source of emissions (49 percent). Transportation emissions from on- and off-road vehicles are the second largest source of emissions (42 percent). The third largest source is community waste generation (7 percent). The remaining sources are water conveyance and wastewater generation (2 percent), agriculture (0.4 percent), and stationary sources (0.02 percent). Trends for greater Los Angeles County, including unincorporated areas, indicated an overall reduction for the period from 2005 to 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48 percent. The Unincorporated Los Angeles County *Community Climate Action Plan 2020* projects a 10-percent reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11-percent emissions reductions for the period from 2013 to 2020.

As shown in Table 3.6-1, 88.5 percent of the GHG emissions from the proposed Project are associated with the electrical needs for equipment operation; and the remaining 11.5 percent are for construction and maintenance of the proposed Project sites. Compliance with the SCAQMD and AVAQMD significance thresholds for GHGs would not trigger mandatory reporting of Project emissions to CARB and demonstrates that the proposed Project's contribution to statewide and Unincorporated Los

⁸ Combined-cycle power plants make use of waste heat from natural gas combustion to power steam turbines, producing as much as 50 percent more energy from the combustion cycle.

Angeles County emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the Project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measures

No mitigation measures are required.

3.6.4.1 No Project Alternative

Under the No Project Alternative, none of the 54 proposed Project sites would be constructed. Therefore, no greenhouse emissions would occur from construction equipment, worker commuting vehicles, or material transport trucks. No mitigation measures would be needed to ensure that emission thresholds are not exceeded; however, existing communication sites would continue to operate and be inspected, maintained, and repaired.

3.6.5 Cumulative Impacts

The area of geographic consideration for cumulative impacts of GHG emissions is global. Climate change is a global problem, and GHGs persist in the atmosphere for long enough time periods to be dispersed around the globe. Impacts of GHGs are also borne globally.

From the standpoint of CEQA, GHG impacts to climate change are inherently cumulative. Significant cumulative impacts would occur if the proposed Project were to directly or indirectly result in an increase in GHG emissions compared to existing conditions; conflict with AB 32, or be inconsistent with the state's ability to achieve the Executive Order B-30-15 and S-3-05 targets of reducing California's GHG emissions to 40 percent below 1990 levels by 2030 and 80 percent below 1990 levels by 2050. Compliance with the SCAQMD and AVAQMD significance thresholds for GHGs would not trigger mandatory reporting of Project emissions to CARB. This demonstrates that the potential contribution of the proposed Project would not conflict with downward trends in emissions from transportation and electric power sources by approximately 11 to 20 percent from peak levels during the period from 2000 to 2013 (CARB 2015).

The AVAQMD and SCAQMD emission thresholds were set to ensure that individual projects, when combined with other air pollution-emitting activities in their jurisdictions, do not result in significant GHG impacts. In developing their GHG thresholds, the districts made various assumptions about growth in population and housing and indicators of economic activity, including transportation activity as indicated by vehicle miles traveled. The proposed Project is not growth-inducing and would not result in an economic activity that would be inconsistent with these assumptions in forecasting district-wide emissions.

Although the Project would result in an increase of GHG emissions as described in Table 3.6-1, GHG emissions are less than AVAQMD and SCQAMD significance thresholds and would not conflict with AB 32 or the state's ability to achieve the Executive Order B-30-15 and S-3-05 targets of reducing

California's GHG emissions to 40 percent below 1990 levels by 2030 and 80 percent below 1990 levels by 2050. Project GHG emissions would not be cumulatively considerable.

3.7 Hazards and Hazardous Materials

This section describes the known and potential hazards and hazardous materials associated with construction of the proposed Project sites located in Los Angeles and San Bernardino counties. The section analyzes potential impacts on and from hazards and hazardous materials associated with construction and operation of the proposed Project and Project Alternative.

3.7.1 Environmental Setting

3.7.1.1 **Hazardous Wastes**

Past hazardous waste or hazardous material releases at a proposed Project site or adjacent properties could have implications on site selection because of the potential for worker exposure to contaminated soil and/or groundwater as well as financial risks from acquiring or leasing a contaminated site. To address these concerns, each proposed Project site was evaluated through completion of an environmental database records search (Envirostor 2015; Geotracker 2015) that identified the potential presence of recognized environmental conditions (RECs). Releases of hazardous materials to soil or groundwater on or within a 1.0-mile radius of each proposed Project site were identified. Records reviewed included but were not limited to:

- Federal environmental databases for the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), Resource Conservation and Recovery Act (RCRA) and Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS)
- State and tribal-equivalent National Priority List (NPL) and CERCLIS databases (EPA 2015)
- State, tribal, and local government solid waste disposal site lists
- State, tribal, and local hazardous waste/contaminated site lists
- Water Quality Control Board Leaking Underground Storage Tank (LUST) online database (RWQCB 2015)
- State, tribal, and local registered storage tank lists and leaking storage tanks lists
- RWQCB Geotracker database and California Department of Toxic Substance Control (DTSC) Envirostor database

After completion of the records search, including an Environmental Data Resources Inc. (EDR Report) for each site, RECs potentially encountered during construction activities were identified for each proposed Project site. The findings are presented below.

Existing Hazardous Waste Sites and Sites within 1 mile of a National Priority List

One proposed Project site is located within 1.0 mile of facilities listed on USEPA's Superfund Program's NPL site (USEPA 2012). The site is listed in **Error! Reference source not found.**

Table 3.7-1: Proposed Project Sites within 1 mile of an NPL Site

Site ID (Name)	Address	NPL Site	Groundwater Depth at Site (Feet)
SDW	310 Via Blanca, San Dimas, CA 91773	Eastshore Recreational Vehicle is part of an NPL Site. EPA ID CAD983566712. Site is located 0.4 mile from Project site	Unknown, downgradient from site

High Potential for RECs

One proposed Project site has been identified as having a high potential to encounter RECs on site during intrusive site-related activities and is described in **Error! Reference source not found..** Criteria for sites to be identified as having High potential include but are not limited to:

- Sites that have active LUST; or
- Sites with other ongoing regulatory enforcement actions and remedial activities.

Table 3.7-2: Proposed Project Sites with High Potential to Encounter Recognized Environmental Concerns

Site ID	Address	Comments	Groundwater Depth at Site (Feet)
PDC (Pacific Design Center)	720 San Vicente Blvd. West Hollywood, CA 90069	Past on-site LUSTs have been remediated. MMRP FUDS less than 660 feet upgradient that requires evaluation (Schrillo Aero Tool). Two ongoing LUST remedial actions within 660 feet to 0.25 mile from Project site (Southern CA RTD and Sunlin Inc.). Potential for human contact with contamination in soil, soil vapor, and groundwater during intrusive activities.	25

Medium Potential for RECs

One proposed Project site is identified as having a medium potential to encounter RECs on site during intrusive site-related activities and is presented in **Error! Reference source not found..** Criteria for sites to be identified as having medium potential include but are not limited to:

- Sites with a closed Cortese list site
- Sites with a closed LUST site within the site boundary

- Site is upgradient from an NPL or other Cortese List site

Table 3.7-3: Proposed Project Sites with Medium Potential to Encounter Recognized Environmental Concerns

Site ID	Address	Comments	Groundwater Depth at Site (Feet)
RIH (Rio Hondo)	Near Workman Mill Road Hacienda Heights, CA 91745	MMRP FUDS less than 75 feet from Project site that requires evaluation (NIKE Battery 14). Potential for human contact with contamination in soil or groundwater during intrusive activities. Site is adjacent to closed landfill.	Depth to groundwater unknown
MMRP FUDS = Military Munitions Response Program Formerly Used Defense Site			

Low Potential for RECs

Error! Reference source not found. lists proposed Project sites that have a low potential to encounter RECs during intrusive activities. Criteria for sites to be identified as having low potential include but are not limited to:

- UST or AST are present on site without a history of RECs being released; or
- Adjacent off-site REC releases have been remediated; however, potential exists that past migration of RECs to the proposed Project site may have occurred.

Table 3.7-4: Proposed Project Sites with Low Potential to Encounter Recognized Environmental Concerns during Intrusive Site-Related Activities

SIM	Simpsons Building	Building 42, Fox Lot, 10201 West Pico Blvd, Los Angeles CA 90064

No Potential for RECs

Proposed Project sites identified as having no potential to encounter RECs on site during intrusive site-related activities are listed in **Error! Reference source not found.** Criteria for sites to be identified as having no potential include but are not limited to:

- No active Cortese list sites, NPL sites, or LUST sites within site boundary
- No LUST sites within 0.25 mile of facility
- No NPL sites within 1.0 mile of facility
- No past Cortese list sites within site boundary
- adjacent off-site REC releases have been remediated; however, no potential exists that past migration of RECs to the proposed Project sites may have occurred

3.7.1.2 Airports and Airstrips

One LMR project site is located within an Airport Land Use Plan (ALUP) boundary. SDW is located within Area E of the Brackett Field Airport Land Use Compatibility Plan (ALUCP). No sites are located within an

ALUCP or within 2 miles of a public airport or public use airport that does not have an approved ALUCP. No LMR sites are within 2 miles of a private airstrip.

3.7.1.3 Wildland Fire Risk

USFS and NPS have management and administrative responsibility for certain federal lands proposed for siting of LMR system components. Each agency has the legal authority to protect those lands from the effects of wildfire. This is primarily accomplished through the implementation of resource management and fire management plans that contain policies addressing vegetation management and creation of defense zones to address the Wildland/Urban Interface.⁹

California PRC Sections 4201-4204 and Government Code Sections 51175-51189 require identification of fire hazard severity zones within the State of California and specify standards for brush clearance around buildings or structures located in, upon, or adjoining any mountainous, forest, brush, or grassland area. Fire hazard severity zones are measured qualitatively, based on vegetation, topography, weather, crown fire potential (a fire's tendency to burn upwards into trees and tall brush), and ember production and movement within the area in question. Fire prevention areas considered to be under state jurisdiction are referred to as "state responsibility areas." In state responsibility areas, the California Department of Forestry and Fire Protection is required to delineate three hazard ranges: moderate, high, and very high. In "local responsibility areas," which are under the jurisdiction of local entities (e.g., cities, counties), local agencies are required only to identify very high fire hazard severity zones. Sites identified in these areas are presented in **Error! Reference source not found.**

Though under federal jurisdiction, all of the proposed Project sites located in the SMMNRA and ANF are assumed to be within a very high fire hazard severity zone and are included in **Error! Reference source not found.**

Table 3.7-7: Proposed Project Sites in Areas Designated as a Very High Fire Hazard Severity Zone

Site ID	Site Name	Responsibility Area (Federal, State, or Local)
AGH	Agoura Hills	LRA

Figure 3.7-1: LMR Project Sites in Very High Fire Hazard Severity Zones

3.7.2 Regulatory Setting

3.7.2.1 *Federal Regulatory Setting*

Comprehensive Environmental Response, Compensation, and Liability Act (Superfund) of 1980

CERCLA (42 U.S.C. Section 9601 et seq.), and all subsequent amendments provide a federal Superfund to clean up uncontrolled or abandoned hazardous-waste sites, including those affected by unauthorized releases of pollutants and contaminants. CERCLA grants the USEPA authority to assign responsible parties to a contamination event and to seek remuneration for its restoration.

Superfund Amendments and Reauthorization Act of 1986

Among its requirements, the Superfund Amendments and Reauthorization Act (SARA) (42 U.S.C. Section 9601 et seq.) identifies requirements for planning, reporting, and notification concerning hazardous materials. USEPA maintains a database of sites that are included on the NPL (40 CFR Part 300) (USEPA 2012). The NPL is the list of national priorities among the known releases or threatened releases of hazardous substances, pollutants, or contaminants throughout the United States and its territories. The NPL is intended primarily to guide the USEPA in determining which sites warrant further investigation and remediation. Sites are listed on the NPL upon completion of a Hazard Ranking System screening, followed by consideration of public comments on proposed listings.

Resource Conservation and Recovery Act

The Federal Resource Conservation and Recovery Act (RCRA) (40 CFR Parts 239–282), which amended the Solid Waste Disposal Act (42 U.S.C. Section 6901 et seq.), establishes a framework for the proper management of hazardous and nonhazardous solid waste. This Act, along with the Toxic Substances Control Act of 1976, enacted a program administered by USEPA for the regulation of the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA was amended in 1984 by the Hazardous and Solid Waste Act (HSWA), which affirmed and extended the “cradle to grave” system of regulating hazardous wastes from their creation to disposal. The use of certain techniques for the disposal of some hazardous wastes was specifically prohibited by the HSWA. RCRA focuses on active and future facilities; it does not address abandoned or historical sites, which are managed under CERCLA.

Hazardous Materials Regulations

The federal hazardous materials regulations (49 CFR 171-180) identify the required shipping papers, package marking, labeling, transport vehicle placarding, training, and registrations applicable to the shipment and transportation of hazardous materials. Sections 5101-5127 regulate the transportation of hazardous materials through the Hazardous Materials Transportation Act (HMTA). Under the HMTA, the Department of Transportation has the responsibility for safe transit of hazardous materials.

Occupational Safety and Health Act

The Occupational Safety and Health Act was passed by Congress in 1970 and is the primary federal law that governs occupational health and safety in the workplace. In part, it governs hazards in a working

environment, such as exposure to toxic chemicals, excessive noise levels, mechanical dangers, heat or cold stress, or unsanitary conditions.

Clean Water Act

The Clean Water Act (33 U.S.C. Section 1251 et seq.) was enacted to restore and maintain the chemical, physical, and biological integrity of the nation's waters by regulating point and nonpoint pollution sources, providing assistance to publicly owned treatment works for the improvement of wastewater treatment, and maintaining the integrity of wetlands. This includes the creation of the National Pollutant Discharge Elimination System (NPDES), which requires states to establish discharge standards specific to water bodies and regulates storm water discharge from construction sites through the implementation of a storm water pollution prevention plan (SWPPP).

Spill Prevention, Control, and Countermeasure Rule

The federal Spill Prevention, Control, and Countermeasure Rule (40 CFR Part 112) was enacted to require response and cleanup after a spill occurs and prevent discharge of oil into navigable waters of the United States or adjoining shorelines. Facilities subject to the rule must prepare and implement a spill prevention, control and countermeasure (SPCC) plan.

Federal Aviation Regulation

The federal aviation regulation (14 CFR Part 77) establishes standards and notification requirement for objects that may affect navigable airspace. This regulation requires that the administrator of the FAA must be notified by any person or organization who intends to sponsor construction or alterations exceeding 200 feet above ground level, as well as construction of alternatives in close proximity to an airport that may exceed certain heights (determined by the ratio of height/distance). In addition, FAA Advisory Circular AC 70/7560-1K, Obstruction Marking and Lighting, outlines standards for marking and lighting structures that exceed an overall height of 200 feet above ground level to promote aviation safety (FAA 2015).

3.7.2.2 State Regulatory Setting

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Porter-Cologne) (California Water Code Section 13000 et seq.) is a state law that provides a comprehensive water quality management system for the protection of California waters. Porter-Cologne designated the State Water Resources Control Board as the ultimate authority over state water rights and water quality policy and established nine Regional Water Quality Control Boards (RWQCBs) to oversee water quality on a day-to-day basis at the local/regional level. The RWQCBs have the responsibility of granting NPDES permits for stormwater runoff from construction sites.

California Health and Safety Code Section 25501

California law defines a hazardous material as any material that, because of its quantity, concentration, or physical, chemical, or infectious characteristics, may pose a present or potential hazard to human health and safety or to the environment if released in the workplace or the environment (California Health and Safety Code Section 25501). A hazardous waste is defined as a discarded material of any form (i.e., solid, liquid, gas) that may pose a present or potential hazard to human health and safety or to the environment when improperly treated, stored, transported, disposed of, or otherwise managed (California Health and Safety Code Section 25117).

California Resource Conservation Recovery Act

California's RCRA (22 CCR Division 4.5) hazardous waste program is more stringent than the federal counterpart, and certain wastes that would not qualify as hazardous based on federal standards may still qualify as hazardous waste according to California standards (termed non-RCRA hazardous waste).

California Occupational Safety and Health Administration Enforcement Unit

The California Occupational Safety and Health Administration (Cal/OSHA) enforcement unit has jurisdiction over every employer and place of employment in California, which is necessary to adequately enforce and administer all occupational safety and health standards and regulations. This includes the requirement that Material Safety Data Sheets (MSDS) for hazardous materials be available.

California Occupational Safety and Health Administration (CCR Title 8)

The Department of Industrial Relations in the Labor and Workforce Development Agency has administered the Cal/OSHA program since 1973, when California's plan was submitted to Federal OSHA for approval. Cal/OSHA protects workers and the public from safety hazards through its occupational safety and health programs, and it provides consultative assistance to employers. Handling and storage of fuels, flammable materials, and common construction-related hazardous materials are governed by Cal/OSHA.

California State Aeronautics Act

The California State Aeronautic Act (PUC § 21001 et seq.) is intended to protect the public interest in aeronautics and aeronautical progress. Administered by the California Department of Transportation, Division of Aeronautics, Article 3.5, Airport Land Use Commissions, (PUC §§ 21670 – 21679.5) outlines the statutory requirements for Airport Land Use Commissions (ALUCs) including the preparation of an Airport Land Use Compatibility Plan (ALUCP). Airport land use compatibility focuses on ensuring that land development near airports does not constrain the safe and efficient operation of the airport or exposing people living or working nearby to unacceptable levels of noise or safety hazards.

3.7.2.3 Local Regulatory Setting

Airport Land Use Compatibility Plans

Los Angeles County has 15 public and public use airports that have airport land use plans, which were all reviewed as part of this analysis. The ALUCPs and related documents that are applicable to this analysis include only Brackett Field Airfield Land Use Compatibility Plan (adopted December 9, 2015), a portion of which envelops Site SDW. The Brackett Field ALUCP identifies policies in areas in the vicinity of the airport to minimize the potential for off-airport aircraft accidents or incidents that might be associated with an emergency landing. These policies consider risks both to people and property on the ground and to people on board the aircraft. The plan relies on land use planning contained within the plan and federal regulations identified at 14 CFR Part 77 (discussed above) to further reduce potential risks near Brackett Field.

Los Angeles County Health and Safety Code

In accordance with the California Health and Safety Code (Chapter 6.95), business concerns operating within the jurisdiction of the Los Angeles County Certified Unified Program Agency (CUPA) are required to obtain annually a unified program facility permit before handling hazardous materials (Los Angeles County Code of Ordinances, Chapter 12.64) or before operating an aboveground petroleum storage tank facility (Los Angeles County Code of Ordinances, Chapter 12.70).

San Bernardino County Code of Ordinances

Similar to Los Angeles County, in San Bernardino County no person or entity is allowed to own, operate, or allow the operation of any activity or facility subject to the CUPA permit program elements without first obtaining and paying the applicable fees for a permit (San Bernardino County Code of Ordinances, Chapter 6.23). The CUPA permit includes, but is not limited to, hazardous waste generators and hazardous waste on-site treatment; underground and aboveground storage tanks, and California accidental release prevention program, as described in greater detail in Title 2, Division 3, Chapter 7 of the Code of Ordinances.

3.7.3 Significance Criteria

The proposed Project would result in significant impact from hazards and hazardous materials if any of the following significance criteria are met:

- 1) Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?
- 2) Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?
- 3) Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

- 4) Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?
- 5) For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?
- 6) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?
- 7) Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?
- 8) Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

3.7.4 Impact Analysis

3.7.4.1 **Proposed Project**

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impacts

Diesel fuel is the primary hazardous material at the site. During construction diesel fuel will be required on site for heavy equipment. A diesel generator has been included in the analysis to potentially be placed at each proposed Project site. The generator would be placed on the site during the construction phase, fueled, and tested. The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. In accordance with such regulations, the transport of hazardous materials and wastes can occur only with transporters who have received training and appropriate licensing.

Refueling of equipment on site will be done in accordance with approved Safety and Health Plans. BMPs described in Chapter 2 include instruction on how and where refueling on a Project site may occur, spill prevention practices, and what to do if an accidental spill were to occur.

Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Waste manifest would be required for the disposal of any hazardous waste generated on site that needs to be disposed of at an approved landfill. Accidental spills or releases associated with the on-site fuel storage tanks will be controlled through secondary containment, SPCC plans as required by federal law where applicable, and worker education. Emergency response plans will be in place.

Hazards would be less than significant with implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on site, BMPs

discussed in Chapter 2, and emergency response plan preparation and coordination. Project impacts on the public or the environment during construction would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Hazards for operations will be less than described under construction; however, transportation and storage of diesel fuel on site would occur. Hazards will be less than significant through implementation of BMPs discussed in Chapter 2, regulations and requirements addressing transport driver education, preparation of SPCC plans as required by federal law to contain spills or releases on site, and emergency response plan preparation and coordination. Project impacts on the public or the environment related to potential creation of significant hazards during operation of the proposed Project sites would be less than significant.

Mitigation Measures

No mitigation measures are required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impacts

This analysis assumes that a diesel fuel tank from 1,000 up to 1,500 gallons is integrated into the design of the backup generator for each of the Project sites. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks will meet nationally recognized standards. Secondary containment (construction of concrete pad with a berm to contain potential diesel fuel spill) will be in place. Diesel fuel tanks greater than 660-gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112. Construction of the proposed Project would not create or result in any reasonably foreseeable upset or accident conditions. Impacts associated with release of hazardous materials to the environment would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Operation impacts would be limited to refilling the on-site diesel generator periodically. Refueling would be done in accordance with BMPs discussed in Chapter 2. Operation of the Project would not create or

result in any reasonably foreseeable upset or accident conditions. Impacts associated with release of hazardous materials to the environment during operation are less than significant.

Mitigation Measures

No mitigation measures are required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school?

Construction Impacts

As shown in **Error! Reference source not found.**, two proposed Project sites (LARICSHQ and PASPD01) are within 0.25 mile of a school. During construction, heavy equipment will be used to excavate foundations and erect towers. For proposed Project sites that will be collocated on existing towers, man-lifts and other support trucks will be used to transport equipment to the site. Fueling of the equipment may occur on site as described under HAZ-1. Construction impacts, including potential refueling of construction equipment on site, would be completed in accordance with BMPs described in Chapter 2. The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel is the primary hazardous material at the site. In accordance with such regulations, the transport of hazardous materials and wastes can occur only with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. The contractor is required to comply with all applicable regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on site, and emergency response plan preparation, including coordination with schools with 0.25 mile of the Project site. Impacts associated with emissions or handling of hazardous materials during construction would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Operation impacts are similar to those described above under Construction Impacts; however, transportation and handling of diesel fuel would be limited to refilling the diesel generator on site periodically. Refueling would be done in accordance with BMPs discussed in Chapter 2. Operational impacts associated with emissions or handling of hazardous materials during operation would be less than significant.

Mitigation Measures

No mitigation measures are required.

HAZ-4: Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impacts

Only Site PDC is located in an area identified as a hazardous material site. The site has an active investigation for a LUST. LMR equipment proposed for the site would be placed on existing structures at the facilities with minimal ground-disturbing activities. Construction at this facility may include placement of new equipment structure and/or trenching for utilities that will disturb the ground. If potential contamination is not appropriately located and characterized prior to disturbance, disposal of excavated soil could result in a significant impact and create a significant hazard to the public or the environment at Site PDC.

Mitigation Measures

The following measure is applicable to Site PDC.

HAZ MM 1 Prior to construction activity, the construction contractor must prepare a Phase I Environmental Site Assessment meeting the standards outlined in the American Society for Testing Materials (ASTM), Practice for Limited Environmental Due Diligence: Transaction Screen Process E 1528.

- Phase I documents shall be reviewed to determine if the lateral and vertical extent of impacted soil and/or groundwater will be encountered by proposed construction activities.
- If proposed construction activities will not encounter impacted soil or groundwater based on the documented vertical and lateral extent, no further action will be required.
- If it is determined that the construction footprint will encounter impacted soils or encounter impacted groundwater, the contractor shall prepare a site-specific Health and Safety Plan that meets the requirements of 29 CFR 1910 for worker safety.
- If the lateral and vertical extent or the nature of the impacted soil cannot be determined from available documents, a Phase II investigation shall be completed to determine if the soils and/or groundwater that may be encountered during construction (within the footprint any excavation) are impacted. The Phase II investigation shall also determine the nature of contaminations that may be encountered.
- The Phase II report should also address disposal alternatives and procedures for any impacted soil that may be encountered or groundwater which may need to be removed.

Impacts after Mitigation

With implementation of HAZ MM 1, the location of the LUST site and impacted soil and groundwater would be identified to ensure proper disposal. After implementation of HAZ MM 1, impacts resulting from disturbance would be less than significant on the public and the environment at Site PDC.

Operation Impacts

No impacts are associated with the operation of Site PDC. Once this site is constructed, any hazardous material impacts that may be present would have been avoided and/or covered in hard surface and would no longer pose any type of health hazard to facility workers. Operation of the facility does not include intrusive activities or use of groundwater. No impacts would occur from operations.

Mitigation Measures

No mitigation measures are required.

HAZ-5: For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impacts

Site SDW is the only proposed Project site located within an approved ALUP or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport. No other proposed Project sites are within an ALUP, and no impacts would occur to any site other than Site SDW.

Site SDW lies within Area E land use as defined in the ALUCP for Brackett Field. The approved ALUP indicates that structures more than 100 feet tall within the Area E land use need to be evaluated by the FAA using Form 7460-1, in compliance with 14 CFR Part 77 to determine if the structure creates an air navigation hazard for the field. If the structure creates a navigation hazard, this would be a significant impact.

Mitigation Measures

The following mitigation measure shall apply at Site SDW.

HAZ MM 2 Prior to issuance of building permits, the Contractor shall submit Form 7460–1 (Notice of Proposed Construction or Alteration) to the FAA, in the form and manner prescribed in 14 CFR Part 77. The Contractor shall also provide documentation to the appropriate city or county planning agency demonstrating that the FAA has issued a “Determination of No Hazard to Air Navigation.”

The FAA regulates objects affecting navigable airspace according to 14 CFR Part 77. The federal and state Departments of Transportation also require the proponent to submit FAA Form 7460–1, Notice of Proposed Construction or Alteration. According to 14 CFR Part 77, notification allows the FAA to identify potential aeronautical hazards in

advance, thus preventing or minimizing any adverse impacts on the safe and efficient use of navigable airspace.

Per 14 CFR Part 77, notification requirements include sending one executed form set (four copies) of FAA Form 7460–1, Notice of Proposed Construction or Alteration, to the Manager, Air Traffic Division, of the FAA Regional Office having jurisdiction over the area within which the construction or alteration will be located. The notice required must be submitted at least 45 days before the earlier of the following dates: (1) the date the proposed construction or alteration is to begin, or (2) the date an application for a construction permit is to be filed.

Impacts after Mitigation

FAA must be notified in accordance with 14 CFR Part 77. Prior to start of construction, Form 7460-1 needs to be filed with the FAA. Filing of the form triggers the FAA to complete an aeronautical study and return a hazard determination. The proposed antenna structure, a proposed 180-foot-tall lattice structure, would need to be built in compliance with FAA’s hazard determination and associated conditions from the aeronautical study (e.g., obstruction lighting). Application of HAZ MM 2 would ensure that the proposed Project complies with all FAA regulations regarding structures located within proximity to airports. After application of HAZ MM 2, impacts would be reduced to less than significant.

Operation Impacts

Operation of the proposed Project facilities would not result in impacts to aeronautical navigation. Pursuant to mitigation measure HAZ MM 2, the Contractor must receive a “Determination of No Hazard to Air Navigation” from the FAA prior to construction of Site SDW. Compliance with mitigation measure HAZ MM 2 and all current FCC and FAA regulations will ensure that the facility would not pose a risk to people living or working in the Project area. Operational impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

HAZ-6: For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impacts

No proposed Project sites were identified within 2 miles of a private airstrip. No safety hazards would occur for people residing or working in the Project area. No impacts would occur from construction at any proposed Project site.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

No proposed Project sites were identified within 2 miles of a private airstrip. No safety hazards would occur for people residing or working in the Project area. No impacts would occur from operations at any proposed Project site.

Mitigation Measures

No mitigation measures are required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impacts

No proposed Project facilities would be built that would interfere with an adopted emergency response plan or emergency evacuation plan. The locations of proposed Project facilities have been fully coordinated with city and county emergency responders to ensure the location would not interfere with emergency response vehicles or facilities. LMR radio frequencies are assigned by the FCC based on availability to ensure that frequencies do not get duplicated or interfere with previously assigned channels. The LMR system is being integrated with participating agencies to enhance communication among emergency responders. The intent of the proposed Project is to enhance communication among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans and would result in beneficial operational impacts.

Construction activities at proposed Project sites where a new monopole or new tower is being constructed are fully coordinated with property owners where the proposed structure is to be placed. Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications. As no impairment of or interference with an emergency response plan or emergency evacuation plan would occur from construction, no impact would occur.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

No proposed Project facilities would be built that would interfere with an adopted emergency response plan or emergency evacuation plan. Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans and would result in beneficial operational impacts. No impairment of or physical interference with an

adopted emergency response plan would occur; therefore, no impacts associated with these criteria would occur.

Mitigation Measures

No mitigation measures are required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impacts

Forty-seven proposed Project sites are either located or, in the case of sites on federal land, presumed within a Very High Fire Hazard Severity Zone (**Error! Reference source not found.**). Construction in these zones will comply with local municipal code, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. Construction activities in these areas represent an elevated risk of igniting a wildland fire.

California PRC Sections 4201-4204 and Government Code Sections 51175-51189 require identification of fire hazard severity zones within the State of California and specify standards for brush clearance around buildings or structures located in, upon, or adjoining any mountainous, forest, brush, or grassland area. Fire hazard severity zones are measured qualitatively, based on vegetation, topography, weather, crown fire potential (a fire's tendency to burn upwards into trees and tall brush), and ember production and movement within the area in question.

All proposed Project sites within wildland areas are in previously disturbed, well-cleared areas. Seven sites (sites ASD, LACF072, LARICSHQ, PASDPD01, PDC, SGH, and WS1) are not in areas identified as a Very High Fire Hazard Severity Zone and do not pose an elevated risk of wildland fire ignition. Impacts from construction at these sites are less than significant. Construction at the 48 sites listed in **Error! Reference source not found.**, because they are located or assumed located within a very high fire hazard zone, pose an elevated risk of wildland fire ignition; and these risks are considered a significant impact.

Mitigation Measures

No mitigation measures are required at sites ASD, LACF072, LARICSHQ, PASDPD01, PDC, SGH, or WS1. Implementation of HAZ MM 3 would be required at the 48 sites listed in **Error! Reference source not found.**

HAZ MM 3 Fire Management Plan. Prior to construction activity, the Authority must work with the agency responsible for fire protection in the jurisdiction where the site is located to develop and implement a fire management plan for use during construction activity. The plan will identify project locations, project descriptions, anticipated construction activities, limitation of activities during periods of elevated fire risk (e.g., "red flag")

days), level of suppression equipment required on site, training requirements, and points of contact.

Impacts after Mitigation

The training aspects of HAZ MM 3 would reduce potential for ignition of wildland fires, since awareness of fire safety would be elevated, and would preclude careless activities such as smoking in non-approved areas, construction activities during non-approved activity periods, etc. Additionally, the chances of an ignited fire spreading would be limited by worker training and availability of suppression tools and water. As a result, construction impacts related to wildland fire would be reduced to less than significant for the 48 sites identified within a Very High Hazard Severity Zone after implementation of HAZ MM 3, Preparation of Fire Management Plan.

Operation Impacts

Proposed Project facilities would be unmanned, equipment would be maintained within a shelter, and the diesel generator would be operated only during a power outage and periodically for routine maintenance. The risk of starting a fire from operational activities would be minimal. Operation of the proposed Project at all sites would have a less than significant impact.

Mitigation Measures

No mitigation measures are required.

3.7.4.2 No Project Alternative

Under the No Project Alternative, construction and operation of the proposed Project sites would not occur. Potential hazards associated with routine transport or potential upset and disposal of hazardous materials or potential hazardous emissions within 0.25 mile of a school would not occur. Proposed Project sites listed pursuant to Government Code Section 65962.5 would not be disturbed. No change in safety hazards would occur in association with construction or operation of proposed Project sites within 2 miles of public or private airports or related to construction and operation of Project sites within wildland or wildland interfaces, and no impacts would occur to emergency plans. Additionally, without implementation of the proposed Project, fewer areas within Los Angeles County would benefit from improved communication during emergency responses, major incidents, or natural disasters.

3.7.5 Cumulative Impacts

3.7.5.1 Geographic Extent

The effects of the proposed Project on hazards and hazardous materials are dependent on the hazard considered. For purposes of the cumulative analysis the following geographic areas for each impact analysis were considered:

- HAZ-1. Because release of any hazardous substances would be confined to the individual proposed Project site, the area potentially impacted by the proposed Project is limited to the

site boundary along with undefined routes associated with transport of diesel fuel to and from each site to service the emergency generators. The cumulative impacts analysis includes the proposed Project site. This analysis also includes a generalized discussion regarding transportation of hazardous materials from sites. Because hazardous materials could be generated, transported, or disposed from any proposed Project site, all sites are included in the analysis.

- HAZ-2. The potential for impact from the proposed Project is limited to the site boundary for the reasons described under Impact HAZ-1; the geography for the cumulative impacts analysis includes activities contained within the proposed Project site boundary. Because hazardous materials could potentially be released from any proposed Project site, all sites are included in the analysis.
- HAZ-3. The potential for impact would occur at sites within 0.25 mile of a school. Only two proposed Project sites, LARICSHQ and PASPD01, were within 0.25 mile of a school. Based on this, a separate 0.25-mile boundary was drawn around the two schools in proximity to these sites (East Los Angeles Academy and the University of Phoenix Pasadena campus, respectively). These two areas were used for consideration of cumulative impacts.
- HAZ-4. The threshold relates to the Project site only; therefore, the cumulative impacts review is limited to the site boundary. Only one site (Site PDC) coincides with occurrence of a site listed pursuant to Government Code Section 65962.5. The cumulative impacts analysis includes the area within the boundary of Site PDC.
- HAZ-5. This threshold considers the Project area only. Only one site (Site SDW) was identified as being within an ALUP of a public or public use airport, and no sites were identified as being within 2 miles of a public airport or public use airport. As a result, the geography reviewed for cumulative effects is the area immediately surrounding Site SDW.
- HAZ-6. No private airstrips were identified within the vicinity of any proposed Project site. No geographic extent was identified. As no impacts were identified, no cumulative impacts associated with the proposed Project would occur. No additional cumulative impact analysis is warranted.
- HAZ-7. No impacts were identified that would result in impairment of or interference with an emergency response plan or emergency evacuation plan. No geographic extent was identified. Since no impacts were identified, no cumulative impacts associated with the proposed Project would occur.
- HAZ-8. The impact analysis conducted compares against a landscape level baseline (i.e., very high and assumed very high severity zones throughout the proposed Project area). Analysis is at the regional level.

3.7.5.2 Existing Cumulative Conditions

Regarding the analysis for Impacts HAZ-1 through HAZ-4, the Project area contains urban, rural, and remote areas and includes a wide variety of land use patterns. Past activities may have resulted in release of hazardous substances. The primary hazardous substance planned for use during construction or operations at each site would be diesel fuel, which would be used to power on-site diesel equipment during construction and run the emergency backup diesel generator planned for each site during operations. Diesel would be transported to the site in accordance with applicable regulations.

Impacts HAZ 5 and HAZ 6 consider airports (public and public use) and private airstrips. Construction within the ALUCP of Brackett Field (near Site SDW) is under the purview of the Los Angeles County Airport Commission. The ALUCP was developed to regulate land uses and encompasses a study area extending nearly 5 miles from the airfield. The ALUCP includes a requirement that new development be coordinated through the land use commission and that tall structures be further evaluated pursuant to FAA regulations found at 14 CFR Part 77. No private airstrips were identified in the vicinity of any proposed Project site.

No construction or operations impacts that would impair or interfere with an emergency response plan or emergency evacuation plan were identified associated with construction or operations at any proposed Project site. No cumulative impacts would occur.

Regarding wildland fire potential (HAZ-8), each of the 54 proposed Project sites includes some potential to ignite a wildland fire; and at 48 sites that fall into or are assumed in a Very High Fire Hazard Severity Zone, this risk is considered elevated enough to warrant mitigation in the form of development and implementation of a Fire Management Plan for the proposed Project. Over 700 additional projects were identified within 2 miles of the 54 proposed Project sites, and over 500 additional projects were within 2 miles of the 48 sites rated as very high severity. Modern wildland fires are often severe and can spread over areas that exceed 2 linear miles. As an example, the 2009 Station Fire, located largely on the Angeles National Forest, burned over 250 square miles. Also included in the consideration of risk potential for fires are weather, topography, fuel loading, fuel moisture, and personnel and equipment availability to suppress fire. Human factors include fire cause, which can include accidental causes and arson, which was determined as the cause of the Station Fire (USDA Forest Service 2015).

3.7.5.3 Cumulative Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Many industrial sites may have experienced release of hazardous materials from leaking underground storage tanks, landfills, or simply through past practices that were best practices in their time. The potential for future releases, including releases from proposed Project activities, is considered far less than past activities, due to the regulatory environment and current practices that exist to prevent release of hazardous materials to the environment. Project activities that could potentially result in release of hazardous materials would be contained to the site, with the exception that diesel fuel would

occasionally be delivered to each site to service the emergency backup generators placed at each site. All projects, including the proposed Project, are required to comply with applicable federal and state regulations to ensure that hazardous materials are transported, used, and disposed properly. While accidental spills could occur, spill prevention plans required by federal law would include requirements for containment and remediation of any released contaminant. Because containment would occur quickly, the chance of an on-site or in-transport spill resulting in a cumulatively significant hazard when combined with other past or future spills is not high. Because it is assumed that all projects would be conducted in accordance with applicable regulations, the potential for cumulative impacts associated with release of contaminants creating a significant hazard to the public is less than significant.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

As discussed under Impact HAZ-1, proposed Project activities that could potentially result in release of hazardous materials would be contained to the site, with the exception that diesel fuel would occasionally be delivered to each site to service the emergency backup generators placed at each site. All projects, including the proposed Project, are required to comply with applicable federal and state regulations to ensure that hazardous materials are transported, used and disposed properly. While accidental spills could occur, spill prevention plans required by federal law would include requirements for containment and remediation of any released contaminant. Because containment would occur quickly, the chance of an on-site or in-transport spill resulting in a cumulatively significant hazard when combined with other past or future spills is not high. Because it is assumed that all projects would be conducted in accordance with applicable regulations, the potential for cumulative impacts associated with release of contaminants creating a significant hazard to the public is less than significant.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Only two proposed Project sites (sites LARICSHQ and PASPD01) were identified within 0.25 mile of a school, each with one school identified. The project list consulted in Table 2.7-1 encompassed the entire project area around each of the schools.

The East Los Angeles County Community School located on Monterey Pass Road in Monterey Park is within 0.25 mile of Site LARICSHQ. No additional projects were identified that were within 0.25 mile of this school. No cumulative impacts would occur.

The University of Phoenix Pasadena Learning Center on North Euclid Avenue in Pasadena is within 0.25 mile of Site PASPD01. The 0.25-mile search of Table 2.7-1 from University of Phoenix revealed two projects that lie within the area of analysis. These include the existing LA-RICS Long Term Evolution Site PASD001, located on a parking structure near Pasadena City Hall, and new apartment construction at 262 Los Robles Avenue in Pasadena. LTE Site PASD001 would likely require servicing that includes occasional replenishment of diesel fuel associated with its emergency backup generator. No long-term

use of hazardous materials is expected from new apartment buildings. It is assumed that all hazardous materials would be managed in accordance with applicable regulations; and, therefore, any releases would be immediately and closely contained. Therefore, no cumulative impact associated with release of hazardous substances near this school is anticipated.

HAZ-4: Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Only Site PDC was included in this analysis, because it is the only proposed Project site that is included on a list of hazardous material sites compiled pursuant to Government Code Section 65962.5. One project from Table 2.7-1 was also identified within the site boundary of Site PDC: the LA-RICS LTE Site WHD, which is considered in this analysis.

As discussed under Impact HAZ-1, proposed Project activities that could potentially result in release of hazardous materials would be confined to the site, with the exception that diesel fuel would occasionally be delivered to each site to service the emergency backup generators placed at each site. All projects, including the proposed Project, are required to comply with applicable federal and state regulations to ensure that hazardous materials are transported, used, and disposed properly. While accidental spills could occur, spill prevention plans required by federal law would include requirements for containment and remediation of any released contaminant. Because containment would occur quickly, the chance of an on-site or in-transport spill resulting in a cumulatively significant hazard when combined with other past or future spills is not high. Because it is assumed that all projects would be conducted in accordance with applicable regulations, the potential for cumulative impacts associated with release of contaminants creating a significant hazard to the public is less than significant.

HAZ-5: For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Only Site SDW occurs within the geography identified for analysis of this threshold. No other projects were identified immediately adjacent to Site SDW, the closest project being a subdivision of two-story residences, and the nearest tall structures nearly 2 miles distant. No cumulative impacts have been identified that would result in a safety hazard for people residing or working in the Project area.

HAZ-6: For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

No private airstrips were identified within the vicinity of any proposed Project site. No cumulative impacts would occur.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

No impacts were identified that would impair implementation of or interfere with an adopted emergency response plan or emergency evacuation plan. No cumulative impacts would occur.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Based on past wildfire activity in southern California, the potential for wildland fire represents a significant risk of loss, injury, and death. This risk becomes elevated in wildland areas and in the urban interface where urbanized areas are intermixed with wildlands. The risk associated with wildland fire in southern California is significant.

Impacts associated with the proposed Project were identified as less than significant at 7 urban sites, and significant but reduced to less than significant at 48 sites with elevated fire risk that require implementation of HAZ MM 3. Because the project sites are generally maintained to prevent fuel buildup adjacent to the sites, conditions conducive to the spread of wildfire are generally fairly low. Because the measures required in the Fire Management Plan would help both to prevent fire ignition and to quickly suppress any fire that was ignited, the chance of fire igniting and spreading from proposed Project sites as a result of project implementation is considered substantially reduced. As a result, the proposed Project would be considered not to add a cumulatively considerable impact to wildland fire risk.

3.8 Hydrology/Water Quality

3.8.1 Environmental Setting

Water resources refer to the occurrence, availability, and physical, chemical, and biological characteristics of surface water and groundwater, including hydrologic properties and water quality for aquatic plant and animal communities and public water supplies. Waterbodies include aquifers, springs, streams, rivers, lakes, reservoirs, estuaries, and nearshore and offshore marine waters. Water quality encompasses the level of pollutants that affect the suitability of water for a given use. Water use classifications generally include public water supply, recreation, propagation of fish and other aquatic life, agricultural use, and industrial use.

3.8.1.1 *Surface Waters*

Los Angeles County occupies approximately 4,083 square miles. Elevations range from sea level to 10,064 feet amsl at the summit of Mount San Antonio. Los Angeles County is approximately 25 percent mountains; 10 percent coastal plain; and 65 percent foothills, valley, and desert. Most mountains are lower than 5,000 feet amsl with only 210 square miles (5 percent) above this elevation. Surface water in streams is derived principally from precipitation, runoff, and, in some cases, groundwater (LACDRP 2015).

Average annual precipitation in Los Angeles County ranges from approximately 4.5 inches in the coastal plain to 35 inches in mountainous areas. Average annual precipitation in portions of the Mojave Desert area in north Los Angeles County is as low as 2.5 inches. Rainfall intensity in southern California can range from 0.1 inch per day to more than an inch per hour. Snowfall at elevations above 5,000 feet frequently occurs during winter storms but melts rapidly except on the higher peaks and north-facing slopes. Most precipitation occurs between December and March. Dry periods of several months are common (LACDPW 2006).

One proposed Project site in San Bernardino County is located within or near the City of Chino Hills, where average annual precipitation is approximately 21 inches. Most precipitation falls between December and March.

Runoff characteristics are influenced by soil type, terrain, vegetation, and other conditions. Precipitation during periods of low soil moisture is almost entirely absorbed by porous soils. Substantial surface runoff occurs after soil moisture is near field capacity and during extreme intense rainfall events. Because much of the coastal plain is urbanized, natural soil and vegetation have been replaced by impervious surfaces. In urban areas, stormwater runoff is directed to storm drains and lined channels with little opportunity for natural infiltration to groundwater aquifers (LACDPW 2006).

Piru Creek in western Los Angeles County is the only Wild and Scenic River identified, and it is in a separate watershed more than 5 miles from the nearest Project site, Site LACFDEL (National Wild and Scenic Rivers System 2015).

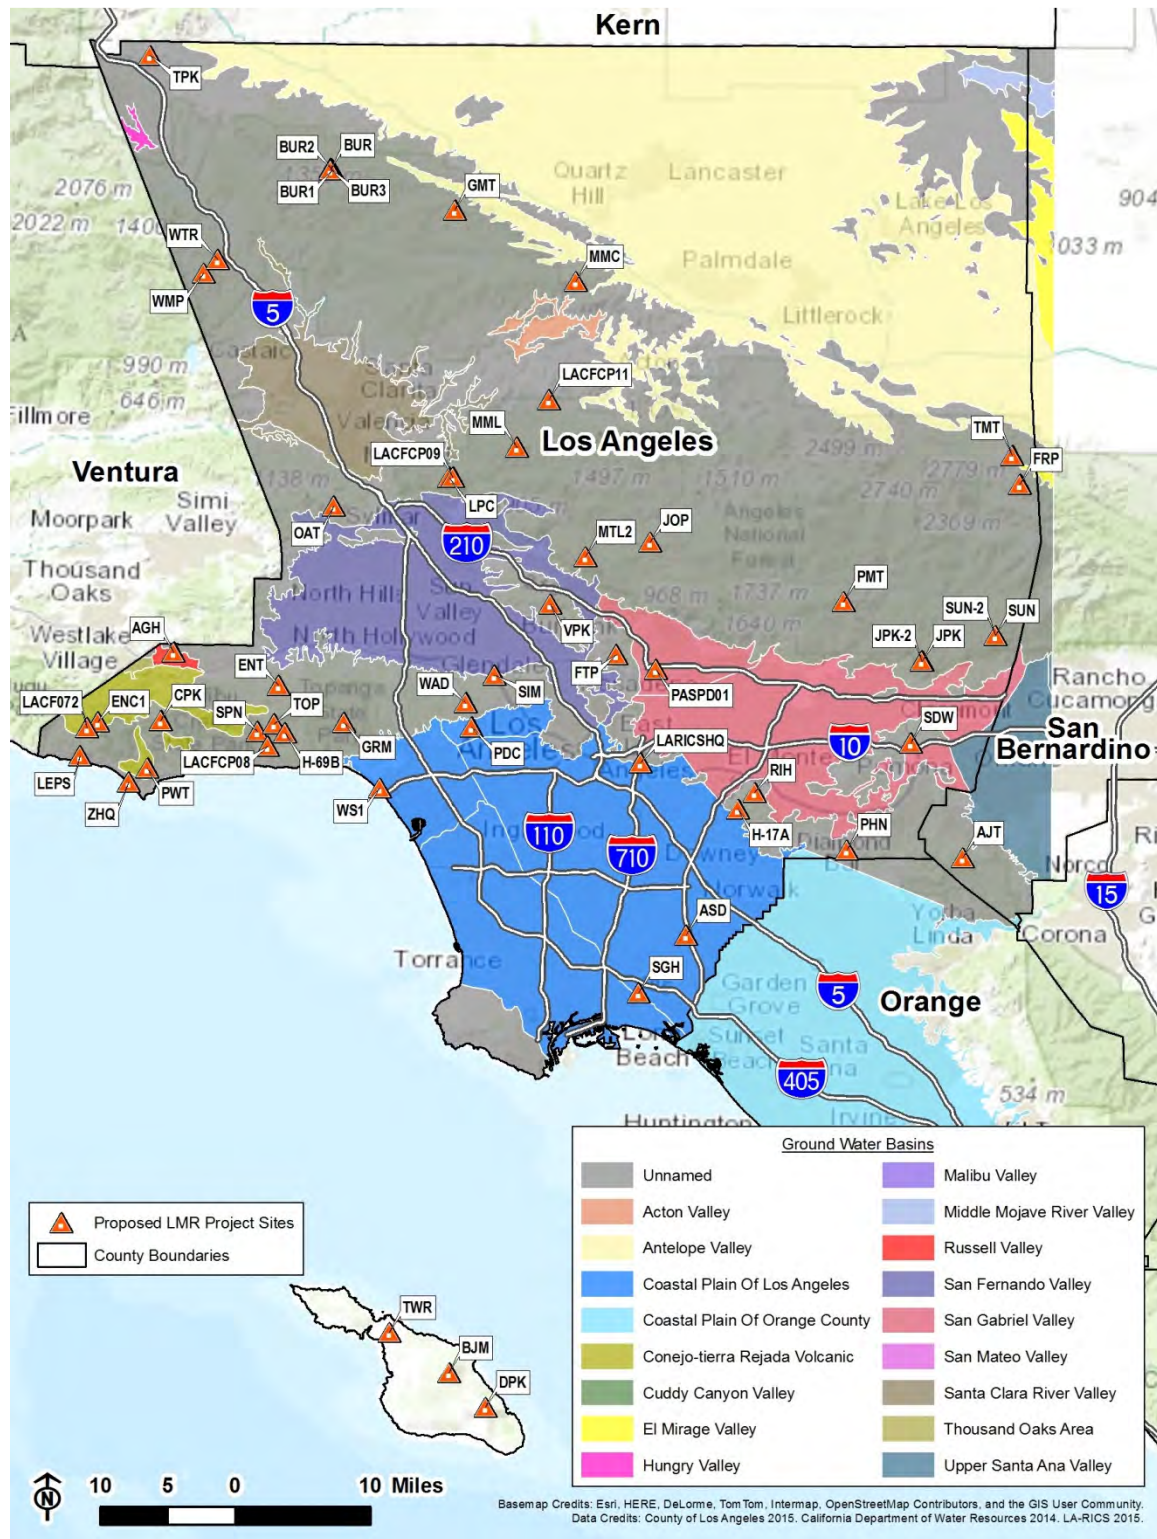

3.8.1.2 Groundwater Aquifers

Most groundwater production is concentrated in populated areas, particularly in southern Los Angeles County and Orange County. Published information regarding the depth of groundwater and other aquifer parameters is scarce or unavailable in sparsely populated areas or where groundwater resources have not been used extensively. Descriptions of aquifers and number of proposed Project sites within specific groundwater basins are provided in Table 3.8-1. Proposed Project sites and groundwater aquifers are shown in Figure 3.8-1. Groundwater basins in which each Project site is located are identified in Chapter 4.

