HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Back Country

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Antelope Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health, watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health

(USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as Backcountry. Backcountry includes areas of the national forest that are generally undeveloped with few roads. Most of the national forest's remote recreation and administrative facilities are found in this zone. The level of human use and infrastructure is generally low to moderate. The zone is managed for motorized public access on designated roads and trails. Although this zone generally allows a broad range of uses, the management intent is to retain the natural character inherent in this zone and limit the level and type of development (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. This site is a designated communications site for government use only in the Forest Plan. While this restriction prohibits commercial use of the site for communications, exceptions may be made for state and local government agencies; a permit for a facility that intended for emergency response is likely. Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Backcountry land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. Pine Mountain is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: San Gabriel Canyon Rd

Distance (Miles): 5.1

Disaster Route: State Route 39

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Interstate 605

Distance (Miles): 6.37

Nearest Major Arterial: San Gabriel Canyon Rd

Distance (Miles): 2.22

Access to the Project Site Provided Via: Extension off of Forest Route 2N24

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Scholl Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: PWT

Site Name: Portshead Water Tank

Site Discussion:

Propose installation of up to 20 whip and up to 5 microwave antennas on new monopole up to 28 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 150 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 8 foot diameter x 36 foot deep drilled caisson with concrete cap for monopole support; or up to 16 foot x 16 foot x 10 foot deep concrete mat foundation.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Setting

Visual Description:

This site is located in the Santa Monica Mountains National Recreation Area within Zumas/Trancas Canyons and is managed by the NPS. The site includes a white, 24-foot tall water tank set into a cut slope on a concrete pad at the end of an access road that connects to Cavalleri Road via Kanan Dume Road. A second, smaller water tank on the west side of the existing one has been removed. A utility pole is the tallest vertical structure. A few low shrubs and trees are along the site's perimeter. The site is located approximately 0.2 mile west of Kanan Dume Road within the coastal zone in the City of Malibu. The City of Malibu has designated Kanan-Dume Road as a scenic road within the city. The road travels north from the city into the Santa Monica Mountains and the NRA. The city defines scenic roads as those "traversing or providing views of areas of outstanding scenic quality, containing striking views of natural vegetation, geology, and other unique natural features, including the ocean" (City of Malibu 2002). A low density residential area is south of the site, which is otherwise surrounded by undeveloped land that is sparsely vegetated. The Ocean View Trail circles around the north side of the site. This trail combines with the Canyon View Trail to create a 3-mile loop that winds through chaparral covered slopes, offering good views of the ocean and the canyon floor. The trails also pass through a coastal sage scrub community (NPS 2009).

Visual Sensitivity: High

On federally administered public lands: Yes, National Park Service

If yes, enter applicable ratings: None

Within the California coastal zone boundary: Yes, City of Malibu Local Coastal Plan

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Kanan-Dume Road

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new monopole would be approximately the height of the existing water tank, and shorter than the existing utility pole. Although the monopole would introduce a new vertical element to the site, it would only be approximately 4 feet taller than the existing water tank, and would not perceptibly change the scenic vista due to its slender girth. In addition, the monopole would be at a lower elevation than the Ocean View Trail that curves around the site to the north, so the structure would be below the visual plane of ocean views from the trail. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

New facilities would be located within an existing site on an asphalt surface. The construction staging area would also be located in the same area. No removal of or damage to scenic resources would occur.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings has already been degraded by the presence of the 24-foot white water tower, which is a large, brightly-colored man-made mass on a hillside with sparse, low vegetation. The new monopole and associated equipment would be compatible with the existing site. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in an urban area and would include construction of new facilities. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. This site is in an urban area where numerous sources of day and nighttime lighting are present, such as vehicle headlights, traffic signals, street lights, and building security lights. Because of the presence of these light sources, tower lighting, if required, would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 529

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site PWT. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site PWT or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?**Construction Impact:** Less than Significant**Operational Impact:** Less than Significant**Discussion:**

Emissions from the construction of proposed site PWT would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site PWT will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site PWT would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site PWT or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site PWT, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site PWT, which is 529 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds for NO_x, CO, below for PM₁₀, PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site PWT and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site PWT in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site PWT and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); monarch butterfly (*Danaus plexippus*; ESA-Pet)

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

None

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP); coastal California gnatcatchers (*Polioptila californica californica*; ESA-T, CDFW-SSC); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, 1B.1);

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

NPS - Santa Monica Mountains National Recreation Area; Santa Monica Coastal Resource Area; SCAG Zoning - Open Space and Recreation; Natural Landscape Block - Zuma/Trancas Canyons/Santa Monica Mountains;

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Santa Monica Mountains National Recreation Area General Management Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

California sagebrush scrub [*Artemisia californica* Shrubland Alliance]; Association-*Artemisia californica*-*Malosma laurina*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site PWT is located on a hillside slope within a cut-slope constructed for the installation of the water tank. The ground surrounding the tank has revegetated with both native and non-native species, but this perimeter extending up to about 100 feet from the tank is regularly mowed. American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP) may pass through the study area while foraging, but the study area does not provide steep cliff habitat required for nesting. The project site is surrounded by fairly extensive stands of coastal sage scrub vegetation; there is evidence of past fires. Protocol surveys for coastal California gnatcatcher (*Polioptila californica californica*; ESA-T, ESA-CH, CDFW-SSC) were conducted in 2014 and no birds were detected. Habitat was

considered to be marginally suitable for the gnatcatcher based on the vertical structure, shrub density, slope, and habitat fragmentation. There are no reported observations of gnatcatchers within several miles of the project area. Also, corvids, potential predators of the gnatcatcher were common throughout the area. California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) is known to occur in Ramirez Canyon; the drainage is about 0.5-miles west of Site PWT, but the location of the frogs within the canyon is not available from Santa Monica National Recreation Area. Though no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. Site PWT is hydrologically connected to lower Ramirez Canyon. Monarch butterfly (*Danaus plexippus*, ESA-Pet) are expected to pass through the area during migration; suitable roost trees were not observed within the survey area during the habitat assessment survey. Potentially suitable habitat for Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, 1B.1) is within coastal sage scrub vegetation. Designated critical habitat about 1 mile to the northwest in a similar ecological setting. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) and coastal California gnatcatchers (*Polioptila californica californica*; ESA-T, CDFW-SSC) in the project area, and the importance of maintaining coastal sage scrub vegetation. Minimize disturbance to natural vegetation; especially coastal sage scrub vegetation (e.g., California sagebrush [*Artemisia californica*], sage [*Salvia* spp], and Laurel sumac [*Malosma laurina*], and California buckwheat [*Eriogonum fasciculatum*]). Prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Conduct protocol surveys for the gnatcatcher; if nesting is present within the project area limit construction activities to the non-breeding season. To protect dispersing California red-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Manage trenches so as not to trap wildlife. Preconstruction surveys would verify if Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, 1B.1) is present; protect as necessary. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 14 Coastal California Gnatcatcher Protocol Surveys • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community occur within 500 feet of the project site. Site PWT is hydrologically connected to Ramirez Canyon, a drainage occupied by California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC).

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Riverine wetland feature type as indicated by the National Wetland Inventory (USFWS 2014). However, this wetland type is restricted to ephemeral drainages. Construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Zuma/Trancas Canyons/Santa Monica Mountains Natural Landscape Block which overlaps the ranges of approximately 297 amphibian, reptile, mammal and bird species. The site is also located within the proposed Santa Monica Mountains Coastal Resource Area, which is identified as an important regional habitat linkage in the Los Angeles General Plan. Linkages in this CRA connect open spaces together that may be fragmented due to rural development and connect to habitats in Ventura County. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the SMMNRA GMP would be made by the NPS. Construction activities could impact species and introduce non-native species, conflicting with SMMNRA GMP goals.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local,

regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, National Park Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

There are no recorded historical resources within the direct area of potential effects (APE). The direct APE consists solely of a fenced infrastructure feature consisting of a large water tank on a paved surface. Within the indirect APE, there are eight prehistoric archaeological sites. Of the sites (Resource No. P-19-002158) is a National Register of Historic Places (National Register)-eligible site that encompasses a variety of prehistoric elements and artifacts. There is also an associated 1950s-vintage refuse deposit. Although no osteological material has been recorded, researchers of this site believe that it is probably present. LMR construction at this project location includes the attachment of whip antennas on a proposed 28-foot monopole; construction of a new equipment shelter; and installation of a backup generator and fuel tank on a concrete pad. Given the proximity of Resource No. P-19-002158 to the direct APE there is a high probability to encounter archaeological materials during LMR construction. This was confirmed through archival research and during a field survey of the direct APE conducted by an SOI-qualified archaeologist in January 2015. Based on the nature of this project site and the identified resources, impacts from project activities would be significant; however, implementation of mitigation measures would reduce impacts to less than significant levels.

Mitigation Measure(s):

CUL MM 1, 3, and 4 would be implemented at this project site. Archeological monitoring would be required during all ground disturbing activities and monitors would restrict access to P-19-002158 during LMR

construction. In addition, because this project location is on National Park Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

There are no recorded historical resources within the direct area of potential effects (APE). The direct APE consists solely of a fenced infrastructure feature consisting of a large water tank on a paved surface. Within the indirect APE, there are eight prehistoric archaeological sites. Of the sites (Resource No. P-19-002158) is a National Register of Historic Places (National Register)-eligible site that encompasses a variety of prehistoric elements and artifacts. There is also an associated 1950s-vintage refuse deposit. Although no osteological material has been recorded, researchers of this site believe that it is probably present. LMR construction at this project location includes the attachment of whip antennas on a proposed 28-foot monopole; construction of a new equipment shelter; and installation of a backup generator and fuel tank on a concrete pad. Given the proximity of Resource No. P-19-002158 to the direct APE there is a high probability to encounter archaeological materials during LMR construction. This was confirmed through archival research and during a field survey of the direct APE conducted by an SOI-qualified archaeologist in January 2015. Based on the nature of this project site and the identified resources, impacts from project activities would be significant; however, implementation of mitigation measures would reduce impacts to less than significant levels.

Mitigation Measure(s):

CUL MM 1, 3, and 4 would be implemented at this project site. Archeological monitoring would be required during all ground disturbing activities and monitors would restrict access to P-19-002158 during LMR construction. In addition, because this project location is on National Park Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Miocene Monterey Formation, which has a high potential for significant vertebrate fossils. No localities are recorded within the proposed site; however, this formation has produced numerous fossil specimens throughout the Santa Monica Mountains region. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Monterey Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Human remains have not been previously recorded within the direct area of potential effects (APE); however, based on archival research and a field survey in January 2015, there is a moderate to high probability for them to occur at this project location. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 1, 3, and 4 would be implemented at this project site. Archaeological monitoring will be undertaken during all ground disturbing activities to ensure that human remains are not disturbed during LMR construction. Monitors would also restrict access to P-19-002158 during LMR construction.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. However, archival research and a field survey conducted in January 2015 indicate that they are present within this project location and could be impacted by LMR construction. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 1, 3, and 4 would be implemented at this project site. Archaeological monitoring will be undertaken during all ground disturbing activities to ensure that human remains are not disturbed during LMR construction. Monitors would also restrict access to P-19-002158 during LMR construction.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: moderate pending geotechnical analysis

Soil Type: Urban land-Rock outcrop-Millsholm Association

Erosion Potential: Low

Expansive Soil: Low

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed site is on relatively flat grade surrounded by low angle to moderate slopes

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line has been identified approximately 1/8 of a mile north of the property (Santa Susana) (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These

acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of well-drained light clay loam with low to very high runoff and moderate permeability. Moderate slopes surround the site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the City of Malibu planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located at water tank pad that has been cut into bedrock. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site PWT and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site PWT was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site PWT. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site PWT would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site PWT, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site PWT would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Conejo-tierra Rejada Volcanic

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. While this site is situated in an area downgradient of moderate to steep slopes, it is not listed by California Geologic Survey as being within a Landslide Zone. However, due to its location downgradient of these slopes, some risk of surprise inundation by mudflow exists during construction.

Mitigation Measure(s):

GEO MM 1. Performance of a geotechnical report at the site, a condition of construction during the building permitting process would identify if there were a requirement for additional design features to prevent impacts associated with mudflow.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: NPS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: Malibu Coastal Zone

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Malibu

General Plan Designation: Public Open Space

Zoning: Public Open Space

What is the zoning height restriction, if any?:

28 feet

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Malibu

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site PWT is located approximately 800 feet from Kanan Dume Road, a designated Scenic Road, on a parcel that supports an approximately 24-foot-tall storage tank within the City of Malibu Coastal Zone. The City of Malibu Coastal Zone Land Use Plan was certified by the California Coast Commission on September 13, 2002 and provides for communication facilities as a conditional use in all land use designations. Policies in the Land Use Plan include avoiding or minimizing impacts to Environmentally Sensitive Habitat Areas and scenic resources; avoiding facility visibility from public viewing areas; and co-locating facilities where feasible. Per Local Implementation Plan Policy 3.14.1, the general requirements for every wireless telecommunications facility and antenna include development standards specifying that the maximum height of ground or building-mounted antennae shall not exceed 28 feet. However, if the antennae elements are mounted flush on an existing structure that exceeds 28 feet, the antennae elements may be equal to the height of the building. Roof-mounted antennae may extend no more than 3 feet

about the roof from which they are attached. Per Land Use Plan Policy 6.5, new development shall be sited and designed to minimize adverse impacts on scenic areas visible from scenic roads to the maximum feasible extent. The proposal is to mount whip antennas on a proposed 28-foot-tall monopole at a site that currently does not include communications facilities. Terrain screens the 24-foot-tall storage tank from views along Kanan Dume Road, and the proposed 28-foot-tall monopole also would be screened from view. The proposal is in compliance with the City of Malibu Coastal Zone Local Implementation Plan section on wireless telecommunications antennae and facilities as well as other city plans, policies, and ordinances.

Site PWT is also on National Park Service Land. In accordance with the Superintendent's Compendium of Designations, Closures, Permit Requirements, and Other Restrictions Imposed under Discretionary Authority (NPS 2014b), construction of a structure requires a permit from the Superintendent, but wireless communications site development or use are not otherwise specified for this unit of the NPS system. The Authority would apply for the permit and adhere to the terms and conditions.

The final determination of consistency would be made by NPS. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan, and this is not considered a significant impact.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Malibu

Applicable Noise Ordinance: Title 8 Health and Safety, Chapter 8.24 Noise

Noise Level Threshold: N/A; no construction from 7 pm to 7 am on weekdays, before 8 a.m. or after 5 p.m. on Saturday, or any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: 300 feet

Ambient Noise Level: 45 dBA

Sensitive Noise Receiver 1: Single Family Residential Dwellings

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

Hourly average construction noise levels are anticipated to be approximately 89 dBA. The predicted noise levels represent the demolition phase which is anticipated to be the loudest construction phase. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site. However, in some instances, it may be necessary for construction activities to take place outside of these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The affected jurisdiction has not established a construction noise level threshold. Therefore, construction noise levels at the proposed Project site would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable"

community noise equivalent level (CNEL) developed by the California Department of Health Services was referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. Noise levels from both sources would be below the 60 dBA “normally acceptable” level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers within this distance to the site; therefore, groundborne vibrational noise impacts would be less than significant.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings or sensitive receivers within this distance to the site; therefore, impacts from groundborne vibration would be less than significant.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. Therefore, extremely sensitive (fragile) buildings and sensitive receivers would not be exposed to excessive groundborne vibration or groundborne noise from Project operation and impacts would be less than significant.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, the estimated noise level at 300 feet from proposed sites would be 63 dBA and not exceed the 90 dBA daytime or 80 dBA nighttime criterion; therefore, construction impacts would be less than significant.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (kW) to 100 kW power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 dBA at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 dBA. The resulting noise emissions would be 58 dBA at 21 feet or 56 dBA at 25 feet. Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 dBA to 60 dBA. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 dBA) or nighttime (80 dBA) thresholds; therefore, impacts from operational noise would be less than significant.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working

in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: City of Malibu Local Coastal Program, Land Use Plan

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: Yes

If yes, Plan or Designation Area: National Park Service Santa Monica Mountains National Recreation Area

National or California State Park: Yes

If yes, Plan or Designation Area: Santa Monica Mountains National Recreation Area

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: Within Santa Monica Mountains National Recreation Area

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Pacific Coast Hwy

Distance (Miles): 0.83

Disaster Route: Kana Dume Road

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Us Highway 101

Distance (Miles): 0.8

Nearest Major Arterial: Portshead Tank

Distance (Miles): 0.13

Access to the Project Site Provided Via: Extension off of Cavalleri Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: L A COUNTY WATERWORKS DIST #29

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does not meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: RIH

Site Name: Rio Hondo

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose construction of up to 200 foot long x 4 foot high retaining wall. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Surrounding area west of site

Aesthetics

Setting

Visual Description:

The site is located on a ridgeline at an elevation of 1,165 feet and consists of a wide, 150-foot tall lattice tower with several microwave dishes attached, a small one-story windowless shelter, and a fuel tank on an asphalt base surrounded by a chain link fence. A few medium sized deciduous trees are enclosed within the fence along the periphery of the site. Three similar sites with lattice towers (one substantially taller) and attached microwave dishes is immediately east of the site. A large white water tank is immediately west of the site. The northern half of the area is a mine or quarry, and includes reclaimed areas. The southwestern area includes cemetery plots within a memorial park and mortuary. The southeastern area is primarily agricultural. The south central area (immediately south of the site) is an undeveloped hillside consisting of grasses and some scattered low shrubs and trees.

Visual Sensitivity: Low

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located adjacent to a quarry/mine and is not within a scenic vista.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The new facilities would be located within a site that includes existing towers that have already altered the landscape. In addition, the surrounding landscape has been heavily impacted by quarry/mining activities that have cut terraces into the hillsides and removed a substantial amount of vegetation. For these reasons, no impacts to visual character and quality would occur.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Cemetery

Distance to Sensitive Receptor: 877

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site RIH. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site RIH or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site RIH would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site RIH will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site RIH would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site RIH or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site RIH, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site RIH, which is 877 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 11 are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site RIH and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site RIH in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site RIH and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition,

the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

bank swallow (*Riparia riparia*; CA-T); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); coastal California gnatcatcher (*Poliophtila californica californica*; ESA-T, ESA-CH, CDFW-SSC); least Bell's vireo (*Vireo bellii pusillus*; ESA-E, CA-E); San Diego desert woodrat (*Neotoma lepida intermedia*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

intermediate mariposa-lily (*Calochortus weedii* var. *intermedius*; 1B.2); many stemmed dudleya (*Dudleya multicaulis*; CA-1B.2)

Sensitive Communities Recorded within 1 Mile:

coastal California gnatcatcher (*Poliophtila californica californica*; ESA-T, ESA-CH, CDFW-SSC)

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

coastal California gnatcatcher (*Poliophtila californica californica*; ESA-T, ESA-CH, CDFW-SSC); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); San Diego woodrat (*Neotoma lepida intermedia*; CDFW-SSC); intermediate mariposa-lily (*Calochortus weedii* var. *intermedius*; 1B.2);

Designated Critical Habitat Within 500 Feet:

coastal California gnatcatcher (*Poliophtila californica californica*; ESA-T, ESA-CH, CDFW-SSC)

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

None

Local Policy or Ordinance for Biological Resources:

Los Angeles County General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Laurel sumac scrub [*Malosma laurina* Shrubland Alliance]; Association - *Malosma laurina*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site RIH is located on an isolated hill between the Puente Hills landfill and Rose Hills Memorial Park. The project area includes native and restored coastal sage scrub vegetation. The project area is within designated critical habitat for the coastal California gnatcatcher (*Poliophtila californica californica*; ESA-T, ESA-CH, CDFW-SSC). At least one pair of gnatcatchers was known to nest in 2014 in the project area based on surveys associated with a Southern California Edison project. The project area is presumed occupied and additional surveys were not conducted. Coastal sage scrub vegetation and components of critical habitat primary constituent elements occur within and adjacent to the project site as well as throughout the project area. Riparian and streamside habitat

suitable for nesting bank swallows (*Riparia riparia*; CA-T) and least Bell's vireo (*Vireo bellii pusillus*; ESA-E, CA-E) are not present in the project area. The dense vegetation and varied topography of the project area result in unsuitable habitat for the burrowing owl (*Athene cunicularia*; CDFW-SSC). Potential habitat for the coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) occurs within the project area and individuals could be killed by project activities. Though not recorded by CDFW in the CNDDDB, the San Diego woodrat (*Neotoma lepida intermedia*; CDFW-SSC) was discovered in the project area during surveys for the California Edison project. Within the portion of the survey area that was not disturbed contains moderate quality habitat for intermediate mariposa-lily (*Calochortus weedii* var. *intermedius*; 1B.2). Evidence of the woody flower/fruit stalks was not observed during the 9/11/2014 habitat assessment survey. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of coastal California gnatcatchers (*Poliophtila californica californica*; ESA-T, ESA-CH, CDFW-SSC) in the project area, and the importance of maintaining coastal sage scrub vegetation. Minimize disturbance to natural vegetation; do not remove coastal sage scrub vegetation (e.g., California sagebrush [*Artemisia californica*], sage [*Salvia* spp], and Laurel sumac [*Malosma laurina*], and California buckwheat [*Eriogonum fasciculatum*]). Prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. No construction activities during the gnatcatcher breeding season. Stay on existing roads. Conduct protocol surveys for the gnatcatcher; if nesting is present within the project area limit construction activities to the non-breeding season. Manage trenches so as not to trap wildlife. Conduct spring botanical surveys for intermediate mariposa-lily (*Calochortus weedii* var. *intermedius*; 1B.2); if present mark the areas requiring special protection. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 13 Coastal California Gnatcatcher Breeding Season Restrictions • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Critical habitat for coastal California gnatcatcher (*Poliophtila californica californica*; ESA-T, ESA-CH, CDFW-SSC) is within 500 feet of the project site.

Mitigation Measure(s):

Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection of Habitat • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The community plan is primarily concerned with trails and a wide range of recreational activities, minimizing future disturbance to native vegetation, increasing open space, maintaining SEA boundaries, determine fuel modification zones, develop hillside development standards, and maintaining a 50' buffer around riparian habitat. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Construction at Site RIH could result in removal of vegetation and human disturbance at each site and therefore could result in conflict with the Los Angeles County General Plan's Policy C/NR 3.1, which calls for conservation and enhancement of ecological function diverse natural habitats and biological resources. The site contains an existing tower facility, related infrastructure, and access road along with disturbed native scrub vegetation. The current use at the site is communications facility, and substantive removal of native vegetation is not expected. Construction and operations activities at the site do have the potential to impact biological resources, as described in Impact BIO 1. These impacts to resources conflict with Policy C/NR 3.1. Because a potential for significant impact associated with the resources protected by the Los Angeles County General Plan exists, this would constitute a significant impact.

Mitigation Measure(s):

The mitigation measures identified in Impact BIO 1 would reduce impacts from construction and operations to less than significant. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 4 Site Sanitation • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 13 Coastal California Gnatcatcher Breeding Season Protocol Surveys • BIO MM 14 Coastal

California Gnatcatcher Breeding Season Restriction • BIO MM 15 Southwestern Willow Flycatcher Protection • BIO MM 16 Snowy Plover Protection • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Monarch Butterfly Protection • BIO MM 24 Prevent the Spread of Nonnative Vegetation • BIO MM 25 Special Status Plants Surveys and Protection

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Pliocene to Pleistocene Fernando Formation, which is known to be fossiliferous. No localities are recorded within the proposed site; however, vertebrate fossil localities have been recorded from this formation at the nearby Puente Hills landfill. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Fernando Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Therefore, project activities would not disturb any human remains.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: Moderate pending geotechnical analysis

Soil Type: Soper-Fontana-Calleguas-Balcom-Anaheim Association

Erosion Potential: Low

Expansive Soil: Low to moderate potential

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed site is on relatively flat grade surrounded by low angle to moderate slopes

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require

additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site ranges from a well-drained gravelly loam to a clay loam with rapid runoff and moderately slow permeability. Moderate slopes surround the flat site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the City of Malibu planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical

analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site RIH and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site RIH was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site RIH. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site RIH would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site RIH, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site RIH would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage

Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: Yes

If yes, please explain: One ENVIROSTOR and FUDS Site (Nike Battery 14) located less than 1/8 mile from Project Site

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: Yes

If yes, please explain: Puente Hills Landfill

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Located in a State Fire Hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC

plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open

areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced, and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space

Zoning: Open Space

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Hacienda Heights Community Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing telecommunications structure and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

The proposed facilities at this site may be inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and the policy to protect areas that have significant natural resources. However, no physical impact would occur as a result of an inconsistency between the proposed project and the policy, and this is not considered a significant impact. As discussed in Sections 3.5 (geologic and soil hazards), Section 3.7 (fire hazards), Section 3.3 (biological effects), as well as in a site-by-site assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than

significant.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: Yes

Trail Name: Located within 0.25 miles of Schabarum-Skyline Trail

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Pomona Frwy

Distance (Miles): 0.75

Disaster Route: Workman Mill Road

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: Site RIH is approximately 4.5 miles from El Monte Airport and more than 3 miles from various helipads

Nearest Highway/Freeway: Pomona Frwy

Distance (Miles): 0.83

Nearest Major Arterial: Workman Mill Rd

Distance (Miles): 1.01

Access to the Project Site Provided Via: Extension off of Canyon Drive

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site RIH is approximately 24,000 feet from El Monte Airport. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered (in this case, whip and microwave antennas mounted to a proposed 180-foot-tall monopole with an up to 15-foot-tall lightning rod), the TOWAIR tool indicates that the antenna structure is a “pass slope determination,” which indicates the structure would not interfere with takeoff and landing operations, and does not require Federal Aviation Administration (FAA) notification based on the structure height and distance from runways. No impacts to aviation flight safety are anticipated.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Savage Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does not meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: SDW

Site Name: San Dimas

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

The site is on a hilltop and includes a small, sky-blue one-story windowless shelter and two tall thin red and white lattice towers connected with horizontal supports. The towers are approximately 120 feet tall. Two large microwave dishes are attached to a short monopole. The site occupies a small corner of a dirt area occupying approximately 0.8 acre and enclosed with a chain link fence. The site is located within a suburb adjacent to a major highway (Orange Freeway/Highway 57). Residences are large estates or triplexes/townhouses of a fairly homogenous design with landscaped lawns consisting of a variety of vegetation. A large expanse of undeveloped land separates the site from residences to the south, which are Mediterranean style 2-story duplexes. This subdivision is at a lower elevation than the site, making it a prominent vertical feature.

Visual Sensitivity: Low

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located in a suburban setting that is not within a scenic vista or within view of one.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed new facilities would be located within a site that includes an existing tower and water tank that have already altered the suburban landscape. Therefore, no impacts to visual character and quality would occur.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in an urban area and would include construction of new facilities. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. This site is in an urban area where numerous sources of day and nighttime lighting are present, such as vehicle headlights, traffic signals, street lights, and building security lights. Because of the presence of these light sources, tower lighting, if required, would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 193

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site SDW. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site SDW or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?**Construction Impact:** Significant Impact Reduced to Less than Significant with Mitigation Incorporated**Operational Impact:** Less than Significant**Discussion:**

Emissions from the construction of proposed site SDW would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site SDW will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site SDW would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site SDW or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site SDW, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site SDW, which is 193 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 10 are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site SDW and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site SDW in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site SDW and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition,

the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

coastal California gnatcatcher (*Polioptila californica californica*; ESA-T, ESA-CH, CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

many-stemmed dudleya (*Dudleya multicaulis*; 1B.2)

Sensitive Communities Recorded within 1 Mile:

coastal California gnatcatcher Critical Habitat (*Polioptila californica californica*; ESA-T, ESA-CH, CDFW-SSC)

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

coastal California gnatcatcher (*Polioptila californica californica*; ESA-T, ESA-CH, CDFW-SSC)

Designated Critical Habitat Within 500 Feet:

coastal California gnatcatcher (*Polioptila californica californica*; ESA-T, ESA-CH, CDFW-SSC)

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

SEA - San Gabriel Valley (Buzzard Peak/San Jose Hills)

Local Policy or Ordinance for Biological Resources:

City of San Dimas General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Ruderal/Coastal Sage Scrub

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site SDW is within the City of San Dimas and is located on a ridgeline overlooking Walnut Creek and adjacent to the I-10/I-215 interchange. The project site is situated at approximately 1,227 feet elevation. The site is fenced and has an asphalt driveway and cleared compacted soils. The site is surrounded on 3 sides by upscale housing developments. The down slope is part of the watershed for Walnut Creek which is dry most of the year at this location. Scattered vegetation on the site includes native narrow-leaf milkweed and common weeds such as wild oats (*Avena* sp), red-stemmed filaree (*Erodium cicutarium*), coyote melon (*Cucurbita foetidissima*), biennial mustard (*Hirschfeldia incana*), horehound (*Marrubium vulgare*), telegraph weed (*Heterotheca grandiflora*), and. A row of California pepper trees (*Schinus molle*) stands adjacent to an existing water tank on the site. The project area consists primarily of residential or other developed lands, in ruderal condition or planted with ornamental vegetation. The canyon and drainage to the south of the project site is the headwaters of Walnut Creek. The area has been impacted by development and past fires and is primarily composed of nonnative grasslands dominated by wild oats (*Avena* sp) and brome grasses (*Bromus* spp.) with California black walnut trees in the drainage

bottoms and scattered shrubs including Mexican elderberry and coast prickly pear (*Opuntia littoralis*). A few steep slopes and road cuts include scattered, small patches of remnant coastal sage scrub vegetation, composed largely of coast prickly pear but also includes sparse California sagebrush on the steepest slopes. A dense patch of coast prickly pear with elderberry (*Opuntia littoralis*-mixed coastal sage scrub community) is immediately down slope of the project site. The bottom of the canyon includes the headwaters of Walnut Creek. The canyon floor and adjacent side canyons contain walnut woodland. Designated critical habitat for coastal California gnatcatcher (*Poliioptila californica californica*; ESA-T, ESA-CH, CDFW-SSC) is within the project area, as close as 100 feet from the fenced compound and potentially included within the projected project site. Critical habitat primary constituent elements are present in the project area; however, the closer to the developed facility the more degraded the habitat, with an increased presence of non-native species and active vegetation removal. No formal surveys for the gnatcatcher were conducted. The project area does not contain canyon habitat for the many-stemmed dudleya (*Dudleya multicaulis*; 1B.2); several locations for this plant occur on the other side of the freeway (0.25-miles to the east) near Puddingstone Lake. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of coastal California gnatcatchers (*Poliioptila californica californica*; ESA-T, CDFW-SSC) in the project area, and the importance of maintaining coastal sage scrub vegetation. Minimize disturbance to natural vegetation; especially coastal sage scrub vegetation (e.g., California sagebrush [*Artemisia californica*], sage [*Salvia* spp], and Laurel sumac [*Malosma laurina*], and California buckwheat [*Eriogonum fasciculatum*]), and do not remove coastal sage scrub vegetation within designated critical habitat. Prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Conduct protocol surveys for the gnatcatcher; if nesting is present within the project area limit construction activities to the non-breeding season. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

coastal California gnatcatcher Critical Habitat (*Poliioptila californica californica*; ESA-T, ESA-CH, CDFW-SSC) and the California walnut woodland sensitive community are within the study area.

Mitigation Measure(s):

Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Freshwater Forested/Shrub wetland feature type as indicated by the National Wetland Inventory (USFWS 2014). However, this wetland type is restricted to ephemeral drainages. Construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the East San Gabriel Significant Ecological Area. According to the Los Angeles General Plan, this SEA represents the only regional wildlife linkage between the San Gabriel Mountains and the Puente Hills and Chino Hills complex. It does not provide a continuous movement corridor, however, but provides for discontinuous patches of habitat, best suited for bird species. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No project-related policies within the City of San Dimas General Plan were identified, and there would be no impact to resources protected by the City of San Dimas General Plan from the proposed construction activities associated with Site SDW. As no project-related policies within the City of San Dimas General Plan were identified, no conflicts would occur, and there would be no impact from the proposed operations activities associated with resources protected by the City of San Dimas at Site SDW. Further, because the Authority is exercising intergovernmental immunity, the plan is not applicable and no conflict with the City of San Dimas General Plan exists.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in November 2014. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Miocene Monterey Formation, which is known to be fossiliferous. No localities are recorded within the proposed site; however, vertebrate fossil localities have been recorded from this formation in the vicinity, including the holotype of the fossil pipefish, *Syngnathus emeritus*. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Monterey Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: Moderate pending geotechnical investigation

Soil Type: Soper-Fontana-Calleguas-Balcom-Anaheim Association

Erosion Potential: Low

Expansive Soil: Low

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require

additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of well-drained material ranging from gravelly to clayey loam with rapid runoff and moderately slow permeability. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the local city planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical

analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site SDW and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site SDW was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site SDW. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site SDW would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site SDW, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site SDW would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: Brackett Field Airport

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: Yes

If yes, please explain: Eastshore Recreational Vehicle is part of an NPL Site. EPA ID CAD983566712. Site is located 0.4 miles from Project Site.

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage

Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: Yes

If yes, please explain: Yes, Very High Fire Severity Zone

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site: Yes, private airstrip approximately 2 miles from Project Site

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste

transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site SDW lies within Area E land use as defined in the Airport Land Use Compatibility Plan (ALUCP) for Brackett Field. The approved Table 2A within the ALUCP indicates that structures more than 100 feet tall within the Area E land use need to be evaluated by the FAA to determine if the structure creates an air navigation hazard for the field. The proposed project would not create hazards to people residing in the project area, and notification FAA must be notified in accordance with 14 CFR Part 77. Prior to start of construction Form 7460-1 needs to be filed with the FAA. Filing of the form triggers the FAA to complete an aeronautical study and return a hazard determination.

Mitigation Measure(s):

HAZ MM 2: Prior to issuance of building permits, the Contractor shall submit Form 7460-1 (Notice of Proposed Construction or Alteration) to the FAA, in the form and manner prescribed in 14 CFR part 77. The Contractor shall also provide documentation to the appropriate city or county planning agency demonstrating that the FAA has issued a "Determination of No Hazard to Air Navigation."

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced, and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Site SDW is located approximately 1 mile from Puddingstone reservoir, although there is a deep valley between the site and the reservoir. Other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No, but the site is approximately 9,700 feet from Brackett Field

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: San Dimas

General Plan Designation: Single Family Residential Very Low

Zoning: Specific Plan 5

What is the zoning height restriction, if any?:

12 feet; 30 feet if designed as public art

City or county permit requirements for communication facilities, if any:

None identified

Comprehensive Plan or General Plan Local Agency: San Dimas

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, such plans, policies, and regulations are not applicable to the project. Nevertheless, in the exercise of its discretion and in the interest in working cooperatively with local jurisdictions, local land-use plans, policies, and regulations are referenced, described, and addressed in recognition that such plans, policies, and regulations reflect the local community's policy decisions with respect to appropriate uses of land in the area. Consideration of these plans, policies and regulations, therefore, assists in determining whether the proposed project may conflict with nearby land uses, which could affect the analysis of whether the proposed project would result in potentially significant environmental impacts.

Based on the zoning ordinances for telecommunication facilities, the maximum allowable height of structures is 12 feet or 30 feet if designed as public art. Exceptions to the ordinance may be allowed, ordinarily with a conditional use permit. However, per the doctrine of intergovernmental immunity, the permit requirement is not applicable to the project. Because the Authority is exercising intergovernmental immunity, the City of San Dimas General Plan is not applicable and no conflict with the plan exists.

The proposed facilities at this site may be inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and the policy to protect areas that have significant natural resources. However, no physical impact would occur as a result of an inconsistency between the proposed project and the policy, and this is not considered a significant impact. As discussed in Sections 3.5 (geologic and soil hazards), Section 3.7 (fire hazards), Section 3.3 (biological effects), as well as in a site-by-site assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than significant.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: San Dimas

Applicable Noise Ordinance: Title 8 Health and Safety, Chapter 8.36 Noise Ordinance

Noise Level Threshold: N/A; no construction from 8 pm to 7 am or any time on Sundays

ALUP or Within 2 Miles of Public Airport: Brackett Field Airport

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: 25 feet

Ambient Noise Level: 50 dBA

Sensitive Noise Receiver 1: Single Family Residential Dwellings

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

Hourly average construction noise levels are anticipated to be approximately 89 dBA. The predicted noise levels represent the demolition phase which is anticipated to be the loudest construction phase. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site. However, in some instances, it may be necessary for construction activities to take place outside of these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The affected jurisdiction has not established a construction noise level threshold. Therefore, construction noise levels at the proposed Project site would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable" community noise equivalent level (CNEL) developed by the California Department of Health Services was

referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. Noise levels from both sources would be below the 60 dBA “normally acceptable” level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. Sensitive receivers (single-family dwellings) are located within 25 feet of Project site SDW; therefore, groundborne vibrational noise impacts would be significant.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site; therefore, impacts from groundborne vibration would be less than significant.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. Therefore, extremely sensitive (fragile) buildings and sensitive receivers would not be exposed to excessive groundborne vibration or groundborne noise from Project operation and impacts would be less than significant.

Mitigation Measure(s):

NOI MM 1

Prior to commencement of construction at site SDW, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction vibration impacts. Such measures may include but are not limited to the following:

- Route heavily-loaded trucks away from residential streets, if possible, selecting streets with the fewest homes if

no other alternatives are available.

- ☑ Operate earth moving equipment including excavators/mini excavators and dump trucks as far away from vibration-sensitive locations as possible.
- ☑ Phase demolition and earth-moving operations so as not to occur simultaneously. Total vibration could be significantly less when each vibration event occurs separately.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, the estimated noise level at 25 feet from proposed sites would be 89 dBA and not exceed the 90 dBA daytime criterion but would exceed the 80 dBA nighttime criterion; therefore, construction noise impacts for this Site would be significant.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds; therefore, impacts from operational noise would be less than significant.

Mitigation Measure(s):

NOI MM 2

☑ Prior to commencement of construction aSite SDW, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction noise impacts below the levels specified in FTA nighttime threshold. Such measures may include but are not limited to the following:

- ☑ Use noise blankets or other muffling devices on equipment and quiet-use generators at noise-sensitive receivers.
- ☑ Use well-maintained equipment and have equipment inspected regularly.
- ☑ Operate construction equipment for periods of fewer than 15 consecutive minutes when possible.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This site is located within the airport land use plan (ALUP) of a public airport (Brackett Field Airport). Ambient conditions near this site are dominated by aircraft noise and are within the 65 dBA CNEL noise contour identified by the ALUP. Site SDW would be located approximately 25 feet from the nearest noise-sensitive receiver. Construction noise at this site would occur during operation of the concrete saw and is estimated to be 89 dBA at this distance. The combined baseline 65 dBA CNEL and the temporary, short duration construction noise levels at receiver near site SDW would remain at 89 dBA, which is below the 90 dBA threshold where adverse community reaction could occur but would exceed the 80 dBA nighttime threshold. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, the site is not located in a jurisdiction with a noise ordinance that is applicable to the Authority. Therefore, construction of the project would not expose people residing or working in the project area to excessive noise levels. Impacts from construction of the Project would be less than significant.

It is anticipated that operation of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance, which would include landscaping maintenance, routine site inspections, and occasional equipment repairs. Noise from maintenance activities, which includes an estimated 58 dBA at 21 feet during the monthly backup generator during testing, would not be substantially different from existing levels, except for new sites in rural locations, where ambient noise levels would be closer to 45 dBA, and would generally occur less than once per week during daytime hours between 7:00 am and 8:00 pm on weekdays, consistent with the City of San Dimas noise ordinance. Operation of the Project, including the HVAC system and emergency generator, would result in noise emissions below 60 dBA and would be considered “normally acceptable” for outdoor residential exposure. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels. Impacts from operation of the Project would be less than significant.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Orange Frwy

Distance (Miles): 0.65

Disaster Route: Interstate 210

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: Approximately 9,700 feet from a runway at Brackett Field

Nearest Highway/Freeway: Corona Frwy

Distance (Miles): 0.19

Nearest Major Arterial: S San Dimas Ave

Distance (Miles): 0.38

Access to the Project Site Provided Via: Via Blanca

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site SDW is approximately 9,700 feet from a runway at Brackett Field. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered (in this case, proposed whip and microwave antennas mounted on a proposed 180-foot-tall lattice tower with an up to 15-foot-tall lightning rod), the TOWAIR tool indicates that the antenna structure is a “fail slope determination,” which indicates the structure could interfere with takeoff and landing operations, and would require Federal Aviation Administration (FAA) notification based on the structure height and distance from runways. The allowable height is 1 foot for every 100 feet of horizontal distance (a structure of about 97 feet in this case) when the proposal is for a 180-foot-tall lattice tower with a lightning rod extending up to 15 feet higher. The proposed construction may be allowed, but not without further coordination with FAA. If FAA approves the tower for construction, this would indicate that operation of the tower would not change air traffic patterns or result in substantial safety risks to flight operations.

Mitigation Measure(s):

HAZ MM 2: Prior to issuance of building permits, the Contractor shall submit Form 7460-1 (Notice of Proposed Construction or Alteration) to the FAA, in the form and manner prescribed in 14 CFR part 77. The Contractor shall also provide documentation to the appropriate city or county planning agency demonstrating that the FAA has issued a “Determination of No Hazard to Air Navigation.”

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Savage Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: SOUTHERN CALIFORNIA W C

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does not meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: SGH

Site Name: Signal Hill

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on existing 160 foot lattice tower to be extended to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

The site is located on a hilltop within a gated residential community. The site consists of an elongated concrete surface that occupies approximately two of the residential lots and is enclosed by a high concrete wall. An L-shaped 2-story windowless equipment room with a sloped green tile roof is on the west side of the site. A 160-foot tall red and white lattice tower with several attached microwave dishes is in the center of the site. A tree-lined concrete driveway provides access on the east side. Single-family residences directly abut the site on the north and west; their back yards end at the site's boundary wall. The existing 160-foot lattice tower is located within a matter of feet from the closest residence. A similar site, which occupies a slightly larger area and includes three small shelters and a very large lattice tower with attached microwave dishes is located immediately to the south and is adjacent to the Signal Hill site. An oil drilling rig is directly east of and adjacent to this other site. Both lattice towers are the most obvious and dominant visual feature due to their height, bulk, and hilltop location, and their obvious dissimilarity with the surrounding residences. The surrounding residences are large 2-story houses on relatively small lots and comprise the majority of the surrounding area. A trail system is at the far north and extends to the western and eastern end of the 0.25-mile radius. Larger, 2-story estate-like houses on small lots occupy the southeastern area, and 2- to 4-story multi-family residences occupy the eastern area. Most of the residences are designed in a Mediterranean style with buff-colored stucco facades and red tile roofs. Lawns are small but landscaped with grass, shrubs, and relatively small trees of various species. A small park (Sunset View Park) is south of the site and provides views of the distant horizon to the south. This elongated park parallels a road and consists of low grasses and shrubs, concrete benches, and a concrete path. An oil drilling rig occupies the equivalent of a residential lot immediately adjacent to three residences southeast of Sunset View Park. A larger, circular shaped park (Hilltop Park) is to the west of the area, which includes covered picnic tables, a lawn, and rows of broadleaf and deciduous trees planted in a semi-circle around a circular concrete path. This park also provides broad, distant views to the south. An oil drilling rig is immediately adjacent to the park's entrance

Visual Sensitivity: Medium

On federally administered public lands: No

If yes, enter applicable ratings: N/A

State, regional, or municipal recreation area: Yes

If yes, enter recreation area name: Hilltop Park, Sunset View Park

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located in a highly developed suburban setting. Scenic vistas from Hilltop Park and Sunset View Park are toward the south, facing the Pacific Ocean and away from the built environment that includes the site's location.

Tall palm trees that ring the eastern side of Hilltop Park help obscure views of the existing towers at the site if looking east. Any viewers looking north from Sunset View Park would see two- to four-story houses, mature vegetation, and an oil rig that would help block views of the site, although the existing towers would be visible from the northwestern corner of the park. However, the scenic vistas are to the south. Adding new antennas to the existing lattice tower and extending it 20 feet would not interfere with any scenic views.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Microwave and whip antennas would be mounted to the existing 160-foot lattice tower, which would be extended an additional 20 feet. The existing lattice tower, adjacent lattice tower, and oil rig have already altered the character and quality of this dense suburban neighborhood. The new antennas would be barely noticeable, as would the additional 20 feet to the 160-foot tower.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in an urban area and would include construction of new facilities. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. This site is in an urban area where numerous sources of day and nighttime lighting are present, such as vehicle headlights, traffic signals, street lights, and building security lights. Because of the presence of these light sources, tower lighting, if required, would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 95

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site SGH. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site SGH or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site SGH would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site SGH will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site SGH would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site SGH or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site SGH, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site SGH, which is 95 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 4 are higher than the SCAQMD thresholds for NO_x, lower for CO, PM₁₀, PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site SGH and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site SGH in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site SGH and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

None

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

None

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

None

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

None

Local Policy or Ordinance for Biological Resources:

City of Signal Hill General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Ornamentals

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site SGH is located on a broad hilltop surrounded by residential and commercial development with mature landscaping, paved roads, and a small urban park and oil well pumps in the general vicinity. No natural habitats are present in the project area; no habitats for special status species of wildlife or plants are present in the project area. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities.

Mitigation Measure(s):

Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 18 Nesting Bird Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The city of Signal Hill no longer contains native vegetation and does not contain habitat for sensitive species. Most vacant land with ruderal vegetation is involved in oil production. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The City of Signal Hill General Plan does not include policies to protect biological resources.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct area of potential effects (APE). Within the indirect APE there is one historical resource (Resource No. P-19-179272), which is California Historical Landmark No. 580 (Alamita Oil Well 1). This resource is situated approximately 1,500 feet from the direct APE and well beyond line-of-sight of the direct APE due to distance and the intervening urban landscape. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. LMR construction at this project location includes the attachment of whip and microwave antennas on an existing 160-foot lattice tower, extended to 180 feet. Indoor equipment will be located in an existing equipment shelter and a proposed backup generator and fuel tank will be located on a concrete pad. Based on the distance of the identified historical resource from the direct APE, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The area is mapped as Quaternary older alluvium, which has a moderate potential for significant vertebrate fossils from the late Pleistocene. No localities are recorded within the proposed site; however, vertebrate fossil localities have been recorded from this geologic unit in the vicinity. Recovered fossils include mammoth and bird material from unspecified depth. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Quaternary older alluvium to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Quaternary alluvium and marine deposits

Stability: Moderate pending geotechnical analysis

Soil Type: Urban land-Sorrento-Hanford Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: No

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line has been identified approximately 1/8 of a mile south of the property (Santa Susana) (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). Antennas and support structure would be collocated to existing lattice structure, therefore a geotechnical study for new structures is not required. Proposed whip and microwave antennas would be attached to the existing tower. All structures in southern California are located within an area subject to seismic shaking. The UBC and CBC have specific design requirements to reduce or eliminate the effects of seismic shaking. Existing structures were built in accordance with current UBC and CBC at the time of

construction. Therefore, the effects of seismic shaking would be less than significant.

Mitigation Measure(s):

None required.

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located on flat grade in an urban environment. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the City of Signal Hill planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing storm drains inlets.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no impact on the project. The site is located in an urban area and antenna are to be located on an existing lattice tower. The tower is proposed to be extended from 160 to 180 feet in eight. No new structures would be built to support the antenna. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site SGH and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site SGH was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site SGH. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site SGH would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site SGH, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site SGH would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: Long Beach Airport is within two miles. Site SGH is not within the ALUP boundary of this airport.

Private Airport in Vicinity: St Mary Medical Center

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage

Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: Yes

If yes, please explain: LMR less than 1/4 from Envirosstor Site, Brownfield site less than 1/2 mile, one closed LUST site less than 1/8 mile away, one CERCLIS-NFRAP site less than 1/2 mile, and two RCRA corrective action sites less than one mile.

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: Yes

If yes, please explain: 13 gas and oil wells within 200 FT of LMR Site Boundary

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste

transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The project site is not within a designated Fire Hazard Severity Zone.

Mitigation Measure(s):

None required.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Coastal Plain Of Los Angeles

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation would not be required at the site therefore dewatering would not be necessary. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If

runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No, but the site is approximately 4,600 feet from Long Beach Airport

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Signal Hill

General Plan Designation: Low Density Residential

Zoning: Hilltop Specific Plan District

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

None identified

Comprehensive Plan or General Plan Local Agency: Signal Hill

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing telecommunications structure and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

The proposed facilities at this site may be inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and the policy to protect areas that have significant natural resources. However, no physical impact would occur as a result of an inconsistency between the proposed project and the policy, and this is not considered a significant impact. As discussed in Sections 3.5 (geologic and soil hazards), Section 3.7 (fire hazards), Section 3.3 (biological effects), as well as in a site-by-site

assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than significant.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Signal Hill

Applicable Noise Ordinance: Title 9 Public, Peace, Morals and Welfare, Chapter 9.16 Noise

Noise Level Threshold: N/A; no construction from 6 pm to 7 am on weekdays or at any time on weekends and holidays

ALUP or Within 2 Miles of Public Airport: Long Beach Daugherty Field Airport

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: 25 feet

Ambient Noise Level: 55 dBA

Sensitive Noise Receiver 1: Single Family Residential Dwellings

Sensitive Noise Receiver 2: Multi-family Residential Dwellings

Sensitive Noise Receiver 3: Sunset View Park

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

Hourly average construction noise levels are anticipated to be approximately 89 dBA. The predicted noise levels represent the demolition phase which is anticipated to be the loudest construction phase. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site. However, in some instances, it may be necessary for construction activities to take place outside of these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The affected jurisdiction has not established a construction noise level threshold. Therefore, construction noise levels at the proposed Project site would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable"

community noise equivalent level (CNEL) developed by the California Department of Health Services was referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. Noise levels from both sources would be below the 60 dBA “normally acceptable” level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. Sensitive receivers (single-family dwellings) are located within 25 feet of Project site SGH; therefore, groundborne vibrational noise impacts would be significant.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site; therefore, impacts from groundborne vibration would be less than significant.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. Therefore, extremely sensitive (fragile) buildings and sensitive receivers would not be exposed to excessive groundborne vibration or groundborne noise from Project operation and impacts would be less than significant.

Mitigation Measure(s):

NOI MM 1

Prior to commencement of construction at site SGH, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction vibration impacts. Such measures may include but are not limited to the following:

- Route heavily-loaded trucks away from residential streets, if possible, selecting streets with the fewest homes if no other alternatives are available.

- ☑ Operate earth moving equipment including excavators/mini excavators and dump trucks as far away from vibration-sensitive locations as possible.
- ☑ Phase demolition and earth-moving operations so as not to occur simultaneously. Total vibration could be significantly less when each vibration event occurs separately.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, the estimated noise level at 25 feet from proposed sites would be 89 dBA and not exceed the 90 dBA daytime criterion but would exceed the 80 dBA nighttime criterion; therefore, construction noise impacts for this Site would be significant.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds; therefore, impacts from operational noise would be less than significant.

Mitigation Measure(s):

NOI MM 2

☑ Prior to commencement of construction at SGH, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction noise impacts below the levels specified in FTA nighttime threshold. Such measures may include but are not limited to the following:

- ☑ Use noise blankets or other muffling devices on equipment and quiet-use generators at noise-sensitive receivers.
- ☑ Use well-maintained equipment and have equipment inspected regularly.
- ☑ Operate construction equipment for periods of fewer than 15 consecutive minutes when possible.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This site is located within two miles of a public airport (Long Beach Daugherty Field Airport), but outside of the 65 dBA CNEL developed by the airport land use plan. Estimated construction noise levels for all other proposed Project sites would be below the 90-dBA FTA threshold where adverse community reaction could occur during daytime hours but would exceed the 80-dBA nighttime threshold. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, this proposed Project location is not located in a jurisdiction with a noise ordinance that is applicable to the Authority. Therefore, it is anticipated that construction of this site would not expose people to excessive noise levels. Impacts from construction of the Project would be less than significant.

After construction, the site will be unmanned during operation except for occupational maintenance, which would include landscaping maintenance, routine site inspections, and occasional equipment repairs. Noise from maintenance activities, which includes an estimated 58 dBA at 21 feet during the monthly backup generator during testing, would not be substantially different from existing levels, except for new sites in rural locations, where ambient noise levels would be closer to 45 dBA, and would generally occur less than once per week during daytime hours between 8:00 a.m. and 6:00 p.m. On weekdays, consistent with the City of Signal Hill noise ordinance. Operation of the Project, including the HVAC system and emergency generator, would result in noise emissions below 60 dBA and would be considered “normally acceptable” for outdoor residential exposure. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels. Impacts from operation of the Project would be less than significant.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: State Route 1

Distance (Miles): 0.39

Disaster Route: Cherry Avenue

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: Approximately 4,600 feet from a runway at Long Beach Airport

Nearest Highway/Freeway: Interstate 405

Distance (Miles): 0.65

Nearest Major Arterial: Cherry Ave

Distance (Miles): 0.25

Access to the Project Site Provided Via: Stanley Avenue

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In this urbanized area, this construction-related traffic would be less than one-quarter of a percent of the average daily traffic.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site SGH is approximately 4,800 feet from a runway at Long Beach Airport. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered (in this case, proposed whip and microwave antennas mounted on an existing 160-foot lattice tower that is to be extended to 180 feet tall with an up to 15-foot-tall lightning rod), the TOWAIR tool indicates that the antenna structure is a “fail slope determination,” which indicates the structure could interfere with takeoff and landing operations, and would require Federal Aviation Administration (FAA) notification based on the structure height and distance from runways. The allowable height is 1 foot for every 100 feet of horizontal distance (a structure of about 46 feet in this case) when the proposal is for a 180-foot-tall lattice tower with a lightning rod extending up to 15 feet higher. The proposed construction may be allowed, but not without further coordination with FAA. If FAA approves the tower for construction, this would indicate that operation of the tower would not change air traffic patterns or result in substantial safety risks to flight operations.

Mitigation Measure(s):

HAZ MM 2: Prior to issuance of building permits, the Contractor shall submit Form 7460–1 (Notice of Proposed Construction or Alteration) to the FAA, in the form and manner prescribed in 14 CFR part 77. The Contractor shall also provide documentation to the appropriate city or county planning agency demonstrating that the FAA has issued a “Determination of No Hazard to Air Navigation.”

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day at each site, and typically would be less than 1 percent of average daily traffic on nearby streets. Construction-related activities may require lane narrowing at a driveway or detours in the parking lots of existing facilities. These actions could temporarily impair access on adjacent roadways, potentially creating traffic hazards and limiting emergency access, resulting in a significant impact. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

TRANS MM 1: The construction contractor shall maintain a minimum of one open lane of traffic at all site access roads during project construction. Use of standard construction traffic control practices such as flagmen, warning signs, and other measures shall be implemented as necessary to ensure that traffic flow remains uninterrupted at all times.

TRANS MM 2: Any temporary road or lane closures that may affect state highways shall be coordinated with Caltrans prior to commencement of construction at the site that will require the road or lane closures. If construction requires temporary road or lane closures on roads and streets managed by local entities, a traffic management plan shall be prepared and submitted to the relevant county and/or city public works department or other appropriate department for approval prior to commencement of construction at the site. Encroachment permits would be obtained where applicable.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Savage Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: CITY OF SIGNAL HILL

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Dewatering would not be required for building mount or collocation sites because groundwater is not expected at the shallow depths of excavation associated with this activity. Wastewater treatment plants in the project would not be affected during construction. During operations, the project would not result in the production of any wastewater that would require treatment.

Mitigation Measure(s):

None required.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: SIM

Site Name: Simpsons' Building

Site Discussion:

Propose installation of up to 20 whip and up to 7 microwave antennas on roof top of existing building without exceeding current overall height of the structure including appurtenances. Propose indoor equipment racks to be located in room in existing building, or in a new up to 600 square foot shelter on building roof, or up to 600 square foot shelter on adjacent grounds (prefab or CMU). Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank adjacent to the building.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 100 cubic yards removed

Proposed trenching for underground conduits to accommodate power and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide

Proposed foundations include:

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Address: Building 42, Fox Lot, 10201 West Pico Blvd

Aesthetics

Setting

Visual Description:

The site is located on the roof of a building in Universal Studios, Los Angeles. No obvious towers or other fixtures are visible. The building houses the ride for Krustyland, a theme park ride based on the Simpsons animated television show. The windowless, angular terraced building is approximately five stories tall and painted a vivid cobalt blue. Red decorative designs and illustrations are attached to a depiction of the ride on a freestanding structure on the 3rd story terrace. Bright red metal supports extend from the front of the building (similar to flying buttresses) and are topped with colored metal flags. The site is within a theme park with a carnival-like atmosphere in a visually distracting and chaotic setting. A giant clown face signals the entrance to the ride complex. Carnival lights and brightly painted games flank the entrance. The ground is painted with vivid colors and starbursts. Several outdoor picnic tables and umbrellas are clustered in groups around the plaza area. A few deciduous trees are planted throughout the plaza. Various restaurants and other attractions in the plaza have various theme-based designs. Similar large buildings that house rides are scattered throughout the area. The theme park is concentrated primarily on the southern half of the 0.25-mile radius. A wide, undeveloped corridor of grass and deciduous trees follows a curvilinear path east-west directly north of the site. Large parking areas and other buildings are north of that. The site is most readily visible from the open plaza area. Other rides, games, buildings, and trees obstruct the site from farther vantage points.

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located in an amusement theme park that is not within a scenic vista or within view of one.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Microwave and whip antennas would be mounted to a ballast frame, and whip antennas would be mounted inside a parapet on the roof of an existing 55-foot tall building. There would be no new permanent disturbance. The visual character of the site is an amusement theme park with a carnival-like atmosphere and a visually distracting and chaotic setting. A giant clown face signals the entrance to the ride complex. Carnival lights and brightly painted games flank the entrance. The ground is painted with bright colors and starbursts. The new antennas would be largely unnoticeable and would not conflict with the amusement park character and quality of the setting.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. The site is in an urban area. The proposed Project facilities would be roof mounted or collocated and constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. No additional lighting would be required. This would not result in a substantial new source of day or nighttime light or glare that would adversely affect nighttime views of the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Commercial building

Distance to Sensitive Receptor: 135

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site SIM. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site SIM or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site SIM would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site SIM will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site SIM would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site SIM or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site SIM, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site SIM, which is 41 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds for NO_x, CO, lower for PM₁₀, PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site LST and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site SIM in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site SIM and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

pallid bat (*Antrozous pallius*; CDFW-SS); western pond turtle (*Emys marmorata*; CDFW-SS)

Special Status Plants Recorded within 1 Mile:

Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, 1B.1); mesa horkelia (*Horkelia cuneata* var *puberula*; 1B.1); Parish's brittlescale (*Atriplex parish*; 1B.1);

Sensitive Communities Recorded within 1 Mile:

California Walnut Woodland; Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

None

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

None

Local Policy or Ordinance for Biological Resources:

Los Angeles County General Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Ornamentals

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site SIM is located in an urban setting at Universal Studios. Landscape vegetation in the area includes ornamental trees and shrubs, with interspersed native California black walnut trees (*Juglans californica*). Adjacent to the project area a 7-story building is under construction. No natural habitats are present in the project area; no habitats for special status species of wildlife or plants are present in the project area. Roof-top mount.

Mitigation Measure(s):

None required.

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site. The California walnut trees present within the landscaped environment do not function as a natural vegetation community.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Freshwater Pond wetland feature type as indicated by the National Wetland Inventory (USFWS 2014). However, this wetland type is restricted to ephemeral drainages. Construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not have the potential to conflict with the Los Angeles County General Plan. Policies C/NR3.1, C/NR 3.8, and C/NR 3.9 of the plan promote protection of biological resources and encourage site sensitive design in settings where sensitive biological resources occur. The site is urbanized, however, and the surrounding area is highly developed and there is no potential for sensitive natural resources to occur on site. No conflict with local policies or ordinances exists.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

Yes

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct area of potential effects (APE). The direct APE consists of the Simpsons' Building itself, which was built in 1993 and, based on archival research and field survey, is not a historical resource. There is also a small area adjacent to the building that is largely paved parking surrounded by mature trees. Within the indirect APE there are two historical resources. Resource No. P-19-187794 (HPD 033713) is the Universal Studios Historic District that is situated approximately 500 feet north of the direct APE. The second, Resource No. P-19-001945 is the National Register of Historic Places (National Register)-listed Campo de Cahuenga, a commemorative historical site which encompasses the Feliz Adobe (a reconstruction) and Fremont-Pio Memorial Park, all of which is associated with the signing of the Articles of Capitulation ending the Mexican-American War; there is also a high probability that this location encompasses prehistoric remains that represent the Native American village of Cahuenga. The site is also California Historical Landmark No. 151. Campo de Cahuenga is situated at the western-most boundary of the indirect APE (0.5 mile) and well beyond line-of-sight of the SIM project location due to distance and the intervening urban landscape. LMR construction at this project location includes the installation of whip and microwave antennas on the roof of the SIM building where they would not be visible at ground level; construction of a new equipment shelter; and installation of a new backup generator and fuel tank on a concrete pad. None of these LMR construction activities will have an adverse direct or visual effect on historical resources. This was confirmed through archival research and during a field survey of the direct APE conducted by an SOI-qualified archaeologist in January 2015. Based on the distance between the

identified resources and the direct APE, there would be no direct or indirect impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is one historical resource (archaeological) within the indirect APE. The Resource No. P-19-001945 is the National Register of Historic Places (National Register)-listed Campo de Cahuenga, a commemorative historical site that encompasses the Feliz Adobe (a reconstruction) and Fremont-Pio Memorial Park, all of which is associated with the signing of the Articles of Capitulation ending the Mexican-American War. There is also a high probability that this location encompasses prehistoric materials associated with the Native American village of Cahuenga. Campo de Cahuenga is situated at the western-most boundary of the indirect APE, 0.5 miles from the direct APE, and well outside the construction impact area for this project location. Based on the distance between the identified resources and the direct APE, there would be no direct or indirect impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Miocene Topanga Formation, which has a high potential for significant vertebrate fossils. No localities are recorded within the proposed site; however, vertebrate fossil localities have been recorded from this formation in the vicinity. Recovered fossils include the extinct four-legged mammal Desmostylia, smelt, codlets, boarfish, herring, cod, bigeyes croaker, and mackerel. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Topanga Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within the direct areas of potential effects (APE) and the project location is not sensitive for them. Although there is high probability that prehistoric materials are associated with the Native American village of Cahuenga, based on the distance between this resource and the direct APE (0.5 mile),

there would be no direct or indirect impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct area of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs; however, additional archival research indicates that there may be prehistoric materials associated with the Native American village of Cahuenga. Campo de Cahuenga is situated at the western-most boundary of the indirect APE, 0.5 mile from the direct APE, and well outside the construction impact area for this project location. Based on the distance between the identified resources and the direct APE, there would be no direct or indirect impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Quaternary alluvium and marine deposits

Stability: Moderate pending geotechnical analysis

Soil Type: Urban land-Lithic Xerorthents-Hambright-Castaic Association

Erosion Potential: Low

Expansive Soil: Low

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate slopes

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). Antennas would be located on the roof of the existing building, therefore a geotechnical study for new structures is not required. All structures in southern California are located within an area subject to seismic shaking. The UBC and CBC have specific design requirements to reduce or eliminate the effects of seismic shaking. Permitting processes are required to evaluate and mitigate other geologic hazards prior to issuance of a building permit. Existing structures were built in accordance with current UBC and CBC at the time of construction. Therefore, the effects of seismic shaking or other geologic hazards would be less than significant.

Mitigation Measure(s):

None required.

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site has a mix of shallow, well drained stony loam to silty clay loam. This soil type exhibits a medium to very rapid runoff with moderately slow permeability, resulting in moderate erosion resistance. Moderate slopes surround the site. Grading, excavation, and other construction activities associated with the implementation of the proposed project could cause erosion due to exposed soils. Building permits require that standard BMPs for erosion control be put in place on all projects. There would be no ground disturbing activities associated with the operation of the LMR facility.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located in an urban area and antenna are to be located a the roof of existing building. No new structures would be built to support the antenna. Antennas would be located on the roof of the existing building, therefore a geotechnical study for new structures is not required. All structures in southern California are located within an area subject to seismic shaking. The UBC and CBC have specific design requirements to reduce or eliminate the effects of seismic shaking. Permitting processes are required to evaluate and mitigate other geologic hazards, such as land spreading prior to issuance of a building permit. Existing structures were built in accordance with current UBC and CBC at the time of construction. Therefore, the effects of seismic shaking or other geologic hazards would be no impact.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site SJM and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site SJM was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site SJM. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site SJM would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site SJM, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site SJM would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: NBC-TV Heliport

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: Yes

If yes, please explain: Less than 1/2 mile from Site on Final NPL. Site is Area 2 (EPA ID CAD980894901) associated with groundwater contamination (VOCs and solvents).

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage

Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: Yes

If yes, please explain: LMR Site is within 1/4 mile of 1 permitted UST, one active LUST site, one closed Cortese LUST site, and one VCP is ongoing.

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: Yes

If yes, please explain: Universal City Industrial Waste Disposal Facility

Located in a Local Fire hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or

releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open

areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced, and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation would not be required at the site therefore dewatering would not be necessary. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If

runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No, but the site is approximately 19,600 feet from Bob Hope Airport

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Specific Plan

Zoning: Specific Plan

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

None identified

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing building and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Hollywood Frwy

Distance (Miles): 1.27

Disaster Route: Highway 101

Transit, Bicycle, or Pedestrian Facilities: Located within 0.25 miles of the LA Metro Rail

Within Vicinity of Aviation Facility: Approximately 19,600 feet from Bob Hope Airport

Nearest Highway/Freeway: Hollywood Frwy

Distance (Miles): 0.39

Nearest Major Arterial: Lankershim Blvd

Distance (Miles): 0.38

Access to the Project Site Provided Via: Universal Hollywood Drive to Production Plaza

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In this urbanized area, this construction-related traffic would be less than one-quarter of a percent of the average daily traffic.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site SIM is approximately 19,600 feet from Bob Hope Airport. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered, the TOWAIR tool indicates that the antenna structure (in this case, antennas mounted on the roof of an existing building) meets the 6.10-meter (20-foot) rule criteria. This means that FAA notification is not required if the antenna structure is 6.10 meters (20 feet) or less in height, unless the antenna structure would increase the height of another antenna structure. No impacts to aviation flight safety are anticipated.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day at each site, and typically would be less than 1 percent of average daily traffic on nearby streets. Construction-related activities may require lane narrowing at a driveway or detours in the parking lots of existing facilities. These actions could temporarily impair access on adjacent roadways, potentially creating traffic hazards and limiting emergency access, resulting in a significant impact. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

TRANS MM 1: The construction contractor shall maintain a minimum of one open lane of traffic at all site access roads during project construction. Use of standard construction traffic control practices such as flagmen, warning signs, and other measures shall be implemented as necessary to ensure that traffic flow remains uninterrupted at all times.

TRANS MM 2: Any temporary road or lane closures that may affect state highways shall be coordinated with Caltrans prior to commencement of construction at the site that will require the road or lane closures. If construction requires temporary road or lane closures on roads and streets managed by local entities, a traffic management plan shall be prepared and submitted to the relevant county and/or city public works department or other appropriate department for approval prior to commencement of construction at the site. Encroachment permits would be obtained where applicable.

Utilities

Setting

Nearest Solid Waste Disposal Facility: City of Burbank Landfill #3

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: CITY OF LOS ANGELES

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Dewatering would not be required for building mount or collocation sites because groundwater is not expected at the shallow depths of excavation associated with this activity. Wastewater treatment plants in the project would not be affected during construction. During operations, the project would not result in the production of any wastewater that would require treatment.

Mitigation Measure(s):

None required.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: SPN

Site Name: Saddle Peak

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This site is in the Santa Monica Mountains National Recreation Area and is located off Saddle Peak Road near the intersection with Piuma Road and Schueren Road on a ridgeline designated by Los Angeles County as “significant.” The site is also located in proximity to the Backbone Trail. The Backbone Trail contours along the ridgeline to the north of the site and provides views of it. The Backbone Trail is a Santa Monica Mountains ridgeline trail that follows ridges, traverses chaparral-covered hillsides, enters oak woodlands, and crosses creeks and valleys in the Santa Monica Mountains National Recreation Area. Trail development has occurred piecemeal across a patchwork of public lands, and therefore has different names in some sections, and not all sections are open to all users. The site is part of a large compound of similar sites. The single site consists of several lattice towers of varying heights, including one 150-foot tower, a utility pole with transformer, two one-story buildings, and associated equipment enclosed by a chain link fence and concrete wall. The site is above a low-density neighborhood of estate houses to the west. Chaparral vegetation is denser to the northwest, where the houses are located, and more scattered and drier to the southwest. Dominant views include the ridgeline, highway, and telephone lines. Primary sensitive viewers include NRA visitors.

Visual Sensitivity: High

On federally administered public lands: No, but within boundary of Santa Monica Mountains NRA

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: Yes, Santa Monica Mountains Local Coastal Plan

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Backbone Trail

State, regional, or municipal recreation area: Yes

If yes, enter recreation area name: adjacent to Malibu Creek State Park

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: Yes

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is located on a designated significant ridgeline and is within view of some sections of the Backbone Trail. The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new facilities would be located within a site that includes several existing towers that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing towers, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from

the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings are impacted by the presence of a large compound comprised of existing buildings and towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 730

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site SPN. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site SPN or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site SPN would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site SPN will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site SPN would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for Nox and could result in cumulatively considerable net increases in O3 from the Nox emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site SPN or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site SPN, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site SPN, which is 730 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds for NO_x, CO, PM_{2.5}, lower for PM₁₀ but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site SPN and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site SPN in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site SPN and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP); California mountain kingsnake (San Diego population; *Lampropeltis zonata pulchra*; CDFW-SSC); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); monarch butterfly (*Danaus plexippus*; ESA-Pet);

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP); California mountain kingsnake (San Diego population; *Lampropeltis zonata pulchra*; CDFW-SSC); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

Santa Monica Mountains National Recreation Area (NPS); SEA/CRA - Santa Monica Mountains (Buffer B5); SCAG Zoning - Wildlife Preserves & Sanctuaries (Malibu Coastal Zone)

Local Policy or Ordinance for Biological Resources:

Santa Monica Mountains Local Coastal Program Land Use Plan and Local Implementation Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Birch leaf mountain mahogany chaparral [*Cercocarpus montanus* Shrubland Alliance]; Association - *Cercocarpus montanus*-*Artemisia californica*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site SPN is located within an existing complex of communication facilities on Saddle Peak, high in the Santa Monica Mountains. The project area is within the montane chaparral vegetation community. The north-facing slopes contain mountain mahogany (*Cercocarpus montanus*), chamise (*Adenostoma fasciculata*), scrub oak, toyon (*Heteromeles arbutifolius*), and manzanita. The south-facing slopes contain laurel sumac (*Malosma laurina*), and bush buckwheat (*Eriogonum fasciculatum*). American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP) may pass by the site while foraging, but the project area does not provide steep cliff habitat required for nesting.

