Natural Resource Program Center  
Fort Collins, Colorado

The Natural Resource Publication series addresses natural resource topics that are of interest and applicability to a broad readership in the National Park Service and to others in the management of natural resources, including the scientific community, the public, and the NPS conservation and environmental constituencies. Manuscripts are peer-reviewed to ensure that the information is scientifically credible, technically accurate, appropriately written for the intended audience, and is designed and published in a professional manner.

The Natural Resource Technical Report series is used to disseminate the peer-reviewed results of scientific studies in the physical, biological, and social sciences for both the advancement of science and the achievement of the National Park Service's mission. The reports provide contributors with a forum for displaying comprehensive data that are often deleted from journals because of page limitations. Current examples of such reports include the results of research that addresses natural resource management issues; natural resource inventory and monitoring activities; resource assessment reports; scientific literature reviews; and peer-reviewed proceedings of technical workshops, conferences, or symposia.

Views, statements, findings, conclusions, recommendations, and data in this report are solely those of the author(s) and do not necessarily reflect views and policies of the U.S. Department of the Interior, National Park Service. Mention of trade names or commercial products does not constitute endorsement or recommendation for use by the National Park Service.

Printed copies of reports in this series may be produced in limited quantity, and are only available as long as the supply lasts. You may send a request to:

Northern Colorado Plateau Network  
P.O. Box 848  
Moab, UT 84532

This report is also available electronically from the Northern Colorado Plateau Network website, <http://science.nature.nps.gov/im/units/hcpn/index.cfm>, or at <http://www.nature.nps.gov/publications/NRPM/index.cfm>.

# Abstract

In 2005–2006, the National Park Service’s Northern Colorado Plateau Network received funding to develop a revised checklist of the vascular plant flora of Capitol Reef National Park. This entailed a thorough review of existing literature, re-examination of specimens from the Capitol Reef National Park herbarium and other state and national museum collections, and additional field work to corroborate unverified species reports or locate new species. Based on this study, 887 vascular plant taxa have been confirmed or reliably reported as occurring in the park (835 are known from validated herbarium specimens and 52 from unvouchered literature reports). Another 117 species formerly considered part of the park flora have now been shown to be falsely reported. The current flora of Capitol Reef National Park represents about 25% of the known flora of Utah, and 52.4% of the flora of the Colorado Plateau ecoregion within Utah. At least 7 of these species are federally listed as threatened or endangered, and 54 more are considered species of concern by the state natural heritage program. Introduced plants make up 13.8% of the park flora (45 species), of which only 3 species are considered noxious weeds by the State of Utah. Further surveys in Capitol Reef National Park are likely to find additional new species (about 192 are known from similar habitats outside the park boundary), especially among late- season flowering, weedy, or wetland taxa.

# Acknowledgements

I would like to thank the following individuals for their assistance with this project. Botanist Dr. Angela Evenden, former leader of the Northern Colorado Plateau Network in Moab, Utah, was an active proponent of this project and helped secure funding for field work and herbarium studies in 2006. Tom Clark, natural resources chief at Capitol Reef National Park, and Debi Clark, interagency botanist, provided access to all mounted and unmounted CARE herbarium specimens, research permits, reprints, and advice on botanical issues related to the park. Amy Tendick and Liz Ballenger recorded specimen-label data from all mounted collections in the CARE herbarium. Dr. Mary Barkworth, of Utah State University, corroborated the identification of *Stipa scribnieri* in the park. Libby Nance, former database specialist with the NCPN, assisted with development and quality control of the park's NPSpecies database. Libby Nance, Janet Coles, and Helen Thomas also provided data from recent vegetation mapping and wetland inventories in the park. Drs. Stanley Welsh and Duane Atwood provided access to herbarium collections at Brigham Young University. Dr. Michael Piep provided access to collections at the Utah State University (Intermountain) herbarium. Dr. Ron Hartman and Ernie Nelson provided access and specimen loans from the Rocky Mountain Herbarium at the University of Wyoming. Thanks to the technical reviewers (Dr. Angela Evenden, Dr. Dusty Perkins, and Libby Nance) for their comments and suggestions. To any others whom I may have inadvertently forgotten, please accept my apologies (and thanks).

Research was conducted under permit # CARE-2006-SCI-0002 for study number CARE-06002. Funding was provided by the National Park Service through the University of Wyoming.

# 1 Introduction

In 2006, the National Park Service (NPS) established a cooperative agreement with the University of Wyoming, through the Rocky Mountains Cooperative Ecosystem Studies Unit, to produce a series of technical reports summarizing the vascular plant flora of each of the 16 national park units of the Northern Colorado Plateau Network (NCPN). These reports are based on existing information in the park service's NPSpecies database system and augmented by further data mining, reviews of state and regional herbaria, and new field surveys to resolve the status of many reported and unconfirmed species. The objective of these reports is to summarize the current state of knowledge of the flora of each park for the benefit of NPS biologists and interpretive staff, outside researchers, and the general public. The following report addresses the vascular flora of Capitol Reef National Park (NP), in south-central Utah. Other NCPN park units are addressed in separate reports.

## 1.1 Background and justification

One of the primary missions of the NPS is "to conserve unimpaired the natural and cultural resources and values of the national park system for the enjoyment of this and future generations" (NPS 2000). Due to their high degree of protection and distribution across a wide variety of habitat types, the nation's national park units make a significant contribution to the protection of biological diversity (Noss and Cooperrider 1994). Unfortunately, the full contribution of the NPS system is not known, as many park units have traditionally lacked comprehensive biological inventories or monitoring programs to identify the composition and condition of their biota. Knowing the status of park flora and fauna is critical for effective park management and for systematically identifying and filling gaps in the nation's protected area network (Margules and Pressey 2000).

To rectify this shortcoming, Congress passed the National Parks Omnibus Management Act in 1998 to provide guidance and funding for an inventory and monitoring program across the entire national park system. Since 2000, the NCPN Inventory and Monitoring Program has been developing and verifying species lists of vertebrates and vascular plants for each park unit in the network

(Evenden et al. 2002). This effort has entailed reviewing existing species checklists, corroborating the identification of specimens in park museum and herbarium collections, locating additional specimen records from other museums, mining relevant literature and datasets, and conducting field surveys to locate new taxa or confirm unsubstantiated reports.<sup>†</sup> All of these data have been synthesized in NPSpecies, the park service's standardized database for documenting park status (present, probably present, unconfirmed, falsely reported), abundance, residency, nativity, and rarity. With the production of a technical series of reports on the flora of each park, the NPSpecies data will now be available to a broader audience.

## 1.2 Objectives

The objectives of this project were to:

1. Document the current status (present, reported, potential, or falsely reported) of all vascular plant species that have been cited as occurring in Capitol Reef NP, based on a review of herbarium collections and past literature; and
2. Develop an annotated checklist of the flora of Capitol Reef NP, with supplemental information on taxonomic synonyms, distribution, within-park abundance, flowering period, growth form, nativity, habitat, and sources for each record.

## 1.3 Study area

### 1.3.1 History and setting

The oldest evidence of human occupation of the Capitol Reef and Waterpocket Fold area comes from dart points dating from 2,000 to 8,000 years before present. Sedentary farmers and hunter-gatherers of the Ancestral Puebloan and Fremont cultures inhabited areas near perennial water sources within the park during the period from 600 to 1275 A.D. Following periods of extensive drought, native cultures adopted the more nomadic lifestyle that existed at the time of European contact (Frye 1998).

Waterpocket Fold presented a significant barrier to early European explorers, who largely bypassed the park area until the mid-19th century. Almon Thompson, of the Powell survey, made

<sup>†</sup>Taxa refer to all named species, subspecies, and varieties.

the first scientific explorations through the future park in 1872, en route to the Henry Mountains. Geologists Grove Karl Gilbert and Clarence Dutton mapped the Waterpocket Fold in detail in the late 1870s. Mormon pioneers began settling the area in the vicinity of Capitol Reef in the late 1870s and early 1880s. A small farming community began at Fruita in 1886, but struggled due to its remoteness (Frye 1998).

Wayne County civic leaders and boosters began espousing protection of a portion of the Capitol Reef area around Fruita (the “Wayne Wonderland”) as a state or national park in the early 1920s. Such a designation would result in improved road access to the area and greater economic prosperity from tourism. These efforts reached fruition in August 1937, with the creation of Capitol Reef National Monument by President Franklin Roosevelt, under the Antiquities Act. The monument’s original boundaries were enlarged by President Eisenhower in 1958, and again in 1969 by President Johnson, who increased the area by nearly 600%. In December 1971, Congress fixed the current boundaries at 241,904 acres (97,895 ha) and upgraded Capitol Reef to full national park status (Evenden et al. 2002, Frye 1998). With the additions in 1969, the park currently stretches nearly 70 miles, from Thousand Lake Mountain almost to Lake Powell.

Capitol Reef National Park is located in west-central Wayne, north-central Garfield, southwestern Emery, and southeastern Sevier counties in central Utah (Figure 1.3.1), about 75 road miles east of Richfield. Elevation within the park ranges from 3,880 feet (1,183 m) at the bottom of Halls Creek to 8,960 feet (2,731 m) on the flank of Thousand Lake Mountain. Annual precipitation averages 5 inches (12.5 cm) at the south end of the park and 12 inches (30 cm) at the higher, north end. Fruita has an annual precipitation of 7.2 inches (18 cm), with 30% coming in the summer monsoon season. The average minimum temperature at Fruita in January is 18°F (-8°C), and in July, 92°F (33°C) (Heil et al. 1993).

