ABSTRACT
The essential oil of the aerial parts of *Centaurea sempervirens* L. (Asteraceae), synonym : *Cheirolophus sempervirens* (L.) Pomel, was obtained by steam distillation and analyzed by GC-FID and GC-MS. 30 components were identified corresponding to 78.5% of the total oil. Among the identified constituents, oxygenated compounds represented 33.4%, from which 21.2% were hydrocarbons, 10.7% were sesquiterpenes. The non oxygenated compounds were hydrocarbons (9.8%). Phthalates represented 35.3% of the total oil. The major components were 6,10,14-trimethylpentadecan-2-one (12.4%) and *epi*-torilenol (5.1%). This is the first report on the chemical composition of the essential oil of this species.

Keywords: *Centaurea sempervirens* L., *Cheirolophus sempervirens* (L.) Pomel, Asteraceae, Essential oil composition.

INTRODUCTION

The genus *Centaurea* from the Asteraceae family is one of the most widely distributed plant genera in the world. This genus includes more than 500 species, 45 of which grow spontaneously in Algeria, with 7 species localized in the Sahara[1,2]. Many *Centaurea* species are used in the popular medicine of many countries[3-8]. In addition, various studies have shown medicinal properties of *Centaurea* species such as antimicrobial[9], antibacterial[10,11], hypoglycemic[12], antifungal[13-16], cytotoxic and phytotoxic[17-19], analgesic[20], anti-inflammatory and immunological[21]. *Centaurea* species are well known for their high structural diversity in major bioactive compounds, including triterpenes, flavonoids, lignans, fatty acids and sesquiterpene lactones[22-29].

Studies conducted on the chemical composition of their essential oils showed the presence of fatty acids, hydrocarbon derivatives, phytol, β-eudesmol and caryophyllene oxide in the majority of them[30-32]. Within the context of the study of *Centaurea* species growing in Algeria[33-36], we have taken interest in the study of *Centaurea sempervirens* and more precisely the chemical composition of its essential oil. Previous studies on this plant led to the isolation of sesquiterpene acids and sesquiterpene lactones[37], flavonoids[38] and polyacetylenes[39,40]. To the best of our knowledge there is no previous report on the essential oil composition of this species.

MATERIALS AND METHODS

Plant material

The aerial parts of *Centaurea sempervirens*, synonym : *Cheirolophus sempervirens* (L.) Pomel[41] were collected on June 2011 from Djebel El Wahch in the area of Constantine Northeast Algeria, and authenticated by professor Mohamed Kaabeche, Setif 1 university Algeria, according to Quezel and Santa (1963)[1]. A voucher specimen has been deposited in the Herbarium of the VARENBIOMOL research unit, University Frères Mentouri Constantine 1.

Extraction of the essential oil

The aerial parts (400 g) of *Centaurea sempervirens* were subjected to steam distillation in a Kaiser Lang apparatus for three hours. The obtained essential oil was collected and dried over anhydrous sodium sulphate and kept at 4°C until analysis. The yield of the oil was calculated in relation of the dry weight of the plant.

GC-FID Analysis

The essential oil was analyzed on an Agilent gas chromatograph (GC-FID) Model 6890, equipped with a HP-5MS fused silica capillary column (5%-diphenyl-95%-dimethylpolysiloxane (25 m x 0.25 mm, film thickness 0.25 µm), programmed from 50 °C (5 min) to 250 °C at 3 °/min and held for 10 min. Injector and flame ionization detector temperatures were 280 and 300 °C, respectively. The essential oil was diluted in acetone (3.5%, v/v) and injected in split mode (1/60), helium was used as a carrier gas (1.0 mL/min). Solutions of standard alkanes (C_8-C_{20}) were analyzed under the same conditions to calculate

[a]Compounds are listed in order of their RI

[b]RI (retention index) measured relative to *n*-alkanes (C_8-C_{20}) using HP-5MS

retention indices (RI) with Van del Dool and Kratz equation.

GC-MS Analysis

Mass spectrometry was performed on an Agilent gas chromatograph-mass spectrometer (GC-MS) Model 7890/5975, equipped with HP-5MS capillary column (25 m x 0.25 mm, film thickness 0.25 µm) programmed with the same conditions as for GC-FID. The mass spectrometer (MS) ionization was set in positive electron impact mode at 70 eV and electron multiplier was set at 2200 V. Ion source and MS quadrupole temperatures were 230 °C and 180 °C, respectively. Mass spectral data were acquired in the scan mode in the *m/z* range 33-450. The essential oil constituents were identified by matching their mass spectra and retention indices (RI) with those of reference compounds from libraries such as Adams[42] and Mc Lafferty & Stauffer[43]. The proportions of the identified compounds were calculated by internal normalization.

RESULTS AND DISCUSSION

The steam distillation of the essential oil of *Centaurea sempervirens* gave a viscous liquid with a green color and a strong odor. The yield of essential oil was 0.2% (w/w) in relation to the dry weight of the plant. The analysis and identification of the compounds of the essential oil was performed using the GC-MS. The general chemical profile of the essential oil, the percentage content and retention indices of the constituents are summarized in Table 1. This investigation allowed the identification of 30 constituents

corresponding to 78.5% of the total oil. Among the identified constituents, oxygenated compounds represented 33.4%, from which 21.2% were hydrocarbons, 10.7% were sesquiterpenes. The non oxygenated compounds were hydrocarbon derivatives (9.8%). Phthalates represented 35.3% of the total oil. The major components were diisopentylphthalate (33.0%); 6,10,14-trimethylpentadecan-2-one (12.4%) and *epi*-torilenol (5.1%). The presence of 6,10,14-trimethylpentadecan-2-one as main component of *C. sempervirens* agreed with the reported results on *C. grisebachii* subsp. *grisebachii*[44] while the presence of the phthalate esters could be explained in most cases by a probable pollution of the harvest area of studied plants[45].

To the best of our knowledge this is the first report on essential oil composition of *Centaurea sempervirens* L.

CONCLUSION

We report for the first time the essential oil composition of *Centaurea sempervirens* collected from the area of Constantine in the Northeast of Algeria. Analysis by GC-FID and GC-MS allowed the identification of 6,10,14-trimethyl-pentadeca-2-one (12.4%) and *epi*-torilenol (5.1%) as major components. In addition, the presence in significant amount of hydrocarbons (9.8%), oxygenated hydrocarbons (21.2%) and oxygenated sesquiterpenes (10.7%) was in accordance with the chemical composition of other *Centaurea* species.

ACKNOWLEDGEMENTS

We are grateful to professor Mohamed Kaabeche (Setif 1 university, Algeria) for the identification of the plant material and MESRS (DGRSDT) for financial support.