California mountain kingsnake (San Diego population; *Lampropeltis zonata pulchra*; CDSFW-SSC) and coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) could occur in the project area and could be killed project activities. Potentially suitable habitat (and a potential reintroduction site) for California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) has been reported by Santa Monica National Recreation Area to occur within 1 mile of Site SPN at an unspecified location within Cold Creek Nature Preserve. Though the project site is located in steep mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. Monarch butterfly (*Danaus plexippus*; ESA-Pet) may pass through the area on migration, but no tall trees are present within the project area that may serve as potential roosts. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC), California mountain kingsnake (San Diego population; *Lampropeltis zonata pulchra*; CDSFW-SSC), and California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) in the project area. Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. To protect dispersing California red-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures:

- BIO MM 1 Mitigation Monitoring and Reporting Plan
- BIO MM 2 WEAP
- BIO MM 3 Biological Compliance Reporting
- BIO MM 4 Site Sanitation
- BIO MM 8 Biological Monitoring
- BIO MM 9 Protect Native Vegetation and Common Wildlife
- BIO MM 10 No Pets
- BIO MM 11 Site Access
- BIO MM 17 Raptor Protection
- BIO MM 18 Nesting Bird Protection
- BIO MM 19 Trenches and Holes Management
- BIO MM 21 Protected Amphibian Protection
- BIO MM 23 Prevent the Spread of Nonnative Vegetation
- BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site. Site SPN may be hydrologically connected to stream habitats that include California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) potentially suitable habitat.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the proposed Santa Monica Mountains Coastal Resource Area, which is identified as an important regional habitat linkage in the Los Angeles General Plan. Linkages in this CRA connect open spaces together that may be fragmented due to rural development and connect to habitats in Ventura County. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site SPN is comprised solely of H3 habitat. The study area for Site SPN contains H2 habitat and H1 Quiet Zone. Protection of SERAs identified in the land use plan (LUP) includes prohibition or other strict regulation of proposed site development. Policies contained within Goal CO-2 of the LUP offer protection of SERAs as a priority over other development standards in the Local Implementation Plan. Impacts to resources at the site are described in Impact BIO 1 and Impact BIO 2. Existing site conditions include disturbed areas that are not considered SERAs, and therefore not subject to SERA restrictions. Because construction activity would potentially affect SERA(s), and construction and operations activities could impact migratory birds and other special-status species, a potential for conflict exists with LUP policies CO-40, CO-41, CO-42, and CO-44. This conflict would constitute a significant impact.

Mitigation Measure(s):

The mitigation measures identified in Impact BIO 1 coupled with application of LU MM 3 (requiring the Authority obtain a coastal development permit) would reduce impacts to less than significant. Required mitigation measures:

- BIO MM 1 Mitigation Monitoring and Reporting Plan
- BIO MM 2 Worker Environmental Awareness Program
- BIO MM 3 Biological Compliance Reporting
- BIO MM 4 Site Sanitation
- BIO MM 5 Hazardous Materials Management
- BIO MM 6 Anti-perch Devices
- BIO MM 8 Biological Monitoring
- BIO MM 9 Protect Native Vegetation and Common Wildlife
- BIO MM 10 No Pets
- BIO MM 11 Site Access
- BIO MM 12 Coastal California Gnatcatcher Protection
- BIO MM 17 Raptor Protection
- BIO MM 18 Nesting Bird Protection
- BIO MM 19 Trenches and Holes Management
- BIO MM 21 Protected Amphibian Protection
- BIO MM 22 Monarch Butterfly Protection
- BIO MM 23 Prevent the Spread of Nonnative Vegetation
- BIO MM 24 Special Status Plants Surveys and Protectio

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct area of potential effects (APE). The direct APE encompasses an existing communications site that consists of multiple lattice towers and associated infrastructure features and paved roads and parking areas. Within the indirect APE, there is one archaeological site (P-19-004322) that is situated approximately 1,330 feet from the direct APE. The site consists of two adjacent rockshelters that may have prehistoric components, but is primarily thought to be of historic age and displays a 1913 inscription. During a field survey in October 2014, a third rockshelter was noted as well as a small lithic scatter. LMR construction at this project location includes the attachment of whip and microwave antennas on a proposed 180-foot lattice tower; construction of a new equipment shelter; and installation of a backup generator and fuel tank on a concrete pad. Given the distance of the archaeological site from the direct APE, there will be no adverse impacts from LMR construction. The status and condition of this project area were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Given the distance between the direct APE and the identified archaeological resources, there would be no direct or indirect impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. The archaeological site at this location is approximately 1,330 feet from the direct APE. Given the distance between the direct APE and the identified archaeological resources, there would be no direct or indirect impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Miocene Topanga Formation, which has a high potential for significant vertebrate fossils. No localities are recorded within the proposed site; however, vertebrate fossil localities have been recorded from this formation in the vicinity. Recovered fossils include carnivores, horses, camels, deer, and rodents. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Topanga Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Archival research and field survey at this project location identified an archaeological site approximately 1,330 feet from the direct APE; however, it is well outside the construction impact area. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: Moderate pending geotechnical analysis

Soil Type: Urban land-Rock outcrop-Millsholm Association

Erosion Potential: Low

Expansive Soil: Low

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require

additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of well-drained, light clay loam with light clay loam low to very high runoff and moderate permeability. Moderate to steep slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard

has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site SPN and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site SPN was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site SPN. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site SPN would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site SPN, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site SPN would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: Los Angeles County Fire Department Camp 8 Heliport

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: N/A

Located in a State Fire Hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site: Yes, Los Angeles County Fire Department Camp 8 Heliport is 1.2 miles from Project Site

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste

transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced, and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

The proposed project would not violate any water or waste water standards during construction or operation. There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed

as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: Santa Monica Mountains Coastal Zone

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Mountain Lands (RL20)

Zoning: Light Agriculture

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Monica Mountains Coastal Zone

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site SPN is proposed along an adopted Significant Ridgeline within the Santa Monica Mountains Coastal Zone. The Santa Monica Mountains Land Use Plan, a component of the Santa Monica Mountains Local Coastal Program, was issued in August 2014 and allows for telecommunication facilities within several land use categories, including open space, rural lands, rural residential, rural villages, residential, commercial, commercial recreation – limited intensity, and public and semi-public facilities (County of Los Angeles, Department of Regional Planning 2014). Per the Local Implementation Plan adopted in 2014, new development is prohibited on Significant Ridgelines. Structures must be located sufficiently below Significant Ridgelines so that the highest point of a structure is located at least 50 vertical feet and 50 horizontal feet from a Significant Ridgeline. The proposal is to establish a 180-foot-tall tower at an existing communications facility, thus expanding the existing facility. This would result in

a conflict with the Santa Monica Mountains Land Use Plan.

The final determination of consistency would be made by the agency responsible for issuing a Local Coastal Permit. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan, and plan inconsistency is not considered a significant impact.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: Santa Monica Mountains Local Coastal Program, Land Use Plan

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Pacific Coast Hwy

Distance (Miles): 4.41

Disaster Route: Malibu Canyon Road

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Us Highway 101

Distance (Miles): 2.47

Nearest Major Arterial: Mulholland Hwy

Distance (Miles): 1.68

Access to the Project Site Provided Via: Extension off of W. Saddle Peak Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: LAS VIRGENES MUNI W DIST

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: SUN

Site Name: Sunset Ridge

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Address: Angeles National Forest

Surrounding area east of site

Site view looking west

Surrounding area west of site

Aesthetics

Setting

Visual Description:

This isolated site is located in Angeles National Forest on a ridge top west of Mount Baldy Road in a cleared area surrounded by chaparral vegetation. The site includes four existing lattice towers of unknown heights, a transformer, two small one-story buildings, and associated equipment enclosed within a chain link fence. Various types of antennas are attached to each tower. Vegetation within and around the site has been cleared and the surface is dirt. Steep topography blocks views of the site from Mount Baldy Road. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Experimental Forest, which is generally closed to the public except by permit. The site is also a USFS Designated Communication Site, which allows for such use on national forests except when identified as not suitable because of law, national or regional policy, or the revised forest plan (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Experimental Forest

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the proposed new facilities would be located within a site that includes existing towers that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing towers, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result

in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. The existing visual character and quality of the site and its surroundings are impacted by the presence of existing buildings and towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. There would be no change to the site's scenic attractiveness rating. In addition, the site is located on a USFS Designated Communication Site, which generally allows for such use within the area's landscape. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Industrial building

Distance to Sensitive Receptor: 792

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site SUN. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site SUN or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site SUN would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site SUN will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site SUN would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site SUN or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site SUN, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site SUN, which is 792 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 10 are higher than the SCAQMD thresholds for NO_x, CO, PM_{2.5}, lower for PM₁₀ but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site SUN and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site SUN in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site SUN and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

None

Special Status Plants Recorded within 1 Mile:

Greata's aster (*Symphotrichum greatae*; 1B.3); Hall's monardella (*Monardella macrantha* ssp. *Hallii*; 1B.3)

Sensitive Communities Recorded within 1 Mile:

Canyon Live Oak Ravine Forest; Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

US Forest Service -Angeles National Forest; SCAG Zoning - Wildlife Preserves and Sanctuaries; Essential Connectivity Area - Sugarloaf Mountain/Keller Peak - San Gabriel/Cucamonga; Natural Landscape Block - San Dimas

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Interior live oak chaparral [*Quercus wislizenii* Woodland Alliance]; Association - *Quercus wislizenii*-*Ceanothus leucodermis*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Sunset Ridge is located along a high ridgeline in the San Gabriel Mountains. The vegetation is dominated by scrub oak and is recovering from a fire. The study areas considered to be outside the current range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), but as the condor population increases it is expected to expand geographically. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. Southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) is known to occur in San Antonio Canyon, about 1.5 miles to the west of Site SUN. Though the project site is located in steep mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-

related construction activities and travel on access roads could impact dispersing frogs, if present. Site SUN is not hydrologically connected to San Antonio Canyon. The site does not contain stream habitat for Greata's aster (*Symphytotrichum greatae*; 1B.3). Jeffery pine forest habitat for Hall's monardella (*Monardella macrantha* ssp. *hallii*; 1B.3) is not present in the project area. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

To address future use of the area by condors all trash and construction debris (especially small items such as nuts and washers) will be removed from the site; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) in the project area and along access roads. To protect dispersing southern mountain yellow-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site. The site does not contain Canyon Live Oak Ravine Forest.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Riverine wetland feature type as indicated by the National Wetland Inventory

(USFWS 2014). However, this wetland type is restricted to ephemeral drainages. Construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated San Dimas Natural Landscape Block which overlaps the ranges of approximately 272 amphibian, reptile, mammal and bird species. It is also located within an Essential Connectivity Habitat Area Sugarloaf Mountain/Keller Peak - San Gabriel/Cucamonga that connects to the San Gabriel/Cucamonga and Lytle Creek Ridge Natural Landscape Blocks. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

Recommended mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

Yes

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

Project locations SUN and SUN2 are overlapping sites with slightly different, but immediately adjacent construction footprints. There are two historical resources within the direct and indirect areas of potential effects (APEs). The first of these is Resource No. P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. The second historical resource is Resource No. P-19-187829, which is eligible for inclusion in the National Register of Historic Places as the San Dimas Experimental Forest Historic District. This resource encompasses 17,161 acres of buildings, structures, sites, and landscapes that date to between 1933-1952. Included among the contributing landscape elements are the major topographical features found on the forest, because without this particular topography of streams and canyons forming isolated watersheds, Resource No. P-19-187829 would not have been selected as a location for an experimental forest. The Experimental Forest is the only such forest in Southern California, and believed to be the most significant within the U.S. Forest system. Both the direct and indirect APEs are completely encompassed by P-19-186535; P-19-187829 encompasses the direct APE and three fourths of the indirect APE. Given the enormous size and scale of Resource Nos. P-19-186535 and P-19-187829, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant. There is also one additional recorded resource within this project location's indirect APE. Resource No. P-19-186918 (FS-

05015200101-HIS) is a segment of Forest Service Road 2N07, (the Sunset Ridge Fire Road/Sunset Peak Mountain Way), which was first recorded as a trail in 1924 and improved to a vehicle road by 1942. The road crosses the southeastern area of the indirect APE running northeast/southwest and is approximately 1,100 feet from the indirect APE at its closest point. The route of this road, as opposed to its physical surface, is considered historic and the road is a U.S. Forest Service Heritage Resource, but not an eligible or listed historical resource; therefore there would be no impacts from project activities on Resource No. P-19-186918 (FS-05015200101-HIS). LMR activities at this project location include attachment of whip and microwave antennas mounted on a proposed 180-foot lattice tower, a new equipment shelter and fuel tank mounted on a concrete pad, and extension of an existing chain link fence. There is existing communications equipment at this location and at other adjacent communications-related sites situated within between 800 and 1,800 feet of the direct APE. The sites include multiple lattice towers, equipment shelters, and associated infrastructure features. Construction of an additional tower at this project location would be in keeping with the existing communications/industrial landscape, including the presence of other towers within the immediate/adjacent environment. The status and condition of this project area were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Given the nature of this site and the identified resources at this project location, impacts from project activities would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

Project locations SUN and SUN2 are overlapping sites with slightly different, but immediately adjacent construction footprints. There are two historical resources within the direct and indirect areas of potential effects (APEs). The first of these is Resource No. P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. The second historical resource is Resource No. P-19-187829, which is eligible for inclusion in the National Register of Historic Places as the San Dimas Experimental Forest Historic District. This resource encompasses 17,161 acres of buildings, structures, sites, and landscapes that date to between 1933-1952. Included among the contributing landscape elements are the major topographical features found on the forest, because without this particular topography of streams and canyons forming isolated watersheds, Resource No. P-19-187829 would not have been selected as a location for an experimental forest. The Experimental Forest is the only such forest in Southern California, and believed to be the most significant within the U.S. Forest system. Both the direct and indirect APEs are completely encompassed by P-19-186535; P-19-187829 encompasses the direct APE and three fourths of the indirect APE. Given the enormous size and scale of Resource Nos. P-19-186535 and P-19-187829, the small footprint of the project site, and the lack of any uniquely definable associated resource features at this proposed project site, impacts would be less than significant. There is also one additional recorded resource within this project location's indirect APE. Resource No. P-19-186918 (FS-05015200101-HIS) is a segment of Forest Service Road 2N07, (the Sunset Ridge Fire Road/Sunset Peak Mountain Way), which was first recorded as a trail in 1924 and improved to a vehicle road by 1942. The road crosses the southeastern area of the indirect APE running northeast/southwest and is approximately 1,100 feet from the indirect APE at its closest point. The route of this road, as opposed to its physical surface, is considered historic and the road is a U.S. Forest Service Heritage Resource, but not an eligible or listed historical resource; therefore there would be no impacts from project activities on Resource No. P-19-186918 (FS-05015200101-HIS). LMR activities at this project location include attachment of whip and microwave antennas mounted on a proposed 180-foot lattice tower, a new equipment shelter and fuel tank mounted on a concrete pad, and

extension of an existing chain link fence. There is existing communications equipment at this location and at other adjacent communications-related sites situated within between 800 and 1,800 feet of the direct APE. The sites include multiple lattice towers, equipment shelters, and associated infrastructure features. Construction of an additional tower at this project location would be in keeping with the existing communications/industrial landscape, including the presence of other towers within the immediate/adjacent environment. The status and condition of this project area were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Given the nature of this site and the identified resources at this project location, impacts from project activities would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Precambrian igneous and metamorphic rock complex

Stability: Moderate to high pending geotechnical analysis

Soil Type: Sobrante-Exchequer-Cieneba Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line has been identified approximately 1.25 miles southeast of the property (Santa Susana) (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These

acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of material ranging from well-drained silty loam to gravelly loam with low to very high runoff and moderate permeability. Moderate to steep slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site SUN and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site SUN was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site SUN. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site SUN would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site SUN, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site SUN would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to

issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Experimental Forest

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Antelope Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health, watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health

(USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as Experimental Forest. The Experimental Forest zone serves as a research and demonstration area, and is generally closed to the public except by permit. Access is controlled. The San Dimas Experimental Forest (SDEF) is a protected field laboratory for studies of hydrology, fire, and other topics relating to the ecology of chaparral and related ecosystems. It has been closed to the general public, except under special written permit. Uses within the SDEF include a communications site that was authorized by special-use authorization (USFS, Pacific Southwest Region 2005b).

Communications sites may be permitted within the SDEF, but would require special-use authorization. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. Compatibility of the proposed land use is further evaluated through the permit application process. No land use plan incompatibility impacts are anticipated because of the communications site designation, but new development will still require a permitting process prior to construction.

Development of communication facilities at the site could result in the loss of forest land or conversion of forest land to non-forest use, but losses would be minimal as the site has been previously developed. Minimal impacts would be expected based on the presence of existing communications facilities, other developments, access roads, and ground disturbance.

Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Experimental Forest land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. Sunset Ridge is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Access to the Project Site Provided Via: Extension off of Sunset Peak Mtwy

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Savage Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: SUN2

Site Name: Sunset Ridge-2

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Surrounding area west of site

Aesthetics

Setting

Visual Description:

This site is immediately adjacent to the Sunset Ridge site, and the same conditions apply. This isolated site is located in Angeles National Forest on a ridge top west of Mount Baldy Road in a cleared area surrounded by chaparral vegetation. The site is comprised of a large dirt parking area and one small shelter with adjacent monopole. Steep topography blocks views of the site from Mount Baldy Road. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Experimental Forest, which is generally closed to the public except by permit.

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Experimental Forest

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new facilities would be located immediately adjacent to a site that includes existing towers that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing towers, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. The existing visual character and quality of the site and its surroundings are impacted by the presence of existing buildings and towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. There would be no change to the site's scenic attractiveness rating. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Industrial building

Distance to Sensitive Receptor: 790

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site SUN2. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site SUN2 or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site SUN2 would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site SUN2 will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site SUN2 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site SUN2 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site SUN2, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site SUN2, which is 790 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 4 are higher than the SCAQMD thresholds for NO_x, CO, PM_{2.5}, lower for PM₁₀ but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site SUN2 and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site SUN2 in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site SUN2 and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

None

Special Status Plants Recorded within 1 Mile:

Greata's aster (*Symphotrichum greatae*; 1B.3); Hall's monardella (*Monardella macrantha* ssp *hallii*; 1B.3)

Sensitive Communities Recorded within 1 Mile:

Canyon Live Oak Ravine Forest; Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

US Forest Service -Angeles National Forest; SCAG Zoning - Wildlife Preserves and Sanctuaries; Essential Connectivity Area - Sugarloaf Mountain/Keller Peak - San Gabriel/Cucamonga; Natural Landscape Block - San Dimas

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Interior live oak chaparral [*Quercus wislizenii* Woodland Alliance]; Association - *Quercus wislizenii*-*Ceanothus leucodermis*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

SUN2 is located along a high ridgeline in the San Gabriel Mountains. The vegetation is dominated by scrub oak and is recovering from a fire. The study areas considered to be outside the current range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), but as the condor population increases it is expected to expand geographically. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. Southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) is known to occur in San Antonio Canyon, about 1.5 miles to the west of Site SUN2. Though the project site is located in steep mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-

related construction activities and travel on access roads could impact dispersing frogs, if present. Site SUN2 is not hydrologically connected to San Antonio Canyon. The site does not contain stream habitat for Greata's aster (*Symphytotrichum greatae*; 1B.3). Jeffery pine forest habitat for Hall's monardella (*Monardella macrantha* ssp. *hallii*; 1B.3) is not present in the project area. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

To address future use of the area by condors all trash and construction debris (especially small items such as nuts and washers) will be removed from the site; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) in the project area and along access roads. To protect dispersing southern mountain yellow-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site. The site does not contain Canyon Live Oak Ravine Forest.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Riverine wetland feature type as indicated by the National Wetland Inventory

(USFWS 2014). However, this wetland type is restricted to ephemeral drainages. Construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated San Dimas Natural Landscape Block which overlaps the ranges of approximately 272 amphibian, reptile, mammal and bird species. It is also located within an Essential Connectivity Habitat Area Sugarloaf Mountain/Keller Peak - San Gabriel/Cucamonga that connects to the San Gabriel/Cucamonga and Lytle Creek Ridge Natural Landscape Blocks. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

Recommended mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

Yes

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

Project locations SUN2 and SUN are overlapping sites with slightly different, but immediately adjacent construction footprints. There are two historical resources within the direct and indirect areas of potential effects (APEs). The first of these is Resource No. P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. The second historical resource is Resource No. P-19-187829, which is eligible for inclusion in the National Register of Historic Places as the San Dimas Experimental Forest Historic District. This resource encompasses 17,161 acres of buildings, structures, sites, and landscapes that date to between 1933-1952. Included among the contributing landscape elements are the major topographical features found on the forest, because without this particular topography of streams and canyons forming isolated watersheds, Resource No. P-19-187829 would not have been selected as a location for an experimental forest. The Experimental Forest is the only such forest in Southern California, and believed to be the most significant within the U.S. Forest system. Both the direct and indirect APEs are completely encompassed by P-19-186535; P-19-187829 encompasses the direct APE and three fourths of the indirect APE. Given the enormous size and scale of Resource Nos. P-19-186535 and P-19-187829, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant. There is also one additional recorded resource within this project location's indirect APE. Resource No. P-19-186918 (FS-

05015200101-HIS) is a segment of Forest Service Road 2N07, (the Sunset Ridge Fire Road/Sunset Peak Mountain Way), which was first recorded as a trail in 1924 and improved to a vehicle road by 1942. The road crosses the southeastern area of the indirect APE running northeast/southwest and is approximately 1,100 feet from the indirect APE at its closest point. The route of this road, as opposed to its physical surface, is considered historic and the road is a U.S. Forest Service Heritage Resource, but not an eligible or listed historical resource; therefore there would be no impacts from project activities on Resource No. P-19-186918 (FS-05015200101-HIS). LMR activities at this project location include attachment of whip and microwave antennas mounted on a proposed 180-foot lattice tower, a new equipment shelter and fuel tank mounted on a concrete pad, and extension of an existing chain link fence. There is existing communications equipment at this location and at other adjacent communications-related sites situated within between 800 and 1,800 feet of the direct APE. The sites include multiple lattice towers, equipment shelters, and associated infrastructure features. Construction of an additional tower at this project location would be in keeping with the existing communications/industrial landscape, including the presence of other towers within the immediate/adjacent environment. The status and condition of this project area were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Given the nature of this site and the identified resources at this project location, impacts from project activities would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

Project locations SUN2 and SUN are overlapping sites with slightly different, but immediately adjacent construction footprints. There are two historical resources within the direct and indirect areas of potential effects (APEs). The first of these is Resource No. P-19-186535, which is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. The second historical resource is Resource No. P-19-187829, which is eligible for inclusion in the National Register of Historic Places as the San Dimas Experimental Forest Historic District. This resource encompasses 17,161 acres of buildings, structures, sites, and landscapes that date to between 1933-1952. Included among the contributing landscape elements are the major topographical features found on the forest, because without this particular topography of streams and canyons forming isolated watersheds, Resource No. P-19-187829 would not have been selected as a location for an experimental forest. The Experimental Forest is the only such forest in Southern California, and believed to be the most significant within the U.S. Forest system. Both the direct and indirect APEs are completely encompassed by P-19-186535; P-19-187829 encompasses the direct APE and three fourths of the indirect APE. Given the enormous size and scale of Resource Nos. P-19-186535 and P-19-187829, the small footprint of the project site, and the lack of any uniquely definable associated resource features at this proposed project site, impacts would be less than significant. There is also one additional recorded resource within this project location's indirect APE. Resource No. P-19-186918 (FS-05015200101-HIS) is a segment of Forest Service Road 2N07, (the Sunset Ridge Fire Road/Sunset Peak Mountain Way), which was first recorded as a trail in 1924 and improved to a vehicle road by 1942. The road crosses the southeastern area of the indirect APE running northeast/southwest and is approximately 1,100 feet from the indirect APE at its closest point. The route of this road, as opposed to its physical surface, is considered historic and the road is a U.S. Forest Service Heritage Resource, but not an eligible or listed historical resource; therefore there would be no impacts from project activities on Resource No. P-19-186918 (FS-05015200101-HIS). LMR activities at this project location include attachment of whip and microwave antennas mounted on a proposed 180-foot lattice tower, a new equipment shelter and fuel tank mounted on a concrete pad, and

extension of an existing chain link fence. There is existing communications equipment at this location and at other adjacent communications-related sites situated within between 800 and 1,800 feet of the direct APE. The sites include multiple lattice towers, equipment shelters, and associated infrastructure features. Construction of an additional tower at this project location would be in keeping with the existing communications/industrial landscape, including the presence of other towers within the immediate/adjacent environment. The status and condition of this project area were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Given the nature of this site and the identified resources at this project location, impacts from project activities would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Precambrian igneous and metamorphic rock complex

Stability: Moderate pending geotechnical analysis

Soil Type: Sobrante-Exchequer-Cieneba Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line has been identified approximately 1.25 miles southeast of the property (Santa Susana) (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These

acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of material ranging from well-drained silty loam to gravelly loam with low to very high runoff and moderate permeability. Moderate to steep slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site SUN2 and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site SUN2 was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site SUN2. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site SUN2 would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site SUN2, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site SUN2 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to

issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Experimental Forest

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Antelope Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health, watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health

(USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as Experimental Forest. The Experimental Forest zone serves as a research and demonstration area, and is generally closed to the public except by permit. Access is controlled. The San Dimas Experimental Forest (SDEF) is a protected field laboratory for studies of hydrology, fire, and other topics relating to the ecology of chaparral and related ecosystems. It has been closed to the general public, except under special written permit. Uses within the SDEF include a communications site that was authorized by special-use authorization (USFS, Pacific Southwest Region 2005b).

Communications sites may be permitted within the SDEF, but would require special-use authorization. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. Compatibility of the proposed land use is further evaluated through the permit application process. No land use plan incompatibility impacts are anticipated because of the communications site designation, but new development will still require a permitting process prior to construction.

Development of communication facilities at the site could result in the loss of forest land or conversion of forest land to non-forest use, but losses would be minimal as the site has been previously developed. Minimal impacts would be expected based on the presence of existing communications facilities, other developments, access roads, and ground disturbance.

Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Experimental Forest land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. Sunset Ridge is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication sites would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Foothill Frwy

Distance (Miles): 1.9

Disaster Route: State Route 210

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Foothill Frwy

Distance (Miles): 4.41

Nearest Major Arterial: Mount Baldy Rd

Distance (Miles): 1.52

Access to the Project Site Provided Via: Extension off of Sunset Peak Mtwy

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Savage Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: TMT

Site Name: Table Mountain

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Aesthetics

Setting

Visual Description:

This site is in Angeles National Forest located immediately adjacent to the Mountain High North Resort ski area on the north side of Angeles Crest Highway, a Scenic Byway. A small lattice tower of unknown height exists on the site, set adjacent to some trees. A dirt driveway forms a circle through sparse trees. Steep topography blocks views of the site from Table Mountain Road and Angeles Crest Highway, which provides access to both the site and the ski area. The site is approximately 100 feet west of, and on approximately the same elevation, as the top of the ski lift among thinly dispersed evergreen trees, and would be visible to winter recreationists at the top of the mountain. This site is also adjacent to the Table Mountain Campground and Camp McClellan. Another ski area, Mountain High Ski Resort, is located on a different hillside directly south of the site. Sensitive viewers include ANF visitors, particularly winter recreationists. The site is approximately 500 feet northwest of NASA's Table Mountain Observatory, a remote science and engineering facility in a "unique physical environment (high, dry and relatively pollution free)" that is used for "a substantial number of world-class science, technology and flight projects" addressing Sun–Earth system science, atmospheric composition, climate change, ozone depletion, planetary astronomy, optical communications, and flight project support (NASA 2014). The site is approximately 0.4 mile northeast of the Angeles Crest Scenic Byway. Highway 2, also known as the Angeles Crest Scenic Byway, is a 55-mile National Forest Scenic Byway that travels through the San Gabriel Mountains in Angeles National Forest. The goals of the National Forest Scenic Byways program include "showcase[ing] outstanding National Forest scenery" and "contribut[ing] to the nation's overall scenic byways effort" (USFS n.d.). According to the 2014 Los Angeles County General Plan Update EIR, the San Gabriel Mountains play a major role in physically defining the topographically and aesthetically diverse communities. These landforms create dramatic backdrops against developed communities, and provide extensive benefits to residents (County of Los Angeles 2014a). The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as A. SAC A is considered distinctive; 24% of Angeles National Forest is rated A (USFS 1995). The USFS zone for this area is Developed Area. In such areas, the level of human use and infrastructure is typically higher than in other zones. This zone includes a number of highly popular developed recreation facilities, and recreation and non-recreation special-uses facilities. This zone is the lowest designation for naturalness (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC A; Developed

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: State Route 2; Angeles Crest Scenic Byway

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new facilities would not be visible from the Angeles Crest Scenic Byway due to very steep topography, road cuts, and tall vegetation that obscure the site from view. The site would be visible to recreationists at the Mountain High North Resort ski area during winter, and would be visible to those at the Mountain High Resort ski area south of the site from the top of the ski lifts. However, the top of the ski area to the south is over one mile away. The new features would be uncharacteristic of the scenic vista without the presence of the ski resort immediately adjacent to the site. The chair lifts intrude onto the scenic vista and introduce vertical elements into the landscape, and ski runs cut swaths through the trees. The new facilities would not perceptibly change the scenic vista due to the presence of these elements and, to a lesser degree, the small existing tower, which would attenuate the noticeability of new structure. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would be added to it. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. The new tower would not interfere with views from telescopes used at the Table Mountain Observatory given its height and distance from the site. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Expansion of the site would be required to accommodate the new facilities. However, the site would be designed to avoid removal of or damage to vegetation, which consists of scattered trees within a disturbed area that do not constitute a scenic resource. No rock outcroppings, historic buildings, or other scenic resources exist in the area. The same construction activities described for scenic vistas, described above, would also apply.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Although the USFS scenic integrity objective for this area is high and the SAC rating (A) is distinctive, this area is also identified as a Developed Area zone. In such areas, the level of human use and infrastructure is typically higher than in other zones. This zone includes a number of highly popular developed recreation facilities, and recreation and non-recreation special-uses facilities. This zone is the lowest designation for naturalness. The site is already impacted by the presence of the ski resort. The new facilities would be compatible with the existing site, and with the surrounding landscape. The same construction activities described for scenic vistas, described above,

would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity. Any disturbed vegetation would be returned to existing conditions.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: Mojave Desert

Air Quality Management District: Antelope Valley

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM10 (unclassified)

State Nonattainment Status: O3, PM10, PM2.5 (unclassified)

Applicable Air Quality Management Plan(s):

AVAQMD 2004 Ozone Attainment Plan (State and Federal), AVAQMD Federal 8-Hour Ozone Attainment Plan, AVAQMD Implementation Schedule for Measures to Reduce PM pursuant to H&S Code 39614(d), AVAQMD CEQA and Federal Conformity Guidelines

Significance Thresholds:

General Conformity (tons/year): CO (100), NOX, VOC (25); Local construction and operation (tons/year): CO (100), NOX, VOC (25), PM2.5, PM10 (15); Local construction and operation (lbs./day): CO (548), NOX, VOC (137), PM2.5, PM10 (82)

Nearest Sensitive Receptors: Research building

Distance to Sensitive Receptor: 721

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The AVAQMD air quality plans considered in this analysis include the AVAQMD 2004 Ozone Attainment Plan (State and Federal) (AVAQMD 2004 Ozone Plan) (AVAQMD 2004). The purpose of this plan was to (1) demonstrate that the AVAQMD would meet the primary O3 NAAQS by the end of 2007; (2) present progress by the AVAQMD toward meeting all state planning milestones including attainment of the O3 CAAQS; and (3) discuss the 8-hour O3 NAAQS in preparation for a new nonattainment designation under a revised standard. Also considered in this analysis of Project air quality impacts is the AVAQMD Federal 8-Hour Ozone Attainment Plan (Western Mojave Desert Nonattainment Area) (AVAQMD 8-Hour Ozone Plan) (AVAQMD 2008). The purpose of this plan is to (1) demonstrate that the AVAQMD will attain the primary O3 NAAQS by June 2021; (2) present progress by the AVAQMD toward meeting all required O3 planning milestones and NAAQS and CAAQS; and (3) discuss the newest 0.075 ppm O3 NAAQS in anticipation of a nonattainment designation for this revised standard.

Finally, the analysis considered the AVAQMD Implementation Schedule for Measures to Reduce PM pursuant to Health and Safety Code 39614(d) (AVAQMD PM Measures Plan) (AVAQMD 2005). The purpose of this plan is for the AVAQMD to develop a list of Best Available Control Technologies (BACT) either currently being implemented or for future consideration to control particulate emissions within the district.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site TMT. The analysis indicates that emissions from the construction of all the proposed Project sites located in the MDAB including site TMT would not exceed AVAQMD significance thresholds for the listed criteria pollutants including O3 precursor NOx. Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of all the proposed Project sites located in the MDAB would not exceed AVAQMD significance thresholds for any criteria pollutants including O3 precursor NOx and particulate matter. Therefore, the Project would not conflict with or obstruct implementation of the

AVAQMD 2004 Ozone Plan, AVAQMD 8-Hour Ozone Plan, or the AVAQMD PM Measures Plan. Impacts of the proposed Project on the implementation of the AVAQMD plans would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Emissions from the construction from proposed LMR Site TMT or emissions from the simultaneous construction of the three proposed Project sites located in the MDAB would not exceed AVAQMD significance thresholds for criteria pollutants. Per AVAQMD guidance, compliance with these significance thresholds is sufficient to demonstrate that construction of the proposed Project sites in the MDAB would not violate any air quality standards or contribute substantially to an existing or projected air quality violation; therefore, Project construction impacts in the MDAB would be less than significant.

Operational emissions of the proposed LMR Site TMT or the operational emissions of all Project sites in the MDAB are less than significant and would not violate any air quality standard or contribute substantially to an existing or projected air quality violation; therefore, Project operational impacts would be less than significant in the MDAB.

Mitigation Measure(s):

No mitigation measures are required.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3 and PM10 (CAAQS) in the MDAB. Cumulatively considerable net increases in these pollutants were examined relative to the AVAQMD significance thresholds for each.

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3 and PM10 (CAAQS) in the MDAB. Cumulatively considerable net increases in these pollutants were examined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed LMR Site FRP or the simultaneous construction of all three proposed Project sites located in the MDAB would not exceed AVAQMD significance thresholds for O3 and PM10. Per AVAQMD guidance, compliance with these significance thresholds is sufficient to demonstrate that construction of the proposed Project sites in the MDAB would not result in cumulatively considerable net increases in these pollutants; therefore, Project construction emissions in the MDAB would be less than significant.

Operational emissions of the proposed LMR Site FRP or all Project sites in the MDAB would not exceed AVAQMD significance thresholds for O3, and PM10. Per AVAQMD guidance (AVAQMD, 2011), compliance with these significance thresholds is sufficient to demonstrate that operation of the proposed Project sites in the MDAB would not result in cumulatively considerable net increases in these pollutants; therefore, Project operational emissions in the MDAB would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The AVAQMD considers residences, schools, daycare centers, playgrounds and medical facilities to be sensitive receptor land uses. Exposure of sensitive receptors to substantial pollutant concentrations as defined above in Chapter 3.2.3.1, Criterion 4 is required for the following project types: (1) any industrial project within 1,000 feet; (2) a distribution center (40 or more trucks per day) within 1,000 feet; (3) a major transportation project (50,000 or more vehicles per day) within 1,000 feet; (4) a dry cleaner using perchlorethylene within 500 feet; and (5) a gasoline dispensing facility within 300 feet.

While the Project as proposed does not fall within one of these project types; the analysis of sites within the MDAB includes a qualitative assessment of pollutants that impact human health.

The use of off-road heavy-duty diesel equipment by the Project for demolition, site grading and excavation, and concrete pad construction activities would result in the generation of diesel particulates (DPM) emissions. DPM were identified as a toxic air contaminant (TAC) by CARB in 1998. Other potential TAC sources associated with construction include the demolition of asbestos-containing materials and the excavation of naturally occurring asbestos (NOA) in soils. The monthly one hour test of the backup generator at each proposed Project site, including site TMT would generate DPM emissions. Emergency operation of the backup generators, which is anticipated to have a 200 hour continuous operational capacity would also generate DPM emissions. No other operational sources of these or other TACs would occur.

According to the Consolidated Table of Office of Environmental Health Hazard Assessment (OEHHA)/ CARB Approved Risk Assessment Health Values, the potential cancer risk from the inhalation of DPM outweighs the potential noncancer health impacts (SCAQMD, 2015; SMAQMD, 2014); therefore, noncancer health impacts of DPM were not assessed further. In addition, the OEHHA Air Toxics Hot Spots Program Guidance Manual does not recommend assessing cancer risk from exposures to a 'maximally exposed individual resident' (sensitive receptor) from activities lasting less than two months, due to the uncertainty in assessing cancer risk from very short-term exposures (OEHHA, 2015).

As discussed in Appendix B, the maximum construction activity scenario assumed at site TMT and all proposed sites would have a six week duration. Similarly, the duration of the monthly test and emergency operation of backup generators at each site would be sources of short-term exposure to sensitive receptors; therefore, further assessment of the potential cancer risk of the project construction and operation is not warranted.

Demolition of existing structures at proposed sites in the MDAB would be subject to AVAQMD Rule 1403. Rule 1403 is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. The rule addresses the national emissions standards for asbestos along with some additional requirements. The rule requires lead agencies and their contractors to notify the District of any regulated renovation or demolition activity. By complying with District Rule 1403, thereby minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the MDAB, including site TMT, would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per AVAQMD guidance (AVAQMD 2011), compliance with the criteria pollutant significance thresholds and the health risk based significance threshold established by AVAQMD Criterion 4 is sufficient to demonstrate that

construction and operation of the proposed Project sites in the MDAB, including site TMT, would not result in sensitive receptor exposure to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site TMT and all proposed Project sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to AVAQMD Rule 402. In addition, the operation of all Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to AVAQMD Rule 402; therefore, Project impacts would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

pallid San Diego pocket mouse (*Chaetodipus fallax pallidus*; CDFW-SSC); southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E); San Gabriel Mountains blue butterfly (*Plebejus saepiolus aureolus*; USFS-S); south coast marsh vole (*Microtus californicus stephensi*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

Big Bear Valley woollypod (*Astragalus leucolobus*; 1B.2); grey-leaved violet (*Viola pinetorum* var. *grisea*; 1B.3); San Antonio milk-vetch (*Astragalus lentiginosus* var. *antonius*; 1B.3)

Sensitive Communities Recorded within 1 Mile:

Canyon Live Oak Ravine Forest

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E); Big Bear Valley woollypod (*Astragalus leucolobus*; 1B.2); San Antonio milk-vetch (*Astragalus lentiginosus* var. *antonius* 1B.3); grey-leaved violet (*Viola pinetorum* var. *grisea*; 1B.3)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

US Forest Service - Angeles National Forest; SEA - Antelope Valley; SCAG Zoning - Wildlife Preserves and Sanctuaries; Essential Connectivity Area - Sugarloaf Mountain/Keller Peak - San Gabriel/Cucamonga

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Jeffrey Pine Forest [*Pinus jeffreyi* Forest Alliance]; Association -*Pinus jeffreyi*-*Symphoricarpos longiflorus*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site TMT is located near the top of Table Mountain in the San Gabriel Mountains, at an elevation of approximately 7,500 feet. The vegetation is Jeffery pine forest. The study areas considered to be outside the current range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), but as the condor population increases it is expected to expand geographically. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. The pallid San Diego pocket mouse

(*Chaetodipus fallax pallidus*; CDFW-SSC) occurs in scrub type habitat at elevations up to about 6,000; the project area is outside the elevation range and does not include appropriate habitat for the species. The south coast marsh vole (*Microtus californicus stephensi*; CDFW-SSC) is found in association with tidal marshes; no suitable habitat is present within the project area for the species. Soils Southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) designated critical habitat and frog occurrence records are known from the San Gabriel River critical habitat unit approximately 2 miles to the southwest of Site TMT. Though the project site is located in steep mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. The San Gabriel Mountains blue butterfly (*Plebejus saepiolus aureolus*; USFS-S) is presumed extinct. It was known only from a single wet meadow within the yellow pine forest near the Big Pines Ranger Station, San Gabriel Mountains, Angeles National Forest, California. Its host plant was *Trifolium wormskioldii*. No wet meadow habitat is found in the project area. The site contains potential habitat for Big Bear Valley woollypod (*Astragalus leucolobus*; 1B.2) and San Antonio milk-vetch (*Astragalus lentiginosus* var. *antoni* 1B.3); during the habitat assessment survey conducted 8/26/2014 an unidentified species of *Astragalus* was observed; a summer survey is required for species level identification. Though the shallow rocky soils at the project site provides poor habitat for the grey-leaved violet (*Viola pinetorum* var. *grisea*; 1B.3), potentially suitable habitat may be present in mesic micro-sites within the project area. Surveys conducted 8/28/2015 did not locate the plant. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

To address future use of the area by condors all trash and construction debris (especially small items such as nuts and washers) will be removed from the site; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of special status plants, and southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) in the project area and along access roads. To protect dispersing southern mountain yellow-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Conduct summer botanical surveys for Big Bear Valley woollypod (*Astragalus leucolobus*; 1B.2), San Antonio milk-vetch (*Astragalus lentiginosus* var. *antoni* 1B.3), and grey-leaved violet (*Viola pinetorum* var. *grisea*; 1B.3); if present mark the areas requiring special protection. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site; Canyon Live Oak Ravine Forest was not observed in the project area. Site TMT is hydrologically connected to stream habitats that include southern mountain yellow-legged frog (*Rana muscosa*; ESA-E, CA-E) critical habitat.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The site is located within a CDFW Essential Connectivity Habitat Area Sugarloaf Mountain/Keller Peak - San Gabriel/Cucamonga that connects to the San Gabriel/Cucamonga, Pleasant View Ridge, and Table Mountain Natural Landscape Blocks. This site is also located within the Antelope Valley Significant Ecological Area and north of Saddleback Butte State Park, which is identified as an important regional habitat linkage in the Los Angeles General Plan. This SEA serves as a major movement corridor for wildlife species as well as plants, and serves as a linkage between the San Gabriel Mountains and the Mojave Desert and into Kern and San Bernardino Counties. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. Additionally, due to the nature of the project, impacts to wildlife movement would be minimal to none. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

Recommended mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct area of potential effects (APEs) (P-19-186535). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant. Within the indirect APE, there are 27 additional recorded resources. These include Resource No. P-19-186810 (FS-05015400143), the Robin and Blue Ridge circuits of a Southern California Edison (SCE) transmission line (wooden poles and cross arms with ceramic insulators) constructed between 1928 and 1963. This resource runs adjacent to the boundary of the direct APE, but most of the circuit has been replaced over time and retains insufficient integrity to be considered a historical resource under the CEQA guidelines. Of the remaining 26 recorded resources within the indirect APE, only one (Resource No. P-19-1604H; FS-05015400011-HIS) is a historical resource. This resource encompasses buildings, structures, landscape features, and refuse deposits dating from 1923-1940. Resource No. P-19-1604H has been determined eligible for inclusion in the National Register of Historic Places (National Register) as the Big Pines Park Headquarters Complex; it is situated approximately 0.36 miles from the direct APE and beyond line-of-sight due to mountainous terrain and forest. Also within the indirect APE is Resource No. P-150007 (FS-05015400073-HIS), the

McClellan Flat Recreational Residence (a Forest Service Heritage Resource), which is a cluster of structures built between 1910 and 1950, 13 of which are still in use. Although a Heritage Resource, this resource has been previously evaluated for inclusion in the National Register and has not been determined eligible as a historical resource. The remaining recorded resources within the indirect APE have been determined to be not historical resources and all are situated between 0.1 and 0.5 miles from the direct APE. LMR activities at this project location include attachment of whip and microwave antennas on a proposed 180-foot lattice tower, construction of a new equipment shelter, and installation of a backup generator and fuel tank on a concrete pad. The project site (direct APE) is heavily disturbed from the previous construction of an existing communications site, equipment shelter, and lattice tower; a road; the former lookout station; and an adjacent ski lift. The condition and status of cultural resources at this project location were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in November 2014. Based on the nature of the project site and the identified historical resources and their locations, impacts from project activities would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any uniquely definable features associated resource features at this proposed project site, impacts would be less than significant. However, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Precambrian igneous and metamorphic rock complex

Stability: Moderate pending geotechnical analysis

Soil Type: Tollhouse-Rock outcrop-Etsel family-Bakeoven Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: No

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line (San Andreas) has been identified approximately 1/4 mile southwest of the property (Santa Susana) (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These

acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of well-drained gravelly to cobbly loam with moderate runoff and moderately rapid permeability. Moderate slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: Mojave Desert

Air Quality Management District: Antelope Valley

AQMD Significance Threshold: 100,000 tons CO₂eq/year (548,000 lbs. daily), 25,000 metric tons (MT) CO₂equivalent(eq)/year amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

Executive Orders S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, Senate Bill 97, AVAQMD CEQA and Federal Conformity Guidelines, Rule 3011 GHG Provisions of Federal Operating Permits

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site TMT and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the three (3) proposed Project sites in the MDAB. The generator test would last one hour at each site during a single day each month. It was also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site TMT was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all three (3) Project sites in the MDAB are estimated at 142.24 TCO₂e (129 MTCO₂e), or less than 47 TCO₂e (43 MTCO₂e) annually for proposed Project site TMT. To be consistent with the analysis of sites located in the SCAB/SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site TMT would be substantially below the AVAQMD annual 100,000 TCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to

2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site TMT, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the AVAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site TMT would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Lahontan

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to

issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Developed Area Interface

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Antelope Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health,

watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as in the Developed Area Interface. The Developed Area Interface zone includes areas adjacent to communities or concentrated use areas and developed sites with more scattered or isolated community infrastructure. The level of human use and infrastructure is typically higher than in other zones, and the level of development varies between areas that are highly developed to areas where no development has occurred. Although this zone may have a broad range of higher intensity uses, the management intent is to limit development to a slow increase of carefully designed facilities to help direct use into the most suitable areas and concentrating on improving facilities before developing new ones (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. No land use impacts are anticipated because of the communications site designation, but new development will still require a permitting process prior to construction.

Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Developed Area Interface land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. East Table Mountain is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Angeles Crest Hwy

Distance (Miles): 2.03

Disaster Route: State Route 2

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Foothill Frwy

Distance (Miles): 0.37

Nearest Major Arterial: Antelope Hwy

Distance (Miles): 5

Access to the Project Site Provided Via: Forest Service Road 4N21

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Antelope Valley Recycling and Disposal Facility

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: TOP

Site Name: Topanga Peak

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose construction of up to 200 foot long x 4 foot high retaining wall. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This site is within Santa Monica Mountains National Recreation Area off Saddle Peak Road just east of the intersection with Stunt Road on a ridgeline designated by Los Angeles County as “significant.” The site includes a microwave dish and whip antennas mounted to monopoles, as well as a water tank, small one-story building, and chain link fence enclosing the site, which is paved. A large radio relay tower is immediately adjacent to the site to the east. The radio tower is tall and broad, and is a prominent feature on the ridgeline. Both the monopoles and radio tower are clearly visible from segments of east- and west-bound traffic on Saddle Peak Road. The Backbone Trail passes between the site and Saddle Peak Road, and a trailhead and pullout exist on the road just east of the site. The site is surrounded by low chaparral vegetation and exposed buff-colored rocks. Sensitive viewers include NRA visitors and hikers on the Backbone Trail. The view is dominated by the ridgeline, roadway corridor, and radio tower. This site is located in proximity to the Backbone Trail. The Backbone Trail is a Santa Monica Mountains ridgeline trail that follows ridges, traverses chaparral-covered hillsides, enters oak woodlands, and crosses creeks and valleys in the Santa Monica Mountains National Recreation Area. Trail development has occurred piecemeal across a patchwork of public lands, and therefore has different names in some sections, and not all sections are open to all users.

Visual Sensitivity: High

On federally administered public lands: No, but within boundary of Santa Monica Mountains NRA

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: Yes, Santa Monica Mountains Local Coastal Plan

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Backbone Trail; Saddle Peak Road

State, regional, or municipal recreation area: Yes

If yes, enter recreation area name: adjacent to Topanga State Park

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: Yes

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is located on a designated significant ridgeline and is within view of some sections of the Backbone Trail, as well as a trailhead. The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new facilities would be located within a site that includes a large, bulky radio tower and two shorter, slim monopoles that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing towers, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be

related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings are impacted by the presence of the existing towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. There would be no substantial change to the visual character or quality of the significant ridgeline, SMMNRA, or Backbone Trail. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare

that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 1336

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site TOP. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that Nox emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOX emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOX emissions limits. With implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or

obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site TOP or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site TOP would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site TOP will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100

pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site TOP would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site TOP or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site TOP, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site TOP, which is 1,336 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds for NO_x, CO, PM_{2.5}, lower for PM₁₀ but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site TOP and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site TOP in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site TOP and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly

trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP); California mountain kingsnake (San Diego population; *Lampropeltis zonata pulchra*; CDSFW-SSC); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); monarch butterfly (*Danaus plexippus*; ESA-Pet); two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC); western pond turtle (*Emys marmorata*; CDFW-SSC); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

Southern Sycamore Alder Riparian Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

American peregrine falcon - foraging (*Falco peregrinus anatum*; CDFW-FP); California mountain kingsnake (San Diego population; *Lampropeltis zonata pulchra*; CDSFW-SSC); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); monarch butterfly (*Danaus plexippus*; ESA-Pet);

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

Yes

Wildlife Corridor or Nursery Site:

Santa Monica Mountains National Recreation Area (NPS); Los Angeles County - Los Angeles Holding 9; SEA/CRA - Santa Monica Mountains (Cold Creek); Natural Landscape Block - Calabasas Peak/Santa Monica Mountains

Local Policy or Ordinance for Biological Resources:

Santa Monica Mountains Local Coastal Program Land Use Plan and Local Implementation Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Chamise chaparral [*Adenostoma fasciculatum* Shrubland Alliance]; Association - *Adenostoma fasciculatum*-*Eriogonum fasciculatum*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site TOP is located on a hill top along a ridgeline in the Santa Monica Mountains. The site contains dense chamise chaparral. Woody species dominating the vegetation are bush buckwheat (*Eriogonum fasciculatum*), deer vetch (*Acmispon glaber*), bush monkeyflower (*Diplacus aurantiacus*), laurel sumac (*Malosma laurina*), scrub oak (*Quercus* sp.) and toyon (*Heteromeles arbutifolia*). The American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP) may

pass by the site while foraging, but the project area does not provide steep cliff habitat required for nesting (suitable nesting habitat may be present within one mile). California mountain kingsnake (San Diego population; *Lampropeltis zonata pulchra*; CDSFW-SSC) and coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) could occur in the project area and could be killed project activities. Potentially suitable habitat (and a potential reintroduction site) for California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) has been reported by Santa Monica National Recreation Area to occur within 1 mile of Site TOP at an unspecified location within Cold Creek Nature Preserve. Though the project site is located in steep mountain terrain and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. Project-related construction activities and travel on access roads could impact dispersing frogs, if present. The monarch butterfly (*Danaus plexippus*; ESA-Pet) may pass through the project area and roost in nearby trees. No aquatic/riparian habitat suitable for two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC) or western pond turtle (*Emys marmorata*; CDFW-SSC) occur within the project area. The study area contains potential habitat for Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, ESA-CH, 1B.1) but it is not likely to be observed until the area burns. The project footprint is within previously cleared and mostly paved lands. Braunton's milkvetch may be present in the study area, but project activities confined to previous disturbance area. Preconstruction surveys would not be necessary. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC), California mountain kingsnake (San Diego population; *Lampropeltis zonata pulchra*; CDSFW-SSC), and California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) in the project area. Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. To protect dispersing California red-legged frogs, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measureable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Conduct a preconstruction survey of nearby trees for roosting monarch butterflies. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 22 Monarch Butterfly Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community occur within 500 feet of the project site. Site CPK may be hydrologically connected to stream habitats that include California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) potentially suitable habitat.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Riverine wetland feature type as indicated by the National Wetland Inventory (USFWS 2014). However, this wetland type is restricted to an ephemeral drainage. Construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Calabasas Peak/Santa Monica Mountains Natural Landscape Block which overlaps the ranges of approximately 276 amphibian, reptile, mammal and bird species. The site is also located within the proposed Santa Monica Mountains Coastal Resource Area, which is identified as an important regional habitat linkage in the Los Angeles General Plan. Linkages in this CRA connect open spaces together that may be fragmented due to rural development and connect to habitats in Ventura County. Cold Creek is a permanent stream managed by the Mountains Restoration Trust. It is a privately owned 1000 plus acre site open to the public by reservation only and managed primarily for hiking and restoration of weedy areas. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site TOP is comprised solely of H3 habitat. The study area for Site TOP contains H2 habitat and H1 Quiet Zone. Protection of SERAs identified in the land use plan (LUP) includes prohibition or other strict regulation of proposed site development. Policies contained within Goal CO-2 of the LUP offer protection of SERAs as a priority over other development standards in the Local Implementation Plan. Impacts to resources at the site are described in Impact BIO 1, Impact BIO 2, and Impact BIO 3. Existing site conditions include disturbed areas that are not considered SERAs, and therefore not subject to SERA restrictions. Because construction activity would potentially affect SERA(s), and construction and operations activities could impact migratory birds and other special-status species, a potential for conflict exists with LUP policies CO-40, CO-41, CO-42, and CO-44. This conflict would constitute a

significant impact.

Mitigation Measure(s):

The mitigation measures identified in Impact BIO 1 coupled with application of LU MM 3 (requiring the Authority obtain a coastal development permit) would reduce impacts to less than significant. Required mitigation measures:

• BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 22 Monarch Butterfly Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: Yes

Native American: Yes

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

There are no previously recorded historical resources within the direct area of potential effects (APE). However, adjacent to the direct APE there are two previously unrecorded resources – one archaeological site and one Cold War-era architectural resource. Both resources were identified during a site visit in January 2015. Given the location of the archaeological materials, it is highly probable that the site was impacted during previous construction and continues well beyond the 50-foot buffer in all directions – including beneath the adjacent existing, fenced communications site. The newly identified architectural resource is approximately 150 feet east of the direct APE. This resource consists of a fenced area consisting of one of a system of 107 microwave radio-relay towers and equipment shelters designed to transmit telephone and television signals nationwide. The system was activated in 1951 and abandoned in the mid-1990s when fiber optic lines replaced the distinctive horn-antenna microwave system. By 1999, most of the system sites had been demolished or sold to communications-related companies or private parties. The nuclear attack-resistant concrete tower and hardened bunker-like equipment shelter at the TOP location was completed in 1979. All of the original equipment has been removed from the tower and shelter and both are covered in modern graffiti; as a result, this architectural retains insufficient integrity to be eligible for inclusion in the National Register of Historic Places or California Register of Historical Resources. The TOP project area itself encompasses an existing water tank, equipment shelter, and several communications antennas mounted on differing types of low monopoles. The site is situated on a paved surface and enclosed by a gated and locked chain-link fence. The remainder of the indirect APE encompasses primarily

undeveloped mountainous terrain and two very small housing areas, each situated approximately 0.25 miles from the direct APE. Residences situated at the southwest boundary of the indirect APE were constructed in the late 1970s. Residences situated at the southeast boundary of the indirect APE were constructed in the 1990s. LMR activities at this project location include attachment of whip and microwave antennas on a proposed 180-foot lattice tower, construction of a new equipment shelter, and installation of a backup generator and fuel tank on a concrete pad. The condition and status of this project area were confirmed through archival research and during a field survey by an SOI-qualified archaeologist and architectural historian in January 2015. Based on the nature of this project site and the identified resources, there would be no direct or indirect impacts on the identified Cold War-era feature due to its lack of integrity or the two modern housing areas. Impacts would be significant on archaeological resources at this project site; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 1, 3, and 4 would be implemented at this project site. Archaeological monitors would ensure that archaeological resources are protected. As well, to avoid additional impacts to the newly identified archaeological site, access to the area of the archaeological site would be restricted to all construction and operational personnel.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

As described in CUL-1, an archaeological site was newly identified during a site visit in January 2015. Given the location of the archaeological materials, it is highly probable that the site was impacted during previous construction and continues well beyond the 50-foot buffer in all directions – including beneath the adjacent existing, fenced communications site. Impacts would be significant on archaeological resources at this project site; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 1, 3, and 4 would be implemented at this project site. Archaeological monitors are required during all ground disturbing activities at this project location to ensure that archaeological resources are protected. As well, to avoid additional impacts to the newly identified archaeological site, access to the area of the archaeological site would be restricted to all construction and operational personnel.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as the Oligocene to Miocene Sespe Formation, which has a high potential for significant vertebrate fossils. No localities are recorded within the proposed site; however, vertebrate fossil localities have been recorded from this formation in the Santa Monica Mountains region, including specimens of frog, opossum, pika, mouse, and the even-toed ungulate *Blastomeryx*. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Sespe Formation to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History

Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs); however, based on the archaeological materials found adjacent to the direct APE that may also extend beneath the project area, this project area may be sensitive for them. Impacts would be significant at this project site; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 1, 3, and 4 would be implemented at this project site. Archaeological monitors would ensure that archaeological resources are protected. As well, to avoid additional impacts to the newly identified archaeological site, access to the area of the archaeological site would be restricted to all construction and operational personnel.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Tribal cultural resources as defined by California Assembly Bill 52 may be situated within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs; however, field surveys in January 2015 indicate that the direct and indirect APEs may be sensitive for them. Impacts would be significant at this project site; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 1, 3, and 4 would be implemented at this project site. Archaeological monitors would ensure that archaeological resources are protected. As well, to avoid additional impacts to the newly identified archaeological site, access to the area of the archaeological site would be restricted to all construction and operational personnel.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: Moderate pending geotechnical analysis

Soil Type: Urban land-Rock outcrop-Millsholm Association

Erosion Potential: Low

Expansive Soil: Low

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require

additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of well-drained light clay loam with low to very high runoff and moderate permeability. Moderate slopes surround the site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical

analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site TOP and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site TOP was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site TOP. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site TOP would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site TOP, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site TOP would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: N/A

Located in a State Fire Hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to

issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: Santa Monica Mountains Coastal Zone

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Public and Semi-Public Facilities

Zoning: Light Agriculture

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Monica Mountains Coastal Zone

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site TOP is proposed along an adopted Significant Ridgeline within the Santa Monica Mountains Coastal Zone. The Santa Monica Mountains Land Use Plan, a component of the Santa Monica Mountains Local Coastal Program, was issued in August 2014 and allows for telecommunication facilities within several land use categories, including open space, rural lands, rural residential, rural villages, residential, commercial, commercial recreation – limited intensity, and public and semi-public facilities (County of Los Angeles, Department of Regional Planning 2014). Per the Local Implementation Plan adopted in 2014, new development is prohibited on Significant Ridgelines. Structures must be located sufficiently below Significant Ridgelines so that the highest point of a structure is located at least 50 vertical feet and 50 horizontal feet from a Significant Ridgeline. The proposal is to establish a 180-foot-tall tower at an existing communications. This would result in a conflict with the Santa Monica

Mountains Land Use Plan.

In addition, Site TOP is within 400 feet of Saddle Peak Road, a designated Scenic Route. Land Use Plan Policy CO-147 limits maximum allowable height to 18 feet above existing or finished grade, whichever is lower, along Scenic Routes. Land Use Plan Policy CO-152 indicates wireless telecommunication facilities along Scenic Routes should be co-located where feasible and made to blend into the landscape.

The final determination of consistency would be made by the agency responsible for issuing a Local Coastal Permit. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan, and plan inconsistency is not considered a significant impact.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: Santa Monica Mountains Local Coastal Program, Land Use Plan

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: S Topanga Canyon Blvd

Distance (Miles): 1.25

Disaster Route: Pacific Coast Highway

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: State Route 27

Distance (Miles): 2.03

Nearest Major Arterial: Mulholland Hwy

Distance (Miles): 1.69

Access to the Project Site Provided Via: Radio Relay

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: L A COUNTY WATERWORKS DIST #29

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: TPK

Site Name: Tejon Peak

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

The site consists of a small, one-story equipment shelter, 60-foot lattice tower with attached antennas, and 15-foot monopole on dirt ground on a hilltop enclosed by a chain link fence. Five large microwave dishes are attached to the lattice tower, and one is attached to the monopole. Seven similar sites are within a 370-foot radius of this site. Other than that, the remaining area is undeveloped and consists primarily of barren ground with low, weedy grasses. Pockets of vegetation exist at the northeastern perimeter of the area.

Visual Sensitivity: Low

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new facilities would be located within a site that includes a lattice tower and monopole that already create a visual intrusion onto the landscape. In addition, seven similar sites, all of which include towers of varying types and heights, are immediately adjacent to this site. The new facilities would not perceptibly change the scenic vista due to the presence of the existing towers, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings are impacted by the presence of several existing towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site and its immediate surroundings. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Equestrian center

Distance to Sensitive Receptor: 15444

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site TPK. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site TPK or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?**Construction Impact:** Significant Impact Reduced to Less than Significant with Mitigation Incorporated**Operational Impact:** Less than Significant**Discussion:**

Emissions from the construction of proposed site TPK would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site TPK will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site TPK would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site TPK or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site TPK, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site TPK, which is 15,444 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 15 are higher than the SCAQMD thresholds for NO_x, CO, PM_{2.5}, lower for PM₁₀ but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site TPK and were not assessed further.

As discussed in Appendix B, the maximum construction activity scenario assumed at each site would have a six week duration. Similarly, the duration of the monthly test and emergency operation of backup generators at each site would be sources of short-term exposure to sensitive receptors; therefore, further assessment of the potential cancer risk of the project construction and operation is not warranted.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site TPK in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer

station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site TPK and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); Tehachapi pocket mouse (*Perognathus alticolus inexpectatus*; DFW-SSC); yellow-blotched salamander (*Ensatina eschscholtzii croceator*; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

Valley Needlegrass Grassland; Wildflower Field; California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP)

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP); golden eagle (*Aquila chrysaetos*; CDFW-FP); coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); Tehachapi pocket mouse (*Perognathus alticolus inexpectatus*; DFW-SSC)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

SEA - San Andreas (Tehachapi Foothills); Natural Landscape Block - Oso Canyon

Local Policy or Ordinance for Biological Resources:

Los Angeles County General Plan - San Andreas Significant Ecological Area

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Brome grass grasslands [*Bromus rubens*-*Schismus (arabicus, barbatus)* Semi-Natural Herbaceous Stands];

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site TPK is located on a broad mountain top on Tejon Peak. Woody vegetation is dominated by canyon live oak in the canyons but mostly non-native grassland dominated by cheatgrass (*Bromus tectorum*) and red brome (*B. rubens*) with canyon live oak in the draws and canyons outside of the study area. The study area is within the foraging range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), and designated critical habitat is located just less than one mile north. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at construction sites. Several communication towers and facilities are present at and near the project site and few if any anti-perch devices have been installed on these

structures. The proposed developments include the addition of a new lattice tower that could be used as perches by condors. Coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC) may occur on-site and individuals could be killed by project activities. Tehachapi pocket mouse (*Perognathus alticolus inexpectatus*; CDFW-SSC) has been recorded within the project vicinity, with a few additional occurrences (historic and recent) in the Tehachapi Mountains. This is a very rare rodent known only from a few locations in a limited range. Its habitat includes native and non-native grasslands, and it constructs burrows in loose, sandy soils. The primary threat to the species is thought to be habitat fragmentation, though any type of surface disturbance may cause adverse impacts if the species is present. The elevation of the project site (4,885 feet) is within the elevation range for the species (3,500 to 6,000 feet). There are scattered small mammal burrows in the area; no species-specific surveys have been conducted; suitable habitat may be present in the study area. No aquatic or riparian habitat suitable for the yellow-blotched salamander (*Ensatina eschscholtzii croceator*; CDFW-SSC) occurs within the project area. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of California condors, Tehachapi pocket mouse, and coast horned lizard in the project area, and the importance of maintaining a clean construction site. A biological monitor will be present during construction; all trash and construction debris (especially small items such as nuts and washers) will be removed from site each day; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures:

- BIO MM 1 Mitigation Monitoring and Reporting Plan
- BIO MM 2 WEAP
- BIO MM 3 Biological Compliance Reporting
- BIO MM 4 Site Sanitation
- BIO MM 5 Hazardous Materials Management
- BIO MM 6 Anti-perch Devices
- BIO MM 7 California Condor Protection
- BIO MM 8 Biological Monitoring
- BIO MM 9 Protect Native Vegetation and Common Wildlife
- BIO MM 10 No Pets
- BIO MM 11 Site Access
- BIO MM 17 Raptor Protection
- BIO MM 18 Nesting Bird Protection
- BIO MM 19 Trenches and Holes Management
- BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Wildflower field, a sensitive natural community, is within 500 feet of the project site. No Valley Needlegrass Grassland was identified (no needlegrass was observed during the survey). Though the project area has been highly degraded and non-native grasses dominate, native species persist and elements of the wildflower fields are expected to emerge in spring.

Mitigation Measure(s):

Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Do not remove riparian trees. Stay on existing roads. Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental

Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 11 Site Access • BIO MM 19 Trenches and Holes Management • BIO MM 23 Prevent the Spread of Nonnative Vegetation

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Oso Canyon Natural Landscape Block which overlaps the ranges of approximately 266 amphibian, reptile, mammal and bird species. It is also located within the San Andreas (Portal Ridge-Liebre Mountain) Significant Ecological Area, which is identified as an important regional habitat linkage in the Los Angeles General Plan. This SEA is an important linkage between the Coastal Ranges, the San Gabriel Mountains, and the Tehachapi Mountains which also represent the only mountain linkage from the Transverse Ranges and the Coast ranges to the Sierra Nevada Range. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. Additionally, due to the nature of the project, impacts to wildlife movement would be minimal to none. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Construction at Site TPK could result in removal of vegetation and human disturbance at each site and therefore could result in conflict with the Los Angeles County General Plan's Policy C/NR 3.1, which calls for conservation and enhancement of ecological function diverse natural habitats and biological resources. The site contains an existing tower facility, related infrastructure, and access road along with disturbed native scrub vegetation. The current use at the site is communications facility, and substantive removal of native vegetation is not expected.

Construction and operations activities at the site do have the potential to impact biological resources, as described in Impact BIO 1 and Impact BIO 2. These impacts to resources conflict with Policy C/NR 3.1. Site TPK is an already disturbed site adjacent to at least nine other communication towers and is approximately 1 mile northeast of Interstate-5. It is also located at the far northwestern section of the almost 100,000-acre San Andreas Significant

Ecological Area (SEA). Its location at the convergence of the Coastal Ranges into the San Gabriel Mountains, Antelope Valley, and Tehachapi Mountains provides for an important wildlife corridor; however, due to its already developed nature, construction activities will not significantly impact migration corridors or wildlife linkages between metapopulations of species. Additionally, the site is dominated by nonnative grassland habitat which is not the pristine headwaters, riparian habitat, marshes and sinks, or diverse vegetation communities unique to this SEA. Because Site TPK is already a developed communication site, conflicts associated with Policy C/NR 3.8 are considered minor, and impacts associated with construction at the site would be less than significant. Proposed construction of Site TPK would have the potential to impact biological resources within the SEA, and design could potentially fail to prioritize avoidance of the most sensitive biological resources on site. As a result a conflict with Policy C/NR 3.9 would occur, resulting in a significant impact to biological resources identified in Impact BIO 1 and Impact BIO 2. Because a potential for significant impact associated with the resources protected by the Los Angeles County General Plan exists, this would constitute a significant impact.

Mitigation Measure(s):

The mitigation measures identified in Impact BIO 1 and Impact BIO 2 would reduce impacts from construction and operations to less than significant. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 4 Site Sanitation • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 13 Coastal California Gnatcatcher Breeding Season Protocol Surveys • BIO MM 14 Coastal California Gnatcatcher Breeding Season Restriction • BIO MM 15 Southwestern Willow Flycatcher Protection • BIO MM 16 Snowy Plover Protection • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Monarch Butterfly Protection • BIO MM 24 Prevent the Spread of Nonnative Vegetation • BIO MM 25 Special Status Plants Surveys and Protection

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Mesozoic granitic rocks, unit 3 (Sierra Nevada, Death Valley area, Northern Mojave Desert and Transverse Ranges)

Stability: Moderate pending geotechnical analysis

Soil Type: Walong-Rock outcrop-Edmundston-Anaverde Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line has been identified approximately 1.25 miles southwest of the property (Santa Susana) (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the

Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of well-drained sandy loam with medium to very rapid runoff and moderately rapid permeability. Moderate to steep slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: Less than Significant Impact

Discussion:

The potential for localized land spreading, subsidence, and/or collapse is Less than Significant due to the soil characteristics at the site. Factors that cause these hazards, including dissolution of limestone and mining are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse are not expected since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site TPK and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site TPK was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site TPK. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site TPK would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site TPK, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site TPK would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

Located in a Local Fire hazard Zone?: No

If yes, please explain: N/A

Located in a State Fire Hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Lahontan

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to

issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Rural

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Antelope Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing telecommunications structure and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

The proposed facilities at this site may be inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and the policy to protect areas that have significant natural resources. However, no physical impact would occur as a result of an inconsistency between the proposed project and the policy, and this is not considered a significant impact. As discussed in Sections 3.5 (geologic and soil hazards), Section 3.7 (fire hazards), Section 3.3 (biological effects), as well as in a site-by-site assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than

significant.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Golden State Frwy

Distance (Miles): 21.89

Disaster Route: Interstate 5

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Golden State Frwy

Distance (Miles): 1.25

Nearest Major Arterial: Ridge Route Rd

Distance (Miles): 3.83

Access to the Project Site Provided Via: Tejon Mountain Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Chiquita Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: TWR

Site Name: Tower Peak

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

The site is within the coastal zone within Catalina Island's interior on the north side, just south of Two Harbors. California's Coastal Act states that "The scenic and visual qualities of coastal areas shall be considered and protected as a resource of public importance. Permitted development shall be sited and designed to protect views to and along the ocean and scenic coastal areas, to minimize the alteration of natural land forms, to be visually compatible with the character of surrounding areas, and, where feasible, to restore and enhance visual quality in visually degraded areas. New development in highly scenic areas . . . shall be subordinate to the character of its setting." The site is located approximately 0.5 mile west of Little Harbor Road, the island's primary road, on top of a ridgeline. Vegetation is primarily low; none reaches above the site or obscures it. A 100-foot tall lattice tower exists on the site, which also includes a rectangular one-story shelter surrounded by a chain link fence. The surface is dirt and grass. The site would be in view of the Trans Catalina hiking trail to the south (Catalina Chamber n.d.). Sensitive viewers would be hikers and visitors traveling the primary road.