### 1.3.2 Geology

The “Capitol” in Capitol Reef comes from the dome-like outcrops of Navajo Sandstone in the Fruita area that resemble the rotunda shape of many capitol buildings. Early geographers applied the term “reef” to the nearly 100-mile-long Waterpocket Fold, which created a formidable barrier to travelers—much like marine reefs impede ship

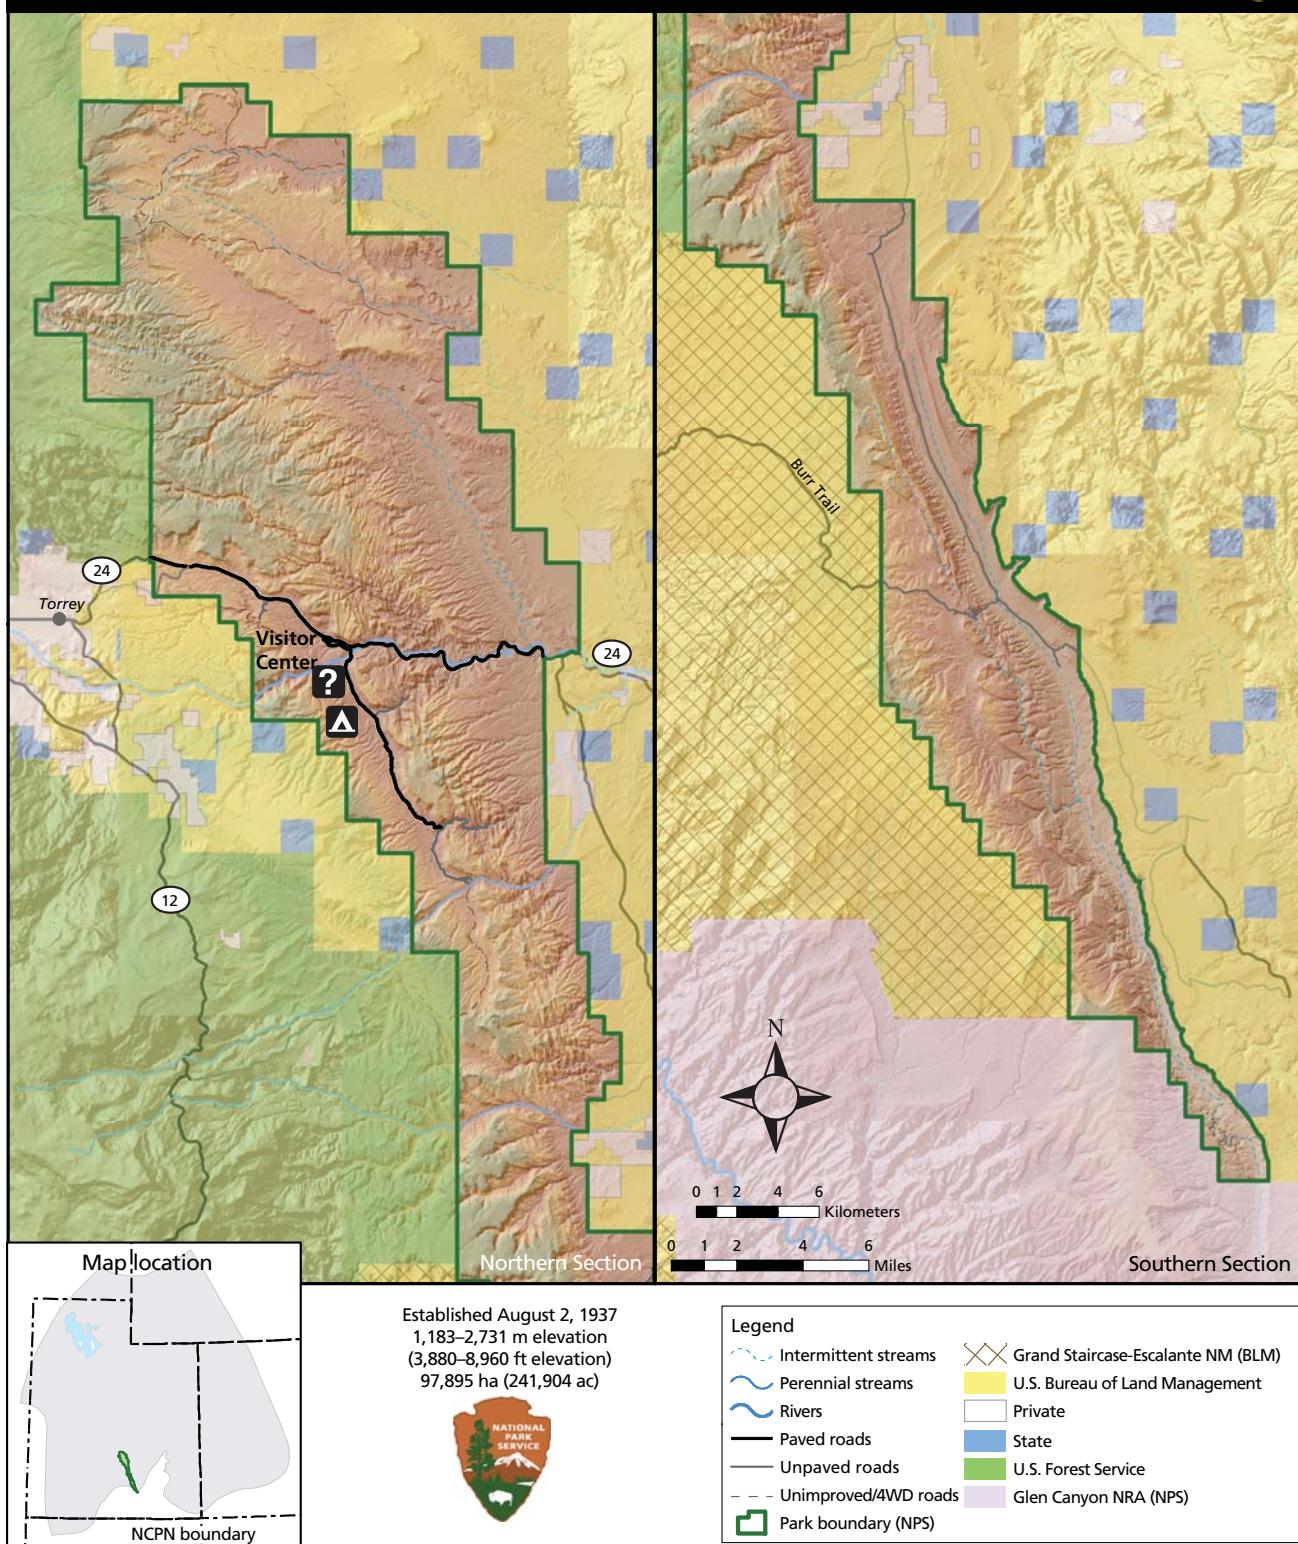

traffic. Waterpocket Fold, an east-dipping monocline extending from Thousand Lake Mountain nearly to Lake Powell, was uplifted during a period of tectonic activity in the late Cretaceous or early Tertiary, along with much of the Colorado Plateau and Rocky Mountains. Different rates of erosion (depending on the nature and position of sedimentary beds) over time carved the deep canyons, domes, arches, and bedrock holes (“waterpockets”) characteristic of the Capitol Reef area (Chronic 1988; Morris et al. 2003).

Rocks exposed in Capitol Reef NP range in age from Permian sandstone to Quaternary volcanic boulders. The oldest strata tend to occur in the western part of the park, becoming progressively younger as one travels eastward, following the tilt of the Waterpocket Fold monocline (Chronic 1988). Permian-age outcrops of the Cutler Group (including the Cedar Mesa and White Rim sandstones), dating to about 265 million years ago, are exposed in the bottom of the Fremont River canyon and Sulphur Creek near the park’s western boundary. These strata were originally deposited as beach and wind-blown sand dunes, and are capped by the marine-derived Kaibab limestone. In the early Triassic, the Capitol Reef area was a coastal tidal flat that was periodically reflooded by marine waters, forming the alternating brown and red mudstones and siltstones of the Moenkopi Formation. During the late Triassic, the park area was buried by river-borne volcanic ash and clay of the Chinle Formation.

Continuing eastward, the Chinle is covered by early Jurassic Wingate Sandstone (derived from wind-blown sand dunes) and sandstone-claystone conglomerates of the fluvial Kayenta Formation. Above the Kayenta are the thick beds of Navajo Sandstone that form the park’s characteristic monolithic cliffs and domes. The Navajo was part of a Sahara-like dune system that extended from Nevada to southern Wyoming. Later in the Jurassic and early Cretaceous, the Capitol Reef area was again inundated by marine intrusions or exposed as a tidal flat. Alternating beds of sandstone, siltstone, mudstone, gypsum, and limestone were laid down during this time as the San Rafael Group (Page Sandstone, Carmel, Entrada, Curtis, and Summerville formations), Morrison Formation, and Dakota Sandstone. Deep marine waters, alternating with delta and coastal plain depositional environments, predominated during the early to mid-Cretaceous, giving rise to the various members of the Mancos Shale and Mesa Verde Formation.

# Capitol Reef National Park

Utah

MAP CREATED BY ANETH WIGHT, NCPN (DERIVED FROM EVENDEN ET AL. 2002)

Figure 1.3.1. Location of Capitol Reef National Park (Wayne, Garfield, Emery, and Sevier counties, Utah).

The Cenozoic has largely been a time of erosion in Capitol Reef NP, interrupted by periods of volcanic activity about 20–25 million years ago and again as recently as 3.7 million years ago (Morris et al. 2003). Remnants of the last period of volcanism persist in the form of intrusive igneous dikes, sills, and diatremes found sporadically in the South Desert area. Large, black boulders on hills near the visitor center were derived from lava fields on plateaus to the west and north and transported to the park as outwash from glaciation (Chronic 1988).