Table 3.8-1: Proposed Project Site Distribution by Groundwater Basin

Groundwater Basin	Description	Proposed Project Sites
Coastal Plain of Los Angeles	Aquifers in this basin are composed of unconsolidated alluvial sediments. Aquifer thickness typically ranges from 30 to 500 feet, and groundwater elevations typically range from approximately 110 to 230 feet below mean sea level due to extensive overdraft. Perched groundwater or non-producing aquifers may occur at shallow depths of 20 feet or more.	5
San Gabriel Valley	Aquifers in this basin are composed of unconsolidated alluvial sediments. Aquifer thickness typically ranges from approximately 300 to more than 3,000 feet, and groundwater elevations typically range from 110 to 1,200 amsl.	1
Conejo-Tierra Rejada Volcanic	Aquifers in this basin are composed of unconsolidated alluvial sediments and sedimentary and volcanic rocks of the Modelo, Topanga, and Conejo Formations. Alluvium is generally only a few feet thick and is not a significant source of groundwater. The sedimentary and volcanic rocks are the primary sources of groundwater and have a combined thickness up to approximately 19,500 feet.	3
Russell Valley	Aquifers in this basin are composed of Holocene-age alluvium, although some groundwater is extracted from underlying volcanic rocks and older Tertiary sedimentary rocks. Holocene-age alluvium consists of unconsolidated, poorly bedded, poorly sorted to sorted sand, gravel, silt, and clay with some cobbles and boulders that average about 35 to 55 feet thick.	1
Unnamed	Isolated aquifers in these mountainous and hilly areas may occur in unconsolidated alluvial sediments at the base of valleys and in porous or fractured bedrock.	41
None-Catalina Island	No aquifers were identified on Catalina Island	3

Figure 3.8-1: Groundwater Aquifers in the Proposed Project Area

3.8.1.3 Floodplains

Floodplains provide many valuable benefits to the natural and human environment, including flood protection, floodwater storage, groundwater recharge, and habitat for flora and fauna. On the other hand, when floodwaters reach certain levels, they can inundate areas of human activity, causing death and injury and damage to structures.

“Flood Zone X” includes areas determined to be outside the 500-year floodplain or sites subject to inundation by a 500-year flood; areas of 100-year flood with average depths of less than 1 foot, or where contributing drainage area is less than 1 square mile, or areas protected by levees from the 100-year flood. “Flood Zone X” includes 17 proposed Project sites; and 36 sites are designated within “Flood Zone D,” classified as areas of undetermined, but possible flood hazards. One site is designated within “Flood Zone AE,” defined as a special flood hazard area with base flood elevations determined (FEMA 2015).

Table 3.8-2: Project Sites in Designated Flood Zones

Flood Zone X	Flood Zone D	Flood Zone AE
AGH, AJT, ASD, CPK, ENC1, LACF072, LARICSHQ, LEPS, PASPD01, PDC, PHN, PWT, SGH, SIM, TPK, WAD, WS1	BJM, BUR, BUR1, BUR2, BUR3, DPK, ENT, FRP, FTP, GMT, GRM, H-17A, H-69B, JOP, JPK, JPK2, LACFCP08, LACFCP09, LACFCP11, LPC, MMC, MML, MTL2, OAT, PMT, RIH, SDW, SPN, SUN, SUN2, TMT, TOP, TWR, VPK, WMP, WTR	ZHQ

3.8.2 Regulatory Setting

3.8.2.1 Federal Regulatory Setting

U.S. Army Corps of Engineers

Clean Water Act

Sections 303, 401, 402 and 404 of the Federal Water Pollution Control Act of 1972 (33 U.S.C. 1251 et seq.), more commonly known as the Clean Water Act (CWA), protect the water quality of jurisdictional surface waters. The CWA requires states to: (1) protect specific beneficial uses of surface water and groundwater; (2) comply with applicable effluent limitations; (3) implement BMPs to eliminate or reduce discharges of pollutants; and (4) regulate the discharge of dredged or fill material into streams, rivers, wetlands, non-wetland, and other surface waters.

Federal Land Management Agencies (USFS and NPS)

Wild and Scenic Rivers Act

The Wild and Scenic Rivers Act of 1968 (16 U.S.C. 1271-1287) established the National Wild and Scenic Rivers System aimed at preserving and protecting wild and scenic rivers in a free-flowing condition for the benefit and enjoyment of present and future generations.

Federal Emergency Management Agency

Executive Order 11988

The National Flood Insurance Program (NFIP) of 1968 provides flood insurance to homeowners, renters, and business owners if their community participates in the NFIP. Participating communities agree to adopt and enforce ordinances that meet or exceed Federal Emergency Management Agency (FEMA) requirements to reduce flooding risks to properties that may be located in floodplains (FEMA 2015; Federal Register 1977). The federal government will then make flood insurance available within the community as a financial protection against flood losses.

3.8.2.2 State Regulatory Setting

California State Water Resources Control Board

The Porter-Cologne Water Quality Control Act (Division 7 of the California Water Code) establishes a regulatory program to augment federal protections under the CWA to protect “waters of the State,” which include surface, ground, and ocean water. In California, the National Pollutant Discharge Elimination System (NPDES) permitting program is administered by the State Water Resources Control Board under the umbrella of the Porter-Cologne Act. NPDES permits are required for dewatering activities and are issued by Regional Water Quality Control Boards (RWQCBs). They set forth effluent limitations, monitoring, and reporting obligations and often require BMPs to preclude impacts to groundwater.

California Department of Fish and Wildlife

Section 1601 et seq. of the California Fish and Game Code (CFGC) authorizes the California Department of Fish and Wildlife (CDFW) to enter into a “Lake or Streambed Alteration Agreement” with project proponents to minimize or avoid impacts to a river, stream, or lake where fish or wildlife resources may be adversely affected (CDFW 2015c).

3.8.2.3 Local Regulatory Setting

Los Angeles County

The Los Angeles County Department of Public Works (LACDPW) Stormwater and Runoff Pollution Control Program tracks industrial and commercial businesses in the unincorporated county area to determine compliance with the provisions of the Municipal NPDES Permit issued by the Los Angeles

RWQCB. The Stormwater and Runoff Pollution Control Ordinance of the County of Los Angeles (Title 12, Chapter 12.80) is intended to protect the health and safety of county residents by protecting the beneficial uses, marine habitats, and ecosystems of receiving waters within the county from pollutants carried by stormwater and non-stormwater discharges.

Chapter 21 of the Flood Control District Code regulates the stormwater and non-stormwater discharges to the facilities of the Los Angeles County Flood Control District for the protection of those facilities, the water quality of the waters in and downstream of those facilities and the quality of the water that is being stored in water-bearing zones underground. Among its requirements, the ordinance prohibits discharge of contaminated stormwater at concentrations that exceed water quality standards and non-stormwater discharges unless authorized by an NPDES permit (LACDPW 2015)

San Bernardino County

Prior to construction, project proponents are to prepare a Water Quality Management Plan and Stormwater Best Management Practices Transfer, Access and Maintenance Agreement (SBDPW 2015).The NPDES permit process addresses the San Bernardino Department of Public Work's environmental needs regarding stormwater quality issues for San Bernardino County.

3.8.3 Significance Criteria

The proposed Project would result in significant impact to hydrology and water quality if any of the following significance criteria, based on Appendix G of the CEQA Guidelines, are met:

- 1) Would the project violate any water quality standards or waste discharge requirements?
- 2) Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of preexisting nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?
- 3) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on or off site?
- 4) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site?
- 5) Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?
- 6) Would the project otherwise substantially degrade water quality?
- 7) Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

- 8) Would the project expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam?
- 9) Would the project expose people or structures to a significant risk of loss, injury, or death from inundation by seiche, tsunami, or mudflow?

Based on the Initial Study for the proposed Project (See Appendix A), it was determined that because the proposed Project would not result in construction of housing within a 100-year floodplain, no further analysis of this topic is warranted within this EIR.

3.8.4 Impact Analysis

3.8.4.1 Proposed Project

WQ-1: Would the project violate any water quality standards or waste discharge requirements?

Construction Impacts

Proposed roof mount or collocation sites would have minimal excavation, primarily trenching associated with placement of utility hookups or grading for placement of an equipment shelter. Water may be used to wet soils for compaction and to control dust. Any surface water runoff that could affect water quality will be controlled by required BMPs as described in Chapter 2. BMPs include placement of various measures such as use of berms and drainage ditches to divert runoff around exposed areas and control stormwater flowing to and through the Project site, and protection of stormwater inlets from sediment through placement of hay bales, sand bags, and fiber rolls. There would be no violation of any water quality standard or waste discharge requirements and no impact under this threshold as it relates to the proposed construction of roof mount and collocations sites.

Sites proposed for new monopoles or towers would require deeper excavation than proposed collocation or roof mount sites. Any potential for surface water runoff to affect water quality will be controlled by required BMPs, as described in Chapter 2. BMPs are intended to reduce run-on and runoff of stormwater, control sediment runoff through placement of hay bales, sand bags, and fiber rolls that protect stormwater or drainage inlets. At these sites groundwater may also be encountered during excavation of deep foundations. The quantity of groundwater that may be encountered is not currently known and would depend on the depth to groundwater, the rate of groundwater flow through the aquifer, the extent of the excavation, and other factors. Following geotechnical investigation, the likelihood of encountering groundwater would be calculated; and, if necessary, a dewatering plan would be prepared. For sites where groundwater is likely to be encountered during excavation, a permit from the local RWQCB would be obtained prior to construction in case dewatering is necessary. Removal or discharge of water would be done in accordance with the terms and conditions contained in the permit.

Dewatering of an excavation would constitute a significant impact if the water is not discharged properly. The Authority will comply with all terms and conditions specified in the applicable permit. Because construction of the proposed Project would be conducted in accordance with applicable NPDES

permit requirements, no violation of water quality standards would occur; and no impact would occur under this threshold as it relates to the proposed construction of new monopole or lattice tower sites.

Mitigation Measures

In the event that groundwater is encountered that requires dewatering, application of UTL MM 1 is required.

Impact after Mitigation

The permitting process is designed to evaluate and ensure groundwater discharges do not affect water quality. The Authority will comply with all conditions and stipulations specified in the applicable permit. Because construction of the Project would be conducted in accordance with applicable stipulations and conditions in the applicable NPDES permit, no violation of water quality standards or waste discharge requirements would occur. Impacts associated with dewatering would be reduced to less than significant, the effect of the mitigation would be to eliminate impact (i.e., no impact).

Operation Impacts

Operation of any proposed Project facility would not require use of or discharge of water from the proposed facility. BMPs require that soils be stabilized once construction is completed, and operational activities would not generate runoff that could affect water quality or generate water discharge. Operation of the proposed Project would occur in compliance with applicable regulations, would not use or discharge measurable amounts of runoff, and no violation of water quality standards or waste discharge requirements would occur. There would be no impacts under this threshold.

Mitigation Measures

No mitigation measures are required.

WQ-2: Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of preexisting nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impacts

Water use during construction would be associated with compaction of soils and wetting of exposed soils during construction to control dust.

Water use is not expected to exceed 500 gallons during the entire six-week construction period at any site. In comparison, a typical household in Los Angeles County uses approximately 250 to 360 gallons of water every day. No new groundwater sources are required to support the proposed Project, and the water supplied to the Project would be acquired from municipal or other public water sources. Only a portion of the up to 27,000 gallons of water used for the 54 sites in the proposed Project to support

construction would likely come from groundwater sources, and usage would be spread over the entire region. Impacts to groundwater supplies would be less than significant.

Groundwater recharge could potentially be affected by creation of new impervious surfaces. This impact would be greatly limited for several reasons. First, the amount of new impervious surfaces at any site is limited to only up to 4,000 square feet at any site (and less at roof mount and collocation sites). Roof mount sites are generally located in urban areas; and only small, new, impermeable surfaces would be created. Roof mount sites are generally urbanized and not located in groundwater recharge areas, and impact to groundwater recharge would be less than significant.

Collocation sites may or may not be in urban areas; very little impermeable surface would be added. Non-urban collocation sites are generally along ridgelines or on or near hilltops. Groundwater recharge areas are in low-lying areas and associated with drainages and basins. Therefore, the proposed roof mount and collocation sites would not result in depletion of groundwater supplies or interfere with groundwater recharge. New monopoles or new towers are located along ridgelines, near or on hilltops, or in urban areas. Ridgelines and hilltops are not groundwater recharge areas, as explained above. No new monopoles and towers located in urban areas would be located in groundwater recharge areas. New monopoles/towers in urban areas would be located at facilities with existing large, paved impervious surfaces. Therefore, construction of the proposed Project would not result in interference with groundwater recharge; and impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

No water would be needed for the operation of the proposed Project, although maintenance activities could result in some minor domestic water uses at some sites. Operation of the proposed Project would not result in depletion of groundwater supplies or interfere with groundwater recharge; and operational impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

WQ-3: Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on or off site?

Construction Impacts

None of the construction at proposed Project sites would substantially alter existing drainage patterns. None of the sites include a proposed concrete pad or access road that would cross drainage; and all proposed sites are in previously disturbed areas along ridgelines or in urban areas with already-existing impervious surfaces. Site design will direct drainage toward storm drains, or antennas will be collocated

to an existing structure or rooftop with minimal or no ground disturbance. All construction plans will be reviewed by applicable local or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage toward existing natural and/or storm drain catch areas, which is a standard part of the review process prior to issuance of a building permit. All plans will be reviewed to ensure existing storm drain systems can support any additional runoff. During the design and building permit approval process, a hydrological analysis will be completed for each proposed Project site, and/or a standard approved equipment and generator pad will be developed. Depending on the results of the analysis, the design may include standard down drains and energy dissipaters as required to minimize potential for erosion. BMPs, as described in Chapter 2, such as hay bales, straw rolls, or similar methods will be implemented to direct runoff toward drains and limit sediment leaving the area during construction to limit erosion of exposed soils (e.g., during excavation). Therefore, construction of the proposed Project will not result in substantial erosion/siltation, and no impact is anticipated.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Operation of the facilities on site would not disrupt or alter drainage patterns. Hydrological analysis of surfaces that could generate runoff would be completed during the design and building permit approval process to ensure that local drainages and storm drain system can support any additional runoff that may occur as part of the proposed Project. Therefore, operation of the proposed Project will not result in substantial erosion/siltation, and no impact is expected.

Mitigation Measures

No mitigation measures are required.

WQ-4: Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site?

Construction Impacts

None of the construction at proposed Project sites would alter (i.e., fill in or change the course of) a stream or river. All construction plans will be reviewed by applicable local or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage toward existing natural and/or storm drain catch areas. All plans will be reviewed to ensure existing storm drain systems can support additional runoff. During the design and building permit approval process, a hydrological analysis will be completed for each proposed Project site; and/or a standard approved equipment and generator pad will be developed. Depending on the results of the analysis, the design may include standard down drains and energy dissipaters, as required, to minimize potential for erosion. The Project facilities proposed on ridgelines or hilltops are being

constructed in previously disturbed areas. The overall existing pads and disturbed area will be minimally expanded or altered at these sites. During construction, BMPs, such as sandbags, hay bales, silt fences, and placing berms around the construction areas, as described in Chapter 2, shall be in place to direct runoff to storm drains and/or natural drainage features. The building permit process reviews drainage issues for each site to assess the amount of runoff that would be generated and whether local drainage systems (natural or man-made) can support any additional runoff that may be generated by the Project. Design of all building pads will be required to demonstrate positive drainage toward existing natural and/or storm drain catch areas. All plans will be reviewed to ensure existing storm drain systems can support additional runoff. Therefore, construction of the Project would not substantially increase the rate or amount of surface runoff or result in flooding on or off site, and no impacts would be associated with this threshold.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

All construction plans will be reviewed by applicable local or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage toward existing natural and/or storm drain catch areas. All plans will be reviewed to ensure existing storm drain systems can support additional runoff. The design may require permanent treatment with BMPs to minimize potential for erosion. The Project facilities proposed on ridgelines or hilltops would be constructed in previously disturbed areas. The overall existing pads and disturbed area would be minimally expanded or altered at these sites. The building permit process reviews drainage issues for each site to assess the amount of runoff that would be generated and whether local drainage systems (natural or man-made) can support any additional runoff that may be generated by the Project.

For Project facilities proposed in urban areas, construction would generally occur within areas that have impervious material and where drainage is directed toward the local storm drain system. Operation of the facilities would not generate any water, and addition of impervious surfaces would be minimal. Design of all building pads will be required to demonstrate positive drainage toward existing natural and/or storm drain catch areas. All plans will be reviewed to ensure existing storm drain systems can support additional runoff. Therefore, operation of the Project will not increase the rate or amount of surface runoff or result in flooding on or off site, and no impacts would be associated with this threshold.

Mitigation Measures

No mitigation measures are required.

WQ-5: Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impacts

As discussed for WQ-3 and WQ-4 all construction plans would be reviewed by applicable local or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage toward existing natural and/or storm drain catch areas. All plans will be reviewed to ensure existing storm drain systems can support additional runoff. The design may include energy dissipaters for water outfall areas to minimize potential for erosion. The Project facilities proposed on ridgelines or hilltops are being constructed in previously disturbed areas. The overall existing pads and disturbed area will be minimally expanded or altered at these sites. The building permit process reviews drainage issues for each site to assess the amount of runoff that will be generated and whether local drainage systems (natural or man-made) can support any additional runoff that may be generated by the Project. For Project facilities located in urban areas, the proposed construction is generally within areas that have impervious material and where drainage is directed towards the local storm drain system. During construction, BMPs such as sandbags, hay bales, silt fences, and placing berms around construction areas shall be in place to direct runoff to storm drains and/or natural drainage features. Design of all building pads will be required to demonstrate positive drainage toward existing natural and/or storm drain catch areas. Project runoff would not exceed the capacity of planned or existing drainage systems, and impacts would be less than significant.

Each proposed Project site may have a diesel fuel tank from 1,000 up to 1,500 gallons integrated into the design of the backup generator. The fuel tank is a potential water pollutant. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks will meet nationally recognized standards. Secondary containment (generators will be placed on a bermed pad) will be in place. Diesel fuel tanks greater than 660-gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112. Fuel tanks would be installed in accordance with prescribed regulations and would not provide a substantial additional source of polluted runoff, and impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Hydrological analysis of surfaces that would generate runoff will be completed during the design and building permit approval process to ensure that local drainages and storm drain system can support any additional runoff that may occur as part of the proposed Project. Fuel storage tanks will be maintained in good condition including required spill prevention measures, water pollution from the threat of a fuel

spill or leak is minimal. Therefore, operation of the Project will not exceed the capacity of existing drainage systems or substantially add to sources of polluted runoff, and no impact would occur.

Mitigation Measures

No mitigation measures are required.

WQ-6: Would the project otherwise substantially degrade water quality?

Construction Impacts

All construction plans will be reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage toward existing natural and/or storm drain catch areas. During construction, BMPs such as sandbags, hay bales, silt fences, and placing berms around construction areas, as described in Chapter 2, shall be in place to direct runoff to storm drains and/or natural drainage features. Silt fences, hay bales, or other types of geofabric specifically designed to reduce siltation will be required to be in place and inspected during construction to substantially reduce and/or eliminate siltation of runoff from the job site during construction. Use of water at the site during construction will be minimal and will be limited to the compaction of soils, concrete wash-out, and potentially for wash-down of site equipment. Water used for soil compaction will result in little or no runoff. Specific concrete and vehicle wash areas will be set up and are required to have plastic or similar material laid out to catch runoff and prevent potential construction contaminants from reaching drainages. Therefore, methods to prevent runoff will be in place during construction of the Project, and water quality will not be substantially degraded, and impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Operation of the facility would not generate any water. The only potential for degradation of water supplies would result from runoff at the facility. No hazardous materials would be stored on site other than fuel for the diesel generator. The diesel generators would have an integrated fuel tank of up to 1,500 gallons in capacity. The tank would meet or exceed regulatory requirements for fuel tanks and would be double-hulled to reduce the potential for any leaks. Fuel tanks are specifically designed following regulatory guidance and subsequent design standards to reduce or eliminate the potential for fuel spills. Therefore, operation of the Project would not substantially degrade water quality, and impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

WQ-7: Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impacts

As shown in Table 3.8-2, only one proposed Project site, Site ZHQ, has a site polygon boundary that extends into a 100-year flood zone (FEMA Zone AE), having a 1-percent annual chance of flood hazard. The flood zone boundary runs roughly parallel to Zuma Beach and bisects the site from southeast to northwest. Approximately one-third of the site is within the designated 100-year flood hazard zone. The northeastern portion of the site is outside the flood hazard zone. Proposed activity at Site ZHQ would follow the eight-step process outlined in EO 11988. Additionally, the site would be subject to any local planning department review and permitting process with placing a facility within a designated floodplain. State and local planning agencies will review proposed construction plans. Any proposed structures will need to meet state and local guidelines to reduce the risk from potential damage due to an inundation flood. This may include placement of structures outside the identified flood zone or raising the elevation of foundation with appropriate erosion control above the base floodplain elevation. With adherence to state and local planning requirements, potential damage from flooding would be less than significant at Site ZHQ, and no impacts would occur at any other site.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Site ZHQ would be built to the applicable standards described under Construction Impacts, as a result the potential for the new structures to impede flood flows would be minimized. Impacts associated with operations would be less than significant at Site ZHQ. No impacts would occur at any other site.

Mitigation Measures

No mitigation measures are required.

WQ-8: Would the project expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impacts

No facilities are proposed to be built within identified flood hazard areas on any Flood Insurance Rate Map (FIRM) associated with dam or levee failure. Site ZHQ lies partially within a 100-year floodplain, and the impacts from flooding are discussed in Impact WQ-7, above. In addition, Site ASD has a water feature (the channelized San Gabriel River, approximately 500 feet west of the site). No other proposed Project sites are in floodplains or have upgradient or adjacent water impoundment features. Risk for significant risk of loss, injury, or death involving flooding, including levees or dams, is minimal at sites ASD and ZHQ; and impacts are considered less than significant. No impacts are expected at any other proposed Project site.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Project operations would result in no impact at every site except Site ZHQ. Federal, state, and local planning processes would ensure that the new construction site is either elevated above the floodplain or protected from potential floods by protective structures if necessary. The flood risk will be evaluated during the planning process, and site plans modified to ensure the flood risk would be less than significant. Therefore, operation impacts at Site ZHQ would be less than significant. No impacts would occur at any other proposed Project site.

Mitigation Measures

No mitigation measures are required.

WQ-9: Would the project expose people or structures to a significant risk of loss, injury, or death from inundation by seiche, tsunami, or mudflow?

Construction Impacts

No proposed Project sites are located next to lake shores or other open waterbodies that could generate a seiche during a seismic event. Therefore, there is no potential for a seiche to inundate a proposed Project site, and there would be no impact from seiches.

The Los Angeles County Department of Public Works (LACDPW) has a database and GIS information that identifies areas with potential mudflow/debris flow occurrences for the current year. This data changes from year to year depending on what areas may have burned during the previous fire season. Mudflows are more likely to occur in areas that recently experienced a wildfire, as vegetation that binds soils together has been stripped; and once the soil is saturated from a rainstorm, it may generate a mudflow. Winter rainstorms may trigger a mudflow in these areas, and this would be considered a significant impact for sites constructed in these areas. Nearly all of the proposed Project sites are located on ridges or hilltops. These areas are not susceptible to mudflows, as there are no slopes above them that could generate a mudflow. However, two sites are located in areas that may be subject to mudflows: Site ENC1, a fire camp located near a river valley; and Site PWT, located near a small swale/drainage. All other sites are located on ridgelines, hilltops, or in urban areas away from any areas that could generate a mudflow. Impacts at sites ENC1 and PWT would be considered significant. No impact would occur from mudflows at any other proposed Project site.

Site ZHQ is within a tsunami inundation area. If a tsunami large enough to inundate the proposed Project site occurs, equipment and structures would be lost. The Southern California Emergency Management systems are tied into the Pacific Rim tsunami warning system, which would allow construction workers within and near the Project site enough time so that they could leave the area without being impacted by the tsunami. Additionally, the likelihood of a tsunami hitting during the

limited construction period of six weeks is very slim or negligible. Catastrophic tsunamis occur, on average, about once or twice per century; 90 percent of them occur in the Pacific Ocean. Significant loss of property, or injury, or death from inundation at Site ZHQ would not result; and impacts would be less than significant. No impact would occur from tsunami at any other proposed Project site.

Mitigation Measures

Implementation of GEO MM 1 (completion of a geotechnical report) would identify potential design measures needed to protect against mudflows at sites ENC1 and PWT.

Impacts after Mitigation

The mitigation measures would mitigate risks associated with mudflows. The geotechnical report will identify if a particular site is at risk for a mudflow and what measures may be implemented to reduce the risk to the facility from mudflows. Design features implemented during the building permit process would reduce risk of mudflow and reduce impacts to less than significant at sites ENC1 and PWT.

Operation Impacts

Sites proposed to be built in mudflow areas will be evaluated during the design, permitting, and construction process as described above. Threats from mudflows during construction would have been mitigated to a less than significant. Operational activities (unmanned activity that does not generate any water) would not increase the risk of a mudflow occurring; therefore, impacts from mudflows would be less than significant at sites ENC1 and PWT, and there would be no impact at any other proposed Project site.

No sites are located next to open water such as a lake or large reservoir. Operational activities would not increase the risk from a seiche. Therefore, no impacts from a seiche would result.

Emergency management systems are in place to provide people the maximum time available to evacuate any area subject to tsunami inundation. Therefore, the impact to people would be less than significant. Structures at Site ZHQ, however, may be subject to a tsunami. The Los Angeles County permitting process and building inspection will require that any structure built in a tsunami inundation zone meet current building codes and may require special footings, protective structures, or other measures to reduce the risk associated with tsunami inundation. The inundation risk would have been evaluated during the planning process, and site plans would have been modified to ensure the flood risk would be less than significant. Therefore, operational impacts related to tsunamis would be less than significant at site ZHQ and there would be no impact from tsunami at any other proposed Project site.

Mitigation Measures

No mitigation measures are required.

3.8.4.2 No Project Alternative

Under the No Project Alternative, no new Project facilities would be constructed, and no new equipment would be installed. No water would be required, nor would wastewater be generated. No impervious surfaces would be created. No additional water pollutants would be generated or released. No excavation would occur. No facilities would be placed in flood zones or in areas subject to seiches or tsunamis. For these reasons, no significant direct or indirect impacts would occur to surface water or groundwater resources or water quality.

3.8.5 Cumulative Impacts

3.8.5.1 Geographic Extent

The effects of the proposed Project on hydrology/water quality are dependent on the resource considered. For purposes of the cumulative analysis the following geographic areas were considered:

- WQ-1. This significance threshold is generalized and not specific to any geography. The analysis of cumulative projects is conducted on a regional basis (i.e., inclusive of the entire proposed Project area).
- WQ-2. Because groundwater supply and groundwater recharge are specific to individual groundwater basins, the analysis for cumulative impact considers the groundwater basin that proposed Project sites and other projects identified in Table 2.7-1 are sited on.
- WQ-3. Any alteration of drainage would be contained to each proposed Project site. The cumulative impacts analysis is limited to the site boundary.
- WQ-4. The potential for cumulative exceedance of stormwater drainage systems or substantial impacts associated with additional sources of polluted runoff includes projects within the watershed of an individual site.
- WQ-5. The potential for cumulatively substantial increase in the rate or amount of surface runoff includes projects within the watershed of an individual site.
- WQ-6. This is a generalized significance threshold and not specific to any geography. The analysis of cumulative projects is conducted on a regional basis (i.e., inclusive of the entire proposed Project area).
- WQ-7. Only one proposed Project site (Site ZHQ) is within a flood zone. The geographic boundary includes cumulative projects from Table 2.7-1 within the flood zone boundary of ZHQ.
- WQ-8. Only three proposed Projects sites (sites ASD, SDW, and ZHQ) are near levees or dams. The geographic boundary includes cumulative projects from Table 2.7-1 in the vicinity of these sites.

- WQ-9. Only three proposed Project sites have been identified as having an elevated potential for flooding (sites ENC1, PWT, and ZHQ). The geographic boundary includes cumulative projects from Table 2.7-1 in the vicinity of these sites.

3.8.5.2 Existing Cumulative Conditions

Los Angeles County occupies approximately 4,083 square miles. Elevations range from sea level to 10,064 feet amsl at the summit of Mount San Antonio. Los Angeles County is approximately 25 percent mountains; 10 percent coastal plain; and 65 percent foothills, valley, and desert. Most mountains are lower than 5,000 feet amsl with only 210 square miles (5 percent) above this elevation. Surface water in streams is derived principally from precipitation, runoff, and, in some cases, groundwater (LACDRP 2015a).

Runoff characteristics are influenced by soil type, terrain, vegetation, and other conditions. Substantial surface runoff occurs after soil moisture is near field capacity and during extreme intense rainfall events. Because much of the coastal plain is urbanized, natural soil and vegetation have been replaced by impervious surfaces. In urban areas, stormwater runoff is directed to storm drains and lined channels with little opportunity for natural infiltration to groundwater aquifers (LACDPW 2006). This intensive use decreases in more rural areas, meaning sites there tend to drain to more natural drainages. Because the Project area is large and hydrologically diverse, many different hydrologic basins can be affected by project activities and the activities identified in the cumulative project list contained in Table 2.7-1.

Most groundwater production is concentrated in populated areas, particularly in southern Los Angeles County and Orange County. Published information regarding the depth of groundwater and other aquifer parameters is scarce or unavailable in sparsely populated areas or where groundwater resources have not been used extensively. Groundwater use is varied throughout the Project area; and, for purposes of this analysis, it is assumed some portion of water used for the Project would be derived from groundwater.

3.8.5.3 Cumulative Impact Analysis

WQ-1: Would the project violate any water quality standards or waste discharge requirements?

No violation of water quality standards or waste discharge requirements was identified for roof mount or collocation sites. Impacts associated with dewatering activities at sites where new monopoles or lattice towers are proposed would be fully mitigated with application of UTI MM 1. Since no project-specific impacts were identified, no cumulative impacts associated with the proposed Project would occur.

WQ-2: Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of preexisting nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Impacts associated with groundwater depletion from the proposed Project were considered less than significant. From the list of over 700 past, present, and reasonably foreseeable projects identified in Table 2.7-1, it is uncertain whether any would be groundwater-dependent and what the water requirements at each project would be. Impacts associated with depletion of groundwater supplies were assumed to be significant. The contribution of proposed Project sites would be minimal, due to the minimal use of water projected. The proposed Project's contribution to this significant impact would not be cumulatively considerable.

Impacts associated with interference with groundwater recharge from the proposed Project were considered less than significant. From the list of over 700 past, present, and reasonably foreseeable projects identified in Table 2.7-1, the extent of new impervious surfaces that would be created is uncertain. Impacts associated with creation of new impervious surfaces' interference with groundwater recharge were assumed to be significant. The contribution of proposed Project sites would be minimal due to the minimal amount of new impervious surface area created. The proposed Project's contribution to this significant impact would not be cumulatively considerable.

WQ-3: Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on or off site?

No proposed Project site is located at or near a stream or river, nor would any proposed site require substantial alteration of existing drainage. No impacts were identified, and no cumulative impact would occur from project implementation.

WQ-4: Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site?

No proposed Project site would require construction or operations activities that would alter an existing drainage pattern of a site or substantially increase the rate or amount of surface runoff. No impacts were identified, and no cumulative impact would occur from project implementation.

WQ-5: Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Runoff from all sites would be controlled through BMPs. Any activity requiring dewatering would require a NPDES permit which would govern activities at each of these sites. Project-specific impacts associated with construction and operations would be less than significant.

Cumulative impacts would potentially occur from other projects identified on Table 2.7-1. Cumulative impacts would be limited to the watershed where individual project sites are located. The impacts from the projects identified in Table 2.7-1 in each of the watersheds where proposed Project sites are located

are summarized in Table 3.8-3. Since all sites are subject to the building permit process, which requires consideration of storm drainage and requires BMPs to direct site drainage and prevent runoff from pollution, the impact is considered less than significant.

WQ-6: Would the project otherwise substantially degrade water quality?

As described previously, runoff from all sites would be controlled through BMPs, and any activity requiring dewatering would be conducted in accordance with the applicable required NPDES permit. The potential for Project-specific activities to generally degrade water quality were determined less than significant.

Cumulative impacts would potentially occur from other projects identified on Table 2.7-1. Cumulative impacts would be limited to the watershed where individual project sites are located. The impacts from the projects identified in Table 2.7-1 in each of the watersheds where proposed Project sites are located are summarized in Table 3.8-3. Since all sites are subject to the building permit process, which requires consideration of storm drainage and requires BMPs to direct site drainage and prevent runoff from pollution, the impact is considered less than significant.

WQ-7: Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Only one proposed Project site (Site ZHQ) intersects with a flood zone (a tsunami inundation zone associated with the Pacific Ocean); and proposed construction on the site would meet federal, state, and local planning requirements. The flood zone is an extension of the Pacific Ocean. Only one other project, a bathroom renovation at Zuma Beach, was identified. The potential for impeding flood flows associated with the Pacific Ocean for these projects is considered minimal, and impacts would be less than significant.

WQ-8: Would the project expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam?

Two sites were identified that have flood prevention structures or a potential to flood:

- Site ASD is approximately 500 feet from the San Gabriel River. A total of six projects on Table 2.7-1 are within the San Gabriel River / Coyote Creek watershed. Project-specific impacts were considered less than significant. The San Gabriel River is highly modified for the purpose of containing floods, and the potential for failure of the channel associated with runoff from these six projects is minimal. Impacts would be less than significant.
- Site ZHQ is in a floodplain (part of the Pacific Ocean tsunami inundation zone). A potential for flooding exists at the site, but proposed activity at Site ZHQ would be managed in accordance with applicable requirements associated with development in the floodplain; and impacts associated with flooding would be less than significant. Fifty eight other projects were identified in Table 2.7-1 within the Zuma Canyon-Frontal Pacific Ocean watershed. No potential exists for these cumulative projects to combine to substantively affect tidal inundation. Impacts would be less than significant.

WQ-9: Would the project expose people or structures to a significant risk of loss, injury, or death from inundation by seiche, tsunami, or mudflow?

No proposed Project sites are located on an enclosed or partially enclosed water body, and no potential for seiches exists. Site ZHQ is within a tsunami inundation zone and discussed above, and no significant cumulative impact associated with exposure to tsunami is anticipated. Two sites, Site ENC1 and Site PWT, are located in conditions that could potentially be subjected to mudflows. Impacts associated with potential mudflows at these sites would be reduced to less than significant once measure GEO MM 1 is implemented. Both sites are in the same watershed (Zuma Canyon - Frontal Pacific Ocean) as 58 cumulative projects identified in Table 2.7-1. Of these 58 cumulative projects, none was located upslope from either Site ENC1 or Site PWT. It was not determined whether projects identified on Table 2.7-1 would potentially trigger mudflow, but the potential for these impacts was assumed to be significant. Because proposed work at sites ENC1 or PWT would not likely trigger mudflows on site, they would not

likely affect downslope areas where other cumulative construction may occur. Therefore, the proposed activities sites ENC1 or PWT would not be cumulatively considerable.

3.9 Land Use/Planning

This section addresses several aspects of land use, including land jurisdiction, zoning, special land use designations, the regulatory environment, and how development as well as operations and maintenance of proposed Project sites could affect land use. Special land use designations evaluated in the analysis include coastal zones and lands subject to Habitat Conservation Plans (HCPs) or Natural Community Conservation Plans (NCCPs). Lands with special farmland designations (prime farmland, unique farmland, farmland of statewide importance), lands limited to agricultural and open space uses per Williamson Act contracts, and forest timberland do not occur within the Project area were found in the Initial Study (see Appendix A-2) to be not applicable to this analysis, and are not addressed further in this discussion.

3.9.1 Environmental Setting

3.9.1.1 Land Jurisdiction

Los Angeles County consists of approximately 4,058 square miles of land (USCB 2010) and includes San Clemente and Santa Catalina islands. The county includes 88 incorporated cities and many unincorporated areas.

All Project sites are located within Los Angeles County with the exception of AeroJet (AJT), which is within San Bernardino County. Portions of Los Angeles and San Bernardino counties are administered by federal and state agencies. Table 3.9-1 indicates agencies with jurisdiction of the proposed Project sites.

ANF - Angeles National Forest SMMNRA – Santa Monica Mountains National Recreation Area USFS – U.S. Forest Service				

3.9.1.2 Existing Land Use and Zoning

State and federal agencies often prepare management plans that may identify land uses compatible with the values of the land being managed. Some federal lands are identified as appropriate for multiple-uses, while other tracts of land may have a specific use, such as wilderness.

Twenty-two of the proposed Project sites are on lands administered by the following federal agencies with 20 sites on USFS land and two sites on NPS land.

U.S. Forest Service

USFS has prepared a Land Management Plan that includes the vision for southern California national forests and the Angeles National Forest Strategy (USFS 2005a, 2005b). Proposed Project sites within the Angeles National Forest (ANF) are located within the following land use designations: Developed Area Interface, Back Country, Back Country Motorized Use Restricted, and Experimental Forest.

Developed Area Interface zone includes areas adjacent to communities or concentrated use areas and developed sites with more scattered or isolated community infrastructure. The level of human use and infrastructure is typically higher than in other zones, and the level of development varies between areas that are highly developed to areas where no development has occurred. Although this zone may have a broad range of higher intensity uses, the management intent is to limit development to a slow increase of carefully designed facilities to help direct use into the most suitable areas and concentrate on improving facilities before developing new ones (USFS 2005b).

Back Country includes areas of the national forest that are generally undeveloped and have few roads. Most of the national forest's remote recreation and administrative facilities are found in this zone. The

level of human use and infrastructure is generally low to moderate. The zone is managed for motorized public access on designated roads and trails. Although this zone generally allows a broad range of uses, the management intent is to retain the natural character inherent in this zone and limit the level and type of development (USFS 2005b).

Back Country Motorized Use Restricted includes areas of the national forest that are generally undeveloped and have few roads. Few facilities are found in this zone, but some may occur in remote locations. Motorized use is restricted to administrative purposes only; this includes USFS and other agency or tribal government needs, as well as access needed to private land or authorized special uses. Although this zone allows a range of low intensity land uses, the management intent is to retain the natural character of the zone and limit the level and type of development (USFS 2005b).

Experimental Forest zone serves as a research and demonstration area and is generally closed to the public except by permit. The San Dimas Experimental Forest (SDEF) is a protected field laboratory for studies of hydrology, fire, and other topics relating to the ecology of chaparral and related ecosystems. It has been closed to the general public, except under special written permit. Uses within the SDEF include a communications site that was authorized by special-use authorization (USFS 2005b).

The Southern California National Forests have established design criteria for protection and conservation of bird species at mountain top communications sites. In addition to criteria to prevent bird perching and entrapment, specifications pertaining to location and structure are useful land use guidance for establishing compatibility with the Forest Service planning documents. These design criteria include:

- New towers shall be the same or less than the tower height of existing towers at the site. New towers shall be no more than 199 feet above ground level and shall not require guy wires.
- Towers shall be unlighted if FAA regulations permit.
- To reduce the number of towers needed in the future, providers shall design new towers structurally and electrically to accommodate comparable antennas for multiple users.
- Security lighting for on-ground facilities and equipment should be down-shielded to keep light within the boundaries of the site.
- Road access to mountain top communication sites must be adequate to support construction, maintenance and demolition of facilities.

National Park Service

The NPS administers the land at two proposed Project sites (LACFCP08 and PWT) within the SMMNRA. In accordance with the Superintendent's Compendium of Designations, Closures, Permit Requirements, and Other Restrictions Imposed under Discretionary Authority (NPS 2014b), construction of a structure requires a permit from the Superintendent, but wireless communications sites development or use are not otherwise specified for this unit of the NPS system.

Topanga State Park

Topanga State Park offers limited camping opportunities, a nature center, and an extensive trail system. The Topanga State Park General Plan (California State Parks [CSP] 2012) contains goals and guidelines for the management of natural and cultural resources within the park. These include specific guidelines to protect natural and cultural resources and to establish management guidelines and policies for visitor use and development. The General Plan does not specifically address communication facilities, but identifies that exterior treatment of new infrastructure should be designed to blend with the park's landscape characteristics, and that infrastructure planning should avoid or mitigation for habitat degradation and fragmentation.

Local Agencies

Cities and counties adopt a comprehensive, long-term general plan for the physical development of the county or city, and of any land outside its boundaries which in the planning agency's judgment bears relation to its planning. Pursuant to California Government Code section 65302, each plan must contain the following mandated seven components or elements: land use, circulation, housing, conservation, open-space, noise, and safety. Cities, towns, and local entities typically use zoning designations to indicate the type of land use (such as residential, commercial, industrial, etc.) and the intensity of the use allowed within an area. Zoning designations regulate the use, form, design, and compatibility of development with the purpose of segregating uses that are thought to be incompatible and to preserve the character of a particular community or neighborhood. For example, in the case of the proposed Project sites, zoning designations may have restrictions on the height of support structures. Zoning is commonly controlled by local governments such as counties or municipalities.

The Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such local plans, policies, and regulations are not applicable to the Project. Nevertheless, in the exercise of its discretion and in the interest in working cooperatively with local jurisdictions, this Draft EIR references, describes, and addresses local land-use plans, policies, and regulations. The Draft EIR takes this approach in recognition that such plans, policies, and regulations reflect the local community's policy decisions with respect to appropriate uses of land in the area. Consideration of these plans, policies, and regulations assists in determining whether the proposed Project may conflict with nearby land uses, which could affect the analysis of whether the proposed Project would result in potentially significant environmental impacts.

3.9.1.3 Special Land Use Designations

In addition to planning and zoning designations, certain lands are given special designations to preserve or protect features and characteristics of the land. These include coastal zones, timberlands, and lands subject to an HCP and/or an NCCP. No proposed Project sites are within designated timberlands, or NCCPs. As such, timberlands and NCCPs are not discussed further in this section.

Coastal Zones

The federal Coastal Zone Management Act (CZMA) of 1972 applies to federal activities, development projects, permits and licenses, and similar project activities that would be located within coastal resources or have the potential to affect them. Congress later delegated coastal resource management to states' coastal management programs. In 1977, the federal government certified the California Coastal Management Program (CCMP). The enforceable policies of that document are in Chapter 3 of the California Coastal Act of 1976 (Coastal Act), and are administered by the California Coastal Commission (CCC).

The mission of the CCC is to protect, conserve, restore, and enhance environmental and human-based resources of the California coast and ocean for environmentally sustainable and prudent use. The Coastal Act addresses issues such as shoreline public access and recreation, reduced cost for visitor accommodations, terrestrial and marine habitat protection, visual resources, landform alteration, agricultural lands, commercial fisheries, industrial uses, water quality, offshore oil and gas development, transportation, development design, power plants, ports, and public works. The policies of the Coastal Act constitute the statutory standards applied to planning and regulatory decisions made by the CCC and by local governments.

The CCC makes coastal development permit decisions and reviews Local Coastal Programs (LCPs) prepared by local governments. It also reviews federal activities that affect the Coastal Zone.

LCPs are the basic planning tools used by the state and local governments in their shared stewardship of the coast. They specify appropriate location, type, and scale of new or changed uses of land and water by inclusion of a land use plan and measures to implement the plan (such as a zoning ordinance). Once certified by the CCC, LCPs govern decisions that determine the short- and long-term conservation and use of coastal resources. While each LCP reflects the unique characteristics of its local coastal community, all regional and statewide interests and concerns must also be addressed in the LCP to conform to Coastal Act goals and policies (CCC 2014).

The state's coastal zone jurisdiction is divided into 126 geographic segments. As of 2014, 73 percent of the LCP segments have been certified, representing close to 87 percent of the geographic area of the coastal zone in which local governments have delegated authority to issue coastal permits (CCC 2014). For segments without a certified LCP or delegated local authority, the regulatory review and permit process remains with the CCC.

An LCP comprises a land use plan and an implementation plan. The land use plan describes existing conditions and issues in the coastal zone and presents land use and development policies to fulfill the intent of the Coastal Act. Should conflicts arise between the land use plan and other local planning documents, such as the General Plan, the policies and regulations of the LCP take precedence within the coastal zone. The implementation plan provides for how the LCP is regulated and what entity has review authority.

All LCPs must be consistent with the Coastal Act, specifically with Chapter 3, which sets broad coastal zone policy for planning and managing coastal resources. The Chapter 3 policies focus on the protection and sustainability of land resources (Article 5) and guide new development within the coastal zone (Article 6). While the Coastal Act's policies do not specifically address communication facilities development, any new development must be consistent with the Chapter 3 policies. Therefore, communication facility projects within the coastal zone are expected to demonstrate that they would not be detrimental to land resources such as sensitive habitats, agricultural lands, and archaeological resources. Similarly, communication facility projects should demonstrate that they support policies for coastal access, visitor-serving uses, coastal-dependent development, and preservation of aesthetic resources. LCPs established by local agencies may be more specific and restrictive, provided that they are consistent with Chapter 3 at a minimum. For coastal zone segments without a certified LCP, Chapter 3 policies prevail as guiding land use policy.

The study area encompasses the Santa Monica Mountains Coastal Zone, the City of Malibu Coastal Zone, the City of Santa Monica Coastal Zone, and the Santa Catalina Island Coastal Zone.

The *Santa Monica Mountains Land Use Plan*, a component of the Santa Monica Mountains LCP, was issued in August 2014 and allows for telecommunication facilities within several land use categories, including open space, rural lands, rural residential, rural villages, residential, commercial, commercial recreation – limited intensity, and public and semi-public facilities (LACDRP 2014). Goals and policies from the Land Use Plan that may pertain to prepared development and operation of the proposed Project sites include:

- Limit structure heights to ensure protection of scenic resources and compatibility with surrounding settings (Pattern and Character of Development Policy LU-38)
- Limit the visual and safety impacts of wireless telecommunications facilities to preserve the character and aesthetics of surrounding areas through careful design, screening, and mitigation requirements. Encourage undergrounding of accessory equipment, collocating, and clustering wireless telecommunication facilities and structures, wherever possible, to help avert unnecessary proliferation of such facilities (Pattern and Character of Development Policy LU-52)
- All facilities and related support structures shall be sited, designed, and operated to avoid when possible the visibility of the facility from public viewing areas and to preserve the character of surrounding areas by protecting ridgelines by setting facilities below the ridge and collocating facilities, where feasible, to avoid proliferation of facilities (Pattern and Character of Development Policy LU-54)
- All facilities [particularly most new or replacement communication transmission lines] shall place support facilities underground, where feasible (Pattern and Character of Development Policy LU-55)
- Require that the extension of water, sewer, or utility infrastructure to serve development be located within legally existing roadways and road rights-of-way in a manner that avoids adverse

impacts to coastal resources to the maximum extent feasible (Development and Environmental Resources Policy LU-12)

- The height of structures shall be limited to minimize impacts to scenic resources (Hillside Management Policy CO-110)
- Avoidance of impacts to scenic resources through site selection and design alternatives is the preferred method over landscape or building material screening. Landscape or building material screening shall not substitute for project alternatives including re-siting or reducing the height or bulk of structures (Scenic Resources Policy CO-132)
- Prohibit development on designated significant ridgelines and require that structures be located sufficiently below such Ridgelines to preserve unobstructed views of a natural skyline. In addition, all ridgelines other than significant ridgelines that are visible from a scenic route, public parkland, public trails, or a beach shall be protected by siting new development below the ridgeline to avoid intrusions into the skyline where feasible. Where there is no feasible alternative building site or where the only alternative building sites below the ridgeline would result in unavoidable impact to HI or 1-12 habitat areas, structures shall be limited to one story (18 feet maximum from existing or finished grade, whichever is lower) to minimize visual impacts and preserve the quality of the scenic area (Scenic Resources Policy CO-136)
- Require wireless telecommunication facilities to be designed and sited in such a manner that they minimize impacts to visual resources and blend into the landscape. Such facilities shall be collocated where feasible. This may include requiring one taller pole rather than multiple shorter poles. New wireless telecommunication facilities may be disguised as trees of a species that would likely be found in the surrounding area and that blend with the natural landscape when it is not feasible to co-locate on an existing pole (Scenic Resources Policy CO-152)
- New and replacement infrastructure may be permitted provided that it complies with applicable provisions of this plan and is designed to avoid and, if infeasible, minimize adverse impacts to environmental and scenic resources. New roads shall be constructed only to provide access to lawfully approved proposed new development and shall comply with the road standards found in the Local Implementation Program. New and replacement utilities shall be developed only to serve legally established uses (Biological Resources Policy CO-48)

The *City of Malibu Coastal Zone Land Use Plan* was adopted by the CCC on September 13, 2002, and provides for communication facilities as a conditional use in all land use designations. Policies in the Land Use Plan or the Local Implementation Plan that may apply to the proposed Project sites include:

- Communication processing, storage, and transmission facilities and lines shall be sited, designed, and operated to avoid or minimize impacts to Environmentally Sensitive Habitat Areas and scenic resources, consistent with all provisions of the LCP. If no feasible alternative can eliminate all impacts, then the alternative that would result in the fewest or least significant impacts shall be selected.