Visual Sensitivity: High

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: Yes, Santa Catalina Island Local Coastal Plan

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Trans-Catalina Trail

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is located on a ridgeline within view of some sections of the Trans Catalina Trail. The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new facilities would be located within a site that includes an existing lattice tower that already creates a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing tower, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with an existing structure would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. This would help protect views to and along the ocean and scenic coastal areas as called for within the coastal zone. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual

impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings are impacted by the presence of the existing tower. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site. Construction activities would result in minor and short term impacts to visual resources.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Cabins

Distance to Sensitive Receptor: 5316

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site TWR. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site TWR or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?**Construction Impact:** Significant Impact Reduced to Less than Significant with Mitigation Incorporated**Operational Impact:** Less than Significant**Discussion:**

Emissions from the construction of proposed site TWR would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site TWR will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and

verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site TWR would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for Nox and could result in cumulatively considerable net increases in O3 from the Nox emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, Nox emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site TWR or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site TWR, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site TWR, which is 5,316 feet from the nearest receptors, the LSTs for criteria pollutants are higher than the SCAQMD thresholds for NO_x, CO, PM_{2.5}, lower for PM₁₀ but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site TWR and were not assessed further.

According to the Consolidated Table of Office of Environmental Health Hazard Assessment (OEHHA)/ CARB Approved Risk Assessment Health Values, the potential cancer risk from the inhalation of DPM outweighs the potential noncancer health impacts (SCAQMD, 2015; SMAQMD, 2014); therefore, noncancer health impacts of DPM were not assessed further. In addition, the OEHHA Air Toxics Hot Spots Program Guidance Manual does not recommend assessing cancer risk from exposures to a 'maximally exposed individual resident' (sensitive receptor) from activities lasting less than two months, due to the uncertainty in assessing cancer risk from very short-term exposures (OEHHA, 2015).

As discussed in Appendix B, the maximum construction activity scenario assumed at each site would have a six week duration. Similarly, the duration of the monthly test and emergency operation of backup generators at each site would be sources of short-term exposure to sensitive receptors; therefore, further assessment of the potential cancer risk of the project construction and operation is not warranted.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site TWR in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site TWR and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T); groundfish (M&F-EFH)

Special Status Plants Recorded within 1 Mile:

beach spectaclepod (*Dithyrea maritima*; CA-T, 1B.1); California dissanthelium (*Dissanthelium californicum*; 1B.2); Catalina crossosoma (*Crossosoma californicum*; 1B.2); Catalina Island dudleya (*Dudleya virens* ssp. *Hassei*; 1B.2); Coulter's saltbush (*Atriplex coulteri*; 1B.2); decumbent goldenbush (*Isocoma menziesii* var. *decumbens*; 1B.2); Lyon's pentachaeta (*Pentachaeta lyonii*; ESA-E, CA-E, 1B.1); Nevin's woolly sunflower (*Constancea nevinii*; 1B.3); round-leaved filaree (*California macrophylla*; 1B.1); Santa Catalina figwort (*Scrophularia villosa*; 1B.2); Santa Catalina Island bedstraw (*Galium catalinense* ssp. *Catalinense*; 1B.2); Santa Catalina Island currant (*Ribes viburnifolium*; 1B.2); Santa Catalina Island ironwood (*Lyonothamnus floribundus* ssp. *Floribundus*; 1B.2); showy island snapdragon (*Gambelia speciosa*; 1B.2); Wiggins' cryptantha (*Cryptantha wigginsii*; 1B.2)

Sensitive Communities Recorded within 1 Mile:

None

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T); bald eagle (*Haliaeetus leucocephalus*; CA-E, CDFW-FP, USFS-S); groundfish (M&F-EFH); island rush-rose (*Crocianthemum greenei*; ESA-T, CNPS-1B.2); Lyon's pentachaeta (*Pentachaeta lyonii*; ESA-E, ESA-CH, CA-E, CNPS-1B.1); round-leaved filaree (*California macrophylla*; CNPS-1B.1); Santa Catalina Island bedstraw (*Galium catalinense* ssp. *Catalinense*; CNPS-1B.2); Wiggins' cryptantha (*Cryptantha wigginsii*; CNPS-1B.2)

Designated Critical Habitat Within 500 Feet:

groundfish (M&F-EFH)

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

Santa Catalina Island Open Space Easement; Coastal Resource Area (Proposed- Santa Catalina Island); SCAG Zoning - Wildlife Preserves and Sanctuaries;

Local Policy or Ordinance for Biological Resources:

Santa Catalina Island Local Coastal Program

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

California sagebrush scrub [*Artemisia californica* Shrubland Alliance]; Association - *Artemisia californica*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Site TWR is located on a hill top along a steep ridge in coastal sage scrub vegetation. Island oak (*Quercus pacifica*) trees are on north-facing slopes and into broad canyons below the project site. Coastal sage scrub on the dryer habitats is dominated by coast prickly pear (*Opuntia littoralis*), coastal sagebrush (*Artemisia californica*), and toyon (*Heteromeles arbutifolia*). Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T) may occur throughout the area. Bald eagles (*Haliaeetus leucocephalus*; CA-E, CDFW-FP, USFS-S) nest on Catalina island and may occur throughout the area; project activities are not in the vicinity of potential nest sites and do not interfere with foraging habitat along the coast line. Essential fish habitat has been designated for groundfish (a guild of bottom dwelling marine fishes) along the coastline approximately 1 mile from the project area; Site TWR is a mountain peak location at an elevation of about 1,200 feet and no project activities would impact marine environments. This upland site does not contain sand dune habitat for beach spectaclepod (*Dithyrea maritima*; ST, 1B.1). The site does not contain habitat for California dissanthelium (*Dissanthelium californicum* 1.2), Catalina crossosoma (*Crossosoma californicum*; 1B.2), and Catalina Island dudleya (*Dudleya virens ssp hasse* CNPS 1B.1). Crossosoma and dudleya are perennials and were not observed during the habitat assessment survey. Crossosoma grows in narrow, mesic canyons and north facing cliffs. The dudleya grows on shady coastal bluff cliffs. Site lacks the coastal bluffs, grasslands or alkaline clay soils habitat needed Coulter's saltbush (*Atriplex coulteri*; CNPS-1B.2). Habitat occurs on site for the island rush-rose (*Crocotanthemum greenei*; ESA-T, CNPS-1B.2) but overgrazing and the drought would remove any evidence of its occurrence; any project activities that would increase the footprint of the existing site may impact native vegetation and potentially the island rush-rose. Habitat for Lyon's pentachaeta (*Pentachaeta lyonii*; ESA-E, ESA-CH, CA-E, CNPS-1B.1) may occur in the study area and near the project site but overgrazing and drought would remove any evidence of its occurrence; there is a 2011 species occurrence record located about 1,200 feet from project site. No suitable granitic cliff habitat for Nevin's woolly sunflower (*Constancea nevinii*; CNPS-1B.3) occurs within the study area. Habitat for the round-leaved filaree (*California macrophylla*; CNPS-1B.1) occurs within the project area but overgrazing and the drought would remove any evidence of its occurrence. No suitable north facing slopes or mesic canyon habitat for Santa Catalina figwort (*Scrophularia villosa*; CNPS-1B.2) occurs within the study area. Rocky canyon habitat for Santa Catalina Island bedstraw (*Galium catalinense ssp. Catalinense*; CNPS-1B.2) may occur within the study area but overgrazing and the drought would remove any evidence of its occurrence. No mesic habitat for Santa Catalina Island currant (*Ribes viburnifolium*; CNPS-1B.2) is present within the study area. No habitat occurs within the study area for the Santa Catalina Island ironwood (*Lyonothamnus floribundus ssp. Floribundus*; CNPS-1B.2); this tree species was not observed during surveys. No suitable mesic canyon habitat for the showy island snapdragon (*Gambelia speciosa*; CNPS-1B.2) is within the study area. Potential habitat for Wiggins' cryptantha (*Cryptantha wigginsii*; CNPS-1B.2) occurs in the project area; the plant is difficult to distinguish from common species. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of Santa Catalina Island fox (*Urocyon littoralis catalinae*; ESA-E, CA-T) in the project area. Prior to initiation of construction activities, the site is to be inspected for the presence of fox dens; if a den is located no construction activities would be initiated and USFWS would be contacted no later than the next business day. Sites that may be used as hiding cover by a fox (e.g., open pipes, equipment piles) would be inspected prior to moving. Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys would verify if the island rush-rose (*Crocotanthemum greenei*; ESA-T, CNPS-1B.2), Lyon's pentachaeta (*Pentachaeta lyonii*; ESA-E, ESA-CH, CA-E, CNPS-1B.1), round-leaved filaree (*California macrophylla*; CNPS-1B.1), Santa Catalina Island bedstraw (*Galium catalinense ssp. Catalinense*; CNPS-1B.2), or Wiggins' cryptantha (*Cryptantha wigginsii*; CNPS-1B.2) is present; protect as necessary. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and

Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 20 Santa Catalina Island Fox Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is located within the Proposed Santa Catalina Island Coastal Resource Area. This CRA provides unobstructed wildlife movement throughout its open spaces mainly in drainages and along ridgelines and dirt roads. The SEA also protects core populations of sensitive plant, wildlife and plant communities such as island scrub oak woodland, wetlands and ironwood forest. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Construction at the proposed Project site may conflict with policies described in California Public Resources Code Section 30240, and with specific policies contained in the Santa Catalina Island Local Coastal Plan. Construction activities on site could potentially degrade habitat values (as discussed in Impact BIO 1) in Environmentally Sensitive Habitat Areas (ESHAs), which would in turn conflict with the California Public Resources Code that precludes these ESHA impacts, and thus conflict with the Santa Catalina Island Local Coastal Plan. These conflicts would be precluded by the measures identified in Impact BIO 1. Specifically identified within the Santa Catalina Island Local Coastal Plan: • Policy 3 of the plan prohibits introduction of non-native animals to Santa Catalina Island and workers bringing pets to the site could potentially create conflict, but application of BIO MM 10, No Pets would preclude these impacts. • Policy 11 requires procedures for grading and other site procedures to minimize erosion, but BMPs to be applied at every site are designed to prevent any erosion from the site. • Proliferation of non-native weeds (considered in Policy 20) would be precluded by application of BIO MM 24, Prevent the Spread of Non-native Vegetation. Impacts associated with construction would be less than significant with mitigation. Operational activities at the site would not alter habitats, and thus would not result in any substantive conflict with existing local policies or ordinances. Impacts would be less than significant.

Mitigation Measure(s):

Incorporation of mitigation measures identified at Impact BIO-1 and application of BIO MM 10 and BIO MM 24 would preclude impacts to sensitive species, thereby avoiding or reducing construction impacts, and in turn avoiding or reducing conflicts with the Santa Catalina Island Local Coastal Plan. This would be verified by application of LU MM 1, which would require the Authority obtain a coastal development permit prior to construction at the site. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 20 Santa Catalina Island Fox Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in October 2014. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Franciscan Complex, unit 2 (Southern California)

Stability: Moderate pending geotechnical analysis

Soil Type: Vallecitos-Thirst-Shoba Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of a well-drained stony silt to gravelly loam with medium to very rapid runoff and slow permeability. Moderate to steep slopes surround the site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site TWR and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site TWR was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site TWR. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site TWR would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site TWR, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site TWR would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: N/A

Located in a State Fire Hazard Zone?: Yes

If yes, please explain: Located within a designated 'Very High' zone

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to

issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: Santa Catalina Island Coastal Zone

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space

Zoning: Open Space

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Catalina Island Land Use Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposal for this site is to construct a new up to 180-foot-tall lattice tower on land within the Santa Catalina Island Coastal Zone. Existing communication facilities occur at the site. The Local Coastal Plan policies discourage the siting of facilities, such as communications facilities, in high-visibility locations. New development is to be attractively designed to protect highly scenic natural or historical areas. The proposed lattice tower, sited in close proximity to existing telecommunications facilities, helps to reduce impacts by consolidating similar facilities and would be designed in recognition of the recommended actions for new development to further reduce effects. Telecommunication facilities have previously been constructed at this site, demonstrating consistency with the LCP.

The final determination of consistency would be made by the agency responsible for issuing a Local Coastal Permit. If a permit is issued, operation and maintenance of the site would occur consistent with any applicable permit conditions. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan, and plan inconsistency is not considered a significant impact.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: Santa Catalina Island Local Coastal Plan

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: Yes

Other Recreational Area Names: Santa Catalina Island Open Space Easement

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: S Western Ave

Distance (Miles): 1.14

Disaster Route: Boat or airplane

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: Approximate 3.8 miles from the Catalina Airport runway

Nearest Highway/Freeway: No highway/freeway on Santa Catalina Island

Distance (Miles): 0

Nearest Major Arterial: W Paseo Del Mar

Distance (Miles): 21.81

Access to the Project Site Provided Via: Extension off of Banning House Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is not within 2 miles of a route identified in the local county Congestion Management Plan. While vehicles bringing materials, equipment, or workers to these Project sites may travel on a CMP route, use of these transportation routes would be dispersed and negligible. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site TWR is approximate 3.8 miles from the Catalina Airport runway. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered (in this case, proposed whip and microwave antennas mounted on a proposed 180-foot-tall lattice tower with an up to 15-foot-tall lightning rod), the TOWAIR tool indicates that the antenna structure is a “pass slope determination,” which indicates the structure would not interfere with takeoff and landing operations, and does not require Federal Aviation Administration (FAA) notification based on the structure height and distance from runways. No impacts to aviation flight safety are anticipated.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Pebbly Beach Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: VPK

Site Name: Verdugo Peak (County)

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose construction of up to 200 foot long x 4 foot high retaining wall. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

The site is on a hilltop and consists of two lattice towers and two one-story equipment shelter buildings of differing sizes enclosed by a chain link fence. Microwave dishes are attached to lattice towers. The site footprint is paved. Tall trees surround the site on all sides except the west. Land around the site is undeveloped and is vegetated with low chaparral shrubs and trees. A paved road provides access to the site. The existing lattice towers are the dominant vertical feature in the area.

Visual Sensitivity: Medium

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: Yes

If yes, enter recreation area name: Wildwood Canyon Park

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new facilities would be located within a site that includes lattice towers that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing towers, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings are impacted by the presence of existing towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site and its immediate surroundings. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 5327

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site VPK. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including Nox, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that Nox emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOX emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOX emissions limits. With implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or

obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site VPK or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site VPK would not exceed the SCAQMD daily significance thresholds including Nox, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of Nox from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site VPK will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100

pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site VPK would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for Nox and could result in cumulatively considerable net increases in O3 from the Nox emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site VPK or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NOx, CO, PM10, and PM2.5. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site VPK, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site VPK, which is 5,327 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 7 are higher than the SCAQMD thresholds for NOx, CO, PM2.5, lower for PM10 but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site VPK and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site VPK in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site VPK and all proposed Projects sites would

not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

City of Glendale General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Chamise chaparral [*Adenostoma fasciculatum* Shrubland Alliance]; Association - *Adenostoma fasciculatum*-*Eriogonum fasciculatum* shrubland.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site VPK is located on a hilltop in chaparral vegetation surrounded by steep slopes. The study areas considered to be outside the current range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), but as the condor population increases it is expected to expand geographically. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at developed sites. The vegetation is too dense to conduct a thorough botanical survey. However, two special status plants, Davidson's bush-mallow (*Malacothamnus davidsonii* CNPS 1B.2) and white rabbit-tobacco (*Pseudognaphalium leucocephalum*; 2B.2) have been recorded within 2 miles of the project site. Habitat for the white rabbit-tobacco is along streams; this habitat does not occur in the project area. Davidson's bush-mallow (*Malacothamnus davidsonii* CNPS 1B.2) is a perennial

and was not observed during the initial survey in September; however, the species was collected in the area and spring is the most appropriate season to survey for this species; suitable habitat may occur in the study area. American peregrine falcon (*Falco peregrinus anatum*; CDFW-FP) may pass through the study area while foraging, but the study area does not provide steep cliff habitat required for nesting. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

To address future use of the area by condors all trash and construction debris (especially small items such as nuts and washers) will be removed from the site; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. Conduct spring botanical surveys for Davidson's bush-mallow (*Malacothamnus davidsonii* CNPS 1B.2); if present mark the areas requiring special protection. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 12 Coastal California Gnatcatcher Protection • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes one Riverine wetland feature type as indicated by the National Wetland Inventory (USFWS 2014). However, this wetland type is restricted to ephemeral drainages. Construction activities would be limited to the Project site, and best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Verdugo Mountains Natural Landscape Block which overlaps the ranges of approximately 230 amphibian, reptile, mammal and bird species. This site is also located within the Verdugo Mountains Significant Ecological Area. This SEA provides for wildlife movement within large open spaces and within bottleneck areas where development occurs. It also provides for movement between areas outside the SEA towards the Angeles National Forest. The SEA does not specifically contain special status wildlife or plant species, it does contain restricted plant communities and the important wildlife corridors. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site VPK is located within the City of Glendale. Policy 1 of the Conservation Element of the City of Glendale General Plan (City of Glendale 1993) promotes the maintenance and restoration of natural resources. While native vegetation occurs in the study area of Site VPK, only disturbed vegetation and development occurs within the actual site boundary of the site. Ground disturbance at the site would not exceed 5,000 square feet, and substantive removal of native vegetation is not expected. As a result, any conflicts with the City of Glendale General Plan associated with construction activities at Site VPK would be minor and construction impacts at Site VPK would be less than significant. The proposed new antenna support structure at Site VPK increases the probability of a bird strike hazard, even if other towers are present. Workers accessing the site during operations for maintenance and repair activities would slightly increase the traffic count which could increase the potential to injure or kill wildlife. These operations impacts may occur to a few individual animals, however, without impacts at a landscape level. Due to the history of disturbance on these sites, the lack of protected species known to occur near the sites, and the minimal activity associated with maintenance and repair activities, operations associated the proposed project at Site VPK would have a less than significant impact on biological resources protected by the City of Glendale General Plan. Because the Authority is exercising intergovernmental immunity, the plan is not applicable and no conflict with the City of Glendale General Plan exists.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct or indirect areas of potential effects (APE). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Based on the absence of historical resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project

site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Mesozoic granitic rocks, unit 3 (Sierra Nevada, Death Valley area, Northern Mojave Desert and Transverse Ranges)

Stability: Moderate pending geotechnical analysis

Soil Type: Urban land-Lithic Xerorthents-Hambright-Castaic Association

Erosion Potential: Low

Expansive Soil: Low

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line has been identified approximately 1 mile north of the property (Santa Susana) (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils

reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of material ranging from well-drained very stony loam to silty clay loam with medium to very rapid runoff and moderate permeability. This soil type exhibits a well-drained, medium to very rapid runoff with slow permeability. Moderate slopes surround the site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site VPK and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site VPK was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site VPK. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site VPK would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site VPK, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site VPK would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: Yes

If yes, please explain: Yes, Very High Fire Severity Zone

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to

issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Glendale

General Plan Designation: Recreational/Open Space

Zoning: Special Recreation

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Glendale

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing telecommunications structure and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

The proposed facilities at this site may be inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and the policy to protect areas that have significant natural resources. However, no physical impact would occur as a result of an inconsistency between the proposed project and the policy, and this is not considered a significant impact. As discussed in Sections 3.5 (geologic and soil hazards), Section 3.7 (fire hazards), Section 3.3 (biological effects), as well as in a site-by-site assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than

significant.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Glendale

Applicable Noise Ordinance: Title 8 Health and Safety, Chapter 8.36 Noise Control

Noise Level Threshold: N/A; no construction from 7 pm to 7 am on weekdays, weekends and holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range

from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would

not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: Yes

Other Recreational Area Names: Henderson Canyon Open Space

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. Site VPK is within the Henderson Canyon Open Space. Open space, like public land under federal management, may be used for recreation, but may have large expanses of land with no areas specifically designated for a concentrated recreational use. Enhancements to the existing communication facilities would not change the recreational opportunities or recreational experience. The communication site itself would preclude recreation and be a long-term permanent impact, but adjacent lands could continue to support compatible recreational uses. There is existing access to the site, and the proposed action to further develop the site would not change access to recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Foothill Frwy

Distance (Miles): 0.13

Disaster Route: Highway 210/Foothills Freeway

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: Approximately 4.4 miles from the Bob Hope Airport runway

Nearest Highway/Freeway: Interstate 210

Distance (Miles): 1.14

Nearest Major Arterial: La Tuna Canyon Rd

Distance (Miles): 1.18

Access to the Project Site Provided Via: Extension off of Hostetter Fire Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site VPK is approximately 4.4 miles from the Bob Hope Airport runway. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered (in this case, proposed whip and microwave antennas mounted on a proposed 180-foot-tall lattice tower with an up to 15-foot-tall lightning rod), the TOWAIR tool indicates that the antenna structure is a "pass slope determination," which indicates the structure would not interfere with takeoff and landing operations, and does not require Federal Aviation Administration (FAA) notification based on the structure height and distance from runways. No impacts to aviation flight safety are anticipated.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: City of Burbank Landfill #3

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: CITY OF GLENDALE

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does not meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: WAD

Site Name: Walker Drive

Site Discussion:

Propose installation of up to 20 whip and up to 5 microwave antennas on existing 120 foot monopole to be extended up to 140 feet, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose construction of up to 200 foot long x 4 foot high retaining wall. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 150 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 8 foot diameter x 36 foot deep drilled caisson with concrete cap for monopole support; or up to 16 foot x 16 foot x 10 foot deep concrete mat foundation.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Surrounding area east of site

Site view looking west

Surrounding area west of site

Aesthetics

Setting

Visual Description:

This site consists of a large water tank, one-story pumping house, narrow lattice tower, 120-foot tall monopole, and three small equipment shelters enclosed by a chain link fence. The water tank is green with a white roof and located atop a dirt mound surrounded by deciduous trees enclosed by a black metal fence. The lattice tower and monopole are on a concrete pad immediately adjacent to the water tower. The site is located at the end of Walker Drive in a residential area. Another water tank is immediately adjacent to the site to the south and appears to be part of the same compound. This smaller water tank is sky blue and elevated on a dirt mound. Two residences abut the site boundary. Residences are single-family houses, typically one story and of various designs. The topography is hilly and varied, and the landscaping is mature and dense, including several tall trees of various species. Telephone poles line the narrow streets. Despite the height of the towers, they are only intermittently visible due to the topography and vegetation.

Visual Sensitivity: Low

On federally administered public lands: No

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located in a residential suburban setting. The proposed new facilities would not be located in an area defined as scenic vista.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new facilities would be compatible with the existing visual character and quality, which is low, and is surrounded primarily by residences. Despite extending the height of the existing tower, the tall trees that currently surround the site and the varying topography of the area would continue to obscure most of the site from view. Construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. The proposed Project facilities would be roof mounted or collocated and constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. No additional lighting would be required. This would not result in a substantial new source of day or nighttime light or glare that would adversely affect nighttime views of the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SSCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 160

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site WAD. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or

obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site WAD or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site WAD would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site WAD will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the

contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site WAD would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site WAD or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NOx, CO, PM10, and PM2.5. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site WAD, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site WAD, which is 160 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds for NOx, CO, lower for PM10, PM2.5 but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site WAD and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site WAD in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site WAD and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant

to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC); monarch butterfly (*Danaus plexippus*; ESA-Pet)

Special Status Plants Recorded within 1 Mile:

Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, 1B.1)

Sensitive Communities Recorded within 1 Mile:

California Walnut Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

monarch butterfly (*Danaus plexippus*; ESA-Pet); pallid bat - foraging (*Antrozous palidus*; CDFW-SSC); Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, 1B.1)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

None

Local Policy or Ordinance for Biological Resources:

City of Beverly Hills General Plan

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Ornamentals

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site WAD is located in the Hollywood Hills at an existing water tank/antenna location in a completely urbanized area that lacks native habitat for sensitive species. There is a steep cliff on one side of the project. It contains laurel sumac (*Malosma laurina*) and our lord's candle (*Yucca whipplei*). The lower portion of the cliff has been cemented to reduce erosion. The portion of the project area that is not developed is too steep to serve as habitat for the coast horned lizard (*Phrynosoma blainvillii*; CDFW-SSC). Monarch butterflies (*Danaus plexippus*; ESA-Pet) may migrate through the area, and may occasionally use the many tall ornamental trees within the project area for roosting. Though highly unlikely, habitat for Braunton's milk-vetch (*Astragalus brauntonii*; ESA-E, 1B.1) may be found within the project area on the steep slope below the water tanks; this location is too steep to effectively survey. No suitable habitat occurs within the project site. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities.

Mitigation Measure(s):

Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries so construction debris or soils are not deposited on the adjacent slope. Check trees for roosting monarch butterflies (*Danaus plexippus*; ESA-Pet) prior to construction activities. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 6 Anti-perch Devices (selected sites) • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 18 Nesting Bird Protection • BIO MM 22 Monarch Butterfly Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site. California Walnut Woodland does not occur within the survey area.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The City of West Hollywood General Plan includes an Infrastructure, Resources and Conservation Element. This element does not include measures specific to biological resources. The proposed project would not conflict with any biological policies outlined in the City of West Hollywood General Plan.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

There are no historical resources within the direct area of potential effects (APE). The WAD project area encompasses a large water tank, an existing 120-foot monopole and associated infrastructure features, all situated within the 1960s-era suburban neighborhood of Trousdale. Within the indirect APE there are eight properties recorded by the SurveyLA project (seven residences and one district). One of the residences is significant for its International-style architecture and six are significant for their mid-century modern architecture. All of the dwellings are situated at least 0.35 miles from the direct APE and beyond line-of-sight due to the intervening distance and rolling terrain, mature trees, and buildings. The eighth property (a district) is situated approximately 650 feet southeast of the direct APE and is a 100,000 square-foot facility (converted to a residence) that encompasses the former Lookout Mountain Air Force Station, which was built in 1941, but is significant for its Cold War-era missions. LMR activities at the WAD project location include attachment of whip and microwave antennas on a 120-foot monopole that is proposed to be extended to 140 feet; construction of a new equipment shelter; and installation of a new backup generator and fuel tank on a concrete pad. The status and condition of this project area were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Based on the extended height of the existing monopole, both the extension and additional antennas would become more visible to the surrounding historical resources and significant visual impacts would occur; however with implementation of mitigation measures (camouflage), impacts would be reduced to less than significant levels.

Mitigation Measure(s):

CUL MM 5 would be implemented at this project site. Architectural camouflage is required to minimize the visual effects of the proposed increase in the height of the monopole on identified historical resources within the indirect APE.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Mesozoic granitic rocks, unit 3 (Sierra Nevada, Death Valley area, Northern Mojave Desert and Transverse Ranges)

Stability: Moderate pending geotechnical investigation

Soil Type: Urban land-Rock outcrop-Millsholm Association

Erosion Potential: Low

Expansive Soil: Low

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: Yes

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). Antennas would be collocated to existing lattice structure, therefore a geotechnical study for new structures is not required. All structures in southern California are located within an area subject to seismic shaking. The UBC and CBC have specific design requirements to reduce or eliminate the effects of seismic shaking. Permitting processes are required to evaluate and mitigate other geologic hazards such as landslides prior to issuance of a building permit. Existing structures were built in accordance with current UBC and CBC at the time of construction. Therefore, the effects of seismic shaking or other geologic hazards would be less than significant.

Mitigation Measure(s):

None required.

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of a well-drained light clay loam with low to very high runoff and moderate permeability. Moderate to steep slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the City of Beverly Hills planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential liquefaction, or potential land subsidence area. The site does lie within a potential landslide zone area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking and evaluate the potential for landslides and appropriate measures to reduce and/or eliminate that hazard associated with landslides. GMED may require additional design requires such as retaining walls, buttresses, piles, or additional site grading to reduce the potential for landslide. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant for this site.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site WAD and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site WAD was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site WAD. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site WAD would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site WAD, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site WAD would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: West Hollywood Sheriff's Heliport

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage

Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: Yes

If yes, please explain: There is one permitted UST within a 1/4 miles of the proposed site. The UST is down gradient from the site.

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: Yes

If yes, please explain: LMR located in Very High Fire Severity Zone

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC

plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open

areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced, and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation would not be required at the site therefore dewatering would not be necessary. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If

runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Beverly Hills

General Plan Designation: Single Family Residential – Low Density

Zoning: One Family Residential Zone

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Beverly Hills

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing telecommunications structure and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

The proposed facilities at this site may be inconsistent with the Los Angeles County General Plan policy to avoid severe hazard areas, including geologic and fire hazards, and the policy to protect areas that have significant natural resources. However, no physical impact would occur as a result of an inconsistency between the proposed project and the policy, and this is not considered a significant impact. As discussed in Sections 3.5 (geologic and soil hazards), Section 3.7 (fire hazards), Section 3.3 (biological effects), as well as in a site-by-site assessment in Chapter 4, significant physical impacts to these resources would be mitigated to less than

significant.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Beverly Hills

Applicable Noise Ordinance: Title 5; Chapter 1; Article 2; Section 5

Noise Level Threshold: N/A; no construction from 6 pm to 8 am on weekdays and Saturdays or at any time on Sundays and holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: 25 feet

Ambient Noise Level: 55 dBA

Sensitive Noise Receiver 1: Single Family Residential Dwellings

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

Hourly average construction noise levels are anticipated to be approximately 89 dBA. The predicted noise levels represent the demolition phase which is anticipated to be the loudest construction phase. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site. However, in some instances, it may be necessary for construction activities to take place outside of these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The affected jurisdiction has not established a construction noise level threshold. Therefore, construction noise levels at the proposed Project site would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable"

community noise equivalent level (CNEL) developed by the California Department of Health Services was referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. Noise levels from both sources would be below the 60 dBA “normally acceptable” level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. Sensitive receivers (single-family dwellings) are located within 25 feet of Project site WAD; therefore, groundborne vibrational noise impacts would be significant.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings within this distance to the site; therefore, impacts from groundborne vibration would be less than significant.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. Therefore, extremely sensitive (fragile) buildings and sensitive receivers would not be exposed to excessive groundborne vibration or groundborne noise from Project operation and impacts would be less than significant.

Mitigation Measure(s):

NOI MM 1

Prior to commencement of construction at site WAD, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction vibration impacts. Such measures may include but are not limited to the following:

- Route heavily-loaded trucks away from residential streets, if possible, selecting streets with the fewest homes if no other alternatives are available.

- Operate earth moving equipment including excavators/mini excavators and dump trucks as far away from vibration-sensitive locations as possible.
- Phase demolition and earth-moving operations so as not to occur simultaneously. Total vibration could be significantly less when each vibration event occurs separately.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, the estimated noise level at 25 feet from proposed sites would be 89 dBA and not exceed the 90 dBA daytime criterion but would exceed the 80 dBA nighttime criterion; therefore, construction noise impacts for this Site would be significant.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds; therefore, impacts from operational noise would be less than significant.

Mitigation Measure(s):

NOI MM 2

• Prior to commencement of construction at Se WAD, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction noise impacts below the levels specified in FTA nighttime threshold. Such measures may include but are not limited to the following:

- Use noise blankets or other muffling devices on equipment and quiet-use generators at noise-sensitive receivers.
- Use well-maintained equipment and have equipment inspected regularly.
- Operate construction equipment for periods of fewer than 15 consecutive minutes when possible.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: Yes

Other Recreational Area Names: Los Angeles City Water Resources Parkland

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Santa Monica Blvd

Distance (Miles): 2.03

Disaster Route: Santa Monica Boulevard

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Hollywood Frwy

Distance (Miles): 1.62

Nearest Major Arterial: Mulholland Dr.

Distance (Miles): 0.68

Access to the Project Site Provided Via: Walker Drive

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. Construction-related traffic would be less than 1 percent of the average daily traffic in this area.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: City of Burbank Landfill #3

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: CITY OF BEVERLY HILLS

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Dewatering would not be required for building mount or collocation sites because groundwater is not expected at the shallow depths of excavation associated with this activity. Wastewater treatment plants in the project would not be affected during construction. During operations, the project would not result in the production of any wastewater that would require treatment.

Mitigation Measure(s):

None required.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: WMP

Site Name: Whitaker Middle Peak

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This isolated site is located adjacent to Whitaker Peak Road in Angeles National Forest on an undeveloped hilltop consisting of low grassy vegetation on all sides. The site includes a small, one-room one-story structure, lattice tower of unknown height, weather tower, and associated equipment (e.g., propane tank) enclosed by a chain link fence. This site is not visible from sensitive vantage points. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Developed Area. The site is also a USFS Designated Communication Site, which allows for such use on national forests except when identified as not suitable because of law, national or regional policy, or the revised forest plan (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Developed Area

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new facilities would be located within a site that includes a lattice tower that already creates a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing tower, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. The existing visual character and quality of the site and its surroundings are impacted by the presence of existing towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site and its immediate surroundings. There would be no change to the site's scenic attractiveness rating. In addition, the site is located on a USFS Designated Communication Site, which generally allows for such use within the area's landscape. Impacts to visual resources from construction activities would be minor and temporary.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SSCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 37113

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site WMP. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or

obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site WMP or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site WMP would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site WMP will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the

contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site WMP would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for Nox and could result in cumulatively considerable net increases in O3 from the Nox emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site WMP or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor Nox and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NOx, CO, PM10, and PM2.5. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site WMP, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site WMP, which is 37,113 feet from the nearest receptors, the LSTs for criteria pollutants are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site WMP and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site WMP in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site WMP and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

Southern Coast Live Oak Riparian Forest; Southern Sycamore Alder Riparian Woodland; Southern Willow Scrub; Valley Oak Woodland; California condor critical habitat (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP); California red-legged frog critical habitat (*Rana draytonii*; ESA-T, ESA-CH, CDFW-SSC)

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

California condor (*Gymnogyps californianus*; ESA-E, CA-E, CDFW-FP); California red-legged frog (*Rana draytonii*; ESA-T, ESA-CH, CDFW-SSC); slender mariposa-lily (*Calochortus clavatus* var. *gracilis* 1B.2)

Designated Critical Habitat Within 500 Feet:

California red-legged frog (*Rana draytonii*; ESA-T, ESA-CH, CDFW-SSC)

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

US Forest Service - Angeles National Forest; SCAG Zoning- Wildlife Preserves and Sanctuaries; Natural Landscape Block - Pine Mountain/Sespe Condor;

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

Bigberry manzanita chaparral [*Arctostaphylos glauca* Shrubland Alliance]; Association - *Arctostaphylos glauca*-*Adenostoma fasciculatum*.

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site WMP is located on a high peak along a ridgeline in the San Gabriel Mountains. Slopes are steep and the vegetation is primarily chamise chaparral. Diagnostic woody shrubs include chamise, manzanita, bush buckwheat and bush poppy (*Romneya coulterii*). The study area is within the foraging range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), and designated critical habitat is approximately 0.2-miles to the west. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at construction sites. Several communication towers and facilities are present at and near the

project site and few if any anti-perch devices have been installed on these structures. The proposed developments include the addition of a new lattice tower would could be used as perches by condors. The project site is within designated critical habitat for the California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC), critical habitat unit VEN-2 (Piru Creek). Though the project site is located on a steep mountain peak and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. On-site construction activities and travel on the long, unimproved access road could impact frogs, if present. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP); and California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) in the project area and along the length of the access road. A biological monitor will be present during construction; all trash and construction debris (especially small items such as nuts and washers) will be removed from site each day; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. To protect dispersing California red-legged frog, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measurable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project area. Valley Oak Woodland was not observed in the project area. Site WMP is within and hydrologically connected to stream habitats that include California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) critical habitat.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Pine Mountains/Sespe Condor Natural Landscape Block which overlaps the ranges of approximately 246 amphibian, reptile, mammal and bird species. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes,

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant. There are no other historical resources within the direct or indirect APEs. The WMP project location encompasses an existing communications site, that includes a lattice tower, equipment shelter, and associated infrastructure features situated on a heavily disturbed area with patchy vegetation, all secured by a chain-link fence. The only other structures within the indirect APE are associated with an adjacent communications site (approximately 370 feet southwest of the direct APE); the remainder of the indirect APE encompasses undeveloped mountainous terrain. LMR activities at this project location include the attachment of whip and microwave antennas on a proposed 100-foot lattice tower, construction of a new equipment shelter, and installation of a new backup generator and fuel tank on a concrete pad. The status and conditions at this project location were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Given the nature of the project site and the identified resource, impacts

from project activities would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any uniquely definable features associated resource features at this proposed project site, impacts would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Mesozoic granitic rocks, unit 3 (Sierra Nevada, Death Valley area, Northern Mojave Desert and Transverse Ranges)

Stability: Moderate pending geotechnical analysis

Soil Type: Vista-Cieneba-Andregg Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line has been identified approximately 1.25 miles northeast of the property (Santa Susana) (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the

Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of a well-drained gravelly to coarse sandy loam with slow to rapid runoff and moderately rapid permeability. Moderate to steep slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site WMP and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site WMP was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site WMP. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site WMP would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site WMP, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site WMP would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to

issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Developed Area Interface

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Clarita Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health,

watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as in the Developed Area Interface. The Developed Area Interface zone includes areas adjacent to communities or concentrated use areas and developed sites with more scattered or isolated community infrastructure. The level of human use and infrastructure is typically higher than in other zones, and the level of development varies between areas that are highly developed to areas where no development has occurred. Although this zone may have a broad range of higher intensity uses, the management intent is to limit development to a slow increase of carefully designed facilities to help direct use into the most suitable areas and concentrating on improving facilities before developing new ones (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. No land use impacts are anticipated because of the communications site designation, but new development will still require a permitting process prior to construction.

Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Developed Area Interface land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. Whitaker Ridge is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Golden State Frwy

Distance (Miles): 0.63

Disaster Route: Interstate 5

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Golden State Frwy

Distance (Miles): 2.03

Nearest Major Arterial: Sloan Canyon Rd

Distance (Miles): 8.32

Access to the Project Site Provided Via: Extension off of Whitaker Peak Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Chiquita Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: WS1

Site Name: 100 Wilshire

Site Discussion:

Propose installation of up to 25 whip and up to 7 microwave antennas on roof top of existing building without exceeding current overall height of the structure including appurtenances. Propose indoor equipment racks to be located in room in existing building, or in a new up to 600 square foot shelter on building roof, or up to 600 square foot shelter on adjacent grounds (prefab or CMU). Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank adjacent to the building.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 100 cubic yards removed

Proposed trenching for underground conduits to accommodate power and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide

Proposed foundations include:

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This site is within the coastal zone on a high-rise (320 feet) office building in a highly developed urban area within the City of Santa Monica along Ocean Boulevard, a 5-lane road that fronts the ocean and Palisades Park. Palisades Park is a slender, 26-acre park with “breathtaking views of the Bay,” which stretches from Palos Verdes Peninsula to Malibu (SMMC 2014). The Pacific Coast Highway (PCH) (State Route 1) parallels Ocean Boulevard approximately 200 feet from the building adjacent to Santa Monica State Beach. This highway is also approximately 20 to 30 feet below the office buildings, which are blocked from view by a vertical cut slope. The PCH is a major north-south state highway that travels most of the Pacific coastline in California. The PCH is a designated “All-American Road” and is among the nation's most scenic. Views to the southwest are of the ocean, interrupted by occasional palm trees and other deciduous landscaping located within a greenbelt that parallels the beachfront. Similarly tall buildings exist in the vicinity, although this structure is one of the tallest, blocking ocean views for structures behind it. Views to the northwest and southeast are of the boulevard with similar vegetation and structures, such as hotels. Views to the northeast are of the city, consisting of restaurants, hotels, and retail and office buildings. Sensitive viewers are highway travelers and visitors to downtown.

Visual Sensitivity: High

On federally administered public lands: No

If yes, enter applicable ratings: N/A

If yes, enter name of scenic corridor: Pacific Coast Highway

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is located in a commercial urban setting on the rooftop a high-rise (320 feet) modern office building that is surrounded by other high-rise buildings and other modern buildings of varying heights. Microwave and whip antennas would be mounted to the existing penthouse exterior walls. The new antennas would not be of sufficient size to have a substantial adverse effect on a scenic vista, including views from Pacific Coast Highway, some of which would be blocked by the steep cut banks along the road in this area. Associated equipment would be housed inside the existing buildings. The low level of impact would help protect views to and along the ocean and scenic coastal areas as called for within the coastal zone. Construction impacts would be limited to trucks transporting personnel, materials, and tools to the building. Equipment, materials, and tools would be hand-carried to the roof using freight elevators. A helicopter would be used to deliver materials to the rooftop if necessary. This short-term impact would not affect scenic vistas given the height of the building and temporary nature of the delivery.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is located in a commercial urban setting on a high-rise (320 feet) modern office building that is surrounded by other high-rise buildings. No scenic resources (trees, rock outcroppings) exist on the rooftop and no historic buildings are present. There would be no alteration of natural forms.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Antennas of similar height already exist on the rooftop, and are not visible from ground level given the height of the building. Similarly, the new antennas would also be obscured from view, and would be compatible with the visual character of the existing site and the commercial setting. The same construction activities described for scenic vistas, described above, would also apply, with only possible temporary disruption due to helicopter delivery of materials.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. The site is in an urban area. The proposed Project facilities would be roof mounted or collocated and constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. No additional lighting would be required. This would not result in a substantial new source of day or nighttime light or glare that would adversely affect nighttime views of the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SSCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Hotel

Distance to Sensitive Receptor: 99

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site WS1. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site WS1 or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?**Construction Impact:** Significant Impact Reduced to Less than Significant with Mitigation Incorporated**Operational Impact:** Less than Significant**Discussion:**

Emissions from the construction of proposed site WS1 would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site WS1 will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100

pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site WS1 would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site WS1 or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NO_x, CO, PM₁₀, and PM_{2.5}. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site WS1, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site WS1, which is 99 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds for NO_x, CO, lower for PM₁₀, PM_{2.5} but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site WS1 and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site WS1 in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site WS1 and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly

trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

bank swallow (*Riparia riparia*; CA-T); least Bell's vireo (*Vireo bellii pusillus*; ESA-E, CA-E); monarch butterfly (*Danaus plexippus*; ESA-Pet); Swainson's hawk (*Buteo swainsoni*; CA-T); two-striped garter snake (*Thamnophis hammondi*; CDFW-SSC); western mastiff bat (*Eumops perotis californicus*; CDFW-SSC); groundfish (M&F-EFH)

Special Status Plants Recorded within 1 Mile:

beach spectaclepod (*Dithyrea maritima*; CA-T, 1B.1); coastal dunes milk-vetch (*Astragalus tener* var. *titi*; ESA-E, CA-E, 1B.1); Parish's brittlescale (*Atriplex parishii*; 1B.1); salt marsh bird's-beak (*Chloropyron maritimum* ssp. *Maritimum*; ESA-E, CA-E, 1B.2); Salt Spring checkerbloom (*Sidalcea neomexicana*; 2B.2); southern tarplant (*Centromadia parryi* ssp. *Australis*; 1B.1); Ventura Marsh milk-vetch (*Astragalus pycnostachyus* var. *lanosissimus*; ESA-E, CA-E, 1B.1)

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site WS1 is located in a completely urbanized area and does not contain native vegetation or natural habitats. Coastal beaches, intensively used by recreationists, are within 0.1-miles on the opposite side of the Pacific Coast Highway. Proposed construction is on the roof of a high-rise building separated from coastal beaches by Pacific Coast Highway. Landscape vegetation occurs within the 500-foot diameter project area between Ocean Avenue and the Pacific Coast Highway. No habitats of any special status plant or wildlife species are present. Western snowy plover (*Charadrius alexandrinus nivosus*; ESA-T; CDFW-SSC) designated critical habitat is associated with

beaches on the opposite side of the Pacific Coast Highway approximately 0.5-miles to the northwest. No suitable habitat or designated critical habitat in the project area. Essential fish habitat has been designated for groundfish (a guild of bottom dwelling marine fishes) along the coastline approximately 0.25-miles from the project site; no project activities will impact marine environments. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities.

Mitigation Measure(s):

None required.

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project area includes one Estuarine and Marine wetland feature type as indicated by the National Wetland Inventory (USFWS 2014). However, this wetland type is located at the Santa Monica State Beach. However, construction activities would be limited to the project site which is isolated from these drainages by the Pacific Coast Highway, urban storm water management, and that construction activities would be on the roof of a high-rise building.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The City of Santa Monica General Plan includes a Conservation Element adopted in 1975. This element does not include measures specific to biological resources. The proposed project would not conflict with any biological policies outlined in the City of Santa Monica General Plan.

Mitigation Measure(s):

None required.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: No

Architectural: Yes

Native American: No

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

Yes

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources within the direct area of potential effects (APE). This project location encompasses the rooftop area of 100 Wilshire Boulevard, a 300-foot-tall office building that was completed in 1971. The rooftop area consists of a recessed equipment penthouse with numerous communications antennas already affixed, a variety of infrastructure items, and numerous other standalone cameras and communications equipment. Within the indirect APE, there are approximately 275 recorded resources, some of which are individually eligible historical resources and historic districts. LMR activities proposed for this project location solely involve the placement of indoor equipment within an existing equipment room of the rooftop penthouse and attaching whip and microwave antennas to the façade of the existing equipment penthouse. No ground disturbance or other equipment is proposed. At ground level, the closest of the historical resources to the building at 100 Wilshire Boulevard are Resource No. P-19-178135, a historic district (Central Business District), which is approximately 300 feet to the northwest; Resource No. P-19-188768, the 3rd St. Promenade, which is approximately 500 feet to the northeast; and Resource No. P-19-177901, 1333 Ocean Avenue, which is approximately 900 feet to the southeast. This was confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Given the height of this building and the array of existing antennas, the proposed additional antennas would not be visible from the ground level or introduce out-of-character visual elements at this location; therefore there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no historical resources (archaeological) within the direct or indirect areas of potential effects (APEs); therefore, the project would not cause a substantial adverse change in an archaeological resource. Based on the absence of historical resources (archaeological), there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The area is mapped as Quaternary older alluvium, which has a moderate potential for significant vertebrate fossils from the late Pleistocene. No localities are recorded within the proposed site; however, vertebrate fossil localities have been recorded from this geologic unit in the vicinity. Recovered fossils include extinct lion collected from a depth of six feet and specimens of extinct horse and ground sloth from depths of 11 feet. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Paleontological monitoring will be undertaken during excavation into the Quaternary older alluvium to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Quaternary alluvium and marine deposits

Stability: Moderate

Soil Type: Urban land-Sorrento-Hanford Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: No

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line has been identified approximately 1.5 miles northwest of the property (Santa Susana) (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). Antennas would be located on the roof of the existing building, therefore a geotechnical study for new structures is not required. All structures in southern California are located within an area subject to seismic shaking. The UBC and CBC have specific design requirements to reduce or eliminate the effects of seismic shaking. Permitting processes are required to evaluate and mitigate other geologic hazards such as landslides prior to issuance of a building permit. Existing structures were built in accordance with

current UBC and CBC at the time of construction. Therefore, the effects of seismic shaking or liquefaction would be less than significant.

Mitigation Measure(s):

None required.

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of well-drained fine sandy loam with negligible to low runoff and moderately rapid permeability. The site is located on flat grade in an urban environment. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the City of Santa Monica planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing storm drains inlets.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located in an urban area and antenna are to be located at the roof of existing building. No new structures would be built to support the antenna. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site WS1 and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site WS1 was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site WS1. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site WS1 would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site WS1, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site WS1 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: Yes

If yes, please explain: LMR Site is within 1/4 mile of 1 permitted UST

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: No

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The project site is not within a designated Fire Hazard Severity Zone.

Mitigation Measure(s):

None required.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No *Note: Flood Inundation Area 240 feet southwest of proposed location

Groundwater Basin: Coastal Plain Of Los Angeles

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation would not be required at the site therefore dewatering would not be necessary. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If

runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: City of Santa Monica Coastal Zone

Is the site located within a Airport Land Use Plan area?: No, but the site is approximately 13,100 feet from Santa Monica Municipal Airport

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Santa Monica

General Plan Designation: OSD (unknown)

Zoning: Residential-Visitor Serving Commercial District

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

None identified

Comprehensive Plan or General Plan Local Agency: Santa Monica

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site involves mounting antennas on an existing telecommunications structure and would not convert land for a new purpose. No conflict with city planning documents, policies, or zoning ordinances was identified.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Santa Monica

Applicable Noise Ordinance: Article 4 Public Welfare, Morals, and Policy, Chapter 4.12 Noise

Noise Level Threshold: 70 dBA from 10 pm to 7 am and 80 dBA from 7 am to 10 pm; no construction from 6 pm to 8 am on weekdays, 5 pm to 9 am on Saturdays, or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: Santa Monica Municipal Airport

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: 25 feet

Ambient Noise Level: 60 dBA

Sensitive Noise Receiver 1: hotel with roof top pool

Sensitive Noise Receiver 2: First Presbyterian Church

Sensitive Noise Receiver 3: recreation area

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

Hourly average construction noise levels are anticipated to be approximately 89 dBA. The predicted noise levels represent the demolition phase which is anticipated to be the loudest construction phase. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site. However, in some instances, it may be necessary for construction activities to take place outside of these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The affected jurisdiction has not established a construction noise level threshold. Therefore, construction noise levels at the proposed Project site would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable"

community noise equivalent level (CNEL) developed by the California Department of Health Services was referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. Noise levels from both sources would be below the 60 dBA “normally acceptable” level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. A sensitive receiver (hotel) is located within 25 feet of Project site WS1; therefore, groundborne vibrational noise impacts would be significant.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings or sensitive receivers within this distance to the site; therefore, impacts from groundborne vibration would be less than significant.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. Therefore, extremely sensitive (fragile) buildings and sensitive receivers would not be exposed to excessive groundborne vibration or groundborne noise from Project operation and impacts would be less than significant.

Mitigation Measure(s):

NOI MM 1

Prior to commencement of construction at site WS1, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction vibration impacts. Such measures may include but are not limited to the following:

- Route heavily-loaded trucks away from residential streets, if possible, selecting streets with the fewest homes if no other alternatives are available.

- Operate earth moving equipment including excavators/mini excavators and dump trucks as far away from vibration-sensitive locations as possible.
- Phase demolition and earth-moving operations so as not to occur simultaneously. Total vibration could be significantly less when each vibration event occurs separately.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The ambient noise level at this site was estimated to be 60 dBA. This value represents a daily average while the construction noise levels would be temporary and intermittent.

The City of Santa Monica ordinance sets a maximum 20 Dba temporary increase above maximum exterior noise standards, which are defined during weekdays as 60 Dba for a fifteen-minute duration during daytime hours (7 a.m. To 10 p.m.) and 50 Dba for a fifteen-minute duration during nighttime hours (10 p.m. To 7 a.m.) for construction activities. The City also prohibits weekday construction after 6 p.m. And before 8 a.m.

The highest noise levels estimated at receivers located within 25 feet of proposed sites would be 89 Dba during the demolition phase of construction. Within the City of Santa Monica jurisdiction, the closest ground-level receiver, a church, is located within 55 feet of the proposed Project site WS1. A hotel is located within 25 feet of the proposed site but the nearest sensitive receiver at the hotel is a rooftop pool, which is further away than the church. Temporary short duration daytime noise exposure at the church during the demolition construction phase would be 82 Dba, which would be higher than 20 Dba above allowable short duration daytime and nighttime thresholds; therefore, construction of the project would result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project and impacts in the City of Santa Monica would be significant absent mitigation.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds; therefore, impacts from operational noise would be less than significant.

Mitigation Measure(s):

NOI MM 2

Prior to commencement of construction at site WS1, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction noise impacts below the levels specified in the City of Santa Monica noise ordinance. Such measures may include but are not limited to the following:

- Use noise blankets or other muffling devices on equipment and quiet-use generators at noise-sensitive receivers.
- Use well-maintained equipment and have equipment inspected regularly.
- Operate construction equipment for periods of fewer than 15 consecutive minutes when possible.

NOI MM 3

Prior to commencement of construction at any site with an applicable noise ordinance where construction activities are necessary outside the specified hours in the ordinance, the Authority shall apply for and obtain variances from the agency with jurisdiction at that site.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

This site is located within two miles of a public airport (Santa Monica Airport), but outside of the 65 dBA CNEL developed by the airport land use plan. Estimated construction noise levels for all other proposed Project sites would be below the 90-dBA FTA threshold where adverse community reaction could occur during daytime hours but would exceed the 80-dBA nighttime threshold. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, this proposed Project location is not located in a jurisdiction with a noise ordinance that is applicable to the Authority. Therefore, it is anticipated that construction of this site would not expose people to excessive noise levels. Impacts from construction of the Project would be less than significant.

After construction, this site will be unmanned during operation except for occupational maintenance, which would include landscaping maintenance, routine site inspections, and occasional equipment repairs. Noise from maintenance activities, which includes an estimated 58 dBA at 21 feet during the monthly backup generator during testing, would not be substantially different from existing levels, except for new sites in rural locations, where ambient noise levels would be closer to 45 dBA, and would generally occur less than once per week during daytime hours between 8:00 a.m. and 6:00 p.m. on weekdays and 9:00 a.m. and 5 p.m. on Saturdays, consistent with the City of Santa Monica noise ordinance. Operation of the Project, including the HVAC system and emergency generator, would result in noise emissions below 60 dBA and would be considered “normally acceptable” for outdoor residential exposure. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels. Impacts from operation of the Project would be less than significant.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: City of Santa Monica Coastal Program, Land Use Plan

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Wilshire Blvd

Distance (Miles): 0

Disaster Route: Wilshire Boulevard or Highway 1/Pacific Coast Highway

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: Approximately 13,100 feet from the Santa Monica Municipal Airport runway

Nearest Highway/Freeway: Santa Monica Frwy

Distance (Miles): 0.04

Nearest Major Arterial: Wilshire Blvd

Distance (Miles): 0

Access to the Project Site Provided Via: Wilshire Boulevard

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In this urbanized area, this construction-related traffic would be less than one-quarter of a percent of the average daily traffic.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site WS1 is approximately 13,100 feet from the Santa Monica Municipal Airport runway. The Federal Communications Commission (FCC) landing slope facility calculator (TOWAIR on-line tool) allows antenna structure owners to determine whether their structures are close enough to an airport or heliport to require an aeronautical study by the Federal Aviation Administration (FAA) and registration with the FCC. Based on the data entered for Site WS1, the TOWAIR tool indicates that the antenna structure (in this case, antennas mounted on the roof of an existing building) meets the 6.10-meter (20-foot) rule criteria. This means that FAA notification is not required if the antenna structure is 6.10 meters (20 feet) or less in height, unless the antenna structure would increase the height of another antenna structure. No impacts to aviation flight safety are anticipated.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day at each site, and typically would be less than 1 percent of average daily traffic on nearby streets. Construction-related activities may require lane narrowing at a driveway or detours in the parking lots of existing facilities. These actions could temporarily impair access on adjacent roadways, potentially creating traffic hazards and limiting emergency access, resulting in a significant impact. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

TRANS MM 1: The construction contractor shall maintain a minimum of one open lane of traffic at all site access roads during project construction. Use of standard construction traffic control practices such as flagmen, warning signs, and other measures shall be implemented as necessary to ensure that traffic flow remains uninterrupted at all times.

TRANS MM 2: Any temporary road or lane closures that may affect state highways shall be coordinated with Caltrans prior to commencement of construction at the site that will require the road or lane closures. If construction requires temporary road or lane closures on roads and streets managed by local entities, a traffic management plan shall be prepared and submitted to the relevant county and/or city public works department or other appropriate department for approval prior to commencement of construction at the site. Encroachment permits would be obtained where applicable.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: CITY OF SANTA MONICA

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Dewatering would not be required for building mount or collocation sites because groundwater is not expected at the shallow depths of excavation associated with this activity. Wastewater treatment plants in the project would not be affected during construction. During operations, the project would not result in the production of any wastewater that would require treatment.

Mitigation Measure(s):

None required.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: WTR

Site Name: Whittaker Ridge

Site Discussion:

Propose installation of up to 40 whip and up to 9 microwave antennas on new lattice tower up to 180 feet tall, with additional up to 15 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 4,000 square feet

Excavation: Up to 600 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 36 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 50 foot x 50 foot x 5 foot concrete slab with up to 10 foot deep x 3 foot diameter concrete piers for tower foundation; or pier foundation consisting of up to 6 foot diameter x up to 70 foot deep concrete piers under each leg.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

This site is located in Angeles National Forest on Whitaker Ridge Road on an undeveloped hilltop consisting of low grassy vegetation on all sides. The site includes a small, one-room one-story structure and a lattice tower enclosed by a chain link fence. The existing tower is visible from 8-lane Highway 5/183 to the east. The view from the highway is dominated by the roadway corridor and primarily undeveloped ridge tops covered with chaparral vegetation. The USFS has designated this area as having a high (unaltered) scenic integrity objective (SIO). Minor under-achievement of SIOs is allowed with Forest Supervisor approval at the project level. Temporary drops of SIO levels would occur during and immediately following project implementation (USFS 2005a, b). The USFS has designated the Scenic Attractiveness Classes (SAC), which is the scenic importance of a landscape based on human perceptions of intrinsic beauty, for this area as B. SAC B is considered typical; 74% of Angeles National Forest is rated B (USFS 1995). The USFS zone for this area is Developed Area. The site is also a USFS Designated Communication Site, which allows for such use on national forests except when identified as not suitable because of law, national or regional policy, or the revised forest plan (USFS n.d.1).

Visual Sensitivity: High

On federally administered public lands: Yes, U.S. Forest Service

If yes, enter applicable ratings: High SIO/SAC B; Developed Area

Within the California coastal zone boundary: No

Adjacent to designated scenic highway or regional trail system: No

If yes, enter name of scenic corridor: N/A

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the proposed new facilities would be located within a site that includes a lattice tower that already creates a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing tower, which would attenuate the noticeability of new structures. In addition, locating the new tower and equipment with existing structures would concentrate the impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. Because of its location on a ridge top, the new facilities would not block or remove views of the scenic vista; rather, they would become part of them. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No impact would occur because the proposed project site is not within a scenic highway corridor, and no scenic resources would be substantially damaged.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing scenic attractiveness for this site is designated B, which is considered typical. The existing visual character and quality of the site and its surroundings are impacted by the presence of existing towers. Although the new lattice tower and associated equipment would contrast and be incompatible with the visual character of the surrounding landscape, they would be compatible with the existing site and its immediate surroundings. There would be no change to the site's scenic attractiveness rating. In addition, the site is located on a USFS Designated Communication Site, which generally allows for such use within the area's landscape. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in a rural/remote area. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. Sites located in more rural areas with less development experience light intrusions from occasional vehicle headlights, rural residences and buildings, and distant city lights. Sites located in more remote areas experience light intrusions from overhead airplane lights, occasional vehicle headlights, and sky glow from distant urban areas. Tower lighting is intended to be visible to pilots for purposes of aircraft operations safety, and would not result in illumination of areas not currently illuminated. Based on the nature of tower safety lighting (LED white or red solid or blinking lights), it would not introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO2

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SSCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Single family home

Distance to Sensitive Receptor: 9519

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site WTR. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOx emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOx emissions limits. With

implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant. Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site WTR or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?**Construction Impact:** Significant Impact Reduced to Less than Significant with Mitigation Incorporated**Operational Impact:** Less than Significant**Discussion:**

Emissions from the construction of proposed site WTR would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site WTR will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the

contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site WTR would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site WTR or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NOx, CO, PM10, and PM2.5. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site WTR, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site WTR, which is 9,519 feet from the nearest receptors, the LSTs for criteria pollutants are higher than the SCAQMD thresholds for Nox, CO, lower for PM10, PM2.5 but still above the estimated daily emissions from daily construction and operational activities. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site WTR and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site WTR in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site WTR and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators

and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

No mitigation measures are required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC)

Special Status Plants Recorded within 1 Mile:

slender mariposa-lily (*Calochortus clavatus* var. *gracilis*; 1B.2)

Sensitive Communities Recorded within 1 Mile:

Southern Coast Live Oak Riparian Forest; Southern Sycamore Alder Riparian Woodland; Southern Willow Scrub; Valley Oak Woodland

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP); California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC); slender mariposa-lily (*Calochortus clavatus* var. *gracilis*; 1B.2)

Designated Critical Habitat Within 500 Feet:

None

Riparian Habitat Within 500 Feet:

None

Indicators of Waters of the US Within 500 Feet:

None

Wildlife Corridor or Nursery Site:

US Forest Service - Angeles National Forest; SCAG Zoning- Wildlife Preserves and Sanctuaries; Natural Landscape Block - Pine Mountain/Sespe Condor;

Local Policy or Ordinance for Biological Resources:

Biological resources are managed under the Angeles National Forest Land Management Plan.

Applicable HCP or NCCP:

None

Dominant Vegetation Community:

California buckwheat scrub [*Eriogonum fasciculatum* Shrubland Alliance].

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Discussion:

Site WTR is located at a high point along Whitaker Ridge in the Santa Monica Mountains. The site contains chamise chaparral on the north-facing slopes and coastal sage scrub on the south-facing slopes. The study area is within the foraging range of the California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP), and designated critical habitat is approximately 1.5-miles to the west. Condors will perch on tall man-made structures, which can contribute to the bird's habituation to human presence; condors may consume "micro-trash" items (e.g., screws, washers, glass, brightly colored objects) often found at construction sites. Several communication towers and facilities are present at and near the project site and few if any anti-perch devices have been installed on these structures. The proposed developments include the addition of a new lattice tower would could be used

as perches by condors. California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) critical habitat is 1.5 miles southwest (critical habitat unit VEN-2, Piru Creek). Though the construction site is located on a steep mountain peak and no aquatic/riparian habitat occurs in the project area, frogs have been reported to disperse overland, regardless of topography, distances of up to 2 miles during rainy periods. On-site construction activities and travel on the long, unimproved access road could impact frogs if present. The site contains potential habitat slender mariposa-lily (*Calochortus clavatus* var. *gracilis*; 1B.2). Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities. New lattice tower that may require lighting presents collision hazard for migratory birds; construction and design of the tower meets guidelines of USFWS Office of Migratory Birds.

Mitigation Measure(s):

Construction crews are to participate in environmental awareness instruction and be informed of the possible presence of slender mariposa-lily (*Calochortus clavatus* var. *gracilis*; 1B.2) and California condor (*Gymnogyps californianus*; ESA-E, ESA-CH, CA-E, CDFW-FP); and California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) in the project area and along access roads. A biological monitor will be present during construction; all trash and construction debris (especially small items such as nuts and washers) will be removed from site each day; anti-perch devices would be affixed to any elevated, horizontal structures suitable for perching by raptors, ravens, vultures, or other large birds; all workers shall avoid any interaction with condors and shall immediately stop work if condors are present in the project area; the contractor shall prepare plans and implement spill containment measures; all wires, cables, and other items that could entangle a condor are to be securely fastened down or removed from site. To protect dispersing California red-legged frog, no on-site construction activities, or construction-related travel on access roads will occur during the night or during rainy periods (within 24 hours of a measurable [0.01 inch] precipitation event, or within 48 hours of a major [0.1 inch] precipitation event). Manage trenches so as not to trap wildlife. Minimize disturbance to natural vegetation; prior to construction, mark the construction disturbance limits and monitor for adherence to these boundaries. Stay on existing roads. Conduct spring botanical surveys for mariposa lily; if present mark the areas requiring special protection. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 4 Site Sanitation • BIO MM 5 Hazardous Materials Management • BIO MM 6 Anti-perch Devices • BIO MM 7 California Condor Protection • BIO MM 8 Biological Monitoring • BIO MM 9 Protect Native Vegetation and Common Wildlife • BIO MM 10 No Pets • BIO MM 11 Site Access • BIO MM 17 Raptor Protection • BIO MM 18 Nesting Bird Protection • BIO MM 19 Trenches and Holes Management • BIO MM 21 Protected Amphibian Protection • BIO MM 23 Prevent the Spread of Nonnative Vegetation • BIO MM 24 Special Status Plants Surveys and Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no riparian habitats or other sensitive natural community within 500 feet of the project area. Valley Oak Woodland was not observed in the project area. Site WTR is hydrologically connected to stream habitats that include California red-legged frog (*Rana draytonii*; ESA-T; CDFW-SSC) critical habitat.

Mitigation Measure(s):

None required.

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no indicators of Waters of the U.S., other wetlands, or water features with characteristics of wetlands, as defined by the Federal Clean Water Act or the State of California, present within 500 feet of the project site.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The site is located within the CDFW's designated Pine Mountains/Sespe Condor Natural Landscape Block which overlaps the ranges of approximately 246 amphibian, reptile, mammal and bird species. However, the proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Final determination of consistency with the Angeles National Forest LMP would be made by the USFS. Construction would result in ground disturbance that could increase the potential for introduction or spread of invasive species. This would conflict with Goal 2.1 of the ANF LMP. Additionally there is a potential to impact individual species at this site. This would conflict with Goal 6.2 of the ANF LMP.

Mitigation Measure(s):

See Impact BIO 1 for applicable mitigation measures.

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: Yes, U.S. Forest Service. See Impact analysis, CUL-1.

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: Yes

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: No

Unique Paleontological/Geological Resources: No

Sensitive for Human Remains within the Direct / Indirect APE:

No

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. The direct APE encompasses a single communications site that includes a lattice tower, equipment shelter, and associated infrastructure all enclosed within a chain-link fence. The remainder of the project area (direct and indirect APEs) consists of undeveloped mountains terrain; there are no other buildings or structures and no other historical resources within this project area. LMR activities at this project location include the attachment of whip and microwave antennas on a proposed 180-foot lattice tower, construction of a new equipment shelter, and installation of new backup generator and fuel tank on a concrete pad. The status and conditions at this project area were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in December 2014. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any resource-associated features at this proposed project site, impacts would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Less than Significant Impact

Indirect / Visual Impact: Less than Significant Impact

Discussion:

There is one historical resource within the direct and indirect areas of potential effects (APEs) (P-19-186535). P-19-186535 is considered a historical resource and is eligible for protection under CEQA for its cultural value as the first national forest created in California. The 346,000-acre mountainous area is California Registered Historical Landmark No. 717 and was dedicated as the San Gabriel Mountains National Monument on October 10, 2014. Both the direct and indirect APEs are completely encompassed by this California Landmark. Given the enormous size and scale of Resource P-19-186535, the small footprint of the project site, and the lack of any uniquely definable features associated resource features at this proposed project site, impacts would be less than significant.

Mitigation Measure(s):

None required; however, because this project location is on U.S. Forest Service land, consultation with this agency is in progress.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There is no potential for significant fossil remains at this project site.

Mitigation Measure(s):

None required.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within either the direct or indirect areas of potential effects (APEs) and the project location is not sensitive for them. Based on the absence of identified human remains, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: No Impact

Indirect / Visual Impact: No Impact

Discussion:

There are no known Tribal cultural resources as defined by California Assembly Bill 52 within the direct or indirect areas of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014

and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs. Based on the absence of Tribal resources, there would be no impacts from project activities at this project site.

Mitigation Measure(s):

None required.

Geology and Soils

Setting

Surface Geology: Tertiary nonmarine rocks, undivided

Stability: Moderate pending geotechnical analysis

Soil Type: Sobrante-Exchequer-Cieneba Association

Erosion Potential: low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: No

Landslide Zone: No

Steep Slopes: Proposed site is on relatively flat grade surrounded by moderate to steep slopes

Within Area of Known Fissures/Land Subsidence: No

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: No Impact

Operational Impact: No Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, potential liquefaction, or potential land subsidence area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking. Therefore the impacts from potential seismic shaking would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of a well-drained silt loam with low to very high runoff and moderate permeability. Moderate to steep slopes surround the proposed flat building site. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the Los Angeles County planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site to minimize erosion and directed towards existing natural and constructed drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The potential for land spreading, subsidence, and/or collapse is considered to have no Impact on the project. The site is located on a ridge line, with shallow bedrock, on a relatively flat area. Factors that cause these hazards, including dissolution of limestone, mining, and groundwater extraction are not a concern at the site. Earthquake and faulting-related impacts to land spreading, subsidence, and/or collapse may be a concern but are considered "no Impact" since this site is not listed with California Geologic Survey as being within an Alquist-Priolo Earthquake Fault Zone, landslide area, or potential liquefaction area. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for land spreading, subsidence, and/or collapse.

Mitigation Measure(s):

None required.

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site WTR and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site WTR was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site WTR. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site WTR would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site WTR, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site WTR would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Applicable Emergency Response or Emergency Evacuation Plan: Yes

Wildland Fire Risk: No

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

If yes, please explain: No

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: No

Flood Inundation Area: No

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to

issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within a FEMA-designated 100-year flood zone.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Dams, levees, or other water storage features are not present upgradient of the site, and the site is not located in a flood zone, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations.

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not listed within the official California Inundation Map. No potential exists for inundation by seiche or tsunami. In addition, this site is not situated in an area that is subject to inundation by mudflow.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: Yes

If yes, which agency: USFS

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: No

If yes, please explain: N/A

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Unincorporated Los Angeles County

General Plan Designation: Open Space – National Forest; Forest Plan land use designation is Developed Area Interface

Zoning: Watershed

What is the zoning height restriction, if any?:

Information is not available (either not specified or more specificity in the project application is required to determine if a height restriction exists, which often would be addressed through a conditional use permit).