### 1.3.3 Vegetation

The plant communities of Capitol Reef National Park have been described in detail by Meyer (1990), Heil et al. (1993), and the Northern Colorado Plateau Network (in ed.). These can be aggregated into five general vegetation types that correlate with elevational and moisture gradients. Bentonite and gypsum badlands and low-elevation, clay-rich substrates (such as the Moenkopi, Chinle, and Mancos) are dominated by salt desert scrub vegetation of shadscale (*Atriplex confertifolia*), mat saltbush (*A. corrugata*), Castle Valley saltbush (*A. gardneri* var. *cuneata*), spiny hopsage (*Grayia spinosa*), and crisp-leaf wild buckwheat (*Eriogonum corymbosum* var. *corymbosum*). Low-elevation desert sites with shallow soils over impervious bedrock support stands of blackbrush (*Coleogyne ramosissima*) and rabbitbrush (*Chrysothamnus* spp.) (Heil et al. 1993).

Sagebrush shrublands and grasslands replace desert scrub at higher elevations and on alluvial terraces or sandy soils. These stands may be dominated by big sagebrush (*Artemesia tridentata*), rubber rabbitbrush (*Chrysothamnus nauseosus*), or fourwing saltbush (*Atriplex canescens*). More saline terraces may be locally dominated by greasewood (*Sarcobatus vermiculatus*), and sites over stabilized sand dunes by sand sagebrush (*Artemesia filifolia*) or perennial grasses.

Pinyon-juniper woodlands predominate on thin, rocky soils at low to mid-elevations. These pygmy forests are dominated by two-needle pinyon (*Pinus edulis*) and Utah juniper (*Juniperus osteosperma*), with understories of green ephedra (*Ephedra viridis*) or other low shrubs or grasses. Wind-blasted, rocky ridges are often locally dominated by cushion plant species, while slickrock exposures or ledges may be sparsely vegetated by dwarf mountain mahogany (*Cercocarpus intricatus*).

Mixed conifer forests, which occur at higher elevations on deep, coarse-textured soils, or in shady slot canyons, consist primarily of Ponderosa pine (*Pinus ponderosa*), bitterbrush (*Purshia tridentata*), alder-leaf mountain mahogany (*Cercocarpus montanus*), and greenleaf manzanita (*Arctostaphylos patula*). Quaking aspen (*Populus tremuloides*) may predominate in more mesic sites with rich soils. Western bristlecone pine (*Pinus longaeva*)-cushion plant stands occur locally in the park, and are considered a community of conservation concern by Heil et al. (1993).

Wetlands occur across all elevations and are associated with perennial rivers, streams, or seeps. Fremont cottonwood (*Populus fremontii*) woodlands with an understory of willows (*Salix* spp.) or rabbitbrush occur commonly along the larger watercourses. Stands of common reed (*Phragmites australis*) or Baltic rush (*Juncus arcticus*) may occur among cottonwood forests. At higher elevations, riparian woodlands may be dominated by thinleaf alder (*Alnus incana*), water birch (*Betula occidentalis*), blue spruce (*Picea pungens*), or red-osier dogwood (*Cornus sericea*). Hanging gardens associated with shady cliff alcoves and perennial seeps are uncommon in the park, but are commonly occupied by southern maidenhair fern (*Adiantum capillus-veneris*), giant helleborine (*Epipactis gigantea*), and western poison ivy (*Toxicodendron rydbergii*) (Fowler et al. 2007; Welsh 1989). Many of the riverside terraces in the Fruita area were converted to orchards by Mormon pioneers. These are still maintained by the National Park Service, and contain a number of cultivated fruit species and weeds (Heil et al. 1993).

### 1.3.4 Previous botanical studies

Lester Ward, of the Powell Survey, explored Rabbit Valley and the Aquarius Plateau west of Capitol Reef in 1875, but apparently did not collect botanical specimens within the future park itself. Likewise, Marcus E. Jones conducted field work in the Henry Mountains and vicinity of Hanksville and Loa in 1894, Per Axel Rydberg and E. C. Carlton surveyed the Aquarius Plateau in 1905, and W. D. Stanton botanized the Henry Mountains in 1930, but all apparently bypassed Capitol Reef, itself. The earliest collections known from Capitol Reef National Monument were made by Bertrand F. Harrison, Ben Markham, and Elden Beck, of Brigham Young University, in 1938 (Table 1.3.4, Figure 1.3.4). Noteworthy among the finds that year was the collection of the holotype of Beck's spring-parsley (*Cymopterus beckii*),

**Table 1.3.4. Chronology of plant collecting efforts in Capitol Reef National Park.**

Year	Collector(s)	# of new taxa	Comments
1938–1940	B. F. Harrison, B. Markham, E. Beck, Reed, & W. B. McDougall	7	Bertrand Harrison and colleagues from Brigham Young University collected at least 7 plant taxa in Capitol Reef National Monument over a three-year period, including the holotype of <i>Cymopterus beckii</i> in 1938. NPS regional biologist W. B. McDougall made a cursory checklist of monument flora in 1940 based on a one-day visit (McDougall 1940).
1951	B. F. Harrison	1	B. F. Harrison collected the first record of Springfield's bluestem ( <i>Bothriochloa springfieldii</i> ) while passing through the monument.
1958	F. Swancara & E. Lehnert	40	Frank Swancara and Emery Lehnert made collections of 40 new taxa. These specimens formed the foundation of the Capitol Reef herbarium (CARE).
1961	R. Barneby	1	Rupert Barneby, of the New York Botanical Garden, collected the type of <i>Astragalus harrisonii</i> from Capitol Reef National Monument.
1965–1968	K. Erdman & K. Taylor	11	Kimball Erdman and Kelly Taylor added 11 new species to the monument flora.
1970–1971	R. Nelson	79	Ruth Nelson discovered 79 new species for Capitol Reef National Park, including first records for several rare or locally endemic species, such as Bicknell milkvetch ( <i>Astragalus consobrinus</i> ), Woodruff's milkvetch ( <i>A. woodruffii</i> ), and low hymenoxys ( <i>Hymenoxys acaulis</i> var. <i>nana</i> ).
1972	N. D. Atwood & L. Higgins	1	Duane Atwood and Larry Higgins collected the type of <i>Phacelia rafaelensis</i> from Capitol Reef National Park.
1973–1975	H. K. Harrison	90	Keith Harrison made nearly 600 collections for the CARE herbarium and documented 90 new taxa for the park flora.
1977–1978	P. Camp, E. Neese, and S. White	38	Pam Camp, of Utah State University, made more than 200 collections in the Halls Creek area of Capitol Reef National Park and Glen Canyon National Recreation Area. Excluding Glen Canyon records, she added 37 new taxa to the flora of Capitol Reef National Park. Elizabeth Neese and S. White discovered <i>Spiranthes diluvialis</i> in Capitol Reef in 1977 (this species was listed as threatened under the Endangered Species Act in 1992).
1980–1981	S. Meyer	186	Susan Meyer made more than 300 collections for the CARE herbarium and added 186 new species to the park flora. Meyer (1982) compiled a checklist of 512 plant species for the park.
1982	N. D. Atwood, S. Goodrich, S. Welsh, and E. Neese	4	Stan Welsh and colleagues discovered 4 new species for the park, including the type of <i>Erigeron maguirei</i> var. <i>harrisonii</i> (no longer considered distinct from <i>E. maguirei</i> ).
1984–1985	J. Lichhardt, S. Welsh, and E. Neese	7	Juanita Lichhardt, Stan Welsh, and Elizabeth Neese added 7 new species to the park flora.
1986–1988	K. Heil, J. M. Porter, R. Fleming, and W. Romme	353	Ken Heil, Mark Porter, and Rich Fleming, of San Juan College, and William Romme, of Fort Lewis College, conducted a multi-year vegetation classification, floristic inventory, and rare-plant survey for Capitol Reef National Park. In the course of collecting more than 650 specimens for the CARE herbarium, this group added 353 new species to the park flora and 33 new rare species, including first records of Rabbit Valley gilia ( <i>Gilia caespitosa</i> ), Winkler's pincushion cactus ( <i>Pediocactus winkleri</i> ), Wright's fishhook cactus ( <i>Sclerocactus wrightiae</i> ), Jones' cycladenia ( <i>Cycladenia humilis</i> var. <i>jonesii</i> ), and Barneby's reed-mustard ( <i>Schoenocrambe barnebyi</i> ). Heil et al. (1993) produced a checklist of the park flora with 759 taxa.
1989–1991	E. Haskell, J. Spence, K. Mason, and K. Heil	3	Eric Haskell, John Spence, Karen Mason, and Ken Heil added first reports of Thunberg's barberry ( <i>Berberis thunbergii</i> ), <i>Dryopteris filix-mas</i> , and cardinal-flower ( <i>Lobelia cardinalis</i> ).
1992–1993	J. Fowler, C. L. May, and J. Hak	0	Jim Fowler and colleagues surveyed hanging garden vegetation in the park, but added no new species to the flora (Fowler et al. 2007).

**Table 1.3.4. Chronology of plant collecting efforts in Capitol Reef National Park, cont.**

Year	Collector(s)	# of new taxa	Comments
1995–1997	T. Clark, D. Clark, K. Harper, R. Van Buren, and Z. Aanderud	2	Tom and Debi Clark discovered the first record of <i>Gilia tenuis</i> (a rare species) in the park. Kim Harper, Renee Van Buren, and Z. Aanderud discovered <i>Gnaphalium wrightii</i> in Capitol Reef NP.
1997–2002	D. Clark	1	Debi Clark and colleagues with the Interagency Rare Plant Team surveyed Capitol Reef and adjacent BLM and USFS lands for rare plants, partly funded by a grant from Canon USA, Inc. <i>Thelesperma subnudum</i> var. <i>alpinum</i> was discovered in the park in 2000 (Clark 2002)
2004	K. Andersen, D. Barnes, K. Harper, & Northern Colorado Plateau Network veg mapping team	3 (+ 25 reported)	Donna Barnes and Kim Harper of Utah Valley State College collected more than 50 specimens for the CARE herbarium, including first records of 2 taxa. Kim Andersen collected one new exotic species and reported 2 others during a survey of noxious weeds (Dewey and Andersen 2005). The Northern Colorado Plateau Network (in ed.) vegetation mapping team reported 23 new species for the park (without vouchers)
2005	R. Harms, W. Fertig, & P. Lesica	7	Rebecca Harms discovered 3 new species for the park during a survey of seeps and springs (Springer et al. 2006). Walter Fertig and Peter Lesica added 4 new species.

named in honor of its discoverer. National Park Service regional biologist W. B. McDougall compiled the first plant checklist for the new monument (mostly prominent trees and shrubs) based on a one-day visit in 1940 (Frye 1998; McDougall 1940).