- All facilities and related support structures shall be sited, designed, and operated to avoid the visibility of the facility from public viewing areas and to preserve the character of surrounding areas by protecting ridgelines by setting facilities below the ridge and collocating facilities, where feasible, to avoid proliferation of facilities.
- All facilities shall place support facilities underground, where feasible. New communication transmission lines shall be sited and designed to be located underground, except where it would present or contribute to geologic hazards. Existing communication transmission lines should be relocated underground when they are replaced or when funding for undergrounding is available.
- The maximum height of ground or building-mounted antennas shall not exceed 28 feet; however, if the antenna elements are mounted flush on an existing structure that exceeds 28 feet, the antenna elements may be equal to the height of the building. Roof-mounted antennas may extend no more than 3 feet above the roof from which they are attached.
- Prominent ridgelines and other intervening ridgelines that are visible from a public road, a beach, public viewing areas, or public hiking trails shall be protected by setting structures below the ridgeline to avoid intrusions into the skyline where feasible. Where no feasible alternative building sites are below the ridgeline or where the only alternative building site would result in unavoidable adverse impacts to environmentally sensitive habitat areas (ESHA), structures shall be limited to one story (18 feet maximum from existing or finished grade, whichever is lower) in height to minimize visual impacts.

The *City of Santa Monica Local Coastal Program Land Use Plan* does not discuss communication facilities. The only mention of utilities is to indicate that conversion or rehabilitation of existing structures that involves replacement or relocation of utilities shall provide underground utilities. One proposed Project site, 100 Wilshire (WS1), is located within the City of Santa Monica Coastal Zone and within an area classified as Residential-Visitor Commercial, which allows for three-story (45-foot) structures (City of Santa Monica 1992). Policies that may apply to the Project site include:

- The scenic and visual qualities of the Coastal Zone shall be considered and protected as an important public resource.
- All new development in the Coastal Zone, including any conversion or rehabilitation of existing structures which involves the replacement or relocation of the existing electrical service, shall provide underground utilities.
- New or expanded public works facilities shall be designed and limited to accommodate needs generated by development or uses permitted consistent with the provisions of this Land Use Plan.

The *Santa Catalina Island Local Coastal Plan* was approved by the Los Angeles County Board of Supervisors on March 15, 1983, and was certified by the CCC on November 17, 1983. Areas in the Plan allocated for industrial, transportation, and utilities include the existing Airport-In-The-Sky and Pebbly

Beach, although utilities are allowed in other development areas provided that the placement of such facilities is otherwise consistent with the policies of the Local Coastal Plan. Plan policies and recommended actions that may pertain to proposed development of proposed Project sites include:

- Limit new development in scope and carefully design it to be compatible with the unique character of the Island.
- Relate new development to the natural character of the Island by limiting building heights (except for selected architectural accents approved through design review), specifying types of building materials and sensitively reviewing designs and landscaping materials.
- Mitigate environmental impacts by channeling development into already developed and/or publicly used areas; minimizing grading (cut and fill) operations; avoiding steep slopes, tsunami run-up areas, archaeological sites, landslide areas, and view corridors; and by ensuring the provision of sufficient water resources and solid and liquid waste facilities prior to development approvals.
- New development... shall be attractively designed to protect highly scenic natural or historical areas. Views of the shoreline, both from the land and water, should also be protected.
- Priority shall be assigned to protection of the land/water interface, ridgelines, distinctive geologic features, native trees and vegetation, natural streams, and riparian habitats.
- All intensive new development shall be channeled into non-easement areas adjacent to already existing development such as Two Harbors, Avalon Canyon, Empire Landing, White's Landing, Airport-In-The-Sky, and Pebbly Beach.
- Plant materials shall be used to integrate the man-made and natural environments, to screen or soften visual impacts of new developments, and to provide diversity within developed areas. Native vegetation shall be favored in easement areas while introduced vegetation from similar climates, such as palm trees and eucalyptus, shall be permitted in the more "urban" environments (e.g., Avalon Canyon, Two Harbors).
- Discourage siting of facilities such as communications facilities and park ranger stations in high-visibility locations.

Lands Subject to Habitat Conservation Plans

Some lands within the Project area are located within protected wildlife areas subject to an HCP. An HCP is a land management agreement generally between the land owner and the U.S. Fish and Wildlife Service (USFWS) to protect and improve habitat for federally protected species.

The West Mojave HCP, covering 9.3 million acres of land and amending the California Desert Conservation Area Plan, is implemented by the BLM, San Bernardino County, and several municipalities. Its main goal is protecting and managing over 100 listed or sensitive species. Plan objectives include protecting large habitat blocks, avoiding human impacts on conservation areas, considering habitat

specialists in conservation efforts, maintaining biodiversity and providing a streamlined process for incidental take permits. The plan also provides for large areas of disturbed lands to be available for development, recreation, and resource extraction (BLM, California Desert District 2005).

Table 3.9-2 identifies those proposed Project sites that are located on lands with these special management designations. If a proposed Project site is not listed in the table, it is not within a coastal zone or on land subject to an HCP.

Table 3.9-2: Proposed Project Sites Within a Coastal Zone or on Land Subject to a Habitat Conservation Plan

Site ID	Site Name	Within Coastal Zone	Within Land Subject to a Habitat Conservation Plan
BJM	Black Jack Peak	Santa Catalina Island Coastal Zone	
CPK	Castro Peak	Santa Monica Mountains Coastal Zone	
DPK	Dakin Peak	Santa Catalina Island Coastal Zone

3.9.2 Regulatory Setting

3.9.2.1 *Federal Regulatory Setting*

National Oceanic and Atmospheric Administration, Office of Ocean and Coastal Resource Management

Coastal Zone Management Act

The Coastal Zone Management Act (CZMA) was enacted in 1972 to protect the coastal environment from growing demands associated with residential, recreational, commercial, and industrial uses. The CZMA provisions help states develop coastal management programs to manage and balance competing uses of coastal zones. Federal actions that are likely to affect land or water uses or natural resources of the coastal zone must be consistent with enforceable policies of a state's federally approved coastal management program. As the lead federal agency for the proposed LMR project, FEMA documents this by preparing a Consistency Determination. When a private entity proposes to develop within a coastal zone and the activity requires a federal license or permit, the applicant must demonstrate consistency with the state's coastal management program by preparing a Consistency Certification.

U.S. Fish and Wildlife Service

Endangered Species Act

Section 10(a)(1)(B) of the Federal Endangered Species Act pertains to the development of HCPs. HCPs are required as part of an application for an Incidental Take Permit. HCPs also are designed to protect and improve habitat and its associated federally protected species subject to the Federal Endangered Species Act.

U.S. Department of Agriculture

National Forest Management Act

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health, watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS 2005b).

U.S. Department of the Interior

Organic Act

The 1916 Organic Act established the National Park Service (NPS) "to conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations." NPS units prepare general management plans (GMPs) to set long-term goals for individual

park units that clearly define conditions to be achieved and maintained over time and the conditions necessary for visitors to enjoy the park's significant resources (NPS 2006). Portions of the Santa Monica Mountains National Recreation Area are administered by NPS per the Santa Monica Mountains National Recreation Area GMP, which provides a framework for managing development, visitation, and natural and cultural resources. The Land Protection Plan (NPS 1998) focuses on the execution and implementation of land protection strategies through effective use of available funds.

3.9.2.2 State Regulatory Setting

California Coastal Commission

The California Coastal Act of 1976 provides for the transfer of most of the authority to local governments through adoption and certification of LCPs. LCPs contain the rules for future development and protection of coastal resources, including appropriate location, type, and scale of new or changed uses of land and water. Each LCP includes a land use plan and measures to implement the plan (such as zoning ordinances) (CCC 2014). Once an LCP has been certified, a local government may issue coastal development permits.

The CCC is tasked with protection of coastal resources, including shoreline public access and recreation, lower-cost visitor accommodations, terrestrial and marine habitat protection, visual resources, landform alteration, agricultural lands, commercial fisheries, industrial uses, water quality, offshore oil and gas development, transportation, development design, power plants, ports, and public works. Development in the coastal zone usually requires a coastal development permit. Development activities include, but are not limited to, construction of buildings, divisions of land, and activities that change the intensity of use of land or public access to coastal waters. The CCC issues coastal development permits, although a local agency takes over this responsibility once an LCP has been certified by the CCC (CCC 2001; Government Printing Office 1977).

3.9.2.3 Local Regulatory Setting

In accordance with California State law (Title 7, Division 1, Chapter 3, Article 5 §65300), cities and counties prepare and adopt a General Plan to guide the growth and land development within their jurisdiction. As noted previously, the Authority is not subject to certain local land-use plans, policies, and regulations, per the doctrine of intergovernmental immunity; however, the proposed Project must comply with the Los Angeles County General Plan, even though it is exempt from compliance with the County's zoning ordinance. Therefore, the following analysis discusses local land use restrictions as identified in local general plans and zoning ordinances to assist in determining whether the proposed Project may conflict with nearby land uses, which could affect the analysis of whether the proposed Project would result in potentially significant environmental impacts. It also discusses consistency with the Los Angeles County General Plan.

Los Angeles County General Plan policies pertinent to the proposed Project include:

- Avoid severe hazard areas, such as flood-prone areas, active fault zones, steep hillsides, landslide areas, and fire hazard areas.
- Protect areas that have significant natural resources and scenic values, including Significant Ecological Areas, the coastal zone, and prime agricultural lands.
- Protect cultural heritage resources.
- Conserve the available supply of water and protect water quality.
- Ensure that development in non-urban areas is compatible with rural lifestyles, does not necessitate the expansion of urban service systems, and does not cause significant negative environmental impacts or subject people and property to serious hazards.
- Maintain high-quality emergency response services.
- In national forests, maintain the mountains in open space and non-urban uses similar to the present pattern of use.

Zoning ordinances provide the written laws and regulations that define how property in a specific geographic zone can be used. Antennas and similar structures are addressed in Chapter 22.52 of the Los Angeles County Code. To resolve ambiguity of the code, the Los Angeles County Department of Regional Planning (LACDRP) issued Policy No. 01-2010 (dated July 26, 2010), which establishes zoning ordinance policy for permitting wireless telecommunications facilities in the County (LACDRP 2010). The policy establishes various design and site placement criteria, which include a maximum height of 75 feet and requirement to incorporate camouflage techniques for all new facilities. Other Los Angeles County zoning ordinances addressing wireless and other telecommunication facilities are specific to the Santa Monica Mountains Local Implementation Plan, Community-wide Development Standards (addressed in Title 22, Planning and Zoning, Chapter 22.44, Supplemental Districts, Part 10). Key standards include limiting equipment to that necessary for the site, putting related communications and power lines underground, avoiding scenic resources and public viewing areas, avoiding H1 habitat areas, structurally designing new monopoles and lattice towers to accommodate collocation of at least one other wireless facility, and collocating on existing facilities where feasible.

Table 3.9-3 identifies the General Plans and Zoning Ordinances for the municipalities within the Project area in which a Project site is proposed (see Table 3.9-1). The documents listed in Table 3.9-3 provide the source data used to complete Table 3.9-4.

Table 3.9-3: General Plans and Zoning Ordinances in the Project Area

City or County	General Plan Name	Date of Last Update	Zoning Ordinance Name	Date of Last Update
Agoura Hills	City of Agoura Hills General Plan Update	06/30/2011	City of Agoura Hills' Municipal Code	03/31/2014
Beverly Hills	City of Beverly Hills General Plan	11/15/2011	Beverly Hills, California City Code	03/21/2014
Calabasas	City of Calabasas 2030 General Plan	October 2015	City Calabasas Municipal Code	8/27/15

Whittier	Whittier General Plan	Not listed	Whittier Municipal Code	07/08/2014

3.9.3 Significance Criteria

The proposed Project would result in significant impact to land use and planning if either of the following significance criteria, based on Appendix G of the CEQA Guidelines, are met:

- 1) Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan,

LCP, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

2) Would the project conflict with any applicable HCP or NCCP?

Based on the Initial Study prepared for the LMR project, it was determined that the project would not result in the physical division of an established community so no further analysis of this topic is warranted within this EIR.

3.9.4 Impact Analysis

3.9.4.1 *Proposed Project*

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impacts

As discussed above, the Project sites cover multiple jurisdictions. All of the plans identified above were reviewed for relevance, and the proposed Project sites were reviewed for consistency with relevant plans, policies, and regulations, as indicated in Table 3.9-4.

Table 3.9-4: Planning and/or Zoning Designations for Proposed Project Sites

Site ID	Site Name	General Plan Name	General Plan Designation	Zoning Designation	Height Restriction	Inconsistent with Plans or Policies
AGH	Agoura Hills	City of Agoura Hills General Plan Update Los Angeles County General Plan 2035	Open Space Deed Restricted	Open Space Deed Restricted	60 feet	Yes, exceeds height restriction by up to 10 feet ¹

WTR	Whittaker Ridge	Los Angeles County General Plan 2035	Open Space – National Forest; Forest Plan land use designation is Developed Area Interface; designated communications site	Watershed	N/A	No, but requires USFS special use permit ^{1, 2}
ZHQ	Zuma Life Guard HQ	City of Malibu General Plan; Downtown Specific Plan Los Angeles County General Plan 2035	Public Open Space	Public Open Space	28 feet	No

Notes:

N/A = Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit)

¹ – Telecommunications uses presently on site

² – Angeles National Forest would require special use authorization; sites on USFS land are noted within Los Angeles County zoning ordinances and may require a County issued Conditional Use Permit, if applicable

Sources: See Table 3.9-3 for a list of the sources used

Proposed Project sites may be inconsistent with current land use plans where (i) new structures would be constructed at locations where telecommunications structures do not currently exist, (ii) the LMR structures would be taller than existing structures, or (iii) an existing structure may be increased in

height. As noted in Section 3.9.1.2, the Authority is not subject to certain local land-use plans, policies, and regulations, per the doctrine of intergovernmental immunity. Therefore, local land use restrictions may not be applicable but are discussed here to assist in determining whether the proposed Project may conflict with nearby land uses, which could affect the analysis of whether the proposed Project would result in potentially significant environmental impacts.

Project sites proposed to use existing structures at existing communications sites would not result in changes to land use that would conflict with land use plans, policies, or regulations. Where antennas are being added to existing towers, monopoles, or roof tops, the Project would not result in new structures that may conflict with land use plan height restrictions. Sites AJT, LARICSHQ, PDC, SGH, SIM, WAD, and WS1 use existing telecommunications sites and do not convert land for a new purpose. Consequently, no impact would occur at these sites.

As indicated in Table 3.9-4, a review of city and county general plans and zoning ordinances indicate that Sites AGH, FTP, H-17A, JPK, JPK2, LEPS, MMC, PASPD01, and SDW are inconsistent with local zoning ordinances regarding height restrictions. Additionally, Sites JPK and JPK2 are inconsistent with the City of San Dimas goal of preserving the integrity of the foothills through Open Space Objective 5.1 to preserve existing ridgelines and Policy 5.1.2 to protect views and viewsheds of the foothills. Sites AGH, ENT, FTP, H-17A, MMC, OAT, PASPD01, PHN, RIH, SDW, SGH, TPK, VPK, and WAD are inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and/or the policy to protect areas that have significant natural resources. As discussed in this EIR in Sections 3.5 (Geology/Soils), Section 3.7 (Hazards and Hazardous Materials), Section 3.3 (Biological Resources), as well as in a site-by-site assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than significant. Because no physical impact would occur as a result of an inconsistency between the proposed Project and the plans identified in Table 3.9-4, the plan inconsistency is not considered a significant impact. Similarly, all sites listed in Table 3.9-4 that are consistent with local plans, policies, and ordinances would have no significant impact.

Sites BUR, BUR1, BUR2, BUR3, FRP, GMT, JOP, JPK, JPK2, LACFCP09, LACFCP11, LPC, MML, MTL2, PMT, SUN, SUN2, TMT, WMP, and WTR are within Angeles National Forest. Of these, sites GMT, JOP, LACFCP09, LACFCP11, and PMT are in locations not presently designated as a communications site in the Forest Plan. The Forest Plan does not indicate if communication facilities outside designated communication sites are compatible or incompatible, but it does not prohibit such use. As noted in Section 3.9.1.2, the Southern California National Forests have established design criteria for communication towers, including a criterion that new structures should not be taller than existing structures. For proposed sites at designated communications sites (including BUR, BUR1, BUR2, BUR3, FRP, LPC, MTL-2, SUN, SUN2, TMT, WMP, and WTR), the Authority requested information from representatives of the Angeles National Forest regarding the height of existing structures; but this information has not been received and communications plans are not publically available. Coordination with Angeles National Forest is ongoing, and the final determination of consistency would be made by the USFS in connection with their consideration of the Authority's application to construct all sites on

USFS land. Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed Project and an applicable plan, and this is not considered a significant impact.

As noted in Table 3.9-2, sites BJM, CPK, DPK, ENC1, H-69B, LACF072, LACFCP08, LEPS, PWT, SPN, TOP, TWR, WS1, and ZHQ are within the coastal zone; and most are subject to land use plans adopted by the CCC. Table 3.9-5 identifies characteristics of the site locations, proposed antennas and support structures, and potential conflicts with coastal zone planning documents by coastal zone. Conformance with coastal zone land use plans largely depends on structure height and other design elements for making the equipment blend visually into the environmental setting. The final determination of consistency for sites CPK, H-69B, LACFCP08, SPN, and TOP would be made by the agency responsible for issuing a Local Coastal Permit. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. At sites BJM, CPK, DPK, PWT, SPN, TOP, TWR, WS1, and ZHQ, no physical impact would occur as a result of an inconsistency between the proposed Project and an applicable plan, and this is not considered a significant impact.

Sites ENC1, H-69B, LACF072, and LACFCP08 would exceed the allowable height along a designated scenic route established by the LCP for the Santa Monica Mountains Coastal Zone. While inconsistency with a plan is not a physical impact on the environment, Section 3.1 (Aesthetics) of this EIR has taken these inconsistencies into account for purposes of analyzing the proposed Project's impact on visual resources and only Site H-69B was found to have a significant impact.

Two sites, LACFCP08 and PWT, are on land within the jurisdiction of the National Park Service as well as being within the Santa Monica Mountains Coastal Zone. In accordance with the Superintendent's Compendium of Designations, Closures, Permit Requirements, and Other Restrictions Imposed under Discretionary Authority (NPS 2014b), construction of a structure on NPS land requires a permit from the Superintendent. The final determination of consistency for sites LACFCP08 and PWT would be made by NPS. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed Project and an applicable plan, and this is not considered a significant impact.

Individual site analyses are provided in Chapter 4.

Mitigation Measures

None required.

Operation Impacts

Impacts from operation of the proposed Project would be the same as those described for construction.

Mitigation Measures

No mitigation would be required during the operations phase.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

As indicated in Table 3.9-2, no NCCP and one HCP apply to proposed Project sites in the Project area. Proposed Project Site MMC is on land subject to the West Mojave HCP.

No other proposed Project sites evaluated in this EIR are on land subject to an NCCP or HCP.

Construction Impacts

Site MMC contains existing antenna support structures. No impacts to conservation resources are expected or identified in the West Mojave HCP.

The West Mojave HCP does not cover communication sites and does not preclude access and opportunities to build or maintain permitted communications sites. As a result, the proposed Project sites would not conflict with land use policies of the West Mojave HCP. No land use impacts would occur from placing proposed Project sites on land subject to the West Mojave HCP.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Impacts from operation of the Project sites would be the same as described for construction. No impacts would be expected from operation of the Project.

Mitigation Measures

No mitigation measures are required.

3.9.4.2 No Project Alternative

With the No Project Alternative, the proposed Project communications sites would not be constructed, and equipment would not be added to existing communications sites. To the extent that other land uses are found to be compatible with the existing conditions at the proposed sites, the land would remain available for development of other facilities.

3.9.5 Cumulative Impacts

3.9.5.1 Geographic Extent

The geographic extent for the analysis of cumulative impacts associated with land use includes projects with the boundaries of proposed Project sites or within 100 feet of the perimeter of the site boundary (see Chapter 4 for site boundary maps). Most land use effects are associated with direct physical use of the site, although immediately adjacent land uses may be affected by a change in use of a neighboring property. Zoning ordinances account for compatibility of adjacent land uses when establishing zoning maps. Consequently, when a telecommunications structure is an allowable use for the zone in which it is located, it is considered compatible with the goals of adjacent zones even if a telecommunications structure may be prohibited in the adjacent zone.

3.9.5.2 Existing Cumulative Conditions

Table 2.7-1 in Chapter 2 lists proposed projects in the vicinity of proposed Project sites. Those that are within the geographic extent for the land use analysis include four LA-RICS LTE sites, one proposed LA-RICS LMR site that was previously approved, two communications towers proposed by other entities, and the proposed replacement of a gas turbine-driven compressor station at the Aliso Canyon natural gas storage field. Past projects and those that may currently be under development have been through a land use planning and permitting process and were determined to be compatible with city or county General Plans, zoning ordinances, or other plans applicable to the land use management agency.

Proposed sites in close proximity to other proposed projects include Sites MML, OAT, PASPD01, PDC, PHN, RIH, VPK, and WS1.

The criteria by which land use impacts would be considered cumulatively significant are the same as those considered for the proposed Project and discussed in Section 3.9.4.1.

3.9.5.3 Cumulative Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local

coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Sites PHN and VPK would be collocated on sites with existing telecommunication facilities. If associated facilities are needed, such as the addition of an equipment shed or power lines, the facilities would be within the perimeter of the land allocated as a telecommunications facility; and the land use would not change. Table 3.9-4 shows no inconsistencies with existing plans, policies, or zoning ordinances; and, with no change in land use, no cumulative land use impact would occur at these sites.

Site MML is an alternate to Site MAM, and only one of these two LA-RICS LMR sites would be developed; therefore, no cumulative effect is associated with these two proposed sites.

Sites PASPD01 and PDC are proposed in close proximity (typically adjacent) to an approved LA-RICS LTE site. Site PDC is a roof mount; whereas, the LTE site is a monopole. Alternatively, Site PASPD01 is proposed as a monopole, while the LTE site is a roof mount. No inconsistencies with land use plans, policies, or ordinances exist for Site PDC or the adjacent LTE sites. The City of Pasadena zoning ordinance allows for telecommunications facilities but has a height restriction of 50 feet in the zoning ordinance. Per the doctrine of intergovernmental immunity, the zoning ordinance would not apply to Site PASPD01 or the adjacent proposed LTE site. Both of these sites are in urban (developed) environments. While the LMR sites would contribute to the overall development of the site, the nature of the developed land use would not change and the cumulative land use impact would be less than significant.

Site OAT includes two existing lattice towers, so the proposed tower would not change the current land use. The compressor station replacement project in near proximity to this site would contribute to the ongoing development of the area and may contribute to ground disturbance; but the cumulative effect on land use would be minimal, as the consolidation of development in one area has fewer effects than the same amount of development dispersed over a larger area. No conflicts with land use plans, policies, or regulations would occur. The cumulative effect on land use would be less than significant.

Site RIH is proposed within the proximity of an existing antenna farm with five existing structures and one additional communications tower proposed in addition to the proposed Project site. The proposals do not conflict with land use plans, policies, or regulations. The immediate area is already allocated for antennas, so the land use would not change, and there would be no cumulative effect.

Site WS1, a proposed roof mount on an existing 320-foot building located within the City of Santa Monica Coastal Zone, is the only site within a coastal zone with another antenna proposed nearby. The proposed roof mount on an existing building would eliminate the loss of the land for other uses and would minimize the potential for conflicts with the LCP goals and policies addressing preservation of views. While the project description for the proposed MediaFLO USA Inc. communications tower is unknown, this would likely be a building mount, based on the development in the immediate area. Consequently, there would be no cumulative effect on the coastal zone.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

The only proposed Project site within land subject to an HCP is Site MMC and no other actions are proposed within the geographic extent of the cumulative analysis for land use. No sites were identified on land subject to an NCCP. Consequently, no cumulative effect on an HCP or NCCP would occur.

3.10 Noise

This section evaluates noise impacts that would result from construction and operation of the proposed Project sites. It discusses the existing noise environment at and around the Project area, as well as the regulatory framework for regulation of noise. It also analyzes the proposed Project's effect on the existing ambient noise environment during construction and operation. The analysis in this section is based on a comprehensive review of existing documentation for the Project area; estimates of ambient noise conditions based on land use type and population density; and applicable policies, standards, and regulations. The section addresses noise and vibration impacts on humans, as well as vibration effects on structures. Noise effects on wildlife are addressed in Section 3.3.

3.10.1 Environmental Setting

The environmental setting explains the fundamentals of noise and groundborne vibration and describes the existing noise conditions including noise-sensitive receivers identified in the Project area.

3.10.1.1 Fundamentals of Noise

Noise can be defined as unwanted sound. Sound is mechanical energy transmitted by pressure waves in a compressible medium such as air. The sound pressure level or decibel (dB) scale is the most common descriptor used to characterize the loudness of an ambient sound level. In general, human sound perception is such that a change in sound level of 3 dB is just noticeable, a change of 5 dB is clearly noticeable, and a change of 10 dB is perceived as doubling or halving sound level. The human ear is not equally sensitive to all frequencies in the entire spectrum, so noise measurements are weighted more heavily for frequencies to which humans are sensitive in a process called "A-weighting," or "dBA." The A-weighted sound level is widely accepted by acousticians as a proper unit for describing environmental noise. Table 3.10-1 describes typical A-weighted noise levels for various noise sources.

Table 3.10-1: Typical A-Weighted Noise Levels

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
	110	Rock band
Jet fly-over at 1000 feet		
	100

Source: Caltrans 2013

To characterize the noise environment in a given area, the following noise descriptors are commonly used:

- Maximum Sound Level (L_{max}): The maximum sound level measured during the measurement period
- Minimum Sound Level (L_{min}): The minimum sound level measured during the measurement period
- Equivalent Sound Level (L_{eq}): The equivalent steady state sound level that in a stated period of time would contain the same acoustical energy
- Day/night Average Noise Level or Community Noise Equivalent Level (L_{dn} or CNEL): Both descriptors provide the same 24-hour level with 10 dBA applied to the actual noise level during the hours from 10:00 p.m. to 7:00 a.m. The CNEL also requires that 5 dBA be applied to the actual noise level during the hours from 7:00 p.m. to 10:00 p.m. The applied increments take into account a person's increased sensitivity to noise during these periods.

3.10.1.2 Sound Propagation

When sound propagates over a distance, it changes in level and frequency content. The manner in which noise reduces with distance depends on the following factors.

Geometric Spreading

Sound from a localized source (i.e., a point source) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 decibels for each doubling of distance from a point source. Roadways consist of several localized noise sources on a defined path and hence can be treated as a line source, which approximates the effect of several point sources. Noise from a line source

propagates outward in a cylindrical pattern, often referred to as cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source.

Ground Absorption

The propagation path of noise from a roadway to receiver is usually very close to the ground. Noise attenuation from ground absorption and reflective-wave canceling adds to the attenuation associated with geometric spreading. Traditionally, the excess attenuation has also been expressed in terms of attenuation per doubling of distance. This approximation is usually sufficiently accurate for distances of less than 200 feet. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receiver, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., those sites with an absorptive ground surface between the source and the receiver, such as soft dirt, grass, or scattered bushes and trees), an excess ground-attenuation value of 1.5 decibels per doubling of distance is normally assumed. When added to the spherical spreading, the excess ground attenuation results in an overall drop-off rate of 7.5 decibels per doubling of distance.

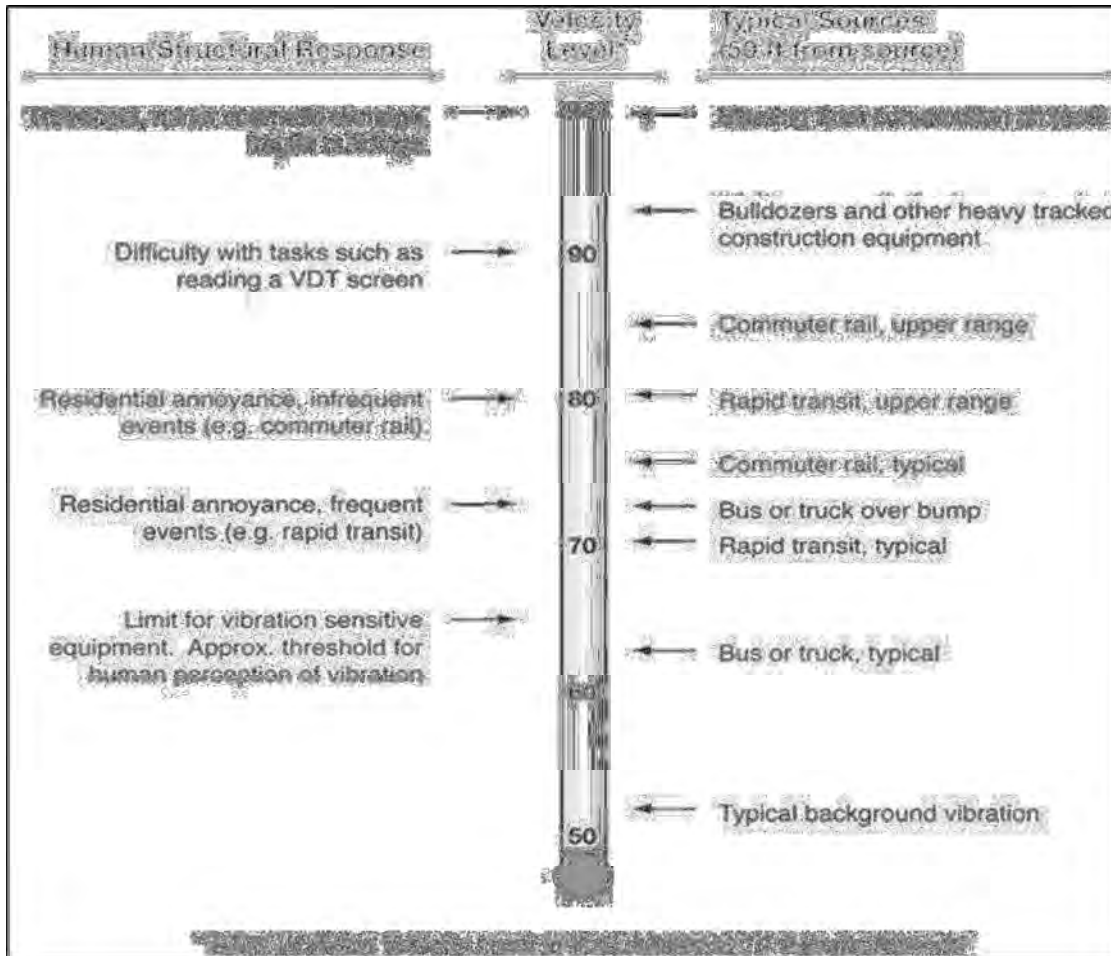

Shielding by Natural or Human-Made Features

A large object or barrier in the path between a noise source and a receiver can substantially attenuate noise levels at the receiver. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Natural terrain features (e.g., hills and dense woods) and human-made features (e.g., buildings and walls) can substantially reduce noise levels. Walls are often constructed between a source and a receiver specifically to reduce noise. A barrier that breaks the line of sight between a source and a receiver will typically result in at least 5 dB of noise reduction. Taller barriers provide increased noise reduction. Vegetation between the noise source and receiver is rarely effective in reducing noise because it does not create a solid barrier.

3.10.1.3 Fundamentals of Groundborne Vibration

In contrast to airborne noise, groundborne vibration (GBV) is not a phenomenon experienced by most people on a daily basis. Typical outdoor sources of perceptible GBV are construction equipment and traffic on rough roads. Figure 3.10-1 depicts the typical levels of GBV. The effects of GBV include feelable movement of the building floors, rattling of windows, shaking of items on shelves or hanging on walls, and rumbling sounds. Groundborne noise (GBN) is the rumbling sound caused by the vibration of room surfaces. The annoyance potential of GBN is usually characterized with the A-weighted sound level. GBV is almost never annoying to people who are outdoors. The ground motion caused by vibration is measured as particle velocity in inches per second and is referenced as vibration decibels (VdB).

Figure 3.10-1: Typical Levels of Groundborne Vibration

Source: FTA, 2006.

3.10.1.4 Existing Noise Conditions

Existing noise sources in the Project area generally include transportation noise (e.g., vehicle traffic, aircrafts, transit), mechanical equipment (e.g., air conditioning, mechanical equipment), and natural sources (e.g., wind, birds, insects).

Identification of Sensitive Receivers

Some land uses are considered more sensitive to ambient noise and groundborne vibration levels than others. People in residences, motels and hotels, schools, libraries, churches, hospitals, nursing homes, auditoriums, natural areas, and parks and outdoor recreation areas are generally more sensitive to noise than are people at commercial and industrial establishments. Consequently, the noise standards for sensitive land uses are more stringent than for those at less sensitive uses. The number and type of noise sensitive uses within the Project area varies depending upon the location and degree of development in the area. Some receivers are located adjacent to the proposed Project sites, while

others are located up to 500 feet away from the proposed sites. Chapter 4 details the type and distance receivers are located from each proposed site. The distance from the Project sites not immediately adjacent to noise-sensitive receivers was measured from property boundary to property boundary and, therefore, represents a conservative distance. The actual distance would likely be greater, as Project-related construction and operational activity and sensitive receivers are generally not located on the actual property boundary. Receivers located adjacent to the proposed sites were assumed to be a minimum of 25 feet from any proposed activity to account for a conservative setback from the property boundary of the Project site activity and the receiver, respectively. Most of the relevant local noise ordinances do not specify a distance at which noise-sensitive receivers should be assessed, but a few do reference 500 feet as the distance for assessing noise-sensitive receivers and potential noise impacts. The highest potential continuous noise levels associated with the Project would occur when emergency diesel generators are needed for periods of more than 24 hours. As discussed in greater detail in Section 3.10.4, these generators typically produce a maximum of 68 dBA at a reference distance of 21 feet, or 58 dBA if housed in a solid enclosure. At approximately 500 feet from the source, these levels would be reduced to approximately 41 dBA (near the lowest ambient noise level at the proposed sites) even if ground absorption or natural/human-made shielding effects are not taken into account; therefore, a distance of 500 feet from the Project sites was used to identify potential noise-sensitive receivers with the impact analyses focusing on the closest receiver(s).

Ambient Noise Levels

Ambient noise levels within the Project area vary depending on the location, degree of development, and general human activity in the area. Due to the numerous noise-sensitive sites in the study area, ambient noise levels were determined based on estimating existing noise exposure as defined in the *Federal Transit Administration Transit Noise and Vibration Impact Assessment* manual (FTA 2006). *Table 5-7 Estimating Existing Noise Exposure for General Noise Assessment* in the manual lists ambient noise levels based on distance to roadways and various population densities (from less than 100 people per square mile to 30,000+ people per square mile) that were developed by USEPA (USEPA 1974). For noise-sensitive sites located near airports, noise contours established for the airport were reviewed and referenced, where applicable. The proposed Project sites are located in areas ranging from rural undeveloped lands (less than 100 people per square mile) to heavily developed urban areas (30,000+ people per square mile). In addition, in heavily developed urban areas where sites are located near moderately traveled roadways, the distance to roadways was used to estimate noise exposure. The ambient noise levels throughout the Project area, based on FTA guidance described above, are estimated to range between 45 dBA and 65 dBA.

3.10.2 Regulatory Setting

3.10.2.1 *Federal Regulatory Setting*

In 1974, the USEPA published information on negative effects of noise and identified indoor and outdoor noise limits that protect public health and welfare. This document provides information for state and local governments to use in developing their own noise standards. USEPA has indicated that

average acceptable day-night sound pressure levels fall in a range between 50 dBA in quiet suburban areas and 70 dBA in very noisy urban areas and has identified an L_{dn} of 55 dB on the A-weighted scale (dBA) would protect the public from outdoor activity interference. The Federal Transit Administration (FTA) *Transit Noise and Vibration Impact Assessment* guidelines for a general noise assessment indicate 90 dBA during daytime hours (7 a.m. to 10 p.m.) and 80 dBA during nighttime hours (10 p.m. to 7 a.m.) are thresholds where adverse community reaction could occur for construction activities on a temporary basis (FHA 2006). Although the FTA guidelines do not constitute regulatory requirements, these impact thresholds are referenced in this analysis to determine the potential significance of project construction noise impacts except in proposed locations where local ordinances apply.

3.10.2.2 State Regulatory Setting

The State of California has adopted noise standards in areas of regulation not preempted by the federal government. State standards regulate noise levels of motor vehicles, sound transmission through buildings, occupational noise control, and noise insulation. Title 24 of the California Code of Regulations (CCR), also known as the California Buildings Standards Code, establishes building standards applicable to all occupancies throughout the state. The CCR provides acoustical regulations for both exterior-to-interior sound insulation, as well as sound and impact isolation between adjacent spaces of various occupied units. Title 24 regulations generally state that interior noise levels generated by exterior noise sources shall not exceed 45 dBA Ldn/CNEL, with windows closed, in any habitable room for general residential uses.

Section 65302(f) of the California Government Code establishes the requirement that local land use planning jurisdictions prepare a General Plan. The Noise Element is a mandatory component of the General Plan. It includes general community noise guidelines developed by the California Department of Health Services and specific planning guidelines for noise/land use compatibility developed by the local jurisdiction. The State of California General Plan Guidelines (2003) lists the following guidelines for CNELs, originally developed by the California Department of Health Services, that are acceptable for use by local agencies:

- CNEL below 60 dBA: normally acceptable for low-density residential use
- CNEL of 55 to 70 dBA: conditionally acceptable for low-density residential use
 - CNEL below 65 dBA: normally acceptable for high-density residential use
 - CNEL of 60 to 70 dBA: conditionally acceptable for high-density residential, transient lodging, churches, educational and medical facilities
- CNEL below 70 dBA: normally acceptable for commercial uses
- CNEL below 77 dBA: conditionally acceptable for commercial uses
- CNEL below 75 dBA: normally acceptable industrial uses

- CNEL below 80 dBA: conditionally acceptable for industrial uses

“Normally acceptable” is defined as satisfactory for the specified land use, assuming that normal conventional construction is used in buildings. “Conditionally acceptable” may require some additional noise attenuation or special study. “Normally unacceptable” levels begin where the conditionally acceptable ranges end. The 60-dBA “normally acceptable” threshold listed above was used to establish a significance threshold for operational noise at the closest noise-sensitive receivers located within a 500-foot radius of Project sites.

3.10.2.3 Local Regulatory Setting

Local Jurisdictions

There are no federal or state standards for short-term noise exposure. Therefore, thresholds for construction noise are based upon local ordinances where they apply.

Project sites are proposed within portions of Los Angeles and San Bernardino counties and within the jurisdiction of 16 cities within these counties. Local noise regulations are summarized in Table 3.10-2. Some local ordinances have established a noise level threshold for construction activities. A vibration level threshold for construction activities has been established within unincorporated areas of Los Angeles County but not for any of the affected cities. All local ordinances either exempt noise and vibration from construction activities at all times or within specified hours of the day and/or night.

Table 3.10-2: Summary of Local Regulations

Site ID(Name)	Jurisdiction		Noise Ordinance	Noise Level Threshold	Noise Restrictions	Vibration Restrictions
	City	County				
AGH(Agoura Hills)	Agoura Hills	Los Angeles	City of Agoura Hills; Article IX - Zoning; Chapter 6 - Regulatory Provisions, Part 2 - Special Regulations; Division 6 - Noise Regulations	none specified	Work must not occur between 8:00 p.m. and 7:00 a.m. on weekdays, including Saturday, or at any time on Sunday or a legal holiday.	See noise restrictions
ASD (Auto Square Drive)	Cerritos	Los Angeles	Cerritos Municipal Code, Chapter 22.80 - Environmental Performance Standards, Section 480 - Noise	No noise shall be generated which causes the maximum sound level (noise level) at any point on property lines surrounding the premises on which noise is produced to exceed the background (ambient noise) including traffic noise by 5 dBA measured at the same point, or 50 dBA, whichever is greater in residential areas.	Exemptions. The provisions for noise limits shall not be applied to occasional use of equipment for maintenance of any lot or buildings or for building construction, for which a valid building permit has been issued, between the hour of 7 a.m. and 7 p.m. or for any public works activities or civic event which are authorized by the city.	No vibration (other than from transportation facilities or temporary construction work) shall be permitted which is discernible without instruments at the points of measurement specified in Section 22.80.210 . Airport Land Use Commissions

The Los Angeles County Airport Land Use Plan (ALUP) was adopted on December 19, 1991, and revised on December 1, 2004. Land Use Plans have also been completed for Cable Airport (adopted December 9, 1981) and General William J. Fox Airfield (adopted December 1, 2004). A land use plan was developed and approved for the Brackett Field Airport on December 9, 2015. No other approved airport land use plans are in the project area, although Los Angeles County has developed Airport Influence Area maps for other airports to show ALUP noise contours. Table 3.10-3 summarizes the proposed sites that are located within the airport influence areas or within 2.0 miles of these areas. Table 3.10-4 summarizes the Project sites within the vicinity of private airstrips.

Table 3.10-3: Project Sites Within or in the Vicinity of Airport Influence Areas

3.10.3 Significance Criteria

The proposed Project would result in significant impacts from noise if any of the following significance criteria, based on Appendix G of the CEQA Guidelines, are met:

- 1) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance or applicable standards of other agencies
- 2) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels
- 3) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project
- 4) For a project located within an airport land use plan, or where such a plan has not been adopted, within 2 miles of a public airport or public use airport, exposure of people residing or working in the project area to excessive noise levels
- 5) For a project within the vicinity of a private airstrip, exposure of people residing or working in the project area to excessive noise levels

Based on the IS prepared for the LMR Project (Appendix A), it was determined that because operation of the Project would not include any activities or equipment usage that would result in a permanent increase in noise levels in the vicinity of a proposed Project site, no further analysis of whether the Project would result in a substantial permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project is warranted within this EIR.

3.10.4 Impact Analysis

3.10.4.1 ***Proposed Project***

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations. Additionally, in the following analysis, the EIR examines whether the proposed Project would result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or standards of other agencies, regardless of their applicability.

Construction Impacts

Construction of the proposed Project sites would generate noise from construction equipment usage, vehicle trips from construction workers, and supply trucks traveling to and from each proposed Project

site. Table 3.10-5 provides a summary of the construction phases and potential equipment that would be used under a maximum construction scenario. Additional detail on construction activities and methods is presented in Section 2.1.2.6.

Table 3.10-5: Summary of Construction Activities

Equipment Type	Specification (BHP)	No. Per Site	Hours Per Day	Trips To/ From Site	Days on Site ¹	Usage

Equipment Type	Specification (BHP)	No. Per Site	Hours Per Day	Trips To/ From Site	Days on Site ¹	Usage
<i>Assessment, Los Angeles Regional Interoperable Communications System (LA-RICS) Project (NTIA 2014).</i>						

Noise levels would vary depending on the type of equipment used, how and when it operates, and how well it is maintained. Demolition activities are anticipated to generate the loudest noise levels during construction. Therefore, predicted noise levels at each site were based on construction equipment that would be used during the demolition phase, which would include repeated use of a concrete saw and dump truck throughout a proposed 8-hour work day, use of a mini excavator for half of the proposed work day, and sporadic use of a water truck for about an hour as needed. The FHWA Roadway Construction Noise Model (RCNM), which estimates noise from various types of construction equipment, was used to assess potential short-term construction impacts at each site where noise sensitive receivers were identified.

Built into the model are estimates of equipment usage factors that reflect industry data for different pieces of equipment. For example, a concrete saw is typically 'in use' approximately 20-percent of the time when it is involved in a construction phase such as demolition (FHWA 2006). Appendix B summarizes the methods and assumptions used for this analysis. In estimating noise exposures from construction equipment, it was assumed that attenuation would occur as a result of geometric spreading and ground surface absorption. The geometric spreading of sound from a localized source (i.e., a point source) is discussed above. Existing or future noise abatement, such as sound walls, was not included in noise level estimates; and, therefore, the estimates are conservative.

Chapter 4 details estimated construction noise levels at each proposed site. Estimated construction noise levels would range between 68 dBA at proposed Site LEPS, which would be located 300 feet from a multi-family residential dwelling, and 89 dBA at proposed Site ENC1, which would be located 25 feet from scattered residential dwellings. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site; however, in some instances, it may be necessary for construction activities to take place outside these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

Hourly average worst case construction noise levels would be approximately 89 dBA at proposed Project sites where receivers are located within 25 feet and would be similar at other sites at this distance. None of the affected jurisdictions have established a construction noise level threshold. Therefore, construction noise levels at the proposed Project sites would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operational Impacts

During operation at each proposed Project site, the dominant noise source would be from the HVAC system, since this equipment would operate 24 hours a day. In addition, emergency generators would operate monthly and could impact sensitive receivers in close proximity. Both of these impacts are described in further detail below. The methods and assumptions underlying the analysis are summarized below and presented in more detail in Appendix B.

Each proposed Project site would require installation of an HVAC system which would also be enclosed in a shelter. According to the Air Conditioning, Heating, and Refrigeration Institute (AHRI) standard 270, the typical noise ratings for refrigeration units with 1.5-ton capacity range between 63 dBA and 67 dBA (AHRI 1997). To provide a conservative analysis, this analysis assumed that the noise emissions from the shelters would be 67 dBA and that the air conditioning units would be on the ground approximately 10 feet from a reflective surface. Based on the calculation methodology detailed in AHRI standard 275, which can be used to estimate the propagation of A-weighted noise from outdoor HVAC equipment based on the unit's proximity to reflective surfaces, position on or above the ground, and the pathway to noise sensitive (receiver) locations (AHRI 2011), the noise exposure from the HVAC systems would be 52 dBA at 10 feet. This analysis assumed the air conditioners would operate 24 hours a day; and, therefore, data were calculated as community noise equivalent level (CNEL). The basic conversion from L_{eq} to CNEL assumes a 5-dBA penalty and 10-dBA penalty added during evening hours (7:00 p.m. to 10:00 p.m.) and nighttime hours (10:00 p.m. to 7:00 a.m.), respectively. Based on this calculation, the CNEL at 10 feet and 20 feet would be 59 dBA and 53 dBA, respectively. Noise from HVAC systems would not violate any thresholds established in local ordinances. In addition, noise levels would be below a 60-dBA CNEL threshold and would be considered "normally acceptable" for outdoor residential exposure established by the California Department of Health Services (see Section 3.10.2.2).

Emergency diesel generators (35 kW to 100 kW) would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators at the proposed sites would be housed by solid walls,

which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet, which is below the 60-dBA CNEL “normally acceptable” threshold for outdoor residential exposure.

Impacts from operation of the Project would be less than significant.

Mitigation Measures

No mitigation measures are required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impacts

Groundborne vibration and groundborne noise levels are generally caused by impact devices such as pile driving; use of these devices is not anticipated during construction; however, operation of heavy equipment may generate localized groundborne vibration and noise that could be perceptible to sensitive receivers within close proximity.

Annoyance Assessment

Groundborne vibration noise levels were calculated and compared to FTA general assessment guidelines shown in Table 3.10-6. As described in further detail in Section 2.1.2.6, construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck similar to a loaded truck, and a jackhammer. As shown in the table, vibration levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet.

Table 3.10-6: Vibration Source Levels for Construction Equipment

Equipment		PPV at 25 feet	Approximate Lv* at 25 feet
pile driver (impact)	Upper range	1.518	112
	Typical	0.644	104
pile driver (sonic)	Upper range	0.734	105
	Typical	0.170	93
clam shovel drop (slurry wall)		0.202	94
hydromill (slurry wall)	In soil	0.008	66
	In rock	0.017	75

large bulldozer		0.089	87
caisson drilling		0.089	87
loaded trucks		0.076	86

Table 3.10-6: Vibration Source Levels for Construction Equipment

Equipment	PPV at 25 feet	Approximate Lv* at 25 feet
jackhammer	0.035	79
small bulldozer	0.003	58

*RMS velocity in decibels (VdB) re 1 micro-inch/second: PPV – peak particle velocity
Source: FTA, 2006

A majority of the sensitive receivers located within close proximity (25 feet) of the proposed Project sites, which include ENC1, PDC, SDW, SGH, WAD, WS1, and ZHQ, consists of residential development. According to FTA guidance, annoyance from groundborne vibration at residential land uses where people normally sleep is 80 VdB¹⁰ for infrequent events, defined as less than 30 daily events. The potential for annoyance exists from a single round trip by a 30-ton flatbed truck delivering large pieces of equipment such as the crane and reach fork, eight daily round trips by a dump truck hauling waste material from the site, and a single round trip by the concrete truck trip. As shown in the table, these trips have the potential for producing up to 86 VdB, exceeding the FTA annoyance threshold. Annoyance is an indicator of the potential for the proposed Project to result in exposure of persons to or generation of excessive groundborne noise levels; therefore, impacts from construction of the Project could expose sensitive receiver locations to excessive groundborne vibration. Impacts of the proposed Project at these receiver locations would be significant absent mitigation.

Damage Assessment

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels listed in Table 3.10-6 for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is not anticipated at sensitive receiver locations.

As detailed in Table 3.10-2, the ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. The ordinance prohibits construction activities in excess of this threshold. Table 3.10-6 indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV at 25 feet for a jackhammer to 0.089 PPV for a loaded truck such as the 3-ton flatbed. Applying the damage assessment methodology developed by FTA and described in Appendix B-3, the distance beyond which potential vibration from construction of the proposed Project sites

¹⁰ The ground motion caused by vibration is measured as peak particle velocity (PPV) in inches per section and referenced as VdB.

would diminish below the 0.01 PPV vibration threshold for unincorporated Los Angeles County is 97 feet.

Similar estimated construction vibration levels are anticipated at other sites; however, other jurisdictions have not established a vibration level threshold. Therefore, construction vibration levels at the proposed Project sites in unincorporated Los Angeles County would not be higher than other sites but would exceed the established vibration level threshold. For purposes of this analysis, the EIR considers the unincorporated Los Angeles County's vibration level thresholds applicable and, thus, considers impacts in unincorporated Los Angeles to be significant.