City or county permit requirements for communication facilities, if any:

Special Use Permit from USFS; county zoning ordinances indicate a Conditional Use Permit is required, although federal land requirements may have primacy and eliminate the need for a county permit. The LA-RICS Authority is not subject to certain local land-use plans, policies, and regulations under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)), and would be exempt from the county permit that normally could be required for a commercial telecommunications application.

Comprehensive Plan or General Plan Local Agency: Los Angeles County

Los Angeles County Community or Area Plan: Santa Clarita Valley Area Plan

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The National Forest Management Act of 1976 (NFMA) established standards for management of national forests and grasslands. NFMA requires projects and permits to be consistent with applicable land management plans (LMPs). The Angeles National Forest LMP provides strategies and tactics for numerous uses and resources including, but not limited to, traditional and contemporary uses, species management, fire, forest health,

watershed, wilderness, heritage resources, recreation, landscape aesthetics, transportation, and rangeland health (USFS, Pacific Southwest Region 2005b).

The Angeles National Forest Plan land designation for the proposed site is identified as in the Developed Area Interface. The Developed Area Interface zone includes areas adjacent to communities or concentrated use areas and developed sites with more scattered or isolated community infrastructure. The level of human use and infrastructure is typically higher than in other zones, and the level of development varies between areas that are highly developed to areas where no development has occurred. Although this zone may have a broad range of higher intensity uses, the management intent is to limit development to a slow increase of carefully designed facilities to help direct use into the most suitable areas and concentrating on improving facilities before developing new ones (USFS, Pacific Southwest Region 2005b).

The Forest Service requires a Special Use Permit application prior to the development of facilities on National Forest land. This site is a designated communications site in the Forest Plan, increasing the likelihood of Forest Service approval for the proposed communication facilities. No land use impacts are anticipated because of the communications site designation, but new development will still require a permitting process prior to construction.

Prior to construction, the Authority would apply for a Special Use Permit for each site. If the USFS issues the permit, the Authority would adhere to specified development and operational conditions identified in the permit. The issuance of a permit and adherence to its terms would demonstrate consistency with USFS land use plans and policies. No physical impact would occur as a result of an inconsistency between the proposed project and an applicable plan.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Unincorporated

Applicable Noise Ordinance: Title 12 Environmental Protection, Chapter 12.08 Noise Control, Part 4 Specific Noise Restrictions

Noise Level Threshold: N/A; no construction from 7 pm to 7 am or at any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: N/A

Ambient Noise Level: N/A

Sensitive Noise Receiver 1: N/A

Sensitive Noise Receiver 2: N/A

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

There are no sensitive receivers near this site. In addition, there is no noise level threshold established in the noise ordinance. Construction and operation of this site would not generate noise levels in excess of standards established in the noise ordinance.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a

jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. There are no sensitive receivers near this site; therefore, no groundborne vibrational noise impact would occur.

The ordinance for unincorporated Los Angeles County requires that construction vibration not exceed a perceivable motion velocity of 0.01 PPV over the range of 1 to 100 Hertz at the receiver sites. Although levels in excess of 0.01 PPV are still well below the potential damage 0.12 - 0.50 PPV criteria set by the FTA, the ordinance prohibits construction activities in excess of this threshold. Analysis indicates that vibration levels from construction equipment used for this Project would range from 0.003 PPV for a jackhammer to 0.089 PPV for a loaded 3-ton flatbed at 25 feet. Applying the damage assessment methodology developed by FTA and described in Appendix B 3, the distance beyond which potential vibration from construction of the proposed Project sites would diminish below the 0.01 PPV vibration threshold is 97 feet. There are no sensitive receivers or extremely sensitive (fragile) buildings within this distance or near the Project site; therefore, no impacts due to groundborne vibration from construction would occur.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. There are no extremely sensitive (fragile) buildings and no sensitive receivers near this site; therefore, no impacts due to excessive groundborne vibration or groundborne noise from Project operation would occur.

Mitigation Measure(s):

None required.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, noise levels estimated at 25 feet from proposed sites would not exceed the 90 Dba daytime criterion but would exceed FTA threshold 80 Dba nighttime criterion. Although nighttime construction noise levels would exceed the FTA adverse community guidelines, there are no sensitive receiver locations near this site; therefore, impacts from construction noise would not occur.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by

solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet or more from all project sites and in areas with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds. There are no sensitive receiver locations near this site; therefore, impacts from operational noise would not occur.

Mitigation Measure(s):

None required.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: No

If yes, Plan or Designation Area: N/A

Angeles National Forest: Yes

If yes, Plan or Designation Area: Angeles Forest Plan, Developed Area Interface land use designation

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: No

Other Recreational Area Names: N/A

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The project would not increase use of recreational facilities. Public lands administered by the Forest Service are managed for multiple uses, including recreation. The site is already being used for communication purposes and is not on land specifically designated for recreation, such as a campground or trailhead. Whitaker Ridge is identified as a designated communications site in the Angeles National Forest Land Use Plan. The communication site would preclude recreational use within the fenced area; however, most recreational activities (such as hiking or horseback riding) near the LMR site would be compatible uses of the adjacent lands. Noise and human presence during construction could temporarily impact some types of recreational activities, such as bird watching or camping. Following completion of construction activities, these types of effects would be negligible because facilities would not be manned and maintenance activities would be infrequent. There is existing access to the site, and the proposed action to further develop the site would not change access to recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Golden State Frwy

Distance (Miles):

Disaster Route: Interstate 5

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Golden State Frwy

Distance (Miles): 0.63

Nearest Major Arterial: Sloan Canyon Rd

Distance (Miles): 8.23

Access to the Project Site Provided Via: Whitaker Ridge Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In more remote areas, such as this site location, construction-related traffic could account for from 1 to 9 percent of the total average daily traffic, but the overall traffic volumes are quite low because of the remoteness of the locations and the lack of development; therefore, the increase in traffic for six weeks would not be a disruption to traffic flow.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day and construction activity generally would affect access only to the site (e.g., the existing telecommunications site or water tank site) and would not affect any adjacent roads that could be used for emergency access. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

None required.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Chiquita Canyon Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: N/A

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

Project Description

Site ID: ZHQ

Site Name: Zuma Lifeguard

Site Discussion:

Propose installation of up to 10 whip and up to 3 microwave antennas on new monopole up to 28 feet tall, with additional up to 7 foot lightning rod. Tower obstruction lighting (if required) may include red or white LED lamps, steady and/or flashing. Proposed indoor equipment racks to be located in existing equipment shelter or construct new up to 600 square foot shelter (prefab or CMU) with exterior security lighting. Propose installation of an up to 85kW diesel generator with an up to 1,500 gallon belly tank. Propose installation of up to 800 feet of chain-link fence up to 12 feet high.

Temporary disturbance area (includes staging): Up to 5,000 square feet

Permanent disturbance area: Up to 3,000 square feet

Excavation: Up to 150 cubic yards removed

Proposed trenching for underground conduits to accommodate power, grounding rings and/or fiber not to exceed 800 linear feet length, up to 48 inches below grade, up to 24 inches wide.

Proposed foundations include:

Up to 8 foot diameter x 36 foot deep drilled caisson with concrete cap for monopole support; or up to 16 foot x 16 foot x 10 foot deep concrete mat foundation.

Up to 600 square feet x 18 inch concrete slab, or raised foundation for equipment shelter.

Up to 200 square feet x 18 inch concrete slab for generator.

Demolition of existing pavement and/or structures

Aesthetics

Setting

Visual Description:

Zuma Beach Lifeguard Headquarters is located in the coastal zone on the west side of 4-lane Pacific Coast Highway (PCH) on Zuma County Beach. The PCH is a major north-south state highway that travels most of the Pacific coastline in California. The PCH is a designated "All-American Road" and is among the nation's most scenic. Ocean views to the southwest across the beach are largely uninterrupted, with the exception of occasional low-rise buildings such as the Life Guard Headquarters, associated parking lots, and telephone poles that line both sides of highway. The Life Guard Headquarters is a beige two-story building with a red Mediterranean style roof. Some slender monopoles with whip antennas are attached to the east side of the building. Automobiles and buses park along segments of this side of the highway. Vegetation on the southwest side of highway is limited to manicured grass and shrubs, and scattered palm trees. Views to the northeast are comprised of a low cliff that rises adjacent to the highway where chaparral vegetation prevails. Scattered development exists on this side of highway. Views to the northwest are of the highway corridor, the ocean, and distant views of the Santa Monica Mountains. Views to the southeast are of the highway corridor, the ocean, limited development, and Point Dume in the distance. California's Coastal Act states that "The scenic and visual qualities of coastal areas shall be considered and protected as a resource of public importance. Permitted development shall be sited and designed to protect views to and along the ocean and scenic coastal areas, to minimize the alteration of natural land forms, to be visually compatible with the character of surrounding areas, and, where feasible, to restore and enhance visual quality in visually degraded areas. New development in highly scenic areas . . . Shall be subordinate to the character of its setting."

Visual Sensitivity: High

On federally administered public lands: No, but within boundary of Santa Monica Mountains NRA

If yes, enter applicable ratings: N/A

Within the California coastal zone boundary: Yes, City of Malibu Local Coastal Plan

Adjacent to designated scenic highway or regional trail system: Yes

If yes, enter name of scenic corridor: Pacific Coast Highway

State, regional, or municipal recreation area: No

If yes, enter recreation area name: N/A

Historic district or landmark: No

If yes, enter name: N/A

Significant Ridgeline: No

Impact Analysis

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The proposed new features would be uncharacteristic of the scenic vista if no structures were already present. However, the new monopole would be compatible with the existing monopoles that already create a visual intrusion onto the landscape. The new facilities would not perceptibly change the scenic vista due to the presence of the existing monopoles, which would attenuate the noticeability of new one. The new antennas would also not be of sufficient size to have a substantial adverse effect on a scenic vista, including views from the Pacific Coast Highway. In addition, locating the new monopole and equipment with existing structures would concentrate the

impacts so that a small area of the scenic vista is altered, thereby minimizing impacts to it. The low level of impact would help protect views to and along the ocean and scenic coastal areas as called for within the coastal zone. Ongoing and recurring maintenance activities would be barely visible and infrequent. For these reasons, no substantial impacts to scenic vistas would occur. Construction impacts would be related to construction of the new tower and equipment, and creation of a staging area. Construction and demolition activities, and transportation to and from the site would create dust that would temporarily affect the viewshed. These construction activities would result in minor temporary visual impacts.

Mitigation Measure(s):

None required.

AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Proposed new facilities would be located within an existing site that has been previously disturbed. No trees, rock outcroppings, historic buildings or other scenic resources exist at the site, therefore no substantial impact would occur to these resources.

Mitigation Measure(s):

None required.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The existing visual character and quality of the site and its surroundings are impacted by the presence of existing monopoles. The new monopole and associated equipment would be compatible with the existing site, and with the surrounding, predominantly built environment. The same construction activities described for scenic vistas, described above, would also apply, with temporary degradation of the existing visual character due to the presence of machinery and construction activity.

Mitigation Measure(s):

None required.

AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Temporary impacts related to glare from the windshields of construction vehicles or headlights (if used during daylight hours) would occur. Construction would not occur at night; therefore, no night lighting of sites or nighttime headlight glare from construction vehicles would occur. This site would be located in an urban area and would include construction of new facilities. The proposed Project facilities would be constructed of materials that do not produce glare. Exterior security lighting equivalent to a 100-watt light bulb would be required if a new equipment shelter is constructed. For aviation safety, FAA may require lighting on the new towers consisting of steady and/or flashing red or white light-emitting diodes (LED) lamps. This site is in an urban area where numerous sources of day and nighttime lighting are present, such as vehicle headlights, traffic signals, street lights, and building security lights. Because of the presence of these light sources, tower lighting, if required, would not

introduce a substantial new source of light or glare that would adversely affect day or nighttime views in the area.

Mitigation Measure(s):

None required.

Air Quality

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

Federal Nonattainment/Maintenance Status: Nonattainment: O3, PM2.5; Maintenance: CO, NO

State Nonattainment Status: O3, PM2.5, PM10

Applicable Air Quality Management Plan(s):

SSCAQMD Final 2012 Air Quality Management Plan, Rule 1403 – Asbestos Emissions From Demolition/Renovation Activities

Significance Thresholds:

General (tons/year): VOC, NOx (10), CO (100), PM2.5 (100), PM10 (70); Local construction (lbs./day): NOx (100), VOC (75), PM2.5 (55), PM10 (150), CO (550); Local operation (lbs./day): NOx (55), VOC (55), PM2.5 (55), PM10 (150), CO (550)

Nearest Sensitive Receptors: Kiosk

Distance to Sensitive Receptor: 20

Impact Analysis

AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant

Discussion:

The SCAQMD air quality plan considered in this analysis is the SCAQMD 2012 Air Quality Management Plan (SCAQMD Plan). The purpose of this plan is to demonstrate attainment of the PM2.5 24-hour standard of 35 µg/m³ by 2014 within the SCAB, identify measures and actions to fulfill the 8-hour O3 SIP commitments to the USEPA to achieve emissions reductions from Best Available Control Technology (BACT), and to demonstrate attainment of the 1-hour O3 CAAQS by 2022.

A maximum construction activity scenario as described in Appendix B-1 was assumed for proposed site ZHQ. The analysis indicates that emissions from construction of this site would not exceed SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all proposed Project sites would exceed this threshold and could conflict with or obstruct implementation of the SCAQMD Plan resulting in a significant impact. The analysis also indicates that NOx emissions from simultaneous construction of all proposed Project sites located in the SCAB would exceed the daily significance threshold even if Tier 4 equipment is being used. Tier 4 standards for nonroad compression-ignition engines used in construction and built in 2014 or later are subject to emissions requirements established in 40 CFR 1039.101 that reduce emissions by up to 90 percent.

The maximum number of proposed Project sites that can be constructed simultaneously while staying beneath the SCAQMD threshold for this criteria pollutant was examined. The analysis indicates that a maximum of 13 sites can begin construction on the first day of the anticipated six week schedule for each site. By staggering the schedules for individual sites, construction of additional sites can begin with up to 28 sites under construction simultaneously without exceeding daily NOX emissions limits for the unmitigated scenario. A maximum of 16 sites can begin construction on the first day of a six-week schedule for each site if Tier 4 equipment is utilized. By staggering the schedules for individual sites and using Tier 4 equipment, construction of additional sites can begin with up to 37 sites under construction simultaneously without exceeding daily NOX emissions limits. With implementation of Mitigation Measure AQ MM 1, the construction of proposed Project sites would not conflict or

obstruct implementation of the SCAQMD Plan; therefore, the Project impacts would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Emissions from the operation of proposed site ZHQ or the simultaneous operation of all proposed Project sites located in the SCAB including would not conflict or obstruct implementation of the SCAQMD Plan; therefore, the Project operational impacts would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-2: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Impact: Less than Significant

Operational Impact: Less than Significant

Discussion:

Emissions from the construction of proposed site ZHQ would not exceed the SCAQMD daily significance thresholds including NOx, a precursor for O3; however, simultaneous construction of all 51 proposed Project sites located in the SCAB would result in violation of this threshold, and could contribute to the SCAB nonattainment status for O3. The Project's construction emissions in the SCAB would be significant. With implementation of Mitigation Measure AQ MM-1, which requires the contractor to submit to the Authority for review and approval the week prior to construction a report that verifies the estimated emissions of NOx from all construction activities at all proposed Project sites will not exceed the SCAQMD 100 pound daily threshold or which proposes substitution of equipment with Tier 4 engines or limitation of construction activities to comply with this threshold, the Project construction impacts in the SCAB would not violate any air standard or contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Operational emissions would result from trips to the proposed Project sites for maintenance and testing of emergency generators. Operational emissions from the proposed Project sites in the SCAB including site ZHQ will not exceed significance thresholds for any criteria pollutants, would not contribute substantially to an existing or projected air quality violation and therefore, would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the

contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-3: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

This analysis focuses on the criteria pollutants for which the region is classified as nonattainment: O3, PM2.5 (NAAQS and CAAQS), and PM10 (CAAQS) in the SCAB. Cumulatively considerable net increases in these pollutants were determined relative to the SCAQMD significance thresholds for each.

Emissions from the construction of proposed site ZHQ would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx; however, simultaneous construction of all 51 proposed Project sites within the SCAB would exceed the significance threshold for NOx and could result in cumulatively considerable net increases in O3 from the NOx emissions.

With implementation of Mitigation Measure AQ MM 1, construction emissions of O3 precursor NOx would not result in a cumulatively considerable net increase in O3 in the SCAB; therefore, NOx emissions in the SCAB would be less than significant. Compliance with SCAQMD significance thresholds is sufficient to demonstrate that the construction of the Project would not result in a cumulatively considerable net increase in these criteria pollutants; therefore, the impact of Project construction would be less than significant.

Operational emissions of proposed site ZHQ or the simultaneous operation of all proposed Project sites in the SCAB would not exceed SCAQMD significance thresholds for PM2.5, PM10 or O3 precursor NOx and would not result in cumulatively considerable net increases in O3; therefore, the impact of Project operation would be less than significant.

Mitigation Measure(s):

AQ MM 1

No later than 12:00 pm on the Thursday prior to each week of construction, the contractor shall submit a report to the Authority for review and approval which includes, at minimum, the following information: (1) a list of the types and numbers of pieces of on-site construction equipment that will operate at each proposed Project site within the SCAB on each day of the following week of construction; (2) an estimate of the combined total of NOX emissions from all construction activities at all proposed Project sites in the SCAB for each day of the week and verification that the total does not exceed 100 pounds; (3) If combined NOX emissions are forecast to exceed 100 pounds on any day during the week following submittal of the report, the report shall document this fact, and the contractor shall substitute equipment with Tier 4 engines that adhere to emissions standards listed in 40 CFR 1039.101 for all types of off-road equipment to which Environmental Protection Agency regulations apply to the extent necessary to reduce emissions to 100 pounds, or otherwise limit construction activity to the extent necessary to reduce daily basin-wide NOX emissions to 100 pounds, to the satisfaction of the Authority. Compliance with this requirement shall be documented in the following week's report.

AQ-4: Would the project expose sensitive receptors to substantial pollutant concentrations?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The SCAQMD has established local significance thresholds (LSTs), which were developed based on the ambient concentrations of that pollutant for each source receptor area (SRA) and the distance of the pollutant source to the nearest sensitive receptor. There are 39 designated SRAs in the SCAQMD. The LSTs are modifications to the thresholds for NOx, CO, PM10, and PM2.5. The district has not established local thresholds for reactive organic gases (ROGs). Table 9 in Appendix B-1 lists the SRAs within which each of the proposed Project sites would be located including site ZHQ, the distance of each proposed site to the nearest sensitive receptor, and the resulting LST for these criteria pollutants.

For site ZHQ, which is 41 feet from the nearest receptors, the LSTs for criteria pollutants in SRA No. 2 are higher than the SCAQMD thresholds. Per SCAQMD guidance (SCAQMD, 1993), compliance with the local significance thresholds for criteria pollutants demonstrates that construction and operation of the proposed Project sites in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors for this and all project sites would be less than significant.

As discussed in Chapter 3.2.4, the duration of Project construction and operation emissions of diesel particulates, a toxic air contaminant, would be less than the two month minimum for a health risk assessment recommended by the Office of Environmental Health Hazard Assessment at all sites including site ZHQ and were not assessed further.

Demolition of existing structures at proposed sites in the SCAB would be subject to SCAQMD Rule 1403, which is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of asbestos-containing waste material generated or handled during these activities. By complying with District Rule 1403 and minimizing the release of airborne asbestos emissions, demolition activity would not result in a significant impact to air quality.

Proposed sites within the SCAB would lie outside areas within California that are more likely to contain NOA according to a study completed by the California Department of Conservation, A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos (DOC, 2000); therefore, NOAs are not discussed further in this assessment.

Per SCAQMD guidance, compliance with the district's health based risk assessment significance thresholds is sufficient to demonstrate that construction and operation of the proposed Project sites including site ZHQ in the SCAB would not result in exposure of sensitive receptors to substantial pollutant concentrations; therefore, impacts to sensitive receptors would be less than significant.

Mitigation Measure(s):

None required.

AQ-5: Would the project create objectionable odors affecting a substantial number of people?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Project construction emissions of dust from demolition activities, and/or excavated soil has the potential to generate objectionable odors. However, odors most often reported to the SCAQMD are associated with transfer station/recycling, autobody, foundry/metal processing, wastewater/water treatment, and landfills, which comprise approximately 55-percent of all complaints. Construction activities that include painting and solvent use accounting for only 3-percent of complaints. The construction of site ZHQ and all proposed Projects sites would not include extensive soil excavation or other construction activities (painting and solvent use) that commonly trigger public complaints and would not likely create an odor nuisance pursuant to SCAQMD Rule 402. In addition, the operation of proposed Project sites include scheduled monthly maintenance visits to test backup generators and concurrent biannual trips for routine maintenance activities and would not create an odor nuisance pursuant

to SCAQMD Rule 402; therefore, Project impacts of the proposed Project would be less than significant.

Mitigation Measure(s):

None required.

Biology

Setting

Special Status Animals Recorded within 1 Mile:

groundfish (M&F-EFH); monarch butterfly (Danaus plexippus; ESA-Pet)

Special Status Plants Recorded within 1 Mile:

None

Sensitive Communities Recorded within 1 Mile:

western snowy plover critical habitat(Charadrius alexandrinus nivosus; ESA-T, ESA-CH, CDFW-SSC); tidewater goby critical habitat (Eucyclogobius newberryi; ESA-E, ESA-CH, CDFW-SSC);

Species or Habitat Present in Project Vicinity (Generally Within 500 Feet):

western snowy plover (Charadrius alexandrinus nivosus; ESA-T; CDFW-SSC)

Designated Critical Habitat Within 500 Feet:

western snowy plover (Charadrius alexandrinus nivosus; ESA-T; CDFW-SSC); groundfish (M&F-EFH)

Ornamentals

Impact Analysis

BIO-1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site ZHQ is located at the Zuma Beach lifeguard station with a paved parking lot between the Pacific Coast Highway and the beach, heavily used by recreationists. All natural sand dunes have been bladed flat. Some native coastal strand species are present adjacent to existing structures. Native species observed included (Cakile maritima), California croton (Croton californica), heliotropium, and pickleweed iceplant (Carpobrotus edulis). Monarch butterflies (Danaus plexippus; ESA-Pet) may pass through the area but there are no potential roost trees. Western snowy plover (Charadrius alexandrinus nivosus; ESA-T, ESA-CH, CDFW-SSC) critical habitat has been designated along the beach adjacent to the project site. The beach is a focal area for recreationists, whose presence would preclude nesting by the plover on the beach; nesting occurs in protected areas. Tidewater goby (Eucyclogobius newberryi; ESA-E, ESA-CH, CDFW-SSC) designated critical habitat is approximately 0.35 miles southeast of the site at the intermittent outflow from Zuma Canyon. Essential fish habitat has been designated for groundfish (a guild of bottom dwelling marine fishes) along the coastline within the project area; no project activities would impact

marine environments. Disturbance to or destruction of nests of native bird species that are protected by the Migratory Bird Treaty Act and the California Fish and Game Code Section 3503.5 and 3513 could occur as a result of vegetation removal or other on-site construction activities.

Mitigation Measure(s):

A biological monitor will verify no breeding western snowy plover (*Charadrius alexandrinus nivosus*; ESA-T, ESA-CH, CDFW-SSC) are utilizing the project area through coordination with USFWS and on-site surveys. Anti-perch devices will be affixed to elevated surfaces to preclude perching by avian predators of the plover. Preconstruction surveys for nesting birds will occur prior to on-site construction-related disturbance activities from March 1 through September 15. Appropriate buffers, based in part on the species present and site-specific conditions, will be established to protect nesting birds and active bird nests. Required mitigation measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 WEAP • BIO MM 3 Biological Compliance Reporting • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring • BIO MM 10 No Pets • BIO MM 16 Snowy Plover Protection • BIO MM 18 Nesting Bird Protection

BIO-2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Critical habitat for the Western snowy plover is within the study area. There are no riparian habitats within 500 feet of the project site. Essential fish habitat has been designated (for groundfish, coastal pelagic species, U.S. West Coast fisheries for highly migratory species) along the coastline; no project activities would impact marine environments.

Mitigation Measure(s):

Required Mitigation Measures: • BIO MM 1 Mitigation Monitoring and Reporting Plan • BIO MM 2 Worker Environmental Awareness Program • BIO MM 3 Biological Compliance Reporting • BIO MM 6 Anti-perch Devices • BIO MM 8 Biological Monitoring

BIO-3: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

The project area includes the following two wetland feature types as indicated by the National Wetland Inventory (USFWS 2014): 1) Freshwater Forested/Shrub Wetland; and 2) Estuarine and Marine Wetland. However, these wetland types are restricted to ephemeral drainages. Adverse impacts to these wetlands may occur due to sedimentation as a result of runoff from the construction. However, construction activities would be limited to the project site which is isolated from these drainages by the Pacific Coast Highway; best management practices would be implemented to control erosion and sedimentation of excavated soil from stormwater runoff.

Mitigation Measure(s):

None required.

BIO-4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Zuma Beach is adjacent to the Pt Dume State Marine Conservation Area, The Santa Monica Mountains National Recreation Area and Malibu Creek State Park. The main goal of the state park is to preserve the riparian forest and woodlands and its wildlife habitat and the stream. The proposed project would be located within a previously disturbed area and proposed activities are consistent with current site usage. The proposed project would not introduce new disturbances to wildlife corridors that would interfere substantially with wildlife movement.

Mitigation Measure(s):

None required.

BIO-5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Site ZHQ does not contain Environmentally Sensitive Habitat Areas (ESHAs), but the study area includes both beach areas and the Pacific Ocean which are ESHA under the City of Malibu Local Coastal Program (LCP) Land Use Plan (LUP). The City of Malibu General Plan Conservation Element provides specific conservation policies. These include avoidance of consumption of ecologically sensitive lands (including ESHAs [CON Policies 1.1.1 and 1.2.4]), prioritization of protection of ESHA over development (CON Policy 1.1.4), protection of plants and wildlife (CON Policy 1.1.5), prevention of spread of invasive plants (CON Policy 1.2.5), discouragement of use of herbicides (CON Policy 1.2.7), protection of all sea birds/shore birds and their nesting and roosting sites in ESHA, and control of surface runoff (CON Policy 1.3.11). Impacts from construction and operations are described in BIO Impact 1, Bio Impact 2, and Bio Impact 3. Because a potential for significant impact associated with the resources protected by the LCP LUP exists, a conflict with the policies contained in the LCP LUP exists and this would constitute a significant impact.

Mitigation Measure(s):

The mitigation measures identified in Impact BIO 1 coupled with application of LU MM 3 (requiring the Authority obtain a coastal development permit) would reduce impacts to less than significant. Required mitigation measures:

- BIO MM 1 Mitigation Monitoring and Reporting Plan
- BIO MM 2 Worker Environmental Awareness Program
- BIO MM 3 Biological Compliance Reporting
- BIO MM 4 Site Sanitation
- BIO MM 5 Hazardous Materials Management
- BIO MM 8 Biological Monitoring
- BIO MM 9 Protect Native Vegetation and Common Wildlife
- BIO MM 10 No Pets
- BIO MM 11 Site Access
- BIO MM 16 Snowy Plover Instructions
- BIO MM 18 Nesting Bird Instructions
- BIO MM 24 Prevent the Spread of Nonnative Vegetation

BIO-6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No applicable Habitat Conservation Plan or Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan occurs. No impacts from construction or operations would occur.

Mitigation Measure(s):

None required.

Cultural Resources

Setting

Area of Potential Effects (APE) on Federal Land: No

Historical Resources / Historic Properties within the Construction Footprint (Direct APE):

Archaeological: No

Architectural: No

Native American: No

Historical Resources / Historic Properties within the ½ mile Visual (Indirect) APE:

Archaeological: Yes

Architectural: No

Native American: Yes

Unique Paleontological/Geological Resources: Yes

Sensitive for Human Remains within the Direct / Indirect APE:

Yes

Proximity to a National Historic Landmark (Within the Direct APE or Within the Visual (Indirect) APE):

No

Proximity to a Confirmed (listed or officially determined eligible) Historic District (Within the Direct APE or Within the Visual (Indirect) APE):

No

Impact Analysis

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

There are no previously recorded historical resources within the direct area of potential effects (APE). The direct APE encompasses the Zuma Beach Lifeguard Headquarters building (built ca 1955), a garage, and a storage building surrounded by a large paved parking area. Based on archival research and a site visit in January 2015, the lifeguard station is not a historical resource. Within the indirect APE, the Pacific Coast Highway runs east/west and immediately adjacent along the northeastern boundary of the project area. The Pacific Ocean is within 250 feet to the southwest and more than half of the indirect APE encompasses the Pacific Ocean. There are five recorded prehistoric archaeological/Native American resources (Resource Nos. P-19-002829, P-19-002814, P-19-002813, P-19-000200, and P-19-000201); one of these is recorded as having burials. All five of the sites have been described as disturbed from grading and modern development, including the alignment of the Pacific Coast Highway,, which bisets at least one and likely three of the recorded resources. None of the five archaeological sites are designated as historical resources; however, both north and south of the Pacific Coast Highway sensitive for prehistoric archaeology and burials. Based on indigenous use of marine resources subsurface archaeological materials could extend as far as the coastline. LMR activities at this project location include attachment of whip and microwave antennas on a proposed 28-foot monopole, construction of a new equipment shelter, and installation of a new backup generator and fuel tank on a concrete pad. The status and conditions at this project location were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Based on the archaeological sensitivity of the

Project site, impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be reduced to less than significant.

Mitigation Measure(s):

CUL MM 1, 3, and 4 would be implemented at this project site. Archaeological monitors are required during all ground disturbing activities at this project location to ensure that archaeological resources are protected.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

There are no previously recorded historical resources within the direct area of potential effects (APE). The direct APE encompasses the Zuma Beach Lifeguard Headquarters building (built ca 1955), a garage, and a storage building surrounded by a large paved parking area. Based on archival research and a site visit in January 2015, the lifeguard station is not a historical resource. Within the indirect APE, the Pacific Coast Highway runs east/west and immediately adjacent along the northeastern boundary of the project area. The Pacific Ocean is within 250 feet to the southwest and more than half of the indirect APE encompasses the Pacific Ocean. There are five recorded prehistoric archaeological/Native American resources (Resource Nos. P-19-002829, P-19-002814, P-19-002813, P-19-000200, and P-19-000201); one of these is recorded as having burials. All five of the sites have been described as disturbed from grading and modern development, including the alignment of the Pacific Coast Highway,, which bisets at least one and likely three of the recorded resources. None of the five archaeological sites are designated as historical resources; however, both north and south of the Pacific Coast Highway sensitive for prehistoric archaeology and burials. Based on indigenous use of marine resources subsurface archaeological materials could extend as far as the coastline. LMR activities at this project location include attachment of whip and microwave antennas on a proposed 28-foot monopole, construction of a new equipment shelter, and installation of a new backup generator and fuel tank on a concrete pad. The status and conditions at this project location were confirmed through archival research and during a field survey conducted by both a Secretary of the Interior (SOI)-qualified archaeologist and architectural historian in January 2015. Based on the archaeological sensitivity of the Project site, impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be reduced to less than significant.

Mitigation Measure(s):

CUL MM 1, 3, and 4 would be implemented at this project site. Archaeological monitors are required during all ground disturbing activities at this project location to ensure that archaeological resources are protected.

CUL-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Proposed project activities would have a significant impact on paleontological resources. The site is mapped as low sensitivity younger Quaternary alluvial sediments at the surface. However, these deposits typically overlie older geologic units that may contain significant vertebrate fossils at depth. No localities are recorded within the proposed site; however a locality is recorded in the vicinity that produced an extensive fossil fauna of late Pleistocene vertebrates. Recovered fossils include tapir, deer, horse, rabbit, rodent, and numerous bird species. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 6 and 7 would be implemented at this project site. Periodic paleontological spot checks are required when excavation exceeds depths of five feet into the Quaternary alluvium to determine if older, paleontologically

sensitive sediments are present. If present, monitoring would be conducted during excavation into paleontologically sensitive sediments to reduce the impact to a less than significant level. In accordance with CUL MM 6, prior to the start of construction a paleontological resources monitoring plan would be prepared and implemented. The plan would include specific locations and construction activities requiring monitoring, procedures to follow for monitoring and fossil discovery, and a curation agreement with the Natural History Museum of Los Angeles County.

CUL-4: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

No human remains have been identified within the direct area of potential effects (APEs); however, based records searches, field survey and the presence of nearby recorded archaeological sites, the project site has moderate to high sensitivity for them. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 1, 3, and 4 would be implemented at this project site. Archaeological monitors are required during all ground disturbing activities at this project location to ensure that human remains are protected.

CUL-5: Would the project directly or indirectly disturb Tribal cultural resources?

Direct Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Indirect / Visual Impact: No Impact

Discussion:

Tribal cultural resources as defined by California Assembly Bill 52 have been identified within the indirect area of potential effects (APEs). The Native American Heritage Commission (NAHC) was contacted in August 2014 and a search of their sacred land file requested. A response from the NAHC in September 2014, indicated there were no known Native American cultural resources present within either the direct or indirect APEs; however current records searches and field surveys reveal the presence of archaeological/Tribal resources on both the north and south sides of the Pacific Coast Highway making the project site sensitive for them. Impacts at this Project site would be significant; however, with implementation of mitigation measures, impacts would be less than significant.

Mitigation Measure(s):

CUL MM 1, 3, and 4 would be implemented at this project site. Archaeological monitors are required during all ground disturbing activities at this project location to ensure that Tribal resources are protected.

Geology and Soils

Setting

Surface Geology: Miocene marine rocks

Stability: Moderate pending geotechnical analysis

Soil Type: Urban land-Rock outcrop-Millsholm Association

Erosion Potential: Low

Expansive Soil: No

Alquist-Priolo Zone: No

Liquefaction Potential: Yes

Landslide Zone: No

Steep Slopes: No

Within Area of Known Fissures/Land Subsidence: An Earthquake Fault Line has been identified approximately 2 miles northeast of the property (EDR, 2014). However, property is not located within an Alquist-Priolo Earthquake Fault Zone.

Impact Analysis

GEO-1: Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Construction Impact: No Impact

Operational Impact: No Impact

ii) Strong seismic ground shaking?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iii) Seismic-related ground failure, including liquefaction?

Construction Impact: Significant Impact Reduced to Less than Significant w

Operational Impact: Less than Significant Impact

iv) Landslides?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, or potential land subsidence area. The site does lie within a potential liquefaction area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles County Department of Public Works (LADPW) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo

Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking including liquefaction. GMED may require special foundation requirements, such as spread footings, deep piles, or other modifications to the foundation to reduce potential effects of liquefaction. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Available soil data suggests the proposed site is comprised of fine-grained sand and light clay loam material. This soil type exhibits a well-drained, medium to very rapid runoff with moderate permeability. Building permits require that standard BMPs for erosion control be put in place on all projects. Construction plans would be reviewed by the City of Malibu planning department prior to issuance of a building permit to ensure proper drainage is maintained at the site and directed towards existing natural drainage features.

Mitigation Measure(s):

None required.

GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Construction Impact: Significant Impact Reduced to Less than Significant with Miti

Operational Impact: Less than Significant Impact

Discussion:

This site does not fall within a designated Alquist-Priolo (A-P) Earthquake Special study zone, potential landslide zone, or potential land subsidence area. The site does lie within a potential liquefaction area as designated by California Department of Conservation, California Geological Survey (CGS). A geotechnical geology and soils report for the site is required to obtain a building permit for the construction of new antenna support structures. The report is reviewed by Los Angeles Department of Public Works (LADWP) Geotechnical and Materials Engineering Division (GMED). GMED is responsible for conducting the review of geologic and soils reports for verification of compliance with the Los Angeles County Building Code, State Seismic Mapping Act and Alquist-Priolo Earthquake Fault Zone Act. These acts and California Building Codes ensure site design includes specific elements to minimize damage from seismic shaking including liquefaction. GMED may require special foundation requirements, such as spread footings, deep piles, or other modifications to the foundation to reduce potential effects of liquefaction. Therefore the impacts from potential seismic shaking, landslides, or liquefaction would be Less than Significant with Mitigation for this site.

Mitigation Measure(s):

GEO MM 1, Geotechnical Investigation

GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. This site does not exhibit these soil characteristics and this hazard

has no impact for construction and operation at the site. Construction design would be based off of geotechnical analysis of the soils at the site and would further consider the potential for expansive soils. Compliance with building codes and requirements would reduce expansive soil-related hazards.

Mitigation Measure(s):

None required.

Greenhouse Gases

Setting

Air Basin: South Coast

Air Quality Management District: South Coast

AQMD Significance Threshold: 10,000 metric tons CO₂equivalent(eq)/year (MTCO₂e)amortized over life of the Project

Applicable Greenhouse Gas Plan, Policy, or Regulation:

EO S-3-05/B-16-2012/B-30-15, AB 32 California Global Warming Solutions Act of 2006, SB 97, SCAQMD Interim CEQA GHG Significance Threshold, Rule 2701 SoCAL Climate Solutions Exchange, Rule 2702 GHG Reduction Program

GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Direct emissions of GHGs associated with the operation of LMR Site ZHQ and all the proposed Project sites include emissions from vehicles transporting routine maintenance personnel to service equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for the 51 proposed Project sites in the SCAB. The generator test would last one hour at each site and test days would be evenly distributed during each month of the year. For the analysis it was assumed there will be an average of 11.75 trips per week to sites within the SCAB, with three maintenance trips on four weekdays per week and three additional weekday trips per month. It is also assumed that maintenance days coincide with generator test days.

Finally, indirect GHG emissions from electricity consumption to operate equipment (monopole/antennas) at each proposed Project site including LMR Site ZHQ was determined with an assumed power rating from the Los Angeles Department of Water and Power for this analysis, which is included in the CalEEMod emissions model.

Total annual GHG emissions for all 51 Project sites in the SCAB are estimated at 2,214.17 MTCO₂e, or less than 44 MTCO₂e annually for proposed Project site ZHQ. Per guidance provided by the SCAQMD, construction emissions were amortized by averaging daily emissions estimates during the construction period over a 30-year project lifetime for the proposed Project. The estimated annual direct emissions of GHGs from the construction and direct and indirect emissions of GHGs from operation of proposed Project site ZHQ would be substantially below the SCAQMD annual 10,000 MTCO₂e threshold; therefore, the construction and operation of this site would have a less than significant impact on the environment.

Mitigation Measure(s):

None required.

GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The CARB 2015 Edition of the California GHG Emission Inventory; California Greenhouse Gas Emissions for 2000 to 2013 – Trends of Emissions and Other Indicators summarizes statewide emissions of GHGs from seven source categories in the AB 32 Scoping Plan including transportation, industrial, electric power, commercial and

residential, agriculture, recycling and waste, and high global warming potential, which consist of primarily of substitutes for ozone depleting substances. Trends in GHGs indicate a 1.5 million MTCO₂e decrease from 2012 to 2013 and 7 percent from peak levels in 2004. Emissions from the transportation sector represented 37 percent of total emissions in 2013, with the majority of emissions coming from on-road vehicles. Trends in this sector indicate an 11 percent decrease from 2007 peak levels, primarily due to low-carbon fuel standards and incentives for alternative fuel vehicles such as compressed natural gas. Emissions from the electric power sector represented 20 percent of statewide GHG emissions in 2013, with emissions decreasing by approximately 20 percent from peak levels in 2008. Decreases in the energy sector are a primary result of decreases in imported electricity, more efficient renewable sources including solar and wind power, and the use of increased energy production from combined-cycle power plants. During the period 2000 to 2013, California per capita GHG emissions have continued to drop from a peak 14 MTCO₂e in 2001 to 12 MTCO₂e in 2013.

Estimated GHG emissions from community activities in unincorporated areas of Los Angeles (ULAC) in 2010 were estimated at 7.9 million MTCO₂e. Of these total emissions, building energy use is the largest source of emissions (49%). Transportation emissions from on- and off road vehicles are the second largest source of emissions (42%). The third largest source is community waste generation (7%). The remaining sources are water conveyance and wastewater generation (2%), agriculture (0.4%), and stationary sources (0.02%). Trends for greater Los Angeles County, including unincorporated areas indicated an overall reduction for the period 2005 – 2008 from 8.1 million MTCO₂e to 7.98 million MTCO₂e, a reduction of 1.48%. The ULAC Community Climate Action Plan 2020 projects a 10% reduction from 2013 levels in unincorporated areas of the County will be necessary to be consistent with AB 32 and has set a goal of 11% emissions reductions for the period 2013 – 2020.

Approximately 88.5 percent of the GHG emissions from the proposed Project sites, including site ZHQ, would be associated with the electrical needs for equipment operation; and the remaining 11.5 percent would be for construction and maintenance. Compliance with the SCAQMD significance thresholds for GHGs would not trigger mandatory reporting of site emissions to CARB. Compliance demonstrates that the contribution to statewide and ULAC emissions, which are trending downward for transportation and electric power sources, would be less than significant; therefore, the construction and operation of proposed Project site ZHQ would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

Mitigation Measure(s):

None required.

Hazardous Materials

Setting

School(s) Within Quarter Mile: No

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: Los Angeles County Sheriff Heliport

Applicable Emergency Response or Emergency Evacuation Plan: yes

Wildland Fire Risk: Yes

Site Located on Land Listed as a Hazardous Materials Site?: No

If yes, please explain: N/A

Site Located within 1 Mile of National Priority List (Superfund) Site?: No

If yes, please explain: N/A

Site Located Within ¼ Mile of Listed Cortese, Leaking Underground Storage Tank (LUST), Permitted Underground Storage Tank (UST) or Brownfield Site?: No

If yes, please explain: N/A

Site Located in a Methane Hazard Zone?: No

If yes, please explain: N/A

Potential for Methane Exposure?: No

If yes, please explain: N/A

Located within 200 feet of an Oil or Gas Well?: No

If yes, please explain: N/A

Site Located within 1,000 Feet of a Landfill?: No

If yes, please explain: N/A

Located in a Local Fire hazard Zone?: Yes

If yes, please explain: Very High Fire Severity Zone

Located in a State Fire Hazard Zone?: No

If yes, please explain: N/A

Federal Aviation Administration (FAA) Part 77 Notification due to Proximity of Site:

Impact Analysis

HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, state, and local regulations. Diesel fuel would be the primary hazardous material used at the site. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous material and waste transporters are required to complete and carry hazardous waste manifests with shipments. Accidental spills or releases associated with the on-site fuel storage tanks would be controlled through secondary containment, SPCC plans where applicable, and worker education. Emergency response plans would be in place. Hazards would be

reduced to a less than significant impact through implementation of regulations and requirements addressing transport driver education, preparation of SPCC plans to contain spills or releases on-site, and emergency response plan preparation and coordination.

Mitigation Measure(s):

None required.

HAZ-2: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

A diesel fuel tank from 1,000 up to 1,500 gallons would be integrated into the design of the backup generator for the project. The fuel tanks would be installed in accordance with California Fire Code and applicable hazardous material storage ordinances. Federal, state, and local regulations, permits, and notification procedures associated with construction, installation, use, and storage of fuel tanks and fuel would be implemented. Tanks would meet nationally recognized standards. Secondary containment would be in place. Tanks greater than 660 gallon capacity, or fuel storage greater than 1,320 gallons, would have an SPCC Plan prepared in accordance with 40 CFR Part 112.

Mitigation Measure(s):

None required.

HAZ-3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no schools located within 0.25 mile of the proposed Project site.

Mitigation Measure(s):

None required.

HAZ-4: Would a project located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located on a hazardous material site pursuant to Government Code Section 65962.5.

Mitigation Measure(s):

None required.

HAZ-5: Would a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the boundaries of an airport land use plan or within two miles of a public airport or public use airport.

Mitigation Measure(s):

None required.

HAZ-6: Would a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

The proposed Project site is not located within the vicinity of a private airstrip.

Mitigation Measure(s):

None required.

HAZ-7: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Construction activities are reviewed, shift changes understood, and ingress and egress for construction equipment reviewed and placed to minimize impact to the facility where the monopole or tower is being constructed. Installation of hardware and integration of software for LMR equipment is planned so as to minimize disruption, if any, of local emergency responders' communications.

Operation of the LMR communication system is designed to enhance communications among emergency responders and facilitate better coordination among various agencies responding. The proposed Project would enhance implementation of emergency plans.

Mitigation Measure(s):

None required.

HAZ-8: Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

The proposed Project site is located within a Very High Fire Hazard Severity Zone. Construction at all sites would comply with applicable regulations, including provisions for emergency vehicle access, use of approved building materials, design, and brush clearance. For sites in very high fire hazard zones, there is an elevated potential for ignition of wildland fire associated with construction, and ignition of a wildland fire would be a significant impact. Operations activities would not be expected to result in wildland fire ignition and impacts would be less than significant.

Mitigation Measure(s):

Implementation of HAZ MM 3, Fire Management Plan, would increase fire awareness, provide for fire communications, provide for available water and fire suppression tools on site, and prohibit smoking in open areas. With implementation of HAZ MM 3 the potential to ignite wildland fire on site would be greatly reduced,

and the impact reduced to less than significant.

Hydrology and Water

Setting

Regional Water Quality Control Board: Los Angeles

Floodzone: Yes, Flood zone AE

Flood Inundation Area: Yes

Groundwater Basin: Unnamed

Impact Analysis

WQ-1 : Would the project violate any water quality standards or waste discharge requirements?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

There is no potential for violation of water quality standards from storm water runoff during construction, as building permit requirements include application of BMPs already incorporated into project design that prevent sediment from exposed soils migrating off site. Deep excavation associated with the support structure foundation may result in groundwater being encountered. In the event groundwater is encountered and dewatering is necessary, a discharge permit would be required from the applicable Regional Water Quality Control Board. Compliance with the permit conditions would prevent any violation of water quality standards and would meet waste discharge requirements. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

MM UTL 1 would be required in the event dewatering from foundation excavation is required.

WQ-2 : Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Groundwater would likely be included in the up to 500 gallons of water obtained from public water supplies necessary to construct the site. Only minor new impervious surfaces would be constructed at the site. Minor amounts of water would be used during operations for domestic purposes. These minor uses would not result in overdraft or prevent recharge of any known aquifer.

Mitigation Measure(s):

None required.

WQ-3 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

All construction plans would be submitted to and reviewed by local and/or county planning departments prior to

issuance of a building permit. Design of all building pads will be required to demonstrate positive drainage towards existing natural and/or storm drain catch areas. All plans would be reviewed during the permitting process and prior to start of construction to ensure existing storm drain system can support additional runoff. If runoff is directed towards a natural drainage, design may be required to include a baffle system to preclude any adverse erosion to existing natural drainage feature. BMPs as described in the text will be implemented during construction to limit erosion of exposed soils (e.g. during excavation). Therefore, construction and operation would not substantially alter the existing drainage of the area in a manner to result in substantial erosion or siltation off site.

Mitigation Measure(s):

None required.

WQ-4 : Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Proposed construction would not substantially alter the existing drainage of the area. BMPs applied during construction, as required during the permitting process would include a requirement for positive drainage toward existing and natural storm drain catch areas. Once construction is completed, any exposed soils would be stabilized, and operation of the facility would not result in discharge of measurable amounts of runoff from the proposed facility.

Mitigation Measure(s):

None required.

WQ-5 : Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Stormwater discharge requirements during construction and operation of this site will be managed in accordance with the Federal, State, and Local/Municipal regulations and building codes. In addition, the proposed impervious footprint would result in limited change in runoff volume already existing at the site. BMPs will be employed to limit Total Suspended Solids from leaving the site during construction as described in the text. Additional pollutants introduced to the site as a result of construction and operation, including petroleum/oil/lubricants from heavy equipment and fuel storage required as part of operations will be managed using BMPs as described in the Hazardous Materials section.

Mitigation Measure(s):

None required.

WQ-6 : Would the project otherwise substantially degrade water quality?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Water quality requirements during construction and operation of this site will be managed in accordance with the Federal, State, and local/municipal regulations and building codes as described in the text. BMPs will be employed as part of project design (as required during the building permit process) to prevent runoff leaving the site during construction and operations phases.

Mitigation Measure(s):

None required.

WQ-7 : Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Site ZHQ partially lies within a coastal flood inundation zone. State and local planning agencies will review proposed construction plans. Any proposed structures will need to meet state and local guidelines the reduce the risk potential damage from a inundation flood. This may include placement of structures outside the identified flood zone or raising the elevation of foundation with appropriate erosion control above the base floodplain elevation. With adherence to state and local planning requirements, potential damage from flooding during construction and operations would be less than significant.

Mitigation Measure(s):

None required.

WQ-8 : Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Site ZHQ lies partially within a 100 year floodplain. Dams, levees, or other water storage features are not present upgradient from the site, limiting potential for significant risk of loss, injury, death involving flooding during construction or operations..

Mitigation Measure(s):

None required.

WQ-9 : Would the project result in inundation by seiche, tsunami, or mudflow?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Site ZHQ partially lies within a coastal flood inundation zone and within a tsunami inundation zone. Early warning associated with the Southern California Emergency System would prevent potential injury or harm from an unlikely occurrence of tsunami to workers during construction activity. State and local planning agencies will review proposed construction plans. Any proposed structures will need to meet state and local guidelines the reduce the risk of potential damage from a inundation flood or tsunami. This may include placement of structures outside the identified flood zone or raising the elevation of foundation with appropriate erosion control above the base floodplain elevation. With adherence to state and local planning requirements, potential damage from flooding will be less than significant.

Mitigation Measure(s):

None required.

Land Use Planning

Setting

Is the site on federally owned or administered land?: No

If yes, which agency: N/A

Is the site on state owned or administered land?: No

If yes, which department?: N/A

Is the site located within the Coastal Management Zone?: Yes

If yes, please explain: Malibu Coastal Zone

Is the site located within a Airport Land Use Plan area?: No

If yes, provide name of airfield/airport: N/A

If yes, provide name of applicable Airport Land Use Plan: N/A

Applicable HCP or NCCP: N/A

Local Agency Jurisdiction: Malibu

General Plan Designation: Public Open Space

Zoning: Public Open Space

What is the zoning height restriction, if any?:

28 feet

City or county permit requirements for communication facilities, if any:

Conditional Use Permit

Comprehensive Plan or General Plan Local Agency: Malibu

Los Angeles County Community or Area Plan: N/A

City of Los Angeles Community or Area Plan: N/A

Other Special District, Area or Specific Plan: N/A

Impact Analysis

LU-1: Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Site ZHQ is located adjacent to the Pacific Coast Highway on a site that is fully developed, including roof-mounted communication facilities, within the City of Malibu Coastal Zone. The City of Malibu Coastal Zone Land Use Plan was certified by the California Coast Commission on September 13, 2002 and provides for communication facilities as a conditional use in all land use designations. Policies in the Land Use Plan include avoiding or minimizing impacts to Environmentally Sensitive Habitat Areas and scenic resources; avoiding facility visibility from public viewing areas; and co-locating facilities where feasible. Per Local Implementation Plan Policy 3.14.1, the general requirements for every wireless telecommunications facility and antenna include development standards specifying that the maximum height of ground or building-mounted antennae shall not exceed 28 feet. However, if the antennae elements are mounted flush on an existing structure that exceeds 28 feet, the antennae elements may be equal to the height of the building. Roof-mounted antennae may extend no more than 3 feet

about the roof from which they are attached. Per Land Use Plan Policy 6.36, telecommunications facilities along Pacific Coast Highway shall place support facilities underground, where feasible. The proposal is to mount whip and microwave antennas on a proposed 28-foot-tall monopole at the site. The proposal is in compliance with the City of Malibu Coastal Zone Local Implementation Plan section on wireless telecommunications antennae and facilities as well as other city plans, policies, and ordinances.

Mitigation Measure(s):

None required.

LU-2: Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

No Habitat Conservation Plan or Natural Community Conservation Plan has been identified that is applicable to this site location.

Mitigation Measure(s):

None required.

Noise

Setting

City: Malibu

Applicable Noise Ordinance: Title 8 Health and Safety, Chapter 8.24 Noise

Noise Level Threshold: N/A; no construction from 7 pm to 7 am on weekdays, before 8 a.m. or after 5 p.m. on Saturday, or any time on Sundays or holidays

ALUP or Within 2 Miles of Public Airport: No

Private Airport in Vicinity: No

Distance to Nearest Off-Site Sensitive Receiver: 25 feet

Ambient Noise Level: 45 dBA

Sensitive Noise Receiver 1: recreation area (beach)

Sensitive Noise Receiver 2: Single Family Residential Dwellings

Sensitive Noise Receiver 3: N/A

Impact Analysis

NOI-1: Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

As discussed in Chapter 3.9, Land Use/Planning, the Authority is not subject to certain local land-use plans, policies, and regulations, under the doctrine of intergovernmental immunity (Cal. Gov. Code § 53090(a)). Therefore, the noise level standards and permitted hours of construction established in local general plans and noise ordinance are not necessarily applicable to the Project; however, the Authority will work cooperatively with local jurisdictions and make every effort to comply with local standards and regulations.

Hourly average construction noise levels are anticipated to be approximately 89 dBA. The predicted noise levels represent the demolition phase which is anticipated to be the loudest construction phase. Construction would be scheduled to occur within the specified hours when construction activities are allowed pursuant to the noise ordinances established by the city or county with jurisdiction at the given site. However, in some instances, it may be necessary for construction activities to take place outside of these specified hours due to an accelerated construction schedule or avoidance of peak traffic hours in urban locations requiring night or weekend work.

Because there are no federal or state standards for short-term noise exposure, thresholds for construction noise are based upon local ordinances where they apply. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is applicable to the Authority, this would be a significant impact. If construction outside of specified hours is necessary in a jurisdiction with a noise ordinance that is not applicable to the Authority under the doctrine of intergovernmental immunity, this would not be a significant impact.

The affected jurisdiction has not established a construction noise level threshold. Therefore, construction noise levels at the proposed Project site would not generate noise in excess of standards established in the local general plan or noise ordinance; and impacts during construction of the Project would be less than significant.

Because noise level thresholds have not been established in the local ordinance, a 60 dBA "normally acceptable"

community noise equivalent level (CNEL) developed by the California Department of Health Services was referenced in the analysis of the dominant noise source during Project operation, which is HVAC units for equipment shelters. According to the Air Conditioning, Heating, and Refrigeration Institute standards and Project assumptions, noise emissions from the HVAC systems would be approximately 53 dBA CNEL at 20 feet. In addition, emergency diesel generators would operate intermittently, for backup power purposes. Noise from diesel generators operating inside solid enclosures would be 58 dBA CNEL at 21 feet. Noise levels from both sources would be below the 60 dBA “normally acceptable” level. Therefore, operational noise would not exceed any standards established in a local general plan or ordinance, or applicable standards of other agencies.

Mitigation Measure(s):

None required.

NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Groundborne vibration noise levels were calculated and compared to the FTA 80 VdB general assessment guideline for infrequent events. Construction activities for the proposed Project sites would include demolition, site preparation, excavation, and pad construction phases under a maximum construction scenario. Equipment used during these phases that are potential sources of vibration during construction include an excavator, similar to a small bulldozer, 3-ton flatbed truck, dump truck and concrete truck, similar to a loaded truck, and a jackhammer. Groundborne vibration noise levels from construction equipment used for this Project could range from 58 VdB to 86 VdB at a distance of 25 feet. A sensitive receiver (recreation area) is located within 25 feet of Project site ZHQ; therefore, groundborne vibrational noise impacts would be significant.

For areas outside unincorporated Los Angeles County, a construction vibration damage assessment based on criteria, as defined by FTA, was applied. The FTA criteria identify construction vibration ranging from 0.12 peak particle velocity (PPV) in inches per second for buildings extremely susceptible to vibration damage to 0.5 PPV for reinforced-concrete, steel, or timber (no plaster) buildings. Based on these criteria, the estimated vibration levels for equipment that will be used in the construction of the proposed Project sites, specifically loaded trucks, jackhammers, and small bulldozers, vibration damage is estimated at 0.003 to 0.089 PPV at 25 feet. There are no extremely sensitive (fragile) buildings or sensitive receivers within this distance to the site; therefore, impacts from groundborne vibration would be less than significant.

Upon completion of construction, the proposed Project would not require the routine operation of any groundborne noise or vibration-generating equipment. One piece of equipment that would be a potential intermittent source of vibration during the operation of proposed Project sites is a backup generator. Newly manufactured portable generators are typically equipped with rubber mounts or other vibration reducing hardware to isolate the vibratory motion of the operating generator motor from stationary mounting surfaces. Other units incorporate vibration dampening into the motor design. Therefore, extremely sensitive (fragile) buildings and sensitive receivers would not be exposed to excessive groundborne vibration or groundborne noise from Project operation and impacts would be less than significant.

Mitigation Measure(s):

NOI MM 1

Prior to commencement of construction at Site ZHQ, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction vibration impacts. Such measures may include but are not limited to the following:

- Route heavily-loaded trucks away from residential streets, if possible, selecting streets with the fewest homes if no other alternatives are available.

- Operate earth moving equipment including excavators/mini excavators and dump trucks as far away from vibration-sensitive locations as possible.
- Phase demolition and earth-moving operations so as not to occur simultaneously. Total vibration could be significantly less when each vibration event occurs separately.

NOI-3: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: Less than Significant Impact

Discussion:

Although construction activities associated with the proposed Project site would generate increases in noise levels, these increases would be temporary and of short duration. There are no federal or state standards for short-term noise exposure and local noise ordinance for this Project site does not established thresholds for temporary or periodic noise level increases above the ambient noise level.

Applying FTA criteria that establish guidelines for when adverse community reaction to construction noise can occur on a temporary basis, the estimated noise level at 25 feet from proposed sites would be 89 Dba and not exceed the 90 Dba daytime criterion but would exceed the 80 Dba nighttime criterion; therefore, construction noise impacts for this Site would be significant.

For purposes of evaluating whether operation of the Project would result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project, the FTA guidelines for temporary increases above ambient noise levels were also applied.

During operation of the proposed Project sites, emergency diesel generators with a 35 kilowatt (Kw) to 100 Kw power range would operate one hour per month as part of routine maintenance and would operate to provide backup power in the event of a power outage. Noise from diesel generators varies greatly depending on the size and design. Newer models generally have built-in attenuation. The diesel generators used for this Project are assumed to have a noise rating of 68 Dba at 21 feet. Furthermore, the emergency generators would be housed by solid walls, which would attenuate at least 10 Dba. The resulting noise emissions would be 58 Dba at 21 feet or 56 Dba at 25 feet. Receivers are located 25 feet from this project site and with existing ambient noise levels typically ranging from 45 Dba to 60 Dba. Adding the operational noise to ambient conditions would not exceed FTA daytime (90 Dba) or nighttime (80 Dba) thresholds; therefore, impacts from operational noise would be less than significant.

Mitigation Measure(s):

NOI MM 2

• Prior to commencement of construction of Site ZHQ, the contractor shall demonstrate, to the satisfaction of the Authority, measures that will reduce construction noise impacts below the levels specified in FTA nighttime threshold. Such measures may include but are not limited to the following:

- Use noise blankets or other muffling devices on equipment and quiet-use generators at noise-sensitive receivers.
- Use well-maintained equipment and have equipment inspected regularly.
- Operate construction equipment for periods of fewer than 15 consecutive minutes when possible.

NOI-4: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within an airport land use plan or within two miles of a public airport. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

NOI-5: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

This site is not located within the vicinity of a private airstrip. Therefore, construction of this site would not expose people to excessive noise levels. After construction, the sites will be unmanned during operation except for occupational maintenance. Therefore, operation of the project would not expose people residing or working in the project area to excessive noise levels.

Mitigation Measure(s):

None required.

Recreation

Setting

California Coastal Zone: Yes

If yes, Plan or Designation Area: City of Malibu Local Coastal Program, Land Use Plan

Angeles National Forest: No

If yes, Plan or Designation Area: N/A

On National Park Service Land within the Santa Monica Mountains National Recreation Area: No

If yes, Plan or Designation Area: N/A

National or California State Park: No

If yes, Plan or Designation Area: N/A

Located in the Vicinity of Trails: No

Trail Name: N/A

Parks and other Recreational Areas: Yes

Other Recreational Area Names: Zuma Beach County Park

REC-1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Development of the LMR site would not result in an increased use of parks or other recreational facilities. Communication facilities would not serve as an attraction that would increase visitation of existing parks or recreation areas. The construction work force would be obtained from the local population so there would be no increase in the general population to put additional demand on the existing recreational facilities or prompt the need to expand on existing parks and other recreational facilities. While the proposed project is within or near areas used for recreation, the proposal is an expansion of or addition of equipment to an existing facility with communications equipment. Consequently, the proposed changes would not substantively change the recreation experience to those visiting the general vicinity. There is existing access to the site, and the proposed action to further develop the site would not change access to parks or other recreational facilities in near proximity to the LMR site.

Mitigation Measure(s):

None required.

Transportation

Setting

Conflicts With Plan/Ordinance Protecting the Effectiveness of Circulation System: No

Applicable Congestion Management Program: LA Congestion Management Program

County Congestion Management Road or Highway: Pacific Coast Hwy

Distance (Miles):

Disaster Route: Highway 1/Pacific Coast Highway

Transit, Bicycle, or Pedestrian Facilities: No

Within Vicinity of Aviation Facility: No airports within 5 miles

Nearest Highway/Freeway: Us Highway 101

Distance (Miles): 0

Nearest Major Arterial: Highway N-9

Distance (Miles): 1.35

Access to the Project Site Provided Via: Zuma Beach Access Road

Impact Analysis

TRAN-1: Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site does not conflict with an applicable plan, ordinance, or policy associated with the performance of the circulation system (including mass transit, nonmotorized travel, intersections, streets, highways and freeways, pedestrian and bicycle paths) or otherwise decrease the performance or safety of such facilities. No effects on mass transit are anticipated. Any excavated material associated with trenching would be very short term with required access maintained for vehicles, bicycles, and pedestrians. Based on the equipment needs and the typical work force size, an average of 25 trips to each proposed Project site would be made daily during the approximately 6-week construction phase. In this urbanized area, this construction-related traffic would be less than one-quarter of a percent of the average daily traffic.

Mitigation Measure(s):

None required.

TRAN-2: Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

The site is within 2 miles of a route identified in the local county Congestion Management Plan, thus increasing

the potential that vehicles accessing the sites for construction or maintenance would contribute to congestion. The effects would be nearly indistinguishable from existing levels of traffic on these routes because the approximately six-week construction period would typically add fewer than 25 round trips by vehicle per work day and the increase in traffic would be less than 1 percent of the average daily traffic for sites near a route in the CMP. Because fewer than 50 trips would be added during either the AM or PM weekday peak hours, the preparation of a transportation impact analysis is not required.

Mitigation Measure(s):

None required.

TRAN-3: Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

There are no airports within 5 miles of the site; air traffic would be expected to be at altitudes high enough that proposed communications system equipment would not change air traffic patterns or pose a substantial safety risk.

Mitigation Measure(s):

None required.

TRAN-4: Would the project result in inadequate emergency access?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

Construction-related traffic would be limited to 25 trips per day at each site, and typically would be less than 1 percent of average daily traffic on nearby streets. Construction-related activities may require lane narrowing at a driveway or detours in the parking lots of existing facilities. These actions could temporarily impair access on adjacent roadways, potentially creating traffic hazards and limiting emergency access, resulting in a significant impact. Vehicle trips generated during operations would not be of sufficient volume to affect the level of service of any roadway. With operation of the LMR system, communications for first responders would be enhanced and provide opportunities for better communications associated with access during emergencies.

Mitigation Measure(s):

TRANS MM 1: The construction contractor shall maintain a minimum of one open lane of traffic at all site access roads during project construction. Use of standard construction traffic control practices such as flagmen, warning signs, and other measures shall be implemented as necessary to ensure that traffic flow remains uninterrupted at all times.

TRANS MM 2: Any temporary road or lane closures that may affect state highways shall be coordinated with Caltrans prior to commencement of construction at the site that will require the road or lane closures. If construction requires temporary road or lane closures on roads and streets managed by local entities, a traffic management plan shall be prepared and submitted to the relevant county and/or city public works department or other appropriate department for approval prior to commencement of construction at the site. Encroachment permits would be obtained where applicable.

Utilities

Setting

Nearest Solid Waste Disposal Facility: Calabasas Landfill

Adequate Disposal Capacity: Yes

Site Served by or has Available Access to Domestic Water System: L A COUNTY WATERWORKS DIST #29

Impact Analysis

UTI-1: Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Construction Impact: Significant Impact Reduced to Less than Significant with Mitigation Incorporated

Operational Impact: No Impact

Discussion:

• Where a new monopole or lattice tower would be constructed, some excavation activities for construction of deep foundations could require dewatering. When perched groundwater is encountered for tower support foundations and does meet requirements for discharge to the environment, a groundwater discharge permit would be obtained from the applicable RWQCB and removal or discharge of water would be in accordance with the terms and conditions of the permit. If treatment at a wastewater treatment plant is necessary, each of the wastewater treatment plants identified within the service area of Project sites would have the capacity to address the demand as no more than 20,000 gallons would be expected to be extracted from a given site and the volume of water would be less than 1 percent of the total daily capacity of even the smaller wastewater treatment plants.

Mitigation Measure(s):

UTL MM 1, Discharge Permit: In the event groundwater in sufficient quantity is encountered to require dewatering, a discharge permit would be obtained from the applicable RWQCB prior to construction, and removal or discharge of water would be in accordance with the terms and conditions of the permit.

UTI-2. Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Some grading may occur at the site and the addition of up to 4,000 square feet of impermeable surfaces for foundations would increase stormwater runoff where soils on site naturally drain well. Building pads would be designed for positive drainage toward existing natural and/or storm drain catchment areas with the capacity to support the additional runoff associated with new impervious surfaces. No new storm-water drainage facilities or expansions of existing facilities are anticipated as a result of the proposed Project sites.

Mitigation Measure(s):

None required.

UTI-3. Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Construction Impact: Less than Significant Impact

Operational Impact: No Impact

Discussion:

Water for dust abatement and other on-site construction uses is projected to be up to 500 gallons for dust

abatement and other on-site construction uses during the approximately six-week duration of construction and would be hauled to each site by water truck or water trailer. Existing water supplies would be used to satisfy the short-term need. The total water requirement for a Project site would be about .0003 percent of the daily treated water supply processed by the LACSD. Water supplies from existing entitlements and resources would be sufficient to serve the Project. No water would be required for operations.

Mitigation Measure(s):

None required.

UTI-4: Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Construction Impact: Less than Significant Impact

Operational Impact: Less than Significant Impact

Discussion:

Solid waste would be generated during construction of the proposed Project sites, including up to 50 tons of largely reusable and recyclable construction debris (wood, metal cardboard, waste concrete), and discarded trash. In compliance with California Green Building Standards Code found at Title 24 of the California Code of Regulations, Part 11, Section 5.408.1, waste materials would be reused, recycled, and/or composted to further minimize the volume of waste by at least 50 percent of the construction waste that is generated. Based on the identified applicable landfills for each proposed Project site and the known capacity limits (up to 5,000 tons/day), construction of the Project sites, even without requirements for reuse and recycling, would not exceed the permitted capacity of the landfill(s) serving each Project site.

Once constructed, solid waste generated by the proposed Project would be limited to equipment components that have failed and need to be replaced; such waste generation would be infrequent and small in quantity. Waste from operations would not exceed the permitted capacity of the landfill(s) serving each site.

Mitigation Measure(s):

None required.

UTI-5: Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Construction Impact: No Impact

Operational Impact: No Impact

Discussion:

Solid waste generated during construction and maintenance of the LMR sites would be handled in a manner that is consistent with federal, state, and local statutes applicable to the type of solid waste generated.

Mitigation Measure(s):

None required.

5.0 Other CEQA Considerations

5.1 Energy Conservation

Pursuant to CEQA Guidelines Appendix F, an EIR should consider potentially significant energy impacts of a project caused by wasteful, inefficient, or unnecessary consumption of energy. The following section describes existing energy use and systems in the vicinity of the proposed Project, and provides information about the proposed Project's construction, transportation and operational energy impacts.

5.1.1 Environmental Setting

Construction and operation at each of the proposed Project sites would require use of electricity, and a mix of diesel and gasoline; use of natural gas is not anticipated at any site. Power required for construction would consist of gasoline and diesel for vehicles, construction equipment and generators. Once each Project site becomes operational, energy required during normal operating conditions would be provided via electrical utility service, and only minimal gasoline or diesel would be used by maintenance workers visiting the site monthly, and from monthly scheduled testing of the diesel generators. Automatic transfer switches would accommodate automatic transfer of power sources in the event of an electrical utility outage and would be capable of being monitored remotely. During emergency conditions 85 kilowatt diesel-powered emergency generators would power equipment at the site for up to seven days at most sites. Remote sites would be equipped with larger diesel storage tanks to provide up to 14 days of emergency power. Routine maintenance visits and inspections of the Project sites would use a fleet powered by gasoline and diesel engines.

5.1.1.1 Electricity

Based on data from the State of California Energy Consumption Data Management System Los Angeles County consumed approximately 69.9 billion kilowatt hours of electricity (kWh) in 2014 (California Energy Commission 2016a). This would equate to approximately 5.8 billion kWh electricity consumed per month on average.

Electrical service to the proposed Project sites would be provided by four utilities: Glendale Water and Power, Los Angeles Department of Water & Power, Pasadena Water & Power, and Southern California Edison. Consumption by utility is provided in Table 5.1-1.