Botanical research and collecting was sporadic during the Capitol Reef National Monument era. Frank Swancara and Emery Lehnert initiated the Capitol Reef herbarium (CARE) with their collections in 1958. Rupert Barneby visited the monument in 1961 and collected the type specimen of a new species, Harrison's milkvetch (*Astragalus harrisonii*). Ruth Nelson more than doubled the known flora of the area by adding 79 new species in 1970–1971. Duane Atwood and Larry Higgins, graduate students from Brigham Young University, took the type of San Rafael phacelia (*Phacelia rafaelensis*) from the park in 1972 (Welsh 1982).

The pace of new discovery accelerated in the mid-1970s and early 1980s. Keith Harrison made nearly 600 collections for the CARE herbarium from 1973 to 1975, and documented 90 new species for the park. Pam Camp, of Utah State University, collected more than 200 specimens in the Halls Creek drainage area along both sides of the Capitol Reef NP/Glen Canyon National Recreation Area boundary in 1977–1978. Camp discovered at least 37 new species for Capitol Reef NP, but several additional species credited to her in later checklists (Heil et al. 1993) were actually found

on the Glen Canyon side and remain unconfirmed (but potential) for Capitol Reef. Elizabeth Neese and S. White discovered an unusual orchid along the Fremont River in 1977 that was eventually identified as Ute ladies'-tresses (*Spiranthes diluvialis*, federally listed as threatened under the Endangered Species Act since 1992). From 1980 to 1981, Susan Meyer made more than 300 collections from the park and added 186 new species to the flora (increasing it by nearly 40%). Meyer (1982, 1990) published a park checklist identifying 512 taxa. Stan Welsh and colleagues from Brigham Young University conducted a study of grazing impacts on the park in 1982, and discovered the holotype of Maguire's fleabane (*Erigeron maguirei* var. *harrisonii*, now considered synonymous with var. *maguirei*) (Welsh 1982).

The most comprehensive survey of the flora and vegetation of Capitol Reef NP took place from 1986 to 1988, under the direction of Ken Heil, Mark Porter, and Rich Fleming, of San Juan College, and William Romme, of Fort Lewis College (Heil et al. 1993). This group collected more than 650 specimens for the CARE herbarium in the course of sampling 34 vegetation types. Heil et al. (1993) produced a checklist identifying 759 taxa for the park, of which 353 represented new species. In addition, Heil and his colleagues discovered 33 new rare species for the park, including four of the park's seven listed threatened or endangered plant species (see Tables 1.3.4 and 3.3).

In the past 20 years, the number of new species discovered in Capitol Reef NP has leveled off (Figure 1.3.4), but not stopped. Rare and uncommon species continue to be discovered, including male fern (*Dryopteris filix-mas*), by John Spence and Karen Mason in 1990, Mussentuchit gilia (*Gilia tenuis*) and alpine greenthread (*Thelesperma subnudum* var. *alpinum*), by Tom and Debi Clark in 1995 and 2000, and Wright's cudweed (*Gnaphalium wrightii*), by Kim Harper and Renee Van Buren in 1997. More recently, Donna Barnes and Kim Harper, from Utah Valley State College, added two new species while conducting general floristic collecting in the park in 2004. Kim

Andersen of Utah State University vouchered or reported three new invasive plant taxa in 2004 (Dewey and Andersen 2005). Vegetation mapping crews from Capitol Reef NP and the Northern Colorado Plateau Network (in ed.) reported 23 new species (without vouchers) in 2004. Rebecca Harms discovered three new riparian species in a 2005 survey of seeps and springs (Springer et al. 2006). Montana botanist Peter Lesica and I collected four new species during the 2005 field season (Table 1.3.4).

Additional details on plant-collecting efforts at Capitol Reef NP can be found in Table 1.3.4.

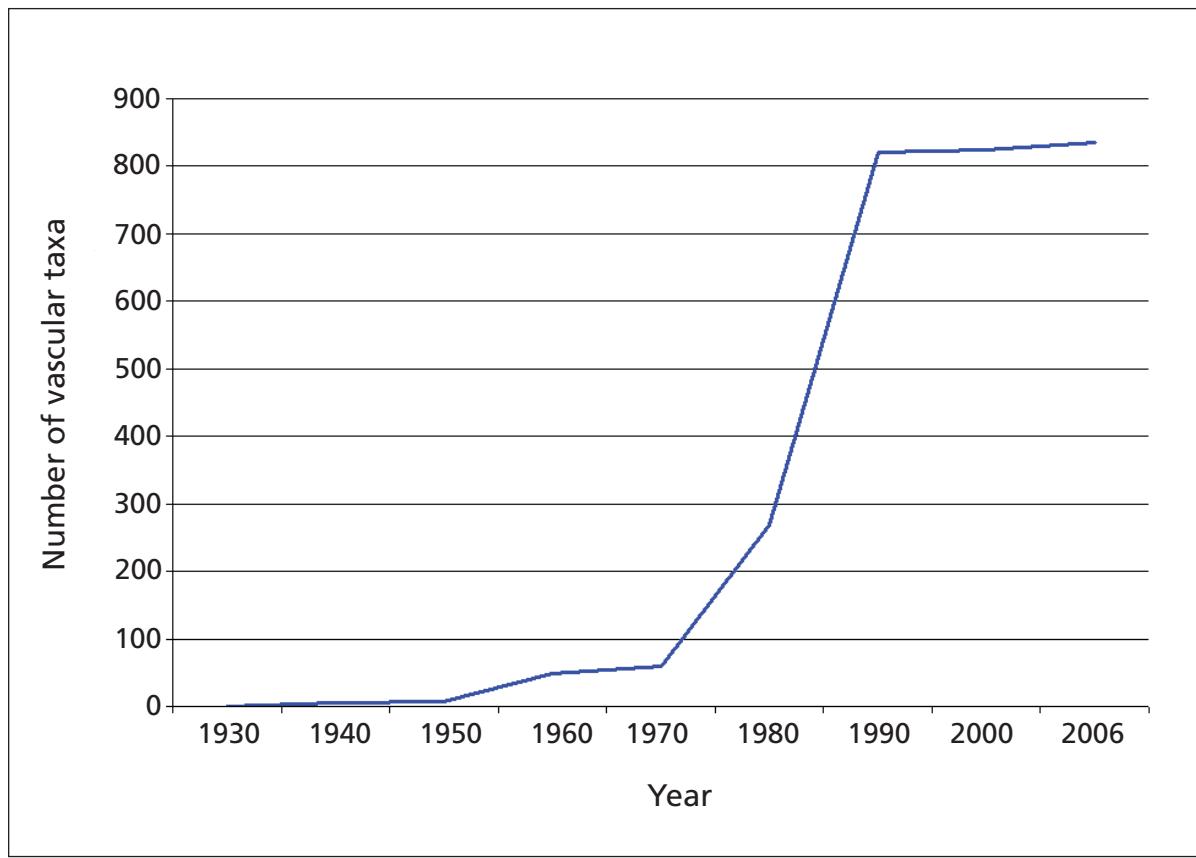

Figure 1.3.4. Increase in the number of plant taxa confirmed as present in Capitol Reef National Park by decade, 1930–2006.

## 2 Methods

In January and February 2005, I reviewed all mounted specimens in the Capitol Reef National Park herbarium (CARE) to determine whether each was correctly identified to species, subspecies, or variety following the nomenclature of Welsh et al. (2003). As necessary, I made corrections and annotations to each specimen and to the voucher records in the park's Automated National Cataloging System (ANCS+) and NPSpecies database. Based on this herbarium work and a review of park references (Heil et al. 1993; Meyer 1982; Dewey and Andersen 2005; Springer et al. 2006), I developed four lists:

1. A revised checklist of species that were present in the park (confirmed by an authenticated voucher; included in Appendices A and D);
2. A list of species that were reported in the literature but not corroborated with a voucher (equivalent to "probably present" in NPSpecies terminology; included in Appendices A and D);
3. A list of potential species ("unconfirmed" in NPSpecies) known from the vicinity of Capitol Reef National Park, using an unpublished list generated by Dr. N. Duane Atwood of Brigham Young University and Albee and others (1988) (Appendix B); and
4. A list of species that are now known to be misidentified or highly questionable (Appendix C).

I annotated each list with supplemental information on life form, geographic range (within

the context of Utah), population size in the park (derived from Heil et al. 1993, NCPN in ed., and field observations), flowering period, distribution across general vegetation types, nativity, data source (collector and collection number from a sample specimen or literature citation), year of earliest collection (from herbarium records), and relevant synonymy and taxonomic problems (based on review of Barkworth et al. 2003, 2007; Barneby 1989; Cronquist 1994; Cronquist et al. 1972, 1977, 1984, 1997; Dorn 2001; Flora of North America Editorial Committee 1993, 1997, 2000, 2002a, 2002b, 2003, 2005, 2006a, 2006b, 2006c; Holmgren et al. 2005; and Weber and Wittmann 2001). I then incorporated the annotations to these lists and label data from the CARE herbarium review into the NPSpecies database for the park.