Sensitive receivers (scattered residential dwellings) are located within this distance to proposed Project sites ENC1 and LACF072. At Site ENC1, which would be located within 25 feet of the closest residential dwellings, vibration from loaded trucks such as the 3-ton flatbed or dump trucks could be as high as 0.018 PPV depending on the geology, soil type and stiffness¹¹. At Site LACF072, which would be located within 65 feet of the closest residential dwelling, loaded trucks could produce as much as 0.076 PPV; therefore, impacts from construction of the Project could expose these sensitive receiver locations to excessive groundborne vibration; and impacts of the proposed Project would be significant.

Mitigation Measures

At sites ENC1 and LACF072, where construction vibration levels would exceed the unincorporated Los Angeles County vibration ordinance threshold, NOI MM 1 would be required.

NOI MM 1 Prior to commencement of construction at sites ENC1 and LACF072, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction vibration impacts to less than significant levels. Such measures may include but are not limited to the following:

- Route heavily-loaded trucks away from residential streets, if possible, selecting streets with the fewest homes if no other alternatives are available.
- Operate earth moving equipment including excavators/mini excavators and dump trucks as far away from vibration-sensitive locations as possible.
- Phase demolition and earth-moving operations so as not to occur simultaneously. Total vibration could be significantly less when each vibration event occurs separately.

Significance after Mitigation

Impacts would be less than significant with mitigation incorporated.

¹¹ Factors that can affect the efficiency of vibration propagation include geologic features, soil type and soil stiffness. Stiff clayey soils have been associated with efficient transfer of vibration energy. Shallow bedrock below 30 feet has also shown to exhibit high vibration efficiency.

Operational Impacts

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration-reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. Therefore, operational groundborne vibration or noise would be less than significant during operation of each Project site.

Mitigation Measures

No mitigation measures are required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impacts

Although construction activities associated with the proposed Project sites would generate increases in noise levels, these increases would be temporary and of short duration. As discussed above, the FTA guidelines for a general noise assessment indicate 90 dBA during daytime hours (7 a.m. to 10 p.m.) and 80 dBA during nighttime hours (10 p.m. to 7 a.m.) are thresholds where adverse community reaction could occur for construction activities on a temporary basis (FHA 2006). As discussed under Impact NOI-1, the highest noise levels estimated at receivers located within 25 feet of proposed sites would be 89 dBA during the demolition phase of construction. Therefore, noise levels estimated at the proposed sites would not exceed the 90-dBA FTA adverse community reaction guidelines for a temporary increase in construction noise during daytime hours, but would exceed the 80-dBA threshold during nighttime hours. Nighttime operations would constitute a significant impact absent mitigation.

Additionally, for site WS1 in the City of Santa Monica, the City of Santa Monica ordinance sets a maximum 20-dBA temporary increase above acceptable exterior ambient noise levels, which are defined during weekdays as 60 dBA for a 15-minute duration during daytime hours (7 a.m. to 10 p.m.) and 50 dBA for a 15-minute duration during nighttime hours (10 p.m. to 7 a.m.) for construction activities. The ordinance also prohibits construction before 8 a.m. and after 6 p.m. on weekdays, before 9 a.m. and after 5 p.m. on weekends and designated U.S. holidays as shown in Table 3.10-2.

As discussed under Impact NOI-1, the highest noise levels estimated at receivers located within 25 feet of proposed sites would be 89 dBA during the demolition phase of construction. Within the City of Santa Monica, the closest ground-level receiver, a church, is located within 55 feet of the proposed Project Site WS1. A hotel is located within 25 feet of the proposed site; but the nearest sensitive receiver at the hotel is a rooftop pool, which is further away than the church. Temporary, short-duration daytime noise exposure at the church during the demolition construction phase would be 82 dBA, which would be

more than 20 dBA above the allowable short-duration daytime level of 60 dBA. Noise exposure at the church would be more than 20 dBA above the nighttime ambient noise level of 50 dBA established by the City, although weekday construction after 6 p.m. and before 8 a.m. is not permitted. Temporary or periodic increases above ambient noise levels due to construction noise at the proposed Project site in the City of Santa Monica (WS1) would not be greater than at other sites, but would exceed the established noise level threshold. For the purposes of this analysis, the EIR considers noise impacts in the City of Santa Monica significant absent mitigation.

Mitigation Measures

Measure NOI MM 2 would be required at sites ENC1, LACF072, PDC, SDW, SGH, WAD, and ZHQ if nighttime operations were to occur, and at Site WS1 at all times.

NOI MM 2 Prior to commencement of construction, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction noise impacts below the levels specified in the FTA nighttime threshold or applicable ordinance. Such measures may include but are not limited to the following:

- Use noise blankets or other muffling devices on equipment and quiet-use generators at noise-sensitive receivers.
- Use well-maintained equipment and have equipment inspected regularly.
- Operate construction equipment for periods of fewer than 15 consecutive minutes when possible.

Significance after Mitigation

Implementation of NOI MM 2 would reduce noise impacts at all sites below threshold levels and impacts would be reduced to less than significant.

Operational Impacts

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the analysis makes reference to the FTA guidelines for temporary increases above ambient noise levels.

During operation of the proposed Project sites, emergency diesel generators with a 35-kilowatt (kW) to 100-kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet (APS 2015)¹².

¹² A 'residential quiet' well designed enclosure with air-scoops and foam is rated 64 to 68 dBA – quiet but noticeable at 10-feet / normal conversation at 21-feet. For the average residential application dBA levels in the 64 to 68 range are acceptable to most neighbors and meet most noise level restrictions if any exist.

Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet. All receivers identified for the Project are located beyond 21 feet. There are six Project sites (ENC1, SDW, SGH, SWP, WAD, and ZHQ) where the nearest receivers are located within 25 feet (depending on final layout of the sites) and would be exposed to approximately 56 dBA based on noise reduction through geometric spreading over distance. These six sites would be located in less developed areas with existing low ambient noise levels ranging from 45 dBA to 55 dBA. Adding the operational noise to ambient conditions would not result in noise level increases of 12 dBA over ambient conditions.

Impacts from operation of the Project would be less than significant.

Mitigation Measures

No mitigation measures are required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impacts

One site (SDW) is located within a proposed ALUP for Brackett Field. Ambient conditions near this site are dominated by aircraft noise and are within the 65-dBA CNEL noise contour identified by the ALUP. Site SDW would be located approximately 25 feet from the nearest noise-sensitive receiver. Construction noise at this site would occur during operation of the concrete saw and is estimated to be 89 dBA at this distance. The combined baseline 65 dBA CNEL and the temporary, short-duration construction noise levels at receiver near Site SDW would remain at 89 dBA, which is below the 90-dBA threshold where adverse community reaction could occur but would exceed the 80-dBA nighttime threshold¹³.

Other Project sites within 2.0 miles of a public airport area of influence are outside the 65-CNEL noise contours. Estimated construction noise levels for all other proposed Project sites would be below the 90-dBA FTA threshold where adverse community reaction could occur during daytime hours but would exceed the 80-dBA nighttime threshold. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, none of the proposed Project locations are located in a jurisdiction with a noise ordinance that is applicable to the Authority.

Chapter 4 details estimated construction noise levels at each proposed site. The additional noise associated with temporary construction of a Project site, combined with aircraft-related noise, would not be expected to expose people residing or working in the Project area to excessive noise levels.

Impacts from construction of the Project would be less than significant.

¹³ Under the rules of decibel addition, two noise sources separate by 10 decibels or greater sum to the higher of the two levels as detailed in the FHWA guidance document Highway Traffic Noise: Analysis and Abatement (FHWA 2011).

Mitigation Measures

No mitigation measures are required.

Operational Impacts

After construction, all sites will be unmanned during operation except for occasional maintenance, which would include landscaping maintenance, routine site inspections, and occasional equipment repairs. Noise from maintenance activities, which includes an estimated 58 dBA at 21 feet during the monthly backup generator during testing, would not be substantially different from existing levels except for new sites in rural locations, where ambient noise levels would be closer to 45 dBA, and would generally occur less than once per week during daytime hours between 8:00 a.m. and 6:00 p.m. on any day and 9:00 a.m. to 6:00 p.m. on Sundays, consistent with the Los Angeles County noise ordinance. Operation of the Project, including the HVAC system and emergency generator, would result in noise emissions below 60 dBA and would be considered “normally acceptable” for outdoor residential exposure. Therefore, operation of the Project would not expose people residing or working in the project area to excessive noise levels.

Impacts from operation of the Project would be less than significant.

Mitigation Measures

No mitigation measures are required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Seven proposed Project sites are within the vicinity (up to 2.0 miles) of private airstrips, with one site near a seaplane base, and the others near heliports (see Table 3.10-4). One proposed site (PASPD01) is located within 0.25 to 0.5 mile from the private airstrips and within urban areas. This site is located well outside the airstrips, where most noise is generated. A noise impact contour based on local CNEL guidelines, if they exist, would be located closer to private airstrips due to lower volume traffic (takeoffs and landings) compared to larger, busier airports.

Construction Impacts

Conservatively assuming a 65 dBA CNEL at the proposed Project site located 0.25 mile from private airstrips, this combined baseline noise level in combination with the estimated construction noise levels for all proposed Project sites would be below the 90-dBA threshold where adverse community reaction could occur. Chapter 4 details estimated construction noise levels at each proposed Project site. Therefore, construction of these sites would not expose people, workers, or residents to excessive noise levels. Impacts from construction of the Project would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operational Impacts

After construction, all seven sites within the vicinity (up to 2.0 miles) of private airstrips will be unmanned during operation except for occasional maintenance, which would include landscaping maintenance, routine site inspections, and occasional equipment repairs. Conservatively assuming a 65 dBA CNEL at proposed Project sites located 0.25 mile from private airstrips, operation of the Project, including the HVAC systems and emergency generators, would result in noise emissions below 60 dBA and would be considered “normally acceptable” for outdoor residential exposure. Therefore, operation of the Project would not expose people residing or working in the Project area to excessive noise levels.

Impacts from operation of the Project would be less than significant.

Mitigation Measures

No mitigation measures are required.

3.10.4.2 No Project Alternative

Under the No Project Alternative, none of the Project sites would be constructed. Therefore, no noise exposure or impacts would occur from construction equipment, worker commuting vehicles, or material transport trucks. Existing communication sites would continue to operate and be inspected, maintained, and repaired; noise levels associated with operations and maintenance would not change.

3.10.5 Cumulative Impacts

3.10.5.1 Geographic Extent

As discussed in Section 3.10.4, Impact Analysis, construction-related noise from the demolition phase would diminish from a maximum of 89 dBA at receivers located closest (25 feet) to a proposed Project site to ambient (55 dBA) levels within about 725 feet over a soft ground surface and within about 1,425 feet over a hard ground surface. Operational noise from the proposed Project would dissipate to ambient levels within less than 20 feet of the proposed site boundaries. Vibration from construction and operation of the proposed Project sites would dissipate to acceptable levels (80 VdB or 0.12 PPV) within 100 feet. To assess the potential cumulative noise and vibration impacts with past, present, and reasonably foreseeable future projects, projects within 1,500 feet of the perimeter of Project site boundaries were considered.

Based on a review of Table 2.7-1, sites ENT, LEPS, MML, MTL2, PASPD01, PDC, PHN, PWT, RIH, SGH, SIM, SUN, SUN2, WS1, and ZHQ would be constructed within 1,500 feet of other projects. The remaining proposed Project sites have no other projects within 1,500 feet; therefore, there would be no potential for cumulative effects at those proposed locations.

3.10.5.2 Existing Cumulative Conditions

Ambient Levels. Cumulative noise and vibration levels within the counties of Los Angeles and San Bernardino and throughout the incorporated cities include and will continue to include an expanded number of sources of man-made noise and vibration, mainly due to increased roadway traffic, air traffic,

and other human activity including construction projects and an expanded geographic area of impact as urbanization spreads and population grows. Past, present, and reasonably foreseeable future projects listed in Table 2.7-1 would add to the future expected noise levels throughout the study area; however, varying noise and vibration levels would continue to occur depending on the proximity to human activity. Rural communities or unpopulated lands will continue to have the lowest noise and vibration levels.

Sensitive Receivers. Cumulative conditions will introduce new residences or other sensitive receivers to areas near the proposed Project. Past, present, and reasonably foreseeable future projects listed in Table 2.7-1 would bring an increased number of noise sensitive uses to the area. The significance criteria identified in Section 3.10.4 are used to characterize the cumulative impacts.

Construction vs. Operational Impact Assessment. The analysis of the cumulative impact of proposed Project sites on other past, present, and reasonably foreseeable future projects addresses the cumulative effect of construction noise and vibration and operational noise and vibration separately, as each type of noise and its potential impact on sensitive receivers is regulated and evaluated differently in the Project impact assessment.

3.10.5.3 Cumulative Impact Analysis

Construction of other projects listed in Table 2.7-1 would involve construction activities that could occur concurrently with one or more of the proposed Project sites. Because of variability in project timelines, many of the projects would not likely contribute to overlapping impacts in the cumulative scenario; however, it is possible that a variety of projects could occur at the same time as construction of the proposed Project sites. For instance, the construction of the 7,633 single-family unit residential subdivision on Old Topanga Canyon Road within 1,500 feet of Site ENT would increase the likelihood of concurrent construction activities. Other large projects, including the renovation of the 48,000 square-foot Julia Morgan Building and addition of a new hotel within 1,500 feet of Site PASPD01 and the development of a 391-acre mixed-use site at University City Plaza within 1,500 feet of Site SIM, would also have an increased likelihood of concurrent construction. Still other projects, such as the new signage and storefront color change project at 64 E. Colorado Boulevard in Pasadena near Site PASPD01, would not involve similar construction activities; and project overlap would not be an issue. Construction from past projects such as the LTE sites listed in Table 2.7-1, however, would not occur simultaneously with the proposed Project sites and have not been evaluated further.

Conversely, operation of the proposed Project sites would overlap with all past, present, and reasonably foreseeable future projects.

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

There are no federal or state standards for short-term noise exposure, and none of the affected jurisdictions have established a construction noise level threshold. Therefore, construction noise levels at the proposed Project sites would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant. In the areas where Project construction may occur simultaneously with other present and reasonably foreseeable development, the combined effects of noise generated by the Project and other development could adversely impact noise-sensitive receivers cumulatively. Projects listed in Table 2.7-1 involving the construction of new housing units would introduce new noise-sensitive receivers within 1,500 feet of proposed Project sites ENT, LEPS, SIM, and WS1. The combined effect of construction noise from a proposed Project site and from other projects listed in Table 27-1 could increase noise levels experienced by sensitive receivers depending on the difference between the individual construction noise levels from each project. The FHWA guidance document *Highway Traffic Noise: Analysis and Abatement* (FHWA 2011) explains the rules of decibel addition used to determine a combined noise level from multiple sources.

A difference of 0 to 1 dBA between construction noise sources would increase noise levels perceived by sensitive receivers by 3 dBA and a difference of 4 to 9 dBA between construction noise sources would increase noise levels perceived by sensitive receivers by 1 dBA. A greater than 10-dBA difference between construction noise sources would be equivalent to sensitive noise receivers perceiving construction noise from the louder source only. However, because none of the affected jurisdictions have established a construction noise level threshold, noise levels at the proposed Project sites in combination with noise from other projects simultaneously under construction would not generate noise in excess of standards established in a local general plan or noise ordinance. There would be no significant cumulative impacts from the Project.

The analysis of operational noise from the proposed Project sites determined that the only continuous source of operational noise, HVAC systems for equipment shelters, would remain below the FTA 60 dBA CNEL considered “normally acceptable” for outdoor residential exposure. Although the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity, the HVAC noise would also not exceed any of the non-construction thresholds established by affected jurisdictions, including unincorporated Los Angeles County and the City of Santa Monica. As shown in the impact assessment (Section 3.10.4.1, NOI-1), noise from HVAC operation for the proposed sites would be 52 dBA at 10 feet, or 44 dBA at the minimum site boundary distance of 25 feet, which is equivalent to ambient levels in sparsely developed areas and below non-construction limits established by these jurisdictions.

Operational noise from past, present, and reasonably foreseeable future projects would be limited under thresholds established by local ordinances. The other projects located within 1,500 feet of the proposed Project sites would likely include similar sources of operational noise, namely HVAC systems for residential units that would dissipate at the property line to ambient levels and would comply with local noise ordinance thresholds and “normally acceptable” exposure levels for sensitive receivers. It is

possible that some of the projects listed in Table 2.7-1 could include sources of operational noise distinct and possibly higher than operational noise associated with the proposed Project sites.

The Tehachapi Renewable Transmission project would be located within 1,500 feet of proposed Project Site RIH and would need to comply with 60-dBA weekday daytime and 50-dBA weekday nighttime thresholds established by unincorporated Los Angeles County; therefore, it can be assumed that the maximum difference between this operational source of noise and Site RIH operational noise (44 dBA) would be 16 dBA during daytime hours and 6 dBA during nighttime hours. The cumulative effect of noise from Site RIH and this project could expose sensitive receivers to a cumulative increase that is 1 dBA in excess of (nighttime) standards established in a local general plan or noise ordinance. However, the contribution of the Project site operational noise, which is equivalent to ambient conditions, would not be significant, and the other project would need to apply for a variance for nighttime construction; therefore, no significant cumulative impact would occur.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Sensitive receivers within 25 feet of sites PDC, SDW, SGH, WAD, WS1, and ZHQ, would be exposed to noise from groundborne vibration exceeding the FTA annoyance threshold; therefore, impacts from construction of the Project could expose sensitive receiver locations to excessive groundborne noise levels. NOI MM 1 would be required to reduce Project impacts during construction to less than significant levels. Construction of other projects listed in Table 2.7-1, especially the larger housing and development projects, could occur concurrently causing a cumulative increase in groundborne noise in excess of the FTA threshold and a significant cumulative impact; however, the contribution of the proposed Project with these sites would not be cumulatively considerable. Groundborne noise from construction of past projects such as the LTE sites listed in Table 2.7-1 would not occur simultaneously with the proposed Project sites and have not been evaluated further.

An analysis based on FTA vibration damage criteria determined that no impacts would occur at sensitive receiver locations as close as 25 feet from the construction of these proposed Project site boundaries. Other projects would not be constructed as close to the same susceptible structures and the residential/commercial development projects listed in Table 2.7-1. For example, the new mixed-use office/retail/residential project near proposed Site WS1 would add newer buildings (receivers) with higher vibration damage thresholds in the vicinity of proposed Project sites. Although a cumulative effect on groundborne vibration could result, the contribution of Project site construction would not be significant; therefore, no significant cumulative impact would occur.

Two proposed Project sites, ENC1 and LACF072, would be located within the jurisdiction of unincorporated Los Angeles County, which has established a perceivable motion threshold for construction vibration. NOI MM 1 would be required to reduce Project impacts during construction to less than significant levels; however, none of the projects listed in Table 2.7-1 are located within 1,500

feet of these two sites. No cumulatively considerable effects from construction vibration would occur at these sites.

The proposed Project sites would install newly manufactured portable generators equipped with rubber mounts or other vibration-reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Therefore, groundborne vibration or noise would be less than significant during operation. Other projects listed in Table 2.7-1, such as the listed commercial/residential development projects, would either not have an operational source of groundborne vibration or noise or would likely use generators and other motorized equipment fitted with similar dampening modifications. No cumulative impacts from operational sources of groundborne vibration or noise would occur at these sites.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Noise levels estimated at proposed Sites ENC1, PDC, SDW, SGH, WAD, and ZHQ would exceed the 80-dBA FTA adverse community reaction guidelines for a temporary increase in construction noise during nighttime hours. This is a significant impact absent mitigation; however, NOI MM 2 would reduce Project impacts during construction to less than significant levels. Temporary or periodic increases in ambient noise levels from the concurrent construction of other projects listed in Table 2.7-1, such as the small residential improvement projects on Ocean View Drive and Avis Court near Site SGH, are unlikely to be cumulatively significant. Conversely, other projects such as the Mirador Apartment Complex near Site PASPD01 or construction/demolition of the ATF equestrian facilities, could produce similar vibration levels but sensitive receivers near the Project site closest to these other projects, PWT, are at much greater distances to Site PWT and would not to exceed the FTA threshold. In combination, a cumulative increase in temporary noise levels could occur; however, there would be no significant cumulative impact and the contribution of the proposed Project would not be cumulatively considerable.

Within the City of Santa Monica, temporary increases in noise from the construction of Site WS1 would be substantial and, therefore, significant. After implementation of NOI MM 2, impacts of the proposed Project would be less than significant. Temporary or periodic increases in ambient noise levels from the construction of other projects within 1,500 feet of WS1, which includes the Miramar Hotel mixed-use project located 177 feet away, would need to comply with the City ordinance limiting a temporary or periodic increase above ambient levels at the property boundary. In combination, a cumulative increase in temporary noise levels at sensitive receivers would not occur with the implementation of construction noise mitigation measures at WS1. The contribution of the proposed Project Site WS1 would not be cumulatively considerable.

The temporary and periodic contribution to ambient noise levels from monthly backup generator testing would not result in noise level increases above the 12-dBA Caltrans threshold applied to the assessment of Project sites. Impacts from operation of the Project would be less than significant. None of the affected jurisdictions have established thresholds for increases above ambient levels from facility

operation, and there are no federal or state standards for short-term noise exposure. Lacking a threshold or ordinance, it is possible that other projects listed in Table 2.7-1 could be potential sources of temporary or periodic increases in noise levels above ambient levels; however, the types of projects located within 1,500 feet of proposed Project sites are primarily residential and commercial retail developments. Projects such as the 20-story commercial structure on Melrose Avenue that would be located within 823 feet of Site PDC would not be expected to be sources of temporary or periodic noise that could substantially increase noise levels above the ambient level. Industrial projects including the Sunshine Canyon Landfill 69-kV subtransmission line segment relocation, which would be immediately adjacent to Project Site OAT, may incorporate HVAC and generator equipment; but the Project analysis indicates these are not a potential source of significant temporary or periodic noise that would significantly affect ambient noise levels; therefore, no significant cumulative impact from proposed Project site operational noise sources and other project operational noise sources would occur.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Only one proposed Project site, WS1, would be located within 2 miles of a public airport, Santa Monica Municipal, and would also have other past, present, and foreseeable future projects located within 1,500 feet. This site would be located outside the 70-dBA CNEL contour established by the Los Angeles County ALUP; therefore, construction workers would not be exposed to excessive noise levels from the airport. People residing near the site would also not be exposed to noise levels that would exceed any local general plan or noise ordinance or applicable standards of other agencies as a result of Project construction. Similarly, operation of the proposed Project would not expose maintenance personnel to excessive noise from the airport or residents to excessive operational noise levels. Other planned, present, and foreseeable future projects would also be located outside the airport's 70-dBA CNEL contour and would not create a cumulative exposure for workers or residents near Site WS1 to excessive noise levels; therefore, no significant cumulative impacts would occur.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Only one proposed Project site, PASPD01, would be located within 2 miles of private airstrips, Huntington Memorial Hospital Heliport/Mesa Heliport/Super Bowl Heliport, and would also have other past, present, and foreseeable future projects located within 1,500 feet. Noise generated by helicopter use of heliports is primarily concentrated at the takeoff/landing pad, especially for an elevated pad such as the Huntington Memorial Hospital Heliport. Therefore, construction workers would not be exposed to excessive noise levels from the heliports. People residing near the site would also not be exposed to noise levels that would exceed any local general plan or noise ordinance or applicable standards of other agencies as a result of Project construction. Similarly, operation of the proposed Project would not expose maintenance personnel to excessive noise from the heliports or residents to excessive operational noise levels. Other planned, present, and foreseeable future projects would also be located

outside the heliport noise contour and would not create a cumulative exposure for workers or residents near PASPD01 to excessive noise levels; therefore, no significant cumulative impacts would occur.

3.11 Recreation

This section identifies the proposed Project sites that coincide with lands that may be designated or managed for recreation purposes and the potential impacts the Project sites would have on the recreation uses associated with facilities designated for recreational use.

3.11.1 Environmental Setting

Proposed Project sites are located in varying settings, some of which are adjacent to recreational areas. Potentially affected recreation areas include:

- Wilderness or other recreational features within the Angeles National Forest and San Gabriel Mountains National Monument
- Recreational trails and trailhead facilities such as parking areas or kiosks
- Designated recreational facilities on federal, state, county, or city land within the vicinity of the proposed Project sites, including public parks, lakes and streams, boating areas, campgrounds, playgrounds, shooting ranges, etc.
- Open space preserves, which are often used for recreational purposes

Table 3.11-1 identifies the proposed Project sites located on lands or facilities that may be used or managed for recreation. Not all of these recreation and open space areas are necessarily used for recreation in the vicinity of a given proposed Project site. The site list in Table 3.11-1 accounts for potential direct physical impacts to lands identified as a park, recreation area, open space, or recreational trail regardless of immediate use within the identified recreational or open space lands. Sites not on recreational land or on an established public trail are not listed.

Table 3.11-1: Proposed Project Sites on Land Designated for Potential Recreational Use

Site ID	Site Name	Recreation Area	Type of Recreational Use/Facility in the Recreation Area and Current Use
BJM	Black Jack Peak	Santa Catalina Island Open Space Easement	Open space available for recreational use, including being approximately 0.25 mile from Blackjack Campground. The proposed site itself, however, is already developed as a communications site.
DPK	Dakin Peak	Santa Catalina Island Open Space Easement	Open space available for recreational use, including being approximately 0.25 mile from Blackjack Campground. The proposed site itself, however, is already developed as a communications site.
GRM	Green Mountain	Topanga State Park within Santa Monica Mountain National Recreation Area	Opportunities vary by location but may include camping, rock climbing, biking, horseback riding, swimming, etc. Topanga State Park includes

Table 3.11-1: Proposed Project Sites on Land Designated for Potential Recreational Use

Site ID	Site Name	Recreation Area	Type of Recreational Use/Facility in the Recreation Area and Current Use
			numerous hiking trails. The proposed site itself, however, is already developed as a communications site.
H-17A	H-17A	Hellman Park	Opportunities include hiking and horseback riding
LACFCP08	Camp 8	National Park Service land within Santa Monica Mountain National Recreation Area	Opportunities vary by location but may include camping, rock climbing, biking, horseback riding, swimming, etc. The proposed site itself, however, is partially developed and is adjacent to a highly developed property.
LACFCP11	County CP 11	Angeles National Forest, Santa Clara River Trail	Multi-use land that may include recreational use, including being within 0.25 mile of Santa Clara River Trail. The proposed site itself, however, is partially developed and is adjacent to a highly developed property.
PHN	Puente Hills	Schabarum Extension Trail	Developed trail, including existing communications site, trail coincides with portions of the access road
PWT	Portshead Tank	National Park Service land within Santa Monica Mountain National Recreation Area	Opportunities vary by location but may include camping, rock climbing, biking, horseback riding, swimming, etc. The site itself, however, includes a storage tank, and most of the site has been previously disturbed.
RIH	Rio Hondo	Schabarum-Skyline Trail	Developed trail, including existing communications site; trail coincides with portions of the access road
TWR	Tower Peak	Santa Catalina Island Open Space Easement	Open space. The proposed site itself, however, is already developed as a communications site.
VPK	VPK	Henderson Canyon Open Space	Hiking, dog walking, horseback riding, cycling. The proposed site itself, however, is already developed as a communications site.
WAD	Walker Drive	Los Angeles City Water Resources Parkland	Open space and parkland Including Beverly Hills City Parkland within 0.1 mile of the site. The proposed site itself, however, is developed, including a storage tank and monopole.
ZHQ	Zuma Life Guard HQ	Zuma Beach County Park	Swimming, surfing, fishing, beach-going; horseback riding available within 0.25 mile at Malibu Equestrian Park. The site itself, however, is completely developed with buildings and a parking area.

3.11.2 Regulatory Setting

Numerous laws and regulations exist to protect the ability of the public to enjoy natural and developed lands for recreational pursuits. For example, the Clean Air Act and Clean Water Act support protection of air quality and water resources, respectively, which contribute to the outdoor recreation users' experience. A few key regulations provide a certain emphasis on the designation, preservation, and/or protection of land for the purpose of recreation and are highlighted in this section. While these laws and regulations do not have permit requirements, they provide an understanding of the importance of preserving open space for recreational purposes as well as the protection of sensitive natural resources.

3.11.2.1 Federal Regulatory Setting

U.S. Forest Service

Multiple Use, Sustained Yield Act of 1960

The Multiple Use Sustained Yield Act authorizes and directs the Secretary of Agriculture to develop and administer the renewable resources of timber, range, water, recreation, and wildlife on the national forests for multiple use and sustained yield of the products and services. The goals are to manage these resources in the combination that best meets the needs of the American people while maintaining the productivity of the renewable resources in perpetuity.

Department of the Interior and Department of Agriculture

Wilderness Act of 1964

The National Wilderness Preservation System was established to ensure that expanding settlement and growing mechanization would not result in a lack of lands designated for preservation and protection in their natural condition. In the Wilderness Act (P.L. 88-577; 16 U.S.C. 1131-1136), wilderness is defined as "an area where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain." Other characteristics defining a wilderness include:

- An area retaining its primeval character and influence without permanent improvements
- Generally appears to be affected primarily by the forces of nature
- Provides outstanding opportunities for solitude or a primitive and unconfined type of recreation
- May contain ecological, geological, or other features of scientific, educational, scenic, or historical values

3.11.2.2 State Regulatory Setting

Open Space Easement Act of 1974 (California Government Code Section 51070 et seq.)

Cities and counties may accept or purchase easements from private landowners for open space and resource conservation purposes. When the open space easement is acquired pursuant to the Open

Space Easement Act of 1974, the land must remain within an easement in perpetuity or for at least 10 years. A city or county must have an adopted open space plan element as a prerequisite to acquiring an open space easement, and preserving the easement land in open space must be consistent with the local jurisdiction's General Plan (Governor's Office of Planning and Research 1997).

3.11.2.3 Local Regulatory Setting

Los Angeles County

Los Angeles County adopted its 2035 General Plan in October 2015, and it is directly applicable to unincorporated lands not in federal or state jurisdiction within Los Angeles County.

General Plan Provisions for Parks, Recreation, and Open Space

Park and recreational planning in Los Angeles County is largely guided by the 1992 *Parks and Recreation Strategic Plan for 2010* and the 2004 *Strategic Asset Management Plan for 2020*, both prepared by the Department of Parks and Recreation. The County's park system totals nearly 70,000 acres and includes local parks, regional parks, and multi-user trails and access to other recreation facilities such as city parks. Trail use ranges from hiking and walking to mountain biking and horseback riding. The 2035 General Plan notes that the quality of the trail experience is directly proportional to the state of the visual, natural, and educational environment through which the trail passes, and thus adopted the County of Los Angeles Trails Manual to provide County staff with guidelines and standards for trail planning, design, and maintenance (Los Angeles County 2015b).

In addition to local and regional parks and trails, other types of recreation facilities include multi-benefit parks (such as flood control basins that can be used for recreation), school sites, city parks and facilities, private recreational facilities, and greenways.

The Conservation and Natural Resources Element of the 2035 General Plan addresses the importance of open space. Los Angeles County works with various land conservancies to maintain and protect open space land, some of which has been adopted into the County's Significant Ecological Areas (SEAs) Program.

California Quimby Act

The California Quimby Act, which is part of the Subdivision Map Act, applies to residential subdivisions. The act permits the County to require the dedication of land (generally 3 or more acres of parkland per 1,000 subdivision residents) or payment of fees for park and recreation purposes.

San Bernardino County

San Bernardino County Adopted its General Plan in 2007, with the last amendment approved in April 2014. The General Plan is directly applicable to unincorporated lands not within federal or state jurisdiction within San Bernardino County.

General Plan Provisions for Open Space

The Open Space Element of San Bernardino County’s General Plan guides the protection and preservation of open space, recreation, and scenic areas, while accommodating future growth within the county. Goals include providing open space, parks, trails, and recreational amenities; preserving cultural and scenic resources; enhancing the character of scenic routes; and minimizing conflicts between open space and surrounding land uses (San Bernardino County Land Use Services Division 2014).

Nearly 80 percent of San Bernardino County land is held in federal ownership and is administrated by several different federal agencies including the Bureau of Land Management, U.S. Forest Service, and National Park Service. The vicinity of the LMR site with San Bernardino County, however, is not under federal or state land management and is within the “cities” designation of the open space overlay map (San Bernardino County Land Use Services Division 2014).

Affected Cities

General Plans and zoning ordinances for incorporated cities in which a proposed Project site is located on or adjacent to recreation lands or a trail were reviewed for goals, policies, or ordinances that may be applicable to the establishment or operation of LMR facilities in the context of recreation and open space. Table 3.11-2 summarizes those policies and ordinances by community.

Table 3.11-2: Community Policies and Ordinances Applicable to Communication Sites

City/Town	Recreation and Open Space General Plan Policies and Ordinances Potentially Applicable to Communication Sites
Beverly Hills	<ul style="list-style-type: none"> Protect, enhance, and expand open space resources, remaining natural areas, and significant wildlife and vegetation in the City as integral parts of a sustainable environment within a larger regional ecosystem... Encourage new development on hillsides and in canyon areas to preserve natural land formations and native vegetation... (City of Beverly Hills General Plan, Open Space Element, Policy OS-1: Natural and Open Space Protection) Protect parkland from non-recreational uses that result in loss of acreage used for recreational purposes; any loss of park land shall be replaced with acreage suitable for comparable uses so that the City's current park land acreage is not decreased. (City of Beverly Hills General Plan, Open Space Element, Park and Recreational Facilities, Policy OS-8.7: Recreational Parkland Replacement)
Carson	<ul style="list-style-type: none"> Uses permitted in the Open Space Zone or eligible for consideration as a special use: minor and major communications facilities are subject to the requirements of Carson Municipal Code 9138.16. Minor uses are an automatically permitted use provided special limitations and requirements are satisfied as noted in the code and major uses are permitted upon approval of a Conditional Use permit. (City of Carson Municipal Code, Division 1, 9151.1 Uses Permitted; Transportation, Communications,

Table 3.11-2: Community Policies and Ordinances Applicable to Communication Sites

City/Town	Recreation and Open Space General Plan Policies and Ordinances Potentially Applicable to Communication Sites
	Utilities)
Cerritos	<ul style="list-style-type: none"> Ensure that no net loss of open space acreage occurs within the City. (City of Cerritos General Plan, Chapter 8 Open Space/Recreation Element, Maintain Open Space in the City, Policy OSR-5.1)
Glendale	<ul style="list-style-type: none"> All wireless telecommunications facilities and accessory wireless equipment shall comply with... the city's noise regulations as set forth in chapter 8.36 (City of Glendale Municipal Code, Title 30 Zoning Chapter 30.48 Wireless Telecommunications Facilities Permits, Section 30.48.070 Wireless telecommunications facilities development standards, Item A.1) The SR (Special Recreation) zone is intended as a zone for public and private open space and recreational uses and is intended to provide and protect open space, natural physical features, and scenic resources in accordance with the comprehensive general plan of the city. Individual review of all uses and development is provided due to the unique and special characteristics of the variety of recreational uses possible in order to foster compatibility between uses and to protect the public health, safety, and general welfare of the community (City of Glendale Municipal Code, Title 30 Zoning, Chapter 30.15 Special Purpose Districts, Section 30.15.010 Purpose, Item D.) Utility and transmission facilities may be permitted in the special purpose zoning districts (which includes the SR zone) subject to approval of a conditional use permit. (City of Glendale Municipal Code, Title 30 Zoning, Chapter 30.15 Special Purpose Districts, Section 30.15.020 Special purpose district land uses and permit requirements, Item B.) The [Noise] element suggests that the normally acceptable range for playgrounds and neighborhood parks be established at less than 70 decibels (City of Glendale General Plan, Open Space and Conservation Element, Chapter 4 – The Open Space and Conservation Plan, Item f. Noise, page 4-30).
Los Angeles	<ul style="list-style-type: none"> Roof-mounted antennas shall be located at the greatest feasible distance from the edge of the building. Equipment and antennas shall not extend more than 10 feet above the highest point of the rooftop, unless mounted on the walls of a penthouse (City of Los Angeles Planning and Zoning Municipal Code, Chapter I General Provisions and Zoning, Article 2 Specific Planning – Zoning Comprehensive Zoning Plan, Section 12.21 General Provisions, Item A. Use, 20 Wireless Telecommunication Facilities Standards [a][2][ii] Attached or Roof Mounted Antenna Setback). An effort shall be made to locate new [wireless telecommunications facilities] on existing approved structures or sites (City of Los Angeles Planning and Zoning Municipal Code, Chapter I General Provisions and Zoning, Article 2 Specific Planning –

Table 3.11-2: Community Policies and Ordinances Applicable to Communication Sites

City/Town	Recreation and Open Space General Plan Policies and Ordinances Potentially Applicable to Communication Sites
	<p>Zoning Comprehensive Zoning Plan, Section 12.21 General Provisions, Item A. Use, 20 Wireless Telecommunication Facilities Standards [a][3] Locating Antenna at Existing Sites)</p> <ul style="list-style-type: none"> • ...The [wireless telecommunication facilities] shall be designed to have the least possible visual impact on the environment... (City of Los Angeles Planning and Zoning Municipal Code, Chapter I General Provisions and Zoning, Article 2 Specific Planning – Zoning Comprehensive Zoning Plan, Section 12.21 General Provisions, Item A. Use, 20 Wireless Telecommunication Facilities [a][4] Visual Impact) • Ground, roof, and pole mounted antennas shall be screened by fencing, buildings, or parapets that appear to be an integral part of the building or landscaping so that not more than 25 percent of the combined tower structure and antenna height is visible from grade level of adjoining property and adjoining public rights-of-way. (City of Los Angeles Planning and Zoning Municipal Code, Chapter I General Provisions and Zoning, Article 2 Specific Planning – Zoning Comprehensive Zoning Plan, Section 12.21 General Provisions, Item A. Use, 20 Wireless Telecommunication Facilities [a][5][i] Screening) • Where development is allowed in ecologically important areas, the intensity of development should be kept at a minimum consistent with reasonable uses of the land. All measures should be taken to protect these areas including buffering ecologically important areas from conflicting or detrimental uses. (City of Los Angeles General Plan, Open Space Element, Privately Owned Open Space Lands and Desirable Open Space, Policy 4, page 7)
Malibu	<ul style="list-style-type: none"> • The following uses may be permitted subject to obtaining a conditional use permit: A. Wireless telecommunications antennae and facilities (pursuant to Chapter 17.46) provided, that... it is not feasible to locate such... facility on any other non-residentially zoned property (other than recreational vehicle park zoning districts) B. Emergency communication and service facilities (City of Malibu Municipal Code, Title 17 Zoning, Chapter 17.32 OS Public Open Space District, Section 17.32.030 Conditionally permitted uses) • The City shall preserve, protect, and enhance the character and visual quality of natural open space as a scenic resource of great value and importance to the quality of life of residents and to the enhancement of the scenic experience of visitors. (City of Malibu General Plan, Section II Elements of the General Plan, Chapter 2.0 Open Space and Recreation Element, Section 2.5 Goals, Objectives, Policies and Implementation Measures, Item 2.5.1 OS Goal 1: An Abundance of Open Space Contributing to a Rural, Natural Environment Consistent with this Open Space Management Plan, Open Space [OS] Policy 1.1.3)
Rancho Palos Verdes	<ul style="list-style-type: none"> • The installation and/or operation of a commercial antenna shall require the submittal

Table 3.11-2: Community Policies and Ordinances Applicable to Communication Sites

City/Town	Recreation and Open Space General Plan Policies and Ordinances Potentially Applicable to Communication Sites
	<p>and approval of a conditional use permit [to] a. To minimize visual impacts of antenna towers through careful design, siting and vegetation screening; b. To avoid damage to adjacent properties from tower failure through careful design and siting of tower structures; c. To maximize use of an existing transmission or relay tower to minimize the need to construct new towers; d. To ensure that antennas are compatible with adjacent uses. (City of Rancho Palos Verdes Municipal Code, Title 17 – Zoning Chapter 17.76 Miscellaneous Permits and Standards, Section 17.76.020 Antennas, [A] Commercial Antennas, [1] Purpose)</p> <ul style="list-style-type: none"> • The applicant shall demonstrate that the tower can be expected to have the least visual impact on the environment, taking into consideration technical, engineering, economic, and other pertinent factors. Towers clustered on the same site shall be of similar height and design whenever possible. (City of Rancho Palos Verdes Municipal Code, Title 17 – Zoning, Chapter 17.76 Miscellaneous Permits and Standards, Section 17.76.020 Antennas, [A] Commercial Antennas, [5] Visual Impact) • The applicant shall provide a landscape plan to be approved by the director or planning commission. The plan shall note specifications for landscape and screening, including plantings, fences, walls, and other features designed to screen and buffer towers, accessory uses, and stored equipment. Native vegetation shall be preserved to the greatest extent practicable and incorporated into the landscape plan. (City of Rancho Palos Verdes Municipal Code, Title 17 – Zoning, Chapter 17.76 Miscellaneous Permits and Standards, Section 17.76.020 Antennas, [A] Commercial Antennas, [8] Landscaping)

3.11.3 Significance Criteria

The proposed Project would result in significant impact to recreation if the following significance criterion is met:

- 1) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Based on the Initial Study (IS) for the LMR project, it was determined that the project would not include or require construction or expansion of recreation facilities, and no further analysis of that topic is warranted within the LMR EIR.

3.11.4 Impact Analysis

3.11.4.1 Proposed Project

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impacts

Construction of the proposed Project sites would not result in an increased use of parks or other recreational facilities. Of the proposed Project sites on land within a park, recreation area, open space, or trail, all are within previously developed areas, including areas that currently are highly developed or on an existing communication site. Consequently, building and operating a telecommunications site in the proposed location would not convert land that is currently in use for recreational purposes, change the recreational experience, or contribute to closure of the recreational facility or displacement of recreational visitors to other parks. Access to individual recreational facilities would not change as a result of development of proposed Project sites. The construction workforce would be obtained from the local population, so no increase in the general population would put additional demand on the existing recreational facilities. No impacts would occur from construction of the Project.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

All proposed Project sites within a recreation area (as listed in Table 3.11-1) are on previously developed land, and several sites require adding equipment or expanding existing communications facilities. All proposed Project sites within parks, recreation areas, or open space have been previously developed and have existing access. Because access to the proposed Project sites exists and would not change as a result of the Project, actions to further develop the existing sites would not change access to parks, open space, trails, or other recreational facilities in proximity to the proposed Project sites.

No impacts would occur from operation of the Project, as the sites are not expected to change recreational opportunities or the recreational experience compared to existing conditions.

Mitigation Measures

No mitigation measures are required.

3.11.4.2 No Project Alternative

Like the proposed Project, the No Project Alternative would cause no change in the current usage or conditions affecting parks or recreational facilities. No impacts would occur.

3.11.5 Cumulative Impacts

Construction of a communications facility can typically be completed in about six weeks and can be accomplished by local workers. Facilities are unmanned, so operations and maintenance require few employees to maintain large numbers of sites. Consequently, even if more sites were proposed than those addressed by this analysis, the Project would have no effect in the use of local or regional recreational facilities by the work force and their families.

The only other potential impact on recreation is the placement of communications sites on land set aside for recreational purposes. As identified in this analysis, all of the proposed Project sites addressed in this analysis within recreational facilities coincide with previously developed property. Therefore, no change in the amount of land available for recreation use would occur.

Because the proposed Project would have no effect on recreation, there would be no contribution to cumulative effects to recreation.

3.12 Transportation/Traffic

This chapter analyzes the impacts of Project development on the existing and future transportation and circulation system in the vicinity of the Project site. Transportation issues of concern that are addressed include the effects of the proposed Project sites on highways or roadways identified in the Congestion Management Program (CMP) and the installation of towers that might interfere with existing flight path approaches to airports and heliports.

3.12.1 Environmental Setting

3.12.1.1 Highways and Roadways

Los Angeles County has an extensive network of interstate freeways, state highways, regional roadways and local surface streets that provide access throughout the study area. The highway system extends to adjoining counties, including San Bernardino County where one proposed Project site is located. This highway and roadway network is the major means of transportation throughout Los Angeles County and the surrounding region. Interstate highways serve as regional evacuation routes during emergencies. The highway network spans the county in all directions and links critical infrastructure facilities such as the ports of Los Angeles and Long Beach and major airports such as Los Angeles International Airport and Long Beach Airport.

Based on Caltrans traffic count data, the average daily traffic (estimated or actual) on streets nearest to Project sites varies depending on the nearby land uses. The average daily traffic was sorted based on nearby land use observed in aerial photograph images. In residential and residential/commercial mixed use areas, traffic counts range from approximately 3,800 to 9,000 vehicles per day. More urbanized settings, including dense commercial uses and office buildings, range from approximately 10,000 to 37,500 vehicles per day on streets nearest to proposed Project sites. Sites in more remote locations are along routes with generally fewer than 3,000 vehicles per day. The busiest arterial streets and highways near (but generally not adjacent to) proposed Project sites may exceed well over 100,000 vehicles per day. Table 3.12-1 identifies the LMR sites within 2 miles of a highway or roadway identified in the CMP.

3.12.1.2 Airports and Air Traffic

Los Angeles County is home to 15 public airports, 11 private airports, and more than 150 private heliports (Tollfree Airline 2014). Of the 26 airports, 15 are within the Los Angeles County Airport Land Use Commission jurisdiction (LACDRP 2009).

State law requires the creation of Airport Land Use Commissions (ALUCs) to coordinate planning for the areas surrounding public use airports. In Los Angeles County, the Regional Planning Commission has the responsibility for acting as the ALUC and for coordinating the airport planning of public agencies within the County. The ALUC is required to prepare and adopt a Comprehensive Land Use Plan for the airport area of influence to promote and ensure compatibility between each airport and surrounding land uses (Los Angeles County GIS Data Portal 2014).

Table 3.12-1 identifies proposed Project sites within 20,000 feet of the runways and landing/takeoff areas of airports, seaplane bases, or heliports. Distances listed from the nearest runway or landing/takeoff area are approximate. All of the general aviation, public airports in the County have runways that exceed 3,200 feet; however, several of the private airports open to the public have runways of less than 3,200 feet.

3.12.1.3 Mass Transit and Non-Vehicular Transportation

Forms of mass transit surface transportation in Los Angeles County include bus, rail, and ferry service to offshore islands. Buses use the network of highways and roadways. Rail service includes 73 miles of Metro Rail (which is between light rail and heavy rail systems), commuter rail, and intercity train services via Amtrak. In addition to ferry service to Santa Catalina Island, ships and boats travel into and out of the Port of Los Angeles and the Port of Long Beach.

At least 144 miles of bikeways traverse the County, and more than 800 miles of new bikeways are planned to be developed by 2032 (LACDPW 2012).

3.12.2 Regulatory Setting

3.12.2.1 Federal Regulatory Setting

U.S. Department of Transportation

The National Highway Traffic Safety Administration, under the U.S. Department of Transportation, was established by the Highway Safety Act of 1970 to carry out safety programs under the National Traffic and Motor Vehicle Safety Act of 1966 and the Highway Safety Act of 1966. NHTSA is responsible for reducing deaths, injuries, and economic losses resulting from motor vehicle crashes by setting and enforcing vehicle safety performance standards and through grants to state and local governments to enable them to conduct effective local highway safety programs (NHTSA 2014). This includes establishing safety standards for commercial motor vehicles that may be used to transport equipment to proposed Project sites.

The FAA is charged with providing a safe and efficient aerospace system. To accomplish this, FAA’s rulemaking includes airspace as well as ground operations near airports and helipads, such as visibility of air traffic surface control areas. With regard to LMR facilities, the most applicable FAA regulation is Title 14 CFR Part 77, Objects Affecting Navigable Airspace, which requires that the administrator of the FAA must be notified by any person or organization who intends to sponsor construction or alterations exceeding 200 feet above ground level, as well as construction of alternatives in close proximity to an airport that may exceed certain heights (determined by the ratio of height/distance). In addition, FAA Advisory Circular AC 70/7560-1K, *Obstruction Marking and Lighting*, outlines standards for marking and lighting structures that exceed an overall height of 200 feet above ground level, to promote aviation

safety (FAA 2015). According to the advisory circular, a notice to the FAA Administrator is required if the proposed object would be more than 200 feet above ground level at its location or if it would be near a public-use or military airport, heliport, or seaplane base. Objects near an aviation facility are subject to the requirement when within:

- 20,000 feet of an airport or seaplane base with at least one runway exceeding 3,200 feet in length and the object would exceed a horizontal slope of 100:1 (100 feet horizontally for each 1 foot of vertical height) from the nearest point of the nearest runway
- 10,000 feet of an airport or seaplane base having no runway more than 3,200 feet in length and the object would exceed a 50:1 horizontal slope from the nearest point of the nearest runway
- 5,000 feet of a heliport and would exceed a 25:1 horizontal slope from the nearest landing and takeoff area of that heliport

Federal Communications Commission

While the FCC does not regulate transportation, it has the authority to require the painting and/or illumination of antenna towers when it determines that such towers may otherwise constitute a hazard to air navigation. The FCC's rules governing antenna tower lighting and painting requirements are based upon the advisory recommendations of the FAA. Although the FAA's lighting and painting standards are advisory in nature, the FCC's rules make the standards mandatory. The FCC always requires an FAA determination that an antenna tower will not pose an aviation hazard before it will grant permission to build that antenna tower, and it will not approve the construction permit unless the FAA determines that the structure would not be a physical hazard or the hazard has been mitigated by conforming to the FAA's painting and lighting recommendations (FCC 2014a).

3.12.2.2 State Regulatory Setting

California Department of Transportation

Variance Permit

Caltrans manages more than 50,000 miles of California's highway and freeway lanes. In accordance with Division 15 of the California Vehicle Code, Caltrans has the discretionary authority to issue special permits for the movement of vehicles/loads exceeding statutory limitations on the size, weight, and loading of vehicles. An application for a transportation permit is required when the hauled load exceeds 15 feet in width, 17 feet in height, and/or 135 feet in length (Caltrans 2014a). To be eligible for an oversize permit, the operator must demonstrate that the load cannot be reduced down and transported in a legal vehicle.