Table 5.1-1: Electrical Consumption by Utility

Service Provider	Service Area	Utility Consumption (Million KWh)		
		2014	2013	2012
Glendale Water & Power	City of Glendale	1,112.0	1,101.0	1,109.0
Los Angeles Department of Water & Power	City of Los Angeles	21,376.8	22,521.1	23,600.9
Pasadena Water & Power	City of Pasadena	1,126.8	1,143.6	1,098.8
Southern California Edison	Southern California	87,418.4	85,221.6	86,043.5

Source: California Energy Commission 2016b

5.1.1.2 Gasoline and / or Diesel Fuel

Los Angeles County consumed approximately 2.4 billion gallons of gasoline in 2012, 2.5 billion gallons in 2013, and 2.3 billion gallons in 2014 (California Energy Commission 2016). While data was not available for county-wide consumption of diesel fuel, the state Board of Equalization does report that diesel consumption equates to about 19 percent of gasoline usage in the state. Reported and extrapolated gasoline and diesel consumption data are provided in Table 5.1-2

Table 5.1-2: Fuel Consumption in Los Angeles County

Fuel Type (unit)	Los Angeles County Consumption		
	2014	2013	2012
Gasoline (million therms)	2,858	3,129	2,993
Gasoline (million gallons) ¹	2,288	2,505	2,396
Diesel (million gallons) ²	435	476	455

Source: California Energy Commission 2016c, California Board of Equalization 2013

¹Data extrapolated from California Energy Commission 2016c

²Data extrapolated from California Energy Commission 2016c and California Board of Equalization 2013

5.1.2 Regulatory Setting

5.1.2.1 Federal Regulatory Setting

Energy Policy Act of 2005

The Energy Policy Act of 2005 was enacted to promote the usage of renewable energy sources in addition to a reduced reliance on fossil fuels, higher energy efficiency in buildings, and increasing the percentage of alternative fuel vehicles.

Fuel Efficiency Standard

The Federal Government sets fuel efficiency standards for construction equipment. The first federal standards (Tier 1) were adopted in 1994 for all off-road engines over 50 horse power (hp) and to be phased in by 2000. In 1998, a new standard was adopted that introduced Tier 1 for all equipment below 50 hp and introduced the Tier 2 and Tier 3 standards. Tier 2 and Tier 3 standards for all equipment were

to be phased in by 2008. Tier 4 efficiency requirements are contained in 40 Code of Federal Regulations Parts 1039, 1065, and 1068 (originally adopted in 69 Federal Register 38958 [June 29, 2004], and were most recently updated in 2014 [79 Federal Register 46356]). Emissions requirements for new off-road Tier 4 vehicles are to be completely phased in by the end of 2015.

Corporate Average Fuel Economy (CAFE) Standards

New federal rules have been adopted that set national GHG emissions standards and will significantly increase the fuel economy of all new passenger cars and light trucks sold in the United States. The National Highway Traffic Safety Administration (NHTSA) has established fuel economy standards that strengthen each year reaching an estimated 34.1 mpg miles per gallon for the combined industry-wide fleet for model year 2016. (See 75 Fed. Reg. 25324 et seq. [May, 7, 2010]).

5.1.2.2 State Regulatory Setting

Executive Order S-1-07

Executive Order S-1-07, which was signed by Governor Schwarzenegger in 2007, proclaims that the transportation sector is the main source of GHG emissions in California. It establishes a goal to reduce the carbon intensity of transportation fuels sold in California by at least 10 percent by 2020. As a result of this order, CARB approved a proposed regulation to implement the Low Carbon Fuel Standard (LCFS) on April 23, 2009, which would reduce GHG emissions from the transportation sector in California by about 16 MMT by 2020. The LCFS is designed to reduce California's dependence on petroleum, create a lasting market for clean transportation technology, and stimulate the production and use of alternative, low-carbon fuels in California. The LCFS is designed to provide a durable framework that uses market mechanisms to spur the steady introduction of lower carbon fuels. The framework establishes performance standards that fuel producers and importers must meet each year beginning in 2011.

California Renewable Portfolio Standard

Established in 2002 under SB 1078, and accelerated by SB 107 [2006] and SB 2 [2011], California's RPS obligates investor-owned utilities, energy service providers and community choice aggregators to procure 33 percent of their electricity from renewable energy sources by 2020. The California Public Utilities Commission (CPUC) and the California Energy Commission (CEC) are jointly responsible for implementing the program. Renewable energy generation data for the utility service providers in the Project area is described below in Table 5.1-3.

Table 5.1-3: Renewable Energy Generation

Service Provider	Year	Renewable Energy Sources	Percentage of Energy Sales
Glendale Water & Power	2014	Hydroelectric, solar, landfill gas, and geothermal	20%
Los Angeles Department of Water & Power	2013	Wind, landfill gas, and solar	20%
Pasadena Water & Power	2014	Solar, geothermal, and landfill gas	20%
Southern California Edison	2014	Geothermal, wind, solar, hydroelectric and landfill gas	23.5%

Executive Order B-30-15 (EO B-30-15)

A new statewide goal for the reduction of greenhouse gas emissions was established by Governor Edmund G. Brown on April 29, 2015. Achievement of the reduction target of 40 percent below 1990 levels by 2030 established in EO B-30-15, coupled with the Clean Energy and Pollution Reduction Act of 2015 (Senate Bill 350), will result in substantial carbon emissions reductions due to increasing statewide usage of renewable energy to 50 percent by 2030.

5.1.3 Significance Criteria:

- 1) Would construction of the proposed Project use large amounts of energy or use energy in a wasteful manner?
- 2) Would operation of the proposed Project use large amounts of energy or use energy in a wasteful manner?
- 3) Would the proposed Project result in the construction or expansion of energy infrastructure that would cause significant environmental effects?

5.1.4 Impact Analysis

As noted earlier in this section, the guidance on energy conservation in CEQA Guidelines Appendix F is based on the statutory requirement that the mitigation measures in an EIR include “measures to reduce the wasteful, inefficient, and unnecessary consumption of energy” (Pub. Resources Code Section 21100(b)(3)). Consistent with this mandate, CEQA Guidelines Appendix F lists possible energy impacts and potential conservation measures that should be considered in an EIR when they are “applicable or relevant to the project” and the impacts are “potentially significant.” Appendix F does not mandate the analysis of particular energy-related impacts or include specific significance criteria by which to measure a project’s energy impacts. However, the Authority has determined that application of the following significance criteria are appropriate for use in this EIR and will allow it to determine whether

construction and operation of the proposed Project would result in the wasteful, inefficient or unnecessary consumption of energy.

Impact Energy-1: Would construction of the proposed Project use large amounts of energy or use energy in a wasteful manner?

Construction Impacts

Construction of the proposed Project would require the use of electricity and gasoline and / or diesel fuel.

Construction of the proposed Project would utilize electrical service, which is currently available at the majority of proposed Project sites via Southern California Edison, Los Angeles Department of Water & Power, Pasadena Water & Power, and Glendale Water & Power, and from generators. Electrical demand during construction would be minimal, and required only for operation of power hand tools, occasional lighting, and other minor equipment needed to build each site over a six week period. Electrical demand during would be temporary and likely less than 100 kWh per day. This is considered de minimis compared to 69.9 billion kWh of electricity consumed in Los Angeles County in 2014 (which would equate to approximately 192 million kWh per day). Construction of the proposed sites would not use large amounts of electricity and would not use it in a wasteful manner and impacts associated with use of energy during construction. Impacts would be less than significant.

Assumptions for the vehicle types, the number of trips, and other equipment used during construction of a proposed Project site are provided are provided in Appendix B. This equipment and usage is based on a hypothetical worst case scenario (also referred to as a composite site) relative to the maximum extent of site preparation activities, such as demolition and grading, and construction of the tower and ancillary facilities. Based on this worst case scenario if all equipment at the site was powered by gasoline each site would utilize approximately 6,912 gallons of fuel during construction totaling approximately 373,000 gallons of fuel for 54 sites. If all fuel used at each site were diesel, this would compare to 435,000,000 gallons used in 2014 in Los Angeles County, or about .08 percent of total construction. If all fuel used at each site were gasoline (total use of 2.288 billion gallons in 2014) total fuel use consumed during construction would be approximately 0.016 percent of total 2014 usage in Los Angeles County. Use of fuel during construction would be temporary. Construction of the proposed sites would not use large amounts of gasoline or diesel fuel and would not use it in a wasteful manner. Impacts associated with use of fuel for energy during construction would be less than significant.

Mitigation Measures

No mitigation measures are required.

Operational Impacts

Impact Energy-2: Would operation of the proposed Project use large amounts of energy or use energy in a wasteful manner?

Operation of the proposed Project sites would require electricity for the radio equipment and air conditioning units within the shelters along with security and FAA compliant lighting, where applicable. With the exception of three remote locations (sites GMT, JOP, and PMT) which are off the power grid, the proposed Project sites would utilize power that is either currently available at the sites.

Operation and maintenance of each proposed Project site would have a maximum power draw in the range of approximately 15 to 52 kWh. An average of 35 kWh was used to estimate a site's monthly consumption. This value would equate to 25,550 kWh per month per site, or 306,600 kWh per year per site. Total electrical use at 54 sites would be approximately 16.6 million kWh per year, or about 0.002 percent of total annual electrical demand in Los Angeles County.

Southern California Edison, Los Angeles Department of Water & Power, Glendale Water & Power, and Pasadena Water & Power would supply the electricity for the vast majority of Project sites. The electricity derived from these utility providers for operation of the Project would not cause a substantial increase in demand for energy production and would not require the construction of or need for additional energy generation facilities. As shown above in Table 5.1-3, electric utility service providers in the Project area are meeting or exceeding the current state regulations for the use of renewable energy. As such, the electricity requirements for operation of the proposed Project would result in a less than significant impact relative to the use of large amounts of energy or use energy in a wasteful manner. Operational impacts would be less than significant.

Operation of the proposed Project would require a minimal amount of diesel stored in the storage tanks used to fuel the emergency generators. The use of alternative fuels, such as biodiesel for the generators as well as maintenance vehicles would be considered during final design of the proposed Project sites. Maintenance visits to the proposed Project sites and annual inspections will require a minor amount of fossil fuel, which may be either gasoline or diesel, depending on the vehicles required for maintenance operations. In addition, the total number of vehicle trips is anticipated to be less than existing conditions due to the consolidation of LMR service, which would reduce the number of jurisdictions visiting the sites for maintenance and inspections. Vehicle trips to the proposed Project sites and fuel to power diesel generators would not result in use large amounts of energy. Consumption of fuel during operation of the project would not use large amounts of energy or use fuel in a wasteful manner. Operational impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

Impact Energy-3: Would the proposed Project result in the construction or expansion of energy infrastructure that would cause significant environmental effects?

Construction Impacts

As noted under Impact Energy 2, demand for electricity during construction would be minimal at each proposed project site. There would be no potential for construction of the proposed Project to result in

construction or expansion of energy infrastructure. Impacts would be less than significant for this threshold.

Mitigation Measures

No mitigation measures are required.

Operational Impacts

The 16.6 million kWh annual operational demand of the proposed Project is minor compared to nearly 70 billion kWh annual demand in Los Angeles County and would be met without the need for new generation facilities or new transmission lines. As such, the electricity requirements for operation of the proposed Project would result in a less than significant impact relative to need for construction or expansion of energy infrastructure to accommodate the project.

Mitigation Measures

No mitigation measures are required.

5.2 Growth-Inducing Impacts

CEQA requires an EIR to describe any growth-inducing impacts of the proposed project (Pub. Res. Code Section 21100(b)(5); CEQA Guidelines Section 15126.2(d).) An EIR must discuss “the ways” in which the project could directly or indirectly foster economic or population growth or the construction of additional housing in the surrounding environment. (CEQA Guidelines Section 15126.2(d).) The discussion should also describe growth-accommodating features of the project that may remove obstacles to population growth. In addition, characteristics of the project that may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively, need to be addressed.

Significant growth impacts could occur if a project provides infrastructure or service capacity to accommodate growth levels beyond those permitted by local or regional plans and policies. New employees hired for proposed commercial and industrial development projects and population growth resulting from residential development projects represent direct forms of growth. A project would indirectly induce growth if it would increase the capacity of infrastructure or facilities in an area in which the public service currently meets demand.

The proposed Project is designed to improve communications among emergency responders in Los Angeles County. It would entail installation of telecommunications facilities to support emergency response communications and would not improve commercial communications systems available to the general public. It would not provide infrastructure or service capacity to accommodate economic or population growth. It would not increase capacity or extend infrastructure for public use.

The current state of emergency response communications in Los Angeles County is not identified as an impediment to growth; therefore, improving emergency response communications would not remove an obstacle to population growth and is not growth-inducing.

5.3 Radiofrequency Exposures

The FCC is responsible for evaluating the effect of exposure from FCC-regulated transmitters on the quality of the human environment. Safe radiofrequency (RF) exposure limits are specified by the FCC in terms of maximum permissible exposure (MPE) limits that vary with frequency. The requirements for RF-electromagnetic energy exposure compliance are contained in FCC Office of Engineering and Technology (OET) Bulletin 65, *Evaluating Compliance with FCC Guidelines for Human Exposure to Radiofrequency Electromagnetic Fields* (FCC 1997).

The FCC has established an occupational/controlled MPE of 5 milliwatts per square centimeter (mW/cm^2) and an uncontrolled MPE of $1 \text{ mW}/\text{cm}^2$ for equipment that operates above the 1500-MHz frequency range. For equipment operating at 700 MHz, the occupational MPE is $2.83 \text{ mW}/\text{cm}^2$ and an uncontrolled MPE of $0.57 \text{ mW}/\text{cm}^2$. The occupational/controlled exposure limits apply in situations in which persons are exposed during employment or are otherwise temporarily in a location where these limits apply. Application of this limit can be used only when individuals are fully aware of the potential for exposure and can therefore exercise control over that exposure. The general population / uncontrolled exposure limits apply in situations where persons may not be fully aware of the potential for exposure and, therefore, do not exercise control over exposure. The FCC further requires that antenna sites be placarded, that workers be trained to preclude any potential occupational exposures at sites, and that other control measures such as fencing out unauthorized persons and/or shielding of antennas are put into place, where warranted.

Operation of antenna equipment at proposed Project sites would produce RF emissions. RF emissions from operation of each site are not permitted to exceed the MPE standards established by the FCC as set forth in 47 CFR Sections 1.1307 and 1.1310. To comply with this legal standard at each operational site, the Authority will require its contractor to perform an RF emission safety study prior to construction that will model the RF emission level from all equipment on site and demonstrate that it complies with the FCC guidelines and regulations on MPE for the General Public / Uncontrolled and for the Occupational / Controlled groups per the FCC's OET Bulletin 65. After installation of the proposed Project site equipment and prior to operation, the contractor will conduct field measurements to confirm RF emission levels are in compliance and will identify, resolve, and correct any noncompliance (including posting appropriate signage) until compliance can be demonstrated.

Radiofrequency exposures at proposed LMR project sites would be managed in accordance with applicable regulations contained in OET Bulletin 65.

5.4 Significant and Unavoidable Environmental Effects of the Project

CEQA Guidelines Section 15126.2(b) requires an EIR to describe “any significant impacts, including those which can be mitigated but not reduced to a level of insignificance.” Impacts for every resource category required under CEQA were evaluated in Chapter 3.0, and mitigation measures were included for those impacts that were determined to be significant. Thresholds of significance were used to identify potential effects on the environment that could result from construction and operation of the proposed Project. Using Appendix G, *Environmental Checklist* of the CEQA Guidelines, the evaluation of environmental effects led to the categorization of impacts into the following four categories:

- No Impacts
- Impacts found to be less than significant – Minor impacts or changes to the existing situation may occur either temporarily or permanently but are not significant in either case.
- Impacts found to be significant but reduced to less than significant with mitigation – Impacts would occur, but they can be mitigated to less than significant levels.
- Impacts found to be significant and unavoidable – Significant impacts would occur and cannot be reduced to less than significant levels with mitigation measures.

This section identifies project impacts that, even with the implementation of all identified mitigation measures, would remain potentially significant, and are therefore considered unavoidable.

5.4.1 Aesthetics

AES-1: Would the project have a substantial adverse effect on a scenic vista?

Significant impacts have been identified at sites H-69B and JOP. The only potential measure to mitigate impacts at these sites is painting the towers to blend with their visual settings, but this measure is infeasible as FAA guidelines (FAA Advisory Circular 70/7460-1L) govern the paint colors to be used on towers for aviation safety purposes. Additionally, the visual impact of the towers would remain significant if they were painted to blend with the site’s visual setting. As such, no feasible mitigation measures exist to reduce the impacts to less than significant levels. Therefore, impacts are significant and unavoidable at sites H-69B and JOP.

AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Significant impacts have been identified at sites H-69B and JOP. The only potential mitigation measure available is to paint the new facilities to blend with the site’s visual setting. This measure is infeasible. FAA guidelines (FAA Advisory Circular 70/7460-1L) require specific paint colors to be used on towers for aviation safety purposes. Additionally, the visual impact of the towers would remain significant if they were painted to blend with the site’s visual setting. As such, no feasible mitigation measures were

identified to reduce the impacts to less than significant levels. Therefore, impacts are significant and unavoidable at sites H-69B and JOP.

5.4.2 Cultural Resources

CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in §15064.5.

As discussed below, Given the magnitude of the ground disturbance and the extent of the resources present at Project sites H-69B, LACFCP08, LACFCP09, and LPC, even with implementation of the required mitigation measures, impacts would not be reduced to less than significant levels. Therefore, impacts at these four Project sites would be significant and unavoidable.

Site H69-B. Archaeological monitors would be required during all ground-disturbing activities at Project site H-69B. Because of the proximity of archaeological resources to the Project construction area, access to archaeological areas would also be restricted to all construction and operational personnel. With implementation of CUL MMs 1, 3, and 4 impacts would be minimized; however, given the magnitude of the ground disturbance and the location and extent of the resources present at this project site, mitigation measures would not reduce impacts to less than significant levels.

Standard approaches to mitigation for towers (painting/camouflage) (I.E., CUL MM 5), particularly for towers of this height, would not be effective and would not reduce the visual impacts to less than significant levels. In addition, the painting of tall telecommunications towers is controlled by FAA Advisory Circulars 47 CFR § 17.21-17.58 to prevent aviation hazards; therefore, painting would not be a feasible mitigation at this Project site.

Site LACFCP08. Archaeological monitors would be required during all ground-disturbing activities at Project site LACFCP08. In addition, the proposed monopole would be out of character with the Cold War-era Nike landscape; therefore, camouflage of the monopole would be required. With implementation of CUL MMs 2, 3, and 5 impacts on historical resources would be minimized; however, given the magnitude of the ground disturbance and the extent of the resources present at this project site, even with implementation of the required mitigation measures referenced and discussed above, impacts would not be reduced to less than significant levels. Therefore, impacts at this Project site would be significant and unavoidable.

Site LACFCP09. Archaeological monitors would be required during all ground-disturbing activities at Project site LACFCP09. In addition, the proposed monopole would be out of character with the Cold War-era Los Pinetos Nike Missile Site landscape; therefore, camouflage of the monopole would be required. With implementation of CUL MMs 2, 3, and 5 impacts on historical resources would be minimized; however, given the magnitude of the ground disturbance and the extent of the resources present at this project site, even with implementation of the required mitigation measures referenced and discussed above, impacts would not be reduced to less than significant levels. Therefore, impacts at this Project site would be significant and unavoidable.

Site LPC. Archaeological monitors would be required during all ground-disturbing activities at Project site LPC. In addition, the proposed monopole would be out of character with the Cold War-era Los Pinetos Nike Missile Site landscape; therefore, camouflage of the monopole would be required. With implementation of CUL MMs 2, 3, and 5 impacts would be minimized; however, given the magnitude of the ground disturbance and the extent of the resources present at this project site, even with implementation of the required mitigation measures referenced and discussed above, impacts would not be reduced to less than significant levels. Therefore, impacts at this Project site would be significant and unavoidable.

CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5.

At Project site H-69B, impacts on prehistoric archeological resources would be significant. Based on the nature of this site, the location of project activities, and the extent and location of the resources CUL MM 1, CUL MM 3, and CUL MM4 would be implemented to minimize impacts; however, the impacts would remain significant and unavoidable (see CUL 1, Chapter 4, and Appendix B4).

At Project sites LACFCP08, LACFCP09, and LPC, impacts on historic archeological resources would be significant. Based on the historical significance of these project sites and the extent and location of the resources CUL MM 2 and CUL MM 3 would be implemented to minimize impacts; however, the impacts would remain significant and unavoidable (see CUL 1, Chapter 4, and Appendix B4).

CUL-4: Would the project disturb any human remains, including those interred outside formal cemeteries.

CUL MMs 1, 3, and 4 are proposed for Project site H-69B ; however, given the type of project activities and the extent of archaeological resources at this site, mitigation measures would not reduce impacts to less than significant levels.

CUL-5: Would the project cause a substantial adverse change in the significance of a Tribal cultural resource as defined in Public Resources Code Section 21074.

CUL MMs 1, 3, and 4 are proposed for Project site H-69B ; however, given the type of project activities and the extent of archaeological resources at this site, mitigation measures would not reduce impacts to less than significant levels.

6.0 Agencies and Persons Consulted

OPR	(California) Governor's Office of Planning and Research
OHVs	off-highway vehicles
OSHA	Occupational Safety Health Administration
PA	Programmatic Agreement
Pb	lead
PCH	Pacific Coast Highway, also State Route 1
PCT	Pacific Crest Trail
PCTA	Pacific Crest Trail Association
PIZ	project impact zone
P.L.	Public Law
PM	particulate matter
PM ₁₀	Respirable Particulate Matter
PM _{2.5}	Fine Particulate Matter
Porter-Cologne	Porter-Cologne Water Quality Control Act
ppb	parts per billion
ppm	parts per million
PPV	peak particle velocity
PRC	Public Resources Code
Project	the LA-RICS LMR Project
PRPA	Paleontological Resources Preservation Act
PUC	Public Utilities Code
RCNM	FHWA Roadway Construction Noise Model
RCRA	Resource Conservation and Recovery Act
REC	recognized environmental condition
RHR	Regional Haze Rule
RMP	Resource Management Plan
ROG	reactive organic gases
RTP/SCS	Regional Transportation Plan / Sustainable Communities Strategy
RWQCB	Regional Water Quality Control Board
SAC	Scenic Attractiveness Class
SANBAG	San Bernardino Associated Governments
SARA	Superfund Amendments and Reauthorization Act
SBC	San Bernardino County
SBCDPW	San Bernardino County Department of Public Works
SCAB	South Coast Air Basin
SCAG	Southern California Association of Governments
SCAQMD	South Coast Air Quality Management District
SCIC	Southern California Indian Center
SDEF	San Dimas Experimental Forest
SEA	Significant Ecological Area
SERA	Significant Ecological Resource Area
SF	square foot/feet
SHPO	California State Historic Preservation Officer

Acronym/Abbreviation	Term
SIO	scenic integrity objectives
SIP	State Implementation Plan
SMMC	Santa Monica Mountains Conservancy
SMMNRA	Santa Monica Mountains National Recreation Area
SMS	Scenery Management System
SMSA	standard metropolitan statistical area
SO ₂	sulfur dioxide
SOI, Secretary	Secretary of the Interior
SPCC	spill prevention, control and countermeasure
SPL	sound pressure level
SR-	California State Route
SRA	sensitive receptor area
SSC	Species of Special Concern
SUV	sport utility vehicle
SWPPP	Stormwater Pollution and Prevention Plan
SWRCB	State Water Resources Control Board
TAC	toxic air contaminant
THPO	Tribal Historic Preservation Officer
TIA	transport impact analysis
TOWAIR	FCC landing slope facility calculator tool
UBC	Uniform Building Code
UCLA	University of California, Los Angeles
UHF	ultra high frequency
UPRR	Union Pacific Railroad
U.S.	United States
USACE	U.S. Army Corps of Engineers
U.S.C.	U.S. Code
USCB	U.S. Census Bureau
USEPA	U.S. Environmental Protection Agency
USFS	U.S. Forest Service
USFWS	U.S. Fish and Wildlife Service
USGS	U.S. Geological Survey
VCP	Voluntary Cleanup Program
VdB	vibration velocity level
VMT	vehicle miles traveled
VOC	volatile organic compounds
VRI	visual resources inventory
VRM	Visual Resource Management
WEAP	Worker Environmental Awareness Training
WEMO	West Mojave Conservation Management Plan
WRCC	Western Regional Climate Center
WRP	water reclamation plant

8.0 List of Preparers

Lauren Abom, Senior Environmental Planner, Jacobs

M.S., Environmental Education, 2005, California State University, Hayward, CA

B.S., Environmental and Resource Sciences, 1999, University of California, Davis, CA

Years of Experience: 16

Geraldine Aron, Principal Investigator, Paleo Solutions, Inc.

B.S., Geological Sciences, 2000, California State University, Long Beach

M.S., Geological Sciences (emphasis in Paleontology), 2007, California State University, Long Beach

Years of Experience: 18

Dorothy Bungert, Graphics Specialist, Jacobs

BFA, Design Graphics, 2003, New York Institute of Technology

AAS, Interior Design, 2001, Scottsdale Community College

AOS, Graphic and Advertising Design, 1981, Pratt Institute

Years of Experience: 34

David Charlton, Biologist, Jacobs

M.S., Agriculture/Biology, 1980, California Polytechnic University, San Luis Obispo, CA

B.S., Horticulture/Botany, 1974, California Polytechnic University, Pomona, CA

Years of Experience: 26

Phyllis Davis, Transportation Planner, Jacobs

M.S., Geographic Information Systems, 2009, Arizona State University, Tempe, AZ

B.A., Geography, 2004, Arizona State University, Phoenix, AZ

Years of Experience: 8

Beth Defend, Subject Matter Expert – Land Use, Recreation, Transportation, Utilities, Jacobs

B.A., Technical Journalism

Years of Experience: 38

Joe D’Onofrio, Subject Matter Expert-Noise and Air Quality, Jacobs

Masters, Environmental Planning, 1999, Arizona State University

B.S., Mechanical Engineering, 1989, University of Delaware

Years of Experience: 26

Kevin C. Duncan, AICP, Environmental Planner, Jacobs

B.S., Urban Planning, 2002, University of Utah, Salt Lake City, UT

Years of Experience: 13

Jim Hoyt, Environmental Program Manager, Jacobs

B.S., Forestry, 1983, Humboldt State University, Arcata, CA

Years of Experience: 31

Melissa Osborn, Environmental Scientist, Jacobs

B.S., Biology, 2004, Utah State University, Logan, UT

Years of Experience: 9

Bruce Palmer, Senior Biologist, Jacobs

B.S., Biology, 1977, Elmhurst College, Elmhurst, IL

Years of Experience: 35

Paige Peyton, RPA, Senior Cultural Resources Specialist, Jacobs

Ph.D., Research, Archaeology and Ancient History, 2012, University of Leicester, England

M.A., Anthropology, 1990, California State University, San Bernardino

B.A., Anthropology, 1987, California State University, San Bernardino

Years of Experience: 30

Andy Priest, GIS Specialist, Jacobs

B.S., Natural Resource Management, 1994, Colorado State University, Fort Collins, CO

Years of Experience: 20

Dana Ragusa, Noise and Air Quality Specialist, Jacobs

B.S., Liberal Arts, Environmental Studies, 1999, University of Central Florida

Years of Experience: 15

Courtney Richards, Project Manager, Paleo Solutions, Inc.

B.S. Earth and Space Sciences, 2010, University of Washington

M.S. Biological Sciences, 2011, (emphasis in Paleontology), Marshall University

Years of Experience: 10

Carl Rykaczewski, Senior Environmental Project Manager, Jacobs

B.S., Environmental Resource Management, 1981, Pennsylvania State University, University Park, PA

Years of Experience: 28

Misha Seguin, Environmental Scientist, Jacobs

B.S., Environmental Science, 1999, University of Idaho, Moscow, ID

Years of Experience: 15

Erik Steinbach, Archaeologist, Jacobs

B.A. Anthropology, 2003, Arizona State University

Years of Experience: 12

Linda St. John, Word Processor/Technical Editor, Jacobs

A.A., Liberal Arts, 1984, College of the Desert, Palm Desert, CA

Years of Experience: 9

Misty Swan, Environmental Planner, Jacobs

Years of Experience: 25

Tricia Walbaum, Senior Transportation Engineer, Jacobs
B.S., Civil Engineering, 1993, Iowa State University, Ames, IA
Years of Experience: 22

Jason Walsh, Senior CEQA/NEPA Planner, Jacobs
M.S., Environmental Management, 2002, University of San Francisco.
B.A., Science and Management, 1998, Claremont McKenna College.
Years of Experience: 18

Brian Weith, R.G., Senior Environmental Project Manager, Jacobs
B.S., Geology, 1985, Colorado State University, Fort Collins, CO
Years of Experience: 29

Vamshi K. Yellisetty, Project Manager/GIS Manager, Jacobs
M.S., Civil Engineering, 2000, Arizona State University, Tempe, AZ
B.E., Civil Engineering, 1996, Osmania University, India
Years of Experience: 17

City, State Zip Code

Los Angeles Regional Interoperable
Communications System
Joint Powers Authority
2525 Corporate Place, Suite 200
Monterey Park, California 91754

Subject: Notice of Preparation of a Draft Environmental Impact Report

Los Angeles Regional Interoperable Communications System (LA-RICS) Joint Powers Authority (JPA) will be the Lead Agency and will prepare an Environmental Impact Report (EIR) for the proposed Land Mobile Radio system. We need to know the views of your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed project. Your agency will need to use the EIR prepared by our agency when considering your permit or other approvals for the project.

The project description, location, and the potential environmental effects are addressed in the Initial Study, which is attached.

Due to the time limits mandated by State law, your response must be sent at the earliest possible date but not later than 30 days after receipt of this notice.

Please send your response to Nancy Yang, project engineer, 2525 Corporate Place, Suite 200, Monterey Park, California 91754 or e-mail nancy.yang@la-rics.org. We will need the name for a contact person in your agency.

Notice of Public Meetings: The LA-RICS JPA has scheduled five public environmental scoping meetings to provide additional opportunity to input. The public meetings are scheduled as follows and will be held at the following locations from 6:30 p.m. to 8:30 p.m.:

Thursday, September 11, 2014
South Coast AQMD Building, Room GB
21865 Copley Drive, Diamond Bar, CA 91765

Tuesday, September 16, 2014
El Camino Real Charter High School, Auditorium
5440 Valley Circle Blvd., Woodland Hills, CA 91367

Monday, September 15, 2014
Stanley Kleiner Activity Building
43011 10th St. West
Lancaster, CA 93534

Wednesday, September 17, 2014
Peck Park Community Center, Auditorium
560 North Western Ave., San Pedro, CA 90732

Thursday, September 18, 2014
City of Lynwood Bateman Hall, Room 2
11331 Ernestine Ave., Lynwood, CA 90262

Date: August 19, 2014

Signature: 

Title: Executive Director

Telephone: (323)881-8291

1 ENVIRONMENTAL CHECKLIST FORM

1. **Project title:** Los Angeles Regional Interoperable Communications System (LA-RICS) Land Mobile Radio (LMR) System

2. **Lead agency name and address:**

Los Angeles Regional Interoperable Communications System Joint Powers Authority
2525 Corporate Place, Suite 200
Monterey Park, CA 91754

3. **Contact person and phone number:** Nancy Yang (323) 881-8049

4. **Project location:** multiple sites throughout Los Angeles County (County) and in adjacent areas of Orange and San Bernardino counties

5. **Project sponsor's name and address:**

Los Angeles Regional Interoperable Communications System Joint Powers Authority
2525 Corporate Place, Suite 200
Monterey Park, CA 91754

6. **General plan designation:** varies by site

7. **Zoning:** varies by site

8. **Description of project:**

The Project is to install and operate up to 90 LMR facilities at sites located primarily in Los Angeles County (Figure 1). The LMR sites would contain the infrastructure and equipment necessary to provide voice communications coverage throughout the County for emergency responders. Currently, 120 sites are being considered for the LMR project. Their locations are shown on Figure 1, and Table A-1 in Appendix A-1 provides a list of the sites and their addresses. Of these 120 sites, 88 are included in the current proposed system design. The remaining 32 sites are intended to provide alternate site locations if any of the initial 88 sites are determined to be not viable during the site evaluation, system engineering, and permitting processes or in lease agreement discussions with the property owner and need to be removed from consideration. These alternate sites are included in the project description so that the potential environmental impacts of all sites that could potentially be part of the system are analyzed. A maximum of only approximately 80 to 90 sites would be built, however. These locations are widely dispersed across the County in both urban (intensively developed) and rural (less developed) settings. The settings range from coastal locations to downtown Los Angeles to remote mountain peaks throughout the County and to the northern high desert of the County.

In April 2005, the Regional Interoperable Steering Committee was formed to explore the development of a single, shared communications system for all public safety agencies in the greater Los Angeles region. Initial feasibility studies indicated that by leveraging the various agency efforts, a shared regional communications system would not only be possible but would also best meet the needs of the entire regional public safety community and the general public. As a result, the County of Los Angeles, 82 municipalities, and 3 other public sector entities in the region drafted a Joint Powers Agreement that established the Los Angeles Regional Interoperable Communications System (LA-RICS) Joint Powers Authority (Authority) to create a regional area-wide interoperable public safety communications network. Community anchor institutions associated with the project include police, sheriff, and fire departments, as well as hospitals.

This page intentionally left blank

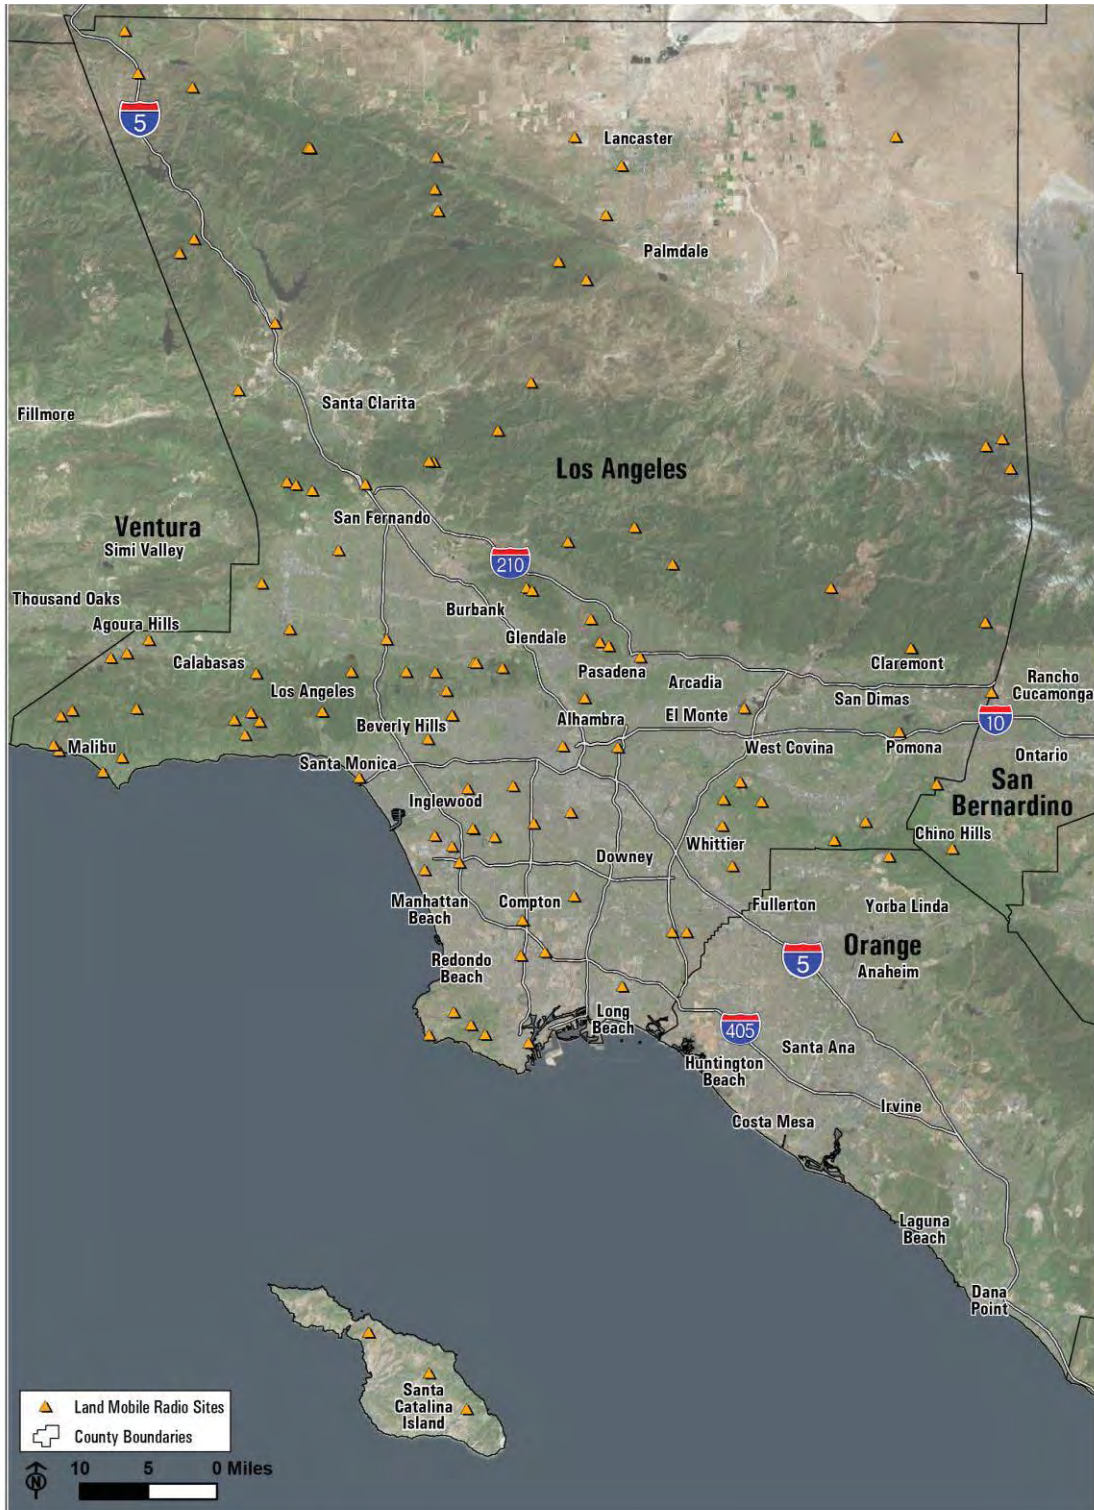

Figure 1. Potential LMR Project Sites

Los Angeles Regional Interoperable Communications System (LA RICS) Land Mobile Radio (LMR) System

The proposed LMR project would be a modern, integrated wireless voice and narrowband data communications system designed and built to serve law enforcement, fire service, health service, and public works professionals throughout Los Angeles County. The new system would provide day-to-day communications within and among agencies and allow seamless interagency communications when responding to routine, emergency, and catastrophic events. The system would be comprised of four different subsystems:

1. Digital Trunked Voice Radio System – provides first responders radio communications utilizing digital technology. It seamlessly operates on two bands of spectrum (700 megahertz [MHz] and ultra high frequency [UHF])
2. Analog Conventional Voice Radio System – provides first responders radio communications utilizing conventional analog technology
3. Los Angeles Regional Tactical Communications System – consists of local, state, and federal interoperability channels in four different bands of spectrum in order to allow outside agencies responding to events in the County to have designated channels for communications
4. Narrowband Mobile Data Network – a data system that provides critical dispatch communications

Purpose of the Project

Effective radio communication is critical in helping police officers prevent and respond to crime situations, keeping firefighters safe as they fight blazes, facilitating life-saving exchanges of information between emergency medical service professionals and hospitals, and allowing public works and utilities the opportunity to coordinate responses to disasters and special events. LMR would support a rapid, safe, and effective public safety response during daily operations. Additionally, it would support a faster, better-coordinated, large-scale response to emergencies such as wildfires, earthquakes, civil disturbance, or other disasters. It would replace the existing aging patchwork of LMR systems with a single county-wide network and would improve overall system capacity and coverage for first and second responders region-wide. Specifically, LMR would provide day-to-day voice and narrowband data radio communications for public safety agencies in the Los Angeles region, enable interoperability among member agencies and mutual aid providers, and support communication with regional, state, and federal agencies in the event of a natural or man-made disaster.

The Los Angeles region is designated as a high-threat area by the Department of Homeland Security (DHS). The new LMR system would allow the region to respond effectively, if an incident were to occur, by providing an efficient and coordinated response to emergencies that presently is not possible in the Los Angeles metropolitan region.

Each of the sites identified for potential use in the LMR project would improve emergency communications within Los Angeles County. The new infrastructure would add capacity, replace existing aging infrastructure with infrastructure that meets current building codes and telecommunications industry standards that better support modern technology and provide for more technologically advanced equipment. The towers would follow general engineering practices for vertical and horizontal separation of equipment to lessen the amount of interference that can result from multiple systems on the same tower through greater separation of different radio frequencies. Different spectrum bands perform differently depending on their interaction with other bands. This enhanced separation of equipment would also allow for greater frequency flexibility and would increase overall system coverage and capacity.

Need for the Project

The greater Los Angeles region experiences many man-made and natural incidents that require a rapid, coordinated response among the region's first and secondary responders. Public safety services in the Los Angeles County region are provided by more than 80 public safety agencies represented by approximately 34,000 first responders and 17,000 secondary responders serving more than 10 million residents, tourists, and commuters in

the region. Many of these agencies use systems that have exceeded their natural useful life (i.e., equipment and programming are no longer supported by vendors). Due to the numerous systems in use and the number of agencies, interagency communication is challenging.

Most of the region's public safety telecommunications infrastructure (shelters and towers) do not meet the technical or operational needs of the agencies that utilize them. Many of the aging communications system sites were built to older and now obsolete industry standards and building codes. Structures at these sites no longer meet the more stringent performance and survivability requirements in current industry standards and codes. This causes performance issues that hamper today's public safety and emergency response operations. Besides the overall age of many structures, most do not possess space (whether inside a shelter or on a tower) to add equipment, and in many cases the towers cannot be cost-effectively retrofitted to support additional antennas because they lack structural capacity and/or retrofitting would impact existing operations. Some towers do not have sufficient space to maintain adequate separation between existing and new antennas to minimize physical and electromagnetic interference. Most of the current infrastructure has not undergone a significant rebuild in several decades.

Additionally, the communication systems deployed by agencies in Los Angeles County do not provide the necessary coverage that all users need. This is particularly the case for the Los Angeles County Sheriff's Department and the Los Angeles County Fire Department. These agencies cover large tracts of the county, and their current radio systems are inadequate and/or antiquated. Often, separate but simultaneous incidents require coordinated emergency responses so that adequate and appropriate personnel are dispatched to each incident. The lack of complete coverage sometimes results in the departments not being able to dispatch the nearest team to the incident because of communication problems.

Without adequate capacity on the radio system, even on a daily basis, first responders often struggle to acquire the necessary resources to communicate. The issue is exacerbated on large incidents where a shortage of radio resources greatly impacts operations due to the need for multiple command, tactical, and mutual aid channels. For example, first responders may not be able to request additional resources to assist them in life-threatening situations, hear evacuation orders, or hear broadcasted warning messages from dispatchers. Without adequate capacity to dedicate individual radio channels to individual incidents, the likelihood of interference between units responding to separate incidents is high.

Proposed Project Description

The proposed LMR sites were selected such that voice coverage could be provided over the Authority's service area, which is all of Los Angeles County (see Figure 1), with the fewest number of sites possible. Locations were selected within or adjacent to existing communication facilities to the maximum extent feasible. The sites include a variety of types (e.g., water tanks, rooftops, police and fire stations, hospitals, remote mountaintops, etc.). Most of these locations have existing communications equipment but do not necessarily have communication towers.

Each LMR site would require installation of multiple, new, fiberglass collinear and microwave antennas and supporting indoor communication equipment and backup batteries. Fiberglass collinear and microwave antennas generally would be installed on either existing or new lattice towers or monopoles, as depicted on Figure 2 and Figure 3. The number of antennas installed would vary by site. Because the LMR sites are proposed for a variety of locations ranging from rooftops and urban police and fire stations to undeveloped or sparsely developed hilltops and mountain peaks, the facilities proposed at each site vary depending on what infrastructure is currently present and the topography of the location.

In general, three general infrastructure components are proposed at each LMR site:

- antenna structure which could be a lattice tower, monopole, or building mounts
- equipment shelter

- emergency generator

New infrastructure at a site would include either a lattice tower or a monopole, but not both. At a few sites antennas would be façade-mounted on existing buildings (e.g., rooftops) rather than on a new or existing tower or monopole. Additionally, most sites would require construction of a new shelter to house radio communication equipment, although some sites would utilize an existing equipment room or shelter. Descriptions of existing structures that would be used vary. General descriptions of the four basic structures that may be newly constructed for the LMR project are provided below.

Lattice Tower. New, self-supporting lattice towers would be a maximum of 180 feet tall (without appurtenance) and on a new concrete pad that would be approximately 36 feet by 36 feet (Figure 2); however, at one site which has an existing 200-foot tower, the new tower may also be 200 feet tall to accommodate the equipment to be installed on the new tower. The existing 200-foot tower does not support space for new equipment, and the spacing of existing equipment is not adequate. Line-of-sight microwave connectivity is also a consideration for the new tower height.

Monopole. New monopoles would generally be 70 feet tall (without appurtenance), although they could range up to 180 feet in height (without appurtenance). A typical monopole would be 6.5 feet in diameter, and installation would require drilling a 36-foot deep caisson. Monopoles would also be free-standing (Figure 3).

Equipment Shelter. New equipment shelters would be installed on a new concrete pad ranging in size from approximately 12 by 16 feet to 24 by 48 feet. Most equipment shelters would be single-story structures, although some sites may require two stories in order to house a generator.

Emergency Generator. Most LMR locations would require a new back-up generator. Generators would be installed on concrete pads ranging in size from 6 by 11 feet to 9 by 13 feet. The generators would include 1,000- to 1,500-gallon internal double walled tanks for diesel fuel.

Figure 2. Typical Tower with Antennas

(Not to Scale)

This page intentionally left blank

Figure 3. Typical Monopole with Antennas

(Not to Scale)

This page intentionally left blank

All of the newly constructed structure foundations described above would be surrounded by an underground ground ring installed in a trench about 30 inches below grade. Although the facilities required at each LMR site would vary, most sites can generally be categorized into four general types. These are listed in Table 1.

Table 1 - General LMR Site Types and Features

LMR Site Types				
New Structures Required	New Lattice Tower with New Shelter	New Monopole with New Shelter	New Lattice Tower	New Equipment Shelter
Lattice Tower	X (generally 180' tall)	NA	X (generally 180' tall)	existing (height varies)
Monopole	NA	X (generally 70' tall)	NA	NA
Equipment Shelter	X	X	(existing)	X
Emergency Generator	X	X	X	X

NA - not applicable

Utilities

Electricity is available at all of the proposed LMR sites. Three sites not connected to an electrical utility line are solar powered. At all non-solar sites, new electrical lines would be installed in new underground conduit between the LMR facility and the nearest existing interconnection point. Underground electrical conduit would also be installed between new emergency generators and the equipment shelter. The amount of trenching required to install the conduit would vary at each site depending on the distance between the LMR facilities and the nearest point of interconnection. The maximum length of total trenching at any site is not expected to exceed 1,000 linear feet.

No other utility infrastructure would be installed as part of the proposed LMR project. The LMR sites would not require water or natural gas, and no wastewater would be generated.

Construction

Construction of the LMR sites is expected to begin in Summer 2015 and be completed in Fall 2016. Construction activity would occur for approximately six weeks at a site. Construction activities could occur at more than one site at a time.

Table 2 provides a summary of construction disturbance needed to construct a representative of each of the four general LMR site types.

Table 2 - Typical Construction Associated with the Four General LMR Site Types

	New Lattice Tower with New Shelter	New Monopole with New Shelter	New Lattice Tower	New Equipment Shelter
Grading	5-20 CY	5-10 CY	5-10 CY	10-30 CY
Temporary Disturbance (staging area)	1,000 SF	1,000 SF	1,800 SF	1,000 SF
Long-term Disturbance (includes structure foundations and conduits)	1,900 SF	2,000 SF	1,600 SF	600 SF
Foundations	Tower (6'x36'x36') pad & pier foundation	Monopole 6'-6" ft. Dia., 36 ft. Deep drilled caisson; caisson area 140 sf	Tower= 6'x36'x36' pad and pier foundation	Tower = NA
	Shelter= (12'x24') slab foundation with (24"x18") footing	Shelter= (12'x16') slab foundation with (18"x18") footing	Shelter = NA	Shelter = 12'x24' slab foundation with 18"X18" footings
	Generator = (8'-6"x11'-0"x9") slab foundation	Generator = (8'-6"x13'-6"x9") slab foundation	Generator = (9'-6"X13'-6"X9") slab foundation	Generator = 8'-6"x11'x9" slab foundation
Trenching for electrical and coaxial cable conduits	18" wide, 50 FT long trench from existing utility pole to meter (36" below grade)	18" wide, 180 FT long trench from transformer to meter (36" below grade)	18" wide, 30 FT long trench from generator to shelter. (36" below grade)	18" wide, 12 FT long trench from transformer to shelter (36" below grade).
	18" wide, 10 FT long trench from generator to shelter (24" below grade)	18" wide, 10 FT long trench from generator to shelter (36" below grade)		12" wide, 10 FT long trench from generator to shelter (24" below grade)
		24" wide, 70 FT long trench for coaxial from shelter to monopole (36" below grade)		
Trenching for grounding	30" below grade around perimeter of each new concrete pad (approx. 260 LF)	30" below grade around perimeter of each new concrete pad (approx. 145 LF)	30" below grade around perimeter of each concrete pad (approx. 200 LF)	30" below grade around perimeter of each new concrete pad (approx. 115 LF)
CY – cubic yards SF – square feet		FT – foot/feet LF – linear feet		NA – not applicable

Construction activities at each site would result in temporary disturbance of a maximum of approximately 5,000 square feet (0.11 acre). A maximum of approximately 2,000 square feet (0.05 acre) of new impermeable surface would be created at locations that require installation of new concrete pads for a tower, shelter, and generator.

Typical construction equipment required would include four-wheel drive vehicles, antenna and line trucks, water trucks, excavators, skidsters, cranes, forklifts, dump trucks, and concrete trucks. Almost all LMR facilities would be constructed within or adjacent to existing telecommunications or other facilities, such as water tanks, or at developed locations that currently have public radio service such as police and fire stations. At facilities such as urban police and fire stations, LMR construction may occur within paved or landscaped areas of the facility property.

Each site, with the exception of the sites that would be installed on buildings or some sites installed at urban police or fire stations, would be secured within a chain link fence. Where LMR sites would be collocated at existing telecommunication sites, construction of new facilities would occur within the existing fenced area of the facility to the maximum extent feasible. At some sites, an existing fenced area may need to be expanded or a new fenced area may be installed adjacent to the existing facility to allow construction of the LMR facilities. The total fenced area of the largest LMR sites would generally be less than 5,000 square feet.

System components would be staged and pre-installed at manufacturers' facilities and would be shipped and stored locally with the construction materials at a central location or multiple warehouses. At sites with limited laydown areas, all construction material would be shipped to each system site for just-in-time field installation with minimal field staging. If sufficient developed, landscaped, or previously disturbed areas exist on or adjacent to the LMR site, material could be staged at the site.

Each of the LMR sites would be accessed via existing paved or unpaved roads. No road improvements or new road construction is anticipated.

Operation

No staff would be required at any of the sites to operate the LMR equipment. The LMR facilities and equipment would need to be inspected, maintained, and repaired as necessary. Maintenance activities would involve both routine preventive maintenance and emergency procedure testing, including emergency generator testing, to maintain service continuity. Facilities and system components would be inspected annually, at a minimum, for corrosion, equipment misalignment, loose fittings, and other common mechanical problems. Maintenance activities may require use of bucket trucks (man-lifts), standard vans, or utility pickup trucks, depending on the scope of maintenance. Fuel tanks in the emergency generators would require occasional refilling. The LMR system components may need to be repaired or replaced to maintain uniform, adequate, safe, and reliable service. Equipment replacement or repair that cannot be diagnosed and performed remotely may require a technician on site, typically in a standard van or utility pickup truck. Where replacement or repair involves installed antennas, a four-person crew with one truck, a boom (aerial lift) truck, and an assist van sport utility vehicle (SUV) might be required.

The sites would have security lighting. Towers would have lighting and markings in compliance with Federal Aviation Administration (FAA) requirements, as applicable based on proposed structure height and location.

As part of site development and maintenance, vegetation on or immediately adjacent to an LMR site would be removed, as needed, in accordance with plans or procedures applicable to the site (i.e., jurisdictional requirements; type of infrastructure to be protected; and site factors including vegetation type, slope, and aspect).

9. **Surrounding land uses and setting:** The 120 LMR project sites being considered are located in varying settings ranging from urban to rural. Adjacent land uses include commercial, industrial, residential, recreational, and undeveloped areas. Most sites are adjacent to existing telecommunication facilities or other utility facilities,

such as municipal water tanks, or are at police, sheriff, and fire station facilities, hospitals, and county and local government buildings.

2 ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED:

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

- | | | |
|--|---|--|
| <input checked="" type="checkbox"/> Aesthetics | <input type="checkbox"/> Agriculture and Forestry Resources | <input checked="" type="checkbox"/> Air Quality |
| <input checked="" type="checkbox"/> Biological Resources | <input checked="" type="checkbox"/> Cultural Resources | <input checked="" type="checkbox"/> Geology /Soils |
| <input checked="" type="checkbox"/> Greenhouse Gas Emissions | <input checked="" type="checkbox"/> Hazards & Hazardous Materials | <input checked="" type="checkbox"/> Hydrology / Water Quality |
| <input checked="" type="checkbox"/> Land Use / Planning | <input type="checkbox"/> Mineral Resources | <input checked="" type="checkbox"/> Noise |
| <input type="checkbox"/> Population / Housing | <input type="checkbox"/> Public Services | <input checked="" type="checkbox"/> Recreation |
| <input checked="" type="checkbox"/> Transportation/Traffic | <input checked="" type="checkbox"/> Utilities / Service Systems | <input checked="" type="checkbox"/> Mandatory Findings of Significance |

DETERMINATION: (To be completed by the Lead Agency)

On the basis of this initial evaluation:

- I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
- I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.
- I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.
- I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
- I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

3 EVALUATION OF ENVIRONMENTAL IMPACTS:

- 1) A brief explanation is required for all answers except “No Impact” answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A “No Impact” answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A “No Impact” answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
- 2) All answers must take account of the whole action involved, including offsite as well as onsite, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
- 3) Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. “Potentially Significant Impact” is appropriate if there is substantial evidence that an effect may be significant. If there are one or more “Potentially Significant Impact” entries when the determination is made, an EIR is required.
- 4) “Negative Declaration: Less Than Significant With Mitigation Incorporated” applies where the incorporation of mitigation measures has reduced an effect from “Potentially Significant Impact” to a “Less Than Significant Impact.” The lead agency must describe the mitigation measures and briefly explain how they reduce the effect to a less than significant level (mitigation measures from “Earlier Analyses,” as described in (5) below, may be cross-referenced).
- 5) Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:
 - a) Earlier Analysis Used. Identify and state where they are available for review.
 - b) Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
 - c) Mitigation Measures. For effects that are “Less than Significant with Mitigation Measures Incorporated,” describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.
- 6) Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.
- 7) Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.
- 8) This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
- 9) The explanation of each issue should identify:
 - a) the significance criteria or threshold, if any, used to evaluate each question; and
 - b) the mitigation measure identified, if any, to reduce the impact to less than significance.

This page intentionally left blank

4 ENVIRONMENTAL ISSUES

4.1 AESTHETICS

Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Have a substantial adverse effect on a scenic vista?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

DISCUSSION

- a) Some LMR sites would include installation of new lattice towers or new monopoles that may be visible from scenic vistas and could result in significant visual impacts. Potentially significant impacts to scenic vistas will be evaluated in the EIR.
- b) The project area includes Los Angeles County and a small portion of adjacent Orange and San Bernardino counties (one potential site is in Orange County and two are in San Bernardino County). One designated state scenic highway traverses this area, State Route 2 in the Angeles National Forest, which is also a U.S. Forest Service (USFS) scenic byway. A number of eligible state scenic highways are in this area, and a few roads in the Santa Monica Mountains area are Los Angeles County designated scenic highways (Caltrans 2014). The proposed LMR towers may be visible from some of these scenic highways. Although none of the towers would be located where they would be expected to damage resources within a scenic highway, potentially significant impacts to scenic highways will be evaluated in the EIR.
- c) The project area encompasses the Wilderness areas within Angeles National Forest. Proposed LMR facilities near the Wilderness areas will be evaluated in the EIR for potential to be seen from Wilderness areas and the potential for the change to have an impact on the recreational experience because of the visibility of the facilities. Although all LMR sites are proposed at or adjacent to existing facilities, the presence of additional towers or monopoles or of new structures that may be taller or otherwise more visible than those currently present and could affect the existing visual character or quality at some locations. Potentially significant impacts to visual character and quality will be evaluated in the EIR.
- d) LMR facilities would require security lighting. Some towers may require lighting in accordance with Federal Aviation Administration requirements, depending on proposed tower height and locations. Glare from reflective surfaces may result from construction of some of the facilities. Potentially significant impacts from light and glare from LMR sites will be evaluated in the EIR.

4.2 AGRICULTURE AND FORESTRY RESOURCES

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with existing zoning for agricultural use or a Williamson Act contract?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) Result in the loss of forest land or conversion of forest land to nonforest use?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to nonagricultural use or conversion of forest land to nonforest use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

DISCUSSION

- None of the proposed LMR sites is located on an area mapped as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance by the Farmland Mapping and Monitoring Program (FMMP 2010). No further analysis is warranted.
- None of the LMR sites are currently used for agricultural use or are under a Williamson Act contract. All of the LMR sites are either within or adjacent to existing telecommunications or other facilities and are not available for agricultural uses. No further analysis is warranted.
- None of the LMR sites are currently used for forestry use. All of the LMR sites, including those proposed for locations within the Angeles National Forest, are either within or adjacent to existing telecommunications or other facilities and are not available for forestry uses. No further analysis is warranted.
- None of the LMR sites are currently forest land. All of the LMR sites, including those proposed for locations within the Angeles National Forest, are either within or adjacent to existing telecommunications or other facilities and are not forest land. No further analysis is warranted.

- e) The purpose of the project is to enhance communications. The project would not involve any activities that would convert Farmland or forest land to other uses. No further analysis is warranted.

4.3 AIR QUALITY

Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Conflict with or obstruct implementation of the applicable air quality plan?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Expose sensitive receptors to substantial pollutant concentrations?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Create objectionable odors affecting a substantial number of people?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

DISCUSSION

- a) The majority of project sites would be located in the South Coast Air Basin (SCAB), within the South Coast Air Quality Management District (SCAQMD). Ten of the potential site locations are in the Mojave Desert Air Basin (MDAB) within the Antelope Valley Air Quality Management District (AVAQMD). The SCAB is designated a nonattainment area for the federal standards for ozone, particulate matter less than 2.5 microns in size (PM_{2.5}), and lead (Los Angeles County portion of SCAB only) and, for the State standards, for ozone, particulate matter less than 10 microns in size (PM₁₀), and PM_{2.5}. The Antelope Valley is designated a nonattainment area for the federal standard for ozone and for the State standards for ozone and PM₁₀. (CARB 2014).

Both districts have established standards for air pollutants generated by construction and by operational activities. During construction of the project, emissions may be generated by grading activities, construction workers traveling to and from the project site, delivery and hauling of construction supplies and debris, and fuel combustion by onsite construction equipment. Construction air emissions would be short-term and would be limited only to the time period when construction activity is taking place; however, an evaluation is needed to determine if air emissions would conflict with air quality plans. Potentially significant air quality impacts will be evaluated in the EIR.

- b) Both the SCAQMD and the AVAQMD have established standards for air pollutants generated by construction and by operational activities. During construction of the project, emissions may be generated by grading activities, construction workers traveling to and from the project site, delivery and hauling of construction supplies and debris, and fuel combustion by onsite construction equipment. Construction air emissions would be short-term and would be limited only to the time period when construction activity is taking place; however, an evaluation is needed to determine if air emissions would violate or contribute to existing air quality violations. Potentially significant air quality impacts will be evaluated in the EIR.

- c) Both the SCAQMD and the AVAQMD have established standards for air pollutants generated by construction and by operational activities. During construction of the project, emissions may be generated by grading activities, construction workers traveling to and from the project site, delivery and hauling of construction supplies and debris, and fuel combustion by onsite construction equipment. Construction air emissions would be short-term and would be limited only to the time period when construction activity is taking place; however, an evaluation is needed to determine if air emissions would be cumulatively considerable. Potentially significant air quality impacts will be evaluated in the EIR.
- d) Air emissions from construction of the LMR sites would be short-term (e.g., five to six weeks), and pollutant concentrations would be localized in the vicinity of the individual LMR construction site; however, some sites would be constructed adjacent to residential areas. Potentially significant impacts from pollutant concentrations from site construction will be evaluated in the EIR.
- e) Exhaust from construction vehicles and equipment may produce odors. These would be temporary and localized and would not affect a substantial number of people. Impacts would be less than significant; however, this will be evaluated in the EIR to confirm this expectation.

4.4 BIOLOGICAL RESOURCES

Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

DISCUSSION

- a) Some LMR sites are located within or adjacent to areas that may provide suitable habitat for candidate, sensitive, or special status species, including areas designated as critical habitat under the federal Endangered Species Act. Potentially significant impacts to these species and their habitat will be evaluated in the EIR.
- b) Construction of the LMR sites may adversely affect riparian or other sensitive natural communities. Potentially significant impacts to the sensitive natural communities and wetlands will be evaluated in the EIR.
- c) Construction of the LMR sites may adversely affect wetlands. Potentially significant impacts to wetlands will be evaluated in the EIR.
- d) Some LMR sites would require creation of new fenced areas in locations that could be used by wildlife. Potentially significant impacts to fish and wildlife movement and use will be evaluated in the EIR.
- e) The EIR will evaluate whether conflicts with local policies and ordinances would result in significant impacts to biological resources.
- f) Some of the LMR sites are proposed for areas covered by Habitat Conservation Plans and Natural Community Conservation Plans. The project is not expected to conflict with these plans; however, the EIR will evaluate whether conflicts with such plans would result in significant impacts.

4.5 CULTURAL RESOURCES

Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Disturb any human remains, including those interred outside formal cemeteries?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

DISCUSSION

- a) The proposed LMR sites would be located on sites throughout Los Angeles County, with one site potentially in Orange County and two sites potentially in San Bernardino County. Site locations may contain historic buildings and landmarks. While the project would be constructed mostly within existing communication facilities sites, construction and operation have the potential for both direct and indirect impacts to historical resources. Potentially significant impacts to historical resources will be evaluated in the EIR.
- b) Construction activities would require excavation for installation of tower or monopole and other facility foundations. Therefore, unknown archaeological resources have potential to be encountered during

project construction. Potentially significant impacts to archaeological resources will be evaluated in the EIR.

- c) Construction activities would require excavation for installation of tower or monopole and other facility foundations. Therefore unknown paleontological resources and/or unique geological features have potential to be encountered during project construction. Potentially significant impacts to paleontological resources and geologic features will be evaluated in the EIR.
- d) The project could result in the disturbance of unknown human remains due to anticipated grading and excavation activities, including those outside formal cemeteries. The potential for impacts to human remains will be evaluated in the EIR.

4.6 GEOLOGY AND SOILS

Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
ii) Strong seismic ground shaking?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
iii) Seismic-related ground failure, including liquefaction?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
iv) Landslides?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Result in substantial soil erosion or the loss of topsoil?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of waste water?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

DISCUSSION

- a) Some of the proposed LMR sites would be located within Alquist-Priolo Earthquake Fault Zones (CDC-CGS 2009). Given the location of the project in the southern California region, the entire project area is subject to the effects of seismic activity. An evaluation of earthquake fault, seismic, and landslide hazards at the LMR sites will be provided in the EIR.

- b) Ground-disturbing activities would occur during construction of the project from activities such as installing concrete foundations for site structures, trenching for utility connections, and installing fences at some sites. Total ground disturbance at each site would not exceed an acre. Standard soil erosion control measures would be implemented during construction. The maximum disturbance area at any site would not exceed approximately 5,000 square feet, and construction activity at a site would typically be completed in five to six weeks. Based on the limited construction area size, the short duration of construction activity, and the implementation of soil erosion control measures, substantial soil erosion and loss of topsoil is not expected. Potentially significant impacts from soil erosion will be evaluated in the EIR.
- c) Prior to any construction and as a standard practice, a geotechnical evaluation would be prepared which would prescribe methods, techniques, and specifications for: site preparation, treatment of undocumented fill and/or alluvial soils, fill placement on sloping ground, fill characteristics, fill placement and compactions, temporary excavations and shoring, permanent slopes, treatment of expansive soils, and treatment of corrosive soils. Design and construction of the project would conform to recommendations in the geotechnical evaluation. Potentially significant impacts from unstable soil or geologic units will be evaluated in the EIR.
- d) Prior to any construction and as a standard practice, a geotechnical evaluation would be prepared which would prescribe methods, techniques, and specifications for: site preparation, treatment of undocumented fill and/or alluvial soils, fill placement on sloping ground, fill characteristics, fill placement and compactions, temporary excavations and shoring, permanent slopes, treatment of expansive soils, and treatment of corrosive soils. Design and construction of the project would conform to recommendations in the geotechnical evaluation. Potentially significant impacts from expansive soil will be evaluated in the EIR.
- e) The project would not include the installation or use of septic tanks or other wastewater disposal systems; therefore, soil suitability to support such systems is not relevant to this project. No further analysis is warranted.

4.7 GREENHOUSE GAS EMISSIONS

Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

DISCUSSION:

- a) Greenhouse gas (GHG) emissions may be generated during construction by grading activities, construction workers traveling to and from the project site, delivery and hauling of construction supplies and debris, and fuel combustion by onsite construction equipment. Operation would also result in an increase in electrical usage, which would generate GHG emissions. An evaluation based on SCAQMD and AVAQMD significance thresholds for greenhouse gas emission is needed to determine if project-related emissions are potentially significant. This will be evaluated further in the EIR.

- b) GHG emissions may be generated during construction by grading activities, construction workers traveling to and from the project site, delivery and hauling of construction supplies and debris, and fuel combustion by onsite construction equipment. Operation would also result in an increase in electrical usage, which would generate GHG emissions. An evaluation for greenhouse gas emission is needed to determine if project-related emissions would conflict with any applicable plans, policies, or regulations. This will be evaluated further in the EIR.

4.8 HAZARDS AND HAZARDOUS MATERIALS

Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

DISCUSSION

- a) Construction of the project would require the use of gasoline, diesel fuel, oil, solvents, and lubricants associated with vehicles and construction activities. Operation of the project would require routine testing of the diesel-powered emergency generator that would be installed at most LMR sites. The

internal storage tank would be double-walled and would contain a maximum of 1,500 gallons of diesel fuel. The potential to affect human health and safety from the transport, use, or disposal of hazardous substances during construction or operations will be evaluated in the EIR.

- b) Construction of the project would require the use of gasoline, diesel fuel, oil, solvents, and lubricants associated with vehicles and construction activities. Releases of these substances could occur during construction. Operation of the project would require routine testing of the diesel-powered emergency generator that would be installed at most LMR sites. The internal storage tank would be double-walled and would contain a maximum of 1,500 gallons of diesel fuel. In the unlikely event of an accident during the transport of diesel fuel or refueling the generator tank that resulted in a release of product, emergency procedures would include notification of appropriate authorities; containment of the spilled product; and clean-up of the spill to federal, State, and local standards. The potential to affect human health and safety from a release of hazardous substances during construction or operations as the result of accident will be evaluated in the EIR.
- c) Some proposed LMR sites are located within one-quarter mile of schools. Because most sites would include installation of a diesel-powered emergency generator, diesel fuel storage may occur within one-quarter mile of schools. The use of diesel fuel in a generator within one-quarter mile of a school is not expected to have a potentially significant impact because of the limited amount of diesel fuel that would be present inside a storage tank at any site (maximum 1,500 gallons) and because fuel tanks would be monitored with a leak detection and alarm system; however, this will be evaluated in the EIR to confirm this expectation.
- d) A review of the LMR sites and hazardous material sites will be conducted, and potentially significant impacts will be evaluated in the EIR.
- e) Some LMR sites would be located within the vicinity of airports. Potentially significant impacts related to hazards from individual sites located within airport land use plans or within 2 miles of a public or public use airport will be evaluated in the EIR.
- f) Some LMR sites would be located within the vicinity of private airstrips. Potentially significant impacts related to hazards from individual sites located within the vicinity of a private airstrip will be evaluated in the EIR.
- g) The project would improve communications to allow for better coordination of emergency response action or evacuation plans. Temporary road or lane closures could be required at or near some LMR sites during construction activities. Any temporary roadway or lane closure would be coordinated with local jurisdictions to minimize potential impacts to emergency access and evacuation routes. No significant impacts would occur; however, this will be evaluated in the EIR to confirm this expectation.
- h) LMR sites not proposed for urban areas may be in areas subject to wildland fires. Potentially significant impacts from wildland fires will be evaluated in the EIR.

4.9 HYDROLOGY AND WATER QUALITY

Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Violate any water quality standards or waste discharge requirements?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of preexisting nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on or off site?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Otherwise substantially degrade water quality?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
j) Inundation by seiche, tsunami, or mudflow?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

DISCUSSION

- a) Project operations would not produce any wastewater. If shallow groundwater is encountered during excavation for foundations or drilling for monopole installation, dewatering may be necessary. Any water produced by dewatering activities during construction would be disposed of in accordance with applicable regulations. Impacts are anticipated to be less than significant; however, this will be evaluated in the EIR to confirm this expectation.