Work in 2005–2007 focused on confirmation of reported and potential species for the park flora through field surveys and review of collections from state and regional herbaria. To target missing species, I made collecting trips to Capitol Reef NP in May 2005 and September 2006, emphasizing under-sampled wetland, weedy, and late-flowering taxa. I undertook herbarium studies at Brigham Young University (BRY), Utah State University (USU), and the University of Wyoming (RM) in March, June, and October 2006 and February and March 2007, and documented park specimens from the Virtual Herbarium website of the New York Botanical Garden (<http://sciweb.nybg.org/science2/hcol/intf/index.asp>). Finally, I located additional new species reports by examining unmounted collections by NCPN researchers and reviewing plot data from recent vegetation mapping and wetland inventories (NCPN in ed.; Springer et al. 2006).

# 3 Results

## 3.1 Summary of the flora of Capitol Reef National Park

Of the 2,028 vascular plant vouchers in the CARE herbarium examined in 2005, 221 were misidentified (10.9%), 81 were revised to a more current name (4%), 288 had variety or subspecies names added (14.2%), and 1,438 were found to be correctly determined (70.9%). Based solely on these collections, the confirmed flora of Capitol Reef National Park stood at 794 taxa (Fertig 2006). From 2005 to 2007, I located an additional 34 taxa from collections at Brigham Young University (many of which had been reported by Heil et al. 1993, but without a duplicate voucher deposited in the CARE herbarium). Field surveys

in 2005 netted another seven new species from my field collections and those of Rebecca Harms (Springer et al. 2006). Overall, the documented flora of Capitol Reef NP has increased by 41 species (4.9%), bringing the total number of taxa to 835 (Table 3.1, Appendices A, D).

Currently, 52 additional taxa have been reported for Capitol Reef NP but have yet to be corroborated with voucher specimens (Table 3.1, Appendix A). Of these, 43 were reported by Heil et al. (1993) or the Northern Colorado Plateau Network (in ed.). Taken together, the number of confirmed and reported vascular plant taxa in Capitol Reef NP stands at 887 taxa (Table 3.1, Appendix A).

At the start of the 2006 field season, I recognized 216 taxa as potentially occurring in Capitol Reef NP, based on the proximity of the park to known

**Table 3.1. Statistical summary of the flora of Capitol Reef National Park.**

Category	Number confirmed in park	Number additionally reported for park	Total
<b>Taxonomic diversity</b>			
Total taxa (including varieties and subspecies)	835	52	887
Full species (excluding varieties and subspecies)	786	45	831
Families	90	1	91
<b>Life form diversity</b>			
Tree taxa	49	2	51
Shrub taxa	115	8	123
Perennial forb taxa	396	31	427
Annual forb taxa	135	4	139
Perennial graminoid taxa	108	6	114
Annual graminoid taxa	22	1	23
Fern taxa	10	0	10
<b>Biogeographic diversity</b>			
Introduced taxa	119	3	122
Native taxa			
Locally endemic taxa	26	1	27
Regionally endemic taxa	110	5	115
Disjunct taxa	1	0	1
Peripheral taxa	8	0	8
Sparse taxa	14	1	15
Widespread taxa	557	42	599
<b>Total native taxa</b>	<b>716</b>	<b>49</b>	<b>765</b>

The number of taxa and families is based on taxonomic concepts of Welsh et al. (2003). See Appendices, "Codes and Definitions", for an explanation of the various categories.

populations (Albee et al. 1988, Fertig 2006). At least 24 of these species were found to occur in the park based on field collections or relocated herbarium specimens in 2005–2007. The current number of potential species that I am recognizing for Capitol Reef NP is 192 (Appendix B).

Of the original pool of species documented or reported for Capitol Reef NP, I found 117 taxa to be falsely reported based on misidentified voucher specimens in the CARE and BRY herbaria. I consider an additional six species cited (but not vouchered) by the NCPN vegetation mapping team (NCPN in ed.) to be questionable based on the absence of suitable habitat or the distance of Capitol Reef NP to the known or expected range of each species (Appendix C).

The confirmed and reported flora of Capitol Reef NP represents 24.7% of the 3,594 native and naturalized taxa documented for the state of Utah by Welsh et al. (2003) and 60.3% of the state's 151 plant families (Table 3.1). Within Wayne and Garfield counties, the park flora captures 57.3% of the 1,547 taxa reported by Welsh et al. (2003). At the ecoregional scale, Capitol Reef NP contains 52.4% of the 1,694 species reported for the Utah portion of the Colorado Plateau (Shultz et al. 2006).

### 3.2 Life form and biogeographic diversity

Although ecologically dominant, tree and shrub species make up only 19.6% of the confirmed and reported plant taxa of Capitol Reef National Park (Table 3.1). Perennial forbs are the most species-rich life form in the park's flora, with 427 known and reported taxa (48.1% of the total flora). About 18% of the flora is comprised of annual forbs and grass-like plants. Like trees and shrubs, perennial graminoids are ecologically important but relatively species-poor, representing 12.2% of the total flora. The diversity of ferns and fern-allies in Capitol Reef NP is especially low (1.1%) (Table 3.1).

Of the park's 765 native taxa, 599 (78.3%) are widespread across Utah and western North America. Only 27 species (3.5% of the total native flora of the park) have extremely limited global distributions (local endemics found within an area of less than  $1^{\circ}$  of latitude  $\times$   $2^{\circ}$  degrees of longitude; see Appendix A for complete definitions of biogeographic categories). Regional endemics (largely restricted to the Colorado Plateau) com-

prise an additional 15% of the park's native flora (Table 3.1). Disjunct, peripheral, and sparse species make up just 3.1% of the total native flora.

### 3.3 Plants of special concern

With seven listed species, Capitol Reef National Park has the largest number of threatened or endangered plant species of any park unit in the Northern Colorado Plateau Network (Table 3.3). At least 18 additional park taxa were formerly candidates for potential listing (Category 2 or 3C) under the Endangered Species Act (UDWR 1998). Eight of these taxa are currently listed as sensitive by the Utah Bureau of Land Management and U.S. Forest Service. The Utah Division of Wildlife Resources Conservation Data Center (UTCDC) lists 61 taxa from Capitol Reef NP as species of concern (UDWR 1998).

Heil's wild buckwheat (*Eriogonum corymbosum* var. *helii*) was described as a new taxon by James Reveal in 2004 (Flora of North America Editorial Committee 2005) and is apparently restricted to Thousand Lake Mountain in Capitol Reef NP and adjacent Fishlake National Forest. It presently has no legal status but research on its distribution and potential management needs should be considered a high priority. Several recent studies have focused on mapping the distribution of the park's threatened, endangered and sensitive species (Clark 1999a, 1999b, 2001a, 2001b, 2002; Heil et al. 1993), monitoring populations (Fertig et al. 2005 and Capitol Reef references cited therein), and researching pollination biology (Tepedino et al. 2003).

### 3.4 Non-native species and noxious weeds

Introduced plant species (not historically native to Utah or North America) make up 13.8% of the confirmed and reported flora of Capitol Reef National Park (Table 3.1). This figure is comparable to the statewide average of 13.5% non-native species (Fertig 2007; Welsh et al. 2003). Of the 122 introduced plant species confirmed or reported for Capitol Reef NP (Table 3.1), only three—Russian knapweed (*Centaurea repens*), field bindweed (*Convolvulus arvensis*), and quackgrass (*Elymus repens*)—are listed as noxious by the State of Utah (State of Utah Department of Agriculture and Food 2007). Heil et al. (1993) and Dewey and Andersen (2005) conducted surveys of non-native and noxious weeds and mapped the distribution of selected species. Since the mid-1980s, several

eradication efforts have been implemented to contain the spread of five-stamen tamarisk (*Tamarix chinensis*), Russian olive (*Elaeagnus angustifolia*),

and tree-of-heaven (*Ailanthus altissima*) along the Fremont River, Sulphur Creek, and Halls Creek Narrows (Evenden et al. 2002).