Encroachment Permit

The California Streets and Highways Code defines encroachment as any tower, pole, pole line, pipe, pipeline, fence, billboard, stand, or building or any structure that is in, under, or over any portion of the State highway rights of way. An encroachment permit must be obtained for all proposed activities that

encroach within, under, or over the State highway rights of way. Work that could require an encroachment permit includes movement or installation of utilities, excavations, vegetation trimming, and surveys (Caltrans 2014b).

California State Aeronautics Act

The purpose of the California State Aeronautic Act (Public Utilities Code [PUC] § 21001 et seq.) “...is to protect the public interest in aeronautics and aeronautical progress.” The Caltrans Division of Aeronautics administers much of this statute. Article 3.5, Airport Land Use Commissions, (PUC §§ 21670 – 21679.5) outlines the statutory requirements for ALUCs including the preparation of an Airport Land Use Compatibility Plan (ALUCP). Airport land use compatibility is the reconciliation of how land development and airports function together so that those uses that can coexist with a nearby airport without either constraining the safe and efficient operation of the airport or exposing people living or working nearby to unacceptable levels of noise or (safety) hazards.

3.12.2.3 Local Regulatory Setting

Los Angeles County Metro

Congestion Management Program

In 1990, the California Legislature enacted the Congestion Management Program (CMP) to implement Proposition 111, a state-wide transportation funding proposal that required local governments to implement mitigation measures to offset the impacts from new development on the regional transportation system. The CMP addresses the impact of local growth on the regional transportation system; the goal is to examine the interactions among land use, transportation, and air quality and to make decisions at the regional and local level in consideration of these interactions. Los Angeles County Metro is the designated agency responsible for implementing the CMP for Los Angeles County (Metro 2014).

When Level-of-Service (LOS) requirements are not maintained on portions of the CMP highway and roadway system, a deficiency plan is required that analyzes the cause of the deficiency and the implementation costs of various alternatives such as roadway modifications, programs, or actions to measurably improve performance. Highways must maintain at least LOS E, which is essentially one grade better than gridlock and is defined by a level of service where traffic flow fluctuates in terms of speed and flow rates, operating speeds average 35 miles per hour, and delays are significant. For arterial streets, LOS E occurs where long queues of vehicles are waiting upstream of an intersection and it may take several signal cycles for a vehicle to clear the intersection. A jurisdiction failing to comply with the CMP may have its allocation of the state gas tax withheld.

Los Angeles County Department of Public Works

The Los Angeles County Department of Public Works (LACDPWS) requires a road permit to perform work within County highways and roadways, in accordance with the Highway Permit Ordinance (Division 1 of Title 16 Los Angeles County Code). A permit may be required when a project would result in the

encroachment within, over, or under a highway; modification of storm drains; construction or maintenance of an overhead structure or other appurtenant facility; excavation for underground facilities; relocation of utilities; or impediment to travel (Los Angeles County Municode 2014a).

The operation of oversize vehicles is prohibited on certain highways in Los Angeles County, in accordance with the Vehicle and Traffic Ordinance (Division 1 of Title 15 Los Angeles County Code). This ordinance states that it is unlawful to drive, operate, or cause or permit to be driven or operated any commercial vehicle exceeding a gross weight of 14,000 pounds on any highways enumerated in Sections 15.48.065 through 15.48.299 of the code. Oversize loads transporting LMR monopoles and equipment would be restricted from using streets listed in the ordinance.

In addition, operation of vehicles in a bike lane is prohibited per Section 15.52.040, Title 15 of the Vehicle and Traffic Ordinance; exceptions are provided to cross at a permanent or temporary driveway or for the purpose of parking a vehicle where parking is permitted or where the vehicle is disabled (Los Angeles County Municode 2014a).

Los Angeles County, Department of Regional Planning

Chapter 9, Section VII Scenic Resources of the Los Angeles County General Plan describes the importance of preserving valuable designated scenic areas, vistas, and roadways. Three scenic highways — including segments of Angeles Crest Highway Route 2, Mulholland Highway, and Malibu Canyon-Las Virgenes Highway — are listed in Table 9.7 of the Plan (LACDRP 2015b). Utilities, including LMR station power supply cables, would require underground installation along these highway segments.

San Bernardino Association of Governments

Congestion Management Program

The designated Congestion Management Agency for San Bernardino County is the San Bernardino Associated Governments (SANBAG). The SANBAG Transportation Technical Advisory Committee meets every two years, at a minimum, with the General Policy Committee and Board of Directors. Together, they are responsible for the conformance monitoring and biennial updating of San Bernardino County's CMP.

San Bernardino County Department of Public Works

The San Bernardino County Department of Public Works (SBCDPW) requires a permit to perform work within county highways and roadways, in accordance with the Highway Permit Ordinance (Division 1 of Title 5 San Bernardino County Code). If required by the Road Commissioner, each applicant for a permit shall file proof of the applicant's right to use the highways for the purposes set forth in the application. A permit may be required when a project would result in any excavation or opening; fill or obstruction; or construction or repair in, over, along, on, across, or through any highway. Generally, a permit is required for any purpose, but exceptions may be made for, or in connection with, the installation of poles, guys, and anchors constructed for use under a franchise for public utility purposes where such

poles, guys, and anchors are located outside the paved or traveled portion of the highway (SBCDPW 2014).

In any permit issued, the Commissioner may specify what lights, barriers, barricades, warning signs, or other measures designed to protect the traveling public must be erected by the permittee. Pursuant to the Vehicle Code of the State of California, and upon the basis of a traffic engineering investigation, the Board of Supervisors may prohibit commercial vehicles exceeding a gross weight of 14,000 pounds from using any street, road, or highway in an unincorporated residential subdivision area and have signs erected to indicate such prohibition.

San Bernardino County Land Use Services Division

Chapter VI, Section B Countywide Goals and Policies of the Open Space Element (Goal OS 5.3) of the San Bernardino County General Plan describes the County's desire to retain the scenic character of visually important roadways throughout the county (San Bernardino County Land Use Services Division 2007). A "scenic route" is defined as a roadway that has scenic vistas and other scenic and aesthetic qualities that over time have been found to add beauty to the county. The Circulation and Infrastructure Background Report (Figures 2-4A through 2-4C of the Background Report) delineates which routes are scenic highways and applies all applicable open space policies to development on these routes. Utilities, including LMR station power supply cables, must be installed underground along these highway segments.

Cities

The proposed Project sites would be located within the jurisdictional boundaries of several cities located in Los Angeles or San Bernardino counties. Each city has adopted many of their respective county's performance standards for highways, roadways, transit, and bicycle/pedestrian paths by reference to the county codes in local general plan documents and municipal codes. Design and construction of the LMR sites would comply with four general categories of city standards: restricting heavy-weight vehicles to designated truck routes, requiring that utilities be installed underground when along scenic highways and corridors, maintaining vehicle and pedestrian access within the public right-of-way during excavation activities, and keeping disaster response routes open.

Table 3.12-1 lists the titles of city documents and performance standards that would impose additional restrictions on the siting of the proposed Project facilities within the jurisdictional boundaries for the city in which the Project site is located. In some cases, the city standards are identical to county standards but have a unique implementation measure or ordinance number and title. In other cases, the standards are unique to that city. Specific plan goals, implementation measures, and ordinances that embody these city standards are grouped below under one of the four general categories and for cities that have not established additional standards.

Vehicle Weight Restrictions – Heavy or Oversize Vehicles and Designated Truck Routes

Table 3.12-2 lists the cities in which Project sites are proposed and identifies the municipal code citation, when applicable, that restricts heavy-weight vehicles to designated truck routes. Routes designated as truck routes are specified in the municipal code or General Plans for most cities, although the truck route or routes with weight restrictions also may be specified through the posting of signs.

Table 3.12-2: Cities that Restrict Heavy-Weight Vehicles to Truck Routes

City Name	Municipal Code Citation	Weight Limit (gross pounds)	Exception for direct route access? ¹
Agoura Hills	Ordinance 3204 Amendments to Los Angeles County Traffic Code, Title 15, Division 1, Chapter 15.48 Weight Limits, Subchapter 060 and Ordinance 3207, Weight Limits on Certain Streets (Municode 2014c)	11,000	yes
Beverly Hills	Article 2, Commercial Vehicle Restrictions, 7-2-203. Streets Designated for Heavy Vehicle Usage (City of Beverly Hills 2014, <i>Municipal Code</i>)	6,000	Public utility vehicles used in construction, installation, or repair of utilities exempt
Calabasas	Chapter 10, Part 10, Oversized Vehicles, Requires permit to operate oversized vehicles on any public streets in the city; exceptions include vehicles used to construct, install or repair public utilities in the city	14,000	No, but may be specified in the permit
Cerritos	Chapter 10.18 Truck Routes, Maximum Gross Weight Limit: Designated Streets (City of Cerritos 2014, <i>Municipal Code</i>)	6,000	yes
Chino Hills	Title 10, Chapter 10.44, Vehicles and Traffic, Commercial Vehicles and Trucks (Municode 2014k)	10,000	yes
Glendale	Title 10, Vehicles and Traffic, Chapter 10.64.110, Truck Routes (Municode 2014d)	10,000	Exception for loading and unloading
Los Angeles	Chapter VIII Traffic, Division H, Restricted Use of Certain Streets (City of Los Angeles 2014a, <i>Charter & Administrative Code</i>)	6,000	yes
Malibu	None identified		
Monterey Park	Title 10, Chapter 10.44.020, Vehicles and Traffic, Truck routes and parking restrictions thereon	6,000	Not specified
Palmdale	Title 10, Chapter 15.102, Vehicles and Traffic, Prohibition of certain vehicles except on designated routes (City of Palmdale 2014b, <i>Municipal Code</i>)	10,000	yes
Pasadena	Title 10, Chapter 10.52 Vehicles and Traffic (Municode 2014g)	6,000	yes

Table 3.12-2: Cities that Restrict Heavy-Weight Vehicles to Truck Routes

City Name	Municipal Code Citation	Weight Limit (gross pounds)	Exception for direct route access? ¹
San Dimas	Title 10, Chapter 10.32.030 Vehicles and Traffic, Weight Limits, Truck Routes Designated (City of San Dimas 2014a, <i>Municipal Code</i>)	6,000	yes
Santa Monica	Article 3, Chapter 3.12.680 Public Safety, Traffic Regulations, Regulation of Operation of Vehicles Over a Certain Size (City of Santa Monica 2014a, <i>Municipal Code</i>)	6,000	yes
Signal Hill	Title 10, Chapter 10.36 Commercial Vehicles and Truck Routes (City of Signal Hill 2014b, <i>Municipal Code</i>)	6,000	yes
West Hollywood	None identified		
Whittier	Chapter 10.36.030 Restricted Use of Certain Streets, Truck Routes (Municode 2014e)	6,000	yes

¹ Exception for direct route access to and from restricted streets construction, alteration, or repair of any building or structure for which a building permit has previously been obtained

Other city policies or ordinances that pertain to the designation of truck routes or restrictions, heavy-weight vehicles, restrictions within business districts, or permits required for truck hauling activities follow.

City of Agoura Hills General Plan Update (2010)

- Mobility Implementation Program Measure 14 - Use of the designated truck routes for ongoing commercial and industrial business operations and during construction of new development

City of Cerritos General Plan (2004)

- Chapter 4, Section 3.2.6 Circulation Element, Truck Routes – Exhibit CIR-3 of General Plan identifies designated truck routes

City of Signal Hill General Plan (2009)

- Circulation Element, Truck Routes – designates streets for use by vehicles weighing three tons or more as truck routes, which are indicated by posted signs

City of West Hollywood General Plan 2035 (2011)

- Mobility Measure M-A.50 Truck Routes – identifies city-designated truck routes to discourage neighborhood intrusion

Scenic Highways and Corridors

City of Los Angeles General Plan (1999)

- Chapter V Section A. Transportation Element Maps, Scenic Highways
- Chapter VI Section D. View Street Designations and Standards, Scenic Highway Guidelines – undergrounding of utilities within 500 feet of centerline of scenic highway

City of Signal Hill General Plan (2009)

- Circulation Element, Scenic Routes – designates a series of roadways at higher elevations as scenic routes

Maintain Access during Excavation Activities

City of Cerritos Municipal Code (2014b)

- Chapter 12.16.160 Excavations, Lights, Barriers, Warning Lights Not Specified – permittee must place and maintain warning lights and signs at each end of an excavation or obstruction and at a distance of no more than 50 feet along the excavation/obstruction from sunset to sunrise until filled in or removed

City of Glendale Municipal Code (2014d)

- Title 12.08.130 (A)(B) Encroachments and Excavations, Protection of Public and Safety Requirements – maintain safe crossings for vehicles and pedestrians at intervals of not more than 300 feet, barriers at each end of excavation, and lights at 50-foot intervals from sunset to sunrise until excavation refilled

City of Los Angeles Municipal Code (2014)

- Chapter VI, Public Works and Property, Article 2, Streets and Sidewalks, Section 62.45(d) – requires permit fees for depositing and maintaining any protection fence, protection canopy, building material, debris or equipment, excepting cranes, in or upon any public streets, sidewalks or parkways

City of Pasadena Municipal Code (Municode 2014g)

- Title 12 Chapter 12.22.030 Streets and Sidewalks, Telecommunications Facilities, Prohibited on Roadway or Public Street – prohibits use or maintenance of any telecommunications facility which projects onto, in, or over any part of the roadway of any public street or which rests, wholly or in part, upon, along, or over any portion of the roadway of any public street

City of Santa Monica Municipal Code (2014a)

- Article 7, Chapter 7.04.230 Public Works, Streets, Sewers, Etc., Vehicle Crossing – requires the maintenance of safe crossings for vehicles and pedestrians at intervals of not more than 300 feet, providing free access to fire hydrants and water gates, and maintaining at least a 6-foot-

wide passage on sidewalks next to excavated materials and obstructions; barriers are to be placed at the end of and along the excavation or obstruction, and lighting is to be placed at intervals of not more than 50 feet from sunset to sundown so as to prevent accidents

- Article 7, Chapter 7.06.110 Right-of-Way Management Regulations, Excavation Permit Issuance – permits issued will not substantially interfere with pedestrian use of the public right-of-way or vehicular safety and may contain conditions relating to time, place and manner of use of the public right-of-way

City of Whittier Municipal Code (2014e)

- Chapter 12.24.090 Excavations Generally, Pedestrian and Vehicle Crossings – maintain safe crossings during excavations for vehicles and pedestrians at intervals not greater than 300 feet, maintain free access to fire hydrants and water gates

Maintain Disaster Response Routes

City of Calabasas Land Use and Development Code (2010)

- Chapter 17.20.080 General Property Development and Use Standards, Disaster Response – discretionary development projects will be required to provide points of ingress and egress, to include emergency access for police and fire vehicles

No Additional Goals, Policies, or Ordinances

- City of Malibu *General Plan (2013)* and *Municipal Code (2014b)*

3.12.3 Significance Criteria

The proposed Project would result in significant impact to transportation and traffic if any of the following significance criteria, based on Appendix G of the CEQA guidelines, are met:

- 1) Would the project conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and nonmotorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?
- 2) Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?
- 3) Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?
- 4) Would the project result in inadequate emergency access?

Based on the Initial Study prepared for the LMR project (see Appendix A-2), it was determined that the Project would not result in increased hazards due to design feature or incompatible uses, it would have

no effect on public transit, bicycle or pedestrian facilities, and no further analysis of these topics is warranted within this EIR.

3.12.4 Impact Analysis

3.12.4.1 Proposed Project

TRANS-1: Would the project conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and nonmotorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impacts

Construction of a typical proposed Project site would take approximately six weeks. As shown in Table 2.1-4 in Chapter 2, Project Description, typical construction equipment required would include four-wheel drive vehicles, antenna and line trucks, water trucks, excavators, skidsters, cranes, forklifts, dump trucks, and concrete trucks. Some equipment would be transported to the construction site and remain there until no longer needed at the site. Other equipment would travel to and from the site on a daily basis throughout the construction period. Construction workers typically would travel to and from the work site via pickup truck. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the construction phase.

Of those proposed Project sites located within residential or mixed use areas, the construction related traffic would be less than 1 percent of the average daily traffic. In more urbanized areas, the construction-related traffic would be less than one-quarter of a percent of the average daily traffic. In more remote areas, construction related traffic could account for a higher percentage of the total average daily traffic (up to 9 percent in a few very isolated sites), but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Almost all proposed Project facilities would be constructed within or adjacent to existing telecommunications or other facilities; and construction of new facilities would occur within existing or extended fenced areas. Most large equipment would be transported without road closures. Temporary disruption of public access via vehicle, bicycle, or pedestrian route would be limited because most sites support existing infrastructure such as water tanks of telecommunications facilities, some work would be done within an existing fenced area that already prevents access, and excavated trenches typically would be backfilled in less than 48 hours.

Each of the proposed Project sites would be accessed via existing paved or unpaved roads. Precise access routes would be determined in coordination with equipment haulers and with local jurisdictions to identify the most suitable route. While precise routes are undetermined at this time, the nearest highway, nearest major arterial street, and the street most likely to provide immediate access to each

proposed Project site are provided in Chapter 4 to provide context of transportation routes that may be used. No road improvements or new road construction are anticipated.

Levels of use on nearby arterial streets and highways vary substantially, and some are part of the CMP. Major travel routes prone to congestion are a greater concern because construction traffic near these routes could further contribute to the congestion. Table 3.12-1 identifies the proposed Project sites within 2 miles of a highway or roadway identified in the CMP. When Project sites are located near these routes, it increases the likelihood that vehicles accessing the Project sites during construction or operations and maintenance phases would use a CMP route, incrementally adding to the volume of traffic that makes these routes congested. As previously noted, however, the additional volume of traffic would be less than 1 percent for the duration of site construction (about six weeks).

None of the proposed Project sites was identified to be in conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (e.g., mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths). Applicable plans, ordinances, and policies are listed in Section 3.12.2.3, including Table 3.12-2 and the policies following that table. The Project would not decrease the performance or safety of such facilities because the sites are either remote enough to have very little existing traffic, or the volume of construction traffic is small enough to equate to less than 1 percent of the average daily traffic. Access would be maintained for vehicles, bicycles, and pedestrians during construction. Construction of the Project would have less than significant impacts on the performance of the circulation system.

Mitigation Measures

No mitigation is required.

Operation Impacts

No staff would be required at any of the sites to operate the LMR equipment. The proposed Project facilities and equipment would need to be inspected, maintained, and repaired as necessary. Equipment replacement or repair that cannot be diagnosed and performed remotely may require a technician on site, typically in a standard van or utility pickup truck. This would occur on a monthly basis and include emergency generator testing and occasional refilling of the generator fuel tanks. Facilities and system components would be inspected annually, at a minimum, for common mechanical problems. Where replacement or repair involves installed antennas, a four-person crew with one truck, a boom (aerial lift) truck, and an assist van sport utility vehicle might be required.

Operations and maintenance of the proposed Project sites would not conflict with an applicable plan, ordinance, or policy (see “Cities” subheading in Section 3.12.2.3) that would influence the effectiveness of the circulation system. Traffic associated with operations and maintenance of each site is projected to be about four trips per month. Even in remote locations where average daily traffic counts are the lowest, operational impacts associated with the proposed Project would be in the thousandths of a percent of the existing average daily traffic. Impacts would be less than significant.

Mitigation Measures

No mitigation is required.

TRANS-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

The 2010 Los Angeles County Congestion Management Program (CMP) sets forth specific requirements for preparation of a transportation impact analysis (TIA). The CMP requires preparation of a TIA for: (1) all CMP arterial monitoring intersections, including monitored freeway on-ramps or off-ramps, where the proposed Project will add 50 or more trips during either the AM or PM weekday peak hours; and (2) mainline freeway monitoring locations where the Project will add 150 or more trips in either direction during either the AM or PM weekday peak hours. As discussed in greater detail below, the proposed Project does not meet these thresholds; therefore, preparation of a TIA was not required.

Site AJT in San Bernardino County is approximately 5 miles from the nearest roadway identified in the San Bernardino County CMP. While the specific access routes to each proposed Project site have not been identified, the analysis was based on a site being within 2 miles of a CMP routes more than 2 miles from a site are viewed as less likely to be used. In addition, the threshold for a project triggering the need for a TIA report is 250 two-way peak-hour trips and the expectation that the project would add at least 50 two-way peak-hour trips to a State highway facility (SANBAG 2007). Therefore, Site AJT does not meet the criteria for contributing to levels of service on a CMP route and is not discussed further.

Construction Impacts

As listed in Table 3.12-1, about half of the proposed Project sites are more than 2 miles from routes identified in the local county Congestion Management Program. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible; and the effect would be less than significant.

The remaining sites are within 2 miles of a route identified in the local county CMP, thus increasing the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Construction impacts on CMP routes would be less than significant.

Mitigation Measures

No mitigation is required.

Operation Impacts

The effects associated with sites within 2 miles of a route identified in the CMP would be indistinguishable from existing levels of traffic on these routes because maintenance would typically generate no more than four round trips per month. The resulting change would be in the thousandths of a percent of the current average daily traffic. Operational impacts on CMP routes would be less than significant.

Mitigation Measures

No mitigation is required.

TRANS-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impacts

Construction and operation of the proposed Project sites would have no effect on the volume of air traffic; but lattice towers and monopoles (including associated equipment such as lightning rods) may be hazards to navigation, particularly when in close proximity to airports. The analysis considered the criteria identified in Title 47 Code of Federal Regulations, Part 17, Subpart B on FAA notification criteria for antenna structures, as well as the findings from running the landing slope facility calculator (TOWAIR) that is available on the FCC website. This tool determines if a proposed antenna structure is close enough to an airport or heliport to require an aeronautical study by the FAA and registration with the FCC. TOWAIR findings are not definitive or binding but are a good indication of interference with navigation that could affect air traffic patterns or pose a substantive safety risk. Certain antenna structures are exempt from FAA notification requirements, including an antenna structure of 6.10 meters (20 feet) or less in height except one that would increase the height of another antenna structure (47 CFR 17.7(e)(3)).

A preliminary analysis was completed using the TOWAIR tool; results are summarized in Table 3.12-3.

Table 3.12-3: Proposed Project Sites that May Be an Obstacle to Navigation for Air Traffic

Site ID	Site Name	TOWAIR Determination Results
	Agoura Hills	No airports within 5 miles
	AeroJet	No airports within 5 miles
	Auto Square Drive	No FAA requirement for Long Beach/Daugherty Field Airport or for Los Alamitos Army Airfield based on distance from runways
	Black Jack Peak	Requires FAA notification and FCC registration
	Burnt Peak	No airports within 5 miles
	Burnt Peak-1	No airports within 5 miles
	Burnt Peak-2	No airports within 5 miles
	Burnt Peak-3	No airports within 5 miles
	Castro Peak	No airports within 5 miles

Table 3.12-3: Proposed Project Sites that May Be an Obstacle to Navigation for Air Traffic

Site ID	Site Name	TOWAIR Determination Results
	Dakin Peak	Requires FAA notification and FCC registration
	Encinal 1 (Fire Camp 13)	No airports within 5 miles
	Entrada Tank Site	No airports within 5 miles
	Frost Peak (Upper Blue Ridge)	No airports within 5 miles

	100 Wilshire	The structure meets the 6.10-meter (20-foot) Rule criteria
	Whittaker Ridge	No airports within 5 miles
	Zuma Life Guard HQ	No airports within 5 miles

Based on distance and runway length (see Table 3.12-1) and TOWAIR results, the following proposed Project sites require FCC registration and FAA notification; and their construction would be a significant impact on navigation that could affect air traffic patterns or pose a substantive safety risk. An aeronautical study would be necessary to determine the actual degree of interference or safety risk. Existing communication towers at some of these sites suggest that navigational interference and safety risks may be within acceptable limits; consequently, the impact would be significant.

BJM Black Jack Peak

DPK Dakin Peak

SDW San Dimas

SGH Signal Hill

Mitigation Measures

Mitigation measure HAZ MM 2, described in Section 3.7.4.1, would be applied. This mitigation measure provides that the Authority would submit Form 7460-1, Notice of Proposed Construction or Alteration, to the FAA.

Impacts after Mitigation

For sites BJM, DPK, SDW, and SGH, FAA must be notified in accordance with 14 CFR Part 77. Prior to the start of construction, the Authority would complete Form 7460-1 and file it with FAA, which would trigger the FAA to complete an aeronautical study and return a hazard determination. If FAA approves construction, the Authority would build these structures in compliance with FAA's hazard determination and associated conditions from the aeronautical study (e.g., obstruction lighting). Application of HAZ MM 2 would ensure that the proposed Project complies with all FAA regulations and mitigates safety risks, reducing the impact to less than significant.

Operation Impacts

If FAA approves sites BJM, DPK, SDW, and SGH for construction, this would indicate that operation of the tower would not change air traffic patterns or result in substantial safety risks to flight operations. If approved by FAA, operation of these sites would have less than significant impacts on navigation that could affect air traffic patterns or pose a substantive safety risk.

Mitigation Measures

No mitigation measures are required.

TRANS-4: Would the project result in inadequate emergency access?

Construction Impacts

Construction-related traffic would be limited to 25 trips per day at each site and would be less than 1 percent of average daily traffic on nearby streets at most locations. At most Project sites, construction activity would affect access only to the site (e.g., the existing antenna farm or water tank site) and would not affect any adjacent roads that could be used for emergency access. At these sites, impacts would be less than significant.

In some of the urban locations, specifically sites ASD, LARICSHQ, PASPD01, PDC, SGH, SIM, WS1, and ZHQ, construction-related activities may require lane narrowing at a driveway or detours in the parking lots of existing facilities. These actions could temporarily impair access on adjacent roadways, potentially creating traffic hazards and limiting emergency access, resulting in a significant impact.

Mitigation Measures

The following mitigation measures would apply at sites ASD, LARICSHQ, PASPD01, PDC, SGH, SIM, WS1, and ZHQ.

TRANS MM 1: The construction contractor shall maintain a minimum of one open lane of traffic at all site access roads during project construction. Use of standard construction traffic control practices such as flagmen, warning signs, and other measures shall be implemented as necessary to ensure that traffic flow remains uninterrupted at all times.

TRANS MM 2: Any temporary road or lane closures that may affect state highways shall be coordinated with Caltrans prior to commencement of construction at the site that will require the road or lane closures. If construction requires temporary road or lane closures on roads and streets managed by local entities, a traffic management plan shall be prepared and submitted to the relevant county and/or city public works department or other appropriate department for approval prior to commencement of construction at the site. Encroachment permits would be obtained where applicable.

Impacts after Mitigation

With implementation of the proposed mitigation measures, temporary impacts on emergency access during the construction phase would be less than significant.

Operation Impacts

Vehicle trips associated with operations at each proposed Project site would be limited to those required for occasional inspections, maintenance, and repair. Up to four vehicle trips per month per Project site would occur during operations, equating to a change in the thousandths of a percent of the current average daily traffic. This would not be of sufficient volume to affect the level of service of any roadway. No impairment of access roads would be necessary during operations, and operational impacts on emergency access would be less than significant. In addition, with operation of the LMR system, communications for first responders would be enhanced and would provide opportunities for better communications associated with access during emergencies.

Mitigation Measures

No emergency access mitigation is required during the operational phase.

3.12.4.2 No Project Alternative

Under the No Project Alternative, no traffic would be added to CMP routes, no change would occur to existing structures that potentially may pose an obstruction to flight operations, and no change would occur in the volume of traffic or accessibility to disaster routes. Therefore, no impacts would occur to influence the traveling public.

First responders would continue to rely on existing communications facilities and equipment; emergency response times would be comparable to existing conditions, at least in terms on the reliability of the communications system.

3.12.5 Cumulative Impacts

The proposed Project is located within Los Angeles and San Bernardino counties. This cumulative impacts analysis considers the existing and future vehicle miles traveled (VMT) projections included in the Program EIR for SCAG's 2012-2035 Regional Transportation Plan/ Sustainable Communities Strategy (RTP/SCS) adopted by the Regional Council of SCAG on April 4, 2012. Project types considered in the SCAG RTP/SCS including the following:

- Aviation
- Environmental Mitigation
- Goods Movement
- High-Speed Regional Transport
- Highways and Arterials

- Non-Motorized Transportation
- Transit
- Transportation Demand Management

Construction Impacts

According to the 2012 RTP/SCS Programmatic EIR, the total existing daily VMT in Los Angeles and San Bernardino counties as of 2011 was 285,322,000.¹⁴ (2012-2035 RTP/SCS Draft Programmatic EIR, Table 3.12-3.) In the City of Los Angeles General Plan Transportation Element, it was reported that more than 24.4 million trips per day occurred within the City of Los Angeles and more than 60.8 million trips per day occurred in Los Angeles County in 1990¹⁵ (City of Los Angeles 1999, Chapter II, Table 5). As discussed in Section 3.12.4, construction trips associated with the proposed Project would be limited to 25 trips per day per site. This amounts to approximately 40,500 construction-related trips over the two-year construction period spread across Los Angeles and San Bernardino counties for the 54 sites addressed in this Draft EIR. To the extent that Project construction overlaps with other projects in the same area, there is potential for a cumulative impact; however, the increase in daily trips associated with the Project represents less than .0007 percent of the 1990 County trips per day; therefore the proposed Project's contribution to cumulative impacts would not be cumulatively considerable.

In some locations, construction-related activities may require lane narrowing at a driveway or detours in the parking lots of existing facilities. This could result in temporary significant impacts that could impair access on adjacent roadways, potentially creating traffic hazards and limiting emergency access. If Project construction overlaps with other projects in the same area and impairs emergency access, the proposed Project would represent a cumulatively considerable contribution to inadequate emergency access. To address this issue, mitigation measures TRANS MM 1 and TRANS MM 2 would reduce the Project's contribution to cumulative impacts to less than cumulatively considerable.

Operational Impacts

Substantial growth and development is anticipated to occur within the SCAG region by 2035, and average daily VMT is expected to increase by 13.3 percent. While the SCAG Programmatic EIR concluded that this increase would be cumulatively significant, proposed Project operations would create only four trips per month, per site, or approximately 216 total trips per month (about 7 trips per day) for the 54 sites addressed in this EIR. These trips for maintenance and operation would be distributed across Los Angeles and San Bernardino counties and would be indistinguishable on any given day that maintenance activities would occur. The Project's contribution to significant transportation impacts would not be cumulatively considerable.

¹⁴ Use of a 2011 baseline is conservative, as VMT has increased and therefore Project construction trips would represent an even smaller percentage of total daily VMT in the two counties.

¹⁵ Use of a 1990 baseline is conservative, as the Census Bureau estimates the 1990 population of Los Angeles County at 8.9 million persons and the 2014 estimate at 10.1 million persons.

3.13 Utilities/Service Systems

This section describes existing utilities and service systems in the Project vicinity including solid waste management capacity and demand, water supply and demand, stormwater drainage, and wastewater treatment requirements and the regulatory requirements applicable to utilities and service systems. It also assesses the proposed Project's effects on these systems.

3.13.1 Environmental Setting

3.13.1.1 Solid Waste Disposal

The Los Angeles County Sanitation Districts (LACSD) operate a comprehensive solid waste management system serving the needs of a large portion of Los Angeles County. The County relies on a combination of publicly and privately owned and operated facilities to maintain a competitive environment for waste collection, recycling, and disposal.

Types of disposal facilities for nonhazardous waste within Los Angeles County include Class III landfills, which accept nonhazardous household waste, and unclassified landfills, which accept materials such as soil, concrete, asphalt, and other construction and demolition debris. As of December 31, 2013, the total remaining permitted Class III landfill capacity in the County was estimated at 113 million tons, after closure of Puente Hills Landfill on October 31, 2013 (LACDPW 2015). Based on solid waste generation, disposal trends, and existing County facilities, the cumulative need for Class III landfill disposal capacity (approximately 113 million tons) is projected to exceed the landfill capacity by the end of year 2025 (LACDPW 2015). Table 3.13-1 provides an overview of landfills nearest to the proposed Project sites, along with the determination of available capacity to serve the Project sites.

Table 3.13-1: Disposal Facility Locations

Landfills Serving Project Study Area	City Location	Number of Project Sites in Service Area	Maximum Daily Capacity (per Solid Waste Facility Permit; tons/day)	2012 Average Daily Disposal (tons/day)	Landfill Capacity Adequate for Solid Waste Disposal Needs?
Antelope Valley Recycling and Disposal Facility	Palmdale	4	1,800	822	Yes
Calabasas Landfill	Agoura	14	3,500	633	Yes
Chiquita Canyon Landfill	Castaic	7	6,000	2,971	Yes
City of Burbank Landfill #3	Burbank	5	240	107	Yes
Pebble Beach Landfill	Avalon	3	49	9	Yes
Savage Canyon Landfill	Whittier	12	350	250	Yes
Scholl Canyon Landfill	Glendale	5	3,400	675	Yes

3.13.1.2 Water and Wastewater Treatment

Los Angeles County is served by a complex water management system consisting of numerous water providers, water quality control boards, and other agencies. Los Angeles County's combination of local and imported water supply is delivered through a system of aqueducts, reservoirs, and groundwater basins. Approximately 33 percent of the water supply comes from local sources, including surface water from mountain runoff, groundwater, and recycled water. The remainder is imported into Los Angeles County from three sources: the Colorado River, the Sacramento-San Joaquin Delta in Northern California via the State Water Project, and the Owens Valley via the Los Angeles Aqueduct (LACDRP 2014a). The Metropolitan Water District of Southern California (MWD) is the largest regional water wholesaler in southern California. MWD delivers an average of 1.7 billion gallons of water per day to nearly 300 cities and unincorporated areas throughout southern California, primarily from the State Water Project and the Colorado River Aqueduct.

The LACSD operates 10 water reclamation plants (WRPs) and one ocean discharge facility (Joint Water Pollution Control Plant), which treat approximately 510 million gallons per day (mgd), 165 mgd of which are available for reuse (LACSD 2014).

Table 3.13-2 and Table 3.13-3 identify the local water service providers and wastewater systems, respectively serving the proposed Project sites.

3.13.1.3 Stormwater Drainage

Stormwater within Los Angeles County is primarily managed by the State Water Resource Control Board and the Los Angeles County Flood Control District (LACFCD). LACFCD is governed, as a separate entity, by the County of Los Angeles Board of Supervisors.

LACFCD encompasses more than 3,000 square miles, 85 cities, and approximately 2.1 million parcels of land. It includes the majority of drainage infrastructure within incorporated and unincorporated areas of the County, including 500 miles of open channel, 2,800 miles of underground storm drain, and an estimated 120,000 catch basins (LACFCD 2014). Cities within the Project area have separate stormwater drainage and sewer systems; stormwater is not processed at the wastewater treatment plants.

Stormwater runoff and compliance with NPDES permits and applicable State Water Resources Control Board requirements are addressed in the hydrology chapter of this document.

3.13.2 Regulatory Setting

This section is organized first by federal, state, and local setting and secondly by solid waste disposal, water and wastewater treatment, and stormwater drainage. Stormwater drainage is closely associated with water quality laws and regulations and may be discussed collectively.

3.13.2.1 Federal Regulatory Setting

Environmental Protection Agency

Resource Conservation and Recovery Act

Enacted in 1976 by the USEPA, the Resource Conservation and Recovery Act (RCRA) set national goals for protecting human health and the environment from the potential hazards of waste disposal, conserving energy and natural resources, reducing the amount of waste generated, and ensuring that wastes are managed in an environmentally sound manner.

Municipal solid waste landfills, which may be used for the disposal of waste materials from construction or maintenance of the Project sites, must comply with RCRA. Construction and demolition debris is neither classified as RCRA hazardous waste nor municipal solid waste, so construction and demolition landfills are not subject to federal design and operational criteria. If construction and demolition debris from the proposed Project sites is sent to municipal solid waste landfills or landfills that accept conditionally exempt small quantity generator waste (applicable for facilities that generate small amounts of hazardous waste), those landfills must still meet federal regulations set forth in RCRA (USEPA 2014b).

Clean Water Act, National Pollutant Discharge Elimination System

The Clean Water Act (CWA) of 1972 is the primary law governing water quality, including wastewater treatment. The provisions of the CWA are addressed in more detail in the water quality chapter of this document.

The CWA provides the statutory basis for the National Pollutant Discharge Elimination System (NPDES) permit program and the basic structure for regulating the discharge of pollutants from point sources to waters of the United States. The CWA gives the USEPA the authority to set effluent limits that ensure protection of the receiving water. In states that have been authorized to implement CWA programs, USEPA still retains oversight responsibilities.

Water pollution discharged from a single point, such as a pipe or from a municipal water treatment plant, is considered point source pollution. Most stormwater discharges are considered point sources and require an NPDES permit. This does not mean that all stormwater discharges contain pollutants; but because stormwater often flows over impervious surfaces, it may accumulate debris, chemicals, sediment, or other materials that are considered pollutants. Proposed Project sites with point source discharges would be subject to an NPDES permit.

3.13.2.2 State Regulatory Setting

California Department of Resources Recycling and Recovery

The California Department of Resources Recycling and Recovery (CalRecycle) is the state agency dealing with recycling and waste reduction, including compliance with the California Integrated Waste Management Act. CalRecycle mandates waste reduction targets for local agencies through the use of

recycling, recovery, and other waste reduction programs. CalRecycle also directs regional areas to develop plans for meeting the objectives outlined by the California Integrated Waste Management Act.

Hundreds of statutes pertain to solid waste law and specific types of waste streams (see <http://www.calrecycle.ca.gov/Laws/Legislation/CalHist/default.htm> for the history of California solid waste law). The important point with regard to the proposed Project sites is that all waste – whether construction and demolition debris, nonfunctional equipment, or trash generated by personnel working at the site – would be subject to proper disposal and transport to an appropriate waste landfill that complies with applicable waste regulations. Compliance with solid waste laws and regulations is the responsibility of the landfill operators. Therefore, disposal of Project waste materials would be processed by approved landfills designed to accept these types of waste.

California State Water Resources Control Board

The Porter-Cologne Water Quality Control Act (California Water Code, Division 7), which became effective January 1, 1970, revamped California’s water pollution law. The current law includes aesthetics and protection of fish and wildlife as beneficial uses of water to be protected, encourages area-wide planning for the solution to water pollution problems, recognizes the interrelationships of water quality and water quantity as expressed by water rights, and establishes the State Water Resources Control Board as the administrator of the related functions of water rights determination and water quality control.

The primary responsibility for the protection of water quality in California rests with the State Water Resources Control Board (SWRCB) and nine Regional Water Quality Control Boards (RWQCBs). The State Board sets statewide policy for the implementation of state and federal laws and regulations. The California State Water Resources Control Board (SWRCB) regulates wastewater discharges to surface water (rivers, ocean, etc.) and to groundwater (via land). The water boards also regulate stormwater discharges from construction, industrial, and municipal activities; discharges from irrigated agriculture; dredge and fill activities; the alteration of any federal water body under the CWA Section 401 certification program; and several other activities with practices that could degrade water quality.

3.13.2.3 Local Regulatory Setting

Los Angeles County

Solid Waste – Los Angeles County developed the Los Angeles County Integrated Waste Management Plan to accomplish the directives of the California Integrated Waste Management Act. The plan describes the steps to be taken by local agencies to achieve the mandated state diversion rate by integrating strategies aimed toward reducing, reusing, recycling, diverting, and marketing solid waste.

Water and Wastewater Treatment – The RWQCBs, which report to the SWRCB, adopt and implement Water Quality Control Plans (Basin Plans) that recognize regional differences in natural water quality, actual and potential beneficial uses, and water quality problems associated with human activities.

Most of the proposed Project sites are within the jurisdiction of the California SWRCB – Los Angeles Region; however, a number of Project sites are within the Lahontan Region. The LACDPW Water Quality Control Plan for the Los Angeles Region is the local regulatory plan for water and wastewater. It is designed as a resource for the Los Angeles RWQCB and others who use water and/or discharge wastewater within the Los Angeles Region. Water quality standards and control measures for surface and ground waters of the Lahontan Region are contained in the Water Quality Control Plan for the Lahontan Region (Basin Plan). The plan designates beneficial uses for water bodies and establishes water quality objectives, waste discharge prohibitions, and other implementation measures to protect those beneficial uses.

Stormwater Drainage – The LACDPW Stormwater and Runoff Pollution Control Program tracks industrial and commercial businesses in the unincorporated county area to determine compliance with the provisions of the Municipal NPDES Permit issued by the Los Angeles RWQCB (LACDPW 2014).

San Bernardino County

Solid Waste – The County of San Bernardino, Department of Public Works (SBCDPW), Solid Waste Management Division reviews and approves all new construction projects required to submit a Construction and Demolition Solid Waste Management Plan (waste management plan). The California Green Building Standards Code (CALGreen) requires all newly constructed buildings (including most nonresidential commercial projects) to develop a waste management plan and divert a minimum of 50 percent of the construction waste (that is reducing, reusing, recycling, diverting, and marketing solid waste). The waste management plan consists of two parts which are incorporated into the Conditions of Approval; the first part includes an estimate of the amount of tonnage to be disposed and diverted during construction, and the second part shows what tonnage was actually diverted and disposed of with disposal/diversion receipts or certifications for documentation (SBCDPW 2015a).

Water, Wastewater Treatment, and Stormwater Drainage – Prior to construction, project proponents are to prepare a Water Quality Management Plan and Stormwater Best Management Practices Transfer, Access and Maintenance Agreement (SBCDPW 2015b). The NPDES permit process addresses the SBCDPW's environmental needs regarding stormwater quality issues for San Bernardino County.

Cities

City regulations in the study area tend to be comparable to those described for Los Angeles County. Most cities provide waste collection services, and many have landfills or transfer stations. These cities also emphasize waste diversion programs to minimize waste going into landfills. Water supply policies often include use of reclaimed wastewater to help decrease demand on other water supplies. Stormwater management follows the regulatory processes established in applicable RWQCB Basin Plans.

3.13.3 Significance Criteria

The proposed Project would result in significant impact to utilities and service systems if any of the following significance criteria are met:

- 1) Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?
- 2) Would the project require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?
- 3) Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?
- 4) Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?
- 5) Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Based on the Initial Study for the LMR project (see Appendix A-2) it was determined that project would not require construction or expansion of water or wastewater facilities or generate wastewater requiring treatment and no further analysis of these topics is warranted within the LMR EIR.

3.13.4 Impact Analysis

3.13.4.1 *Proposed Project*

UTL-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impacts

For building mounts and sites using an existing monopole or tower, wastewater is not anticipated because groundwater is not expected at the shallow depths of excavation associated with construction of these site types. During construction of deep foundations associated with new monopole or new tower locations, groundwater may be encountered for some excavation activities. For sites where dewatering during excavation is necessary, perched groundwater that may be encountered could be contaminated, have high levels of turbidity, or generally not meet other requirements for discharge to the environment. Unpermitted discharges to the environment could exceed treatment requirements of the RWQCBs and would be considered a significant impact.

When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the local RWQCB. Depending on the terms of the permit, the water may be discharged to storm drains. Because the proposed Project sites have separate storm drain and sewer systems, water discharged to storm drains in the Los Angeles Basin eventually leads to the ocean and would not be subject to treatment at a wastewater treatment plant. Temporary outflows associated with dewatering would be controlled so

that storm drain systems would not be overwhelmed and no expansion of storm drains would be required.

If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified in Table 3.13-3 would have the capacity to address the demand, as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measures

UTL MM 1: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction; and removal or discharge of water would be in accordance with the terms and conditions of the permit.

Impacts after Mitigation

The Authority will comply with all conditions and stipulations specified in the applicable permit. Because construction of the Project would be conducted in accordance with applicable stipulations and conditions in the applicable NPDES permit, the effect on wastewater treatment plants in the Project area during construction of the Project would be less than significant.

Operation Impacts

During operations, the Project would not result in the production of any wastewater, and there would be no impact on treatment requirements.

Mitigation Measures

No mitigation measures are required.

UTL-2: Would the project require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impacts

The proposed Project sites would be located at sites with existing communications towers, poles, equipment buildings, or other existing structures such as buildings or storage tanks and therefore would not require the addition of a substantial amount of impermeable surfaces. Some sites are already paved or on an existing building, and the amount of impermeable surface and runoff would be unchanged. At sites where surfaces are more natural, the Project would require grading and the addition of up to 4,000 square feet of impermeable surfaces that would increase stormwater runoff. Some of these sites, however, would be on granite mountain peaks where the natural surface is mostly impermeable, and drainage patterns and runoff would not appreciably change even with the introduction of paved surfaces. Additionally, where sites are in a more natural setting and more likely to require new

impermeable surface, up to 4,000 square feet in the context of the watershed, which may cover hundreds of square miles, is a very small area and would not change drainage patterns.

Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new stormwater drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites and effects on existing stormwater drainage facilities would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Any change in stormwater runoff as a result of the Project would occur in response to the establishment of foundations or other impervious surfaces during construction activities. While the impervious surfaces would remain through the life of the project, they would be designed to account for drainage requirements and existing drainage facilities. Therefore, operational impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

UTL-3: Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impacts

Water for construction would be hauled to each site by water truck or water trailer. Sites requiring the greatest amount of ground disturbance are projected to require a maximum of 500 gallons for dust abatement and other on-site construction uses during the approximately six-week duration of construction. Proposed Project sites that would be mounted on a building or sites where antenna would be added to an existing structure would likely require less water. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply of 165 mgd processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project, and construction impacts on water supplies would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Operation of the Project sites would require no water use; therefore, operations would have no impact on water supplies.

Mitigation Measures

No mitigation measures are required.

UTL-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impacts

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of CCR Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site. Construction impacts on landfill capacity would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Based on the identified applicable landfills for each Project site and the known capacity limits, maintenance of the proposed Project sites would not exceed the permitted capacity of the landfill(s) serving each site. Operational impacts on landfill capacity would be less than significant.

Mitigation Measures

No mitigation measures are required.

UTL-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impacts

Solid waste generated during construction and maintenance of the proposed Project sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of

solid waste generated; thus, construction of the proposed Project would have less than significant impacts related to solid waste statutes and regulations.

Mitigation Measures

No mitigation measures are required.

Operation Impacts

Solid waste generated during construction and maintenance of the proposed Project sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated; thus, operation of the proposed Project would have less than significant impacts related to solid waste statutes and regulations.

Mitigation Measures

No mitigation measures are required.

3.13.4.2 No Project Alternative

Under the No Project Alternative, no added consumption of water would occur; and no additional wastewater to treat or stormwater to drain compared to existing conditions would occur. No solid waste would be generated to dispose of in solid waste landfills. Therefore, no impacts would occur to influence the existing capacity of wastewater treatment facilities, stormwater drainage facilities, water supplies, or landfill capacity.

3.13.5 Cumulative Impacts

The cumulative effects analysis for utilities is based on regional plans including the County of Los Angeles Countywide Integrated Waste Management Plan 2013 Annual Report (LACDPW 2015b), the Water Quality Control Plan: Los Angeles Region Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties (SWRCB – Los Angeles 1994), and the Greater Los Angeles County Integrated Regional Water Management Plan (Greater Los Angeles County Integrated Regional Water Management Region 2014).

Wastewater

The geographic scope for evaluation of cumulative wastewater generation impacts is the boundaries of California RWQCB, Los Angeles Region. Because region-wide volumes of wastewater generated and projected increases in wastewater generation are not readily available, the determination of the significance of cumulative wastewater generation impacts is based on the capacity of existing wastewater treatment plants, which are designed to exceed the anticipated demand for the service area.

No new stormwater drainage facilities or expansions of existing facilities would be required as a result of construction and operation of the proposed Project sites. Additionally, new impervious surfaces created at individual project sites would be far below the general NPDES stormwater permitting thresholds of

1 acre that Los Angeles County (and some cities) have applied to manage stormwater in the Project area. As a result, the Project's contribution to cumulative impacts based on the need for infrastructure improvements would be less than significant.

Water Supply

The geographic area for evaluation of cumulative water supply impacts is the service area of the Metropolitan Water District of Southern California. Service area supply and demand volumes are not published because the volumes fluctuate with precipitation and dry periods. Therefore, the determination of the significance of cumulative water supply impacts is based on a comparison of water supply available in the geographic area. The mission of the MWD is to provide its service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way. The MWD is updating its Integrated Water Resources Plan, known as Water Tomorrow, to guide how water supplies are developed and managed. The goal of the plan is to meet all demands for water under a range of hydrologic conditions. The currently adopted 2010 Update of the Integrated Water Resources Plan has the goal of meeting full service demands at the retail level under all foreseeable hydrologic conditions; the plan also promotes planning for potential future contingency resources such as stormwater capture and large-scale water desalination. The additional use of up to 500 gallons of water over the course of a 45-day construction window at a Project site would temporarily add to existing water demand in the area. This level of demand is less than significant when compared with the 1.7 billion gallons of water supplied by MWD throughout southern California and the more than 632 mgd daily capacity of wastewater treatment plants serving proposed Project sites. An analysis of proposed projects within 2 miles of the Project sites addressed in this EIR reveal development plans for numerous residential homes, commercial retail space, industrial parks, restaurants, golf courses, and other projects with long-term water supply requirements (see Table 2.7-1). In comparison, the one-time use of 500 gallons of water for Project site construction is not cumulatively considerable.