- b) Construction of the proposed LMR sites would result in the creation of new impermeable surfaces at some sites; however, each LMR site is relatively small (maximum of 5,000 square feet total) and would not be expected to substantially interfere with groundwater recharge at any site. Project operations would not require use of water. During construction of the proposed LMR sites, water for dust control and concrete mixing would be obtained from existing municipal sources (e.g., fire hydrants). Water from these sources may come at least partially from local groundwater supplies. Impacts on water supplies from water usage by the project will be evaluated in the EIR.
- c) The project would not result in alteration of a stream or river. The project may require grading at some sites and the addition of impermeable surfaces that may increase stormwater runoff. Best management practices to control soil erosion and stormwater runoff would be implemented during construction, and erosion controls would be incorporated into site design. Although each LMR site would not exceed 5,000 square feet, and changes in site topography and stormwater runoff would not be expected to result in substantial erosion or siltation, potential erosion impacts will be evaluated in the EIR to confirm this expectation.
- d) The project would not result in alteration of a stream or river. The project may require grading at some sites and the addition of impermeable surfaces that may increase stormwater runoff. Best management practices to control soil erosion and stormwater runoff would be implemented during construction, and erosion controls would be incorporated into site design. Although each LMR site would not exceed 5,000 square feet, and changes in site topography and stormwater runoff would not be expected to result in substantial flooding, potential flooding impacts will be evaluated in the EIR to confirm this expectation.
- e) The size of each LMR site would not exceed 5,000 square feet, and the increase in impermeable surface area at any LMR site would not exceed 2,000 square feet. A significant increase in surface water runoff would not be expected. Potential sources of polluted surface water runoff would be limited to leaks or spills associated with construction equipment operations and from leaks of diesel fuel from the emergency generator, particularly when the generator is serviced or refueled. Standard accidental release responses that would be implemented during construction would minimize potential impacts from construction equipment usage. The storage tank in the emergency generator would be double-walled to provide secondary containment and minimize the potential for fuel being released that could pollute stormwater runoff. The potential to affect water quality from a fuel leak or spill during service or refueling will be evaluated in the EIR.
- f) Diesel-powered emergency generators would be required at most LMR sites. The generators would include internal tanks containing 1,000 to 1,500 gallons of diesel fuel. The tank would be double-walled, providing secondary containment for tank leaks. The potential to affect water quality from a fuel leak or spill during service or refueling will be evaluated in the EIR.
- g) The project does not include the construction of any housing and therefore would not result in placing housing in a flood hazard area. No further analysis is warranted.
- h) At least one proposed LMR site is located within a 100-year flood zone (FEMA 2014). Potentially significant impacts to LMR structures within a 100 year flood hazard area will be evaluated in the EIR.
- i) At least one proposed LMR site is located within a 100-year flood zone (FEMA 2014). Potentially significant impacts from damage due to flooding at the proposed LMR sites will be evaluated in the EIR.
- j) Some LMR sites would be located near the coast and therefore could be in locations potentially affected by a tsunami. Potentially significant impacts from seiches, tsunamis, or mudflows at the proposed LMR sites will be evaluated in the EIR.

4.10 LAND USE AND PLANNING

Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Physically divide an established community?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

DISCUSSION

- a) The proposed project is the construction and operation of communications sites. These sites would not be physically connected in any way that has the potential to physically divide any community. No further analysis is warranted.
- b) The proposed LMR sites would be located in areas with a variety of existing land uses and within the jurisdiction of a number of agencies that regulate land use including Los Angeles County, multiple cities, USFS, the federal Bureau of Land Management, and the California Coastal Commission. Potentially significant impacts related to changes in land use and consistency with existing land use policies and zoning at each LMR site will be further addressed in the EIR.
- c) Portions of the project sites are located within the boundaries of habitat conservation plans and natural community conservation plans. Consistency of the proposed sites that would be located in areas subject to these plans will be evaluated in the EIR.

4.11 MINERAL RESOURCES

Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

DISCUSSION

- a) None of the proposed LMR sites is currently being used for mineral resource extraction. All the proposed sites contain existing facilities and structures whose presence precludes use of the area for mineral resource extraction; and, therefore, mineral resources are not available at these sites. Proposed LMR facilities would be constructed at or adjacent to these existing facilities and structures; therefore, the project would not result in a change in site conditions that would affect mineral resource availability. No further analysis is warranted.
- b) None of the proposed LMR sites is currently being used for mineral resource extraction. All the proposed sites contain existing facilities and structures whose presence precludes use of the area for mineral resource extraction; and, therefore, mineral resources are not available at these sites. Proposed LMR facilities would be constructed at or adjacent to these existing facilities and structures; therefore, the project would not result in a change in site conditions that would affect availability of locally important mineral resource recovery sites. No further analysis is warranted.

4.12 NOISE

Would the project result in:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

DISCUSSION

- a) Noise levels in the vicinity of the project would increase during the construction phase of the project. Most city noise ordinances exempt construction activities during daytime hours, and some allow such activities to occur during nighttime hours; however, construction activities generally must comply with noise level restrictions during specified daytime and/or nighttime hours. Noise impacts could be potentially significant, but mostly a person's sensitivity to noise increases during nighttime hours. People

are generally less sensitive to noise during daytime hours when moderate to high noise levels generally dominate ambient conditions. Construction activities at each site would be designed to comply as much as possible with the applicable noise ordinances that limit the hours and/or noise levels during which construction activities may occur. Potentially significant noise impacts will be analyzed in the EIR.

- b) Construction of the project may generate ground-borne vibrations or ground-borne noise. This will be analyzed in the EIR.
- c) Construction activities may temporarily increase noise levels in the vicinity of the project (see item XII-d below), but increases would be short-term (five to six weeks). Operation of the project would not include any activities or equipment usage that would result in a permanent increase in noise levels in the vicinity of a project site. Impacts would be less than significant. No further analysis is warranted.
- d) Operation of construction equipment at the proposed LMR sites may produce a temporary increase in noise levels in the vicinity of a site. The emergency generator that would be present at most LMR sites would be operated periodically as part of routine maintenance testing, which could produce a temporary noise increase. This will be analyzed in the EIR.
- e) Some LMR sites may be located within airport land use zones or within 2 miles of a public airport or public use airport. An evaluation of which sites are located near a public airport and the potential noise impacts at these sites will be analyzed in the EIR.
- f) Some LMR sites may be located within the vicinity of a private airport. An evaluation of which sites are located near a private airport and the potential noise impacts at these sites will be analyzed in the EIR.

4.13 POPULATION AND HOUSING

Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

DISCUSSION

- a) The project would involve the construction and operation of an LMR system that is intended to improve and facilitate communications among emergency responders. While its intent is to improve public safety, it would not increase employment or housing; and it would not provide infrastructure that could induce population growth. Construction of the facilities would result in a short-term increase in construction employment that would be spread throughout Los Angeles County and adjacent areas. The increase in construction employment would not be expected to induce substantial population growth in the area because the work force would be small enough to be accommodated by persons already living in the area. No further analysis is warranted.

- b) The construction and operation of the LMR system would not displace any existing housing. No further analysis is warranted.
- c) The construction and operation of the LMR system would not displace any people. No further analysis is warranted.

4.14 PUBLIC SERVICES

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Fire protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Police protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Schools?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Parks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Other public facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

DISCUSSION

- a) The purpose of the project is to facilitate communications among emergency response agencies including fire, police, and hospitals. Many LMR sites would be constructed at fire stations, police stations, and other public facilities such as hospitals. The project would not result in the need for additional fire and police facilities, would not increase school populations and the need for additional school facilities, would not affect development or use of parks, or result in any other significant impacts to other public facilities. No further analysis is warranted.

4.15 RECREATION

	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

DISCUSSION

- a) The project would not cause a direct population increase (see Section XII above). The construction and operation of the LMR system would have no effect on the use of existing neighborhood parks or regional parks or recreational facilities. Therefore, the project would not result in substantial physical deterioration of recreational facilities. Because some LMR sites would be located in or adjacent to existing recreational facilities, impacts to recreation will be analyzed in the EIR.
- b) The project does not include or require construction or expansion of any recreational facilities. No further analysis is warranted.

4.16 TRANSPORTATION/TRAFFIC

Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and nonmotorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Result in inadequate emergency access?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities or otherwise decrease the performance or safety of such facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

DISCUSSION

- a) Construction of the project, including workers' vehicles and construction equipment, would temporarily increase traffic in the vicinity of the proposed LMR sites. Potential impacts to transportation during construction of the project will be evaluated in the EIR.
- b) Construction of the project, including workers' vehicles and construction equipment, would temporarily increase traffic in the vicinity of the proposed LMR sites. Potential impacts to congestion management programs during construction of the project will be evaluated in the EIR.
- c) The project includes the construction of antenna support structures up to 180 feet tall without appurtenances at some locations where structures of this height do not currently exist. Potentially significant impacts to aircraft traffic patterns will be evaluated in the EIR.
- d) The proposed LMR sites would be accessed using existing roads and related infrastructure such as parking lots. The project would not entail any changes to transportation system designs and, therefore, would not introduce any design feature hazards or incompatible uses. No further analysis is warranted.
- e) Temporary road or lane closures could be required at some LMR sites during construction activities. Any temporary roadway or lane closure would be coordinated with local jurisdictions to minimize potential impacts to emergency access and evacuation routes. No significant impacts would be expected; however, potential impacts to emergency access and evacuation routes will be evaluated in the EIR to confirm this expectation.

The LMR facilities would not be sited where they could affect emergency access. During the design process, siting of the LMR facilities would be discussed with the property owner and operator to ensure existing operations and emergency access are not affected and access to existing facilities would not be blocked, as is required in the site lease/access agreement with the property owner. The LMR system contract requires compliance with applicable regulations and codes, including Life and Safety codes that contain requirements on emergency access. By incorporating code requirements in the placement and design of LMR facilities, operation of the project would have no impact on emergency access.

- f) The project consists of the construction and operation of telecommunication sites. None of the sites would be constructed where public transit, bicycle, or pedestrian facilities are located. The project would have no effect on any policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities nor would it decrease the performance or safety of these facilities. No further analysis is warranted.

4.17 UTILITIES AND SERVICE SYSTEMS

Would the project:	Less Than Significant with			
	Potentially Significant Impact	Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g) Comply with federal, state, and local statutes and regulations related to solid waste?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

DISCUSSION

- a) During excavation activities, dewatering may be necessary. Discharge of any water would follow the Regional Water Quality Control Board (RWQCB) requirements. Construction of the project would not involve discharging concentrated wastewater or large volumes of wastewater to a wastewater treatment facility that would exceed treatment requirements set forth by the RWQCB. As a result, a less than significant impact on requirements of the wastewater treatment plants in the project area is anticipated during construction of the project. During operations, the project would not result in the production of any wastewater that would require treatment. Although less than significant impacts are expected, impacts from wastewater discharge will be evaluated in the EIR to confirm this expectation.
- b) The project would not include construction or expansion of any water or wastewater treatment facilities. Therefore, no impact would occur to these types of facilities, and no further analysis is warranted.
- c) The project may require grading at some sites and the addition of impermeable surfaces that may increase stormwater runoff. Although each LMR site is relatively small (would not generally exceed 5,000 square feet) and changes in site topography and stormwater runoff would not be expected to require major changes in existing stormwater drainage facilities or extensive new stormwater drainage facilities, impacts from stormwater runoff facilities will be evaluated in the EIR.

- d) Water would be required during construction of the LMR sites for activities such as concrete mixing and dust suppression. No water would be required for routine operation of the sites. Water usage for construction and operation are expected to be minor; however, impact of the project's water requirements and water supplies will be evaluated in the EIR to confirm this expectation.
- e) The project would not result in generation of wastewater requiring treatment. No further analysis is required.
- f) Construction of the project would not generally entail demolition of existing structures that would generate waste requiring disposal. At some sites, existing chain link fencing may be removed to expand a fenced area. Small amounts of debris may be created as a routine part of constructing new facilities. Operation of the project would result in minimal or no solid waste on a routine basis. Although quantities of solid waste are expected to be small, an evaluation of solid waste generation and the capacity of landfills in the project area to accept that waste will be provided in the EIR.
- g) The amounts and types of waste that may be generated by construction of the project, as described under XVII f), would not conflict with solid waste regulations and statutes. Operation of the project would generate minimal solid waste; however, impacts to solid waste generation will be included in the EIR.

4.18 MANDATORY FINDINGS OF SIGNIFICANCE

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Does the project have impacts that are individually limited but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

DISCUSSION

- a) Potentially significant impacts that require evaluation in an EIR have been identified for several resources in this Initial Study. Surveys will be conducted to identify biological, archaeological, and cultural resources at and in the vicinity of the project sites to identify resources that may be affected by construction and operation of the project. This issue will be carried forward for analysis.

- b) The project has the potential to result in environmental impacts during construction and operation in several resource categories. In addition, other related projects in the vicinity of the LMR sites may also result in environmental impacts. As such, the project, combined with other projects in the area, has potential to result in a significant cumulative impact. Therefore, the proposed project's contribution to any significant cumulative impact will be analyzed further in the EIR.
- c) Implementation of the project would involve mostly construction impacts. After construction, operational impacts from the project could occur. This topic will be analyzed further in the EIR.

Project Description: (please use a separate page if necessary)

Installation and operation of up to 90 LMR communications sites in Los Angeles County and portions of adjacent Orange and San Bernardino counties to provide voice communications coverage for emergency responders. The proposed sites are within or adjacent to existing communication facilities to the maximum extent feasible. The project consist of installation of antennas on existing and new lattice towers and monopoles and supporting radio equipment in existing and new shelters. Sites may also include new emergency generators. New lattice towers would generally not exceed 180 feet in height. New monopoles would generally be 70 feet tall. Maximum construction footprints would not exceed 5,000 square feet at a site.

Note: The State Clearinghouse will assign identification numbers for all new projects. If a SCH number already exists for a project (e.g. Notice of Preparation or previous draft document) please fill in.

Reviewing Agencies Checklist

Lead Agencies may recommend State Clearinghouse distribution by marking agencies below with and "X".
 If you have already sent your document to the agency please denote that with an "S".

Local Public Review Period (to be filled in by lead agency)

Starting Date August 27, 2014 Ending Date September 25, 2014

Lead Agency (Complete if applicable):

Consulting Firm: Jacobs
 Address: 3257 E Guasti Road, Suite 120
 City/State/Zip: Ontario, CA 91761
 Contact: Carl Rykaczewski
 Phone: 909.974.2721

Applicant: LA-RICS JPA
 Address: 2525 Corporate Place, Suite 200
 City/State/Zip: Monterey Park, CA 91754
 Phone: 323.881.8049

Signature of Lead Agency Representative:  Date: 8-19-14

Authority cited: Section 21083, Public Resources Code. Reference: Section 21161, Public Resources Code.

B-3: NOISE MODELING

B-4: CULTURAL RESOURCES TABLES

JANUARY 2016

This page intentionally left blank

APPENDIX B-1

AIR QUALITY

CONSTRUCTION AND OPERATION EMISSIONS

This page intentionally left blank

Air Quality

This air quality assessment was conducted to identify potential emission increases as a result of the proposed Project in Los Angeles County, California, including the No Project Alternative. Potential impacts would be only temporary during construction and are not anticipated to exceed any existing violations or create any new violations of the ambient air quality standards.

Regulatory Setting

Federal Regulatory Setting

Federal Standards

The federal Clean Air Act (CAA) of 1970 (42 U.S.C. § 7401 et seq.) establishes federal policies and programs that regulate air pollution in the United States. The U.S. Environmental Protection Agency (USEPA) established primary and secondary National Ambient Air Quality Standards (NAAQS) under the provisions of the CAA. The CAA not only established the NAAQS, but also sets emission limits for certain air pollutants from specific sources, sets new source performance standards based on best demonstrated technologies, and established national emissions standards for hazardous air pollutants. Federal NAAQS are currently established for seven pollutants (known as “criteria pollutants”): carbon monoxide (CO), ozone (O₃), nitrogen dioxide (NO₂), sulfur dioxide (SO₂), particulate matter equal to or less than 10 micrometers in aerodynamic diameter (PM₁₀), particulate matter equal to or less than 2.5 micrometers in aerodynamic diameter (PM_{2.5}), and lead (Pb). The State of California has also established emission limits for the above-mentioned criteria pollutants that are more stringent than the NAAQS. In addition, California has set standards for four pollutants not addressed by federal standards: Visibility Reducing Particles, Sulfates, Hydrogen Sulfides, and Vinyl Chloride. Table 1 summarizes the National and California AAQS for air quality pollutants.

Table 1: National and California Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards ¹	Federal Standards ²	
		Concentration ³	Primary ^{3,4}	Secondary ^{3,5}
Ozone	1 Hour	0.09 ppm (180 µg/m ³)	—	Same as Primary Standard
	8 Hour	0.07 ppm (137 µg/m ³)	0.075 ppm (147 µg/m ³)	
Respirable Particulate Matter (PM ₁₀) ⁶	24 Hour	50 µg/m ³	150 µg/m ³	Same as Primary Standard
	Annual Arithmetic Mean	20 µg/m ³	—	
Fine Particulate Matter (PM _{2.5}) ⁶	24 Hour	No Separate State Standard	35 µg/m ³	Same as Primary Standard
	Annual Arithmetic Mean	12 µg/m ³	12.0 µg/m ³	15 µg/m ³

Table 1: National and California Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards ¹	Federal Standards ²	
		Concentration ³	Primary ^{3,4}	Secondary ^{3,5}
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m ³)	35 ppm (40 mg/m ³)	—
	8 Hour	9.0 ppm (10 mg/m ³)	9 ppm (10 mg/m ³)	
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m ³)	—	
Nitrogen Dioxide (NO ₂) ⁷	1 Hour	0.18 ppm (339 µg/m ³)	0.1 ppm (188 µg/m ³)	None
	Annual Arithmetic Mean	0.030 ppm (57 µg/m ³)	0.053 ppm (100 µg/m ³)	Same as Primary Standard
Sulfur Dioxide (SO ₂) ⁸	1 Hour	0.25 ppm (655 µg/m ³)	0.075 ppm (196 µg/m ³)	—
	3 hour	—	—	0.5 ppm (1300 µg/m ³)
	24 Hour	0.04 ppm (105 µg/m ³)	0.14 ppm (for certain areas) ⁸	—
	Annual Arithmetic Mean	—	0.030 ppm (for certain areas)	—
Lead (Pb) ^{9,10}	30 Day Average	1.5 µg/m ³	—	—
	Calendar Quarter	—	1.5 µg/m ³ (for certain areas)	Same as Primary Standard
	Rolling 3-Month Average	—	0.15 µg/m ³	
Visibility Reducing Particles ¹¹	8 Hour	Extinction coefficient of 0.23 per kilometer—visibility of 10 miles or more (0.07 – 30 miles or more for Lake Tahoe) due to particles when relative humidity is less than 70%.	No Federal Standard	
Sulfates	24 Hours	25 µg/m ³		
Hydrogen Sulfides	1 Hour	0.03 ppm (42 µg/m ³)		
Vinyl Chloride ⁹	24 Hour	0.01 ppm (26 µg/m ³)		
Notes:				
1. California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM ₁₀ , PM _{2.5} , and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.				
2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than				

Table 1: National and California Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards ¹	Federal Standards ²	
		Concentration ³	Primary ^{3,4}	Secondary ^{3,5}
<p>once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24 hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m³ is equal to or less than one. For PM2.5, the 24 hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.</p>				
<p>3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.</p>				
<p>4. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.</p>				
<p>5. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.</p>				
<p>6. On December 14, 2012, the national annual PM2.5 primary standard was lowered from 15 µg/m³ to 12.0 µg/m³. The existing national 24-hour PM2.5 standards (primary and secondary) were retained at 35 µg/m³, as was the annual secondary standard of 15 µg/m³. The existing 24-hour PM10 standards (primary and secondary) of 150 µg/m³ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years. On December 14, 2012, the national annual PM2.5 primary standard was lowered from 15 µg/m³ to 12.0 µg/m³. The existing national 24-hour PM2.5 standards (primary and secondary) were retained at 35 µg/m³, as was the annual secondary standard of 15 µg/m³. The existing 24-hour PM10 standards (primary and secondary) of 150 µg/m³ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.</p>				
<p>7. To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.</p>				
<p>8. On June 2, 2010, a new 1-hour SO₂ standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO₂ national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.</p>				
<p>1) Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.</p>				
<p>9. The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.</p>				
<p>10. The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 µg/m³ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.</p>				
<p>11. In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.</p>				
<p>Source: California Air Resources Board, "Ambient Air Quality Standards." Internet URL: http://www.arb.ca.gov/research/aaqs/aaqs2.pdf. Accessed July 19, 2015.</p>				

General Conformity

Under the general conformity rule, determinations are made based on *de minimis* levels. These *de minimis* levels can be found in 40 CFR 93.153(b) and vary according to the type of pollutant and severity of the nonattainment area. Table 2 summarizes *de minimis* levels. These levels were established to focus on those federal actions likely to have the most significant impacts on air quality. If the Project's emissions are below the *de minimis* levels, then it is assumed the Project would not result in any significant air quality impacts and no further analysis is required. Conversely, if the Project's emissions exceed *de minimis* levels, then the Project would require a conformity determination; however, the federal agency is allowed to make changes to the project design before the action occurs to reduce emissions below *de minimis* levels.

Table 2: De Minimis Levels by Type of Pollutant

Criteria Pollutant	Tons/Year	
	Non-Attainment Area	Maintenance Area
Ozone (VOCs or NO _x)	25 (severe) 50 (serious)	100
Ozone (inside transport region – VOCs)	50	50
Ozone (outside transport region)	100	100
Carbon Monoxide, SO ₂ , and NO ₂	100	100
PM ₁₀	70 (serious) 100 (moderate)	100
PM _{2.5}	100	100
Lead	25	25

Greenhouse Gases

Climate change refers to long-term changes in temperature, precipitation, wind patterns, and other elements of the earth's climate system. An ever-increasing body of scientific research attributes these climatological changes to greenhouse gas (GHG) emissions, particularly those generated from the production and use of fossil fuels.

While climate change has been a concern for several decades, the establishment of the Intergovernmental Panel on Climate Change by the United Nations and World Meteorological Organization in 1988 has led to increased efforts devoted to GHG emissions reduction and climate change research and policy. These efforts are primarily concerned with the emissions of GHGs generated by human activity including carbon dioxide (CO₂), methane (CH₄), nitrous oxide (NO_x), tetrafluoromethane, hexafluoroethane, sulfur hexafluoride, HFC-23 (fluoroform), HFC-134a (s, s, s, 2-tetrafluoroethane), and HFC-152a (difluoroethane).

Although climate change and GHG reduction is a concern at the federal level; currently no federal regulations or legislation have been enacted that specifically address GHG emissions reductions and climate change at the project level. Climate change and its associated effects are being addressed through various efforts at the federal level to improve fuel economy and energy efficiency, such as the “National Clean Car Program” and Executive Order (EO) 13693 - Planning for Federal Sustainability in the Next Decade (March 19, 2015), which replaced EO 13514 Federal Leadership in Environmental, Energy and Economic Performance (October 5, 2009).

Whereas EO 13693 was focused on strategies for reducing greenhouse gases internally in federal agency missions, programs and operations, including participation in the interagency Climate Change Adaptation Task Force, EO 13514 sets reduction targets for three categories “scopes” of emissions. Scope 1 emissions are direct greenhouse gas emissions from sources that are owned or controlled by a federal agency. Scope 2 emissions are direct greenhouse gas emissions resulting from the generation of electricity, heat, or steam purchased by a federal agency. Scope 3 emissions are from sources not owned or directly controlled by a federal agency, but related to agency activities such as vendor supply chains, delivery and transportation services, and employee travel and commuting.

State Regulatory Setting

The California Environmental Protection Agency Air Resources Board (CARB) is responsible for ensuring that California ambient air quality standards (CAAQS) (Table 1) are met for certain pollutants and averaging periods. State standards are to be achieved through district-level air quality management plans that are incorporated into the State Implementation Plan.

CARB traditionally has established state air quality standards, maintained oversight authority in air quality planning, developed programs for reducing emissions from motor vehicles, developed air emission inventories, collected air quality and meteorological data, and approved state implementation plans.

The California CAA focuses on attainment of the CAAQS and requires designation of attainment and nonattainment areas with respect to these standards. The act also requires that local and regional air districts expeditiously adopt and prepare an air quality attainment plan if the district violates CAAQS for O₃, CO, SO₂, or NO₂. No locally prepared attainment plans are required for areas that violate state PM₁₀ standards. CARB is responsible for developing plans and projects that will comply with the state PM₁₀ standards.

Greenhouse Gases

With the passage of several pieces of legislation including State Senate and Assembly Bills and Executive Orders, California launched an innovative and proactive approach to dealing with GHG emissions and climate change at the state level. The goal of Executive Order S-3-05 is to reduce California’s GHG emissions to 1990 levels by 2020 and 80 percent below the 1990 levels by the year 2050. Assembly Bill 32 (AB 32), the Global Warming Solutions Act of 2006, set the same overall GHG emissions reduction

goals as outlined in Executive Order S-3-05, while further mandating that CARB create a plan, which includes market mechanisms, and implements rules to achieve “real, quantifiable, cost-effective reductions of greenhouse gases.” Senate Bill 97 (Chapter 185, 2007) required the Governor's Office of Planning and Research (OPR) to develop recommended amendments to the CEQA Guidelines for addressing greenhouse gas emissions. The amendments became effective on March 18, 2010.

Local Regulatory Setting

The proposed Project is located within portions of the Mojave Desert Air Basin (MDAB) and the South Coast Air Basin (SCAB) [see Figure 1]. Three of 54 planned sites located in the MDAB would be under the jurisdiction of the Antelope Valley Air Quality Management District (AVAQMD). The remaining 51 planned sites are located in the SCAB would be under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). These agencies regulate air pollution and operate air monitors throughout the air basins. In addition, the proposed Project is under the jurisdiction of 29 cities. Air quality is managed through land use and development planning practices, which are implemented through the cities’ general planning processes.

The proposed Project may be subject to one or more of the following rules and/or plan elements:

- AVAQMD Regulation IV, Rule 403 (2010) – Fugitive Dust
- AVAQMD Regulation IV, Rule 404 (1986) – Particulate Matter - Concentration
- AVAQMD Regulation XI, Rule 1110.2 (2003) – Emissions from Stationary, Non-road & Portable Internal Combustion Engines
- AVAQMD Regulation XXX, Rule 3011 (2011) – Greenhouse Gas Provisions of Federal Operating Permits
- SCAQMD Regulation IV, Rule 403 (2005) – Fugitive Dust
- SCAQMD Regulation IV, Rule 404 (1986) – Particulate Matter - Concentration
- SCAQMD Regulation XI, Rule 1110.1 (2005) – Emissions from Stationary Internal Combustion Engines
- SCAQMD Regulation XXVII, Rule 2701 & 2702 (2010) – Climate and Greenhouse Gases
- City of Agoura Hills – 2035 General Plan (2010), Chapter 4.15 Climate Change
- City of Burbank – 2035 General Plan (2013), Chapter 2 Air Quality and Climate Change Element, Goal 3 -Reduction of GHGs and Goal 4 - Climate Change
- City of Chino Hills – 2025 General Plan (2010), Chapter 9 Open Space and Conservation, Goal OSC-5 Reduce GHG emissions by 15 percent below 2005 levels by 2030
- City of West Hollywood – 2035 General Plan (2011), Climate Action Plan

Figure 1: Air Basins, Management Districts, Class I Areas, LMR Site Locations

CEQA Significance Criteria

Antelope Valley Air Quality Management District

Projects are considered significant if they trigger or exceed the most appropriate evaluation criteria. The AVAQMD has established significance thresholds most appropriate for a given project.

1. Generates total emissions (direct and indirect) in excess of the thresholds given in Table 3
2. Generates a violation of any ambient air quality standard when added to the local background
3. Does not conform with the applicable attainment or maintenance plan(s)
4. Exposes sensitive receptors to substantial pollutant concentrations, including those resulting in a cancer risk greater than or equal to 10 in a million and/or a Hazard Index (HI) (non-cancerous) greater than or equal to 1

Table 3: AVAQMD Significant Emissions Thresholds

Pollutant	Tons/Year	
	Annual Threshold (tons)	Daily Threshold (pounds)
Greenhouse Gases (CO ₂ e)	100,000	548,000
Carbon Monoxide (CO)	100	548
Oxides of Nitrogen (NO _x)	25	137
Volatile Organic Compounds (VOC)	25	137
Oxides of Sulfur (SO _x)	25	137
Particulate Matter (PM ₁₀)	15	82
Particulate Matter (PM _{2.5})	15	82
Hydrogen Sulfide (H ₂ S)	10	54
Lead (Pb)	0.6	3

Source: Antelope Valley AQMD "California Environmental Quality Act (CEQA) and Federal Conformity Guidelines" Internet URL:<http://www.avaqmd.ca.gov/Modules/ShowDocument.aspx?documentid=2908>. Accessed July 21, 2015.

A significant project must incorporate mitigation sufficient to reduce its impacts to a level that is not significant. A project that cannot mitigate to a level that is not significant must incorporate all feasible mitigation. Annual and daily thresholds are provided so that a multi-phased project (such as a project with a construction phase and a separate operational phase) with phases shorter than one year can be compared to the daily value.

South Coast Air Quality Management District

The SCAQMD has also established significance thresholds that are provided in Table 4 to be evaluated and compared to potential significant adverse air quality impacts.

Table 4: SCAQMD Significant Emissions Thresholds

Mass Daily Thresholds		
Pollutant	Construction	Operation
NO _x	100 lbs/day	55 lbs/day
VOC	75 lbs/day	55 lbs/day
PM ₁₀	150 lbs/day	150 lbs/day
PM _{2.5}	55 lbs/day	55 lbs/day
SO _x	150 lbs/day	150 lbs/day
CO	550 lbs/day	550 lbs/day
Lead	3 lbs/day	3 lbs/day
Toxic Air Contaminants (TACs), Odor and GHG Thresholds		
TACs (including carcinogens and non-carcinogens)	Maximum Incremental Cancer Risk greater than or equal to 10 in 1 million Cancer Burden greater than 0.5 excess cancer cases (in areas greater than or equal to 1 in 1 million) Chronic & Acute Hazard Index greater than or equal to 1.0 (project increment)	
Odor	Project creates an odor nuisance pursuant to SCAQMD Rule 402	
GHG	10,000 MT/yr CO ₂ eq for industrial facilities	
Ambient Air Quality Standards for Criteria Pollutants ^a		
NO ₂ 1-hour average Annual arithmetic mean	SCAQMD is in attainment: project is significant if it causes or contributes to an exceedance of the following attainment standards: 0.18 ppm (state) 0.03 ppm (state) and 0.0534 ppm (federal)	
PM ₁₀ 24-hour average Annual average	10.4 µg/m ³ (construction) ^b and 2.5 µg/m ³ (operation) 1.0 µg/m ³	
PM _{2.5} 24-hour average	10.4 µg/m ³ (construction) ^c and 2.5 µg/m ³ (operation)	
SO ₂ 1-hour average 24-hour average	0.25 ppm (state) & 0.075 ppm (federal – 99 th percentile) 0.04 ppm (state)	
Sulfate 24-hour average	25 µg/m ³ (state)	
CO 1-hour average 8-hour average	SCAQMD is in attainment: project is significant if it causes or contributes to an exceedance of the following attainment standards: 20 ppm (state) and 35 ppm (federal) 9.0 ppm (state/federal)	
Lead 30-day Average Rolling 3-month Average Quarterly Average	1.5 µg/m ³ (state) 0.15 µg/m ³ (federal) 1.5 µg/m ³ (federal)

Environmental Setting

Climate and Meteorology

The project is located within portions of the Mojave Desert Air Basin (MDAB) and the South Coast Air Basin (SCAB). The SCAB is almost completely enclosed by mountains to the north and east, resulting in a fairly regular daily reversal of wind direction – offshore at night and onshore during the day. With the concentrated population and industry, pollution products tend to accumulate and remain within this circulation pattern. The MDAB is separated from the southern California coastal and central California valley regions by mountains (highest elevation approximately 10,000 feet).

Summer is a dry period over most of the state due to the semi-permanent Pacific high pressure that deflects most storms far to the north. In winter, the Pacific High weakens and shifts southward. Upwelling ceases, and winter storms become frequent.

According to the Western Regional Climate Center (WRCC), the most representative monitoring station within the SCAB is located in Los Angeles, California. Climatic data was collected from the Los Angeles monitoring station for this analysis. Temperature and precipitation data recorded in Los Angeles from 1906 to 2013 is summarized below. Average maximum temperatures during the winter and summer months range from 66.4 to 83.1, respectively. Annual average precipitation is approximately 14 inches with over 95 percent of the seasonal rainfall between October and April.

According to the WRCC, the most representative monitoring station within the MDAB is located in Lancaster, California. Climatic data was collected from the Lancaster monitoring station for this analysis. Temperature and precipitation data recorded in Lancaster from 1974 to 2013 is summarized below. Average maximum temperatures during the winter and summer months range from 57.4 to 96.5, respectively. Annual average precipitation is approximately 7 inches with over 90 percent of the seasonal rainfall between October and April.

Attainment Status

Areas can be classified as non-attainment, maintenance, attainment, or unclassified. Geographic areas that exceed a particular National and/or State Ambient Air Quality Standards (NAAQS and CAAQS) for a criteria pollutant are considered “non-attainment” areas for that pollutant. Conversely, areas that are below a criteria pollutant standard are considered “attainment.” Maintenance areas are defined as previously exceeding the NAAQS or CAAQS (non-attainment) for a criteria pollutant, but are presently attaining that standard. Maintenance areas are required to develop a maintenance plan outlining steps for continued attainment over the maintenance period. Table 5 summarizes the attainment status within the proposed Project area.

Table 5: Attainment Status within the Project Area			
Criteria Pollutant	County	Federal Status	State Status
Mojave Desert Basin			
Carbon Monoxide	Los Angeles and San Bernardino	Attainment	Attainment
Lead	Los Angeles and San Bernardino	Attainment	Attainment
Nitrogen Dioxide	Los Angeles and San Bernardino	Attainment	Attainment
Ozone	Los Angeles and San Bernardino	Non-attainment	Non-attainment
PM _{2.5}	Los Angeles and San Bernardino	Attainment	Non-attainment (San Bernardino only)
PM ₁₀	Los Angeles and San Bernardino	Non-attainment (San Bernardino only)	Non-attainment
Sulfur Dioxide	Los Angeles and San Bernardino	Attainment	Attainment
Particulate sulfate	Los Angeles and San Bernardino	n/a	Attainment
Hydrogen sulfide	Los Angeles and San Bernardino	n/a	Unclassified
Visibility reducing particles	Los Angeles and San Bernardino	n/a	Unclassified
South Coast Air Basin			
Carbon Monoxide	Los Angeles, Orange, and San Bernardino	Maintenance	Attainment
Lead	Los Angeles, Orange, and San Bernardino	Non-attainment (Los Angeles only)	Attainment
Nitrogen Dioxide	Los Angeles, Orange, and San Bernardino	Maintenance	Attainment
Ozone	Los Angeles, Orange, and San Bernardino	Non-attainment	Non-attainment
PM _{2.5}	Los Angeles, Orange, and San Bernardino	Non-attainment	Non-attainment
PM ₁₀	Los Angeles, Orange, and San Bernardino	Attainment	Non-attainment
Sulfur Dioxide	Los Angeles, Orange, and San Bernardino	Attainment	Attainment

Table 5: Attainment Status within the Project Area

Criteria Pollutant	County	Federal Status	State Status

n/a – not applicable

Existing Air Quality Monitoring Data

The EPA and local air districts maintain a statewide network of monitoring stations that routinely measure pollutant concentrations in the ambient air. These stations provide data to assess compliance with the NAAQS and CAAQS and to evaluate the effectiveness of pollution control strategies. The AVAQMD maintains and operates one of 14 monitoring stations located within the MDAB. The SCAQMD maintains and operates all 33 monitoring stations located within the SCAB. Daily and historical monitoring data is available through the CARB website < <http://www.arb.ca.gov/aqd/aqmoninca.htm>>.

Fugitive Dust

Fugitive dust is particulate matter which becomes airborne and has the potential to adversely affect human health or the environment. The most common forms of fugitive dust include PM₁₀ and PM_{2.5}. Fugitive dust is mainly generated from construction activities such as earth moving, paved road trackout, driving on haul roads, and disturbing surface areas.

Class I Areas

Construction activities contribute to visibility concerns in nonattainment and maintenance areas through their primary PM_{2.5} and NO_x emissions which contribute to the formation of secondary PM_{2.5}. Under the provisions of the CAA, EPA has designated a number of areas, including national parks and wilderness areas, in the State of California as Mandatory Class I Federal Areas where visibility is an important value. These mandatory Class I areas are listed in 40 CFR 81.406. Under the EPA Regional Haze Rule (RHR), states must establish goals to improve visibility in Class I areas and develop long-term strategies to reduce emissions of air pollutants that cause visibility impairment. These goals are outlined in the state implementation plans.

Of the mandatory Class I areas, San Gabriel Wilderness and Cucamonga Wilderness are the closest to the project. The nearest boundary of the San Gabriel Wilderness located in Los Angeles County is approximately 1.5 miles north from the Pine Mountain site. The nearest boundary of the Cucamonga Wilderness located in San Bernardino County is approximately 3 miles northeast from the Sunset Ridge site.

Impact Analysis

Short-Term Construction Emissions

Air pollutant emissions associated with construction of the proposed Project sites would result from diesel fuel combustion from the operation of construction equipment, gasoline and diesel fuel combustion from worker vehicle commutes to and from each job site, and airborne dust resulting from demolition activities and soil disturbance occurring during construction. Table 6 summarizes the types of construction activities, equipment used, and activity durations for a ‘composite’ proposed Project site based on preliminary information provided for construction activities at four sites¹. The table also lists equipment specifications [brake horse power (BHP) rating], equipment quantities, the number of worker trips to and from the site, and the number of days on site needed to complete each construction activity.

As shown in Table 6, six phases of construction were assumed to occur at each site including:

- Personnel and tool delivery
- Demolition of existing pavement and structures
- Preparation, involving cuts and fills, of the area where monopole, lattice tower, equipment shelters, and emergency generator will be installed
- Excavation for the monopole foundation
- Concrete pad construction
- Microwave and whip antenna installation
- Installation of cabinets, emergency generator and other ground-based equipment

Table 6: Composite Proposed Project Site with Maximum Construction Activities

Equipment Type	Specification (BHP)	No. Per Site	Hours Per Day	Trips To/ From Site	Days on Site ¹	Usage
Personnel and Tool Delivery						
F250 Antenna and Line Truck	306	4	0.067	600 ²	30	Haul equipment.
F550 Civil Truck	306	1	0.067	150	30	Haul personnel.
Demolition						
Concrete Saw ²	81[27] ⁴	1	7	1	1	Break up existing concrete.
Mini Excavator	22.9	1	4	1	1	Cut and fill work.
Dump Truck	450	1	8	1	8	Haul off excess material.
2,000 Gallon Water Truck	210	1	1	1	1	Dust control.
Site Preparation						
Mini Excavator	22.9	1	4	1	15	Cut and fill work.
Excavation						
Auger Drill Rig ²	205 [206] ⁴	1	3	1	2	Install fences, excavate foundation holes and bores.
Excavator	153	1	5	1	10	Trenching.
Cat Skid Steer	73	1	4	1	10	Move excavated soil on site.
2,000 Gallon Water Truck	210	1	1	3	10	Dust control.
Pad Construction						
Concrete Truck	450	1	1	19	19	Pour concrete.
Monopole/Shelter/Tower and Equipment Installation						
3-Ton Flatbed Truck	400	1	3	1	2	Haul materials and equipment.
250-Ton Crane	530	1	8	2	4	Monopole/shelter installation, tower assembly.
8,000 Pound Reach Fork	60	1	4	2	5	Access structures, string conductor, modify structure arms, tree trimming/removal, etc.
Portable Generator ²	84 [7] ²	1	6	1	10	Operate power tools.
<ol style="list-style-type: none"> 1. Maximum six week total construction duration. 2. Assume 5 daily round trips per vehicle per construction day. CalEEMod approximates worker vehicle trips by assigning 1.25 trips per piece of construction equipment not used for buildings or architectural coatings. This is equal to 750 total trips for a 6-week construction schedule. 3. Trips for this piece of equipment accounted for elsewhere in the construction sequencing (F550 or 3-Ton Flatbed trips). 4. Horsepower and usage data referenced from <i>Broadband Technology Opportunities Program Final Environmental Assessment, Los Angeles Regional Interoperable Communications System LTE System</i> (NTIA 2014). 						

A six-week construction schedule operating five weekdays per week was also assumed. Not all construction phases, equipment types, or activity durations will occur at all 54 proposed Project sites; therefore, this methodology represents a maximum construction emissions scenario for all sites. The composite site construction scenario would have overlapping activities including 30 commuting weekdays, one day of demolition, 15 days for site preparation, 10 maximum days for site excavation, 19 days of pad construction, and 10 maximum days of tower and equipment installation occurring within the overall construction timeframe.

Construction emissions were determined using the California Emission Estimator Model (CalEEMod) v 2013.2.2 developed with the California Air Pollution Control Officers Association (CAPCOA) in collaboration with the SCAQMD and other California air districts (EIC, 2013). The model quantifies direct emissions from construction for a variety of land use projects. Significant impacts of the project construction would occur if (1) the CAAQS and NAAQS for criteria pollutants are exceeded, (2) if the project does not conform to applicable attainment or maintenance plans, or (3) if the project exposes sensitive receptors to substantial pollutant concentrations (local significance thresholds).

Three of the proposed Project sites are located in the MDAB and subject to AVAQMD threshold requirements, and the remaining 51 are located in the SCAB and subject to SCAQMD threshold requirements. Separate CalEEMod model runs were completed to determine emissions from a composite site located in each air management district. Construction emissions that are below the AVAQMD and SCAQMD significance thresholds for criteria pollutants (see Table 3 and Table 4), respectively would demonstrate that significant impacts do not occur under the first two significant impact conditions. The analysis focuses on four of the criteria pollutants for which either the MDAB, the SCAB, or both are in nonattainment or maintenance: CO, PM_{2.5}, PM₁₀, and NO_x as well as CARB-designated reactive organic gases (ROG), which is any compound of carbon, excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate, among others². ROGs are a precursor of criteria pollutant O₃.

Proposed Project Sites Located in the MDAB

Table 7 presents the results of the anticipated maximum daily and annual emissions from a composite proposed Project site located within the portion of the MDAB that is under the jurisdiction of the AVAQMD. Compliance with significance thresholds for the four listed criteria pollutants (NO_x, CO, PM₁₀, PM_{2.5}) and reactive organic compounds (ROG), which are O₃ precursors, demonstrates that significant impacts would not occur due to an exceedance of the CAAQS/NAAQS and demonstrates conformity to applicable attainment or maintenance plans³. In addition, compliance with these thresholds and the relative distance to the San Gabriel Wilderness and the Cucamonga Wilderness indicate that

²Additional compounds are listed in *Definitions of VOC and ROG* (CARB, 2004).

³ 2004 Ozone Attainment Plan [State and Federal] (AVAQMD, 2004), *Federal 8-Hour Ozone Attainment Plan* [Western Mojave Desert Non-attainment Area] (AVAQMD, 2008), *Implementation Schedule for Measures to Reduce PM pursuant to H&S Code 39614[d]* (AVAQMD, 2005), *CEQA and Federal Conformity Guidelines*.

construction emissions from LMR sites located in the MDAB would not have a measurable air quality impact on Class I Federal Areas.

Table 7: Construction Emissions for Composite Site within the MDAB

	AVAQMD Maximum Emissions									
	Daily (lbs/day)					Annual (tons/year)				
	ROG	NO _x	CO	PM ₁₀	PM _{2.5}	ROG	NO _x	CO	PM ₁₀	PM _{2.5}
Unmitigated Emissions	0.65	7.13	5.34	0.97	0.30	0.01	0.11	0.08	0.02	<0.01
AVAQMD Threshold	137	137	548	82	82	25	25	100	15	15

Proposed Project Sites Located in the SCAB

Table 8 presents the results of the anticipated maximum daily emissions from a composite proposed Project site located within the SCAB and under the jurisdiction of the SCAQMD. Compliance with significance thresholds for the listed criteria pollutants and ROG demonstrates that significant impacts would not occur due to an exceedance of the CAAQS/NAAQS and demonstrates conformity to applicable attainment or maintenance plans⁴.

SCAQMD Sensitive Receptor Areas – Local Significance Thresholds

For sites located in the SCAB and under SCAQMD jurisdiction, impact avoidance of the third significant impact condition for construction emissions (substantial pollutant concentrations) is demonstrated by using a screening methodology to determine the exposure of sensitive receptors to local significance thresholds. These thresholds modify the maximum daily emissions limits shown in Table 8 based on the location of the nearest sensitive land use (receptor) within a designated sensitive receptor area (SRA) to the source of construction emissions. Table 9 lists the distance from each proposed Project site to the nearest receptor and the modified daily emissions threshold for the associated SRA. The modified maximum daily thresholds assume attainment of ambient air quality standards for each pollutant as defined in *SCAQMD Air Quality Significance Thresholds* at the nearest sensitive receptor location (SCAQMD 2011)⁵.

⁴ Final 2012 Air Quality Management Plan (SCAQMD, 2012); Final 1999 Amendment to the 1997 Ozone State Implementation Plan Revision (SCAQMD, 1999).

⁵ South Coast Air Quality Management District. 2011. *SCAQMD Air Quality Significance Thresholds*. Website <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2>. Accessed May 12, 2015.

Table 8: Construction Emissions for Composite Site within the SCAB

	SCAQMD Maximum Emissions (lbs./day)				
	ROG	NO _x	CO	PM ₁₀	PM _{2.5}
Unmitigated Emissions	0.67	7.27	5.54	1.02	0.41
Mitigated Emissions	0.65	7.14	5.33	0.71	0.34
SCAQMD Threshold	75	100	550	150	55

The screening methodology is applicable to the proposed Project because the construction footprint for each site is less than 5 acres. The district has not established local thresholds for ROG. As shown in the table, daily construction emissions from the composite site would be below the SRA threshold at the nearest sensitive receptor location within each SRA. The site where daily construction emissions of 1.02 lbs./day approach the SRA limit is ASD, with the maximum daily emissions reduced from 150 lbs./day to 4 lbs./day based on the proximity of the nearest sensitive area. Therefore, compliance with local significance thresholds is demonstrated.

Source: Localized Significance Thresholds (SCAQMD, 2014).

1. The modified maximum daily thresholds are based on attainment of ambient air quality standards for each pollutant as defined in *SCAQMD Air Quality Significance Thresholds* at the nearest sensitive receptor location (SCAQMD 2011).

2. Site DPK is not located within a SRA boundary.

Construction Sequencing

Using the maximum daily construction emissions for a composite site located in the SCAB from Table 8, a minimum schedule for completing the construction of all 51 proposed Project sites without exceeding the daily threshold for the listed criteria pollutants was determined. Emissions for NO_x from the construction of the composite site are the highest among these pollutants. The maximum number of sites that can begin construction simultaneously (sites starting) was determined by summing the daily emissions for multiple sites up to a point where total daily emissions would remain below the 100 lbs./day threshold for NO_x. Once started, these sites were assumed to be under active construction (active sites) through the anticipated six-week construction schedule for each site. Additional site construction starts would not occur unless total daily emissions, including the new sites, remain below the NO_x threshold.

As shown in Table 10, a maximum of 13 sites could be started with up to 28 sites under construction simultaneously without exceeding the 100 lbs./day emissions threshold for NO_x. Construction could be completed in 100 days without implementing Tier 4 emission standards for construction equipment. Under this mitigated scenario construction could be completed in 98 days. All three sites located in the AVAQMD could be started and under construction simultaneously without exceeding emissions thresholds for any criteria pollutant.

Table 10: Minimum Construction Schedule within SCAB to Complete All 51 Sites

Scenario	Calendar Days	Maximum Sites Starting	Maximum Active Sites
Unmitigated	100	13	28
Mitigated	98	16	37

Operational Emissions

Maintenance Activities

Operational emissions associated with the composite proposed Project site include emissions from vehicles transporting routine maintenance personnel to service LMR equipment. The EMFAC2011-LDV (Light Duty Vehicles) model, developed by the CARB, was used to estimate emissions from maintenance vehicles based on an assumed monthly generator test and biannual maintenance schedule for all 78 proposed Project sites. The generator test would last one hour at each site, and test days would be evenly distributed during each month of the year. It is also assumed that maintenance days coincide with generator test days.

SCAQMD Rule 1110.2 limits emissions of NO_x, CO, and VOCs from non-emergency engines with a 50 bhp rating or greater. This emissions standard does not apply to emergency generator engines operating less than 200 hours per year; however, it was assumed that manufacturing specifications for Project site backup generators will conform to these requirements. The AVAQMD emissions standards are 36 parts-

per-million (ppm) by volume during a 15-minute operation interval for NO_x, 250 ppm for VOCs, and 2000 ppm for CO.

SCAQMD Operation Emission Thresholds

Based on this schedule, approximately 3 to 4 round trips would occur during 22 weekdays each month of the calendar year for all 51 proposed Project sites located within the SCAQMD. Table 11 shows that emissions of the four criteria pollutants and ROG are well below the daily operational thresholds established by SCAQMD for all sites combined. In addition, compliance with these thresholds and the relative distance to the San Gabriel Wilderness and the Cucamonga Wilderness indicate that construction emissions from LMR sites located in the SCAB would not have a measurable air quality impact on Class I Federal Areas.

Table 11: Operational Emissions for All Sites within SCAQMD

Emission Category	Maximum Daily Emissions (lbs)				
	ROG	NO _x	CO	PM ₁₀	PM _{2.5}
Daily Maintenance	0.27	0.42	1.84	0.07	0.04
Generator Testing	0.22	1.15	1.59	0.12	0.12
Total Daily Emissions	0.49	1.57	3.43	0.19	0.16
Threshold (lbs/day)	55	55	550	150	55
Exceedance	No	No	No	No	No

AVAQMD Operation Emission Thresholds

Based on a similar monthly generator testing and biannual maintenance schedule that is coincident with the generator testing, five round trips would occur each month of the calendar year for the proposed Project sites located within the AVAQMD. Table 12 shows that emissions of the four criteria pollutants and ROG are well below the daily operational thresholds established by AVAQMD for all sites combined. In addition, compliance with these thresholds and the relative distance to the San Gabriel Wilderness and the Cucamonga Wilderness indicate that construction emissions from LMR sites located in the MDAB would not have a measurable air quality impact on Class I Federal Areas.

Table 12: Operational Emissions for All Sites within AVAQMD

Emissions Category	Maximum Daily Emissions (lbs)					Maximum Annual Emissions (tons)				
	ROG	NO _x	CO	PM ₁₀	PM _{2.5}	ROG	NO _x	CO	PM ₁₀	PM _{2.5}
Maintenance	0.02	0.06	0.24	0.01	0.01	<0.01	<0.01	0.03	<0.01	<0.01
Generator Testing	0.02	0.08	0.11	0.01	0.01	<0.01	0.01	0.01	<0.01	<0.01
Total	0.04	0.14	0.35	0.02	0.02	<0.01	0.01	0.04	<0.01	<0.01
Threshold (lbs/day)	137	137	548	82	82					
Threshold (tons/year)						25	25	100	15	15
Exceedance	No	No	No	No	No	No	No	No	No	No

Greenhouse Gas Emissions

Generation of GHG emissions can be determined based on the anticipated generator testing schedule and SCAQMD/AVAQMD emission factors. CalEEMod was used to calculate carbon dioxide equivalent (CO₂e) emissions from off-road construction equipment usage and on-road vehicle trips for construction workers to each proposed Project site amortized over a 30-year project life-cycle. Start-up and running CO₂ emissions from construction worker vehicles were determined using EMFAC2011-LDV. Finally, GHG emissions from electricity consumption by equipment (monopole/antennas) at each proposed Project site was determined with an assumed power rating and supply source (e.g., Los Angeles Department of Water and Power).

Total annual GHG emissions for all 78 proposed Project sites, 51 in the SCAQMD and 3 located in the AVAQMD, are shown in Table 13. The Council on Environmental Quality (CEQA) “presumptive effects threshold”⁶ for GHG emissions considers 25,000 annual metric tons of CO₂e an indication that federal agencies should consider project effects on climate change. As shown in the table, the estimated annual emissions of GHG resulting from the construction and operation of all 78 proposed Project sites is well below this threshold; therefore, climate change impacts are not anticipated as a result of this Project.

⁶ 25,000 metric tons may provide a useful, presumptive, threshold for discussion and disclosure of GHG emissions because it has been used and proposed in rule-makings under the Clean Air Act (e.g., EPA’s Mandatory Reporting of Greenhouse Gases Final Rule, 74 FR 56260, October 30, 2009). This threshold is used in Clean Air Act rule-makings because it provides comprehensive coverage of emissions with a reasonable number of reporters, thereby creating an important data set useful in quantitative analyses of GHG policies, programs and regulations. See 74 FR 56272. This rationale is pertinent to the presentation of NEPA analysis as well.

Table 13: Greenhouse Gas Emissions for All Sites within SCAQMD and AVAQMD

GHG Emission Source	Annual Emissions (metric tons)
Construction (Amortized over 30 year facility life)	220.13
Routine Maintenance	32.12
Generator Testing	16.44
Indirect (Electricity Generation)	2,074.79
Total	2,343.48

Analysis Conclusions

Compliance with SCAQMD and AVAQMD construction emission significance thresholds demonstrates that significant impacts would not occur due to (1) an exceedance of the CAAQS/NAAQS and (2) non-conformity with applicable attainment or maintenance plans for each district as a result of proposed Project site construction. For proposed Project sites located within the SCAB and under SCAQMD jurisdiction, daily construction emissions from a composite site would be below the SRA threshold at the nearest sensitive receptor location within each SRA. Therefore, significant impacts would not occur due to (3) non-compliance with local significance thresholds as a result of proposed Project site construction.

A maximum of 13 proposed Project sites located within the SCAB could be started with up to 28 sites under construction simultaneously without exceeding the SCAQMD daily emissions threshold for any criteria pollutant. Construction could be completed in 100 days without implementing Tier 4 emission standards for construction equipment. Under a mitigated (Tier 4) scenario, construction could be completed in 98 days. All three sites located in the MDAB could be started and under construction simultaneously without exceeding emissions thresholds for any criteria pollutant.

Operational emissions for proposed Project sites are well below the significant daily thresholds established by SCAQMD and AVAQMD for all 54 sites combined. Therefore, significant impacts would not occur as a result of proposed Project system operations. In addition, the estimated annual emissions of GHGs resulting from the construction and operation of all sites are well below the CEQA “presumptive effects threshold” of 25,000 metric tons CO₂e annually; therefore, climate change impacts are not anticipated as a result of this Project. Finally, the proposed improvements are not anticipated to have any measurable air quality impact on Class I Federal Areas.

APPENDIX B-2

BIOLOGICAL RESOURCES

SPECIAL STATUS SPECIES IN LOS ANGELES COUNTY

This page intentionally left blank

Mammals

American badger

CDFW–SSC

The American badger (*Taxidea taxus*) has a wide range in North America; occurrences in California have become rare due to habitat loss and urbanization. This species lives in grassland and scrub from the desert to the yellow pine forest. Individuals are solitary and require a large territory. They are primarily nocturnal and live in burrows, feeding on rodents. Predators include wolves, coyotes, bobcats, mountain lion, and golden eagles. Mortality also commonly occurs from vehicle strikes.

Big free-tailed bat

CDFW–SSC

The big free-tailed bat (*Nyctinomops macrotis*) is rare in California, with most records in urban San Diego, where they are year-round residents. Only vagrants would be expected in Los Angeles County. Populations occur in rocky areas below 8,000 feet. Individuals roost in caves and feed primarily on moths.

California leaf-nosed bat

BLM–S, CDFW–SSC

The California leaf-nosed bat (*Macrotis californicus*) occurs throughout southern California. Individuals roost in caves, mines, and rock shelters near foraging sites. They feed by catching insects in flight and gleaning them off leaves. Adults have one offspring a year and live for 20 to 30 years. They are not known to migrate or hibernate. As with most bats, predators include owls, coyotes, feral cats, and raccoons.

Desert bighorn sheep

BLM–S, USFS–S, CDFW–FP

Desert bighorn sheep (*Ovis canadensis nelsoni*) occur at the higher elevations and steep terrain of the San Gabriel Mountains. They escape predators by moving to steep terrain at night and when danger threatens. They live in groups and feed on a wide variety of grass, forbs, and shrubs. When they mix with cattle they are susceptible to disease. A major drop in numbers in the past was due to hunting.

Fringed myotis

BLM–S, USFS–S

The fringed myotis (*Myotis thysanodes*) is widespread along the coast and in the mountains of western North America. They are slow, maneuverable flyers and catch beetles, spiders, grasshoppers and moths in flight by leaf gleaning. Day and maternity roosts for this species are found in mines, caves, buildings, and crevices. They hibernate in winter but are easily disturbed by visitation.

Long-eared myotis

BLM–S

The long-eared myotis (*Myotis evotis*) is widespread but uncommon. Though populations are found in various habitats, mixed coniferous forests are most common. It avoids the desert and hot Central Valley. Individuals roost in a variety of locations, including tree cavities, stumps, snags, rock crevices, abandoned buildings, cracks in the ground, caves, mines, and loose bark on trees. They feed on insects,

especially beetles. They are a slow and maneuverable flyer, catching prey in flight. They nurse in small colonies of up to 30 individuals and hibernate in winter.

Los Angeles pocket mouse**CDFW–SSC**

The Los Angeles pocket mouse (*Perognathus longimembris brevinasus*) is one of seven subspecies. This species is not common, and existing populations are far apart and isolated. Its range includes much of Los Angeles and western Riverside counties. It is active when its food supply of annual grass and forb seeds is available. It also eats greens and arthropods and larvae. It prefers grasslands, alluvial scrub, and coastal sage scrub. The main threat to this species is loss of habitat due to agriculture and urbanization.

Mohave ground squirrel**BLM–S, CA–T, CDFW–SSC**

The Mohave ground squirrel (*Xerospermophilus mohavensis*) is found in the western Mojave Desert. It is a medium-sized rodent that lives in a habitat of diverse shrubs. It utilizes annual wildflowers, succulent-leaved shrubs, summer-fall seeding shrubs, and Joshua trees for food. This species is active for very short periods of time and remains dormant in low rainfall years. Its short period of activity and shy habits make it difficult to document its presence or absence through surveys. This species rarely drinks water and can actively forage during mid-day in summer, harvesting seeds, its main food supply.

Nelson’s antelope squirrel**BLM–S, CA–T**

Nelson’s antelope squirrel (*Ammospermophilus nelsoni*) is primarily from the San Joaquin Valley with historic collections in Antelope Valley in Los Angeles County. Habitat for this species includes grassy, sparsely shrubby ground in dry, flat or rolling terrain where they inhabit burrows of other small mammals. Individuals feed on green vegetation and seeds, relying on insects during the dry season. Threats to this species include loss of habitat due to agricultural and urban development.

Pallid Bat**USFS-S BLM-S**

The pallid bat (*Antrozous pallidus*) is widespread in California in arid areas, primarily the Mojave Desert. It is extremely rare in urban areas. These bats feed along the edges of woodlands and forests. They roost in bridges, buildings, and culverts. Pallid bats are leaf gleaners. They hibernate lightly, waking up to forage and drink.

Pallid San Diego pocket mouse**CDFW–SSC**

The pallid San Diego pocket mouse (*Chaetodipus fallax pallidus*) is rare, with its range just reaching southern Los Angeles County. It occurs in rocky desert and coastal sage scrub. It is solitary and nocturnal and seeks shelter in burrows. This species eats seeds, greens, and insects. Habitat loss is the main threat to this species.

CDFW–SSC

San Diego black-tailed jackrabbit

The San Diego black-tailed jackrabbit (*Lepus californicus bennettii*) is one of 17 subspecies and a year-round resident of the coastal side of the southern California mountains. Individuals eat grasses, forbs, pine and oak seedlings, and shrubs. They switch to deep-rooted shrubs in summer and can get by without much water. Normal predators include coyotes, foxes, hawks, and eagles. They are also susceptible to parasites such as ticks, fleas, lice, and mites. Threats to this species include loss of habitat.

San Diego desert woodrat

CDFW–SSC

The San Diego desert woodrat (*Neotoma lepida intermedia*) is a large rodent known to occur in northeastern and southern California. Populations can occur in most habitats in the grassland-scrub-woodland mosaic of plant communities in Los Angeles County. Individuals build large, stick nests which are their primary method of protection. Threats to this species include loss of habitat.

San Joaquin pocket mouse

BLM–S

The San Joaquin pocket mouse (*Perognathus inornatus*) occurs in the Mojave Desert portion of Los Angeles County. It inhabits grassland and creosote and saltbush scrub. It feeds on seeds, greens, and insects. This species is rare in Los Angeles County because the county is at the edge of its range.

Santa Catalina Island fox

ESA–E, CA–T

The Santa Catalina Island fox (*Urocyon littoralis catalinae*) is a miniature fox that evolved due to over 6,000 years of isolation on the various Channel Islands. Individuals are crepuscular, being most active at dawn and dusk. They are omnivorous, eating berries, cactus fruits, insects, lizards, and birds. This species is endangered and almost became extinct due to a recent outbreak of canine distemper. A vaccination program has increased the population to over 1,000. Threats from other diseases, such as ear tumors, are being studied.

Santa Catalina shrew

CDFW–SSC

The Santa Catalina shrew (*Sorex ornatus willetti*) is the smallest and rarest mammal on Catalina Island. Only seven occurrences in Avalon, Cottonwood, and Middle Canyon have been documented. Pitfall trapping has found only a few individuals. Any knowledge of its habits is based on ornate shrews (*Sorex ornatus*) on the mainland. It appears to be limited to riparian habitat with dense vegetation for cover, plenty of leaf litter for nesting, and presence of insects for feeding. Historical heavy grazing and droughts have degraded and reduced riparian habitat.

South coast marsh vole

CDFW–SSC

The south coast marsh vole (*Microtus californicus stephensi*) is one of 17 subspecies of vole; this species occurs in the Los Angeles region. It occurs primarily in the tidal marshes of Los Angeles County, as well as in the Mojave Desert. Individuals are most active at dawn and dusk, becoming nocturnal in summer. They do not hibernate. Threats to this species include loss of habitat and isolated populations.

Tehachapi pocket mouse

The Tehachapi pocket mouse (*Perognathus alticolus inexpectatus*) occurs in the Tehachapi area as far south as Lake Elizabeth. It occupies nonnative grasslands, Joshua tree woodland, chaparral, coastal sage scrub, fallow agricultural fields, pinyon-juniper woodland, yellow pine woodland, and oak savannah. It constructs burrows in loose sand from 3,500 to 6,000 feet in elevation. Very little is known about this mouse.

Townsend’s big-eared bat**BLM–S, CA–CT, CDFW–SSC**

The Townsend’s big-eared bat (*Corynorhinus townsendii*) is found throughout California. Populations occur in all habitats from the Mojave Desert to Jeffery pine forests in mountain habitats. Individuals roost and hibernate in abandoned mines and caves. They will abandon roost sites when disturbed by human activities. They feed on moths, flies, wasps, and beetle. Life expectancy ranges from 4 to 15 years. Predators include cats, raccoons, snakes, owls, and hawks.

Western mastiff bat**BLM–S, CDFW–SSC**

The western mastiff bat (*Eumops perotis californicus*) is uncommon in the Central Valley and Santa Monica Mountains in all major plant communities in the county. This species roosts on tall buildings, cliffs, tunnels, and trees. It uses major rock crevices as maternity roosts. Populations are most common where roost sites are prevalent. Individuals feed during the night, flying as much as 15 miles from their day roosts, which are solitary or in small colonies mixed with other species of bat. They forage within 200 feet over vegetation and rock outcrops. They are the largest California bat and are in a family with long narrow wings that are good for long distance flight but poor at maneuvering.

Yuma myotis**BLM–S**

The Yuma myotis (*Myotis yumanensis*) is common throughout the California desert below 8,000 feet. This species prefers forests and woodlands. Individuals roost in mines, buildings, rock crevices, caves and abandoned swallow nests below bridges. Maternal colonies of several thousand individuals occur in caves and mines. Their feeding territory and hibernation sites may differ. They forage on flying insects, primarily over water. They are poor long-distance flyers and are not known to migrate.

Birds**American peregrine falcon****CA–FP, CDFW–FP**

The American peregrine falcon (*Falco peregrinus anatum*) is a widespread species, occurring on six continents. In North America, its breeding range is local and spotty, diminished from effects of chemical poisons. This medium-sized bird of prey feeds on song birds and waterfowl, as well as bats. Adults normally nests on cliffs near water but have also adapted to tall buildings in cities. Individuals are most likely to be observed feeding in open habitats within a mile of a nest site.

**Bald Eagle****CA–E, BLM–S, USFS–S, CDFW–FP**

The bald eagle (*Haliaeetus leucocephalus*) is a large bird of prey distributed across North America from Alaska and Canada to northwest Mexico. Bald eagles occur across much of California in winter. Breeding territories occur mostly in northern California, but are known from the central and southern Sierra Nevada Mountains and foothills, southern California coastal and inland areas, and Santa Catalina Island. They occupy habitat typically near water, such as lakes, reservoirs, rivers, and coastal wetlands. Breeding habitats typically occur in mountain and foothill forests and woodlands near these areas of water. Stick nests are built in the upper canopy of the tallest trees in these areas. In some areas, such as on Santa Catalina Island, nests occur on cliffs. They hunt small animals, such as fish or waterfowl, and they feed on carrion, which can include larger animals.

Bank swallow**BLM–S, CA–T**

The bank swallow (*Riparian riparia*) has a wide distribution: across North America, Europe, and Asia and is a breeding season resident in northern and central California. Occurrence in southern California is rare due to loss of habitat. Adults nests in colonies near stream banks in vertical cliffs. Bank swallows eat flying and jumping insects while in flight, especially over open water.

Black swift**CDFW–SSC**

The black swift (*Cypseloides niger*) is a scarce summer resident of areas of western North America. Only about 200 nesting sites have been located in North America. Individuals migrate to Brazil in the winter. Adults nest in caves in cliffs in forested areas near rivers, often nesting behind waterfalls. They lay a single egg which hatches into a slow-growing chick.

Burrowing owl**BLM–S, CDFW–SSC**

The burrowing owl (*Athene cunicularia*) has a wide distribution across North America; in Los Angeles County, it has become rare due to loss of habitat. This owl species is small and dwells on the ground in dry, open areas with no trees and low grass. They can survive in urban areas, such as vacant lots, pastures, airports, cemeteries, or golf courses. They can utilize drain pipes in curbs for nesting.

California brown pelican**BLM–S, USFS–S, CDFW–FP**

The California brown pelican (*Pelecanus occidentalis californicus*) is distributed along the Pacific coast from the Channel Islands south into Mexico. It is a large, distinctive, fish-eating shore bird often seen skimming the tops of waves just off shore. They feed by diving for fish. They nest on islands free of predators.

California condor**ESA–E, ESA–CH, CA–E, CDFW–FP**

The California condor's (*Gymnogyps californianus*) primary habitat is in Ventura County. Individuals will occasionally travel to adjacent areas such as the Mojave Desert or San Gabriel Mountains. They have been seen flying and perching in the Santa Susana Hills. Condors are carrion scavengers who need broad

wilderness areas for foraging. These areas range from Pacific beaches to mountain forests and meadows. Adults nest in caves and on cliff faces.

Coastal California gnatcatcher**ESA–T, ESA–CH, CDFW–SSC**

The coastal California gnatcatcher (*Polioptila californica californica*) is a permanent resident of the coastal sage scrub below 2,500 feet elevation of southern California and northern Baja California. Much of its habitat has been converted by urbanization. Much of its remaining habitat is managed under Habitat Conservation Plans. This species prefers high diversity coastal sage scrub habitat with low-growing, succulent, and drought-tolerant deciduous species. Adults forage on insects on the ground and in shrubs.

Golden eagle**BLM–S, CDFW–FP, BGEPA**

The golden eagle (*Aquila chrysaetos*) is a large bird of prey with a widespread distribution, but it has been eliminated from most urban areas. Golden eagles prefer to hunt in open areas such as grasslands; they do not like agricultural fields or forests but are attracted to road kill and garbage dumps. Primarily they eat rabbits, ground squirrels, quail, and other ground birds, as well as large mammals such as pronghorn and young sheep. They can easily adapt to domestic animals. Eagles are hardy, and their migration distance depends on climate. In mild areas they remain year-round. They build large nests of sticks primarily on cliffs. Threats include loss of habitat, flying into utility lines, electrocution, and being run over by vehicles.

Grasshopper sparrow**CDFW–SSC**

The grasshopper sparrow (*Ammodramus savannarum*) is a small, seed-eating songbird that occurs throughout North America. This species is less common in the western United States. Populations have been declining at 2.5 percent for the last 40 years. Individuals feed on the ground, killing by pinching the thorax of the large insects, especially grasshoppers. Adults nest on the ground with highly concealed nests made of grass.

Least Bell's vireo**ESA–E, ESA–CH, CA–E, CDFW–SSC**

The least Bell's vireo (*Vireo bellii pusillus*) is distributed throughout the central and southern United States and into Mexico. Populations in California are growing to repopulate historic ranges in central and southern California. Individuals occur in dense willow riparian forest in coastal southern California and forage on insects. Preferred habitat includes low shrubs near water or dry river bottoms. Nests are placed along the margins of bushes.

Le Conte's thrasher**CDFW–SSC**

The Le Conte's thrasher (*Toxostoma lecontei*) is a medium-sized ground bird and year round resident in the southwest North America. Populations have declined due to urbanization, increased agriculture, off-road vehicle use, and increased fire and resulting nonnative weed infestation. In Los Angeles County it is

primarily found in saltbush scrub of the Mojave Desert. It moves primarily by running and can reach high speeds. It rarely flies and often jumps in order to see above the shrubs. It eats insects and small lizards. Competition is primarily from other bird species. Adults nest in thorny plants where their eggs can be eaten by ground squirrels, domestic pets, coyotes, and snakes.

Long-eared owl

CDFW–SSC

The long-eared owl (*Asio otus*) is a large, nocturnal bird of prey with a distribution across North America. They have a wide range throughout the northern hemisphere at elevations between 0 and 6,500 feet. Habitat for long-eared owls includes grasslands for foraging and dense woodland and forest areas for nesting. Individuals primarily feed on rodents but also feed on lizards and rabbits. Adults do not build nests but use nests made by other species such as ravens and hawks. One of the most serious problems is loss of woodland and forest nesting habitat. Urban Los Angeles County is not considered habitat for this species.

Mountain plover

BLM–S, CDFW–SSC

The mountain plover (*Charadrius montanus*) is a dull-colored, ground-nesting, long-legged shorebird native to the short grass prairie. They nest in the Midwest and move to southwestern North America in winter. They are increasingly relying on the Imperial Valley for overwintering. In Los Angeles County, they overwinter primarily in the Mojave Desert area. They feed on insects and often accompany cattle as they stir up the insects. In the Midwest, mountain plovers prefer to build their nests in prairie dog colonies. The decrease in prairie dogs due to agriculture is a major threat. Habitat degradation has resulted in low survival rate of the young. Fewer than 20,000 individuals now survive.