**Table 3.3. Plant species of conservation concern from Capitol Reef National Park.**

Family	Species	Common name	TNC global rank	Federal legal status	UTCDC status
Apocynaceae	<i>Cycladenia humilis</i> var. <i>jonesii</i>	Jones' cycladenia	G3G4T2	USFWS: Threatened	Rare, S2
Betulaceae	<i>Ostrya knowltonii</i>	western hop-hornbeam	G3G4		Watch, S2
Boraginaceae	<i>Cryptantha capitata</i>	head cryptanth	G4		Watch, S2?
Cactaceae	<i>Opuntia basilaris</i> var. <i>heilii</i>	Heil's beavertail	G5T2T3		Rare, S1
Cactaceae	<i>Opuntia phaeacantha</i> var. <i>major</i>	large pricklypear	G5T5		Periph., S2S3
Cactaceae	<i>Pediocactus winkleri</i>	Winkler's pincushion cactus	G2	USFWS: Threatened	Rare, S1
Cactaceae	<i>Sclerocactus wrightiae</i>	Wright's fishhook cactus	G2	USFWS: Endangered	Rare, S2
Campanulaceae	<i>Lobelia cardinalis</i> ssp. <i>graminea</i>	cardinal-flower	G5		Periph., S2
Chenopodiaceae	<i>Chenopodium graveolens</i> var. <i>neomexicanum</i>	New Mexico goosefoot	G5T5		Periph., S1
Compositae (Asteraceae)	<i>Aster welshii</i>	Welsh's aster	G2		Watch, S3?
Compositae (Asteraceae)	<i>Chrysothamnus nauseosus</i> var. <i>bigelovii</i> *	Bigelow's rabbitbrush	G5 T3T5Q		Periph., S2
Compositae (Asteraceae)	<i>Cirsium calcareum</i> var. <i>calcareum</i>	Caineville thistle	G4TNR		Tax. Prob., SNR
Compositae (Asteraceae)	<i>Cirsium neomexicanum</i> var. <i>utahense</i>	Utah thistle	G5T3T4		Add. Data, S3?
Compositae (Asteraceae)	<i>Erigeron abajoensis</i>	Abajo daisy	G1G2	USFS Region 4: Sensitive	Add. Data, S1S2
Compositae (Asteraceae)	<i>Erigeron maguirei</i>	Maguire's daisy	G2	USFWS: Threatened	Rare, S2
Compositae (Asteraceae)	<i>Erigeron pumilus</i> var. <i>condensatus</i>	vernal daisy	G4G5 T3T4		Infreq., S2?
Compositae (Asteraceae)	<i>Gnaphalium wrightii</i>	Wright's cudweed	G5		Periph., S2?
Compositae (Asteraceae)	<i>Hymenoxys acaulis</i> var. <i>nana</i>	low hymenoxys	G5T1T2	USFWS: former C2 candidate	Rare, S1S2
Compositae (Asteraceae)	<i>Thelesperma subnudum</i> var. <i>alpinum</i>	alpine greenthread	G5T2	USFS Region 4: Sensitive; BLM (UT): Sensitive; USFWS: former C2 candidate	Rare, S1
Compositae (Asteraceae)	<i>Townsendia aprica</i>	Last Chance townsendia	G2	USFWS: Threatened	Rare, S1
Compositae (Asteraceae)	<i>Xylorhiza confertifolia</i>	Henrieville woodyaster	G2G3	USFWS: former 3C	Watch, S2S3
Cruciferae (Brassicaceae)	<i>Arabis demissa</i>	nodding rock cress	G5T4	USFWS: former 3C	Watch, S2?

**Table 3.3. Plant species of conservation concern from Capitol Reef National Park, cont.**

Family	Species	Common name	TNC global rank	Federal legal status	UTCDC status
Cruciferae (Brassicaceae)	<i>Physaria acutifolia</i> var. <i>purpurea</i>	purple twinpod	G5T2		Rare, S2
Cruciferae (Brassicaceae)	<i>Schoenocrambe barnebyi</i>	Barneby's reed-mustard	G1	USFWS: Endangered	Rare, S1
Euphorbiaceae	<i>Tragia ramosa</i> *	noseburn	G5		Periph., S1
Gramineae (Poaceae)	<i>Andropogon glomeratus</i> var. <i>scabriglumis</i>	bushy bluestem	G5		Periph., S2
Gramineae (Poaceae)	<i>Festuca sororia</i>	ravine fescue	G4		Add. Data, S2
Gramineae (Poaceae)	<i>Panicum oligosanthes</i> var. <i>scribnierianum</i>	Scribner panicgrass	G5T5		Infreq., S2?

Vitaceae	<i>Parthenocissus vitacea</i>	thicket creeper	G5		Periph., S1

This list is derived from Utah Division of Wildlife Resources (1998). All species are confirmed as present and extant unless indicated by "\*" (reported) or "\*\*\*\*" (historical or extirpated).

Codes: **TNC global rank** assesses abundance and conservation priority on a scale of 1–5 (1 being extremely vulnerable and 5 being secure) for full species (G) and varieties or subspecies (T) across their entire range. A "?" indicates uncertainty in the rank, Q = taxonomic questions, U = unknown, and NR = not ranked. A comparable scoring system is used to measure state abundance (S) in Utah under the column UTCDC status.

Under **legal status**, USFWS = US Fish and Wildlife Service. C2 = category 2 candidate (a former category used for taxa that might warrant being proposed for Threatened or Endangered status following additional research). C3 = category 3 candidates (species dropped from consideration for listing). USFS = U.S. Forest Service. BLM = U.S. Bureau of Land Management.

**UTCDC status** includes conservation categories adopted by the state natural heritage program to prioritize endemic and rare plant taxa (Utah Division of Wildlife Resources 1998). These categories include: Historical (presumed extinct or only known historically through their range), Rare (plants with rangewide viability concerns), Watch (regional endemics without rangewide viability concerns), Peripheral (rare or uncommon in Utah, but more common rangewide), Infrequent (plants occur infrequently over western US), Taxonomic Problems (validity of species, subspecies, or variety has been questioned), Additional Data (species appear rare, but more information needed before being assigned to a different category).

## 4 Discussion

Data on the flora of Capitol Reef National Park developed slowly in the early decades of the park's existence, but greatly increased starting in 1970, with the efforts of Ruth Nelson and, later, Susan Meyer. Over 40% of the park's flora (and a large percentage of its rarest species) were discovered during the floristic and vegetation studies of Heil et al. (1993) in the late 1980s. Presently, the documented and reported flora of Capitol Reef National Park stands at 887 taxa (Tables 3.1 and 3.3, Figure 1.3.4, Appendix A). Based on available habitats and proximity, at least another 192 plant taxa may occur within the park (Appendix B). Should all of these potential species be found, the documented flora of the park would increase by

nearly 18%. Many of the "missing" potential or reported taxa consist of cryptic species that flower later in the growing season, or occur in undersampled wetland or weedy habitats. Confirmation of reported species should remain a high priority, as reports for some of these taxa may ultimately prove to be erroneous. Work is especially needed in the upper Deep Creek and Halls Creek drainages, at the extreme northern and southern ends of the park, to confirm species reported by Heil et al. (1993) and Camp (1978) that may actually occur outside the park. Additional studies would also be useful to better refine the abundance and distribution of species of high management interest (especially rare plants and invasive non-natives).

# Appendices

The following appendices contain annotated checklists of the vascular flora of Capitol Reef National Park.

Appendix A lists all species that have been confirmed for the flora with an authenticated voucher specimen (including extant and historical records) or that have been reliably reported for the park in the literature (Dewey and Andersen 2005; Heil et al. 1993; Meyer 1982; NCPN in ed.). Vouchers were examined from the CARE herbarium and collections from Brigham Young University (BRY), Utah State University (USU), the University of Wyoming (RM), and the digital museum database of the New York Botanical Garden (NY). Species entries in Appendix A are organized alphabetically by family and genus.

Appendix B includes species that may potentially occur within Capitol Reef National Park based on the proximity of the park to other populations or the presence of suitable habitat.

Appendix C lists species that have been previously reported for Capitol Reef National Park but are now considered erroneous because they are based on misidentified specimens or questionable literature records.

Appendix D contains the same confirmed, historical, and reported taxa as in Appendix A, but organized by life form rather than by family in order to better meet the needs of NPS interpretive specialists.

The codes and references for each field in the appropriate appendices are summarized below.

## Family (Appendices A, B, C, and D)

Family concepts and nomenclature follow *A Utah Flora* (Welsh et al. 2003). Alternative family names and treatments from other regional floras (Dorn 2001; Flora of North America Editorial Committee 1993, 2002b; Holmgren et al. 2005; Weber and Wittman 2001) are listed in parentheses.

## Species name (Appendices A, B, C, and D)

Nomenclature for scientific names and taxonomic concepts is derived from Welsh et al. (2003). Scientific names are listed in alphabetical rather than phylogenetic order.

## Synonyms/Taxonomic notes (Appendices A, B, and C)

Pertinent synonyms are included for species with alternative scientific names in other recent state and regional floras (Barkworth et al. 2003, 2007; Barneby 1989; Cronquist 1994; Cronquist et al. 1972, 1977, 1984, 1997; Dorn 2001; Flora of North America Editorial Committee 1993, 1997, 2000, 2002a, 2002b, 2003, 2005, 2006a, 2006b, 2006c; Holmgren et al. 2005; Weber and Wittmann 2001). No effort has been made to identify additional synonyms from monographs and floras preceding the early 1970s.

## Common name (Appendices A, B, C, and D)

Common names are derived primarily from Welsh et al. (2003) and the *Intermountain Flora* (Barneby 1989; Cronquist 1994; Cronquist et al. 1972, 1977, 1984, 1997; Holmgren et al. 2005).

## Life form (Appendices A, B, C, and D)

Life form is based on the stature and growth habit of typical members of a species at reproductive maturity. **Trees** are woody perennials with a single stem or trunk and are typically over 3.5 m tall. **Shrubs** are woody perennials with one to many trunks arising from near the base of the plant and are usually less than 3.5 m tall. Perennial Forbs (**PerF**) are broad-leaved dicots or monocots with non-woody stems (at least above ground level) that live for multiple years. Annual Forbs (**AnnF**) are broad-leaved dicots or monocots with non-woody stems that complete their life cycle (mature, flower, and die) in one year. Perennial Graminoids (**PerG**) are linear-leaved, grass-like monocots that live for multiple years. Annual Graminoids (**AnnG**) are linear-leaved, grass-like monocots that complete their life cycle (mature, flower, and die) in one year. Ferns and fern-allies (**Fern**) are non-flowering vascular plants that reproduce by spores.

## Range (Appendices A, B, and C)

Range represents the distribution of a species within Utah and the state's contribution to the plant's overall global range. Disjunct (**Disj**) taxa have their Utah distribution separated from the main, contiguous portion of their range by a gap of more than 800 km (ca 500 miles). Introduced (**Intro**) taxa are those that are not native to Utah or North America but that have become naturalized (breeding on their own without human assistance). Local Endemics (**LocEn**) are taxa

whose entire global range is restricted to an area of less than 16,500 km<sup>2</sup> (ca 6,370 mi<sup>2</sup>, or 1° of latitude × 2° of longitude). Peripheral (**Periph**) taxa have a widespread global distribution but occur at the margin of their contiguous range in Utah and occupy less than 5% of the state's area (usually only within a few miles of the state border). Regional Endemics (**RegEn**) are taxa with a global range of 16,500–250,000 km<sup>2</sup> (an area about the size of the state of Wyoming). Sparse taxa occur widely across Utah or North America, but their range within Utah is small and patchy, with populations restricted to specialized or uncommon habitats. Widespread (**Wide**) taxa have global ranges exceeding 250,000 km<sup>2</sup> and occur over at least 10% of the state.