Landfill Capacity

The geographic scope of cumulative analysis for landfill capacity is the service area for the landfills serving the proposed Project (see Table 3.13-1). The cumulative impact analysis was based on projections of future landfill capacity based on the entire projected waste stream going to these landfills. According to the County of Los Angeles, Countywide Integrated Waste Management Plan 2013 Annual Report (LACDPW 2015b), existing County landfill facilities are projected to accommodate solid waste disposal needs until the end of 2025, based on current solid waste generation and disposal trends. As noted in Table 3.13-1, the landfills servicing Los Angeles County may accommodate from 3 to 14 proposed Project sites, based on the typical landfill service area. Pebbly Beach Landfill, located on Santa Catalina Island, has the least remaining capacity at 93,000 tons and would serve up to three proposed Project sites. Project needs would be approximately .003 percent of available capacity at this site. Fourteen proposed Project sites are within the Calabasas Landfill services area; this landfill has more than 6.7 million tons of remaining capacity, and Project needs would be approximately .0002

percent of the remaining capacity. Therefore, because landfill capacity would be available through 2025, the cumulative effect of the proposed Project (which would be reduced based on compliance with applicable sections of the California Green Building Code), in combination with the projected waste stream going to landfills serving the Project, would be less than significant.

Project Description

Site ID: AGH

Site Name: Agoura Hills

Site Discussion:

Propose installation of up to 27 whip and up to 5 microwave antennas on new monopole up to 70 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 150 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 8 foot diameter x 36 foot deep drilled caisson with concrete cap for monopole support; or up to 16 foot x 16 foot x 10 foot deep concrete mat foundation.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Address: Unnamed road – nearest intersection Kimberly Dr.

City: Agoura Hills

State: CA

Zip: 91301

Latitude: 34.159236896

Longitude: -118.770917835

Jurisdiction: City of Agoura Hills

Landowner: MORRISON ASSOCIATES

Proposed LMR Facilities

Antenna Support Structure: New Monopole

New Support Structure Height: up to 70'

If Existing Structure is being used, is it FCC Registered?: N/A

FCC Registration Number: N/A

Existing Site Conditions

Existing Onsite Communication Facility Lattice Tower, Monopole, or Antenna: Yes

Existing Tower Type: Lattice (3) (two guyed)

Existing Tower Height: 30 feet (2), one (approx. 20')

Existing Site Use: Communications

Existing Ground Elevation (feet AMSL): 1364

Aesthetics

Setting

Visual Description:

The area surrounding project Site AGH is an urban residential area approximately 8 miles north of Highway 101 in Agoura Hills. The site is located on an undeveloped hilltop covered with low vegetation overlooking the residential areas to the east, south, and west. Views toward the site from roads and residences immediately below the site are primarily obscured by the steepness of the hill slope. Views farther from these roads within the residential areas are often obscured by mature landscaping. None of the buildings located in the immediate vicinity of the project site exceed three stories. Buildings in the vicinity of the project appear to be in excellent condition.

Visual Sensitivity: Low

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed new facilities would be located within a site that includes existing towers that already create a visual intrusion onto the landscape. The new facilities would not be located in an area defined as scenic vista, and are not readily visible due to topography and the presence of mature landscaping. Locating the new tower and equipment at a site with existing structures would concentrate the impacts. The existing towers would attenuate the noticeability of new structures, thereby minimizing visual impacts. The new facilities would not block or remove views given the degree to which the facility is currently obscured by topography and vegetation. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no impacts to scenic vistas would occur.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site is low, and its surroundings are impacted by the presence of an existing site and two towers. Although the monopole and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in an urban area and would include construction of new facilities. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. This site is in an urban area where numerous sources of day and nighttime lighting are present, such as vehicle headlights, traffic signals, street lights, and building security lights. Because of the presence of these light sources, tower lighting, if required, would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 990

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site AGH. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site AGH or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1:

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Emissions from the construction of proposed site AGH would not exceed the SCAQMD daily significance thresholds including Nox, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of Nox from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site AGH will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site AGH would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site AGH or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site AGH, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site AGH, which is 990 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 6 are higher than the SCAQMD thresholds for CO and No_x, lower for PM₁₀ and PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site AGH and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site AGH in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site AGH and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly

trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required

Dominant Vegetation Community:

California walnut [*Juglans californica* Woodland Alliance]; Association - *Juglans californica*-*Malosma laurina* (shrubland).

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site AGH is located in the city of Agoura Hills at the end of a ridgeline within a largely undeveloped complex of hills surrounded by residential development; slopes are fairly steep and no washes are present. The vegetation community includes coastal sage scrub, California black walnut woodland on north-facing slopes with a few trees along the edge of the access road, and many weedy grasses and forbs throughout. American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP) may pass through the study area while foraging, but the study area does not provide steep cliff habitat required for nesting. The project area is within the foraging range of the golden eagle (*Aquila chrysaetos*; CDFW-FP); eagles may pass by the project site while foraging, but the area around the study area does not provide steep cliffs or rocky crags used for nesting. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Sections 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. Though

habitat for the Lyon's pentachaeta (*Pentachaeta lyonii*; FESA-E; CESA-E; CNPS-1B.1) exists within 500 feet of the site. Suitable habitat consists of clay soil in grasslands or openings in coastal sage scrub and chaparral with very little competition from weedy annuals. Potential habitat in the project area would be on the north-facing slopes; Project activities would be limited to top of the hill; no habitat for this plant would be affected.

Mitigation Measure(s):

Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 19 Trenches and Holes Management • BIO MM 18 Nesting Bird Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protectio

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

There are no riparian habitats within 500 feet of the project site. The California walnut grove vegetation community is found primarily down-slope on the north side of the existing facility, though a few trees along the edge of the woodland stand are adjacent to the access road.

Mitigation Measure(s):

Minimize disturbance to natural vegetation; do not remove California walnut trees. Prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Use caution to minimize the use of heavy equipment near (within the dripline) walnut trees to protect the plant's root system. Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of waters of the US, other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within open space designated by the City of Agoura Hills. The project may conflict with the Site AGH would be constructed at an existing communications facility containing three towers within open space designated by the city. The site is mostly bladed and contains nonnative grasses and a few scattered walnut trees, which are not specified for protection under the policy. In addition, BMPs identified to prevent runoff from the site would prevent potential erosion from the site. No conflict with Policy NR-4.2 has been identified. Construction would not result in conflict with the City's oak tree ordinance as there are no oak trees on site. Impacts from proposed Project construction on Policy NR-4.2 would be less than significant and there would be no impact associated with the City's oak tree ordinance. The proposed new antenna support structure at Site AGH increases the probability of a bird strike hazard, even if other towers are present. Workers accessing the site during operations for maintenance and repair activities would slightly increase the traffic count which could increase the potential to injure or kill wildlife. These operations impacts may occur to a few individual animals, however, without impacts at a landscape level. Due to the history of disturbance on site, the lack of protected species known to occur near the sites, and the minimal activity associated with maintenance and repair activities, operations of the proposed project would have a less than significant impact on biological resources protected by the Agoura Hills General Plan. The Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such local plans, policies, and regulations are not applicable to the Project.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE); however, there are three archaeological sites situated in the indirect APE, one of which has been identified as an isolate, and all three of which are now buried beneath modern housing. The closest of the three to the direct APE is 1,125 feet. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in October 2014. Based on the absence of historical resources, the distance of the three identified archaeological resources from the direct APE and their location beneath modern housing developments, there would be no impacts on historical resources from project activities at this project location.

Mitigation Measure(s):

There would be no impacts at this project site; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE); however, there are three archaeological sites situated in the indirect APE, one of which has been identified as an isolate, and all three of which are now buried beneath modern housing. The closest of the three to the direct APE is 1,125 feet. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in October 2014. Based on the absence of historical resources, the distance of the three identified archaeological resources from the direct APE and their location beneath modern housing developments, there would be no impacts on historical resources from project activities at this project location.

Mitigation Measure(s):

There would be no impacts at this project site; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Miocene Monterey Formation, which is known to be fossiliferous. No localities are recorded within the proposed site; however, vertebrate fossil localities have been recorded from this formation in the vicinity. Recovered fossils include specimens of fish and primitive baleen whale. With implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring would be undertaken during excavation into the Monterey Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

There would be no impacts at this project site; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect

areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

There would be no impacts at this project site; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: Moderate pending geotechnical analysis

Soil Type: San Benito-Castaic-Calleguas-Balcom-Badland Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is comprised of well-drained, fine-grained silty/clayey soils that have rapid runoff characteristics with moderately slow permeability. This condition increases erosion hazards in areas of sloping terrain; however, the proposed building site is on relatively flat grade. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the local City planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features,

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program, City of Agora Hills 2035 General Plan

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site AGH and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site AGH was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site AGH. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site AGH would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site AGH, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site AGH would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Russell Valley

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Agoura Hills

General Plan Designation: Open Space-Deed Restricted

Zoning: Open Space-Deed Restricted

What is the zoning height restriction, if any?:

60 feet

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Agoura Hills

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such plans, policies, and regulations are not applicable to the project. Nevertheless, in the exercise of its discretion and in the interest in working cooperatively with local jurisdictions, local land-use plans, policies, and regulations are referenced, described, and addressed in recognition that such plans, policies, and regulations reflect the local community's policy decisions with respect to appropriate uses of land in the area. Consideration of these plans, policies and regulations, therefore, assists in determining whether the proposed project may conflict with nearby land uses, which could affect the analysis of whether the proposed project would result in potentially significant environmental impacts.

Based on the zoning ordinances for this site, the maximum allowable height of structures in this area is 60 feet.

Exceptions to the ordinance may be allowed, ordinarily through a conditional use permit. However, per the doctrine of intergovernmental immunity, the permit requirement is not applicable to the project. Because the Authority is exercising intergovernmental immunity, the City of Agoura Hills General Plan is not applicable and no conflict with the plan exists.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Agoura Hills

Applicable Noise Ordinance: Article IX - Zoning; Chapter 6 - Regulatory Provisions, Part 2 - Special Regulations; Division 6 - Noise Regulations

Noise Level Threshold: N/A; no construction from 8 pm to 7 am on weekdays, including Saturday, or at any time on Sunday or a legal holiday.

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar

to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 dBA daytime criterion but would exceed FTA threshold 80 dBA nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56

dBa at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Camino El Real

Distance (Miles): 0.8

Disaster Route: Kanan Road and Highway 101

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No

Nearest Highway/Freeway: Ventura Frwy

Distance (Miles): 0.8

Nearest Major Arterial: Thousand Oaks Blvd

Distance (Miles): 0.3

Access to the Project Site Provided Via: Kimberly Drive

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: LAS VIRGENES MUNI W DIST

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: AJT

Site Name: AeroJet

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on existing lattice tower without exceeding current overall height of the structure including appurtenances. Propose indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 2,000 square feet

Excavation: Up to 100 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures.

Aesthetics

Setting

Visual Description:

Site AJT is located in Chino Hills east of SR 142 and south of SR 71 in a lightly developed residential area consisting of hilly terrain. The site is on a high, sparsely vegetated and undeveloped hill top. A lattice tower with attached microwave dishes and two small one-story buildings exist. A few deciduous trees exist sporadically around the site. Small residential subdivisions exist to the north and west. A golf course and country club separate the site from the residences to the west. The site is visible from Palermo Drive, which is located just over 0.25-mile west of the site; however, no residences exist on Palermo Drive. New landscaping, which would eventually mature, exists between Palermo Drive and the site. The site is also visible from residences farther west of Palermo Drive on Milano Terrace, which is at a higher elevation, as well as from Catena Drive and Verona Court. None of the buildings located in the immediate vicinity of the project site exceed three stories. Buildings in the vicinity of the project appear to be in excellent condition.

Visual Sensitivity: Low

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Operational impacts would result from installation of the additional whip and microwave antennas to an existing tower, which already creates a visual intrusion onto the landscape in an area with few visual receptors. Given the distance of the existing tower from viewpoints or scenic vistas, the new antennas would not be noticeable. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no impacts to scenic vistas would occur.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site are low, and are already affected by the existing tower. The addition of new antennas to the existing lattice tower would not noticeably alter the site's visual character or quality. The same construction activities described for scenic vistas, described above, would also apply, with no change to the site's visual character.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be roof mounted or collocated and constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. No additional lighting would be required. This would not result in a substantial new source of day or nighttime light or glare that would adversely affect nighttime views of the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Industrial building

Distance to Sensitive Receptor: 350

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site AJT. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site AJT or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site AJT would not exceed the SCAQMD daily significance thresholds including Nox, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of Nox from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site AJT will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site AJT would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for Nox and could result in cumulatively considerable net increases in O3 from the Nox emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site AJT or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site AJT, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site AJT, which is 350 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 33 are higher than the SCAQMD thresholds for CO and No_x, lower for PM₁₀ and PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site AJT and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site AJT in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site AJT and all proposed Projects sites would not

include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

golden eagle (*Aquila chrysaetos*; CDFW-FP); long-eared owl (*Asio otus*; CDFW-SSC); western pond turtle (*Emys marmorata*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

California Walnut (*Juglans californica*) Grove

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

golden eagle - foraging (*Aquila chrysaetos*; CDFW-FP); long-eared owl (*Asio otus*; CDFW-SSC); California Walnut (*Juglans californica*) Grove

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

None

Local Policy or Ordinance for Biological Resources:

City of Chino Hills General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

California walnut [*Juglans californica* Woodland Alliance]; Association - *Juglans californica*-*Malosma laurina* (shrubland).

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site AJT is located in a mostly rural setting in the city of Chino Hills on rolling hills of heavily grazed non-native grassland and sparse California Black Walnut (*Juglans California*) Woodland. Trees are generally denser on north-facing slopes. Non-native grasses and herbaceous species dominate the understory with milk-thistle (*Silybum marianum*), biennial mustard (*Hirschfeldia incana*), horehound (*Marrubium vulgare*), coyote melon (*Cucurbita foetidissima*), and Indian tobacco (*Nicotiana glauca*). The project area is within the foraging range of the golden eagle (*Aquila chrysaetos*; CDFW-FP); eagles may pass by the project site while foraging, but the area around the study area does not provide steep cliffs or rocky crags used for nesting. The study area is at the interface of rural and urban development with roads and various buildings in the vicinity. Eagles are sensitive to disturbance from human activities, and so the vicinity of the project site provides less than ideal eagle foraging habitat. Suitable

nesting and foraging habitat for the long-eared owl (*Asio otus*; CDFW-SSC) is found within the project area. Pre-construction surveys for nesting birds will be conducted; if nesting owls are located a 500-foot avoidance buffer will be implemented. No wetland habitats are present in the project area that would be suitable for the western pond turtle (*Emys marmorata*; CDFW-SSC) or least Bell's vireo (*Vireo bellii pusillus*; ESA-E CA-E). Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities.

Mitigation Measure(s):

Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15 for non-raptors, and January 1 through July 31 for raptors. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. If nesting owls or eagles are located a 500-foot avoidance buffer will be implemented. • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

There are no riparian habitats within 500 feet of the project site. The California walnut grove vegetation community is found primarily down-slope on the north and west sides of the existing facility, though a few trees along the edge of the woodland stand are adjacent to the access road.

Mitigation Measure(s):

Minimize disturbance to natural vegetation; do not remove California walnut trees. Prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Use caution to minimize the use heavy equipment near (with the dripline) walnut trees to protect the plant's root system. Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes the following two wetland feature types as indicated by the National Wetland Inventory (USFWS 2014): 1) Freshwater Forested/Shrub Wetland; and 2) Riverine. However, these wetland types are restricted to ephemeral drainages. Adverse impacts to these wetlands may occur due to sedimentation as a result of runoff from the construction. However, construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from storm water runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The Chino Hills open space plan emphasizes, connecting trails, protecting large scale natural areas for wildlife, creating wildlife habitat, maintaining wildlife corridors, specialized use areas for gardens, grazing, golf, and community benefits such as recreation, camping and outdoor education. The site is presently located in an area used for grazing. Site is fenced and disturbed and would not interfere with present usages.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project activities have the potential to conflict with General Plan Policy CN-1.2 Preserve and protect Chino Hills' biological resources, however the proposed developments are an addition to the existing site facilities, and are consistent with current site usage; there would be no change in the nature of the on-site impacts.

Mitigation Measure(s):

Mitigation Recommended: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in October 2014. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Miocene Monterey Formation, which is known to be fossiliferous. No localities are recorded within the proposed site; however, vertebrate fossil localities have been recorded from this formation in the San Gabriel Valley region. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Monterey Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: Moderate pending geotechnical analysis

Soil Type: Soper-Fontana-Calleguas-Balcom-Anaheim Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). Proposed whip antenna and microwave transmitters would be placed on existing lattice tower. A geotechnical report would not be required, however structural engineers would evaluate the existing lattice tower to determine if can safely support the proposed new equipment. Antennas would be collocated to existing lattice structure, therefore a geotechnical study for new structures is not required. All structures in southern California are located within an area subject to seismic shaking. The UBC and CBC have specific design requirements to reduce or eliminate the effects of seismic shaking. Permitting processes are required to evaluate and mitigate other geologic hazards such as landslides prior to issuance of a building permit. Existing structures were built in accordance with current UBC and CBC at the time of construction. Therefore, the

effects of seismic shaking or other geologic hazards would be less than significant.

Mitigation Measure(s):

None required.

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is comprised of well-drained, gravelly sandy clay loam that has a rapid runoff characteristics with moderately slow permeability. This condition increases erosion hazards in areas of sloping terrain; however, the proposed building site is on relatively flat grade. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the local City planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Proposed antennas and microwave units are to be co-located to an existing tower, there fore no new structures would be built. There is no impact during construction, as no structures are being built.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site AJT and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site AJT was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site AJT. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site AJT would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site AJT, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site AJT would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Santa Ana

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation would not be required at the site therefore dewatering would not be necessary. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting

process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Chino Hills

General Plan Designation: Undesignated

Zoning: Rural Residential

What is the zoning height restriction, if any?:

70 feet

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Chino Hills

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing telecommunications structure and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Chino Hills

Applicable Noise Ordinance: Title 8 – Health and Safety, Chapter 8.08 – Noise Control

Noise Level Threshold: N/A; no construction from 7 pm to 7 am on weekdays and between 8:00 a.m. and 6:00 p.m. on Saturdays, excluding federal holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 dBA daytime criterion but would exceed FTA threshold 80 dBA nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient

noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: Congestion Management Program for San Bernardino County

County Congestion Management Road or Highway: Carbon Canyon Road

Distance (Miles): 1.4

Disaster Route: No published route identified

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Corona Frwy

Distance (Miles): 1.67

Nearest Major Arterial: Grand Ave

Distance (Miles): 3.58

Access to the Project Site Provided Via: Woodview Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles

bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Savage Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Dewatering would not be required for building mount or collocation sites because groundwater is not expected at the shallow depths of excavation associated with this activity. Wastewater treatment plants in the project would not be affected during construction. During operations, the project would not result in the production of any wastewater that would require treatment.

Mitigation Measure(s):

None required.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: ASD

Site Name: Auto Square Drive

Site Discussion:

Propose installation of up to 20 whip and up to 5 microwave antennas on new monopole up to 70 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose construction of up to 200 foot long brick wall to match existing wall. Propose installation of up to 3 HVAC units. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 150 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 8 foot diameter x 36 foot deep drilled caisson with concrete cap for monopole support; or up to 16 foot x 16 foot x 10 foot deep concrete mat foundation.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

The site consists of a gazebo-like structure set within a roundabout in Auto Square Drive, which is in an enormous car dealership area. The site is nearly completely surrounded on all sides by a plaza that contains multiple car dealerships and encompasses nearly the entire surrounding 0.25-mile radius. Large multi-story dealership buildings occur within this plaza, which often block views of the gazebo. The channelized San Gabriel River constitutes the plaza's western border. A residential area exists west of the river, consisting of modest 1- and 2-story, tightly-spaced houses behind a screen of tall evergreen vegetation that lines the street. A greenspace and small park occupy a small sliver of land between the houses and river at the far southwestern section of the 0.25-mile radius. Beyond the greenspace, the ground slopes upward at the channel's edge, which is lined by a chain link fence. Transmission lines comprised of lattice towers and telephone poles, both carrying multiple sets of wires, parallel either side of the concrete river channel.

Visual Sensitivity: Low

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located in a highly developed commercial urban setting within a large automobile dealership complex. The site is not within a scenic vista or within view of one.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located in a highly developed commercial urban setting within a large automobile dealership complex, with low visual quality. The new structures would be compatible with the visual character of the existing site and the commercial setting, particularly given the presence of numerous motor vehicles, dealership buildings, transmission lines, telephone poles, and utilitarian commercial buildings.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in an urban area and would include construction of new facilities. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. This site is in an urban area where numerous sources of day and nighttime lighting are present, such as vehicle headlights, traffic signals, street lights, and building security lights. Because of the presence of these light sources, tower lighting, if required, would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Kiosk

Distance to Sensitive Receptor: 20

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site ASD. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOX emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOX emissions limits. With implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or

obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site ASD or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site ASD would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site ASD will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100

pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site ASD would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for Nox and could result in cumulatively considerable net increases in O3 from the Nox emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site ASD or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site ASD, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site ASD, which is 20 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 4 are higher for CO and lower for NO_x, PM₁₀, PM_{2.5} than the SCAQMD thresholds but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site ASD and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site ASD in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site ASD and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

western yellow-billed cuckoo (*Coccyzus americanus occidentalis*; ESA-T, CA-E)

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

None

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

None

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

None

Local Policy or Ordinance for Biological Resources:

City of Cerritos General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Urban

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site ASD is located in a highly urbanized setting with extensive paved surfaces and minimal lawn and landscape vegetation within the Cerritos Auto Mall. No suitable riparian habitat for the western yellow-billed cuckoo (*Coccyzus americanus occidentalis*; ESA-T, CA-E) is found within the project area. The area is fully paved, with minor amount of lawn.

Mitigation Measure(s):

None required.

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Riverine wetland feature type as indicated by the National Wetland Inventory (USFWS 2014). However, the boundaries of this wetland type are located along the concrete-line bank of the San Gabriel River and entirely within a paved area. Adverse impacts to this wetland may occur due to sedimentation as a result of runoff from the construction. However, construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from storm water runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The City of Cerritos General Plan does not include policies to protect biological resources.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research conducted in May 2014. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as low sensitivity younger Quaternary alluvial sediments at the surface. However, these deposits typically overlie older geologic units that may contain significant vertebrate fossils at depth. No localities are recorded within the proposed site; however, fossil localities have been recorded in similar Quaternary sediments throughout the Los Angeles Basin at depths as shallow as two to eight feet. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site when excavation depths exceed five feet. Periodic paleontological spot checks are required when excavation exceeds depths of five feet into the Quaternary alluvium to determine if older, paleontologically sensitive sediments are present. If present, monitoring would be conducted during excavation into paleontologically sensitive sediments to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 for the overlapping LPK project location and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Quaternary alluvium and marine deposits

Stability: Moderate pending geotechnical investigation

Soil Type: Urban land-Sorrento-Hanford Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: Yes

Landslide Zone: No

Steep Slopes: No

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, or potential land subsidence area. The site does lie within a potential liquefaction area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking including liquefaction. GMED may require special foundation requirements, such as spread footings, deep piles, or other modifications to the foundation to reduce potential

effects of liquefaction. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Soil type would be determined upon completion of geotechnical analysis. However, there is a Less than Significant impact to soil erosion since the proposed site is surrounded by asphalt and concrete surfaces. Potential for soil erosion is limited to construction activities, when there may be a Less than Significant impact to erosion resulting from exposed soils during construction. However, the proposed building site is on relatively flat grade. Building permits require that standard BMPs for erosion control be put in place on all projects. All exposed surfaces from the construction of the project would be covered in hard surfaces once complete. Construction plans are reviewed by the issuing agency for the building permit, to ensure proper drainage is maintained and directed towards existing storm drain inlets.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, or potential land subsidence area. The site does lie within a potential liquefaction area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking including liquefaction. GMED may require special foundation requirements, such as spread footings, deep piles, or other modifications to the foundation to reduce potential effects of liquefaction. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard

has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site ASD and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days. Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B-1.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site ASD was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site ASD. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site ASD would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source

categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site ASD, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site ASD would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The project site is not within a designated Fire Hazard Severity Zone.

Mitigation Measure(s):

None required.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Coastal plain of Los Angeles

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Site ASD is within 500 feet of an aqueduct, but the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Cerritos

General Plan Designation: ADP-5 Cerritos Auto Square

Zoning: Auto Mall/ Restricted Commercial

What is the zoning height restriction, if any?:

85 feet

City or county permit requirements for communication facilities, if any:

None identified

Comprehensive Plan or General Plan Local Agency: Cerritos

Los Angeles County Community or Area Plan: Gateway Planning Area

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing telecommunications structure and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

The proposed facilities at this site would not be inconsistent with the applicable Los Angeles County General Plan policies.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Cerritos

Applicable Noise Ordinance: Cerritos Municipal Code, Chapter 22.80 - Environmental Performance Standards, Section 480 - Noise

Noise Level Threshold: N/A; no construction from 7 pm to 7 am

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 dBA daytime criterion but would exceed FTA threshold 80 dBA nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient

noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Interstate 605

Distance (Miles): 0.22

Disaster Route: Interstate 605

Transit, Bicycle, or Pedestrian Facilities: San Gabriel River Trail, LA Metro West Santa Ana Branch

Within Vicinity of Aviation Facility: Approximately 21,900 feet from runway at Long Beach Municipal Airport

Nearest Highway/Freeway: Interstate 605

Distance (Miles): 0.23

Nearest Major Arterial: Studebaker Road

Distance (Miles): 0.1

Access to the Project Site Provided Via: Auto Square Drive

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In this urbanized area, this construction-related traffic would be less than one-quarter of a percent of the average daily traffic.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site ASD is approximately 19,000 feet from Long Beach Airport. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered (in this case, antennas mounted to a 70-foot-tall monopole), the TOWAIR tool indicates that the antenna structure is a “pass slope determination,” which indicates the structure would not interfere with takeoff and landing operations, and does not require Federal Aviation Administration (FAA) notification based on the structure height and distance from runways. No impacts to aviation flight safety are anticipated.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day at each site, and typically would be less than 1 percent of average daily traffic on nearby streets. Construction-related activities may require lane narrowing at a driveway or detours in the parking lots of existing facilities. These actions could temporarily impair access on adjacent roadways, potentially creating traffic hazards and limiting emergency access, resulting in a significant impact. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

TRANS MM 1: The construction contractor shall maintain a minimum of one open lane of traffic at all site access roads during project construction. Use of standard construction traffic control practices such as flagmen, warning signs, and other measures shall be implemented as necessary to ensure that traffic flow remains uninterrupted at all times.

TRANS MM 2: Any temporary road or lane closures that may affect state highways shall be coordinated with Caltrans prior to commencement of construction at the site that will require the road or lane closures. If construction requires temporary road or lane closures on roads and streets managed by local entities, a traffic management plan shall be prepared and submitted to the relevant county and/or city public works department or other appropriate department for approval prior to commencement of construction at the site. Encroachment permits would be obtained where applicable.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Savage Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: City of Cerritos

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: BJM

Site Name: Black Jack Peak

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Setting

Visual Description:

The Black Jack Peak site is approximately 0.25 mile east of and above Blackjack Campground, which is located about 1,600 feet above sea level on Catalina Island. The site is in proximity to Catalina Island's primary road. A large red and white lattice tower with some attached microwave dishes exists on site adjacent to a large one-story equipment shelter. The area consists of pine and eucalyptus trees. Vegetation is primarily low and none is tall enough to obscure the site. A stone wall surrounds part of the site, which is enclosed by a chain link fence. The existing tower is a predominant feature on a tall ridge top, with no tall surrounding vegetation or other visual obstructions. Vegetation around the site is low and sparse. The campground provides "sweeping views" of rolling terrain to the ocean (Santa Catalina Island Co n.d.). Views from the campground are dominated by rolling terrain, canyons, and panoramic views out to sea (Catalina Island Explorer n.d.). The site would be in view of the Trans Catalina hiking trail to the south. Although it has no official scenic designation, the 37-mile Trans-Catalina trail, completed in 2009, traverses Catalina Island in its entirety and offers "spectacular views across the 43,000-acre Nature Preserve of the Catalina Island Conservancy known as Catalina's 'Interior'." Cyclists are permitted on the East End portion. Visitors hike a single section of the trail, or hike the entire route over multiple days (Catalina Island Conservancy 2015). In addition, another hiking trail/service road bypasses the site to the north, and the island's primary road is about 0.3 mile to the east (Catalina Chamber n.d.). Sensitive viewers would be campers, hikers, and visitors traveling the primary road

Visual Sensitivity: High

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: Yes, Santa Catalina Island Local Coastal Plan

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Trans-Catalina Trail

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present, particularly given the prominence of the unobstructed ridge top. However, the new facilities would be located within a site that includes an existing tower that already creates a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing tower, which would attenuate the noticeability of new structure. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be

barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. The site is located adjacent to the Trans Catalina hiking trail. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts that would occur on weekdays when visitation to Catalina Island, the campground, and the Trans Catalina Trail would be lower.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings has already been degraded by the presence of an existing site and large lattice tower. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations

safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Campsite

Distance to Sensitive Receptor: 1654

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site BJM. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site BJM or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site BJM would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site BJM will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site BJM would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site BJM or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for Nox, CO, PM10, and PM2.5. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site BJM, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site BJM, which is 1,654 feet from the nearest receptors, the LSTs for criteria pollutants are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site BJM and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site BJM in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site BJM and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators

and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T); Townsend's big-eared bat (*Corynorhinus townsendii*; CA-PT; CDFW-SSC); two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC); groundfish (M&F-EFH)

Special Status Plants Recorded within 1 Mile:

beach spectaclepod (*Dithyrea maritima*; CA-T, 1B.1); California dissantheium (*Dissantheium californicum*; 1B.2); Catalina crossosoma (*Crossosoma californicum*; 1B.2); island rush-rose (*Crocantemum greenii*; ESA-T, 1B.2); round-leaved filaree (*California macrophylla*; 1B.1); Santa Catalina figwort (*Scrophularia villosa*; 1B.2); Santa Catalina Island currant (*Ribes viburnifolium*; 1B.2); Santa Catalina Island ironwood (*Lyonothamnus floribundus* ssp *floribundus*; 1B.2); Santa Catalina Island manzanita (*Arctostaphylos catalinae*; 1B.2); Santa Cruz Island winged-rock cress (*Sibara filifolia*; ESA-E, 1B.1); south island bush-poppy (*Dendromecon harfordii* var. *rhamnoides*; 3.1); Wallace's nightshade (*Solanum wallacei*; 1B.1)

Sensitive Communities Recorded within 1 Mile:

None

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T); Townsend's big-eared bat - foraging (*Corynorhinus townsendii*; CA-PT; bald eagle (*Haliaeetus leucocephalus*; CA-E, CDFW-FP, USFS-S); groundfish (M&F-EFH); dissantheium (*Dissantheium californicum*; 1B.2); round-leaved filaree (*California macrophylla*; 1B.1); Santa Cruz Island winged-rock cress (*Sibara filifolia*; ESA-E, 1B.1); round-leaved filaree (*California macrophylla*; 1B.1); island rush-rose (*Crocantemum greenii*; ESA-T, 1B.2); Wallace's nightshade (*Solanum wallacei*; CNPS-1B.1)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

Santa Catalina Island Open Space Easement (Santa Catalina Island Conservancy); SEA/CRA – Santa Catalina Island; SEA – Swain's Canyon; SCAG Zoning - Wildlife Preserves and Sanctuaries

Local Policy or Ordinance for Biological Resources:

Santa Catalina Island Local Coastal Program

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Coastal prickly pear scrub [*Opuntia littoralis* shrubland Alliance]; Association- *Opuntia littoralis*-mixed coastal sage scrub (Chaparral).

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site BJM is located on Black Jack Peak on Santa Catalina Island on hill top that has been leveled and mostly paved to support of the existing facilities. The vegetation in the area has been heavily impacted by overgrazing and long-term drought resulting in bare soil and an increase in non-palatable plant species. Adjacent to the site is coastal sage scrub bisected by hiking trails and bike paths. Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T) may occur throughout the area. Townsend's big-eared bat (*Corynorhinus townsendii*; CA-PT; CDFW-SSC) may forage in the project area, but no potential roost sites of caves or mines are known to occur in the project area. Bald eagles (*Haliaeetus leucocephalus*; CA-E, CDFW-FP, USFS-S) nest on Catalina Island and may occur throughout the area; Site BJM is about 1 mile from the Twin Rocks bald eagle nesting territory (one of 8 nesting territories on Catalina Island in 2014). Project activities are not in the vicinity of potential nest sites and do not interfere with foraging habitat along the coast. No riparian/aquatic habitat suitable for two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC) occurs in the project area. Essential fish habitat has been designated for groundfish (a guild of bottom dwelling marine fishes) along the coastline within the project area; no project activities would impact marine environments. Twelve sensitive plant species have been recorded from the area. The survey conducted on 10/7/14 was too late in the season to identify any of the three annuals: dissanthelium (*Dissanthelium californicum*; 1B.2), round-leaved filaree (*California macrophylla*; 1B.1), and Santa Cruz Island rockcress (*Sibara filifolia*; ESA-E, 1B.1). The beach spectacle pod (*Dithyrea maritima*; CA-T, 1B.1) grows on beach sand dunes; no habitat present in project area. The dissanthelium (*Dissanthelium californicum*; 1B.2) is a native annual grass that grows on mesic sites in canyons, especially after fires. This species is extremely rare and can only be identified after adequate spring rains. No habitat occurs in the project area. The round-leaved filaree (*California macrophylla*; 1B.1) usually occurs in grassy depressions in clay soils. Because it can grow in disturbed conditions its presence or absence would be determined by a spring survey. The crossosoma and island rush-rose are perennials. The crossosoma is a perennial shrub that is most common in narrow canyons and north-facing slopes and was not present within the survey area; suitable habitat is not present in the project area. The island rush-rose (*Crocanthemum greenii*; ESA-T, 1B.2) is a small perennial that could re-sprout and be observable after spring rains following fires. Suitable habitat for this species, includes dry slopes, washes in coastal sage scrub, and desert transition chaparral. Suitable habitat is present in the project area. It has been collected at the foot of Black Jack Peak in 2013. Santa Catalina figwort (*Scrophularia villosa*; 1B.2) and Santa Catalina Island currant (*Ribes viburnifolium*; 1B.2) grow in mesic canyons; no suitable habitat is present in the project area. Santa Catalina Island ironwood (*Lyonothamnus floribundus ssp floribundus*; 1B.2) is a tree and would be observed during the survey. Santa Catalina Island manzanita (*Arctostaphylos catalinae*; 1B.2) and south island bush-poppy (*Dendromecon harfordii* var. *rhamnoides*; 3.1) are distinctive shrubs and would be observed during the habitat assessment. Santa Cruz Island winged-rock cress (*Sibara filifolia*; ESA-E, 1B.1) occurs on rocky volcanic slopes within coastal scrub. A survey in 1901 and 1973 located this plant within 3 miles of the project site; a 1997 survey did not locate plant. Wallace's nightshade (*Solanum wallacei*; 1B.1) occurs on rocky sites within chaparral; could be eliminated by overgrazing and might be observed after spring rains. Not observed during site surveys, but potentially suitable habitat is present. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Worker environmental awareness training would be required for all construction employees. Prior to initiation of construction activities, the project area is to be inspected for the presence of fox dens; if a den is located no construction activities would be initiated and USFWS would be contacted. Sites that may be used as hiding cover by a fox (e.g., open pipes, equipment piles) would be inspected prior to moving. Manage trenches so as not to trap wildlife. Conduct spring botanical surveys for dissanthelium (*Dissanthelium californicum*; 1B.2), round-leaved filaree (*California macrophylla*; 1B.1), Santa Cruz Island winged-rock cress (*Sibara filifolia*; ESA-E, 1B.1), round-leaved filaree (*California macrophylla*; 1B.1), Wallace's nightshade (*Solanum wallacei*; 1B.1), and island rush-rose (*Crocanthemum greenii*; ESA-T, 1B.2); if present mark the areas requiring special protection. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site

construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 20 Santa Catalina Island Fox Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is located within the Santa Catalina Island (Swain's Canyon) Coastal Resource Area and SEA. This CRA provides unobstructed wildlife movement throughout its open spaces mainly in drainages and along ridgelines and dirt roads. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement. Blackjack Mountain is listed one of the 37 SEA's on the island.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Construction at the proposed Project site may conflict with policies described in California Public Resources Code Section 30240, and with specific policies contained in the Santa Catalina Island Local Coastal Plan. Construction activities on site could potentially degrade habitat values (as discussed in Impact BIO 1) in Environmentally Sensitive Habitat Areas (ESHAs), which would in turn conflict with the California Public Resources Code that precludes these ESHA impacts, and thus conflict with the Santa Catalina Island Local Coastal Plan. These conflicts would be precluded by the measures identified in Impact BIO 1. Specifically identified within the Santa Catalina Island Local Coastal Plan: • Policy 3 of the plan prohibits introduction of non-native animals to Santa Catalina Island and workers bringing pets to the site could potentially create conflict, but application of BIO MM 10, No Pets would preclude these impacts. • Policy 11 requires procedures for grading and other site procedures to minimize erosion, but BMPs to be applied at every site are designed to prevent any erosion from the site. • Proliferation of non-native weeds (considered in Policy 20) would be precluded by application of BIO MM 24, Prevent the Spread of Non-native Vegetation. Impacts associated with construction would be less than significant with mitigation. Operational activities at the site would not alter habitats, and thus would not result in any substantive conflict with existing local policies or ordinances. Impacts would be less than significant.

Mitigation Measure(s):

Incorporation of mitigation measures identified at Impact BIO-1 and application of BIO MM 10 and BIO MM 23 would preclude impacts to sensitive species, thereby avoiding or reducing construction impacts, and in turn avoiding or reducing conflicts with the Santa Catalina Island Local Coastal Plan. This would be verified by application of LU MM 1, which would require the Authority obtain a coastal development permit prior to construction at the site. Mitigation Required: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 20 Santa Catalina Island Fox Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in October 2014. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Tertiary volcanic flow rocks, unit 8 (Southern California Basin)

Stability: Moderate to High pending geotechnical analysis

Soil Type: Xerorthents-Thirst-Shoba-SanClemente-Rock outcrop-Eelpoint Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is comprised of well-drained, stony/cobbly silt loam that has a moderate runoff characteristics and slow permeability. This condition caused little to no erosion hazards. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the local City planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site BJM and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days. Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B-1.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site BJM was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site BJM. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site BJM would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source

categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site BJM, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site BJM would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: Catalina Airport

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Located in a State Fire Hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site: Yes

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None Required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: None identified.

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: Santa Catalina Island Coastal Zone

Is the site located within a Airport Land Use Plan area?: No, but approximately 7,400 feet from Catalina Airport in the Sky

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space

Zoning: Open Space

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Catalina Island Land Use Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposal for this site is to construct a new up to 180-foot-tall lattice tower on land within the Santa Catalina Island Coastal Zone. Existing communication facilities occur at the site. The Local Coastal Plan policies discourage the siting of facilities, such as communications facilities, in high-visibility locations. New development is to be attractively designed to protect highly scenic natural or historical areas. The proposed lattice tower, sited in close proximity to existing facilities, helps to reduce impacts by consolidating similar facilities and would be designed in recognition of the recommended actions for new development to further reduce effects.

The final determination of consistency would be made by the agency responsible for issuing a Local Coastal

Permit. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan, and plan inconsistency is not considered a significant impact.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: Catalina Airport

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 dBA daytime criterion but would exceed FTA threshold 80 dBA nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This site is located within two miles of a public airport (Catalina), but outside of the 65 dBA CNEL developed by the airport land use plan. Estimated construction noise levels for this proposed Project site would be below the 90-dBA FTA threshold where adverse community reaction could occur during daytime hours but would exceed the 80-dBA nighttime threshold. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, this proposed Project locations is not located in a jurisdiction with a noise ordinance that is applicable to the Authority. Therefore, it is anticipated that construction of this site would not expose people to excessive noise levels. Impacts from construction of the Project would be less than significant.

After construction, the sites will be unmanned during operation except for occupational maintenance, which includes an estimated 58 dBA at 21 feet during the monthly backup generator during testing, would not be substantially different from existing levels, except for new sites in rural locations, where ambient noise levels would be closer to 45 dBA, and would generally occur less than once per week during daytime hours of between 8:00 a.m. and 6:00 p.m. on any day and 9:00 a.m. to 6:00 p.m. on Sundays, consistent with the Los Angeles County noise ordinance. Operation of the Project, including the HVAC system and emergency generator, would result in noise emissions below 60 dBA and would be considered “normally acceptable” for outdoor residential exposure. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels. Impacts from operation of the Project would be less than significant.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: Santa Catalina Island Coastal Zone

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: Yes

Other Recreational Area Names: Within Santa Catalina Island Open Space Easement

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. Site BJM is within the Santa Catalina Open Space Easement. Open space, like public land under federal management, may be used for recreation, but may have large expanses of land with no areas specifically designated for a concentrated recreational use. Enhancements to the existing communication facilities would not change the recreational opportunities or recreational experience. The communication site itself would preclude recreation and be a long-term permanent impact, but adjacent lands could continue to support compatible recreational uses. There is existing access to the site, and the proposed action to further develop the site would not change access to recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: S Western Ave

Distance (Miles): 23.32

Disaster Route: Boat or airplane

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: Approximately 7,800 feet horizontally from the Catalina Airport runway

Nearest Highway/Freeway: No highway/freeway on Santa Catalina Island

Distance (Miles): 0

Nearest Major Arterial: Shepard St

Distance (Miles): 22.89

Access to the Project Site Provided Via: Cape Canyon Trail

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site BJM is located approximately 7,800 feet horizontally from the Catalina Airport runway. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered (in this case, a 180-foot-tall lattice tower), the TOWAIR tool indicates that the antenna structure is a "fail slope determination," which indicates the structure could interfere with takeoff and landing operations, and would require Federal Aviation Administration (FAA) notification based on the structure height and distance from runways. According to Federal Aviation Regulation Part 77, the height of the proposed tower will require completion of FAA Form 7460-1, Notice of Proposed Construction or Alteration, so that the obstruction can be further evaluated to determine the hazard to navigation. The allowable height is 1 foot for every 100 feet of horizontal distance (a structure of about 78 feet in this case) when the proposal is for a 180-foot-high lattice tower. The proposed construction may be allowed, but not without further coordination with FAA. If FAA approves the tower for construction, this would indicate that operation of the tower would not change air traffic patterns or result in substantial safety risks to flight operations.

Mitigation Measure(s):

HAZ MM 2: Prior to issuance of building permits, the Contractor shall submit Form 7460-1 (Notice of Proposed Construction or Alteration) to the FAA, in the form and manner prescribed in 14 CFR part 77. The Contractor shall also provide documentation to the appropriate city or county planning agency demonstrating that the FAA has issued a "Determination of No Hazard to Air Navigation."

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Pebbly Beach Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: BUR

Site Name: Burnt Peak

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Address: Angeles National Forest, Pine Canyon Rd. to 7N23A

Surrounding area west of site

Aesthetics

Setting

Visual Description:

This isolated site is located in Angeles National Forest on a large cleared area on a high mountain top. A small, beige one-story, one-room windowless shelter and a 20-foot tall monopole currently exist, enclosed by a chain link fence. The site is remote and surrounded by densely wooded areas. This site is not visible from the closest roads due to abrupt topography, cut slopes, and vegetation. No trails, scenic corridors, or other sensitive vantage points have been identified in the vicinity of this site. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Back Country, Motor Vehicle Use Restricted. The site is also a USFS Designated Communication Site, which allows for such use on national forests except when identified as not suitable because of law, national or regional policy, or the revised forest plan (USFS n.d.1)

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Back Country (Motorized Use Restricted)

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new facilities would be located within or adjacent to a site that includes an existing FAA navigational aid, which currently does not create a substantial visual intrusion onto the landscape. The new facilities would be readily visible due to their height, existing topography, and distance but only apparent from remote viewing locations. This site is not visible from the closest roads due to abrupt topography, cut slopes, and vegetation. No trails, scenic corridors, or other sensitive vantage points have been identified in the vicinity of this site. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. The USFS has designated the SAC for this area as B, which is considered typical. The site is also a USFS Designated Communication Site, which allows for such use on national forests. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. At the proposed height, the new antenna support structure would have impacts only locally, given the lack of viewpoints toward the site, resulting in minor change to the site's scenic attractiveness rating. In addition, the site is located on a USFS Designated Communication Site, which generally allow for such use within the area's landscape. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Campsite

Distance to Sensitive Receptor: 6986

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site BUR. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site BUR or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site BUR would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site BUR will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site BUR would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site BUR or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site BUR, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site BUR, which is 6,896 feet from the nearest receptors, the LSTs for criteria pollutants are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site BUR and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site BUR in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site BUR and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators

and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

None

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

Southern Sycamore Alder Riparian Woodland; Southern Willow Scrub

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

California condor (*Gymnogyps californianus*; ESA-E, CA-E, CDFW-FP)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

Angeles National Forest

SCAG Zoning - Wildlife Preserves and Sanctuaries;

Natural Landscape Block - Liebre/Sawmill Mountains

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Canyon live oak chaparral [*Quercus chrysolepis* shrubland alliance]; Association - *Quercus chrysolepis* (native vegetation).

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site BUR is located at the top of Burnt Peak in association with existing facilities. The site is located within a dense and extensive stand of canyon live oak chaparral vegetation community. The study area is within the foraging range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), and potential nesting habitat may be found in steep mountainous terrain surrounding the study area. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. Several communication towers and facilities are present at and near the project site, and few if any anti-perch devices have been installed on these structures. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could

occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

A biological monitor will be present during construction and an environmental awareness program will be presented to all workers; all trash and construction debris (especially small items such as nuts and washers) will be removed from site each day; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 18 Nesting Bird Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Liebre/Sawmill Mountains Natural Landscape Block which overlaps the ranges of approximately 242 amphibian, reptile, mammal and bird species. However, the proposed

project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. There are no other historical resources within this project location. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Given the enormous size and scale of Resource P-19-186535, the small footprint of the Project site, and the lack of any resource-associated features at this proposed Project site, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the Project site, and the lack of any uniquely definable features at this proposed Project site, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Precambrian rocks, undivided, unit 2 (Mojave Desert and Transverse Ranges)

Stability: Moderate pending geotechnical analysis

Soil Type: Gaviota-Cieneba-Capistrano-Caperton Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of gravelly loam and unweathered bedrock, and adjacent soils are well-drained sands and gravels. Soils are well to excessively well drained and have very low to very high runoff with moderately rapid permeability. The proposed building site is relatively flat, though moderate to steep slopes surround the site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site BUR and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days. Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B-1.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site BUR was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site BUR. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site BUR would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source

categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO_{2e} decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO_{2e} in 2001 to 12 MTCO_{2e} in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO_{2e}. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO_{2e} to 7.98 million MTCO_{2e}, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site BUR, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site BUR would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Developed Area Interface

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Antelope Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health,

watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as in the Developed Area Interface. The Developed Area Interface zone includes areas adjacent to communities or concentrated use areas and developed sites with more scattered or isolated community infrastructure. The level of human use and infrastructure is typically higher than in other zones, and the level of development varies between areas that are highly developed to areas where no development has occurred. Although this zone may have a broad range of higher intensity uses, the management intent is to limit development to a slow increase of carefully designed facilities to help direct use into the most suitable areas and concentrating on improving facilities before developing new ones (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. No land use impacts are anticipated because of the communications site designation, but new development will still require a permitting process prior to construction.

Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 dBA daytime criterion but would exceed FTA threshold 80 dBA nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Developed Area Interface land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and not on land specifically designated for recreation, such as a campground or trailhead. Burnt Peak is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: State Route 138

Distance (Miles): 6.34

Disaster Route: State Route 138

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Golden State Frwy

Distance (Miles): 6.34

Nearest Major Arterial: Highway N-2

Distance (Miles): 2.3

Access to the Project Site Provided Via: Forest Route 7N23A

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Chiquita Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does not meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: BUR1

Site Name: Burnt Peak - 1

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Proposed construction of up to 200 foot long x 4 foot high retaining wall. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This site is in Angeles National Forest in the same general area as the Burnt Peak Site, and the same conditions apply. The site consists of a small one-story windowless shelter and a lattice tower with attached microwave dishes. The site is located on dirt ground and is enclosed by a chain link fence. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Back Country, Motor Vehicle Use Restricted. The site is also a USFS Designated Communication Site, which allows for such use on national forests except when identified as not suitable because of law, national or regional policy, or the revised forest plan (USFS n.d.1)

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Back County (Motorized Use Restricted)

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new facilities would be located within or adjacent to a site that includes an existing FAA navigational aid, which currently does not create a substantial visual intrusion onto the landscape. The new facilities would be readily visible due to their height, existing topography, and distance but only apparent from remote viewing locations. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. At the proposed height, the new antenna support structure would have impacts only locally, given the lack of viewpoints toward the site, resulting in minor change to the site's scenic attractiveness rating. In addition, the site is located on a USFS Designated Communication Site, which generally allow for such use within the area's landscape. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Campsite

Distance to Sensitive Receptor: 6940

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site BUR1. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOX emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOX emissions limits. With implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or

obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site BUR1 or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site BUR1 would not exceed the SCAQMD daily significance thresholds including Nox, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of Nox from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site BUR1 will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100

pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site BUR1 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site BUR1 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site BUR1, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site BUR1, which is 6.940 feet from the nearest receptors, the LSTs for criteria pollutants are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site BUR1 and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site BUR1 in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site BUR1 and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators

and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

None

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

Southern Sycamore Alder Riparian Woodland; Southern Willow Scrub

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

California condor (*Gymnogyps californianus*; ESA-E, CA-E, CDFW-FP)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

US Forest Service - Angeles National Forest; SCAG Zoning - Wildlife Preserves and Sanctuaries; Natural Landscape Block - Liebre/Sawmill Mountains

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Canyon live oak chaparral [*Quercus chrysolepis* shrubland alliance]; Association - *Quercus chrysolepis* (native vegetation).