Short-eared owl

CDFW–SSC

The short-eared owl (*Asio flammeus*) is a medium-sized owl of the grasslands and breeds throughout much of North America. This species is a year-round resident in certain areas within California, although migrating population increase its numbers during winter months. Nesting may occur in the Antelope Valley of Los Angeles County. Habitat requirements include open country that supports their rodent prey and provides vegetative cover to conceal their ground nests from predators.

Southwestern willow flycatcher

ESA–E, ESA–CH, CA–E

The southwestern willow flycatcher (*Empidonax traillii extimus*) is a small insect-eating bird that breeds in only a few places in southern California. The different subspecies are difficult to tell apart and are best identified by their songs. This species nests in willow thickets and cottonwood riparian woodlands and forests, and occasionally oaks. Many such habitats are too small to support a nesting pair. Migrating birds will use ornamental trees, follow riparian areas or rivers, and visit trees at isolated springs.

**Swainson's hawk****BLM-S, CA-T**

The Swainson's hawk (*Buteo swainsoni*) breeds throughout much of western North America. In California, territories have been recorded from several locations, including the Mojave Desert. They forage in wide-open spaces, such as grasslands, and often nest in solitary trees. They are social and hang out in groups outside nesting season.

Tricolored blackbird**BLM-S, CDFW-SSC**

The tricolored blackbird (*Agelaius tricolor*) is a large-sized passerine bird that occurs in the Pacific states, primarily within California. This species is found in the same habitat as the red-winged blackbird but is far less abundant. Breeding habitat includes dense cattail (*Typha* spp.), marshes around ponds and lakes, and adjacent agricultural fields. Losses are due to loss of wetlands and the nests in the agricultural fields are destroyed during harvesting.

Western snowy plover**ESA-T, ESA-CH, CDFW-SSC**

The western snowy plover (*Charadrius alexandrinus nivosus*) is a medium-sized ground-nesting bird. The Pacific coast breeding populations occur from Washington to Mexico. Breeding habitat includes areas above the high tide line on coastal beaches, sand spits, dune-backed beaches, sparsely-vegetated dunes, beaches at creek and river mouths, and salt pans at lagoons and estuaries. Less common nesting habitats include bluff-backed beaches, dredged material disposal sites, salt pond levees, dry salt ponds, and river bars. In winter, western snowy plovers are found on many of the beaches used for nesting as well as on beaches where they do not nest, in man-made salt ponds, and on estuarine sand and mud flats. Habitat degradation caused by human disturbance, urban development, introduced beachgrass (*Ammophila* spp.), and expanding predator populations have resulted in a decline in active nesting areas and in the size of the breeding and wintering populations.

White-tailed kite**BLM-S, CDFW-FP**

The white-tailed kite (*Elanus leucurus*) is a medium-sized bird of prey with a white tail and gray back. Its distribution includes a few southern and Pacific states, including California. Although population size in California is not large, management efforts to leave agricultural fields unharvested have increased their numbers. Kites are occasionally observed in alfalfa fields in the Antelope Valley. They are primarily a grassland species, often seen hovering in agricultural fields. Individuals feed on small mammals, lizards, and insects. Nests are made in the upper third of tall trees.

Yellow-breasted chat**CDFW-SSC**

The yellow-breasted chat (*Icteria virens*) is a bright yellow and brown songbird found throughout North America, including California. Distribution includes Los Angeles County, where populations are fairly stable. Habitat for this species includes open scrub and edges of riparian forests. Individuals avoid people and are difficult to see but easily heard. They feed on insects and fruit by gleaning, and they nest in dense shrubs.

Reptiles

Silvery legless lizard

USFS-S, CDFW-SSC

The silvery legless lizard (*Anniella pulchra pulchra*) is a medium-sized gray lizard with a yellow underbelly. This subspecies is endemic to the central and southern regions of California. They live in sandy washes and dunes and migrate into leaf litter at night. They require moisture to shed their skin. They feed on ground-dwelling insects. Threats are thought to occur from loss of habitat and habitat degradation due to the introduction of ornamentals, especially in dune areas.

California mountain kingsnake (San Diego population)

BLM-S, USFS-S, CDFW-SSC

The California mountain kingsnake (*Lampropeltis zonata pulchra*) is a non-venomous snake endemic to southern California with bands of black, red, and cream. It is most common in the chaparral of the Santa Monica Mountains in Los Angeles County. Individuals can be found in Jeffery pine forest and, more commonly, in riparian corridors at lower elevations. They become active in March and are diurnal, though rarely seen. They feed primarily on fence lizards and skinks. Adult females lay eggs, which hatch in late summer. Loss of habitat from firewood collectors and collection for the pet trade has resulted in a decline in populations.

Coast horned lizard

BLM-S, CDFW-SSC

The coast horned lizard (*Phrynosoma blainvillii*) is a medium-sized lizard that relies on camouflage for protection. Its historic range in California extended along the Pacific coast west of the deserts of the Sierra Nevada. This range has been severely fragmented due to urbanization. They are most active in the summer and inhabit open areas of sandy soil and low-growing vegetation in semiarid mountains, valleys, and foothills. Individuals utilize sandy soils and require a supply of red harvester ants (*Pogonomyrmex barbatus*). Though the red harvester ant is their primary food source, they eat a diverse number of insect groups. Horned lizards do not move great distances during their lifetime. Adult females lay eggs in the spring, which hatch in the summer. Juveniles mature in two to three years. Predators include snakes, shrikes, burrowing owls, roadrunners, hawks, and domestic cats.

Mojave desert tortoise

ESA-T, ESA-CH, CA-T

The Mojave desert tortoise (*Gopherus agassizii*) is a keystone species in the Mojave Desert. Individuals are limited to saltbush, creosote bush scrub, and Joshua tree woodland habitat in the Mojave Desert and are found in Los Angeles County. They dig burrows which are used by many other species in their habitat. They feed primarily on wildflowers but will eat some dried annuals and perennials and cacti when nothing else is available. Threats to this species are from loss of habitat, food competition with cattle, introduction of new diseases, degradation of habitat, collection as pets, and an increase in juvenile predation by the introduction of ravens into the desert habitat.

Rosy boa**USFS-S**

The rosy boa (*Charina trivirgata*) occurs in coastal southern California. They spend most of their time under granitic rocks or within crevices. They are an ambush predator that feeds on small rodents. They are diurnal, with most activity occurring in the morning and dusk during hot summer days. Although populations are fairly stable, threats include loss to birds of prey, roads, and urban development.

San Bernardino ringneck snake**USFS-S**

San Bernardino ringneck snake (*Diadophis punctatus modestus*) is a small snake that is gray above and bright orange and yellow below, with orange around its neck. This subspecies is endemic to California, found along the southern California coast and inland into the San Bernardino Mountains. Habitat includes moist situations in varied habitat, including forests, grassland, rocky woodland, hillsides, chaparral, and upland desert along streams. Individuals are found from sea level to 7,000 feet. Ringneck snakes eat earthworms, slugs, small salamanders, lizards, and newborn snakes. They are secretive, most often seen under flat rocks, logs, or loose bark of dead trees.

Western pond turtle**BLM-S, USFS-S, CDFW-SSC**

The western pond turtle (*Emys marmorata*) is found along the Pacific states in the United States. Individuals are found in ponds, lakes, rivers, streams, creeks, etc. with abundant vegetation and rocky or muddy bottoms. These inhabited water bodies are typically in woodland, forest, and grassland areas. Individuals are aquatic, with the exception of adult females during egg-laying. They lay eggs in upland areas, sometimes traveling over a mile in uplands at night to lay their eggs. They lay clutches of one to 13 eggs which take 75 to 80 days to hatch. Adults eat aquatic organisms, carrion, algae, and lily pad pods.

Two-striped garter snake**BLM-S, USFS-S, CDFW-SSC**

The two-striped garter snake (*Thamnophis hammondi*) is native to southern and central California. It is found in coastal sage scrub, oak woodlands and Jeffrey pine forests near permanent fresh water and rocky areas. Threats to this species include loss of habitat and degradation of aquatic habitat. Other factors are livestock grazing, flood control, loss of food supply, and predation by domestic animals.

Amphibians**Arroyo Toad****ESA-E, ESA-CH, CDFW-SSC**

The arroyo toad (*Anaxyrus californicus*) is a small toad that occurs in gravelly streams with a lot of bare sandy ground and willows on the edges. For breeding, the arroyo toad is restricted to rivers and streams of low stream gradient with permanent water. Breeding occurs along the edges and within the streams in small, shallow, gravelly pools adjacent to sandy terraces. The terraces must be stable and contain moderately developed vegetation. Trees usually consist of sycamore and cottonwood. The toads will disperse into upland habitat with sandy soils such as coastal sage scrub and chaparral.

Coast Range newt

Coast Range newts (*Taricha torosa*) live in coastal southern California and spend much of their time outside breeding season in rocks, crevices, and under logs. They have toxic skin, resulting in few predators. They eat worms, snails, slugs, insects in the rotting logs, and aquatic invertebrates. Populations have declined due to loss of coastal streams and introduction of mosquitofish and red crayfish.

California red-legged frog**ESA–T, ESA–CH, CDFW–SSC**

California red-legged frog (*Rana draytonii*) is a small frog of coastal streams of southern California. It has been eliminated from 70 percent of its range. It is active in the daytime and lives in dense, shrubby, or emergent riparian vegetation and still or slow-moving perennial and ephemeral waterbodies that also serve as breeding sites.

San Gabriel slender salamander**USFS–S**

San Gabriel slender salamander (*Batrachoseps gabrieli*) is a small reddish-brown and black-flecked salamander that is found from 11 locations in the San Gabriel River system. It has been found under rocks, wood, or fern fronds on a steep north-west-facing talus slope shaded by *Quercus chrysolepis* and *Pseudotsuga macrocarpa*, on soil along Soldier Creek at the base of the talus slope, and under rocks and logs up to 10 to 15 meters from the stream in Rockbound Canyon.

Southern mountain yellow-legged frog**ESA–E, ESA–CH, CA–E, CDFW–SSC**

The southern mountain yellow-legged frog (*Rana muscosa*) is found in the local mountains south of the King's River. It occurs at sources of permanent water such as streams, lakes, and ponds between 1,200 and 7,500 feet in elevation. It basks in sunny locations. It has been eliminated from over 90 percent of its known range. Its main food is insects. Threats include introduction of a new fungus, loss of habitat, introduction of fish into ponds, livestock grazing, and pesticides.

Western spadefoot toad**BLM–S, CDFW–SSC**

Western spadefoot toad (*Spea hammondi*) is a small, spotted toad with a historic range of coastal Los Angeles County. They are most commonly associated with grasslands and vernal pools but are also found in coastal sage scrub and chaparral. Existing populations are primarily in the Santa Clarita area. They are highly terrestrial but require water to breed. Sufficient upland habitat exists, but adjacent wetland habitat has been eliminated in most areas; also, predators of the tadpoles are common in many of the urban wetlands that still exist.

Yellow-blotched salamander**BLM–S, USFS–S, CDFW–SSC**

Yellow-blotched salamander (*Ensatina eschscholtzii croceator*) is a large, brown and yellow salamander of south-central California. They inhabit cool, moist places under debris soil or near water, especially in places with a thick layer of leaf litter. They inhabit white fir, Jeffrey pine forest, oak woodland, and

chaparral. They are most common in rocky areas with many springs, moist soil, and plenty of shrub cover. Fire can be catastrophic in killing individuals and eliminating habitat in old-growth forests. The yellow-blotched salamander is most active after rains, eating insects, snails, and arthropods. Their main predators are jays and garter snakes. They remain only in the Santa Monica-Santa Susana-San Gabriel Mountains in Los Angeles County.

Fish

Unarmored threespine stickleback

ESA–E, CA–E, CDFW–FP

The unarmored threespine stickleback (*Gasterosteus aculeatus williamsoni*) is a fish limited to the permanent pools in the Santa Clara River system. It is a bottom-feeder and primarily eats invertebrate larvae. Its range expands after winter rains when streams increase their flows.

Invertebrates

El Segundo Blue Butterfly

ESA–E

The El Segundo blue butterfly (*Euphilotes battoides allyni*) was nearly extinct due to loss of coastal dune habitat and its larval host plant and adult nectar plant, *Eriogonum parvifolium*. The larvae feed on the flowers for one month before pupating. Adults hatch from their cocoon in the summer and live only a few days.

Monarch butterfly (California overwintering population)

ESA–Pet, USFS–S

The monarch butterfly (*Danaus plexippus*) is a brightly colored, large, black and orange butterfly. The larvae are poisonous when they feed on the toxic milkweed plant (*Asclepias* spp.). Its alternate food source is fennel (*Foeniculum vulgare*), which is not toxic. The butterfly migrates from Mexico toward Canada each year and overwinters on specific trees along the route. During migration they also roost at night in small clusters. The loss of roost trees, predation, and the loss of milkweed plants along the migration route have resulted in a large drop in population.

Palos Verdes blue butterfly

ESA–E, ESA–CH

The Palos Verdes blue butterfly (*Glaucopsyche lygdamus palosverdesensis*) is a small blue and gray butterfly. This species is limited to the Palos Verdes Peninsula area. The larval host plant is a very rare milk-vetch. Presumably due to the lack of adequate host plants, a new population of the species discovered at a defense site in San Pedro in 1994 has switched to a much more common legume species, deerweed (*Acmispon glaber* [*Lotus scoparius*]).

Plants

Abrams' oxytheca

USFS-S, CNPS-1B.2

The Abrams' oxytheca (*Acanthoscyphus parishii* var. *abramsii*) is a prostrate, pink-flowered spineflower relative. It is found only in the San Gabriel Mountains in Los Angeles County. It occurs in sandy and gravelly soils in between 5,500 and 6,500 feet in elevation.

Conejo dudleya

ESA-T, CNPS-1B.2

The Conejo dudleya (*Dudleya parva*) is a small succulent-leaved perennial with yellow flowers and red flowering stems. It is found in chaparral, Jeffery pine forest, foothill woodlands, and cliffs of the Santa Monica Mountains. Only one historic collection is recorded in Los Angeles County.

Alkali mariposa-lily

BLM-S, USFS-S, CNPS-1B.2

The alkali mariposa lily (*Calochortus striatus*) is a pink-flowered bulb of saltbush scrub occurring on the floor of the Antelope Valley. It is identified by the dark lines in the petals which are missing in *C. palmeri*. It is most common in clay drainages but occurs in dunes on top of clay pans adjacent to dry lakebeds.

Aphanisma

CNPS-1B.2

The aphanisma (*Aphanisma blitoides*) is a succulent annual goosefoot that turns red late in the growing season. Its primary habitat is coastal bluffs, which have been almost entirely impacted by development. It can occur in specific habitats within coastal sage scrub and undisturbed beaches. It can also occur in disturbed areas, especially ditches.

Beach spectaclepod

BLM-S, CA-T, CNPS-1B.1

The beach spectaclepod (*Dithyrea maritima*) is primarily a Channel Island species of sand dunes. It once occurred on the mainland at Seal Beach, Playa Del Rey, and Redondo Beach. It still occurs in the dunes from Ventura to San Luis Obispo where less disturbance has occurred. It is a rough-leaved mustard with cream colored flowers and twin round shaped fruits.

Big Bear Valley woollypod

CNPS-1B.2

The Big Bear Valley woollypod (*Astragalus leucolobus*) is a member of a genus with a large number of rare species. While this species occurs in Jeffery pine forests and pinyon-juniper woodlands, it is specifically known as a "pebble plains" species. This refers to a distinctive clay soil with numerous rounded cobbles which occurs adjacent to Baldwin Lake.

Blochman's dudleya

CNPS-1B.1

The Blochman's dudleya (*Dudleya blochmaniae* ssp. *blochmaniae*) is a tiny, corm-like, succulent-leaved perennial that grows on coastal bluffs in sandy habitats. Only one historic location in Los Angeles County was recorded at Winters Canyon in Malibu in 1948 (just south of Pepperdine University).

CNPS–1B.1

Brand's star phacelia

The Brand's star phacelia (*Phacelia stellaris*) is native to coastal sage scrub and beach dunes on the coast of southern California and Baja California, where it is known from only a few occurrences. Its status is uncertain, as most of its recorded occurrences are in areas that have since been disturbed or degraded in the highly developed coastal region. Populations around San Diego and along the Santa Ana River have been confirmed. All collections in Los Angeles County are historic records in urbanized areas.

Braunton's milk-vetch

ESA–E, ESA–CH, CNPS–1B.1

The Braunton's milk-vetch (*Astragalus brauntonii*) is a large white- to purple-flowered, 1- to 2-foot-tall perennial. It is most common after fires in chaparral. It will persist in bare areas, especially with carbonate bedrock. It also grows on the edges of roadsides and fuel breaks. Potential habitat for this species occurs at Green Mountain in the Santa Monica Mountains.

California Orcutt grass

ESA–E, CA–E, CNPS–1B.1

The California Orcutt grass (*Orcuttia californica*) occurs locally in large vernal pools from coastal and central California. Vernal pools historically occurred in depressions in most grassland. This plant community has been converted to urban development and agriculture; in undeveloped areas, it has been subject to overgrazing and introduction of nonnative grasses.

California satintail

USFS–S, CNPS–2B.1

The California satintail (*Imperata brevifolia*) is a large bunchgrass that grows in riparian areas in coastal sage scrub. It has a wide range but locally is found in the foothills of the San Gabriel Mountains in Los Angeles County. Its presence in California is a relic of a wetter past.

California saw-grass

USFS–S, CNPS–2B.2

The California saw-grass (*Cladium californicum*) is a grass-like perennial of alkali sinks, freshwater marshes, and other wetlands. Only one historic collection is recorded in Los Angeles County from the San Gabriel River drainage above the San Gabriel Reservoir. It is known from only 11 extant populations in the state but also occurs in Mexico.

Catalina crossosoma

CNPS–1B.2

The Catalina crossosoma (*Crossosoma californicum*) is a cream-flowered shrub with distinctive fruits. It is most common on the Channel Islands but rarely occurs on the mainland in mesic canyons in chaparral and bluff scrub. Its range does not extend far from the coast onto the mainland.

California dissanthelium

CNPS–1B.2

The California dissanthelium (*Dissanthelium californicum*) is a small annual grass found in mesic bare areas in coastal sage scrub on Catalina Island. Once thought to be extinct, it reappeared after the nonnative herbivores were removed from the island. It is most common in high rainfall years.

**Catalina Island dudleya****CNPS–1B.2**

The Catalina Island dudleya (*Dudleya virens* ssp. *hassei*) is endemic to Santa Catalina Island on coastal bluffs. A historic collection is known from San Pedro on the mainland. Known from 10 populations, its numbers and distribution were historically reduced by goats.

Chaparral ragwort**CNPS–2B.2**

The chaparral ragwort (*Senecio aphanactis*) is a small, erect yellow-flowering composite with a wide range in the state. All Los Angeles collections are old, and the species may no longer occur in the county. It has been observed at Puddingstone, Santa Catalina Island, and Saugus.

Chickweed oxytheca**USFS-S, BLM-S, CNPS 4.3**

Chickweed oxytheca (*Sidotheca caryophylloides*) is a prostrate, white-flowered annual of the San Gabriel Mountains. It is rare in sandy soils in Jeffery pine forest. It has rarely been collected and is not well tracked because it is a List 4 CNPS species.

Club-haired mariposa-lily**USFS-S, CNPS–4.3**

The club-haired mariposa-lily (*Calochortus clavatus* var. *clavatus*) is a yellow-flowered bulb common from western Los Angeles County and the eastern San Gabriel Mountains. It occurs in grasslands and openings in coastal sage scrub. It has taller stems than the other southern California subspecies and has zig-zag stems. The purple lines, hairs, and stamens are quite variable in color, ranging from mostly purple to almost no purple.

Coast woolly-heads**CNPS–1B.2**

The coast woolly-heads (*Nemacaulis denudata* var. *denudata*) was a fairly common prostrate annual in undisturbed sand dunes. It is found only on sandy banks of streams in Orange County today. It once occurred in the Long Beach area.

Coastal dunes milk-vetch**ESA–E, CA–E, CNPS–1B.1**

The coastal dunes milk-vetch (*Astragalus tener* var. *titi*) is limited to coastal dune habitat and sandy areas in the coastal sage scrub. It is presently known only from coastal terrace grassland at Pebble Beach in Monterey County. It is a small annual herb whose population levels vary with rainfall. It has not been observed in Los Angeles County in nearly 100 years due to the destruction of all habitat. It once occurred near Marina Del Rey and Santa Monica; both areas had extensive wetlands in the past. It probably preferred mesic sites behind dunes but also occurred on foredunes.

Coulter's goldfields**BLM–S, CNPS–1B.1**

Coulter's goldfields (*Lasthenia glabrata* var. *coulteri*) occurs in mesic sites in grasslands such as coastal marshes, alkali sinks, riparian, and vernal pools. Historically, it occurred at very scattered locations in Los

Angeles County. It could occur in compacted soils along rights-of-way at elevations as high as Jeffery pine forest.

Coulter's saltbush**CNPS 1.2B**

Coulter's saltbush (*Atriplex coulteri*) is a prostrate annual with inconspicuous flowers. It grows in the coastal strand, coastal annual grasslands, and coastal sage scrub and occasionally inland in alkaline valleys and river systems. It occurs on the Palos Verdes Peninsula and Catalina Island in Los Angeles County.

Davidson's bush-mallow**CNPS-1B.2**

Davidson's bush-mallow (*Malacothamnus davidsonii*) is a hairy-leaved, pink-flowered shrub that grows in chaparral and coastal sage scrub.

Davidson's saltscale**CNPS-1B.2**

Davidson's saltscale (*Atriplex serenana* var. *davidsonii*) is a low-growing perennial with erect, lanceolate, gray leaves. It occurs on coastal bluff scrub, valley grassland, and some habitats in coastal sage scrub. It occurred historically in Malibu Canyon, Mesmer (historic name for the location along the original Los Angeles River upstream of the Ballona wetlands), Los Angeles at Temple Street, and on Catalina Island.

Decumbent goldenbush**CNPS-1B.2**

Decumbent goldenbush (*Isocoma menziesii* var. *decumbens*) historically occurred in coastal riparian areas. The only mainland historic site in Los Angeles County is a collection from Terminal Island. Otherwise it occurs on the Channel Islands. The genus and species is the most common summer-blooming shrub in Los Angeles County; the subspecies is rare.

Estuary seablite**CNPS-1B.2**

Estuary seablite (*Suaeda esteroa*) is a yellow-green amaranth with succulent leaves and stems. It is found in salt marshes along the coast and inland in brackish water on major creeks. Most sites in Los Angeles County are historic, such as Long Beach, San Pedro, and Ballona wetlands.

Forest Camp sandwort**USFS-S**

Forest Camp sandwort (*Eremogone macradenia* var. *arcuifolia*) is a cream-flowered perennial with needle-like leaves. It is from the desert side of the San Gabriel Mountains, primarily from the Liebre Mountain area.

Gambel's water cress**ESA-E, CA-T, CNPS-1B.1**

Gambel's water cress (*Nasturtium gambelii*) occurs along uncontaminated streams and lake edges. It formerly occurred at La Cienega in Santa Monica. This swamp resulted from the original flow of the Los Angeles River; this habitat no longer exists. The Los Angeles River now empties into the Pacific Ocean in

Long Beach. Its course changed in 1825 due to a flood and an earthquake. La Cienega was a depression at the headwaters of Ballona Creek which empties into Playa Del Rey, and the Ballona wetlands are all that remains of the native vegetation.

Greata's aster**BLM-S, CNPS-1B.3**

Greata's aster (*Symphotrichum greatae*) is a white-flowering perennial daisy of wet habitats in the San Gabriel Mountains. It is primarily found in the San Gabriel River drainage.

Grey-leaved violet**CNPS-1B.3**

The grey-leaved violet (*Viola pinetorum* var. *grisea*) is a yellow-flowered perennial found on dry rocky slopes in pinyon-juniper woodland and Jeffrey pine forests. It has the potential to occur in any of the mountaintop sites. Although it is listed in the county only from Vincent Gap, it has been observed at the top of the Cajon Pass and in mountain ranges to the east of Los Angeles County.

Hall's monardella**USFS-S, CNPS-1B.3**

Hall's monardella (*Monardella macrantha* ssp. *hallii*) is a prostrate, red-flowered perennial that grows under the pine needles in Jeffrey pine forest, primarily in San Diego and Baja California. It has been collected on the road between Sunset Ridge and Sunset Peak in Los Angeles County.

Interior manzanita**USFS-S**

Interior manzanita (*Arctostaphylos parryana* var. *tumescens*) is a 3- to 4-foot-tall shrub with pink flowers. It is found in montane chaparral and Jeffrey pine forest and red fir forest. It is difficult to identify from the other low-growing manzanitas in the San Gabriel Mountains.

Intermediate mariposa-lily**USFS-S, CNPS-1B.2**

The intermediate mariposa-lily (*Calochortus weedii* var. *intermedius*) is a hybrid between two local species: *C. weedii* and *C. plummerae*. Being intermediate in character, the flower color is highly variable. Plant key guides do not include all the hybrid individuals that are nearly all one species or the other. The hybrids are centered in the Tonner Canyon area. This species grows in the grasslands of the oak woodland-chaparral-coastal sage scrub mosaic between Bell and Dayton canyons.

Island green dudleya**CNPS-1B.2**

Island green dudleya (*Dudleya virens* ssp. *insularis*) is a leaf succulent perennial from the Channel Islands. Mainland sites include the cliffs at Point Vincente and Palos Verdes. It occurs on rocky hillsides on north-facing slopes, canyons, and stream banks. The leaves are unusually cylindrical.

Island rush-rose**ESA-T, CNPS-1B.2**

Island rush-rose (*Crocانthemum greenei*) is a short-lived, perennial, yellow-flowering subshrub. This species became extremely rare due to the extensive overgrazing by introduced animals on the Channel

Islands. It is a fire follower, returning after fires from a seed stock in the soils. Until 2007, one to three known plants occurred on Catalina Island, including a location on Blackjack Mountain. The plants were caged to eliminate deer grazing, which lowers plant health and eliminates seed production. As many as 4,000 plants germinated and survived after a fire. It is not known if germination will occur in a wet year without a fire and with bison still on the island.

Late-flowered mariposa-lily**BLM–S, USFS–S, CNPS–1B.2**

The late-flowered mariposa-lily (*Calochortus fimbriatus*) is a pale purple-flowered bulb that occurs only in the Santa Susana Mountains–Newhall area in Los Angeles County. The flower color and shape is highly variable. It is known from 89 populations, often in serpentine soils in chaparral and oak woodland. It is threatened by habitat degradation from overgrazing, fire suppression, and the introduction of nonnative annuals.

Lemon lily**USFS–S, CNPS–1B.2**

The lemon lily (*Lilium parryi*) is a tall perennial with large, yellow flowers. It grows in wet meadows and streams. This plant is obvious when present and extremely limited in habitat. In California it occurs only in the Peninsular and Transverse ranges.

Los Angeles sunflower**CNPS–1A**

The Los Angeles sunflower (*Helianthus inexpectus*) is known from one recent location along the Santa Clara River at Newhall Ranch. Most sunflowers are tall, yellow-flowered annuals with a wide geographic range. The rare perennials found in wet areas have turned out to be hybrid species. It is a polyploidy species but the parents of the *H. nuttallii parishii* are unknown because it is extinct. The hybrid/polyploid populations may have different maternal parents or hybridize at different times, causing genetic differences in each population; this causes difficulties in taxonomy.

Lyon’s pentachaeta**ESA–E, ESA–CH, CA–E, CNPS–1B.1**

Lyon’s pentachaeta pygmy daisy (*Pentachaeta lyonii*) is a 1- to 3-inch-tall yellow-flowering annual daisy. The plant is found on soils that limit the competition with nonnative annuals. This species occurs in native grasslands with clay soils or macrobiotic crust. It is most common in swales. Populations are centered in the coastal Ventura County area including the northern Santa Monica Mountains in Los Angeles County. It was more common in the Channel Islands before heavy grazing damaged the habitat.

Many-stemmed dudleya**BLM–S, USFS–S, CNPS–1B.2**

The many-stemmed dudleya (*Dudleya multicaulis*) grows primarily on cliffs and steep canyon slopes at Marshall Canyon, Puddingstone, Santa Monica, Azusa and Dalton canyons, Elephant Hill, and Pelican Hill.

Marcescent dudleya**ESA–T, CA–R, CNPS–1B.2**

The marcescent dudleya (*Dudleya cymosa* ssp. *marcescens*) is a leaf-succulent with shorter, broader leaves than the common dudleya species. It has yellow flowers, red stems, and red calyxes. This species' best quality habitat is north-facing rocky cliffs with a permanent stream flow on the canyon floor. It can occur on shaded, rocky slopes and narrow canyons and is limited to the northern Santa Monica Mountains.

Marsh sandwort**ESA–E, CA–E, CNPS–1B.1**

The marsh sandwort (*Arenaria paludicola*) is a cream-flowered perennial of wet, marshy areas in bogs and freshwater marshes. It is at risk due to loss of wetland habitat and degradation of water quality. Only one naturally occurring population of marsh sandwort is known to remain in California at Oso Flaco Lake in San Luis Obispo County. A historic collection from Cienega in Los Angeles County is dated in 1900. Presently, Los Angeles County has no habitat for this species.

Mason's neststraw**BLM–S, USFS–S, CNPS–1B.1**

Mason's neststraw (*Stylocline masonii*) is a minute, gray annual without showy flowers. The group is difficult to identify and has been collected only in the Santa Clara wash system in Los Angeles County. Much of its potential habitat has been converted to agriculture. It was probably primarily an inland valley species; it is now extremely rare.

Mesa horkelia**USFS–S, CNPS–1B.1**

The mesa horkelia (*Horkelia cuneata* var. *puberula*) is a cream-colored flowering perennial found from mesic grasslands up to Jeffrey pine forests. Its primary habitat is mesic depressions and stream-sides on grassy banks. In Los Angeles County it occurs in canyons in the San Gabriel Mountains and once occurred in coastal grasslands in El Segundo, Point Dume, Palos Verdes, and Los Angeles. It occurs primarily in the Santa Ana Mountains of Orange County and the San Bernardino Mountains.

Mt. Gleason Paintbrush**USFS–S, CNPS 1B.2**

Mt. Gleason paintbrush (*Castilleja pruinosa* [*gleasonii*]) is a red-flowered, partially parasitic perennial of the higher elevations of the eastern San Gabriel Mountains. It is much more common in Northern California. The leaves are densely hairy and turn gray with age.

Nevin's barberry**ESA–E, ESA–CH, CA–E, CNPS–1B.1**

Nevin's barberry (*Berberis nevinii*) is a yellow-flowering shrub with distinctive holly-like leaves and fleshy red fruit. It normally grows in gravelly washes with an overstory of sycamore and cottonwood. It can grow in washes with alluvial scrub or on adjacent wash bench slopes. It curiously also occurs on hilltops and rocky cliffs in the southern portion of its range. It propagates easily in cultivation but has not been observed setting fruit in the wild. Some of the populations may have been planted as part of early restoration projects.

**Nevin's woolly sunflower****CNPS-1B.3**

Nevin's woolly sunflower (*Constancea nevinii*) is a yellow-flowering, gray-leaved perennial of the Channel Islands. It has finely divided leaves and flat-topped clusters of yellow flowers. It grows in coastal bluff scrub and coastal sage scrub and is known from 48 populations which are recovering from grazing by feral goats.

Orcutt's linanthus**BLM-S, USFS-S, CNPS-1B.3**

Orcutt's linanthus (*Linanthus orcuttii*) is an erect white- to pink-flowered annual. Plants are shorter and flowers larger than the San Gabriel linanthus. It is found in chaparral and Jeffery pine forests. It has not been documented in Los Angeles County from modern collections.

Palmer's mariposa-lily**BLM-S, USFS-S, CNPS-1B.2**

Palmer's mariposa-lily (*Calochortus palmeri* var. *palmeri*) is a pink-flowered bulb that occurs at Sag Ponds along the San Andreas Fault and seeps, springs, and streams in the San Gabriel Mountains. It is threatened by development, grazing, nonnative plants, recreational activities, and vehicles. It is known from 92 populations.

Parish's brittlescale**USFS-S, CNPS-1B.1**

Parish's brittlescale (*Atriplex parishii*) is a small, gray-leaved, prostrate annual of vernal pools, alkaline areas, and saline depressions. It is associated with the coast and river systems in southern and central California. The only historic location in Los Angeles County is from Bixby Knolls near Long Beach.

Parish's gooseberry**CNPS-1A**

Parish's gooseberry (*Ribes divaricatum* var. *parishii*) was historically collected once and then thought to be extinct. It has been collected in the Rio Hondo/Whittier Narrows area in recent times but has not been observed during the recent drought. Historic occurrences are recorded from Pasadena.

Parry's spineflower**BLM-S, USFS-S, CNPS-1B.1**

Parry's spineflower (*Chorizanthe parryi* var. *parryi*) is more common and has a wider range than other subspecies of this species. It is limited to sandy or rocky openings in chaparral, cismontane woodland, coastal scrub, or valley and foothill grasslands of Los Angeles, Riverside, San Bernardino, and Ventura counties in California.

Peirson's lupine**USFS-S, CNPS-1B.3**

Peirson's lupine (*Lupinus peirsonii*) primarily occurs in the San Gabriel Mountains from the crest of the main ridge to washes on the desert side near the base in the Mojave Desert. It can be easily identified because it is the only yellow-flowered perennial lupine in the area; most perennial lupines in the area are purple-flowered.

USFS-S

Peirson's spring beauty

Peirson's spring beauty (*Claytonia lanceolata* var. *peirsonii*) is a white-flowering perennial that occurs in Jeffery pine forest in the San Gabriel Mountains. It occurs in Lodgepole Forest, Subalpine Forest, Red Fir Forest, and wetland-riparian. It can occur in dry, rocky slopes or wet meadows. It is known from a couple of collections in the San Gabriel Mountains.

Robbins' nemacladus

USFS-S, CNPS-1B.2

Robbins' nemacladus (*Nemacladus secundiflorus* var. *robbinsii*) is a minute cream-flowered annual. The collections in Los Angeles County are from non-related habitats, indicating this plant can be found along the coast, in the mountains, and in the desert. In general, the group likes sandy habitat and are commonly only about 2 inches tall, and nearly invisible, when the observer is standing. Many taxa remain undescribed in this poorly understood and under-collected genus. This species has irregular cream-colored flowers lacking purple markings.

Robinson's pepper-grass

CNPS-4.3

Robinson's pepper-grass (*Lepidium virginicum* var. *robinsonii*) is most common in Los Angeles County in the foothills of the San Gabriel Mountains but has been collected in the Verdugo and Puente hills. It also occurs on the Channel Islands. It is most commonly found on bare slopes between shrubs in coastal sage scrub and chaparral.

Rock Creek broomrape

USFS-S, CNPS-1B.2

Rock Creek broomrape (*Orobanche valida* ssp. *valida*) is a parasitic perennial that parasitizes silk tassel bush (*Garrya elliptica*). The only visible portion of the plant is the flower stalk, which can remain visible for several years. It is found in the yellow pine forests of the San Gabriel Mountains.

Ross' pitcher sage

USFS-S, CNPS-1B.2

Ross' pitcher sage (*Lepechinia rossii*) is a showy, pink-flowered shrub with a very limited range in the Liebre Mountains area. It usually occurs in canyons in oak woodland and chaparral. It is most common in openings on north-facing slopes in soils derived from reddish marine sediment. It commonly occurs after fires and in areas disturbed for road cuts and fuel breaks.

Round-leaved filaree

BLM-S, CNPS-1B.1

Round-leaved filaree (*California macrophylla*) is a white-flowered geranium of valley grassland and foothill woodland habitat. It can grow in depressions and clay flats along roadsides. Once widespread throughout coastal and central California and the Channel Islands, today it is most common in the Malibu Creek to Newhall area.

Salt marsh bird's-beak**ESA–E, CA–E, CNPS–1B.2**

Salt marsh bird's-beak (*Chloropyron maritimum* ssp. *maritimum*) is a species found in moist, alkaline environments. It is an erect paintbrush-type semi-parasite that forms host-plant relationships with most salt marsh species, such as saltgrass (*Distichlis spicata*) and pickleweed (*Salicornia* spp.).

Salt Spring checkerbloom**USFS–S, CNPS–2B.2**

Salt Spring checkerbloom (*Sidalcea neomexicana*) is a pink-flowered perennial in the Mallow family. Most collections in Los Angeles County are historic, with one modern collection in La Cañada. It has a widespread range and usually occurs at alkaline springs and seeps from 14 sites in California.

San Antonio milk-vetch**USFS–S, CNPS–1B.3**

San Antonio milk-vetch (*Astragalus lentiginosus* var. *antonius*) is a narrow-leaved, nearly prostrate, blue- to purple-flowered species that occurs in upper-elevation pine forests. It occurs on the dry slopes and has been collected several times on Table Mountain.

San Bernardino aster**BLM–S, USFS–S, CNPS–1B.2**

San Bernardino aster (*Symphyotrichum defoliatum*) is a purple-flowered perennial daisy. Scattered throughout southern California, it is associated with major river systems. Most collections in Los Angeles are historic.

San Bernardino grass-of-Parnassus**USFS–S, CNPS–1B.3**

San Bernardino grass-of-Parnassus (*Parnassia cirrata* var. *cirrata*) a small, white-flowered perennial of moist meadows and stream sides in Jeffrey pine forest. It was only collected once in Los Angeles County in the San Gabriel River drainage.

San Fernando Valley spineflower**ESA–C, CA–E, USFS–S, CNPS–1B.1**

San Fernando Valley spineflower (*Chorizanthe parryi* var. *fernandina*) is a prostrate, white-flowered annual that was thought to be limited to large wash systems. It presumed to be extinct, as those washes were disturbed for urbanization and sand mining. This species was rediscovered, however, in Newhall in shallow soils with exposed bedrock.

San Gabriel bedstraw**BLM–S, USFS–S, CNPS–1B.2**

The San Gabriel bedstraw (*Galium grande*) is a shrub easily identified to genus but difficult to identify to species. It occurs at the upper elevations of the San Gabriel Mountains from chaparral to Jeffrey pine forest. It is distinguished by the plants being sprawling and hairy throughout, the leaves widely elliptical, and the flowers yellow.

San Gabriel Mountains sunflower**USFS-S CNPS 4**

San Gabriel Mountains sunflower (*Hulsea vestita* ssp. *gabrielensis*) is a yellow-orange flowered perennial of mountaintops in the San Gabriel Mountains, including at Magic Mountain. It grows in Jeffery Pine, Red Fir, and Lodgepole pine forest.

San Gabriel linanthus**USFS-S, CNPS-1B.2**

San Gabriel linanthus (*Linanthus concinnus*) is an erect, white-flowered annual that occurs in chaparral and Jeffery and red fir forest in the San Gabriel Mountains. It occurs in sandy openings in rocky areas.

San Gabriel River dudleya**USFS-S CNPS 1B.2**

The San Gabriel River dudleya (*Dudleya cymosa* ssp. *crebrifolia*) is a small reddish and yellow flowering leaf succulent. It is limited to canyons of the San Gabriel River drainage. It occurs on steep, north-facing cliffs for a linear length of about 1 mile.

Santa Barbara morning-glory**CNPS-1A**

Santa Barbara morning-glory (*Calystegia sepium* ssp. *binghamiae*) was once considered extinct. Its historical occurrences were based on only a few, mostly coastal, collections. It was rediscovered near one of its historic locations in Chino, California. It has not been rediscovered in Los Angeles County

Santa Catalina Island desert-thorn**CNPS-1B.1**

Santa Catalina Island desert-thorn (*Lycium brevipes* var. *hassei*) is a purple-flowered, shrubby boxthorn that occurs on Catalina Island and the Palos Verdes Peninsula. Its branching pattern and spines are distinctive even when its leaves or flowers are absent.

Santa Catalina figwort**CNPS-1B.2**

The Santa Catalina figwort (*Scrophularia villosa*) is a red- and yellow-flowered, strongly scented perennial found only in the Channel Islands. It occurs in mesic habitats in coastal sage scrub and chaparral, primarily on north-facing slopes and in narrow shady canyons. It is threatened by habitat loss and degradation from feral herbivores.

Santa Catalina Island bedstraw**CDNP-1B.3**

Santa Catalina Island bedstraw (*Galium catalinense* ssp. *catalinense*) is a cream-flowered shrub that grows on the rocky slopes and coastal bluffs of Catalina Island. It has suffered from overgrazing by goats, which has resulted in a loss of genetic diversity.

Santa Catalina Island currant**CNPS-1B.2**

Santa Catalina Island currant (*Ribes viburnifolium*) is a low-growing shrub used in the native ornamental trade. Because of over-grazing by goats and deer, populations are much smaller than in the past.

Presently, this species is found in narrow, mesic canyons and shady, north-facing slopes. It has been collected on the east-northeastern slopes of Black Jack Peak.

Santa Catalina Island ironwood**CNPS–1B.2**

Santa Catalina Island ironwood (*Lyonothamnus floribundus* ssp. *floribundus*) is a very distinctive tree species that occurs only on the Channel Islands and in canyons on the Tenaja Truck trail off of Highway 74. As this plant grows easily in cultivation, mainland observations may be ornamentals. On Catalina Island, it occurs only on north-facing slopes at the highest elevations. Historic deer and goat grazing has eliminated plant reproduction for many years.

Santa Catalina Island manzanita**CNPS–1B.2**

Santa Catalina Island manzanita (*Arctostaphylos catalinae*) is a white-flowered shrub that reaches up to 16 feet in height. It is limited to nine populations on Santa Catalina and Santa Cruz Island. It occurs on ridges in chaparral.

Santa Cruz Island winged-rockcress**ESA–E, CNPS–1B.1**

Santa Cruz Island winged-rockcress (*Sibara filifolia*) is a small, annual, purple-flowered mustard. It grows in coastal sage scrub, preferring saddles between mountaintops on rocky ridges and shady areas. It was historically threatened by feral herbivores, including goats; about 500 individual plants in 4 populations existed when the goats were removed from the islands. Only one known population occurs on Santa Catalina Island.

Santa Monica dudleya**ESA–T, CNPS–1B.1**

Santa Monica dudleya (*Dudleya cymosa* ssp. *ovatifolia*) is a succulent-leaved, rosette-forming perennial limited to the Santa Monica Mountains and Modjeska Canyon in Orange County. It occurs on shaded slopes of sedimentary and conglomerate rocks cliffs in oak and juniper woodlands. Two populations occur in Los Angeles County: one is Malibu Canyon and the other in Topanga Canyon.

Santa Susana tarplant**CA–R, BLM–S, CNPS–1B.2**

Santa Susana tarplant (*Deinandra minthornii*) is a perennial, yellow-flowering, summer-blooming, rounded shrub. It has a very limited range in the Santa Susana Mountains, with a few scattered plants in the Santa Monica Mountains, on rocky slopes and sandstone crevices in coastal sage scrub and chaparral. No more than 20 populations are known.

Short-joint beavertail**BLM–S, USFS–S, CNPS–1B.2**

Short-joint beavertail (*Opuntia basilaris* var. *brachyclada*) is a variety of beavertail with 2-inch-long cylindrical (rather than flattened) pads that occurs from the desert side of Cajon Pass west to Lake Isabella. It occurs at intermediate elevations in desert chaparral and pinyon-juniper woodland. It is perennial and can be identified all year.

**Short-sepaled lewisia****USFS–S, CNPS–2B.2**

Short-sepaled lewisia (*Lewisia brachycalyx*) is a perennial of meadows and seeps in Jeffery pine forest of the San Gabriel Mountains.

Showy island snapdragon**CNPS–1B.2**

Showy island snapdragon (*Gambelia speciosa*) is now rare on the Channel Islands due to overgrazing. On the mainland, it is commonly grown as a native ornamental species.

Slender-horned spineflower**ESA–E, CA–E, CNPS–1B.1**

The slender-horned spineflower (*Dodecahema leptoceras*) is a tiny, prostrate, cream- and pink-flowered annual. It occurs on wash benches in major dry washes in the Riverside/San Fernando Valley areas. It is primarily found from the Cajon Pass to Redlands with scattered populations from northern Los Angeles County to southern Riverside County.

Slender mariposa-lily**BLM–S, USFS–S, CNPS–1B.2**

Slender mariposa-lily (*Calochortus clavatus* var. *gracilis*) is a yellow-flowered bulb of the grasslands in coastal sage scrub, oak woodland, and chaparral, especially along the southern base of the San Gabriel Mountains. It is most common in the Verdugo Mountain/Newhall area.

Sonoran maiden fern**USFS–S, CNPS–2B.2**

The Sonoran maiden fern (*Thelypteris puberula* var. *sonorensis*) is a perennial fern found in shady canyons of major drainage systems in the San Gabriel and Santa Monica mountains. In Los Angeles County, it is primarily found in the Glendora Canyon and Encinal Canyon areas. It can occur near springs, seeps, and meadows.

South coast saltscare**CNPS–1B.2**

The south coast saltscare (*Atriplex pacifica*) is a prostrate, red-stemmed annual with pointed-tipped leaves. It grows in alkaline clay pans adjacent to sea bluffs in native grasslands. It is associated with the sea coast and with river systems where habitat is nearly always disturbed. It historically occurred in the San Pedro Hills and on some of the Channel Islands.

Southern jewelflower**BLM–S, USFS–S, CNPS–1B.3**

The southern jewelflower (*Streptanthus campestris*) is an erect, purple-flowered mustard. It was collected once at Elizabeth Lake in Los Angeles County in 1986 but is more common in the San Bernardino Mountains. It grows in upper elevations in montane chaparral, oak woodlands, and Jeffery pine forests. It is a very rare plant; it is common for this genus to have species with very few locations.

**Southern Tarplant****CNPS-1B.1**

The southern tarplant (*Centromadia parryi* ssp. *australis*) is a widespread, yellow-flowering summer annual throughout coastal southern California. It is found especially in marshes, swamps, vernal pools, and grasslands. This species does well in disturbed areas.

Spreading navarretia**ESA-T, CNPS 1B.1**

Spreading navarretia (*Navarretia fossalis*) is a minute, white-flowered spineflower. It occurs at vernal pools, clay pans, and depressions. It occurs in the Santa Clarita area in Los Angeles County with historic locations at vernal pools in urbanized portions of Los Angeles Valley.

Thread-leaf Brodiaea**ESA-T CA-E, CNPS 1B.1**

Thread-leaf brodiaea (*Brodiaea filifolia*) is a clumping bulbous perennial with blue-purple flowers. It primarily occurs in Orange County, but a population occurs in the Claremont Wilderness Park and the foothills above Glendora. It occurs on slopes in coastal sage scrub.

Ventura Marsh milk-vetch**ESA-E, ESA-CH, CA-E, CNPS-1B.1**

The Ventura Marsh milkvetch (*Astragalus pycnostachyus* var. *lanosissimus*) is a large, coarse, gray-leaved perennial. Its habitat, the back dunes of a coastal dune system, has been eliminated in all but a small area on a military base in Oxnard. Its habitat is nonexistent in the rest of California, but it could be reestablished in restored dune areas such as the El Segundo Dunes. Its range is based on a couple of historic collections along the coast.

Wallace's nightshade**CNPS-1B.1**

Wallace's nightshade (*Solanum wallacei*) is a purple-flowered perennial with black berries. It occurs primarily on the Channel Islands in shaded canyons and hillsides, stream sides, beaches, and washes.

White rabbit-tobacco**CNPS-2B.2**

The white rabbit-tobacco (*Pseudognaphalium leucocephalum*) is a white-flowered, erect perennial that occurs in coastal sage scrub and chaparral in the coastal foothills of the San Gabriel Mountains. It has been observed in the past in the Santa Clarita, Verdugo Mountains, and Hollywood Hills.

White-veined monardella**CNPS-1B.3**

The white-veined monardella (*Monardella hypoleuca* ssp. *hypoleuca*) is a pale purple perennial that occurs only in the chaparral of the Santa Monica Mountains in Los Angeles County.

Wiggins' cryptantha**CNPS-1B.2**

Wiggins' cryptantha (*Cryptantha wigginsii*) belongs to a large genus of annuals and perennials in which the species of the annuals is based primarily on the seed characteristics. This rare species has been confused with *C. clevelandii*, which had never been collected in the United States. Experts have

determined it is most common on Catalina Island, but it has been collected occasionally on the mainland. In general, it is a spring-flowering annual and would be most common in high rainfall years.

Woolly mountain-parsley

USFS–S, CNPS–1B.3

Woolly mountain-parsley (*Oreonana vestita*) is a minute perennial that is commonly found on mountaintops. It occurs in alpine fellfields, red fir, and subalpine forest. It occurs on rocky ridges and slopes of the eastern San Gabriel Mountains.

APPENDIX B-3

NOISE MODELING

This page intentionally left blank

Noise Analysis Methods and Assumptions

The following summarizes the methods and assumptions for the analysis of potential short-term (construction) and long-term (operational) noise impacts from the proposed Project.

Short-Term (Construction Impacts)

As a worst case scenario, this analysis was based on a composite of activities at four representative sites. Construction activities are summarized in Table 14 (and Construction Noise Estimation) and include a list of likely types and number of pieces of construction equipment, as well as estimates of hours per day and the duration that each type of equipment would be in operation. Noise emissions measured as short-term noise exposures at 50 feet for the types of equipment to be used for the proposed Project were obtained from the Federal Highway Administration's (FHWA) Roadway Construction Noise Model (RCNM) User's Guide (FHWA 2006). The noise emission reference levels are shown in Table 15 below.

Table 14: Summary of Construction Activities

Equipment Type	Specification (BHP)	No. Per Site	Hours Per Day	Trips To/ From Site	Days on Site ¹	Usage
Personnel and Tool Delivery						
F250 Antenna and Line Truck	306	1	0.067	30	30	Haul equipment.
F550 Civil Truck	306	1	0.067	30	30	Haul personnel.
Demolition						
Concrete Saw ²	81[27] ²	1	7	1	1	Break up existing concrete.
Mini Excavator	22.9	1	4	1	1	Cut and fill work.
Dump Truck	450	1	8	1	1	Haul off excess material.
2,000-gallon Water Truck	210	1	1	1	1	Dust control.
Site Preparation						
Mini Excavator	22.9	1	4	1	15	Cut and fill work.
Excavation						
Auger Drill Rig ²	205 [206] ²	1	3	1	2	Install fences, excavate foundation holes and bores.
Excavator	153	1	5	1	10	Trenching.
Cat Skid Steer	73	1	4	1	10	Move excavated soil on site.
2,000-gallon Water Truck	210	1	1	3	10	Dust control.
Pad Construction						
Concrete Truck	450	1	1	19	19	Pour concrete.

Table 14: Summary of Construction Activities

Equipment Type	Specification (BHP)	No. Per Site	Hours Per Day	Trips To/ From Site	Days on Site ¹	Usage
Monopole and Equipment Installation						
3-Ton Flatbed Truck	400	1	3	1	2	Haul materials and equipment.
250-Ton Crane	530	1	8	2	4	Monopole/shelter installation, tower assembly.
8,000-Pound Reach Fork	60	1	4	2	5	Access structures, string conductor, modify structure arms, tree trimming/removal, etc.
Portable Generator	84 [7] ²	1	6	1	10	Operate power tools.
1. Maximum six-week total construction duration. 2. Horsepower and usage data referenced from <i>Broadband Technology Opportunities Program Final Environmental Assessment, Los Angeles Regional Interoperable Communications System LTE System</i> (NTIA 2014).						

Table 15: Noise Emission Reference Levels and Usage Factors

Default Equipment Type	LMR Equipment	Impact Device (Yes/No)	Acoustical Use Factor	Spec Lmax @ 50 feet (dBA)	Actual Measured Lmax @ 50 feet (dBA)
Aerial Man-lift	8,000 lb. Reach Fork	No	20	85	75
Concrete Saw	N/A	No	20	90	90

Source: FHWA 2006 and Caterpillar 2014.

Construction Noise Estimation

The FHWA RCNM is used to assess potential short-term construction impacts based on the loudest phase of construction (demolition). In estimating noise exposures for construction equipment, it was assumed that attenuation would result from geometric spreading and ground surface absorption. The geometric spreading of sound from a localized source (i.e., a point source) propagates uniformly and outwardly in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Noise attenuation from ground absorption and reflective-wave canceling adds to the attenuation associated with geometric spreading. For acoustically absorptive or soft sites (i.e., those sites with an absorptive ground surface between the source and the receiver, such as soft dirt, grass, or scattered bushes and trees), an excess ground-attenuation value of 1.5 decibels per doubling of distance is normally assumed. When added to the spherical spreading, the excess ground attenuation results in an overall drop-off rate of 7.5 decibels per doubling of distance. Existing or future noise abatement, such as sound walls, was not included.

Construction Vibration Estimation

Ground vibrations from construction activities generally do not cause damage to structures, with the exemption of fragile buildings, but can result in audible and feelable ranges in buildings very close to construction sites. Human annoyance to ground-borne vibration is generally related to root mean square (rms) velocity levels expressed in VdB. However, construction vibration for building damage is generally assessed in terms of peak particle velocity (PPV).

A damage assessment and annoyance assessment were conducted for this project. The FTA guidelines were used for this analysis since local ordinances have not established thresholds for construction vibration.

According to FTA, criteria for general assessments can be used to evaluate potential annoyance or interference with vibration-sensitive activities due to construction vibration; however, in most cases, the primary concern for construction vibration is the potential damage effects to structures. Table 3 summarizes the criteria for the annoyance assessment and Table 4 summarizes the damage criteria.

Table 3: Ground-borne Vibration Criteria for General Assessments

Land Use Category	GBV Impact Levels		
	Frequent Events ¹	Occasional Events ²	Infrequent Events ³
Category 1: Buildings where vibration would interfere with interior operations	65 VdB ⁴	65 VdB ⁴	65 VdB ⁴
Category 2: Residences and buildings where people normally sleep	72 VdB	75 VdB	80 VdB
Category 3: Institutional land uses with primarily daytime use	75 VdB	80 VdB	83 VdB

Notes:

- "Frequent Events" is defined as more than 70 vibration events of the same source per day. Most rapid transit projects fall into this category.
- "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day. Most commuter trunk lines have this many operations.
- "Infrequent Events" is defined as fewer than 30 vibration events of the same kind per day. This category includes most commuter rail branch lines.
- This criterion limit is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes. Vibration-sensitive manufacturing or research will require detailed evaluation to define the acceptable vibration levels. Ensuring lower vibration levels in a building often requires special design of the HVAC systems and stiffened floors.

Source: FTA, 2006

Table 4: Construction Vibration Damage Criteria

Building Category	PPV (in/sec)	Approximate Lv*
Reinforced-concrete, steel or timber (no plaster)	0.5	102
Engineered concrete and masonry (no plaster)	0.3	98
Non-engineered timber and masonry buildings	0.2	94
Buildings extremely susceptible to vibration damage	0.12	90

*RMS velocity in decibels (VdB) re 1 micro-inch/second
Source: FTA, 2006

FTA's recommended procedure for estimating vibration impact from construction activities is as follows:

Damage Assessment

- Select the equipment and associated vibration source levels at a reference distance of 25 feet from Table 5.

- Make the propagation adjustment according to the following formula (this formula is based on point sources with normal propagation conditions):

$$PPV_{equip} = PPV_{ref} \times (25/D)^{1.5}$$

where: PPV (equip) is the peak particle velocity in in/sec of the equipment adjusted for distance

PPV (ref) is the reference vibration level in in/sec at 25 feet from Table 5

D is the distance from the equipment to the receiver.

- • Apply the vibration damage criteria from Table 4.

Annoyance Assessment

- • If desired for consideration of annoyance or interference with vibration-sensitive activities, estimate the vibration level Lv at any distance D from the following equation and apply the vibration impact criteria in Table 3 for vibration-sensitive sites:

$$Lv(D) = Lv(25 \text{ ft}) - 30\log(D/25)$$

Table 5 summarizes various pieces of construction equipment with the associated vibration source level.

Table 5: Vibration Source Levels for Construction Equipment

Equipment		PPV at 25 feet	Approximate Lv* at 25 feet
Pile Driver (Impact)	Upper range	1.518	112
	Typical	0.644	104
Pile Driver (sonic)	Upper range	0.734	105
	Typical	0.170	93
Clam shovel drop (slurry wall)		0.202	94
Hydromill (slurry wall)	In soil	0.008	66
	In rock	0.017	75

Caisson Drilling		0.089	87
Loaded Trucks		0.076	86
Jackhammer		0.035	79
Small Bulldozer		0.003	58
*RMS velocity in decibels (VdB) re 1 micro-inch/second			
Source: FTA, 2006			

Long-Term (Operational Impacts)

During operation at each proposed Project site, the HVAC systems would operate 24 hours a day and the emergency generators would operate monthly. Therefore, noise analyses were conducted for the HVAC systems and emergency generators to determine the potential for long-term operational impacts.

Noise levels from other noise sources such as the hum from some pieces of communications equipment, air conditioners (HVAC) for the communications system, and routine facilities maintenance would be similar to those that exist in ambient residential environments. In addition, the communications equipment would be enclosed in equipment shelters which would attenuate at least 10 dBA and reduce the noise below ambient conditions. Therefore, noise from this equipment would not be audible to sensitive receivers and was not evaluated further. Noise from maintenance activities, which would include landscaping maintenance, routine site inspections, and occasional equipment repairs, would not be substantially different from existing levels and would generally occur less than once per week. According to Los Angeles County noise ordinance, maintenance activities are exempt if conducted during daytime hours of 8:00 a.m. and 6:00 p.m. on any day and 9:00 a.m. to 6:00 p.m. on Sundays. Noise generated from maintenance activities would be similar to ambient conditions and would adhere to the local ordinance. Therefore, noise from maintenance activities was not evaluated further. .

The equipment shelters for the HVAC systems would require heating, ventilation, and air conditioning to maintain interior temperature and humidity. Noise from HVAC systems depends on cooling load, electrical power use, and ambient temperature. It was assumed for this Project that the air conditioning requirement for the shelter is approximately 1.5 tons. According to the Air Conditioning, Heating, and Refrigeration Institute (AHRI) standard 270, the typical noise ratings for refrigeration units with 1.5 tons of capacity range between 63 dBA and 67 dBA. As a worst case scenario, this analysis assumed that the noise emissions from the shelters would be 67 dBA and that the air conditioning units would be on the ground approximately 10 feet from a reflective surface.

Emergency diesel generators (35-kilowatt [kW] to 100-kW) would operate intermittently, for backup power purposes, at the proposed Project sites. Emergency generators would be housed in an enclosed shelter with automatic transfer switches to accommodate remote monitoring of the system and automatic transfer of power in the event of a power outage. Diesel fuel for the generators would be stored in internal 500- to 1,500-gallon, double-walled, steel/belly tanks. In the event of a power outage, these tanks would provide up to 168 hours of site operation at full rated load at most sites and 336 hours of operation at remote sites on mountaintops and Santa Catalina Island.

Operating Noise Estimation

This analysis assumed the air conditioners would operate 24 hours a day and therefore was calculated as community noise equivalent level (CNEL). The basic conversion from L_{eq} to CNEL is as shown in Figure 1:

Figure 2: Conversion from L_{eq} to CNEL

$$CNEL = 10 \log_{10} \left[(1/24) \sum_{i=1}^{24} 10^{[L_{eq}(h)_i + W_i]/10} \right]$$

where

CNEL = 24-hour average L_{eq} with a 4.77-dBA penalty and 10-dBA penalty added during evening hours (7 p.m. to 10 p.m.) and night hours (10 p.m. to 7 a.m.)

$L_{eq}(h)_i$ = L_{eq} for the i th hour

W_i = 0 dBA for day hours (7 a.m. to 7 p.m.)

W_i = $10 \log_{10}(3) = 4.77$ dBA for evening hours (7 p.m. to 10 p.m.)

W_i = 10 dBA for night hours (10 p.m. to 7 a.m.)

\log_{10} = Logarithm to the base 10

The Air-Conditioning & Refrigeration Institute (ARI's) application of sound rating levels of outdoor unitary equipment was used to calculate noise exposure resulting from air conditioner operation (ARI 1997). This method calculates noise attenuation with distance and takes into account noise losses from interaction with surrounding structures.

Table B4-4: Native American Consultation and Coordination

Native American Tribe, Organization or Individual	Contact Name/Title	Date of Contact	Contact Method	Date of Response	Consultation Notes
Native American Heritage Commission	Dave Singleton, Program Analyst	08/29/14	Letter	09/15/14	No known Native American resources within the Project area Provided list of nine Gabrieliño groups or individuals to contact.
Cahuilla Band of Mission Indians, Anza, California	Luther Salgado, Sr., Chairman	01/30/15	TCNS	02/12/15	The Cahuilla expressed no interest in this site. However, if the Applicant discovers archaeological remains or resources during construction, the Applicant should immediately stop construction and notify the appropriate Federal Agency and the Tribe.
Colorado River Indian Tribes, Parker, Arizona	Wilene Fisher-Holt, Museum Director	02/06/15	TCNS	No Response	As/TCNS if no response from the Colorado River Indian Tribes within 30 days of TCNS notification, the Tribe has no interest in participating in pre-construction review for the proposed site. The Applicant/tower builder, however, must immediately notify the Tribe in the event archaeological properties or human remains are discovered during construction, consistent with Section IX of the Nationwide Programmatic Agreement and applicable law. No response from this Tribe as of December 2015.
Chemuevi Tribe, Havasu Lake, California	Ronald Escobar, Secretary/Treasurer	02/06/15	TCNS and Email	No Response	Second contact made by email on 09/21/15 with no response as of December 2015
Eastern Shoshone Tribe, Fort Washakie, Wyoming	Wilfred J. Ferris III, Tribal Historic Preservation Officer	03/27/15	TCNS, Letter,	No Response	Second contact made by email on 09/21/15 Additional information and Tribal review fee

Table B4-4: Native American Consultation and Coordination

Native American Tribe, Organization or Individual	Contact Name/Title	Date of Contact	Contact Method	Date of Response	Consultation Notes
			Email, and eTribe		provided on 11/12/15 Review complete with no properties; however, if cultural materials are discovered during construction notify the Eastern Shoshone Tribal Historic Preservation Office.
Fort Mojave Indian Tribe, Mohave Valley, Arizona	Linda Otero, Cultural Society Director	02/06/15	TCNS and Email	No Response	Second contact made by email on 09/21/15 with no response as of December 2015
Gabrieliño, Kizh Nation, Covina, California	Andrew Salas, Chairperson	06/29/15	Letter and Email	07/15/15	Indicated entire Project area within the Gabrieliño Tribal territory Requested one of the Gabrieliño Tribes experienced and certified Native American monitors to be on site during any and all ground disturbances.
Gabrieliño/Tongva San Gabriel Band of Mission Indians, San Gabriel, California	Anthony Morales, Chairperson	06/29/15	Letter and Email	No Response	No Response as of December 2015
Gabrieliño-Tongva Tribe, Los Angeles, California	Bernie Acuna, Co-Chairman	06/29/15	Letter and Email	No Response	No Response as of December 2015
Gabrieliño-Tongva Tribe, Los Angeles, California	Linda Candelaria, Co-Chairman	06/29/15	Letter and Email	No Response	No Response as of December 2015
Gabrieliño-Tongva Tribe, Los Angeles, California	Conrad Acuna, Tribal Member	06/29/15	Letter and Email	No Response	No Response as of December 2015
Tongva Ancestral Territorial Tribal Nation, Marina Del Ray, California	John Tommy Rosas, Tribal Administrator	06/29/15	Letter and Email	No Response	No Response as of December 2015

Table B4-4: Native American Consultation and Coordination

Native American Tribe, Organization or Individual	Contact Name/Title	Date of Contact	Contact Method	Date of Response	Consultation Notes
Gabrieliño -Tongva Indians of California Tribal Council, Bellflower, California	Robert Dorame, Tribal Chair, Cultural Resources	06/29/15	Letter and Email	No Response	No Response as of December 2015
Gabrieliño/Tongva Nation, Los Angeles, California	Sam Dunlap, Cultural Resources Director	06/29/15	Letter and Email	No Response	No Response as of December 2015
Gabrieliño/Tongva Nation, Los Angeles, California	Sandonne Goad, Chairperson	06/29/15	Letter and Email	No Response	No Response as of December 2015
Los Coyotes Reservation, Warner Springs, California	Shane Chapparosa, Chairman	Multiple	TCNS	Multiple	As/TCNS if no response from Los Coyotes within 30 days of TCNS notification, the Tribe has no interest in participating in pre-construction review for the proposed site. The Applicant/tower builder, however, must immediately notify the Tribe in the event archaeological properties or human remains are discovered during construction, consistent with Section IX of the Nationwide Programmatic Agreement and applicable law. No response from this Tribe as of December 2015.
Morongo Band of Mission Indians, Banning, California	Franklin A. Dancy, Director of Planning	01/30/15	TCNS	02/04/15	The Morongo Band has no interest in this site. However, if the Applicant discovers archaeological remains or resources during construction, the Applicant should immediately stop construction and notify the appropriate Federal Agency and the Tribe.

Table B4-4: Native American Consultation and Coordination

Native American Tribe, Organization or Individual	Contact Name/Title	Date of Contact	Contact Method	Date of Response	Consultation Notes
Paiuma/Yuima Band of Mission Indians, Pauma Valley, California	Randall Majel, Chairman	01/30/15	TCNS	02/05/15	The Paiuma/Yuima Band has no interest in this site. However, if the Applicant discovers archaeological remains or resources during construction, the Applicant should immediately stop construction and notify the appropriate Federal Agency and the Tribe.
Ramona Band of Cahuilla Indians, Anza, California	John Gomez, Cultural Resources Coordinator	02/06/15	TCNS and Email	No Response	Second contact made by email on 09/21/15 with no response as of December 2015
San Manuel Band of Mission Indians, Highland, California	Ann Brierty, CRM Specialist	02/06/15	TCNS and Email	No Response	Second contact made by email on 09/21/15 with no response as of December 2015
Santa Ynez Band of Chumash Indians, Santa Ynez, California	Freddie Romero, Cultural Preservation Consultant	Multiple	TCNS	Multiple	The Santa Ynez deferred interest to Tribes local to the Los Angeles County area for all TCNS notifications
Soboba Band of Luiseño Indians, San Jacinto, California	Joseph Ontiveros, Director of Cultural Resources	Multiple	TCNS, Letter, and Email	Multiple	<p>The Soboba deferred interest to Tribes local to the Los Angeles County area for all TCNS notifications</p> <p>Additional information requested and Tribal review fees and data provided in November 2015</p> <p>All project sites for which the Soboba had interest were cleared by December 3, 2015, except three sites, for which monitoring by an archaeologist or Native American Tribe close to the project sites was requested.</p>

Table B4-4: Native American Consultation and Coordination

Native American Tribe, Organization or Individual	Contact Name/Title	Date of Contact	Contact Method	Date of Response	Consultation Notes
Twenty Nine Palms Band of Mission Indians, Coachella, California	Darrell Mike, Chairman	01/30/15	TCNS	03/23/15	The Twenty Nine Palms Band has no interest in this site. However, if the Applicant discovers archaeological remains or resources during construction, the Applicant should immediately stop construction and notify the appropriate Federal Agency and the Tribe.
Timbisha Shoshone Tribe, Bishop, California	George Gholson, Chairman	02/06/15	TCNS	No Response	As/TCNS if no response from the Timbisha Shoshone within 30 days of TCNS notification, the Tribe has no interest in participating in pre-construction review for the proposed site. The Applicant/tower builder, however, must immediately notify the Tribe in the event archaeological properties or human remains are discovered during construction, consistent with Section IX of the Nationwide Programmatic Agreement and applicable law. No response from this Tribe as of December 2015.

DRAFT
ENVIRONMENTAL IMPACT REPORT FOR THE
LOS ANGELES REGIONAL INTEROPERABILITY
COMMUNICATIONS SYSTEM (LA-RICS)
LAND MOBILE RADIO (LMR) SYSTEM

APPENDIX C
BEST MANAGEMENT PRACTICES

JANUARY 2016

This page intentionally left blank

Best Management Practices

1. Prior to construction, the Authority will develop and implement or require the system contractor to develop and implement a mitigation monitoring and reporting plan (MMRP) for the LMR project. This BMP would serve to organize environmental compliance requirements identified in BMPs, mitigation measures, permit requirements, real property agreement conditions, and other applicable sources. The MMRP would also contain an organization chart and communication plan for environmental compliance as it relates to the proposed LMR project.
2. Prior to construction, the Authority will develop and implement or require the system contractor to develop and implement a worker environmental awareness program (WEAP) for the LMR project. This BMP would serve to institute and formalize an education program to increase awareness of environmental resources and measures and rules that are in place to help minimize impacts to those resources
3. Follow applicable State and local permitting requirements for construction.
4. Apply water to the construction site two to three times per day if dust emissions become a problem.
5. Enclose or water down exposed dirt storage piles.
6. Minimize the disturbed area and preserve vegetation to the maximum extent possible.
7. Maintain topsoil whenever possible.
8. Phase construction activities, to the extent possible, to reduce disturbed areas and time of exposure.
9. Plan the development to fit the topography, soils, drainage pattern, and natural vegetation of the site.
10. Delineate clearing limits, easements, setbacks, sensitive or critical areas, trees, drainage courses, and buffer zones to prevent excessive or unnecessary disturbances and exposure. Minimize the size of staging areas to the extent practical.
11. Avoid excavation and grading during wet weather.
12. Use berms and drainage ditches to divert runoff around exposed areas. Place diversion ditches across the top of cut slopes.
13. Control stormwater flowing to and through the project site.
14. Protect slopes by using measures such as erosion control blankets, bonded fiber matrices, turf reinforcement mats, silt fences (for moderate slopes), etc.