#### Park status (Appendices A, C, and D)

Park status identifies whether a species is Present (**Pres**), Historical (**Hist**), or Reported (**Rep**) for Capitol Reef National Park. Species are considered Present if a confirmed voucher or documented observation has been made within park boundaries since 1970. Historical species have been confirmed with a voucher from the park but have not been relocated since before 1970. Reported species are listed for the park in the literature (Dewey and Andersen 2005; Heil et al. 1993; Meyer 1982; NCPN in ed.), but have not been corroborated with a voucher specimen. Species that may potentially occur in CARE are listed in Appendix B. Rejected taxa (listed in Appendix C) have either been falsely reported (**FalsRep**) in the literature based on misidentified herbarium specimens or are considered Questionable (**Ques?**) because park reports are from well outside their known or expected range.

#### Pop. size (Appendix A)

Population size refers to the abundance and frequency with which a species occurs within Capitol Reef National Park. Abundance data are derived from Heil et al. (1993), Northern Colorado Plateau Network (in ed.), and personal observations. Abundant (**Abun**) taxa have large populations, have a broad ecological amplitude (often being dominant in one to several vegetation types), or occur extensively across the park. Common (**Com**) taxa have large local populations but may be restricted to a single vegetation type or do not occur across the entire park. Uncommon (**Unc**) taxa have low-to-medium-sized populations, typically have a narrow ecological amplitude (or at least contribute relatively little to total vegetative cover), or have a small range across the park.

Rare taxa usually have low population numbers and are restricted to a single location within the park. A “?” indicates that population size is unknown.

#### Source (Appendix A)

Sources are the evidence for the assigned park status. In the case of Present and Historical taxa, sources are herbarium records (with collector, collection number, and repository) that were corroborated during this study. For reported taxa, the source is a published or unpublished reference citing the species within the park. Specimen repositories include the Capitol Reef National Park herbarium (CARE), Brigham Young University (BRY), Utah State University (USU), New York Botanical Garden (NY), and the University of Wyoming's Rocky Mountain Herbarium (RM).

#### Year doc. (Appendix A)

Year documented indicates the first year in which a species was confirmed or reported to occur in Capitol Reef National Park. This year does not necessarily correspond with the date of the voucher specimen cited under Source. “NA” indicates that the first year is not known (used mostly for “reported” taxa).

#### Comments (Appendices A, B, C, and D)

This column includes additional comments on the status of a particular species in the park, the place of origin for introduced species, legal status, and other data.

#### Nativity (Appendix D)

Nativity indicates whether a species is native to Utah or Introduced (**Intro**), based on Fertig (2007).

#### Flower time (Appendix D)

Flower time refers to the months in which a species is most likely to be in flower. NA indicates a species that is a non-flowering fern or gymnosperm.

#### Habitat (Appendix D)

The distribution of species across generalized habitats in Capitol Reef National Park is indicated by an “x” in the columns SaltDes through Wet and is derived from the Capitol Reef National Park vegetation classification (Northern Colorado Plateau Network, in ed.), Heil et al. (1993), Meyer (1990), and Welsh et al. (2003). SaltDes=Salt desert scrub dominated by shadscale (*Atriplex confertifolia*), Castle Valley salt-

bush (*A. gardneri* var. *cuneata*), and blackbrush (*Coleogyne ramosissima*). Sage=sagebrush grasslands dominated by big sagebrush (*Artemisia tridentata*), fourwing saltbush (*Atriplex canescens*), and rubber rabbitbrush (*Chrysothamnus nauseosus*). PJ=two-needle pinyon (*Pinus edulis*)/Utah juniper (*Juniperus osteosperma*) woodlands/rim-

rock. MixCon=Mixed conifer forests of ponderosa pine (*Pinus ponderosa*) and quaking aspen (*Populus tremuloides*). Wet=wetlands associated with perennial streams, seeps, and hanging gardens. Additional comments are included for species that are restricted to a particular soil/geologic type or are found mostly in disturbed sites.

**Appendix A. Confirmed, historical, and reported vascular plant taxa of Capitol Reef National Park, organized by family and scientific name with taxonomic and biogeographic notes.**

Cactaceae	<i>Opuntia phaeacantha</i> var. <i>major</i>	Vars. not recognized in <i>Flora of North America</i> (2003)	large pricklypear	PerF	Wide	Pres	Com	Fleming 631 (CARE)	1988	
Cactaceae	<i>Opuntia polyacantha</i> var. <i>polyacantha</i>	<i>Flora of North America</i> (2003) includes vars. <i>rufispina</i> & <i>trichophora</i>	plains pricklypear	PerF	Wide	Pres	Abun	Fleming 376 (CARE)	1987	
Cactaceae	<i>Opuntia polyacantha</i> var. <i>rufispina</i>	Included within <i>O. polyacantha</i> var. <i>polyacantha</i> in <i>Flora of North America</i> (2003)	rufous-spine pricklypear	PerF	Wide	Pres	Unc	Harrison 1950 (BRY)	1975	
Cactaceae	<i>Pediocactus simpsonii</i>	Includes vars. <i>minor</i> & <i>simpsonii</i>	Simpson's hedgehog cactus	PerF	Wide	Pres	Unc	Heil 2593 (CARE)	1986	
Cactaceae	<i>Pediocactus winkleri</i>		Winkler's pin cushion cactus	PerF	LocEn	Pres	Rare	Heil 2578 (CARE)	1986	Type locality is E of Capitol Reef, Wayne Co, UT (Winkler s.r. UNM). USFWS: Threatened
Cactaceae	<i>Sclerocactus whipplei</i> var. <i>roseus</i>	<i>S. parviflorus</i> , <i>S. whipplei</i> var. <i>intermedius</i> . Includes <i>S. contortus</i> & <i>S. terrae-canyonae</i>	small-flower fishhook cactus	PerF	Wide	Pres	Unc	Heil 3105 (CARE)	1973	Type locality of <i>S. parviflorus</i> is Glen Canyon, San Juan Co, UT (Clover & Jotter 2398 US)
Cactaceae	<i>Sclerocactus wrightiae</i>		Wright's fishhook cactus	PerF	LocEn	Pres	Unc	Fleming 310 (CARE)	1987	Type locality is San Rafael Ridge, Emery Co, UT (Benson & Benson 16595 POM). USFWS: Endangered
Campanulaceae	<i>Campanula parryi</i>	<i>C. parryi</i> var. <i>parryi</i>	Parry's harebell	PerF	Wide	Pres	Rare	Fleming 168 (CARE)	1986	
Campanulaceae	<i>Lobelia cardinalis</i> ssp. <i>graminea</i>		cardinal-flower	PerF	Periph	Pres	Rare	Heil 2932 (CARE)	1991	
Cannabaceae	<i>Humulus lupulus</i> var. <i>neomexicanus</i>	<i>H. lupulus</i> ssp. <i>americanus</i>	common hops	PerF	Wide	Pres	Unc	Fleming 696 (CARE)	1988	

**Appendix A. Confirmed, historical, and reported vascular plant taxa of Capitol Reef National Park, organized by family and scientific name with taxonomic and biogeographic notes, cont.**

Family	Species name	Synonyms/ Taxonomic notes	Common name	Life form	Range	Park status	Pop. size	Source	Year doc.	Comments
Capparaceae (Cleomaceae)	<i>Cleome lutea</i>		yellow beeplant	AnnF	Wide	Pres	Unc	Swancara 12 (CARE)	1958	
Capparaceae (Cleomaceae)	<i>Cleome serrulata</i>		Rocky Mountain beeplant	AnnF	Wide	Pres	Rare	Porter 4416 (CARE)	1986	
Capparaceae (Cleomaceae)	<i>Cleomella palmeriana</i> var. <i>palmeriana</i>		Palmer's stinkweed	AnnF	RegEn	Pres	Rare	Porter 2434 (BRY)	1971	Type locality is Green River, Emery Co., UT (Jones s.n. POM)
Caprifoliaceae	<i>Lonicera utahensis</i>		Utah honeysuckle	Shrub	Wide	Rep	NA	Heil et al. (1993)	NA	Specimen has not been relocated. Type locality is Cottonwood Canyon, Salt Lake Co., UT (Watson 477 US)
Caprifoliaceae (Adoxaceae)	<i>Sambucus caerulea</i>		blue elderberry	Shrub	Wide	Pres	Unc	Porter 3958 (CARE)	1986	
Caprifoliaceae	<i>Symphoricarpos longiflorus</i>		long-flower snowberry	Shrub	Wide	Pres	Unc	Nelson 9592 (CARE)	1971	
Caprifoliaceae	<i>Symphoricarpos orbiculatus</i>		coralberry	Shrub	Intro	Pres	Unc	Fleming 413 (CARE)	1987	Native to E North America
Caprifoliaceae	<i>Symphoricarpos oreophilus</i> var. <i>utahensis</i>	<i>S. rotundifolius</i> , Includes vars. <i>parishii</i> & <i>oreophilus</i>	mountain snowberry	Shrub	Wide	Pres	Unc	Meyer 4520 (CARE)	1980	
Caprifoliaceae (Adoxaceae)	<i>Viburnum opulus</i>	<i>V. opulus</i> var. <i>americanum</i>	snowball-bush	Shrub	Intro	Pres	Unc	Fleming 260 (CARE)	1987	Native to Eurasia and Africa
Caryophyllaceae (Aislinaceae)	<i>Arenaria fendleri</i>	<i>Eremogone eastwoodiae</i> var. <i>eastwoodiae</i> , <i>A.</i> <i>eastwoodiae</i>	Eastwood's sandwort	PerF	Wide	Pres	Com	Meyer 4749 (CARE)	1981	
Caryophyllaceae (Aislinaceae)	<i>Arenaria fendleri</i> var. <i>glabrescens</i>	<i>A. Kingii</i> ssp. <i>uintahensis</i> , <i>A. Kingii</i> ssp. <i>compacta</i> , <i>A. Kingii</i> ssp. <i>plateauensis</i> ,	basin sandwort	PerF	Wide	Rep	NA	Heil et al. (1993)	NA	Reports from CARE Herbarium based on collections from outside the park.
		<i>Eremogone kingii</i> var. <i>glabrescens</i> , <i>E. Kingii</i> var. <i>uintahensis</i>