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site BUR1 is located at the top of Burnt Peak in association with existing facilities. The site is located within the canyon live oak chaparral vegetation community. The study area is within the foraging range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), and potential nesting habitat may be found in steep mountainous terrain surrounding the study area. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. Several communication towers and facilities are present at and near the project site, and few if any anti-perch devices have been installed on these structures. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision

hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

An biological monitor will be present during construction and an environmental awareness program will be presented to all workers; all trash and construction debris (especially small items such as nuts and washers) will be removed from site each day; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 18 Nesting Bird Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Liebre/Sawmill Mountains Natural Landscape Block which overlaps the ranges of approximately 242 amphibian, reptile, mammal and bird species. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site

usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. There are no other historical resources within this project location. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Given the enormous size and scale of Resource P-19-186535, the small footprint of the Project site, and the lack of any resource-associated features at this proposed Project site, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the Project site, and the lack of any uniquely definable features at this proposed Project site, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Precambrian rocks, undivided, unit 2 (Mojave Desert and Transverse Ranges)

Stability: Moderate pending geotechnical analysis

Soil Type: Gaviota-Cieneba-Capistrano-Caperton Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of gravelly loam and unweathered bedrock, and adjacent soils are well-drained sands and gravels. Soils are well to excessively well drained and have very low to very high runoff with moderately rapid permeability. The proposed building site is relatively flat, though moderate to steep slopes surround the site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site BUR1 and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days. Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B-1.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site BUR1 was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site BUR1. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site BUR1 would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to

2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site BUR1, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site BUR1 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Developed Area Interface

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Antelope Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health,

watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as in the Developed Area Interface. The Developed Area Interface zone includes areas adjacent to communities or concentrated use areas and developed sites with more scattered or isolated community infrastructure. The level of human use and infrastructure is typically higher than in other zones, and the level of development varies between areas that are highly developed to areas where no development has occurred. Although this zone may have a broad range of higher intensity uses, the management intent is to limit development to a slow increase of carefully designed facilities to help direct use into the most suitable areas and concentrating on improving facilities before developing new ones (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. No land use impacts are anticipated because of the communications site designation, but new development will still require a permitting process prior to construction.

Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B-3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 dBA daytime criterion but would exceed FTA threshold 80 dBA nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Developed Area Interface land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and not on land specifically designated for recreation, such as a campground or trailhead. Burnt Peak is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: State Route 138

Distance (Miles): 6.33

Disaster Route: State Route 138

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Golden State Frwy

Distance (Miles): 6.33

Nearest Major Arterial: Highway N-2

Distance (Miles): 2.23

Access to the Project Site Provided Via: Forest Route 7N23A

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Chiquita Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: BUR2

Site Name: Burnt Peak - 2

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Proposed construction of up to 200 foot long x 4 foot high retaining wall. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Surrounding area west of site

Aesthetics

Setting

Visual Description:

This site is in the same general area as the Burnt Peak site, and the same conditions apply. This site includes a small one-story windowless shelter, smaller similar structure, propane tank, and wide lattice tower with square footprint. The site is located on dirt ground and is enclosed by a high concrete wall. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Back Country, Motor Vehicle Use Restricted. The site is also a USFS Designated Communication Site, which allows for such use on national forests except when identified as not suitable because of law, national or regional policy, or the revised forest plan (USFS n.d.1)

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Back County (Motorized Use Restricted)

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new facilities would be located within or adjacent to a site that includes an existing FAA navigational aid, which currently does not create a substantial visual intrusion onto the landscape. The new facilities would be readily visible due to their height, existing topography, and distance but only apparent from remote viewing locations. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. At the proposed height, the new antenna support structure would have impacts only locally, given the lack of viewpoints toward the site, resulting in minor change to the site's scenic attractiveness rating. In addition, the site is located on a USFS Designated Communication Site, which generally allow for such use within the area's landscape. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Campsite

Distance to Sensitive Receptor: 6646

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site BUR2. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site BUR2 or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site BUR2 would not exceed the SCAQMD daily significance thresholds including Nox, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of Nox from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site BUR2 will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site BUR2 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site BUR2 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site BUR2, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site BUR2, which is 6,646 feet from the nearest receptors, the LSTs for criteria pollutants are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site BUR2 and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site BUR2 in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site BUR2 and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition,

the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Canyon live oak chaparral [*Quercus chrysolepis* shrubland alliance]; Association - *Quercus chrysolepis* (native vegetation).

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site BUR2 is located at the top of Burnt Peak in association with existing facilities. The site is located within the canyon live oak chaparral vegetation community. The study area is within the foraging range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), and potential nesting habitat may be found in steep mountainous terrain surrounding the study area. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. Several communication towers and facilities are present at and near the project site, and few if any anti-perch devices have been installed on these structures. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision

hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

An biological monitor will be present during construction and an environmental awareness program will be presented to all workers; all trash and construction debris (especially small items such as nuts and washers) will be removed from site each day; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 18 Nesting Bird Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Liebre/Sawmill Mountains Natural Landscape Block which overlaps the ranges of approximately 242 amphibian, reptile, mammal and bird species. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site

usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. There are no other historical resources within this project location. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Given the enormous size and scale of Resource P-19-186535, the small footprint of the Project site, and the lack of any resource-associated features at this proposed Project site, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the Project site, and the lack of any uniquely definable features at this proposed Project site, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Precambrian rocks, undivided, unit 2 (Mojave Desert and Transverse Ranges)

Stability: Moderate pending geotechnical analysis

Soil Type: Gaviota-Cieneba-Capistrano-Caperton Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of gravelly loam and unweathered bedrock, and adjacent soils are well-drained sands and gravels. Soils are well to excessively well drained and have very low to very high runoff with moderately rapid permeability. The proposed building site is relatively flat, though moderate to steep slopes surround the site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site BUR2 and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days. Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B-1.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site BUR2 was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site BUR2. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site BUR2 would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to

2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site BUR2, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site BUR2 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Developed Area Interface

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Antelope Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health,

watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as in the Developed Area Interface. The Developed Area Interface zone includes areas adjacent to communities or concentrated use areas and developed sites with more scattered or isolated community infrastructure. The level of human use and infrastructure is typically higher than in other zones, and the level of development varies between areas that are highly developed to areas where no development has occurred. Although this zone may have a broad range of higher intensity uses, the management intent is to limit development to a slow increase of carefully designed facilities to help direct use into the most suitable areas and concentrating on improving facilities before developing new ones (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. No land use impacts are anticipated because of the communications site designation, but new development will still require a permitting process prior to construction.

Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 dBA daytime criterion but would exceed FTA threshold 80 dBA nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Developed Area Interface land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and not on land specifically designated for recreation, such as a campground or trailhead. Burnt Peak is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: State Route 138

Distance (Miles): 6.28

Disaster Route: State Route 138

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Golden State Frwy

Distance (Miles): 6.28

Nearest Major Arterial: Highway N-2

Distance (Miles): 2.19

Access to the Project Site Provided Via: Forest Route 7N23A

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Chiquita Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: BUR3

Site Name: Burnt Peak - 3

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Surrounding area south of site

Site view looking east

Surrounding area east of site

Site view looking west

Surrounding area west of site

Aesthetics

Setting

Visual Description:

This site is the same as the Burnt Peak Site, and the same conditions apply. This site includes a small lattice tower and equipment shelter. No concrete pad exists and the structures are not enclosed by fences. Thises has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Back Country, Motor Vehicle Use Restricted (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Back County (Motorized Use Restricted)

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new facilities would be located within or adjacent to a site that includes an existing FAA navigational aid, which currently does not create a substantial visual intrusion onto the landscape. The new facilities would be readily visible due to their height, existing topography, and distance but only apparent from remote viewing locations. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. At the proposed height, the new antenna support structure would have impacts only locally, given the lack of viewpoints toward the site, resulting in minor change to the site's scenic attractiveness rating. In addition, the site is located on a USFS Designated Communication Site, which generally allow for such use within the area's landscape. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Campsite

Distance to Sensitive Receptor: 6554

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site BUR3. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site BUR3 or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site BUR3 would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site BUR3 will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site BUR3 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site BUR3 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site BUR3, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site BUR3, which is 6,554 feet from the nearest receptors, the LSTs for criteria pollutants are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site BUR3 and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site BUR3 in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site BUR3 and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition,

the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

None

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

Southern Sycamore Alder Riparian Woodland; Southern Willow Scrub

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

California condor (*Gymnogyps californianus*; ESA-E, CA-E, CDFW-FP)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

US Forest Service - Angeles National Forest; SCAG Zoning Wildlife Preserves and Sanctuaries; Natural Landscape Block-Liebre/Sawmill Mountains.

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Canyon live oak chaparral [*Quercus chrysolepis* shrubland alliance]; Association - *Quercus chrysolepis* (native vegetation).

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site BUR3 is located at the top of Burnt Peak in association with existing facilities. The site is located within a dense and extensive stand of the canyon live oak chaparral vegetation community. The study area is within the foraging range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), and potential nesting habitat may be found in steep mountainous terrain surrounding the study area. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. Several communication towers and facilities are present at and near the project site, and few if any anti-perch devices have been installed on these structures. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require

lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

An biological monitor will be present during construction and an environmental awareness program will be presented to all workers; all trash and construction debris (especially small items such as nuts and washers) will be removed from site each day; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 18 Nesting Bird Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Liebre/Sawmill Mountains Natural Landscape Block which overlaps the ranges of approximately 242 amphibian, reptile, mammal and bird species. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site

usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. There are no other historical resources within this project location. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Given the enormous size and scale of Resource P-19-186535, the small footprint of the Project site, and the lack of any resource-associated features at this proposed Project site, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the Project site, and the lack of any uniquely definable features at this proposed Project site, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Precambrian rocks, undivided, unit 2 (Mojave Desert and Transverse Ranges)

Stability: Moderate pending geotechnical analysis

Soil Type: Gaviota-Cieneba-Capistrano-Caperton Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of gravelly loam and unweathered bedrock, and adjacent soils are well-drained sands and gravels. Soils are well to excessively well drained and have very low to very high runoff with moderately rapid permeability. The proposed building site is relatively flat, though moderate to steep slopes surround the site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site BUR3 and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days. Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B-1.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site BUR3 was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site BUR3. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site BUR3 would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to

2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site BUR3, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site BUR3 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Developed Area Interface

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Antelope Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health,

watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as in the Developed Area Interface. The Developed Area Interface zone includes areas adjacent to communities or concentrated use areas and developed sites with more scattered or isolated community infrastructure. The level of human use and infrastructure is typically higher than in other zones, and the level of development varies between areas that are highly developed to areas where no development has occurred. Although this zone may have a broad range of higher intensity uses, the management intent is to limit development to a slow increase of carefully designed facilities to help direct use into the most suitable areas and concentrating on improving facilities before developing new ones (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. No land use impacts are anticipated because of the communications site designation, but new development will still require a permitting process prior to construction.

Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 dBA daytime criterion but would exceed FTA threshold 80 dBA nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Developed Area Interface land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and not on land specifically designated for recreation, such as a campground or trailhead. Burnt Peak is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: State Route 138

Distance (Miles): 6.25

Disaster Route: State Route 138

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Golden State Frwy

Distance (Miles): 6.25

Nearest Major Arterial: Highway N-2

Distance (Miles): 2.22

Access to the Project Site Provided Via: Forest Route 7N23A

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Chiquita Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does not meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: CPK

Site Name: Castro Peak

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Address: 928 Latigo Canyon Rd

Aesthetics

Setting

Visual Description:

This isolated ridge top site is within the Santa Monica Mountains National Recreation Area located southeast of the intersection of Mulholland Highway and Kanan Dume Road on a designated significant ridgeline. The site includes a cleared area with two existing lattice towers of unknown heights (one painted red and white), utility pole with transformer, three small one-story buildings, and associated equipment (e.g., propane tank) enclosed by a chain link fence. One of the lattice towers has a triangular footprint; the other has a rectangular footprint and several attached microwave dishes. Scattered, low chaparral vegetation surrounds the site. The Castro Peak Site is immediately adjacent to the NPS Castro Crest unit within the Santa Monica Mountains NRA, which is a prominent ridgeline that forms part of the Backbone Trail corridor, with “stunning rock formations and views of the ocean and mountains” (NPS 2002). The site is visible from a trailhead on Latigo Canyon Road for the Backbone Trail. The site is accessed via minor roads within the NRA; the access road has no outlet and does not lead to a designated recreation destination.

Visual Sensitivity: High

On federally administered public lands: No, but within boundary of Santa Monica Mountains NRA

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: Yes, Santa Monica Mountains Local Coastal Plan

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Backbone Trail

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: Yes

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is located on a designated significant ridgeline and is within view of a trailhead for the Backbone Trail. The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new facilities would be located within a site that includes existing towers that already create a visual intrusion onto the landscape. The proposed new facilities would not perceptibly change the scenic vista due to the presence of the existing towers, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings are impacted by the presence of an existing site and two towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: office trailer

Distance to Sensitive Receptor: 234

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site CPK. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site CPK or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?**Construction Impact:** Significant Impact Reduced to Less than Significant with Mitigation Incorporated**Operational Impact:** Less than Significant**Discussion:**

Emissions from the construction of proposed site CPK would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site CPK will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site CPK would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site CPK or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site CPK, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site CPK, which is 234 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are lower than the SCAQMD thresholds for CO and No_x, lower for PM₁₀ and PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site CPK and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site CPK in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site CPK and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); monarch butterfly (*Danaus plexippus*; ESA-Pet)

Special Status Plants Recorded within 1 Mile:

marcescent dudleya (*Dudleya cymosa* ssp. *Marcescens*; ESA-T; CA-R,1B.2); round-leaved filaree (California *macrophylla*; 1B.1); Santa Susana tarplant (*Deinandra minthornii*; CA-R,1B.2)

Sensitive Communities Recorded within 1 Mile:

None

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP); golden eagle (*Aquila chrysaetos*; CDFW-FP); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); California red-legged frog - dispersal (*Rana draytonii*; ESA-T; CDFW-SSC); Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1); round-leaved filaree (California *macrophylla*; 1B.1)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

Santa Monica Mountains National Recreation Area and Castro Crest (NPS); SEA/CRA- Santa Monica Mountains; CRA - Buffer 3B (Malibu Creek State Park Buffer Area); Los Angeles County Zoning - Open Space; SCAG Zoning - Wildlife Preserves and Sanctuaries, Beach Parks (Malibu Coastal Zone); Essential Connectivity Area - Castro Peak/Santa Monica Mountains - Pine Mountain/Sespe Condor Wildlife; Natural Landscape Block - Castro Peak/Santa Monica Mountains

Local Policy or Ordinance for Biological Resources:

Santa Monica Mountains Local Coastal Program Land Use Plan and Local Implementation Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Scrub oak chaparral [*Quercus berberidifolius* shrubland Alliance]; Association: *Quercus berberidifolia*-*Adenostoma fasciculatum*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site CPK is part of an existing communications facility located on a leveled top of Castro Peak within an extensive stand of scrub oak on the north-facing slopes and chaparral on the south facing slopes. Common species include

mountain mahogany (*Cercocarpus montanus*), big-berry manzanita (*Arctostaphylos glauca*), chamise (*Adenostoma fasciculata*), and laurel sumac (*Malosma laurina*). American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP) may pass through the study area while foraging, but the study area does not provide steep cliff habitat required for nesting. The project area is within the foraging range of the golden eagle (*Aquila chrysaetos*; CDFW-FP); eagles may pass by the project site while foraging, but the area around the study area does not provide steep cliffs or rocky crags used for nesting. Monarch butterfly (*Danaus plexippus*; ESA-Pet) may pass through the area, but no potential roost trees occur within the project area. Coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) may occur in the project area and individuals could be killed by project activities. Potentially suitable habitat (and a potential reintroduction site) for California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) has been reported by Santa Monica National Recreation Area to occur within 1 mile of Site CPK at an unspecified location within Malibu Creek State Park. Though the project site is located in steep mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. Potentially suitable habitat may occur in the study area, with the presence of Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1) controlled by the fire regime; however, all work is within existing developed site (paved, fenced, encircled by unpaved roads). Record from 2001 (2 mi to southwest) along a firebreak following a fire (where the plants were not previously recorded). Round-leaf filaree (*California macrophylla*; 1B) grows in grassy flats and depressions with clay soils in coastal sage scrub, native annual grassland, and oak woodland. Only poor quality habitat (hilltop within chaparral) exists in the project area; requires spring survey. Santa Susana tarplant (*Deinandra minthornii*; CA-R,1B.2) grows in openings in chaparral primarily on sandstone rock outcrops. Such habitat does not occur in the project area and this shrub was not observed during surveys. Marcescent dudleya (*Dudleya cymosa* ssp *marcescens*); ESA-T, CA-R, 1B.2) grows primarily on volcanic rock outcrops in canyons near streams. This plant is endemic to the Santa Monica Mountains. Suitable habitat does not occur within the project area. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) and coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) in the project area. Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. To protect dispersing California red-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Conduct spring botanical surveys for round-leaf filaree; if present mark the areas requiring special protection. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 19 Trenches and Holes Management • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site. Site CPK may be hydrologically connected to stream habitats that include California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) potentially suitable habitat.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Riverine wetland feature type as indicated by the National Wetland Inventory (USFWS 2015). However, this wetland type is restricted to an ephemeral drainage. Adverse impacts to this wetland may occur due to sedimentation as a result of runoff from the construction. However, construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from storm water runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is part of a large open space habitat block and regional wildlife linkage area. The site is part of a larger complex of communication facilities, and the proposed developments would be located entirely within, and would not expand, the existing development footprint. As such, they would be consistent with current site usage and would not alter the nature of site impacts. Therefore, there would be no substantial adverse impacts to habitat of significant value. The site is located within the CDFW's designated Castro Peak/Santa Monica Mountains Natural Landscape Block which overlaps the ranges of approximately 277 amphibian, reptile, mammal and bird species. It is located within an Essential Connectivity Area that connects with the Las Virgenes Creek/Santa Monica Mountains, Simi Hills, Santa Susana Mountains and Pine Mountain/Sespe Condor Natural Landscape Blocks. Additionally the site is located within the proposed Santa Monica Mountains (Buffer 3[B]) Coastal Resource Area, which is identified as an important regional habitat linkage in the Los Angeles General Plan. Linkages in this CRA connect open spaces together that may be fragmented due to rural development and connect to habitats in Ventura County. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. Additionally, due to the nature of the project, impacts to wildlife movement would be minimal to none. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

Mitigation Recommended: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker

Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Most of Site CPK is comprised of H3 habitat, but Significant Ecological Resource Areas (SERAs) identified at the site include H2 habitat located near the eastern site boundary. The study area for Site CPK contains H1 Quiet Zone habitat. Protection of SERAs identified in the land use plan (LUP) includes prohibition or other strict regulation of proposed site development. Policies contained within Goal CO-2 of the LUP offer protection of SERAs as a priority over other development standards in the Local Implementation Plan. Impacts to resources at the site are described in Impact BIO 1, Impact BIO 2, and Impact BIO 3. Existing site conditions include disturbed areas that are not considered SERAs, and therefore not subject to SERA restrictions. Because construction activity would potentially affect SERA(s), and construction and operations activities could impact migratory birds and other special-status species, a potential for conflict exists with LUP policies CO-40, CO-41, CO-42, and CO-44. This conflict would constitute a significant impact.

Mitigation Measure(s):

The mitigation measures identified in Impact BIO 1 and Impact BIO 2, coupled with application of LU MM 3 (requiring the Authority obtain a coastal development permit) would reduce impacts to less than significant. Mitigation Required: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 22 Monarch Butterfly Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There are no historical resources (archaeological) within the direct area of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. This was confirmed both through archival research and during the field survey conducted in January 2015; however, adjacent to the direct

APE, but within the near indirect APE, there is a single isolated archaeological feature (a rock ring). The rock ring (constructed of locally-sourced material and approximately 7.5 feet x 6.5 feet in size) was investigated during the field visit and there were no associated prehistoric or historic artifacts that would indicate its age or purpose. While the feature could be prehistoric, it could also be of more recent age and possibly even associated with construction, recreational, or operational use of the existing CPK communications tower complex. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required. However, in accordance with CUL MM 1, because of its unverified age and purpose, construction and operation personnel would avoid the rock feature to ensure that it is not disturbed.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the paleontologically sensitive Miocene Topanga Formation, which has produced numerous fossils of marine vertebrates throughout the County of Los Angeles. No localities are recorded within the proposed site; however, significant vertebrate fossils have been recorded from this formation in the Santa Monica Mountains region. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring would be undertaken during excavation into the Topanga Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the

absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: Low to Moderate based on designation within Landslide Zone

Soil Type: Urban land-Rock outcrop-Millsholm Association

Erosion Potential: Moderate to High based on designation within Landslide Zone

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require

additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The Millsholm series consists of shallow, well drained soils that formed in material weathered from sandstone, mudstone and shale often with clay content up to 30%. Moderate to steep slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard

has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site CPK and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days. Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B-1.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site CPK was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site CPK. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site CPK would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source

categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site CPK, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site CPK would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage

Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: Yes

If yes, please explain: Permitted 1,000 gallon diesel fuel UST on project site. Installed 1971. No documented releases associated with UST

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain:

Located in a State Fire Hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site: No

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC

plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open

areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced, and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: Santa Monica Mountains Coastal Zone

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Public and Semi-Public Facilities

Zoning: Light Agriculture

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Monica Mountains Coastal Zone

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site CPK is along an adopted Significant Ridgeline within the Santa Monica Mountains Coastal Zone. The Santa Monica Mountains Land Use Plan, a component of the Santa Monica Mountains Local Coastal Program, was issued in August 2014 and allows for telecommunication facilities within several land use categories, including open space, rural lands, rural residential, rural villages, residential, commercial, commercial recreation – limited intensity, and public and semi-public facilities (County of Los Angeles, Department of Regional Planning 2014). Per the Local Implementation Plan adopted in 2014, new development is prohibited along Significant Ridgelines. The highest point of a structure must be located at least 50 vertical feet and 50 horizontal feet from a Significant Ridgeline. Construction of the proposed project facilities at this site (to establish a 180-foot-tall tower) would result in a significant conflict with the Santa Monica Mountains Land Use Plan. The proposed action is not in

compliance with the adopted and certified Land Use Plan because the proposed project exceeds the identified height limitations. This site has previously been developed as a communications facility and collocation on the existing structure may be allowed. A Coastal Development Permit would need to be obtained prior to construction, and adherence to the terms of the permit would be required.

The final determination of consistency would be made by the agency responsible for issuing a Local Coastal Permit. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan, and plan inconsistency is not considered a significant impact.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B-3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 dBA daytime criterion but would exceed FTA threshold 80 dBA nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: Santa Monica Mountains Local Coastal Program, Land Use Plan

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Pacific Coast Hwy

Distance (Miles): 4.11

Disaster Route: Kanan Dume Road and Pacific Coast Highway are nearest routes

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Us Highway 101

Distance (Miles): 4.11

Nearest Major Arterial: Mulholland Hwy

Distance (Miles): 1.09

Access to the Project Site Provided Via: Castro Peak Motorway

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: LAS VIRGENES MUNI W DIST

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: DPK

Site Name: Dakin Peak

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 200 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Surrounding area east of site

Site view looking west

Surrounding area west of site

Aesthetics

Setting

Visual Description:

The Dakin Peak site is located on Catalina Island in the coastal zone approximately 2 miles inland (west) of the seaside town of Avalon, about 1,558 feet above sea level. This site includes a small one-story shelter inside a small, rectangular compound surrounded by a chain link fence. An existing 210-foot tall lattice tower and one-story shelter on a small triangular-shaped dirt area enclosed by a chain link fence is immediately adjacent to the east. Both sites are located within view of the Trans-Catalina Hiking Trail and a hiking trail/service road (Catalina Chamber n.d.). Vegetation is very low and no other development exists in the area. Primary sensitive viewers would be hikers and visitors traveling Stagecoach Road, a primary road that leads to Avalon.

Visual Sensitivity: High

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: Yes, Santa Catalina Island Local Coastal Plan

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Trans-Catalina Trail

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is located on a hilltop within view of the Trans-Catalina Hiking Trail and a hiking trail/service road. The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new facilities would be located directly adjacent to a site that includes an existing 210-foot tall tower that already creates a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing tower, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. A construction staging area would be created outside the chain link fence that currently surrounds the existing compound. Construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings are impacted by the presence of an adjacent existing site and tower. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing structures immediately adjacent to the site. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any vegetation disturbed by creation of the construction staging area would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 5600

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site DPK. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site DPK or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site DPK would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site DPK will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site DPK would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site DPK or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site DPK, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site DPK, which is 5,600 feet from the nearest receptors, the LSTs for criteria pollutants are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site DPK and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site DPK in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site DPK and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition,

the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T); Santa Catalina shrew (*Sorex ornatus willetti*; CDFW-SSC); groundfish (M&F-EFH)

Special Status Plants Recorded within 1 Mile:

aphanisma (*Aphanisma blitoides*; 1B.2); beach spectaclepod (*Dithyrea maritima*; CA-T, 1B.1); California dissanthelium (*Dissanthelium californicum*; 1B.2); Catalina crossosoma (*Crossosoma californicum*; 1B.2); chaparral ragwort (*Senecio aphanactis*; 2B.2); coast woolly-heads (*Nemacaulis denudata* var. *denudata*; 1B.2); Coulter's saltbush (*Atriplex coulteri*; 1B.2); Davidson's saltscale (*Atriplex serenana* var. *dauidsonii*; 1B.2); island green dudleya (*Dudleya virens* ssp. *insularis*; 1B.2); island rush-rose (*Crocanthemum greenei*; ESA-T, 1B.2); Nevin's woolly sunflower (*Constancea nevinii*; 1B.3); round-leaved filaree (*California macrophylla*; 1B.1); Santa Catalina figwort (*Scrophularia villosa*; 1B.2); Santa Catalina Island bedstraw (*Galium catalinense* ssp. *Catalinense*; 1B.2); Santa Catalina Island currant (*Ribes viburnifolium*; 1B.2); Santa Catalina Island desert-thorn (*Lycium brevipes* var. *hasse*; 1B.1); Santa Catalina Island ironwood (*Lyonothamnus floribundus* ssp. *floribundus*; 1B.2); Santa Catalina Island manzanita (*Arctostaphylos catalinae*; 1B.2); Santa Catalina Island monkeyflower (*Mimulus traskiae*; 1A); Santa Cruz Island winged-rockcress (*Sibara filifolia*; ESA-E, 1B.1); showy island snapdragon (*Gambelia speciosa*; 1B.2); south coast saltscale (*Atriplex pacifica*; 1B.2); Wallace's nightshade (*Solanum wallacei*; 1B.1)

Sensitive Communities Recorded within 1 Mile:

No

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T); Townsend's big-eared bat - foraging (*Corynorhinus townsendii*; CA-CT; CDFW-SSC); bald eagle (*Haliaeetus leucocephalus*; CA-E, CDFW-FP, USFS-S) island rush-rose (*Crocanthemum greenei*; ESA-T, CNPS-1B.2); Santa Cruz Island winged-rockcress (*Sibara filifolia*; ESA-E, 1B.1)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

No

Wildlife Corridor or Nursery Site:

Santa Catalina Island Open Space Easement (Santa Catalina Island Conservancy); SEA/CRA – Santa Catalina Island; SEA - Haypress Area; SCAG Zoning - Wildlife Preserves and Sanctuaries

Local Policy or Ordinance for Biological Resources:

Santa Catalina Island Local Coastal Program

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Laurel sumac scrub [*Malosma laurina* Shrubland Alliance]; Association-*Malosma laurina*-*Eriogonum fasciculatum*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site DPK is located on Santa Catalina Island on a ridgeline within a transition of coastal sage scrub and chaparral vegetation community. The area has been overgrazed, resulting in areas of bare soil. Common shrubs include coast prickly pear (*Opuntia littoralis*), white sage (*Salvia apiana*), laurel sumac (*Malosma laurina*), island buckwheat (*Eriogonum crocatum*), sagebrush (*Artemisia californica*), toyon (*Heteromeles arbutifolia*), black sage (*Salvia mellifera*), and lemonade berry (*Rhus integrifolia*). Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T) may occur throughout the area. Santa Catalina shrew (*Sorex ornatus willetti*; CDFW-SSC) is restricted to riparian areas/mesic sites which are not associated with the project area. Bald eagles (*Haliaeetus leucocephalus*; CA-E, CDFW-FP, USFS-S) nest on Catalina island and may occur throughout the area; project activities are not in the vicinity of potential nest sites and do not interfere with foraging habitat along the coast. Essential fish habitat has been designated for groundfish (a guild of bottom dwelling marine fishes) along the coastline within the project area; no project activities would impact marine environments. Aphanisma (*Aphanisma blitoides*; 1B.2) and beach spectaclepod (*Dithyrea maritima* CA- ST, 1B.1) occur primarily found in coastal sand dunes and sandy areas in coastal sage scrub; this habitat does not occur within the study area. California dissanthelium (*Dissanthelium californicum*; 1B.2) occurs in upper mesic canyons and non-weedy areas; the hilltop location does not provide habitat for this species. Catalina crossosoma (*Crossosoma californicum*; 1B.2) occur on cliffs and mesic north-facing steep slopes of canyons; this shrub was not observed during surveys, and the area does not provide habitat for the species. Chaparral ragwort (*Senecio aphanactis*; 2.2) occurs in alkaline flats of the coastal sage scrub and oak woodland; such habitat does not occur in the project area. Coast woolly (*Nemacaulis denudata*; 1B.2) occurs in coastal dunes and sandy wash benches along coastal streams, which is not present in the project area. The island rush-rose (*Crocantemum greenii*; ESA-T, 1B.2) is a small perennial that could re-sprout and be observable after spring rains following fires. Suitable habitat for this species, includes dry slopes, washes in coastal sage scrub, and desert transition chaparral; suitable habitat is present in the study area. Several occurrences were recorded within one mile between 2013 and 2014 (Goat Harbor burn area). Santa Cruz Island rockcress (*Sibara filifolia*; ESA-E, 1B.1) occurs on rocky volcanic slopes within coastal scrub. A survey in 1901 and 1973 located this plant within 3 miles of the project site; a 1997 survey did not locate plant. Potentially suitable habitat does occur in the project area. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that exceeds 200 feet in height and may require lighting presents unavoidable collision hazard for migratory birds; construction and design of the tower outside guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T) in the project area. Prior to initiation of construction activities, the site is to be inspected for the presence of fox dens; if a den is located no construction activities would be initiated and USFWS would be contacted no later than the next business day. Sites that may be used as hiding cover by a fox (e.g., open pipes, equipment piles) would be inspected prior to moving. Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Any project activities that would increase the footprint of the existing site may impact native vegetation and potentially the island rush-rose (*Crocantemum greenii*; ESA-T, CNPS-1B.2) and Santa Cruz Island rockcress (*Sibara filifolia*; ESA-E, 1B.1); preconstruction surveys would verify if present, and protect as necessary. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Lighting on new 215-foot tall lattice tower to be designed in cooperation with FAA and USFWS Office of Migratory Birds to minimize attraction and resulting mortality of migratory birds. Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 9

Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 20 Santa Catalina Island Fox Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is located within the Santa Catalina Island (Haypress Areas) Coastal Resource Area. This CRA provides unobstructed wildlife movement throughout its open spaces mainly in drainages and along ridgelines and dirt roads. The site is located within the Haypress Area-Hamilton Canyon SEA. The steep narrow canyons near the coast contain rare plant habitat. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Construction at the proposed Project site may conflict with policies described in California Public Resources Code Section 30240, and with specific policies contained in the Santa Catalina Island Local Coastal Plan. Construction activities on site could potentially degrade habitat values (as discussed in Impact BIO 1) in Environmentally Sensitive Habitat Areas (ESHAs), which would in turn conflict with the California Public Resources Code that precludes these ESHA impacts, and thus conflict with the Santa Catalina Island Local Coastal Plan. These conflicts would be precluded by the measures identified in Impact BIO 1. Specifically identified within the Santa Catalina Island Local Coastal Plan: • Policy 3 of the plan prohibits introduction of non-native animals to Santa Catalina Island and workers bringing pets to the site could potentially create conflict, but application of BIO MM 10, No Pets would preclude these impacts. • Policy 11 requires procedures for grading and other site procedures to minimize erosion, but BMPs to be applied at every site are designed to prevent any erosion from the site. • Proliferation of non-native weeds (considered in Policy 20) would be precluded by application of BIO MM 24, Prevent the Spread of Non-native Vegetation. Impacts associated with construction would be less than significant with mitigation. Operational activities at the site would not alter habitats, and thus would not result in any substantive conflict with existing local policies or ordinances. Impacts would be less than significant.

Mitigation Measure(s):

Incorporation of mitigation measures identified at Impact BIO-1 and application of BIO MM 10 and BIO MM 23 would preclude impacts to sensitive species, thereby avoiding or reducing construction impacts, and in turn avoiding or reducing conflicts with the Santa Catalina Island Local Coastal Plan. This would be verified by application of LU MM 1, which would require the Authority obtain a coastal development permit prior to construction at the site. Mitigation Required: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 20 Santa Catalina Island Fox Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in February 2015. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Cenozoic (Tertiary) granitic rocks, unit 2 (Catalina Island)

Stability: Moderate pending geotechnical analysis

Soil Type: Xerorthents-Thirst-Shoba-SanClemente-Rock outcrop-Eelpoint Association

Erosion Potential: Low to moderate

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site has a dominant soil type of well-drained, stony silt loam. This soil type exhibits a well-drained, medium to very rapid runoff with slow permeability resulting in moderate erosion resistance. Moderate slopes surround the site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site DPK and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days. Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B-1.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site DPK was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site DPK. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site DPK would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source

categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO_{2e} decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO_{2e} in 2001 to 12 MTCO_{2e} in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO_{2e}. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO_{2e} to 7.98 million MTCO_{2e}, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site DPK, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site DPK would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: N/A

Located in a State Fire Hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: None identified

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: Santa Catalina Island Coastal Zone

Is the site located within a Airport Land Use Plan area?: No, but approximately 11,500 feet from Pebbly Beach and 13,300 feet from Avalon Bay seaplane bases; requires FAA notification and FCC registration

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space

Zoning: Open Space

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Catalina Island Land Use Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposal for this site is to construct a new up to 180-foot-tall lattice tower on land within the Santa Catalina Island Coastal Zone. Existing communication facilities occur at the site. The Local Coastal Plan policies discourage the siting of facilities, such as communications facilities, in high-visibility locations. New development is to be attractively designed to protect highly scenic natural or historical areas. The proposed lattice tower, sited in close proximity to existing facilities, helps to reduce impacts by consolidating similar facilities and would be designed in recognition of the recommended actions for new development to further reduce effects.

The final determination of consistency would be made by the agency responsible for issuing a Local Coastal Permit. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan, and plan inconsistency is not considered a significant impact.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: Pebbly Beach Seaplane Base - L11

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 dBA daytime criterion but would exceed FTA threshold 80 dBA nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This site is located within the vicinity (approximately 2 miles) of a private airstrip (Pebble Beach Seaplane Base - L11), but outside of the airstrip area where most noise is generated. Conservatively assuming a 65 CNEL at proposed Project sites such as DPK, this combined baseline noise level in combination with the estimated construction noise levels for all proposed Project sites would be below the 90-dBA threshold where adverse community reaction could occur. Therefore, construction of this site would not expose people, workers or residents, to excessive noise levels.

After construction, the site will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: Santa Catalina Island Local Coastal Program

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: Yes

Other Recreational Area Names: Within Santa Catalina Island Open Space Easement

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. Site BJM is within the Santa Catalina Open Space Easement. Open space, like public land under federal management, may be used for recreation, but may have large expanses of land with no areas specifically designated for a concentrated recreational use. Enhancements to the existing communication facilities would not change the recreational opportunities or recreational experience. The communication site itself would preclude recreation and be a long-term permanent impact, but adjacent lands could continue to support compatible recreational uses. There is existing access to the site, and the proposed action to further develop the site would not change access to recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: S Western Ave

Distance (Miles): 25.48

Disaster Route: Boat or airplane

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: Approximately 11,500 feet from Pebbly Beach Seaplane Base and approximately 13,300 feet from Avalon Bay Seaplane Base

Nearest Highway/Freeway: No highway/freeway on Santa Catalina Island

Distance (Miles): 0

Nearest Major Arterial: Shepard St

Distance (Miles): 24.83

Access to the Project Site Provided Via: Divide Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site DPK is approximately 11,500 feet from Pebbly Beach Seaplane Base and approximately 13,300 feet from Avalon Bay Seaplane Base. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered for Site DPK, the TOWAIR tool indicates that the antenna structure (in this case, a lattice tower up to 200 feet tall) requires FCC registration and does not meet the criteria for the 6.10-meter (20-foot) rule exemption. According to Federal Aviation Regulation Part 77, the height of the proposed tower will require completion of FAA Form 7460-1, Notice of Proposed Construction or Alteration, so that the obstruction can be further evaluated to determine the hazard to navigation. The allowable height is 1 foot for every 100 feet of horizontal distance (a structure of about 115 feet in this case) when the proposal is for a 200-foot-high lattice tower. The proposed construction may be allowed, but not without further coordination with FAA. If FAA approves the tower for construction, this would indicate that operation of the tower would not change air traffic patterns or result in substantial safety risks to flight operations.

Mitigation Measure(s):

HAZ MM 2: Prior to issuance of building permits, the Contractor shall submit Form 7460-1 (Notice of Proposed Construction or Alteration) to the FAA, in the form and manner prescribed in 14 CFR part 77. The Contractor shall also provide documentation to the appropriate city or county planning agency demonstrating that the FAA has issued a "Determination of No Hazard to Air Navigation."

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Pebbly Beach Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: ENC1

Site Name: Encinal 1 (Fire Camp 13)

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose construction of up to 200 foot long x 4 foot high retaining wall. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Address: 1250 S. Encinal Canyon Rd

Aesthetics

Setting

Visual Description:

This site is in the Santa Monica Mountains National Recreation Area at the west end of a developed fire camp located south of and adjacent to Encinal Canyon Road, a paved 2-lane rural road that is designated as a scenic routes under the Santa Monica Mountains Coastal Program Land Use Plan. The majority of the camp is at a lower elevation than the surrounding topography and the road, from which several building rooftops can be seen intermittently behind a chain-link fence. Deciduous trees along the south side of the road partially screen views of the camp. The site is surrounded on all sides by hills. Adjacent land along the roadway corridor is primarily undeveloped and consists of rolling hills covered with chaparral vegetation. The location of the proposed lattice tower is currently obscured from, and is at a lower elevation than, the roadway. Primary sensitive viewers include NRA visitors.

Visual Sensitivity: High

On federally administered public lands: No, but within boundary of Santa Monica Mountains NRA

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: Yes, Santa Monica Mountains Local Coastal Plan

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Encinal Canyon Road

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is located in a low area surrounded by hills rather than on a ridge or hill top, and therefore the proposed project would not affect a scenic vista despite the height of the tower. High earthen embankments and tall vegetation between the site and the road would also help obscure the tower from view. Views from the scenic route would not be substantially diminished. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. However, given the site's low elevation, these impacts would not affect scenic vistas.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is located at the west end of a developed fire camp with concrete drives, asphalt and unpaved roads, and buildings. Minimal vegetation is present on site, and no rock outcroppings, historic buildings, or other scenic resources are present. No damage to vegetation or other elements considered scenic resources would occur during construction.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing landscape is characterized by the large fire station compound that includes several buildings, driveways, and paved parking areas. However, much of this development is hidden from view given its location below the roadway that bypasses the compound and the steep topography that surrounds it. Drivers traveling through the area would mostly view the hilly topography and tall evergreen trees. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing compound within which the structures would be located. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any vegetation disturbed during construction would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

Non required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 105

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site ENC1. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that Nox emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOX emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOX emissions limits. With implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or

obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site ENC1 or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site ENC1 would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site ENC1 will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100

pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site ENC1 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site ENC1 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site ENC1, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site ENC1, which is 105 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds for CO and NO_x, lower for PM₁₀ and PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site ENC1 and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site ENC1 in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site ENC1 and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

monarch butterfly (*Danaus plexippus*; ESA-Pet); western pond turtle (*Emys marmorata*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

Santa Monica dudleya (*Dudleya cymosa* ssp. *ovatifolia*; ESA-T, 1B.1); Sonoran maiden fern (*Thelypteris puberula* var. *sonorensis*; 2B.2); marcescent dudleya (*Dudleya cymosa* ssp. *Marcescens*; ESA-T; CA-R,1B.2)

Sensitive Communities Recorded within 1 Mile:

Southern Coast Live Oak Riparian Forest

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

golden eagle (*Aquila chrysaetos*; CDFW-FP); monarch butterfly (*Danaus plexippus*; ESA-Pet); Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1); Sonoran maiden fern (*Thelypteris puberula* var. *sonorensis*; 2B.2)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

Yes

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

Santa Monica Mountains National Recreation Area (NPS); SEA/CRA - Santa Monica Mountains; Los Angeles County - Zuma/Trancas Canyons Open Space; SCAG Zoning - Beach Parks (Malibu Coastal Zone); Natural Landscape Block - Zuma/Trancas Canyons/Santa Monica Mountains

Local Policy or Ordinance for Biological Resources:

Santa Monica Mountains Local Coastal Program Land Use Plan and Local Implementation Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Chamise chaparral [*Adenostoma fasciculatum* Shrubland Alliance]; Association- *Adenostoma fasciculatum*-*Malosma laurina*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site ENC1 is within a large facility with concrete drives, asphalt and unpaved roads, and buildings. It is generally in a canyon setting with hills to the north and a drainage to the south. The hills and canyon slopes are covered with chamise chaparral and coast live oak woodland vegetation. An intermittent stream within the study area includes broadleaf deciduous riparian trees. Common species include purple sage (*Salvia leucophylla*), mountain mahogany (*Cercocarpus montanus*), scrub oak (*Quercus bereberidifolius*), chamise (*Adenostoma fasciculata*), redberry (*Rhamnus crocea*), coast live oak (*Quercus agrifolia*), and bush buckwheat (*Eriogonum fasciculatum*). The canyon

bottoms and drainages have a mixture of natives and ornamentals including alder (*Alnus rhombifolia*), sycamore (*Platanus racemosa*), pines, and ash. The project area is within the foraging range of the golden eagle (*Aquila chrysaetos*; CDFW-FP); eagles may pass by the project site while foraging, but the area around the study area does not provide steep cliffs or rocky crags used for nesting. Numerous sightings of monarch butterflies (*Danaus plexippus*; ESA-Pet) indicate the general vicinity may serve as a migration corridor, and large trees may be used as roost sites. The project area does not contain permanent surface water habitat for western pond turtle (*Emys marmorata*; CDFW-SSC). Project area contains potential habitat for Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1). This species is more common after fires. No plants were observed during botanic survey. Santa Monica dudleya (*Dudleya cymosa* ssp *ovatifolia*; FT, 1B) is limited to cliffs and slopes with sandstone and conglomerate rock outcrops. Suitable habitat does not occur in the study area. A record from 1980 mapped this species around Sequit Canyon as a "best guess;" no follow-up surveys are known. Sonoran maiden fern (*Thelypteris puberula* var. *sonorensis*; 2B.2) is a perennial species found in shady canyons and slopes adjacent to streams. This species was not observed in the area surrounding the project site during surveys conducted 8/5/2015; potentially suitable habitat may be present in the project area. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Conduct spring botanical surveys for Sonoran maiden fern (*Thelypteris puberula* var. *sonorensis*; 2B.2) and Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1); if present mark the areas requiring special protection. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Conduct a preconstruction survey of nearby trees for monarch butterfly roost sites. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Mitigation Required: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 22 Monarch Butterfly Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Patches of riparian habitat consisting of alder, sycamore, coast live oak, and willow is found along drainage channels within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes the following two wetland feature types as indicated by the National Wetland Inventory (USFWS 2014): 1) Freshwater Forested/Shrub Wetland; and 2) Riverine. However, these wetland types are restricted to ephemeral drainages. Adverse impacts to these wetlands may occur due to sedimentation as a result of runoff from the construction. However, construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from storm water runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Zuma/Trancas Canyons/Santa Monica Mountains Natural Landscape Block which overlaps the ranges of approximately 297 amphibian, reptile, mammal and bird species. The site is also located within the proposed Santa Monica Mountains Coastal Resource Area, which is identified as an important regional habitat linkage in the Los Angeles General Plan. Linkages in this CRA connect open spaces together that may be fragmented due to rural development and connect to habitats in Ventura County. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. Additionally, due to the nature of the project, impacts to wildlife movement would be minimal to none. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site ENC1 contains H3 habitat, but Significant Ecological Resource Areas (SERAs) identified at the site include H1 habitat, H2 High Scrutiny Sub-Area habitat, and H1 Quiet Zone habitat. The study area for Site ENC1 also includes H1 habitat. Protection of SERAs identified in the land use plan (LUP) includes prohibition or other strict regulation of proposed site development. Policies contained within Goal CO-2 of the LUP offer protection of SERAs as a priority over other development standards in the Local Implementation Plan. Construction and operations impacts to resources at the site are described in Impact BIO 1, Impact BIO 2, and Impact BIO 3. Existing site conditions include disturbed areas that are not considered SERAs, and therefore not subject to SERA restrictions. Because construction activity would potentially affect SERA(s), and construction and operations activities could impact migratory birds and other special-status species, a potential for conflict exists with LUP policies CO-40, CO-41, CO-42, and CO-44. This conflict would constitute a significant impact.

Mitigation Measure(s):

The mitigation measures identified in Impact BIO 1 and Impact BIO 2, coupled with application of LU MM 3 (requiring the Authority obtain a coastal development permit) would reduce impacts to less than significant. Mitigation Required: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5

Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 22 Monarch Butterfly Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: Yes

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: Yes

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

Yes

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

There are no previously recorded historical resources within the direct area of potential effects (APE). There are three prehistoric archaeological sites (Resource Numbers P-19-001326, P-19-001327, P-19-001328) within the one-half mile indirect APE; however, none are identified as historical resources and all three are situated at the northwest boundary of the indirect APE, approximately 0.5 miles from the direct APE. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. During the field survey, three previously unrecorded concentrations of prehistoric artifacts were identified within the indirect APE, but at the boundary of the direct APE. Additional lithic material was also observed along the cut slope of the direct APE indicating a high probability that the prehistoric archaeological material (probably a single site) extends into the direct APE and was truncated when the area of the direct APE was graded and an access road and concrete pads were constructed. The natural features and terrain within the indirect APE and encompassing the direct APE, also indicate a high probability that other archaeological sites and features are present. Proposed LMR activities at this project location include the attachment of whip antennas and microwave dishes on a proposed 180-foot lattice tower and the construction of an equipment shelter, generator, and fuel tank. The construction of these proposed facilities would adversely affect the newly identified archaeological site(s) at this project location, which, with additional research and archaeological testing, are likely to meet the requirements of CEQA Guidelines Section 15064.5, as a historical resource (archaeological). Identified resources at this project site would be adversely affected and impacts would

be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MMs 1, 3, and 4 are would be implemented at this project site. Archaeological monitors would be present during all ground disturbing activities and construction and operational personnel would avoid the newly identified archaeological resources.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

There are no previously recorded historical resources within the direct area of potential effects (APE). There are three prehistoric archaeological sites (Resource Numbers P-19-001326, P-19-001327, P-19-001328) within the one-half mile indirect APE; however, none are identified as historical resources and all three are situated at the northwest boundary of the indirect APE, approximately 0.5 miles from the direct APE. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. During the field survey, three previously unrecorded concentrations of prehistoric artifacts were identified within the indirect APE, but near the direct APE. Additional lithic material was also observed along the cut slope of the direct APE indicating a high probability that the prehistoric archaeological material (probably a single site) extends into the direct APE and was truncated when the area of the direct APE was graded and an access road and concrete pads were constructed. The natural features and terrain within the indirect APE and encompassing the direct APE, also indicate a high probability that other archaeological sites and features are present. Proposed LMR activities at this project location include the attachment of whip antennas and microwave dishes on a proposed 180-foot lattice tower and the construction of an equipment shelter, generator, and fuel tank. The construction of these proposed facilities would adversely affect the newly identified archaeological site(s) at this project location, which, with additional research and archaeological testing, are likely to meet the requirements of CEQA Guidelines Section 15064.5, as a historical resource (archaeological). Identified resources at this project site would be adversely affected and impacts would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MMs 1, 3, and 4 would be implemented at this project site. Archaeological monitors would be present during all ground disturbing activities and construction and operational personnel would avoid the newly identified archaeological resources.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

The direct APE borders and likely encompasses a newly identified prehistoric archaeological site. The potential for human remains to be disturbed is low, but cannot be ruled out. Identified resources at this project site would be adversely affected and impacts would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MMs 1, 3, and 4 would be implemented at this project site. Archaeological monitors would be present during all ground disturbing activities and construction and operational personnel would avoid the newly identified archaeological resources.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Given the archaeological resources found at this project location, Tribal resources may be present. Identified resources at this project site would be adversely affected and impacts would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MMs 1, 3, and 4 would be implemented at this project site. Archaeological monitors would be present during all ground disturbing activities and construction and operational personnel would avoid the newly identified archaeological resources.

Geology and Soils

Setting

Surface Geology: Tertiary volcanic flow rocks, unit 8 (Southern California Basin)

Stability: Moderate pending geotechnical analysis

Soil Type: Rock outcrop-Lithic Xerorthents-Hambright-Gilroy Association

Erosion Potential: Low to Moderate

Expansive Soil: Low to Moderate Potential

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed building site is flat grade surrounded by moderate slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site has a mix of tertiary volcanic flow rocks ranging from well-drained, very stony loam to fine-grained silt/clay material. This soil type exhibits a medium to very rapid runoff with slow permeability, resulting in moderate erosion resistance. Moderate slopes surround the site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located adjacent to existing fire camp near the top of a hill, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site ENC1 and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days. Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B-1.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site ENC1 was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site ENC1. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site ENC1 would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to

2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site ENC1, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site ENC1 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage

Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: Yes

If yes, please explain: History of LUSTs and releases on Project Site. Site report leak, leak stopped, case closed on LUSTs. NOVs issued. Permitted UST within 1/4 mile of Project Site (Circle R Ranch).