15. Retain sediment on-site and control dewatering practices by using sediment traps or basins for large areas (> 1 acre) when appropriate.
16. Temporarily protect storm drain inlets until the site is stabilized. Protect drainage courses, creeks, and/or catch basins with fiber rolls, silt fences, sand/gravel bags, and/or temporary drainage swales if on-site sediment control measures are not adequately preventing stormwater runoff.
17. Use appropriate erosion control measures to reduce siltation and runoff of contaminants into wetlands and adjacent ponds, streams, or riparian woodland/scrub.
18. Conduct routine inspections of erosion control measures especially before and immediately after rainstorms, and repair if necessary.
19. Establish stabilized construction entrances/exits (e.g. large crushed rocks, stone pads, steel wash racks, hose-down systems, pads).
20. Limit construction activities, including operation of heavy machinery, to normal business hours as established by applicable local noise ordinances (typically 7am-7pm weekdays, but varies by city).
21. Provide advance notification to surrounding land uses disclosing the construction schedule, including the various types of activities that would be occurring throughout the duration of the construction period.
22. The use of noise-producing signals, including horns, whistles, alarms, and bells shall be for safety warning purposes only. No project-related public address or music system shall be audible at any adjacent noise-sensitive receptor.
23. Locate mobile equipment staging, parking, and maintenance areas as far away as practical from noise-sensitive receivers such as schools, hospitals, residential areas, nursing homes, etc.
24. Ensure adequate maintenance of equipment, including proper engine maintenance, use of the manufacturer's standard noise control devices (i.e., mufflers, baffling, and/or engine enclosures), adequate tire inflation, and proper maintenance of pollution control devices.
25. Reduce construction equipment idling to the maximum extent practicable.
26. Implement plans to eliminate and/or minimize oil or fuel spills from construction equipment.
27. Clean up leaks, drips, and other spills immediately to avoid soil or groundwater contamination. Cleanup of a spill on soil would include removing the contaminated soil using the emergency spill cleanup gear. Contaminated soil and disposable gear used to clean up a hazardous materials spill would be properly disposed of following State and Federal hazardous material disposal regulations.
28. Stabilize slopes promptly. Following construction, stabilize all remaining disturbed areas by revegetating with locally acquired sources of native seeds and plants. Plant during the optimum season for the species being planted. Any seeding carried out during the revegetation program is

to be completed with commercially available seeds certified to be free of noxious weed seeds and other invasive species. The target for new plantings is an 80 percent survival rate at the end of 3 years. Control invasive exotic plant species to the maximum extent practical to accomplish the revegetation effort. If the application of a chemical is required to control an invasive exotic plant species, a certified pesticide or herbicide applicator shall apply the chemical per labeled directions and in compliance with all Federal, State, and local laws and regulations.

29. When applicable, adopt measures to minimize traffic impacts during construction such as providing warning signs, limiting the use of public right-of-ways for staging of equipment or materials, using flag persons when needed, and coordinating detours if traffic access points will be obstructed.
30. To the extent possible, adopt other feasible measures under the USEPA Guidance Potential for Reducing Greenhouse Gas Emissions in the Construction Sector.
31. In the event that any prehistoric or historic subsurface cultural resources, as defined by the responsible agency, are discovered during ground disturbing activities, all work within 50 feet of the resources should be halted until a qualified archaeologist has assessed the significance of the find. If any find is determined to be significant, representatives of the federal lead agency, the proponent, and the qualified archaeologist would meet to determine the appropriate course of action. All significant cultural materials recovered shall be subject to scientific analysis, professional museum curation, and a report prepared by the qualified archaeologist according to current professional standards.
32. Dispose of all wastes properly. Materials that cannot be reused or recycled must be taken to an appropriate landfill or may require disposal as hazardous waste. Never throw debris into channels, creeks, or into wetland areas. Never store or leave debris in the street or near a creek where it may contact runoff.
33. Establish an inspection and maintenance approach to ensure BMPs are working adequately.

LMR SITE ACCESS AGREEMENT (DRAFT)

LMR SITE ACCESS AGREEMENT

THIS LMR SITE ACCESS AGREEMENT ("Agreement"), is made and entered into in duplicate original this _____ day of _____, 2016,

BY AND BETWEEN

COUNTY OF LOS ANGELES, a body corporate and politic, hereinafter referred to as "Owner"

AND

THE LOS ANGELES REGIONAL INTEROPERABLE COMMUNICATIONS SYSTEM AUTHORITY, a Joint Powers Authority, hereinafter referred to as "LA-RICS Authority."

RECITALS:

WHEREAS, Owner is a member of the LA-RICS Authority, which was established pursuant to a Joint Powers Agreement dated January 2009 ("JPA") for the purpose of coordinating governmental services to establish a wide-area interoperable public safety communications network commonly known as LA-RICS;

WHEREAS, Owner owns certain real property described on Exhibit A attached hereto ("Real Property"); and

WHEREAS, Owner desires to license the use of a portion of the Real Property to the LA-RICS Authority for use as a Land Mobile Radio ("LMR") communication site; and

WHEREAS, the parties hereto acknowledge that: (a) LA-RICS AUTHORITY has retained Motorola Solutions, Inc. ("LMR Vendor") to design, construct, and perform services with respect to a regional interoperable LMR telecommunications system as a part of the LA-RICS; (b) the LA-RICS AUTHORITY has retained Motorola Solutions, Inc. ("LMR Vendor") to design and construct a regional interoperable LMR telecommunications system as a part of the LA-RICS; and (c) any of the LA-RICS Authority member agencies may assume the LA-RICS Authority's rights and obligations under this Agreement and/or may perform services with respect to this LA-RICS; and

WHEREAS, LA-RICS AUTHORITY is willing to accept and exercise the rights granted by this Agreement for use of a LMR site located on the Real Property in accordance with the terms and conditions prescribed herein.

NOW, THEREFORE, in consideration of the foregoing recitals, which are hereby deemed a contractual part hereof, and the mutual promises, covenants, and conditions set forth herein, the parties hereto agree as follows:

1. **LMR SITE**

1.01 Owner hereby licenses to the LA-RICS AUTHORITY and LA-RICS AUTHORITY hereby accepts from Owner on the terms and conditions set forth herein, the use of land within a portion of the Real Property, together with all necessary space and easements for access and utilities to install and operate an unmanned LMR communication facility, consisting of the parcels of land shown on Exhibit A attached hereto and incorporated herein by this reference (the "LMR Site").

1.02 The LA-RICS AUTHORITY acknowledges its personal inspection of the LMR Site and the surrounding area and evaluation of the extent to which the physical condition thereof will affect its operations. The LA-RICS AUTHORITY accepts the LMR Site in its as-is condition with no duty to investigate, and Owner makes no warranty, express or implied, as to the suitability of the LMR Site or the Real Property for the LA-RICS AUTHORITY's use; its physical condition, including the condition and stability of the soils or groundwater on or under any of the Real Property; and the presence of pollutants or contaminants therein.

1.03 LA-RICS AUTHORITY and/or the LMR Vendor may make or construct or cause to be made or constructed additions, alterations, repairs, replacements or other changes to the LMR Site at the LA-RICS AUTHORITY's expense in accordance with all of the terms and conditions of this Agreement.

1.04 LA-RICS AUTHORITY hereby acknowledges the title of the Owner or its successors in the Real Property and covenants and agrees never to assail, contest, or resist said title.

1.05 Ownership of all improvements constructed by the LA-RICS AUTHORITY upon each and every site comprising the LMR Site and all alterations, additions or betterments thereto shall remain with the LA-RICS AUTHORITY or other agencies as may be provided by any applicable LA-RICS grant requirements. The LA-RICS AUTHORITY may remove any of its own improvements to the Real Property at any time during the term of this Agreement, and Owner hereby waives any and all lien rights it may have in relation thereto, statutory or otherwise.

2. **PURPOSE AND USE**

2.01 The sole purpose of this Agreement is to allow the LA-RICS AUTHORITY to use the LMR Site for the installation, operation, maintenance, and repair of a LMR facility. The LA-RICS AUTHORITY (and/or its member agencies, the LMR Vendor and/or other agents): (a) shall have the right to construct, install, repair, remove, replace, maintain, and operate the LA-RICS AUTHORITY's LMR communications system, which typically consists of, without limitation, the infrastructure, shelters, equipment and related improvements listed on Exhibit B (Equipment List) attached hereto and incorporated herein by this reference (such LMR system, and associated infrastructure, shelters, equipment and related improvements, collectively, the "LA-RICS

Facility") and other related materials as may be deemed necessary by the LA-RICS AUTHORITY, and (b) shall be allowed access over, through and across each site comprising the Real Property for ingress to and egress from the applicable LMR Site 24 hours per day, 7 days per week without notice. Each LMR Site shall be used only for the purposes authorized by this Section 2.01, and such other purposes as are directly related thereto, and for no other purposes whatsoever (collectively the "Permitted Activities").

2.02 The LA-RICS AUTHORITY shall ensure that all usage of the LMR Site and/or the Real Property hereunder, including without limitation usage by the LMR Vendor, is in compliance with all terms and conditions of this Agreement.

2.03 Nothing contained in this Agreement shall be deemed or construed in any way to limit the Owner's authority to exercise any right or power concerning the utilization of the Real Property including without limitation the LMR Site; provided, however, that such Owner authority shall not include the exercise of any right or power that would interfere with the LA-RICS Facility.

3. **APPROVALS/DESIGN REVIEW**

The LA-RICS AUTHORITY shall furnish and submit to Owner copies of project plans and specifications (along with any other information reasonably requested by Owner) for the LMR Site at the 50%, 75%, and 100% stages of design development, for Owner's review and approval. LA-RICS AUTHORITY agrees to discuss with Owner the Owner's concerns, if any, regarding the proposed plans and to work in good faith to address such concerns and obtain Owner approval prior to implementation of said plans.

Conceptual site plans for the LMR Site are identified in Exhibit C. Upon the LA-RICS AUTHORITY's and Owner's (or Owner's authorized agent's) approval of the final site plan for the LMR Site, such final site plan will be deemed incorporated herein by reference as an update to Exhibit C. Owner agrees that it will approve or deny approval of all plans and specifications within 10 business days of receipt of said plans and specifications shall be deemed approved. LA-RICS AUTHORITY shall provide Owner with a notice of work commencement and an estimated time of completion for each LMR Site.

Owner and the LA-RICS AUTHORITY acknowledge that the LA-RICS AUTHORITY is a California joint powers authority whose members have specified, pursuant to Section 4.04 of its Joint Powers Agreement and Section 6509 of the California Government Code, that all common powers exercised by the LA-RICS AUTHORITY's Board of Directors shall be exercised in a manner consistent with, and subject to all the restrictions and limitations upon the exercise of such powers, as are applicable to the County of Los Angeles ("County") (i.e., the LA-RICS AUTHORITY has adopted the County's operating mode). Accordingly, Owner and the LA-RICS AUTHORITY agree that the LA-RICS AUTHORITY (i) will comply with County Building

Code requirements and (ii) will seek only those governmental approvals that would normally apply to the County, other than with respect to ministerial permits as described below. Notwithstanding the foregoing, the parties agree that their cooperation in addressing any concerns raised by the Owner is essential to the success of the LA-RICS project and that accordingly all such concerns will be taken into consideration throughout the LMR Site plan approval process, as described in this Section 3 and in Section 8.

Should ministerial permits be required, Owner shall expeditiously process such permits within its jurisdiction. To the extent there may be costs associated with Owner's review, such costs will be waived for LA-RICS AUTHORITY. The LA-RICS AUTHORITY may perform and obtain, at the LA-RICS AUTHORITY's sole cost and expense, soil borings, percolation tests, engineering reports, environmental investigations or other tests or reports on, over, and under each LMR Site to the extent necessary to proceed with design, construction, or for compliance with the California Environmental Quality Act and/or the National Environmental Policy Act, and/or to determine if the LA-RICS AUTHORITY's use of the LMR Site will be compatible with the LA-RICS AUTHORITY's engineering specifications and design and operational requirements. Owner shall work cooperatively and expeditiously with the LA-RICS AUTHORITY to complete review of any project plans and specifications, so as not to delay the design and construction of the LA-RICS Facility.

4. **TERM**

The initial term ("Initial Term") of the Agreement shall commence upon full execution of this Agreement ("Commencement Date") and shall terminate upon written notice of termination (a) by LA-RICS AUTHORITY or (b) by Owner pursuant to Section 28 (Default) hereof.

5. **CONSIDERATION**

The consideration for the use granted herein shall be LA-RICS AUTHORITY's compliance with all of the terms and conditions of this Agreement.

6. **CONDITIONS PRECEDENT TO INSTALLATION OR ALMRRATIONS OF EQUIPMENT**

Owner shall have the opportunity to review and provide input, if any, as to all project plans and specifications for the LA-RICS AUTHORITY's proposed alterations of the equipment comprising the LA-RICS Facility (not including "like-kind" replacements) after LA-RICS AUTHORITY's initial installation of the LA-RICS Facility on the LMR Site. In addition, Owner shall have the right to inspect said equipment and the LMR Site at any time during and after installation upon not less than twenty-four (24) hours prior written notice to the LA-RICS AUTHORITY (except in cases of emergency pursuant to Section 14 hereof (Emergency Access)) and, at LA-RICS AUTHORITY's option, LA-RICS AUTHORITY may chose to have a representative to accompany Owner during

any such inspection of or access to a LMR Site. The LA-RICS AUTHORITY shall not commence installation of equipment or alteration of a LMR Site, or any portion thereof, until the Owner has reviewed and approved the plans and specifications in accordance with all of the terms and conditions of this Agreement, including without limitation Sections 3 and 8 hereof. Owner's review and approval of the plans shall not release the LA-RICS AUTHORITY from the responsibility for, or the correction of, any errors, omissions or other mistakes that may be contained in the plans and specifications. The LA-RICS AUTHORITY shall be responsible for notifying Owner and all other relevant parties immediately upon discovery of such omissions and/or errors. The LA-RICS AUTHORITY shall not cause or permit any change of any equipment installed by the LA-RICS AUTHORITY on a LMR Site including power outputs or changes in the use of frequencies described in Exhibit B hereto (Equipment List), but not including "like-kind" replacements, except after Owner has been provided an opportunity to review and approve, such plans and specifications.

7. INSTALLATION

7.01 LA-RICS AUTHORITY shall install the LA-RICS Facility at its own expense and risk as approved by Owner in accordance with the terms hereof, and such installation shall not cause radio frequency interference with equipment, transmission or reception (operated currently or in the future) by the Owner. LA-RICS AUTHORITY and/or its agent shall install interference protection devices such as isolators, cavities, circulators, or combiners as required or recommended by accepted industry practices. Each component of the LA-RICS Facility shall be clearly identified with LA-RICS AUTHORITY's and, as applicable, member agency and/or LMR Vendor's name, address, telephone number, Federal Communications Commission ("FCC") license and frequencies in use. Such identification shall be attached to each component of the LA-RICS Facility in plain view.

7.02 LA-RICS AUTHORITY agrees that Owner may grant the use of any unused portion of the Real Property to any third party for the purpose of installing communications transmitting equipment, so long as such uses do not conflict or interfere with LA-RICS AUTHORITY's operations as provided for pursuant to this Agreement. Any third party granted rights by the Owner shall be required to comply with all applicable noninterference rules of the FCC.

7.03 Owner reserves the right, at its expense, to install on the Real Property, including without limitation within the LMR Site, its own communications shelter, telecommunication equipment, and appropriate tower space for telecommunications and/or microwave (collectively, the "Owner Facilities") so long as the installation of said Owner Facilities does not interfere with LA-RICS AUTHORITY's operations. LA-RICS AUTHORITY and Owner agree to make commercially reasonable efforts to resolve any radio frequency interference issues with equipment, transmission or reception caused by the installation of the Owner Facilities.

7.04 LA-RICS AUTHORITY accepts the LMR Site in an "as is" condition as of the date of full execution of this Agreement. LA-RICS AUTHORITY shall have the right to finance and construct approved equipment and related improvements on the LMR Site at LA-RICS AUTHORITY' sole cost and expense, except as may be provided otherwise by other agreements. Following the construction and installation of LA-RICS AUTHORITY's infrastructure, shelter, equipment, and related improvements, LA-RICS AUTHORITY may thereafter, at its sole cost and expense, perform construction, maintenance, repairs, additions to, and replacements of its equipment as necessary and appropriate for its ongoing business and has the right to do all work necessary to prepare, modify and maintain the LMR Site to accommodate LA-RICS AUTHORITY's infrastructure, shelter, equipment, and related improvements and as required for LA-RICS AUTHORITY's operations of the LA-RICS Facility at the LMR Site, including any structural upgrades required to accommodate LA-RICS AUTHORITY's infrastructure, shelter, equipment, and related improvements on the LMR Site.

7.05 Upon completion of the installation of the equipment comprising the LA-RICS Facility at the LMR Site, LA-RICS AUTHORITY shall provide Owner with a time of completion notice and as-built drawings of the LA-RICS Facility ("As-Builts"). Such As-Builts shall include the location of any of LA-RICS AUTHORITY shelters, cabinets, grounding rings, cables, and utility lines associated with LA-RICS AUTHORITY use of the LMR Site in CAD and PDF formats. Upon receipt of the As-Builts by Owner, the As-Builts shall be deemed incorporated herein by reference as updates to Exhibit C (Site Plan). In the event that LA-RICS AUTHORITY fails to deliver the As-Builts as required by this section within ten (10) business days of receipt of written notice, Owner may cause such As-Builts to be prepared on behalf of LA-RICS AUTHORITY and Owner shall assess a fee for such As-Builts, the cost of which shall become immediately due and payable to Owner upon invoice accompanied by supporting documentation of such fee. Owner shall be responsible for completion of and costs associated with As-Builts resulting from any modifications required by Owner.

8. ALTERATIONS

LA-RICS AUTHORITY shall make no renovations, alterations or improvements to the LMR Site or the Real Property other than to install, maintain, replace and operate the LA-RICS Facility in accordance with the documentation attached hereto as Exhibits A, B, and C and/or as permitted elsewhere herein, without providing prior written notice to Owner, provided that such renovations, alterations, or improvements shall be consistent with the authorized use set forth in Section 2.02 hereof. Notwithstanding the foregoing, however, it is understood and agreed that LA-RICS AUTHORITY shall have the right to make repairs and replacements of "like-kind" infrastructure, shelters, equipment, and/or related improvements without providing notice to the Owner or that may be required as a result of FCC rules or regulations, after providing notice to the Owner. LA-RICS AUTHORITY agrees: (i) to submit to the Owner, for review and approval, all plans and specifications, working drawings, and other information reasonably required by the Owner covering proposed alterations by LA-RICS AUTHORITY, (ii) to discuss with Owner the Owner's concerns, if any, regarding the

proposed alterations, and (iii) to work in good faith to address such concerns. All work to be done by LA-RICS AUTHORITY shall be performed in accordance with the plans provided to Owner.

9. **MAINTENANCE**

Owner shall be responsible for maintenance of the Real Property, including the LMR Site, and such maintenance responsibility shall include general upkeep, landscaping, lawn-mowing, and related maintenance activities. The LMR Site shall be kept neat and clean by LA-RICS AUTHORITY and ready for normal use by Owner and other users. Should LA-RICS AUTHORITY fail to accomplish this, following 30 days written notice from Owner, Owner may perform the work and LA-RICS AUTHORITY shall pay the cost thereof upon written demand by Owner.

LA-RICS AUTHORITY shall be responsible for the timely repair of all damage to the LMR Site or the Real Property caused by the negligence or willful misconduct of LA-RICS AUTHORITY, its employees, agents or business vendors, including without limitation the LMR Vendor. Should LA-RICS AUTHORITY fail to promptly make such repairs after thirty (30) days written notice from Owner, Owner may have repairs made and LA-RICS AUTHORITY shall pay the cost thereof upon written demand by Owner.

The parties hereby acknowledge that certain of the LMR Sites are managed and controlled by the County of Los Angeles Internal Services Department ("ISD"). ISD will incur operating expenses in association with operating and managing said LMR Sites. LA-RICS AUTHORITY shall be responsible for reimbursing ISD for LA-RICS AUTHORITY's pro-rata share of the operating expenses for those LMR Sites, which shall include only the following operating and maintenance expenses: emergency generator, tower light repair, pest control, weed abatement, permit fees and safety inspection. The foregoing operating expenses will be invoiced by ISD (and ISD shall provide concurrently documentation of the invoiced amounts and LA-RICS AUTHORITY's pro rata share) and paid by LA-RICS AUTHORITY within sixty (60) days of its receipt of such invoice.

10. **CONSTRUCTION STANDARDS**

Installation and maintenance of LA-RICS AUTHORITY's equipment including without limitation the LA-RICS Facility shall be performed in a neat and workmanlike manner and shall at all times comply in all respects to the statutes, laws, ordinances and regulations of any governmental authority having jurisdiction which are applicable to the installation, construction, operation and maintenance of LA-RICS AUTHORITY's equipment, including but not limited to the County of Los Angeles Building Code.

LA-RICS AUTHORITY shall remove any debris to the extent resulting from maintenance, operation and construction on the LMR Site by LA-RICS AUTHORITY, its agents or contractors (including without limitation the LMR Vendor). In the event that LA-RICS AUTHORITY fails to remove such debris from the LMR Site, Owner shall

provide written notice to LA-RICS AUTHORITY and allow LA-RICS AUTHORITY ten (10) business days after receipt of notice to remove such debris. After the expiration of such ten-business day period, Owner shall cause such debris to be removed and invoice LA-RICS AUTHORITY for the cost of said removal.

11. **OTHER OPERATIONAL RESPONSIBILITIES**

11.01 As applicable, LA-RICS AUTHORITY and its LMR Vendor shall:

(a) Comply with and abide by all applicable rules, regulations and directions of Owner.

(b) At all times hold a valid FCC license for the Permitted Activities and comply with all applicable City and County ordinances and all State and Federal laws, and, in the course thereof, obtain and keep in effect all required permits and licenses required to engage in the Permitted Activities on the LMR Site.

(c) Conduct the Permitted Activities in a courteous and non-profane manner, operate without interfering with the use of the Real Property by Owner or the public, except as herein permitted, and remove any agent, invitee or employee who fails to conduct Permitted Activities in the manner heretofore described.

(d) Assume the risk of loss, damage or destruction to the LA-RICS Facility and any and all fixtures and personal property belonging to LA-RICS AUTHORITY that are installed or placed within the LMR Site, unless such loss, damage or destruction was caused by the negligent or willful act or omission of the Owner, its agents, employees or contractors.

12. **RELOCATION**

12.01 Owner shall have the right to request relocation of the LA-RICS Facility or any portion thereof on no more than one occasion during the term hereof to another location on the Real Property ("Alternate Site"), provided:

(a) the Alternate Site: (i) is substantially similar to LA-RICS AUTHORITY's current LMR Site in size, (ii) is compatible with LA-RICS AUTHORITY's use pursuant to Section 2 hereof, and (iii) does not materially interfere with any portion of the LA-RICS Facility or the LA-RICS system or equipment;

(b) Owner shall pay all costs incurred by LA-RICS AUTHORITY for relocation of LA-RICS AUTHORITY's equipment from the LMR Site to the Alternate Site and any improvement of the Alternate Site to make it substantially similar to the LMR Site, including all costs incurred to obtain all of the certificates, permits, and other approvals that may be required by any agency having jurisdiction, including costs required to comply with CEQA and the National Environmental Policy Act (NEPA), as applicable, prior to any activity at an Alternate Site that would constitute a "project" as that term is defined in Title 14, Section 15378 of the California Code of Regulations, as

well as any soil boring tests needed to permit LA-RICS AUTHORITY's use of the Alternate Site;

(c) Owner shall give LA-RICS AUTHORITY at least six (6) months written notice before requiring relocation; and

(d) LA-RICS AUTHORITY's use of the LA-RICS Facility in question will not be materially interrupted and LA-RICS AUTHORITY shall be allowed, if necessary, to place temporary equipment on the Real Property during the relocation.

12.02 LA-RICS AUTHORITY shall have the right to request relocation of the LA-RICS Facility or any portion thereof to an Alternate Site on the Real Property pursuant to LA-RICS AUTHORITY's obligations under the Spectrum Lease Agreement, provided that:

(a) the Alternate Site: (i) is substantially similar to LA-RICS AUTHORITY's current LMR Site in size, (ii) is compatible with LA-RICS AUTHORITY's use pursuant to Section 2 hereof, and (iii) does not materially interfere with any portion of the LA-RICS Facility or the LA-RICS system or equipment;

(b) LA-RICS AUTHORITY shall pay all costs relating to relocation of LA-RICS AUTHORITY's equipment from the LMR Site to the Alternate Site and any improvement of the Alternate Site to make it substantially similar to the LMR Site, including all costs incurred to obtain all of the certificates, permits, and other approvals that may be required by any agency having jurisdiction, including costs required to comply with CEQA and the National Environmental Policy Act (NEPA), as applicable, prior to any activity at an Alternate Site that would constitute a "project" as that term is defined in Title 14, Section 15378 of the California Code of Regulations, as well as any soil boring tests needed to permit LA-RICS AUTHORITY's use of the Alternate Site;

(c) LA-RICS AUTHORITY shall give Owner at least sixty (60) days written notice of the requested relocation; requested relocation shall be subject to prior approval by Owner, such approval not to be unreasonably withheld.

13. **ACCESS TO LMR SITE**

13.01 Owner hereby grants to the LA-RICS AUTHORITY, its member agencies, the LMR Vendor, and other agents a nonexclusive right to use, at its sole risk, during the term and option period of this Agreement, the access which serves the LMR Site ("Access"). The LA-RICS AUTHORITY, on behalf of itself and its member agencies, and the LMR Vendor, acknowledge and accept the present condition of the Access on an "as is" basis. The LA-RICS AUTHORITY shall provide Owner with notice of all of its representatives or agents who are authorized to access the LMR Site pursuant to this Section. LA-RICS AUTHORITY shall document the condition of the Access prior to the execution of this Agreement by means of photographs to be provided at LA-RICS AUTHORITY's cost.

13.02 LA-RICS AUTHORITY acknowledges and agrees that occasions may arise requiring the LA-RICS AUTHORITY to share in the cost of cleaning up of mud-slide debris and repairing the Access to its original accessible condition (as documented pursuant to Section 13.01) after a storm or heavy rainfall. LA-RICS AUTHORITY hereby agrees to pay its reasonable proportionate share of such clean-up repair costs within thirty (30) days of receipt of an invoice from Owner, and acknowledges and agrees that the details of any such clean-up or repair and associated cost may be disclosed to LA-RICS AUTHORITY by Owner upon at least thirty (30) days notice. Notwithstanding the foregoing, the LA-RICS AUTHORITY's financial burden pursuant to this Section shall not exceed five thousand dollars (\$5,000) per incident.

14. **EMERGENCY ACCESS BY OWNER**

The Owner and its authorized agents may access the LMR Site at any time for the purpose of performing maintenance, inspection and/or for making emergency improvements or repairs to the LMR Site or to interrupt or terminate LA-RICS AUTHORITY's transmission(s) from the LMR Site should LA-RICS AUTHORITY be unable or unwilling to respond to Owner's request to take immediate action to correct any deficiency which threatens Owner's operation on the LMR Site, provided that Owner shall endeavor to provide a 24-hour prior notice to LA-RICS AUTHORITY and shall access the LMR Site in the presence, if possible, of an LA-RICS AUTHORITY representative, if provided by LA-RICS AUTHORITY. Notwithstanding the foregoing, Owner shall not be required to provide notice to LA-RICS AUTHORITY prior to entering the LMR Site due to an emergency; provided, however, that under no circumstance shall the Owner access LA-RICS AUTHORITY's equipment cabinets. Owner shall use its best efforts to minimize any inconvenience or disturbance to LA-RICS AUTHORITY when entering the LMR Site. LA-RICS AUTHORITY shall reimburse Owner within thirty (30) days of receipt of Owner's written request for Owner's actual costs to correct any deficiency that is corrected by Owner pursuant to this Section.

15. **RADIO FREQUENCY EMISSIONS/INTERFERENCE**

15.01 **No Interference.** LA-RICS AUTHORITY shall not use the LMR Site in any way which causes radio frequency ("RF") interference in excess of levels permitted by the FCC or otherwise interferes with the use of the Real Property by Owner or Owner's agents, invitees or other licensees or users who may occupy portions of the Real Property at the time this Agreement is entered into. LA-RICS AUTHORITY shall be responsible for electromagnetic compatibility of LA-RICS AUTHORITY's equipment with existing and future equipment at the Real Property. LA-RICS AUTHORITY shall conform to Owner's Internal Services Department Facilities Standard STD-140 Radio Site Management, including without limitation the requirement of submitting radio system installation plans for approval.

15.02 **Interference With Public Safety Systems.** In the event of any interference with Owner's Sheriff or Fire Department, CWIRS, Paramedic or LANet systems, or any future public safety-related systems, which is caused by LA-RICS

AUTHORITY's equipment or operations, LA-RICS AUTHORITY shall be immediately notified by Owner of such interference. Following such notification, the parties will meet promptly to cooperatively discuss and reach agreement on how such interference will be resolved.

15.03 Interference With Non-Public Safety Systems. In the event LA-RICS AUTHORITY's operations or equipment cause interference with non-public safety-related systems of Owner or any other duly authorized occupant of the Real Property, written notice of such interference shall be provided to LA-RICS AUTHORITY and LA-RICS promptly meet with Owner to cooperatively discuss and reach agreement on how such interference will be resolved. Owner agrees that Owner and/or any other occupants of the Real Property who currently have or in the future take possession of the Real Property will be permitted to install only such radio equipment that is of the type and frequency which will not cause measurable interference with the existing equipment of LA-RICS AUTHORITY.

15.04 Interference During Emergency. If any measurable interference caused by LA-RICS AUTHORITY's equipment with Owner's electronic equipment during an emergency incident occurs, the LA-RICS AUTHORITY will immediately cease operation, transmission or further use of LA-RICS AUTHORITY's equipment until such time as the emergency incident or interference has ended but LA-RICS AUTHORITY shall be permitted to power up its equipment for intermittent testing with notice.

15.05 Compliance With Law. LA-RICS AUTHORITY is aware of its obligation to comply with all applicable rules and regulations of the FCC pertaining to RF emissions standards, as well as applicable rules and/or regulations of any other federal or state agency (including without limitation the Occupational Safety and Health Administration ("OSHA") having jurisdiction over the installation, operation, maintenance and/or working conditions involving RF emissions and/or safety and work standards performed on or near communications towers and antenna-licensed premises. LA-RICS AUTHORITY agrees to be solely responsible for compliance with all applicable FCC and other governmental requirements with respect to installation, operation, and maintenance of its own equipment and for repairs to its own equipment at the LMR Site. LA-RICS AUTHORITY will immediately remedy its operations to comply with such applicable laws, rules and regulations as they apply to its operations, individually and in the aggregate, with all applicable FCC and other applicable governmental RF emissions standards, but shall only be liable for any violations of such applicable standards to the extent arising solely from LA-RICS AUTHORITY's equipment alone and not in combination with others. Where LA-RICS AUTHORITY's equipment, in combination with other, exceed or violates such standards, LA-RICS AUTHORITY shall reasonably cooperate with Owner and with other relevant parties to mitigate such violations in a timely manner.

16. **UTILITIES**

LA-RICS AUTHORITY shall, at its sole cost and expense, cause the installation of any utility service line required by or for the conduct of the Permitted Activities, and shall be responsible for the payment of all utilities necessary for the operation of the LA-RICS Facility on the LMR Site. If such installation is not feasible, as determined by Owner, LA-RICS AUTHORITY acknowledges and agrees that LA-RICS AUTHORITY nonetheless shall be responsible for any all costs of utilities used by LA-RICS AUTHORITY, which costs will be invoiced by Owner and paid by LA-RICS AUTHORITY within thirty (30) days of its receipt of such invoice.

17. **HOLD HARMLESS AND INDEMNIFICATION**

LA-RICS AUTHORITY agrees to indemnify, defend, save and hold harmless Owner and its Special Districts, agents, elected and appointed officers, and employees from and against any and all liability, expense (including, without limitation, defense costs and legal fees), and claims for damages of any nature whatsoever, including, without limitation, bodily injury, death, personal injury, or property damage arising from or connected with LA-RICS AUTHORITY's operations or its services hereunder, including, without limitation, any Workers' Compensation suit, liability, or expense, arising from or connected with services performed on behalf of LA-RICS AUTHORITY by any person pursuant to this Agreement including without limitation the LMR Vendor.

Owner agrees to indemnify, defend, save and hold harmless LA-RICS AUTHORITY and its member agencies, agents, elected and appointed officers, employees, and contractors from and against any and all liability, expense (including, without limitation, defense costs and legal fees), and claims for damages of any nature whatsoever, including, without limitation, bodily injury, death, personal injury, or property damage arising from or connected with the negligence or willful misconduct of Owner and/or its agents, elected and appointed officers, employees, and contractors in connection with the performance of Owner's obligations hereunder.

18. **INSURANCE**

18.01 Without limiting LA-RICS AUTHORITY's obligations to Owner, LA-RICS AUTHORITY shall provide and maintain, at its own expense during the term of this Agreement, the following program(s) of insurance covering its operations hereunder. Such insurance shall be provided by insurer(s) satisfactory to the Owner's Risk Manager, and evidence of such programs satisfactory to the Owner Risk Manager, shall be delivered to the CEO, Real Estate Division, on or before the effective date of this Agreement. Such evidence shall specifically identify this Agreement and shall contain express conditions that Owner is to be given written notice at least thirty (30) days in advance of any modification or termination of any provisions of insurance and shall name the Owner as an additional insured (except for the Workers' Compensation Insurance). LA-RICS AUTHORITY may self-insure the insurance required under this Agreement, but LA-RICS AUTHORITY will require its contractors and subcontractors to

provide commercial insurance as required in the Section, and any additional insurance required by LA-RICS AUTHORITY of its contractor/subcontractor, shall name the Owner as an additional insured.

(a) General Liability. A program of insurance which shall be primary to and not contributing with any other insurance maintained by Owner, written on ISO policy form CG 00 01 or its equivalent, and endorsed to name the Owner as an additional insured, and shall include, but not be limited to:

(1) Comprehensive general liability insurance endorsed for Site-operations, products/completed operations, contractual, broad form property damage, and personal injury with a limit of not less than

General Aggregate:	\$2 million
Products/Completed Operations Aggregate:	\$2 million
Personal and Advertising Injury:	\$1 million
Per occurrence	\$1 million

(2) Automobile Liability insurance (written on ISO form CA 00 01 or its equivalent) with a limit of liability of not less than \$1 million for each accident, and providing coverage for all "owned," "hired" and "non-owned" vehicles, or coverage for "any auto," used in LA-RICS AUTHORITY's business operations.

(b) Workers Compensation. A program of workers' compensation insurance in an amount and form to meet all applicable requirements of the labor code of the State of California, and which specifically covers all persons providing services on behalf of LA-RICS AUTHORITY and all risks to such persons under the Agreement.

Each Accident:	\$1 million
Disease - policy limit:	\$1 million
Disease - each employee:	\$1 million

(c) Commercial Property Insurance. Such coverage shall:

- Provide coverage for Owner's property, and any improvements and betterments; This coverage shall be at least as broad as that provided by the Causes-of-Loss Special Form (ISO form CP 10 30), Ordinance or Law Coverage, flood, and Business Interruption equal to two (2) years annual rent;
- Be written for the full replacement cost of the property, with a deductible no greater than \$250,000 or 5% of the property value whichever is less. Insurance proceeds shall be payable to the Owner and LA-RICS AUTHORITY as their

interests may appear and be utilized for repair and restoration of the Premises. Failure to use such insurance proceeds to timely repair and restore the Premises shall constitute a material breach of the Agreement.

(d) **Construction Insurance.** If major construction work is performed by LA-RICS AUTHORITY during the term of this Lease (i.e. demolition of structures, construction of new structures, renovation or retrofit involving structures frame, foundation or supports, or more than 50% of building, etc.) then LA-RICS AUTHORITY or LA-RICS AUTHORITY's contractor shall provide the following insurance. Owner shall determine the coverage limits required on a project by project basis:

- **Builder's Risk Course of Construction Insurance.** Such coverage shall insure against damage from perils covered by the Causes-of-Loss Special Form (ISO form CP 10 30). This insurance shall be endorsed to include earthquake, flood, ordinance or law coverage, coverage for temporary offsite storage, debris removal, pollutant cleanup and removal, testing, preservation of property, excavation costs, landscaping, shrubs and plants, and full collapse coverage during construction, without restricting collapse coverage to specified perils. Such insurance shall be extended to include boiler & machinery coverage for air conditioning, heating and other equipment during testing. This insurance shall be written on a completed-value basis and cover the entire value of the construction project, including Owner furnished materials and equipment, against loss or damage until completion and acceptance by the LA-RICS AUTHORITY and the Owner if required.
- **General Liability Insurance.** Such coverage shall be written on ISO policy form CG 00 01 or its equivalent, naming Owner as an additional insured, with limits of not less than

General Aggregate:	\$50 million
Products/Completed Operations Aggregate:	\$50 million
Personal and Advertising Injury:	\$25 million
Each Occurrence:	\$25 million

The Products/Completed Operations coverage shall continue to be maintained in the amount indicated above for at least two (2) years from the date the Project is completed and accepted by the LA-RICS AUTHORITY and the Owner if required.

- **Automobile Liability.** such coverage shall be written on ISO policy form CA 00 01 or its equivalent with limits of not less than \$5 million for bodily injury and property damage, in combined or equivalent split limits, for each single accident. such insurance shall cover

liability arising out of LA-RICS AUTHORITY's or LA-RICS AUTHORITY's contractor use of autos pursuant to this lease, including owned, leased, hired, and/or non-owned autos, as each may be applicable.

- **Professional Liability.** Such insurance shall cover liability arising from any error, omission, negligent, or wrongful act of the LA-RICS AUTHORITY's contractor and/or licensed professional (i.e. architects, engineers, surveyors, etc.) with limits of not less than \$5 million per claim and \$10 million aggregate. The coverage shall also provide an extended two-year reporting period commencing upon expiration, termination or cancellation of the construction project.
- **Workers Compensation and Employers' Liability Insurance** or qualified self-insurance satisfying statutory requirements. Such coverage shall provide Employers' Liability coverage with limits of not less than \$1 million per accident. Such policy shall be endorsed to waive subrogation against the Owner for injury to the LA-RICS AUTHORITY's or LA-RICS AUTHORITY's contractor employees. If the LA-RICS AUTHORITY's or LA-RICS AUTHORITY's contractor employees will be engaged in maritime employment, the coverage shall provide the benefits required by the U.S. Longshore and Harbor Workers Compensation Act, Jones Act or any other federal law to which the LA-RICS AUTHORITY is subject. If LA-RICS AUTHORITY or LA-RICS AUTHORITY's contractor will provide leased employees, or, is an employee leasing or temporary staffing firm or a professional employer organization (PEO), coverage also shall include an Alternate Employer Endorsement (providing scope of coverage equivalent to ISO policy form WC 00 03 01 A) naming the Owner as the Alternate Employer, and the endorsement form shall be modified to provide that Owner will receive not less than thirty (30) days advance written notice of cancellation of this coverage provision.

18.02 Insurer Financial Ratings. Insurance is to be provided by an insurance company acceptable to Owner with an A.M. Best rating of not less than A:VII, unless otherwise approved by Owner.

18.03 Failure to Maintain Coverage. Failure by LA-RICS AUTHORITY to maintain the required insurance, or to provide evidence of insurance coverage acceptable to Owner, shall constitute a material breach of this Agreement.

18.04 Notification of Incidents. LA-RICS AUTHORITY shall report to Owner any accident or incident relating to activities performed under this Agreement which involves injury or property damage which might reasonably be thought to result in the filing of a

claim or lawsuit against LA-RICS AUTHORITY and/or Owner. Such report shall be made in writing within seventy-two (72) hours of LA-RICS AUTHORITY's knowledge of such occurrence.

18.05 Compensation for Owner Costs. In the event that LA-RICS AUTHORITY fails to comply with any of the indemnification or insurance requirements of this Agreement, and such failure to comply results in any costs to Owner, LA-RICS AUTHORITY shall pay full compensation for all reasonable costs incurred by Owner.

19. **FAILURE TO PROCURE INSURANCE**

19.01 Failure on the part of LA-RICS AUTHORITY to procure or maintain the required program(s) of insurance shall constitute a material breach of contract upon which Owner may immediately terminate this Agreement, or at its discretion, procure or renew such insurance and pay any and all premiums in connection therewith, and all monies so paid by Owner shall be repaid by LA-RICS AUTHORITY to Owner upon demand.

19.02 Use of the LMR Site shall not commence until LA-RICS AUTHORITY has complied with the aforementioned insurance requirements, and shall be suspended during any period that LA-RICS AUTHORITY fails to maintain said insurance policies in full force and effect.

20. **TAXES**

20.01 The interest (as defined in California Revenue and Taxation Code Section 107) in the LMR Site created by this Agreement may be subject to property taxation if created. The party in whom the property interest is vested may be subject to the payment of the property taxes levied on the interest.

20.02 LA-RICS AUTHORITY shall pay before delinquency all lawful taxes, assessments, fees or charges which at any time may be levied by the Federal, State, Owner, City, or any other tax or assessment-levying body upon the LMR Site arising from LA-RICS AUTHORITY' use of the LMR Site.

20.03 If LA-RICS AUTHORITY fails to pay any lawful taxes or assessments upon the LMR Site which LA-RICS AUTHORITY is obligated to pay, LA-RICS AUTHORITY will be in default of this Agreement.

21.04 Owner reserves the right to pay any such tax, assessment, fees or charges, and all monies so paid by Owner shall be repaid by LA-RICS AUTHORITY to Owner upon demand. LA-RICS AUTHORITY and Owner agree that this is a license and not a lease and no real estate interest is being conveyed herein.

21. **NOTICES**

Notices desired or required to be given pursuant to this Agreement or by any law now in effect shall be given by enclosing the same in a sealed envelope, Certified Mail - Return Receipt Requested, addressed to the party for whom intended and depositing such envelope, with postage prepaid, in the U.S. Post Office or any substation thereof, or any public letter box, and any such notice and the envelope containing the same, shall be addressed to LA-RICS AUTHORITY as follows:

LA-RICS AUTHORITY
2525 Corporate Place, Second Floor

Monterey Park, California 91754

ATTN: Executive Director

or such other place as may hereinafter be designated in writing by LA-RICS AUTHORITY.

The notices and the certificate of insurance and envelopes containing the same to the Owner shall be addressed as follows:

County of Los Angeles
Chief Executive Office – Real Estate Division
222 South Hill Street, 3rd Floor
Los Angeles, California 90012

Attn: Property Management

or such other place as may hereinafter be designated in writing by Owner.

Notice shall be effective upon actual receipt or refusal as shown on the receipt obtained pursuant to the foregoing. Notices may also be provided by electronic mail or facsimile transmission, provided that such notices are followed up with a copy sent via US Mail.

22. **LA-RICS FACILITY REMOVAL**

22.01 LA-RICS AUTHORITY shall remove all of its LA-RICS Facility and personal and improvements from the LMR Site and the Real Property and restore the LMR Site to its original condition, reasonable wear and tear and damage or destruction by the acts of God beyond the control of LA-RICS AUTHORITY excepted, on or before the expiration of this Agreement, unless this Agreement is otherwise terminated or cancelled prior to the expiration date provided herein, in which case LA-RICS AUTHORITY shall remove from the LMR Site and the Real Property all of its LA-RICS Facility and personal property and improvements and restore the LMR Site to its original

condition, reasonable wear and tear and damage or destruction by the acts of God beyond the control of LA-RICS AUTHORITY excepted, within ninety (90) days of the cancellation. If weather conditions or lack of access to the LMR Site render the timely removal of LA-RICS AUTHORITY' property impossible, then LA-RICS AUTHORITY shall have thirty (30) days from the earliest date on which access is possible in which to comply with this provision.

22.02 If LA-RICS AUTHORITY does not timely remove all of its LA-RICS Facility, personal property and improvements from the LMR Site and the Real Property within the time provided in this section, Owner may, but shall not be required to, remove the LA-RICS Facility and all personal property and improvements at LA-RICS AUTHORITY's expense. LA-RICS AUTHORITY shall reimburse Owner within thirty (30) days of receipt of an itemized accounting of the cost for such removal of personal property and improvements. Owner shall incur no liability for any damage to the LA-RICS Facility during removal or storage.

23. **INDEPENDENT STATUS**

This Agreement is by and between Owner and LA-RICS AUTHORITY and is not intended and shall not be construed to create the relationship of agent, servant, employee, partnership, joint venture or association as between Owner and LA-RICS AUTHORITY. LA-RICS AUTHORITY understands and agrees to bear the sole responsibility and liability for furnishing Workers' Compensation with respect to services performed on behalf of LA-RICS AUTHORITY pursuant to this Agreement.

24. **AMENDMENT**

Any modification of any of the terms and conditions hereof shall require a written amendment signed by an authorized agent of the LA-RICS AUTHORITY and an authorized agent of Owner.

25. **ASSIGNMENT**

25.01 This Agreement may not be sold, assigned or transferred by LA-RICS AUTHORITY without written consent of Owner, which consent will be at Owner's sole discretion. All assignments will require an Assignment Agreement. No change of stock ownership, partnership interest or control of LA-RICS AUTHORITY or transfer upon partnership or corporate dissolution of LA-RICS AUTHORITY shall constitute an assignment hereunder.

25.02 To effect an assignment or transfer pursuant to this Section 25, LA-RICS AUTHORITY shall first deliver to the Owner:

- (i) A written request for approval;
- (ii) The name, address, and most recent financial statements of the proposed sublicensee, assignee, or other transferee;

- (iii) Proposed unredacted instrument of transfer or assignment or any or all of its rights hereunder; and
- (iv) Any other information reasonably requested by the OWNER.

25.03 Owner shall approve or disapprove a proposed transfer, assignment or sublicense within sixty (60) days after LA-RICS AUTHORITY delivers all such items to the Owner. Owner's failure to respond to any request pursuant to this Section shall be deemed disapproval of said request.

25.04 In the case of an assignment of this Agreement, the proposed instrument shall include a written assumption by the assignee of all obligations of LA-RICS AUTHORITY under the Agreement arising thereafter and assignee shall be liable to perform the full obligations of the LA-RICS AUTHORITY under this Agreement and as a condition to the completion of such transfer must cure, remedy, or correct any event of default existing at the time of such transfer in a manner satisfactory to the Owner.

25.05 In the case of a sublicense, the proposed instrument shall specifically include a provision that the sublicense shall comply with and be subject to all of the terms covenants, and conditions of this Agreement.

25.06 Owner shall have the right to lease or license the use of space on LA-RICS Authority's telecommunications pole to third party(ies), if such telecommunications pole is capable of housing such third party(ies), based on terms mutually agreeable to the LA-RICS Authority. Owner shall submit any proposed lease or license to the LA-RICS Authority for review and approval prior to entering into such lease or license. Such proposed instrument shall specifically include: (a) a provision that the lease or license shall comply with and be subject to all of the terms covenants, and conditions of this Agreement, and (b) a requirement that any third party use of LA-RICS Authority's telecommunications pole shall not interfere with LA-RICS Authority's use of the LA-RICS Facility or its operations. The parties agree that any revenues generated by such third party leases or licenses by Owner shall be retained by Owner, except for a fee in an amount calculated to compensate LA-RICS AUTHORITY for its administrative and other costs associated with approval of the lease or license.

26. **SUBORDINATION AND NON-DISTURBANCE**

Owner shall obtain, not later than fifteen (15) days following the execution of this Agreement, a Non-Disturbance Agreement, as defined below, from its existing mortgagees, ground lessors and master lessors, if any, of the Real Property. At Owner's option, this Agreement shall be subordinate to any future master lease, ground lease, mortgage, deed of trust, or other security interest (a "Mortgage") by Owner which from time to time may encumber all or part of the Real Property; provided, however, as a condition precedent to LA-RICS AUTHORITY being required to subordinate its interest in this Agreement to any future Mortgage covering the Real Property, Owner shall obtain for LA-RICS AUTHORITY's benefit a non-disturbance and attornment

agreement in a form reasonably satisfactory to LA-RICS AUTHORITY and containing at a minimum the terms set forth herein below ("Non-Disturbance Agreement"), and shall recognize LA-RICS AUTHORITY's right to remain in occupancy of and have access to the LMR Site as long as LA-RICS AUTHORITY is not in default of this Agreement beyond applicable notice and cure periods. The Non-Disturbance Agreement shall include the encumbering party's ("Lender's") agreement that, if Lender or its successor in interest or any purchase of Lender's or its successor's interest (a "Purchaser") acquires an ownership interest in the Real Property, Lender or such successor in interest or Purchaser will (a) honor all of the terms of this Agreement, (b) fulfill Owner's obligations under this Agreement, and (c) promptly cure all of the then-existing Owner defaults under this Agreement. Such Non-Disturbance Agreement must be binding on all of Lender's participants in the subject loan (if any) and on all successors and assigns of Lender and/or its participants and on all Purchasers. In return for such Non-Disturbance Agreement, LA-RICS AUTHORITY will execute an agreement for the Lender's benefit in which LA-RICS AUTHORITY: (i) confirms that the Agreement is subordinate to the Mortgage or other real property interest in favor of the Lender, (ii) agrees to attorn to Lender if Lender becomes the owner of the Real Property, and (iii) agrees to accept a cure by Lender of any of Owner's defaults, provided such cure is completed within the deadline applicable to Owner.

27. **CONDEMNATION**

In the event of any condemnation of the Real Property (or any portion thereof), LA-RICS AUTHORITY may terminate this Agreement upon written notice to Owner if such condemnation may reasonably be expected to disrupt LA-RICS AUTHORITY's operations at the LMR Site for more than forty-five (45) days. LA-RICS AUTHORITY may on its own behalf make a claim in any condemnation proceeding involving the LMR Site for losses related to the equipment comprising the applicable LA-RICS Facility, its relocation costs and its damages and losses (but not for the loss of its interest, if any, under this Agreement). Any such notice of termination shall cause this Agreement to expire with the same force and effect as though the date set forth in such notice were the date originally set as the expiration date of this Agreement, and Owner and LA-RICS AUTHORITY shall make an appropriate adjustment, as of such termination date, with respect to payments due to the other, if any, under this Agreement.

28. **DEFAULT**

Except as otherwise provided in this Agreement, in the event of a default hereunder by LA-RICS AUTHORITY, Owner shall provide written notice thereof to LA-RICS AUTHORITY. LA-RICS AUTHORITY shall have sixty (60) days from the date of said notice in which to cure the default, provided that LA-RICS AUTHORITY shall have such extended period beyond sixty (60) days as may be required if the nature of the cure is such that it reasonably requires more than sixty (60) days and LA-RICS AUTHORITY has commenced to cure the default within the 60-day period and has acted with reasonable diligence in commencing and pursuing such cure to completion. Owner may not maintain any action or effect any remedies for default against LA-RICS

AUTHORITY unless and until LA-RICS AUTHORITY has failed to cure a default within the time periods set forth in this section. In the event that LA-RICS AUTHORITY fails to cure a default within sixty (60) days or as otherwise provided in this section, Owner may: (a) cure the default and invoice LA-RICS AUTHORITY for all costs reasonably incurred in effecting such cure, or (b) terminate this Agreement upon written notice to LA-RICS AUTHORITY, take possession of the LMR Site and remove all LA-RICS AUTHORITY's improvements located thereon. In the event of a default hereunder by Owner, LA-RICS AUTHORITY shall provide written notice thereof to Owner. Owner shall have sixty (60) days from the date of said notice in which to cure the default, provided that Owner shall have such extended period beyond sixty (60) days as may be required if the nature of the cure is such that it reasonably requires more than sixty (60) days and Owner has commenced to cure the default within the 60-day period and has acted with reasonable diligence in commencing and pursuing such cure to completion. LA-RICS AUTHORITY may not maintain any action or effect any remedies for default against Owner unless and until Owner has failed to cure a default within the time periods set forth in this section. In the event that Owner fails to cure a default within sixty (60) days or as otherwise provided in this section, LA-RICS AUTHORITY may: (a) cure the default and invoice Owner for all costs reasonably incurred by LA-RICS AUTHORITY in effecting such cure, or (b) terminate this Agreement upon written notice to Owner.

29. **WAIVER**

29.01 Any waiver by either party of the breach of any one or more of the covenants, conditions, terms and agreements herein contained shall not be construed to be a waiver of any other breach of the same or of any other covenant, condition, term or agreement herein contained, nor shall failure on the part of either party to require exact, full and complete compliance with any of the covenants, conditions, terms or agreements herein contained be construed as in any manner changing the terms of this Agreement or stopping either party from enforcing the full provisions thereof.

29.02 No option, right, power, remedy, or privilege of either party shall be construed as being exhausted by the exercise thereof in one or more instances. The rights, powers, options, and remedies given either party by this Agreement shall be cumulative.

30. **HAZARDOUS MATERIALS**

The parties hereto hereby warrant and represent that they shall comply with all applicable Federal, State, and local laws and regulations concerning the use, release, storage and disposal of hazardous substances on the LMR Site and the Real Property. For purposes of this Agreement, the term "hazardous substances" shall be deemed to include hazardous, toxic or radioactive substances, as defined in California Health and Safety Code Section 25316, as amended from time to time, or the same or a related defined term in any successor or companion statutes, and crude oil or byproducts of crude oil other than crude oil which exists on the Real Property as a natural formation,

and those chemicals and substances identified pursuant to Health and Safety Code Section 25249.8., as it may be amended from time to time.

The parties each agree to indemnify and defend the other and the other's agents, officers, employees, and contractors against any and all losses, liabilities, claims and/or costs (including reasonable attorneys' fees and costs) to the extent arising from the indemnifying party's breach of any warranty or agreement contained in this Section.

31. **DAMAGE OR DESTRUCTION**

Either party shall have the right to terminate this Agreement with respect to all or any portion of the LMR Site in the event of one of the following: (a) the applicable Real Property or the LMR Site is damaged by fire or other casualty, incidents of war, earthquake, or other violent action of the elements such that repairs cannot reasonably be expected to be completed within forty-five (45) days following said damage (or Owner in its sole discretion elects not to make such repair); or (b) the applicable Real Property or LMR Site is damaged by fire or other casualty, incidents of war, earthquake, or other violent action of the elements such that such damage may reasonably be expected to disrupt LA-RICS AUTHORITY's operations at such LMR Site for more than forty-five (45) days. Notwithstanding the foregoing, in the event of any of the damage described in this Section, LA-RICS AUTHORITY shall have the right to elect to perform or cause to be performed any of the required repairs to the applicable Real Property or LMR Site should Owner elect not to undertake such repairs. Any notice of termination provided pursuant to this Section shall cause this Agreement to expire with the same force and effect as though the date set forth in such notice were the date originally set as the expiration date of this Agreement, and the parties shall make an appropriate adjustment, as of such termination date, with respect to payments due to the other under this Agreement, if any.

Should any matter or condition beyond the control of the parties, such as war, public emergency, calamity, fire, earthquake, flood or act of God prevent performance of this Agreement by either party, such party shall be relieved of the performance of such obligations during the time period of the event.

LA-RICS AUTHORITY shall be solely responsible for any damage or loss to LA-RICS AUTHORITY's equipment resulting from theft or vandalism or resulting from any other cause, except to the extent caused by Owner's acts or omissions.

32. **AUTHORIZATION WARRANTY**

The parties hereto represent and warrant that the person executing this Agreement for each of them is an authorized agent who has actual authority to bind such party to each and every term, condition, and obligation of this Agreement and that all requirements of such party have been fulfilled to provide such authority.

33. **INDEPENDENT CONTRACTOR STATUS**

This Agreement is not intended, and shall not be construed, to create the relationship of agent, servant, employee, partnership, joint venture, or association between Owner and LA-RICS AUTHORITY. LA-RICS AUTHORITY shall bear the sole responsibility and liability for furnishing Worker's Compensation benefits to any person for injuries from or connected with services performed on behalf of LA-RICS AUTHORITY pursuant to this Agreement as required by law. The foregoing indemnification does not apply to liability caused by the negligence of the Owner.

34. **GOVERNING LAW, JURISDICTION, AND VENUE**

This Agreement shall be governed by, and construed in accordance with the internal laws of the State of California. LA-RICS AUTHORITY agrees and consents to the exclusive jurisdiction of the courts of the State of California for all purposes regarding this Agreement and further agrees and consents that venue of any action brought hereunder shall be exclusively in the County of Los Angeles.

35. **COMPLIANCE WITH APPLICABLE LAW**

In the performance of this Agreement, each party and anyone acting on such party's behalf pursuant to this Agreement shall comply with all applicable Federal, State and local laws, rules, regulations, ordinances, directives, guidelines, policies and procedures (including without limitation the rules and regulations of the FCC, the Federal Aviation Administration ("FAA"), and OSHA, and all provisions required thereby to be included in this Agreement are hereby incorporated herein by reference.

36. **COMPLIANCE WITH CIVIL RIGHTS LAWS, NONDISCRIMINATION AND AFFIRMATIVE ACTION**

36.01 LA-RICS AUTHORITY hereby assures that it will comply with Subchapter VI of the Civil Rights Act of 1964, 42 USC Sections 2000 (e) (1) through 2000 (e) (17), to the end that no person shall, on the grounds of race, creed, color, sex, religion, ancestry, age, condition or physical handicap, marital status, political affiliation, or national origin, be excluded from participation in, be denied the benefits of, or be otherwise subject to discrimination under this Agreement or under any project, program or activity supported by this Agreement.

36.02 LA-RICS AUTHORITY certifies and agrees that it will deal with its subcontractors, bidders, or vendors without regard to or because of race, color, religion, ancestry, national origin, sex, age, physical or mental disability, marital status, or political affiliation.

36.03 LA-RICS AUTHORITY certifies and agrees that it, its affiliates, subsidiaries, or holding companies shall comply with all applicable Federal and State laws and regulations to the end that no person shall, on the grounds of race, color, religion, ancestry, national origin, sex, age, physical or mental disability, marital status, or political affiliation, be excluded from participation in, be denied the benefits of, or be

otherwise subjected to discrimination under this Agreement or under any project, program, or activity supported by this Agreement.

36.04 If the Owner finds that any of the above provisions of this Section have been violated, such violation shall constitute a material breach of this Agreement upon which the Owner may terminate, or suspend this Agreement.

36.05 While the Owner reserves the right to determine independently that the anti-discrimination provisions of this Agreement have been violated, in addition, a determination by the California Fair Employment Practices Commission, the Federal Equal Employment Opportunity Commission that LA-RICS AUTHORITY has violated Federal or State anti discrimination laws or regulations shall constitute a finding by Owner that LA-RICS AUTHORITY has violated the anti-discrimination provisions of this Agreement.

36.06 In the event LA-RICS AUTHORITY violates the antidiscrimination provisions of the Agreement, the parties agree that it is difficult to ascertain the amount of liquidated damages, and hereby agree that the Owner shall, at its sole option, be entitled to the sum of FIVE HUNDRED DOLLARS (\$500.00) for each such violation pursuant to California Civil Code 1671 as liquidated damages in lieu of terminating or suspending this Agreement.

37. **NON EXCLUSIVITY**

Nothing herein is intended or shall be construed as creating any exclusive arrangement with LA-RICS AUTHORITY. This Agreement shall not restrict the Owner from acquiring similar, equal or like goods and/or services from other entities or sources.

38. **NOTICE OF EMPLOYEES REGARDING THE FEDERAL EARNED INCOME CREDIT**

LA-RICS AUTHORITY shall notify its employees, and shall require each Contractor and Subcontractor to notify its employees, that they may be eligible for the Federal Earned Income Credit under the federal income tax laws. Such notice shall be provided in accordance with the requirements set forth in Internal Revenue Service Notice No. 1015.

39. **PUBLIC RECORDS ACT**

39.01 Any documents submitted by LA-RICS AUTHORITY or its agents including without limitation the LMR Vendor and all information obtained in connection with the Owner's right to inspect the LMR Site or any other rights provided by this Agreement shall become the exclusive property of the Owner. All such documents become a matter of public record and shall be regarded as public records, except as specifically provided by California Government Code Section 6250 et seq. ("Public Records Act") and which are marked "trade secret," "confidential," or "proprietary." The

Owner shall not be in any way liable or responsible for the disclosure of any such records including, without limitation, those so marked, if disclosure is required by law, or by an order issued by a court of competent jurisdiction.

39.02 In the event the Owner is required to defend an action on a Public Records Act request as requested by LA-RICS AUTHORITY for any of the aforementioned documents, information, books, records, and/or contents of a proposed marked "trade secret," "confidential", or "proprietary," LA-RICS AUTHORITY agrees to refund and indemnify the Owner from all costs and expenses, including without limitation reasonable attorney's fees, incurred in such action or liability arising under the Public Records Act within thirty days after LA-RICS AUTHORITY's receipt of Owner's invoice.

39.03 Any documents submitted by Owner or its agents and all information obtained in connection with LA-RICS AUTHORITY's rights provided by this Agreement shall become the exclusive property of LA-RICS AUTHORITY. All such documents become a matter of public record and shall be regarded as public records, except as specifically provided by California Government Code Section 6250 et seq. ("Public Records Act") and which are marked "trade secret," "confidential," or "proprietary." LA-RICS AUTHORITY shall not be in any way liable or responsible for the disclosure of any such records including, without limitation, those so marked, if disclosure is required by law, or by an order issued by a court of competent jurisdiction.

39.04 In the event the LA_RICS AUTHORITY is required to defend an action on a Public Records Act request as requested by the Owner for any of the aforementioned documents, information, books, records, and/or contents Owner agrees to refund and indemnify the LA-RICS AUTHORITY from all costs and expenses, including without limitation reasonable attorney's fees, incurred in such action or liability arising under the Public Records Act within thirty days after Owner's receipt of LA-RICS AUTHORITY's invoice.

40. **OTHER TERMS AND CONDITIONS**

40.01 Advertising Materials and Signs. Except for warning signs required by law, LA-RICS AUTHORITY shall not post signs upon the LMR Site or improvements thereon, or distribute or cause to be distributed any advertising materials unless prior approval therefor is obtained from the Owner.

40.02 Habitation. The LMR Site shall not be used for human habitation.

40.03 Illegal Activities. LA-RICS AUTHORITY shall not knowingly permit any illegal activities to be conducted upon the LMR Site.

40.04 Safety. LA-RICS AUTHORITY shall immediately correct any unsafe condition on the LMR Site, as well as any unsafe practices occurring thereon, to the extent such unsafe condition or practice occurs as a result of LA-RICS AUTHORITY's use of the LMR Site. LA-RICS AUTHORITY shall cooperate fully with Owner in the

investigation of any accidental injury or death occurring on the LMR Site, including a prompt report thereof to the Owner. LA-RICS AUTHORITY shall cooperate and comply fully with Owner, State, municipal, federal or any other regulatory agency having jurisdiction thereover, regarding any safety inspections and certifications of any and all LA-RICS AUTHORITY's structures and enclosures. LA-RICS AUTHORITY, at its expense, may use any and all appropriate means of restricting public access to the LMR Site.

40.05 Sanitation. No offensive matter, refuse, or substance constituting an unnecessary, unreasonable or unlawful fire hazard, or material detrimental to the public health in violation of the law, shall be permitted or remain on the LMR Site and within a distance of fifty (50) feet thereof, and LA-RICS AUTHORITY and Owner shall prevent any accumulation thereof from occurring.

40.06 Security Devices. LA-RICS AUTHORITY, at its own expense, may provide any legal devices or equipment and the installation thereof, designated for the purpose of protecting the LMR Site from theft, burglary or vandalism, provided written approval for installation thereof is first obtained from the Owner. Owner shall be responsible for securing the Real Property to the extent deemed necessary by Owner in its sole discretion.

41. **ACKNOWLEDGMENT OF INELIGIBILITY FOR RELOCATION ASSISTANCE**

LA-RICS AUTHORITY hereby disclaims any status as a "displaced person" as such is defined in Government Code Section 7260 and hereby acknowledges its ineligibility for relocation assistance as provided in Government Code Section 7260 through 7276, inclusive, as interpreted in Title 25, Chapter 6, Section 6034(b) (1) of the California Administrative Code upon the future cancellation or termination of this Agreement.

42. **LA-RICS AUTHORITY'S STAFF AND EMPLOYMENT PRACTICES**

42.01 LA-RICS AUTHORITY shall designate one member of its staff as an Operations Manager with whom the Owner may deal with on a daily basis. Any person selected by LA-RICS AUTHORITY as an Operations Manager shall be fully acquainted with LA-RICS AUTHORITY's operation, familiar with the terms and the conditions prescribed therefore by this Agreement, and authorized to act in the day-to-day operation thereof.

42.02 LA-RICS AUTHORITY shall establish an identification system for each of its personnel assigned to service the LMR Site that clearly indicates the name of the person. The identification system shall be furnished at LA-RICS AUTHORITY expense and may include appropriate uniform attire and name badges as routinely maintained by LA-RICS AUTHORITY.

43. **BANKRUPTCY**

The Owner and LA-RICS AUTHORITY hereby expressly agree and acknowledge that it is the intention of both parties that in the event that during the term of this Agreement LA-RICS AUTHORITY shall become a debtor in any voluntary or involuntary bankruptcy proceeding (a Proceeding) under the United States Bankruptcy Code, 11 U.S.C. 101, et seq. (the Code), this Agreement is and shall be treated as an unexpired lease of nonresidential real property for purposes of Section 365 of the Code, 11 U.S.C. 365 (as may be amended), and, accordingly, shall be subject to the provisions of subsections (d)(3) and (d)(4) of said Section 365 (as may be amended).

44. **SUCCESSORS AND ASSIGNS**

Subject to any provision hereof restricting assignment or subletting by LA-RICS AUTHORITY, this Agreement shall bind the parties, their personal representatives, successors and assigns.

45. **SEVERABILITY**

The invalidity of any provision of this Agreement, as determined by a court of competent jurisdiction shall in no way affect the validity of any other provision hereof.

46. **INTERPRETATION**

Unless the context of this Agreement clearly requires otherwise: (i) the plural and singular numbers shall be deemed to include the other; (ii) the masculine, feminine and neuter genders shall be deemed to include the others; (iii) "or" is not exclusive; and (iv) "includes" and "including" are not limiting.

47. **ENTIRE AGREEMENT**

This Agreement (and the attached exhibits) contains the entire agreement between the parties hereto with respect to the matters set forth herein, and no addition or modification of any terms or provisions shall be effective unless set forth in writing, signed by both Owner and LA-RICS AUTHORITY.

COUNTY-SPECIFIC PROVISIONS:

48. **LOBBYIST**

LA-RICS AUTHORITY and each County lobbyist or County lobbying firm as defined in Los Angeles County Code Section 2.160.010, retained by LA-RICS AUTHORITY, shall fully comply with the County Lobbyist Ordinance, Los Angeles County Code Chapter 2.160. Failure on the part of LA-RICS AUTHORITY or any County lobbyist or County lobbying firm retained by LA-RICS AUTHORITY to fully comply with the County Lobbyist Ordinance shall constitute a material breach of this Agreement, upon which County may immediately terminate or suspend this Agreement.

49. **ENFORCEMENT**

The Owner's Chief Executive Officer shall be responsible for the enforcement of this Agreement on behalf of Owner and shall be assisted therein by those officers, employees, or committees of Owner having duties in connection with the administration thereof.

50. **SOLICITATION OF CONSIDERATION**

50.01 It is improper for any County officer, employee or agent to solicit consideration, in any form, from a licensee with the implication, suggestion or statement that the licensee's provision of consideration may secure more favorable treatment for the licensee in the award of the license or that the licensee's failure to provide such consideration may negatively affect the County's consideration of the licensee's submission. A licensee shall not offer to or give, either, directly or through an intermediary, consideration, in any form, to a County officer, employee or agent for the purpose of securing favorable treatment with respect to the issuance of a license.

50.02 LA-RICS AUTHORITY shall immediately report any attempt by a County officer, employee or agent to solicit such improper consideration. The report shall be made either to the County manager charged with the supervision of the employee or to the County Auditor-Controller Employee Fraud Hotline at (213) 974-0914 or (800) 544-6861. Failure to report such solicitation may result in the Agreement being terminated.

51. **ACKNOWLEDGEMENT OF COUNTY'S COMMITMENT TO THE SAFELY SURRENDERED BABY LAW**

LA-RICS AUTHORITY acknowledges that the County of Los Angeles places a high priority on the implementation of the Safely Surrendered Baby Law. LA-RICS AUTHORITY understands that it is the County's policy to encourage LA-RICS AUTHORITY to voluntarily post the Owner's "Safely Surrendered Baby Law" poster in a prominent position at the LA-RICS AUTHORITY' place of business. LA-RICS AUTHORITY will also encourage its contractors and subcontractors, if any, to post this poster in a prominent position in the contractor's or subcontractor's place of business. The County's Department of Children and Family Services will supply LA-RICS AUTHORITY with the poster to be used. As of the inception of this Agreement, information on how to receive the poster can be found on the Internet at www.babysafela.org.

52. **WARRANTY OF ADHERENCE TO OWNER'S CHILD SUPPORT COMPLIANCE PROGRAM**

52.01 LA-RICS AUTHORITY acknowledges that the County has established a goal of ensuring that all LA-RICS AUTHORITY's employees are in compliance with their court-ordered child, family and spousal support obligations in order to mitigate the economic burden otherwise imposed upon the County and its taxpayers.

52.02 As required by the County's Child Support Compliance Program (Owner Code Chapter 2.200) and without limiting the LA-RICS AUTHORITY's duty under this Agreement to comply with all applicable provisions of law, the LA-RICS AUTHORITY warrants that it is now in compliance and shall during the term of this Agreement maintain in compliance with employment and wage reporting requirements as required by the Federal Social Security Act (42 USC Section 653a) and California Unemployment Insurance Code Section 1088.5, and shall implement all lawfully served Wage and Earnings Withholding Orders or Child Support Services Department Notices of Wage and Earnings Assignment for Child, Family or Spousal Support, pursuant to Code of Civil Procedure Section 706.031 and Family Code Section 5246(b).

53. **RECYCLED BOND PAPER**

Consistent with the County's Board of Supervisors' policy to reduce the amount of solid waste deposited at County landfills, LA-RICS AUTHORITY agrees to use recycled-content paper to the maximum extent possible on this Agreement and all documents related thereto.

IN WITNESS WHEREOF, the LA-RICS AUTHORITY has executed this Agreement or caused it to be duly executed and Owner has caused this Agreement to be executed on the day, month and year first above written.