Solanaceae	<i>Physalis hederifolia</i> var. <i>P. hederifolia</i> var. <i>cordifolia</i> , <i>P. hederaefolia</i> var. <i>fendleri</i>		Fendler's ground-cherry	PerF	Wide	
Umbelliferae (Apiaceae)	<i>Angelica pinnata</i>		pinnate angelica	PerF	Wide	Type locality is Uinta Mountains, Summit Co, UT (Watson 458 GH)
Umbelliferae (Apiaceae)	<i>Berula erecta</i> var. <i>indisa</i>		cutleaf water-parsnip	PerF	Wide	
Umbelliferae (Apiaceae)	<i>Cymopterus newberryi</i>		sticky spring-parsley	PerF	RegEn	
Umbelliferae (Apiaceae)	<i>Heracleum lanatum</i>	<i>H. maximum</i> , <i>H. sphondylium</i> var. <i>lanatum</i> , <i>H. sphondylium</i> ssp. <i>montanum</i>	cow parsnip	PerF	Wide	
Umbelliferae (Apiaceae)	<i>Ligusticum filicinum</i>		fernleaf ligusticum	PerF	Wide	Type locality is Uinta Mountains, Summit Co, UT (Watson 454 GH)
Urticaceae	<i>Parietaria pensylvanica</i>		Pennsylvania pellitory	AnnF	Wide	Reports from CARE Herbarium based on collections from outside the park.
Valerianaceae	<i>Valeriana edulis</i>		tobacco-root	PerF	Wide	
Valerianaceae	<i>Valeriana occidentalis</i>		western valerian	PerF	Wide	

Note: The vascular plant species listed in this table are known from the vicinity of Capitol Reef National Park in Wayne, Garfield, Emery, and Sevier counties, Utah, but have not previously been reported or confirmed for the park. Species on this list are derived from a checklist of potential species for NCPN parks prepared by Dr. N. Diane Atwood of Brigham Young University in 2001, and the *Atlas of the Vascular Flora of Utah* (Albee et al. 1988). Some species from Appendix C could be considered as potentially occurring in the park, but are not included here.

**Appendix C. Rejected (falsely reported or questionable) taxa of Capitol Reef National Park.**

Family	Species name	Synonyms/ Taxonomic notes	Common name	Life form	Range	Park status	Comments	
Amaranthaceae	<i>Amaranthus powelli</i>	Powell's amaranth	AnnF	Sparse	FalsRep	Reports from CARE Herbarium based on misidentified specimens of <i>A. retroflexus</i> .		
Boraginaceae	<i>Cryptantha barbigera</i>	bearded cryptanth	AnnF	Periph	FalsRep	Reports from CARE herbarium are based on misidentified specimens of <i>C. crassisepala</i> var. <i>elachantha</i> . Type locality is St. George, Washington Co, UT (Parry 171 GH).		
Boraginaceae	<i>Cryptantha decipiens</i>	beguiling cryptanth	AnnF	Periph	FalsRep	Reports from CARE herbarium are based on misidentified specimens of <i>C. crassisepala</i> var. <i>elachantha</i> .		
Boraginaceae	<i>Cryptantha johnstonii</i>	Johnston's cryptanth	PerF	LocEn	FalsRep	Reports from CARE herbarium are based on misidentified specimens of <i>C. confertiflora</i> . Type locality is Huntington Road, ca 15 mi W of US 506, Emery Co, UT (Higgins 1310 BRY). USFWS: 3C.		
Boraginaceae	<i>Cryptantha tenuis</i>	slender cryptanth	PerF	RegEn	FalsRep	Reports from CARE herbarium are based on misidentified specimens of <i>C. abata</i> and <i>C. flavoculata</i> . Type locality is Courthouse Wash, Grand Co, UT (Eastwood s.n. CAS).		
Caryophyllaceae (Aisinaeae)	<i>Cerastium nutans</i>	nodding chickweed	AnnF	Sparse	FalsRep	Reports from CARE herbarium are based on misidentified specimens of <i>C. fontanum</i> .		
Caryophyllaceae	<i>Silene verecunda</i> ssp. <i>andersonii</i>	Vars. not recognized in <i>Flora of North America</i> (2005)	shy campion	PerF	Periph	Reports from CARE Herbarium are based on misidentified specimens of <i>Lychnis drummondii</i> .		
Chenopodiaceae	<i>Atriplex gardneri</i> var. <i>utahensis</i>	<i>A. tridentata</i> var. <i>robusta</i>	basin saltbush	Shrub	Wide	FalsRep	Reports from CARE Herbarium are based on misidentified specimens of <i>A. canescens</i> var. <i>canescens</i> . Type locality of var. <i>utahensis</i> is Salt Lake City, Salt Lake Co, UT (Jones 1760 POM).	
Chenopodiaceae	<i>Atriplex patula</i>	spear orach	AnnF	Sparse	FalsRep	Reports from CARE herbarium are based on misidentified specimens of <i>A. prostrata</i> .		
Chenopodiaceae	<i>Atriplex rosea</i>	tumbling orach	AnnF	Intro	FalsRep	Reports from CARE herbarium are based on misidentified specimens of <i>A. truncata</i> . Also Reported by Northern Colorado Plateau Network (in ed.). Native to Eurasia.		
Chenopodiaceae	<i>Chenopodium botrys</i> <i>Dysphania botrys</i>	Teloxys botrys, <i>Dysphania botrys</i>	Jerusalem-oak	AnnF	Intro	FalsRep	Reports from CARE herbarium are based on misidentified specimens of <i>C. graveolens</i> var. <i>neomexicanum</i> . Native to Eurasia.	
Compositae (Asteraceae)	<i>Ambrosia artemisiifolia</i>	common ragweed var. <i>elatior</i>	AnnF	Wide	FalsRep	Reports from CARE Herbarium based on misidentified specimens of <i>A. acanthicarpa</i> .

Type locality is Mammoth Creek, Markagunt Plateau, Garfield Co., UT (Jones 6026b US).
Scrophulariaceae	<i>Penstemon marcusii</i>		Marcus Jones' penstemon	PerF	LocEn	FalsRep	Reports from CARE Herbarium are based on misidentified specimens of <i>P. ophianthus</i> . Type locality is near Price, Carbon Co., UT (Jones s.n. POM).
Scrophulariaceae	<i>Penstemon platyphyllus</i>		broadleaf penstemon	PerF	LocEn	FalsRep	Reports from CARE Herbarium are based on misidentified specimens of <i>P. pachyphyllus</i> var. <i>congestus</i> . Type locality is Cottonwood Canyon, Salt Lake Co., UT (Watson 787 GH).
Scrophulariaceae	<i>Penstemon strictiformis</i>		Natural Bridges penstemon	PerF	RegEn	FalsRep	Reports from CARE Herbarium are based on misidentified specimens of <i>P. scariosus</i> var. <i>scariosus</i> . Also reported by Northern Colorado Plateau Network (in ed.).
Scrophulariaceae	<i>Penstemon virgatus</i>		upright blue penstemon	PerF	RegEn	FalsRep	Reports from CARE Herbarium are based on misidentified specimens of <i>P. ophianthus</i> . Not native to Utah.
Umbelliferae (Apiaceae)	<i>Lomatium nuttallii</i>	<i>L. megarrhizum</i> , <i>Aletes nuttallii</i>	Nuttall's desert parsley	PerF	RegEn	FalsRep	Reports from CARE Herbarium based on misidentified specimens of <i>L. junceum</i> . This species is not known from Utah, but is native to Wyoming and Nebraska.

**Appendix C. Rejected (falsely reported or questionable) taxa of Capitol Reef National Park, cont.**

Family	Species name	Synonyms/ Taxonomic notes	Common name	Life form	Range	Park status	Comments
Umbelliferae (Apiaceae)	<i>Lomatium scabrum</i> var. <i>scabrum</i>		rough lomatium	PerF	RegEn	FalsRep	Reports from CARE Herbarium are based on misidentified specimens of <i>L. parryi</i> . Type locality is Frisco, Beaver Co., UT (Jones 1864 US).
Umbelliferae (Apiaceae)	<i>Osmorrhiza chilensis</i>	<i>O. berteroii</i>	Chilean sweet-cicely	PerF	Wide	FalsRep	Reports from CARE Herbarium are based on misidentified specimens of <i>O. depauperata</i> .
Violaceae	<i>Viola canadensis</i>	<i>V. canadensis</i> var. <i>rugulosa</i> , <i>V.</i> <i>scopulorum</i> , <i>V.</i> <i>nydbergii</i>	Canadian white violet	PerF	Wide	FalsRep	Reports from CARE Herbarium based on misidentified specimens of <i>V. adunca</i> . Also reported by Northern Colorado Plateau Network (in ed.).

The vascular plant species listed in this report have been reported for Capitol Reef National Park from published and unpublished literature (Heil et al. 1993, Meyer 1982, Northern Colorado Plateau Network, in ed.) or from herbarium specimens, but are now believed to be erroneous because of misidentifications (False Reports or FalsRep) or because the park is well outside the known or expected range of the species (Questionable or Ques?).