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Located in a State Fire Hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or

releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open

areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced, and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Conejo-tierra Rejada Volcanic

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. While this site is situated in an area downgradient of moderate to steep slopes, it is not listed by California Geologic Survey as being within a Landslide Zone. However, due to its location downgradient of these slopes, some risk of surprise inundation by mudflow exists during construction.

Mitigation Measure(s):

GEO MM 1. Performance of a geotechnical report at the site, a condition of construction during the building permitting process would identify if there were a requirement for additional design features to prevent impacts associated with mudflow.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: Santa Monica Mountains Coastal Zone

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Public and Semi-Public Facilities

Zoning: Light Agriculture

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Monica Mountains Coastal Zone

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site ENC1 is adjacent to a designated Scenic Route within the Santa Monica Mountains Coastal Zone. The Santa Monica Mountains Land Use Plan, a component of the Santa Monica Mountains Local Coastal Program, was issued in August 2014 and allows for telecommunication facilities within several land use categories, including open space, rural lands, rural residential, rural villages, residential, commercial, commercial recreation – limited intensity, and public and semi-public facilities (County of Los Angeles, Department of Regional Planning 2014). Land Use Plan Policy CO-147 limits maximum allowable height to 18 feet above existing or finished grade, whichever is lower, along Scenic Routes. Land Use Plan Policy CO-152 indicates wireless telecommunication facilities along Scenic Routes should be co-located where feasible and made to blend into the landscape. The proposal is to establish a 180-foot-tall tower at a site with existing development, but not developed specifically as

a telecommunications site. Construction of the proposed project facilities at this site would result in a significant conflict with the Santa Monica Mountains Land Use Plan. The proposed action is not in compliance with the adopted and certified Land Use Plan because the proposed project exceeds the identified height limitations. To comply with the Land Use Plan, a Coastal Development Permit would need to be obtained prior to construction, and adherence to the terms of the permit would be required.

The final determination of consistency would be made by the agency responsible for issuing a Local Coastal Permit. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan, and plan inconsistency is not considered a significant impact.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: 25 feet

Ambient Noise Level: 45 dBA

Sensitive Noise Receiver 1: Single Family Residential Dwellings

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

Hourly average construction noise levels are anticipated to be approximately 89 dBA. The predicted noise levels represent the demolition phase which is anticipated to be the loudest construction phase. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site. However, in some instances, it may be necessary for construction activities to take place outside of these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The affected jurisdiction has not established a construction noise level threshold. Therefore, construction noise levels at the proposed Project site would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable"

community noise equivalent level (CNEL) developed by the California Department of Health Services was referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. Noise levels from both sources would be below the 60 dBA “normally acceptable” level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at site ENC1. However, the county ordinance has not defined impacts for groundborne noise; therefore, the potential of the project to result in exposure of persons to or generation of excessive groundborne noise levels is less than significant.

The ordinance for unincorporated Los Angeles County requires that vibration levels during construction not exceed a motion velocity of 0.01 peak particle velocity (PPV) in in/sec over the range of 1 to 100 Hertz as specified in the local ordinance. Although levels in excess of 0.01 PPV are still well below the potential damage criteria set by the FTA, 0.12 PPV for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings, the ordinance prohibits construction activities in excess of this threshold. Vibration levels from construction equipment used for this Project would range from 0.003 PPV at 25 feet for a jackhammer to 0.089 PPV for a loaded truck such as the 3-ton flatbed. Applying the damage assessment methodology developed by FTA and described in Appendix B-3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold for unincorporated Los Angeles County is 97 feet.

Sensitive receivers (scattered residential dwellings) are located within 25 feet of Project site ENC1. Vibration from loaded trucks such as the 3-ton flatbed or dump trucks could be as high as 0.018 PPV depending on the geology, soil type and stiffness; therefore, impacts from construction of the Project could expose these sensitive receiver locations to excessive groundborne vibration and impacts of the proposed Project would be significant.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. Therefore, operational groundborne vibration or noise would be less than significant during operation of each Project site including ENC1.

At site ENC1, where construction vibration levels would exceed the unincorporated Los Angeles County vibration

ordinance threshold, NOI MM 1 would be required.

Mitigation Measure(s):

NOI MM 1

Prior to commencement of construction at sites ENC1, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction vibration impacts. Such measures may include but are not limited to the following:

- Route heavily-loaded trucks away from residential streets, if possible, selecting streets with the fewest homes if no other alternatives are available.
- Operate earth moving equipment including excavators/mini excavators and dump trucks as far away from vibration-sensitive locations as possible.
- Phase demolition and earth-moving operations so as not to occur simultaneously. Total vibration could be significantly less when each vibration event occurs separately.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, the estimated noise level at 25 feet from proposed sites would be 89 dBA and not exceed the 90 dBA daytime criterion but would exceed the 80 dBA nighttime criterion; therefore, construction impacts for this Site would be significant.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds; therefore, impacts from operational noise would be less than significant.

Mitigation Measure(s):

NOI MM 2

Prior to commencement of construction at ite ENC1 the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction noise impacts below the levels specified in FTA nighttime

threshold. Such measures may include but are not limited to the following:

- Use noise blankets or other muffling devices on equipment and quiet-use generators at noise-sensitive receivers.
- Use well-maintained equipment and have equipment inspected regularly.
- Operate construction equipment for periods of fewer than 15 consecutive minutes when possible.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This site is located within the vicinity (approximately 2 miles) of a private airstrip (Los Angeles County Fire Department Heliport), but outside of the airstrip area where most noise is generated. Conservatively assuming a 65 CNEL at proposed Project sites such as ENC1, this combined baseline noise level in combination with the estimated construction noise levels for all proposed Project sites would be below the 90-dBA threshold where adverse community reaction could occur. Therefore, construction of this site would not expose people, workers or residents, to excessive noise levels.

After construction, the site will be unmanned during operation except for occupational maintenance, which would include landscaping maintenance, routine site inspections, and occasional equipment repairs. Conservatively assuming a 65 dBA CNEL at proposed Project sites located 0.25 miles from private airstrips, operation of this Project site, including the HVAC systems and emergency generators, would result in noise emissions below 60 dBA and would be considered “normally acceptable” for outdoor residential exposure. Therefore, operation of this Project site would not expose people residing or working in the Project area to excessive noise levels. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels. Impacts from operation of the Project would be less than significant.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: Santa Monica Mountains Local Coastal Program, Land Use Plan

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Mulholland Hwy

Distance (Miles): 0.51

Disaster Route: State Route 23

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No

Nearest Highway/Freeway: State Route 23

Distance (Miles): 0.51

Nearest Major Arterial: Encinal Canyon Rd

Distance (Miles): 0.02

Access to the Project Site Provided Via: Encinal Canyon Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: LAS VIRGENES MUNI W DIST

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: ENT

Site Name: Entrada Tank Site

Site Discussion:

Propose installation of up to 27 whip and up to 5 microwave antennas on new monopole up to 70 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 150 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 8 foot diameter x 36 foot deep drilled caisson with concrete cap for monopole support; or up to 16 foot x 16 foot x 10 foot deep concrete mat foundation.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This site is located within Santa Monica Mountains National Recreation Area on the north side of Old Topanga Canyon Road on top of a small, mostly barren hill, and consists of two beige water tanks accessed by a paved drive. This undulating road provides views of canyons to the south and distant mountains. Some trees immediately adjacent to the site block views of it. The site is similarly obscured from view for westbound travelers by vegetation, but is intermittently visible approaching from the south. The area is semi-residential. Small houses exist intermittently near the site, and telephone poles line the road. The site is just north of, and overlooks, the intersection of Topanga Canyon Road with the Calabasas Peak Motorway, a wide fire road used as a trail to access Calabasas Peak to the southwest. The trail provides access to the Pacific Ocean, the western Santa Monica Mountains, Castro Peak, and the western San Fernando Valley (Lockeretz 2013). Hikers park along a pullout adjacent to the road directly below the site. Chaparral vegetation lines the road on the approaches to the site, but is sparse around the site itself. Cliffs along the approach from the west block views of the site until about 0.1 mile away. Sensitive viewers include trail users and NRA visitors.

Visual Sensitivity: High

On federally administered public lands: No, but within boundary of Santa Monica Mountains NRA

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Old Topanga Canyon Road

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: Yes

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site would be visible to hikers traveling east on the Calabasas Peak Motorway. The proposed new facilities would not perceptibly change the scenic vista due to the presence of the existing water tanks, which are partially obscured by tall vegetation and, given their mass, would help attenuate the noticeability of new structures. In addition, the presence of existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. The new facilities would be at a lower elevation than hikers traveling east on the Calabasas Peak Motorway, and would not block or remove views of the scenic vista. The existing trees, which are of similar height, would help shield views of the monopole from the trail. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is located at a water tank facility. No scenic resources are present on the site. No damage to scenic resources would occur during construction.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings are already impacted by the presence of two large water tanks. Although the monopole would introduce another man-made feature onto the landscape in the long term, it would not be significantly out of character with the surrounding trees, which are of similar height. The new monopole would also be in character with the telephone poles that currently line the nearby road, as well as the area's semi-residential setting. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any vegetation disturbed during construction would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 360

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site ENT. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site ENT or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site ENT would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site ENT will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site ENT would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site ENT or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site ENT, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site ENT, which is 360 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds for CO and No_x, lower for PM₁₀ and PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site ENT and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site ZHQ in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site ENT and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); monarch butterfly (*Danaus plexippus*; ESA-Pet); two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC); western pond turtle (*Emys marmorata*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

California Walnut Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

American peregrine falcon - foraging (*Falco peregrinus anatum*; CDFW-FP); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); monarch butterfly (*Danaus plexippus*; ESA-Pet); Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1); Lyon's pentachaeta (*Pentachaeta lyonii*; ESA-E, CA-E, 1B.1)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

NPS -Santa Monica National Recreation Area; Santa Monica Mountains Significant Ecological Area: SCAG Zoning-Local Parks and Recreation; Los Angeles County Zoning - Open Space; Natural Landscape Block - Calabasas Peak/Santa Monica Mountains;

Local Policy or Ordinance for Biological Resources:

City of Calabasas General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

California sagebrush scrub [*Artemisia californica* Shrubland Alliance]; Association-*Artemisia californica*-*Salvia leucophylla*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site ENT is located on a ridgetop that has been leveled. Large non-native eucalyptus and pine trees surround the two water tanks. Steep slopes north and east of the site include coastal sage scrub and chaparral vegetation. Common species include purple sage (*Salvia leucophylla*), laurel sumac (*Malosma laurina*), sagebrush (*Artemisia californica*), scrub oak (*Quercus berberidifolius*), California lilac (*Ceanothus* sp), redberry (*Rhamnus crocea*), deerweed (*Acmispon glaber*) and ornamental pines; scattered residences are in the vicinity. American peregrine

falcon (*Falco peregrinus anatum*; CDFW-FP) may pass by the project area while foraging, but the project area does not provide steep cliff habitat required for nesting. Coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) may occur in the project area and individuals could be killed by project activities. Monarch butterflies (*Danaus plexippus*; ESA-Pet) may pass through the area and use the tall trees as roost sites. No wetland habitats are present in the project area that would support two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC) or western pond turtle (*Emys marmorata*; CDFW-SSC). Primary habitat for Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1) is carbonate outcrops on ridgetops; populations most prevalent after a fire. Road edges and other sources of disturbance provide potential habitat. Potentially suitable habitat may occur in the study area. Last known nearest occurrence is from 1941, non-specific mapping. Study area and the project site contains moderate quality habitat, but Braunton's milk-vetch was not observed during survey; rainfall too low to assure lack of presence. Lyon's pentachaeta (*Pentachaeta lyonii*; ESA-E, CA-E, 1B.1) ADD SUITABLE HABITAT FROM AGH. Study area and project site contain poor quality habitat (low clay content soils) for this species. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. On 8/12/2014 an abandoned raptor nest was observed in a eucalyptus trees at the project site.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) in the project area. Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Conduct a preconstruction survey of nearby trees for monarch butterfly roost sites. Conduct spring botanical surveys for Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1) and Lyon's pentachaeta (*Pentachaeta lyonii*; ESA-E, CA-E, 1B.1); if present mark the areas requiring special protection. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Mitigation required: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 22 Monarch Butterfly Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site. California walnut groves were not observed within the project area.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Calabasas Peak/Santa Monica Mountains Natural Landscape Block which overlaps the ranges of approximately 276 amphibian, reptile, mammal and bird species. Additionally the site is located within the proposed Santa Monica Mountains (Buffer 3[B]) Significant Ecological Area, which is identified as an important regional habitat linkage in the Los Angeles General Plan. Linkages in this SEA connect open spaces together that may be fragmented due to rural development and connect to habitats in Ventura County. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. Additionally, due to the nature of the project, impacts to wildlife movement would be minimal to none. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction activities have a potential to impact biological resources at Site ENT. Proposed construction would occur within an existing communication site, and the potential for measureable losses of species diversity or habitats is low, since any ground disturbance would occur within an area already disturbed and containing low quality habitat. The site contains no wetlands or riparian areas. No oak trees occur on site. There is a potential to impact sensitive biological resources during construction, due to increased traffic, noise, motion, and dust generation. These impacts are discussed under Impact 1 in this section. During the operations phase, The proposed new antenna support structure at Site ENT would increase the probability of a bird strike hazard. Workers accessing the site during operations for maintenance and repair activities would slightly increase the traffic count on the access road and public roads leading to the site which could increase the potential to injure or kill wildlife. These operations impacts may occur to a few individual animals, however, without impacts at a landscape level. Because the Authority is exercising intergovernmental immunity, the plan is not applicable and no conflict with the City of Calabasas General Plan exists.

Mitigation Measure(s):

None required

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No; however, there is a historic road - an approximately 2 mile segment of Old Topanga Canyon Road - that crosses a portion of the indirect APE.

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct area of potential effects (APE). Within the indirect APE there is a historic road (Old Topanga Canyon Road), which is approximately 2 miles long and extends across the city of Calabasas between Mulholland Highway at the north and where it intersects at the south with Highway 27. The Calabasas segment of this historic road has been determined eligible for inclusion in the National Register, the California Register, and the Historical Register for the City of Calabasas. At its closest point, the historic road segment, which dates to 1865 is approximately 0.33 miles from the direct APE. Proposed LMR activities at the ENT project location include attachment of whip antennas and microwave dishes on a proposed 70-foot monopole, construction of a new equipment shelter, backup generator, and fuel tank adjacent to two large water tanks and within a stand of mature trees. Due to the intervening distance and mountainous terrain, LMR construction will be beyond line-of-sight of the LMR construction area. This was confirmed through archival research and a field survey of the project location by an SOI-qualified archaeologist and architectural historian in January 2015. Based on the distance of the identified historical resource from the project site, there would be no direct or indirect (visual) impacts from project activities on this resource at this project site. In addition, there are three unevaluated archaeological sites situated within the indirect APE; however, each of the sites is situated between 0.21 and 0.41 miles from the direct APE and would not be directly or indirectly affected by LMR project activities. Therefore there would be no impacts on these three archaeological resources from project activities.

Mitigation Measure(s):

There would be no impacts at this project site; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. There are three unevaluated archaeological sites situated within the indirect APE, each of which is situated between 0.21 and 0.41 miles from the direct APE and would not be directly or indirectly affected by LMR project activities. Therefore there would be no impacts on these three archaeological resources from project activities.

Mitigation Measure(s):

There would be no impacts at this project site; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Miocene Topanga Formation, which has a high potential for significant vertebrate fossils. No localities are recorded within the proposed site; however, vertebrate fossil localities have been recorded from this formation in the vicinity. Recovered fossils include eagle ray, snaggle-tooth shark, basking shark, croaker, herring, rodent, camel, and baleen whale. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Topanga Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

There would be no impacts at this project site; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

There would be no impacts at this project site; however, a monitor would be present during ground disturbing activities at the request of the Soboba Band of Luiseño Indians.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: Low to Moderate based on designation within Landslide Zone

Soil Type: Urban land-Lithic Xerorthents-Hambright-Castaic Association

Erosion Potential: Moderate based on designation within Landslide Zone

Expansive Soil: Low to Moderate potential based on presence of silty clay loam

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require

additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site has a mix of shallow, well drained stony loam to silty clay loam. This soil type exhibits a medium to very rapid runoff with moderately slow permeability, resulting in moderate erosion resistance. Moderate slopes surround the site. Grading, excavation, and other construction activities associated with the implementation of the proposed project could cause erosion due to exposed soils. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the local city planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell

with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site ENT and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days. Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B-1.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site ENT was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site ENT. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site ENT would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source

categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO_{2e} decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO_{2e} in 2001 to 12 MTCO_{2e} in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO_{2e}. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO_{2e} to 7.98 million MTCO_{2e}, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site ENT, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site ENT would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Calabasas

General Plan Designation: Hillside Mountainous

Zoning: Open Space

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Calabasas

Los Angeles County Community or Area Plan: Santa Monica Mountains North Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing telecommunications structure and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

The proposed facilities at this site may be inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and the policy to protect areas that have significant natural resources. However, no physical impact would occur as a result of an inconsistency between the proposed project and the policy, and this is not considered a significant impact. As discussed in Sections 3.5 (geologic and soil hazards), Section 3.7 (fire hazards), Section 3.3 (biological effects), as well as in a site-by-site assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than

significant.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Calabasas

Applicable Noise Ordinance: Municipal Code; Chapter 17.20; Section 160 Noise

Noise Level Threshold: N/A; no construction from 6 pm to 7 am on weekdays or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: 215 feet

Ambient Noise Level: 45 dBA

Sensitive Noise Receiver 1: Scattered Residential Dwellings

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

Hourly average construction noise levels are anticipated to be approximately 89 dBA. The predicted noise levels represent the demolition phase which is anticipated to be the loudest construction phase. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site. However, in some instances, it may be necessary for construction activities to take place outside of these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The affected jurisdiction has not established a construction noise level threshold. Therefore, construction noise levels at the proposed Project site would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable"

community noise equivalent level (CNEL) developed by the California Department of Health Services was referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. Noise levels from both sources would be below the 60 dBA “normally acceptable” level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers within this distance to the Project site; therefore, groundborne vibrational noise impacts would be less than significant.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings or sensitive receivers within this distance to the site; therefore, impacts due to excessive groundborne vibration would be less than significant.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. Therefore, impacts due to excessive groundborne vibration or groundborne noise from Project operation would be less than significant.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, the estimated noise level at 215 feet from proposed sites would be 70 dBA and not exceed the 90 dBA daytime or 80 dBA nighttime criterion; therefore, construction impacts would be less than significant.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds; therefore, impacts from operational noise would be less than significant.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working

in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: State Route 27

Distance (Miles): 1.81

Disaster Route: State Route 27

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No

Nearest Highway/Freeway: Ventura Frwy

Distance (Miles): 1.81

Nearest Major Arterial: Mulholland Hwy

Distance (Miles): 0.62

Access to the Project Site Provided Via: Old Topanga Canyon Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route designated in a Congestion Management Program, thus increasing the

potential that vehicles accessing the sites for construction or maintenance could contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately 6-week construction period would typically add fewer than 25 vehicle trips per work day and maintenance would typically add only one or two vehicles trips per month.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: LAS VIRGENES MUNI W DIST

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: FRP

Site Name: Frost Peak (Upper Blue Ridge)

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This site is accessed from Blue Ridge Road, off Angeles Crest Highway, on a ridge line in Angeles National Forest. The Frost Peak (Upper Blue Ridge) site is approximately 400 feet west of, and above, the Pacific Crest Trail (PCT), one of the country's first National Scenic Trails, which spans 2,650 miles from Mexico to Canada through California, Oregon, and Washington, and traverses the ANF generally from northwest to the southeast. The Pacific Crest Trail Association (PCTA) strives to protect the trail experience, which includes "wild scenery of the highest caliber and integrity," "refuge from industrialized civilization and its sights," and "therapeutic effects of elevated 'crest' views and naturally open landscapes." The desired condition described in the PCTA 2014-2017 Strategic Plan states, "Public lands within the Foreground Trail Corridor, including lands acquired and managed for the PCT, are managed to maximize a natural appearing landscape where human development does not dominate the viewer's experience..." (PCTA 2013). The site is also southwest of the Mountain High East and West Resorts ski areas. The highest and closest ski lift is at an elevation of 8,200 feet. The site would be visible from the top of the ski lifts. The site is also about one mile southeast of the Angeles National Forest Blue Ridge Campground, which provides eight camp sites on a ridgeline between the two ski areas. The campground is closed during winter. The PCT travels right beside the camp. The site is located within a compound consisting of fourteen existing lattice towers or monopoles, and equipment shelters served by the same dirt road. Three lattice towers of varying heights are immediately adjacent. Most of the area has been previously disturbed. Vegetation is mostly low and scrubby, with a few scattered taller trees. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as A. SAC A is considered distinctive; 24% of Angeles National Forest is rated A (USFS 1995). The USFS zone for this area is Developed Area (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High/SAC A; Developed

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Pacific Crest Trail

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new facilities would not be visible from the PCT within 0.25 mile of the site because the trail travels below the site as it contours around the hillside. Trees in the Blue Ridge Campground would obscure views of the

site, as would the distance between the two areas. The site would be visible to recreationists as they reach the top of the nearby chair lifts, and to visitors traveling East Blue Ridge Road. The new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new facilities would be located within a site that includes existing towers that already create a visual intrusion onto the landscape. The chair lifts approximately 0.5 mile northwest also intrude onto the scenic vista and introduce vertical elements into the landscape, and ski runs cut swaths through the trees. The new facilities would not perceptibly change the scenic vista due to the presence of these elements and the existing towers, which would attenuate the noticeability of new structure. In addition, the addition of a new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Although the USFS scenic integrity objective for this area is high and the SAC rating (A) is distinctive, this area is also identified as a Developed Area zone. In such areas, the level of human use and infrastructure is typically higher than in other zones. This zone includes a number of highly popular developed recreation facilities, and recreation and non-recreation special-use facilities. This zone is the lowest designation for naturalness. The site is already impacted by the presence of existing facilities and towers of a similar nature. The surrounding forest has also been developed through the addition of two ski areas. The new facilities would be compatible with the existing site, and with the surrounding landscape to a lesser extent. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: Mohave Desert

Air Quality Management District: Antelope Valley

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM10 (unclassified)

State Nonattainment Status: O3, PM10, PM2.5 (unclassified)

Applicable Air Quality Management Plan(s):

AVAQMD 2004 Ozone Attainment Plan (State and Federal), AVAQMD Federal 8-Hour Ozone Attainment Plan, AVAQMD Implementation Schedule for Measures to Reduce PM pursuant to H&S Code 39614(d), AVAQMD CEQA and Federal Conformity Guidelines

Significance Thresholds:

General Conformity (tons/year): CO (100), NOX, VOC (25); Local construction and operation (tons/year): CO (100), NOX, VOC (25), PM2.5, PM10 (15); Local construction and operation (lbs./day): CO (548), NOX, VOC (137), PM2.5, PM10 (82)

Nearest Sensitive Receptors: Industrial building

Distance to Sensitive Receptor: 50

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The AVAQMD air quality plans considered in this analysis include the AVAQMD 2004 Ozone Attainment Plan (State and Federal) (AVAQMD 2004 Ozone Plan) (AVAQMD 2004). The purpose of this plan was to (1) demonstrate that the AVAQMD would meet the primary O3 NAAQS by the end of 2007; (2) present progress by the AVAQMD toward meeting all state planning milestones including attainment of the O3 CAAQS; and (3) discuss the 8-hour O3 NAAQS in preparation for a new nonattainment designation under a revised standard. Also considered in this analysis of Project air quality impacts is the AVAQMD Federal 8-Hour Ozone Attainment Plan (Western Mojave Desert Nonattainment Area) (AVAQMD 8-Hour Ozone Plan) (AVAQMD 2008). The purpose of this plan is to (1) demonstrate that the AVAQMD will attain the primary O3 NAAQS by June 2021; (2) present progress by the AVAQMD toward meeting all required O3 planning milestones and NAAQS and CAAQS; and (3) discuss the newest 0.075 ppm O3 NAAQS in anticipation of a nonattainment designation for this revised standard.

Finally, the analysis considered the AVAQMD Implementation Schedule for Measures to Reduce PM pursuant to Health and Safety Code 39614(d) (AVAQMD PM Measures Plan) (AVAQMD 2005). The purpose of this plan is for the AVAQMD to develop a list of Best Available Control Technologies (BACT) either currently being implemented or for future consideration to control particulate emissions within the district.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site FRP. The analysis indicates that emissions from the construction of all the proposed Project sites located in the MDAB including site FRP would not exceed AVAQMD significance thresholds for the listed criteria pollutants including O3 precursor NOx. Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of all the proposed Project sites located in the MDAB would not exceed AVAQMD significance thresholds for any criteria pollutants including O3 precursor NOx and particulate matter. Therefore, the Project would not conflict with or obstruct implementation of the

AVAQMD 2004 Ozone Plan, AVAQMD 8-Hour Ozone Plan, or the AVAQMD PM Measures Plan. Impacts of the proposed Project on the implementation of the AVAQMD plans would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Emissions from the construction from proposed LMR Site FRP or emissions from the simultaneous construction of the three proposed Project sites located in the MDAB would not exceed AVAQMD significance thresholds for criteria pollutants. Per AVAQMD guidance, compliance with these significance thresholds is sufficient to demonstrate that construction of the proposed Project sites in the MDAB would not violate any air quality standards or contribute substantially to an existing or projected air quality violation; therefore, Project construction impacts in the MDAB would be less than significant.

Operational emissions of the proposed LMR Site FRP or the operational emissions of all Project sites in the MDAB are less than significant and would not violate any air quality standard or contribute substantially to an existing or projected air quality violation; therefore, Project operational impacts would be less than significant in the MDAB.

Mitigation Measure(s):

No mitigation measures are required.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O₃ and PM₁₀ (CAAQS) in the MDAB. Cumulatively considerable net increases in these pollutants were examined relative to the AVAQMD significance thresholds for each.

Emissions from the construction of proposed LMR Site FRP or the simultaneous construction of all three proposed Project sites located in the MDAB would not exceed AVAQMD significance thresholds for O₃ and PM₁₀. Per AVAQMD guidance, compliance with these significance thresholds is sufficient to demonstrate that construction of the proposed Project sites in the MDAB would not result in cumulatively considerable net increases in these pollutants; therefore, Project construction emissions in the MDAB would be less than significant.

Operational emissions of the proposed LRM Site FRP or all Project sites in the MDAB would not exceed AVAQMD significance thresholds for O₃, and PM₁₀. Per AVAQMD guidance (AVAQMD, 2011), compliance with these significance thresholds is sufficient to demonstrate that operation of the proposed Project sites in the MDAB would not result in cumulatively considerable net increases in these pollutants; therefore, Project operational emissions in the MDAB would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The AVAQMMD considers residences, schools, daycare centers, playgrounds and medical facilities to be sensitive receptor land uses. Exposure of sensitive receptors to substantial pollutant concentrations as defined above in Chapter 3.2.3.1, Criterion 4 is required for the following project types: (1) any industrial project within 1,000 feet; (2) a distribution center (40 or more trucks per day) within 1,000 feet; (3) a major transportation project (50,000 or more vehicles per day) within 1,000 feet; (4) a dry cleaner using perchlorethylene within 500 feet; and (5) a gasoline dispensing facility within 300 feet. While the Project as proposed does not fall within one of these project types; the analysis of sites within the MDAB includes a qualitative assessment of pollutants that impact human health.

The use of off-road heavy-duty diesel equipment by the Project for demolition, site grading and excavation, and concrete pad construction activities would result in the generation of diesel particulates (DPM) emissions. DPM were identified as a toxic air contaminant (TAC) by CARB in 1998. Other potential TAC sources associated with construction include the demolition of asbestos-containing materials and the excavation of naturally occurring asbestos (NOA) in soils. The monthly one hour test of the backup generator at each proposed Project site, including site FRP would generate DPM emissions. Emergency operation of the backup generators, which is anticipated to have a 200 hour continuous operational capacity would also generate DPM emissions. No other operational sources of these or other TACs would occur.

According to the Consolidated Table of Office of Environmental Health Hazard Assessment (OEHHA)/ CARB Approved Risk Assessment Health Values, the potential cancer risk from the inhalation of DPM outweighs the potential noncancer health impacts (SCAQMD, 2015; SMAQMD, 2014); therefore, noncancer health impacts of DPM were not assessed further. In addition, the OEHHA Air Toxics Hot Spots Program Guidance Manual does not recommend assessing cancer risk from exposures to a 'maximally exposed individual resident' (sensitive receptor) from activities lasting less than two months, due to the uncertainty in assessing cancer risk from very short-term exposures (OEHHA, 2015). As discussed in Appendix B, the maximum construction activity scenario assumed at site FRP and all proposed sites would have a six week duration. Similarly, the duration of the monthly test and emergency operation of backup generators at each site would be sources of short-term exposure to sensitive receptors; therefore, further assessment of the potential cancer risk of the project construction and operation is not warranted.

Demolition of existing structures at proposed sites in the MDAB would be subject to AVAQMMD Rule 1403. Rule 1403 is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. The rule addresses the national emissions standards for asbestos along with some additional requirements. The rule requires lead agencies and their contractors to notify the District of any regulated renovation or demolition activity. By complying with District Rule 1403, thereby minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the MDAB, including site FRP, would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per AVAQMMD guidance (AVAQMMD 2011), compliance with the criteria pollutant significance thresholds and the health risk based significance threshold established by AVAQMMD Criterion 4 is sufficient to demonstrate that construction and operation of the proposed Project sites in the MDAB, including site FRP, would not result in sensitive receptor exposure to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site FRP and all proposed Project sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to AVAQMD Rule 402. In addition, the operation of all Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to AVAQMD Rule 402; therefore, Project impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

south coast marsh vole (*Microtus californicus stephensi*; CDFW-SSC); mountain yellow-legged frog-southern California DPS (*Rana muscosa*; ESA-E, ESA-CH, CA-E)

White fir forest [*Abies concolor* Forest Alliance]; Association- *Abies concolor*-*Pinus jeffreyi*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site FRP is located in the Angeles National Forest near the top of Frost Peak in the San Gabriel Mountains at an elevation of approximately 8,450 feet in white fir forest (*Abies concolor*) and Jeffery pine (*Pinus jeffreyi*) forest, with a shrub understory of manzanita (*Arctostaphylos* sp.), buckwheat (*Eriogonum* sp.) and sagebrush (*Artemisia* sp.). The study areas considered to be outside the current range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), but as the condor population increases it is expected to expand geographically. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. The south coast marsh vole (*Microtus californicus stephensi*; CDFW-SSC) if found

in association with tidal marshes; no suitable habitat is present within the project area for the species. Mountain yellow-legged frog - southern California DPS (*Rana muscosa*; ESA-E, CA-E) designated critical habitat and frog occurrence records are known from the San Gabriel River critical habitat unit within 0.8 mile west of the site. Though the project site is located in steep mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. The habitat for lemon lily (*Lilium parryi*; 1B.2) is wet meadows and streams, which does not occur in the project area. The project site includes habitat for San Antonio milk-vetch (*Astragalus lentiginosus* var. *antoni*; 1B.3). A survey during the summer flowering period is necessary to verify the identification. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

To address future use of the area by condors all trash and construction debris (especially small items such as nuts and washers) will be removed from the site; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) in the project area and along access roads. To protect dispersing southern mountain yellow-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Conduct summer botanical surveys for San Antonio milk-vetch (*Astragalus lentiginosus* var. *antoni* 1B.3); if present mark the areas requiring special protection. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Mitigation required: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site. Canyon Live Oak Ravine Forest was not observed in the project area. Site FRP is hydrologically connected to stream habitats that include southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) critical habitat.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located within a CDFW designated Essential Connectivity Habitat Area which connects the San Gabriel/Cucamonga and Table Mountain Natural Landscape Blocks. This and other forest service sites would need to have forest service sensitive species analyzed. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

Mitigation Recommended: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Within the indirect APE, there is one resource (Resource No. P-19-002465H/FS-05015400075-HIS), a historic trail system (pre and post 1926) known as the California Riding and Hiking Trail, which is eligible for inclusion in the National Register of Historic Places in 1996. The Trail crosses the indirect APE just southwest of the direct APE but outside the construction impact area. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in November 2014. LMR activities at the FRP project location include the attachment of whip and microwave antennas on a proposed 180-foot lattice tower and the construction of a new equipment shelter, backup generator, and fuel tank. The proposed 180-foot tower would be taller than the existing cluster of lattice towers; however, it would generally be in keeping with the existing communications/industrial landscape at this project location. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any uniquely definable features at this proposed project site, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there

were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Schist of various types and ages, unit 2 (Southern and West-central California)

Stability: Moderate pending geotechnical analysis

Soil Type: Springdale-Rock outcrop-Etsel family Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of a coarse gravelly sandy material. This soil type exhibits a well-drained, medium to very rapid runoff with moderate permeability. Moderate slopes surround the site. Grading, excavation, and other construction activities associated with the implementation of the proposed project could cause erosion due to exposed soils. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: Mojave Desert

Air Quality Management District: Antelope Valley

AQMD Significance Threshold: 100,000 tons CO₂eq/year (548,000 lbs. daily), 25,000 metric tons (MT) CO₂equivalent(eq)/year amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

Executive Orders S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, Senate Bill 97, AVAQMD CEQA and Federal Conformity Guidelines, Rule 3011 GHG Provisions of Federal Operating Permits

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site FRP and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the three (3) proposed Project sites in the MDAB. The generator test would last one hour at each site during a single day each month. It was also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site FRP was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all three (3) Project sites in the MDAB are estimated at 142.24 TCO₂e (129 MTCO₂e), or less than 47 TCO₂e (43 MTCO₂e) annually for proposed Project site FRP. To be consistent with the analysis of sites located in the SCAB/SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site ENT would be substantially below the AVAQMD annual 100,000 TCO₂e threshold and Council on Environmental Quality 25,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to

2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site FRP, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the AVAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site FRP would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Lahontan

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Developed Area Interface

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Antelope Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health,

watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as in the Developed Area Interface. The Developed Area Interface zone includes areas adjacent to communities or concentrated use areas and developed sites with more scattered or isolated community infrastructure. The level of human use and infrastructure is typically higher than in other zones, and the level of development varies between areas that are highly developed to areas where no development has occurred. Although this zone may have a broad range of higher intensity uses, the management intent is to limit development to a slow increase of carefully designed facilities to help direct use into the most suitable areas and concentrating on improving facilities before developing new ones (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. No land use impacts are anticipated because of the communications site designation, but new development will still require a permitting process prior to construction.

Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am on weekdays or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar

to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 dBA daytime criterion but would exceed FTA threshold 80 dBA nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are

assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Developed Area Interface land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. Blue Ridge is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced site; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to trails or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Highway 2

Distance (Miles): 1.34

Disaster Route: State Route 2

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No

Nearest Highway/Freeway: Foothill Frwy

Distance (Miles): 1.34

Nearest Major Arterial: Highway N-4

Distance (Miles): 6.83

Access to the Project Site Provided Via: E. Blue Ridge Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Savage Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: FTP

Site Name: Flint Peak

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Surrounding area south of site

Site view looking east

Surrounding area east of site

Site view looking west

Surrounding area west of site

Aesthetics

Setting

Visual Description:

This site is located on a high ridge top in mostly undeveloped open space with a golf course to the south. Open space surrounds the site on all sides. Open space is vegetated with chaparral on the south and west sides of the ridge, and topography is undulating. Vegetation is noticeably denser and more evergreen on the northeast side of the ridge. Scattered subdivisions exist farther to the north and east. The site is not evident from the northeastern subdivisions. Vegetation and topography block most views of the site from the northwestern subdivision. Glen Oaks Blvd travels east-west to the south, and below, the site. The site is occasionally visible from the road. Where visible, the existing towers are a dominant feature. A tall, slender red and white lattice tower with four small antennas exists on the site. Six tall monopoles, as well two one-story equipment shelters of varying sizes, also exist. Some antennas are mounted on the buildings. The site footprint is an oblong triangular shape, surrounded on all sides by trees that abut the chain link fence that encloses the site.

Visual Sensitivity: Low

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed new facilities would be located within a site that includes existing towers that already create a visual intrusion onto the landscape. The new facilities would not be located in an area defined as scenic vista, and are not readily visible due to steep topography and mature vegetation. Locating the new tower and equipment with existing structures would concentrate the impacts. The existing towers would attenuate the noticeability of new structures, thereby minimizing visual impacts. The new facilities would not block or remove views given the degree to which the facility is currently obscured by topography and vegetation. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no impacts to scenic vistas would occur.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site is impacted by the presence of the existing site and towers. Although the new tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Golf course

Distance to Sensitive Receptor: 860

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site FTP. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site FTP or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site FTP would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site FTP will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site FTP would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site FTP or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site FTP, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site FTP, which is 860 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 7 are higher than the SCAQMD thresholds for CO and No_x, lower for PM₁₀ and PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site FTP and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site FTP in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site FTP and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); least Bell's vireo (*Vireo bellii pusillus*; ESA-E, CA-E); southwestern willow flycatcher (*Empidonax traillii extimus*; ESA-E, CA-E)

Special Status Plants Recorded within 1 Mile:

Parish's gooseberry (*Ribes divaricatum* var. *parishii*; 1A)

Sensitive Communities Recorded within 1 Mile:

Southern Coast Live Oak Riparian Forest; Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

American peregrine falcon - foraging (*Falco peregrinus anatum*; CDFW-FP); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

None

Local Policy or Ordinance for Biological Resources:

City of Glendale General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

California buckwheat scrub [*Eriogonum fasciculatum* Shrubland Alliance]; Association-*Eriogonum fasciculatum*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site FTP is located on a steep hilltop with chaparral vegetation. Vegetation includes bush buckwheat (*Eriogonum fasciculatum*), and sagebrush (*Artemisia californica*) dominates the south-facing slopes, and dense oak, toyon (*Heteromeles arbutifolius*), bush monkeyflower (*Diplacus aurantiacus*), lemonade berry (*Rhus integrifolia*) and mountain mahogany (*Cercocarpus montanus*) dominates the north-facing slopes. American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP) may pass by the site while foraging, but the project area does not provide steep cliff habitat required for nesting. The study areas considered to be outside the current range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), but as the condor population increases it is expected to expand geographically. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass,

brightly colored objects) often found at developed sites. Coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) may occur on-site and individuals could be killed by project activities. There is no riparian habitat suitable for least Bell's vireo (*Vireo bellii pusillus*; ESA-E, CA-E) or southwestern willow flycatcher (*Empidonax traillii extimus*; ESA-E, CA-E) present in the project area. A historic record (1911) from Eagle Rock of non-specific location near the site was also recorded. A recent occurrence of least Bell's vireo was recorded 1.5 miles from this site in 2013 at Devil's Gate Reservoir. A historical (1906) occurrence of the southwestern willow flycatcher was recorded from the area of Arroyo Seco. Parish's gooseberry (*Ribes divaricatum* var. *parishii*; 1A) occurs in riparian habitat. Such wetland habitat does not occur on site. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

To address future use of the area by condors all trash and construction debris (especially small items such as nuts and washers) will be removed from the site; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of coast horned lizard. Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Mitigation required: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Southern Sycamore Alder Riparian Woodland is within 500 feet of the project site.

Mitigation Measure(s):

Recommended Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within a CDFW's designated Essential Habitat Connectivity Area which connects the San Gabriel/Cucamonga and Table Mountain Natural Landscape Blocks. This and other forest service sites would need to have service sensitive species analyzed. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site FTP is located within the City of Glendale. Policy 1 of the Conservation Element of the City of Glendale General Plan (City of Glendale 1993) promotes the maintenance and restoration of natural resources. While native vegetation occurs in the study area of Site FTP, only disturbed vegetation and development occurs within the actual site boundary of the site. Ground disturbance at the site would not exceed 5,000 square feet, and substantive removal of native vegetation is not expected. As a result, any conflicts with the City of Glendale General Plan associated with construction activities at Site FTP would be minor and construction impacts at Site FTP would be less than significant. The proposed new antenna support structure at Site FTP increases the probability of a bird strike hazard, even if other towers are present. Workers accessing the site during operations for maintenance and repair activities would slightly increase the traffic count which could increase the potential to injure or kill wildlife. These operations impacts may occur to a few individual animals, however, without impacts at a landscape level. Due to the history of disturbance on these sites, the lack of protected species known to occur near the sites, and the minimal activity associated with maintenance and repair activities, operations associated the proposed project at Site FTP would have a less than significant impact on biological resources protected by the City of Glendale General Plan. Because the Authority is exercising intergovernmental immunity, the plan is not applicable and no conflict with the City of Glendale General Plan exists.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in February 2015. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Precambrian rocks, undivided, unit 2 (Mojave Desert and Transverse Ranges)

Stability: Low to Moderate based on designation within Landslide Zone

Soil Type: Vista-Fallbrook-Cieneba Association

Erosion Potential: Moderate based on designation within Landslide Zone

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require

additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of a well-drained, coarse sandy material. This soil type exhibits a slow to rapid runoff with moderate permeability, resulting in moderate erosion resistance. Grading, excavation, and other construction activities associated with the implementation of the proposed project could cause erosion due to exposed soils. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the local city planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell

with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site FTP and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days. Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B-1.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site FTP was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site FTP. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site FTP would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source

categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site FTP, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site FTP would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: Yes

If yes, please explain: Scholl Canyon Landfill is located between 1/8 and 1/4 mile from Project Site.

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: Yes

If yes, please explain: Scholl Canyon Landfill

Located in a Local Fire hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Glendale

General Plan Designation: Very Low Density Residential/Open Space

Zoning: Residential Open Space

What is the zoning height restriction, if any?:

32 feet. Additional height requires Planning Commission approval

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Glendale

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such plans, policies, and regulations are not applicable to the project. Nevertheless, in the exercise of its discretion and in the interest in working cooperatively with local jurisdictions, local land-use plans, policies, and regulations are referenced, described, and addressed in recognition that such plans, policies, and regulations reflect the local community's policy decisions with respect to appropriate uses of land in the area. Consideration of these plans, policies and regulations, therefore, assists in determining whether the proposed project may conflict with nearby land uses, which could affect the analysis of whether the proposed project would result in potentially significant environmental impacts.

Based on the zoning ordinances for this site, the maximum allowable height of structures in this area is 32 feet.

Exceptions to the ordinance may be allowed with Planning Commission approval. However, per the doctrine of intergovernmental immunity, the approval requirement is not applicable to the project. Because the Authority is exercising intergovernmental immunity, the City of Glendale General Plan is not applicable and no conflict with the plan exists.

The proposed facilities at this site may be inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and the policy to protect areas that have significant natural resources. However, no physical impact would occur as a result of an inconsistency between the proposed project and the policy, and this is not considered a significant impact. As discussed in Sections 3.5 (geologic and soil hazards), Section 3.7 (fire hazards), Section 3.3 (biological effects), as well as in a site-by-site assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than significant.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Glendale

Applicable Noise Ordinance: Title 8 Health and Safety, Chapter 8.36 Noise Control

Noise Level Threshold: N/A; no construction from 7 pm to 7 am on weekdays, weekends and holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range

from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would

not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: State Route 134

Distance (Miles): 1.04

Disaster Route: Highway 134/Ventura Freeway

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No

Nearest Highway/Freeway: State Route 134

Distance (Miles): 1.04

Nearest Major Arterial: E Chevy Chase Dr.

Distance (Miles): 0.54

Access to the Project Site Provided Via: extension off of E. Glen Oaks Boulevard

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Scholl Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: CITY OF GLENDALE

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

•Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: GMT

Site Name: Grass Mountain

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of two (2) up to 85kW diesel generators each with up to 1,500 gallon belly tanks. Propose installation of two solar arrays up to 1500 square feet total. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 10,000 square feet

Permanent disturbance area: Up to 8,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This isolated site is located in Angeles National Forest within a large cleared area on a high mountain top overlooking the community of Green Mountain. Low chaparral vegetation surrounds the site on all sides except the north, where tall evergreens are present. The cleared area is visible from the Green Valley community and the San Francisquito Canyon Road below the ridge near the intersection of Spunky Canyon Road. The ridge top dominates this view. A narrow lattice tower enclosed by a chain link fence exists on site. Sensitive viewers are national forest visitors. This site is in proximity to the Pacific Crest Trail. The Pacific Crest Trail traverses the ANF, described above, generally from northwest to the southeast. Thousands of hikers and equestrians use this trail each year. The Pacific Crest Trail Association (PCTA) strives to protect the trail experience, which includes “wild scenery of the highest caliber and integrity,” “refuge from industrialized civilization and its sights,” and “therapeutic effects of elevated ‘crest’ views and naturally open landscapes.” The desired condition described in the PCTA 2014-2017 Strategic Plan states, “Public lands within the Foreground Trail Corridor, including lands acquired and managed for the PCT, are managed to maximize a natural appearing landscape where human development does not dominate the viewer’s experience...” (PCTA 2013). The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Back Country, . The site is also a USFS Designated Communication Site, which allows for such use on national forests except when identified as not suitable because of law, national or regional policy, or the revised forest plan (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High/SAC B; Back Country

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Pacific Crest Trail

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is located on a cleared high hilltop that would be in view of the surrounding ANF and the PCT. The proposed new features would be uncharacteristic of the scenic vista if no structure was already present. However, the new facilities would be located within a site that includes an existing lattice tower that already creates a visual

intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing tower, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. The site would be visible on from other locations within the forest given the ridge line's prominent height. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. The level of human use and infrastructure in a USFS back country zone is typically low to moderate. Although this zone allows a range of compatible uses, the management intent is to retain the natural character inherent in this zone and limit the level and type of development. The existing visual character and quality of the site and its surroundings are impacted by the presence of the existing lattice tower. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site, resulting in no change to the site's scenic attractiveness rating. In addition, the site is located on a USFS Designated Communication Site, which generally allows for such use within the area's landscape. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 5724

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site GMT. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site GMT or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site GMT or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Less than Significant

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site GMT would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site GMT will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites

can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOX emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOX emissions limits. With implementation of Mitigation Measures AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site GMT or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site GMT would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site GMT or the simultaneous operation of all proposed Project sites in the

SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?**Construction Impact:** Less than Significant Impact**Operational Impact:** Less than Significant Impact**Discussion:**

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NOx, CO, PM10, and PM2.5. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site GMT, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site GMT, which is 5,742 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 37 are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site GMT and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for

Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site GMT in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site GMT and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

None

Special Status Plants Recorded within 1 Mile:

round-leaved filaree (California macrophylla; 1B.1); San Fernando Valley spineflower (Chorizanthe parryi var. fernandina; ESA-C, CA-E, USFS-S, 1B.1)

Sensitive Communities Recorded within 1 Mile:

Southern Coast Live Oak Riparian Forest; Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

bald eagles (Haliaeetus leucocephalus; CA-E, CDFW-FP, USFS-S); California condor (Gymnogyps californianus; ESA-E, CA-E, CDFW-FP); round-leaved filaree (California macrophylla; 1B.1)

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site GMT is located in the Angeles National Forest on Grass Mountain, a hill top clearing with non-native grassland and scattered canyon live oak and Coulter pines; down slope are dense stands of chaparral vegetation. Vegetation on the north-facing slope includes Coulter pine, blue elderberry (Sambucus nigra), squawbush (Rhus trilobata), and non-native grassland on the south-facing slopes. A bald eagle (Haliaeetus leucocephalus; CA-E, CDFW-FP, USFS-S) has been observed during the winter in 2009. They may pass through the area while utilizing habitat at Lake Elizabeth, almost 2 miles from the project site; project activities do not interfere with foraging habitat at Lake Elizabeth. The study area is within the foraging range of the California condor (Gymnogyps californianus; ESA-E, ESA-CH, CA-E, CDFW-FP), and potential nesting habitat may be found in steep mountainous terrain surrounding the study area. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to

human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. Several communication towers and facilities are present at and near the project site, and few if any anti-perch devices have been installed on these structures. Habitat for round-leaved filaree (*California macrophylla*; 1B.1) includes clay flats and depressions in native grasslands. Very poor habitat for this species occurs within the survey area though surveys are needed during the appropriate season. Habitat for San Fernando Valley spineflower (*Chorizanthe parryi* var. *Fernandina*; FC, SE, 1B.1) includes mature wash benches along major washes; habitat for this species does not exist in the project area. A historic record (1929) exists within 1 mile of the project site. This plant has not been relocated since 1929, though no thorough surveys have been completed. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

An biological monitor will be present during construction and an environmental awareness program will be presented to all workers; all trash and construction debris (especially small items such as nuts and washers) will be removed from site each day; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Conduct spring botanical surveys for round-leaved filaree (*California macrophylla*; 1B.1); if present mark the areas requiring special protection. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Mitigation required: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated San Francisquito Natural Landscape Block which overlaps the ranges of approximately 237 amphibian, reptile, mammal and bird species. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. There are no other historical resources. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. LMR activities at this project location include the attachment of whip and microwave antennas on a proposed 180-foot lattice tower and the construction of a new equipment shelter, backup generator, and fuel tank within an area where there is existing communications equipment, including a lattice tower. The proposed 180-foot tower would be taller than the existing lattice tower; however, it would generally be in keeping with the existing communications/industrial landscape at this project location. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant,

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land,

consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any uniquely definable features at this proposed project site, impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Precambrian rocks, undivided, unit 2 (Mojave Desert and Transverse Ranges)

Stability: Moderate to High pending geotechnical analysis

Soil Type: Gaviota-Cieneba-Capistrano-Caperton Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed building site is flat grade on ridgetop surrounded by moderate to steep slopes.

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of a well-drained, gravelly loam material with moderate permeability. Erosion resistance is considered moderate at the site. The proposed building site is flat with moderate to steep slopes surrounding the site. Grading, excavation, and other construction activities associated with the implementation of the proposed project could cause erosion due to exposed soils. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site GMT and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Additional detail on the methodology for the construction and operational impact analysis is provided in Appendix B-1.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site GMT was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site GMT. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site GMT would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site GMT, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site GMT would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.
