

102. ELYMUS Linnaeus, Sp. Pl. 1: 83. 1753.

披碱草属 pi jian cao shu

Campeistachys Drobow; *Clinelymus* (Grisebach) Nevski, nom. superfl.; *Elymus* sect. *Clinelymus* Grisebach; *Goulardia* Husnot; *Roegneria* K. Koch; *Semeistachys* Drobow; *Terrellia* Lunell, nom. illeg. superfl.

Plants perennial, usually tufted, usually without, rarely with, rhizomes. Culms usually erect. Leaf sheath of culine leaves split almost to base; auricles present or absent; leaf blade flat or rolled. Spike erect to nodding. Spikelets 1 or 2(–4) per node, sessile, rarely very shortly pedicellate, appressed to rachis, clearly laterally compressed, usually all similar, with 2–10 or more florets; rachis tough. Glumes opposite or side-by-side, linear-lanceolate to lanceolate-ovate, firmly membranous to leathery, 1–9(–11)-veined, not keeled, apex obtuse to shortly awned; veins ± raised. Lemma lanceolate-oblong, rounded abaxially, 5-veined, ± pubescent, apex obtuse or acute to awned, rarely toothed; veins connivent at apex; awn erect or reflexed. Palea shorter than or equaling lemma, apex retuse, subrounded, or acute. Caryopsis usually adherent to lemma and palea. $x = 7$.

About 170 species: temperate regions of both hemispheres, mainly in Asia; 88 species (62 endemic) in China.

The genus *Roegneria* should be referred to *Elymus* because of their many common characters, e.g., plants usually tufted; spikelets usually all similar, 1 per node; lemma lanceolate-oblong, rounded abaxially, 5-veined, veins connivent at apex.

In addition, two North American species have been recorded as cultivated in China (FRPS 9(3): 10, 66. 1987): *Elymus canadensis* Linnaeus and *E. trachycaulis* (Link) Gould ex Shinners (as *R. pauciflora* (Schweinitz) Hylander).

Löve (Feddes Repert. 95: 447–473. 1984) published several new combinations and *nomina nova* in *Elymus* based on names previously validly published in *Roegneria* by Keng and Chen (Acta Univ. Nankin. Sci. Nat. [J. Nanjing Univ. (Biol.)] 1963(1): 1–92. 1963). However, in all cases, Löve cited the place of publication of the basionym from a later publication by Keng (Fl. Ill. Pl. Prim. Sin. Gram., ed. 2, 1965). Under Art. 33.3 of the Saint Louis Code, Löve's combinations were not validly published. These errors in citation are not correctable under Art. 33.4 because they are omissions, nor are they correctable under Art. 33.6(a) because conditions for valid publication were not again fulfilled in the 1965 work.

All species of this genus are good forage plants.

• Mountain slopes. Ningxia, Qinghai, Sichuan, Xinjiang.

“*Elymus brachiaristatus*” (Löve, Feddes Report. 95: 449. 1984) was not validly published because it was given as a *nomen novum* based on “*Clinelymus breviaristatus*” (Keng, Fl. Ill. Pl. Prim. Sin. Gram. 423. 1959), which was itself not validly published because no Latin description was provided (Saint Louis Code, Art. 36.1). Moreover, Löve’s supposed blocking name, *E. breviaristatus* (Hitchcock) Á. Löve (loc. cit. 471. Oct 1984), is in fact an illegitimate later homonym (Art. 53.1) because *E. breviaristatus* Keng ex P. C. Keng had already been validly published in July 1984.

When *Agropyron japonicum* and *A. japonicum* var. *hackelianum* are regarded as taxonomic synonyms and treated at varietal rank under *Elymus ciliaris*, the correct name under Art. 11.4 of the Saint Louis Code is the new combination *E. ciliaris* var. *hackelianus*. The earliest legitimate name at varietal rank is *A. japonicum* var. *hackelianum*, not the autonym, “*A. japonicum* var. *japonicum*,” which was not validly published under Art. 27.2. • Mountain meadows; 3700–4200 m. Gansu, Qinghai, Sichuan, Xinjiang, Xizang, Yunnan.

Löve (Feddes Report. 95: 448. 1984) published *Elymus sclerus* as a nomen novum for *Brachypodium durum*, but the supposed blocking name, “*Elymus durus* Hedw. ex Steud., 1854” (Steudel, Nomencl. Bot., ed. 2, 1: 550, 551. 1840), was merely cited as a synonym by Steudel and was therefore not validly published under Art. 34.1(c) of the Saint Louis Code. Under Art. 11.4, the correct name in *Elymus* at specific rank is *E. durus*. Löve’s name was therefore nomenclaturally superfluous when published and is illegitimate under Art. 52.1.

This species has been treated as conspecific with *Elymus dentatus* (J. D. Hooker) Tzvelev (Spisok Rast. Gerb. Fl. SSSR Bot. Inst. Vsesoyuzn. Akad. Nauk 18: 29. 1970; *Agropyron dentatum* J. D. If the two species are united then the name *E. dentatus* has priority.

Some authors consider *Elymus tsukushiensis* Honda (Bot. Mag. (Tokyo) 1: 391. 1936), described from Japan, to be conspecific with *E. kamoji*, described from China, in which case the name *E. tsukushiensis* would have priority.

Two varieties occur in China. In addition, *Elymus kamoji* var. *intermedius* S. L. Chen & Y. X. Jin (Bull. Nanjing Bot. Gard. 1987: 10. 1988) perhaps also merits recognition. It is characterized by having different leaf epidermis, glumes with an awn ca. 4 mm, and lemmas with a robust, straight, rough awn.
