

VEGETATION SURVEY OF CENTRAL NEPAL

by

Hiroo Kanai, Pushpa Ratna Shakya, and Tirta Bahadur Shrestha

In 1970, we performed a series of vegetation survey on various types of forests in various places of central Nepal. Our purpose was to make clear quantitatively the change of vegetational compositions in central Nepal from south to north. Such a survey has not hitherto been done in Nepal, though many observations on vegetation have been reported. This paper deals with a part of the results of our survey.

We wish to express our gratitude to Dr. P. R. Pande, Department of Forest and Dr. P. N. Suwal, Director, Department of Medicinal Plants, both in H.M.G. of Nepal, who conducted this vegetation survey. Thanks are also due to Dr. T. Suzuki, Oita University, Japan, for his kind advice on our field work. This work is a part of the technical aid provided by the Government of Japan to His Majesty's Government of Nepal.

Method of Survey

The places we surveyed were selected in the belt crossing central Nepal south to north through Kathmandu in order to study the climatic correlation of vegetation in central Nepal (Fig. 79 and Table 1). The sample plots were carefully selected to represent the typical natural forest. The size of quadrat was usually 10 m × 10 m for tree layers, and at most 6 quadrats were laid side by side if the

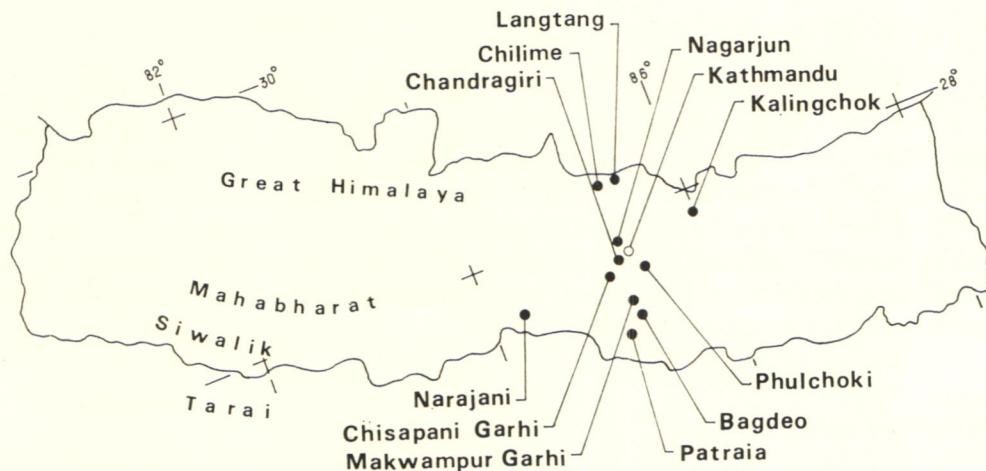

Fig. 79. Surveyed Plots.

circumstances allowed. Sometimes, a 20 m × 20 m quadrat was used when the 1st layer was very high and the place was horizontal. Three 1 m × 1 m quadrats were laid in each larger quadrat to survey the herb layer. The composing species in each quadrat were identified at the place as far as possible. Otherwise, the sample was numbered and taken to our laboratory for identification. We tried to collect good specimens of plants in the quadrat for future proof, but sometimes failed to get them because the height of the tree was too great or flower or fruit was out of season. Coverage of each species in each layer was recorded with ten-graded number corresponding to each ten percent. Altitude of the plot was measured with a Thomen Altitude Meter. Exposure and gradient of the plot were measured with a clinometer. Height of tree layers was measured with a Topcon Hypsometer K-type. Light intensity was measured with a Seconic Auto-leader III and was recorded in light value at ASA 100 as we did not have a meter with lux scale. Relative light intensity was calculated by the following formulae:

$$\log R = 2 - 0.301d \quad R \dots \text{Relative light intensity (\%)} \\ d = b - c \quad b \dots \text{Light value outside the forest} \\ c \dots \text{Light value inside the forest}$$

Measurement of light intensity was sometimes impossible because of bad or changeable weather or because we could not find an open place outside the forest nearby. Girth of tree trunks at breast height was measured with a measuring tape. Basal Area (BA) and its percentage of land area (BAR) were calculated by the following formulae:

$$BA = \frac{1}{4\pi} \times \left(\sum_{n=1}^p G_{an}^2 + \sum_{n=1}^q G_{bn}^2 + \sum_{n=1}^r G_{cn}^2 + \dots \right) \\ G \dots \text{Girth at breast height in cm} \\ a, b, c \dots \text{Species} \\ n \dots \text{Individual number of each species} \\ BAR = \frac{BA}{\text{Size of surveyed area in } cm^2} \times 100$$

Our difficulty was in finding good natural forests. In most cases, the forest floor was quite disturbed by grazing or clearing of litter by villagers. In other cases, there was no place without a single stump and sometimes the forest floor had evidence of a past fire. In the middle altitudes, we could not find even a single patch of forest because of extensive cultivation. In the alpine zone, summer grazing strongly affected the vegetation. Actually, it was impossible to find a sample plot with natural conditions, and consequently, we had to survey the plots that we believed to be least affected.

Forest Types

i) *Shorea robusta* forest

Forest of *Shorea robusta* covered the lower elevation of the Himalayan foothill and the Gangetic Plain. *Shorea robusta* was overwhelming everywhere. The 2nd

layer of the forest was not developed. Two types of *Shorea* forest, montane and plain, could be distinguished:

1) Plain *Shorea robusta* forest

This forest was observed widely in the Terai area and at the foot of Siwalik hills up to 300 m in altitude. Coverage of the 1st layer was quite dense. *Bauhinia Vahlii* and *Combretum decandrum* were common climbers.

The undergrowth consisted of many species. Among them, the prominent species were *Sterculia villosa* and *Imperata cylindrica* in Patraia and *Clerodendrum infortunatum* in Narajani. *Sterculia* was likely to appear in damper places than *Clerodendrum*. Seedlings of *Shorea robusta* were common though the coverage was scarce.

2) Montane *Shorea robusta* forest

This forest covered the hilly areas of Siwalik hills from 200 m to 1000 m in altitude. Composition of the 1st layer was similar to that of the plain *Shorea* forest but the proportion of *Shorea* was much greater at higher elevations especially on the south-facing slopes. The shrub layer was dominated by *Phoenix humile* and the herb layer by *Carex cruciata*. Seedlings of *Dendrocalamus* sp. dominated on north-facing slopes in place of *Carex cruciata*.

ii) Other Forest Types in Plain Region

1) *Terminalia tomentosa* forest

In depressed places that are marshy in the rainy season, *Shorea robusta* was reduced its number and *Terminalia tomentosa* and *Carryea arborea* increased. As undergrowth, neither shrub nor herb layers was developed well.

2) *Acacia eburnea* forest

Successional process from the diluvial plain to *Shorea* forest was of much interest. In some places, *Acacia ebrunea* was the first settler. Undergrowths were weedy; *Elsholzia* sp. occupied most part of the shrub layer, and *Ageratum conizoides* dominated in the herb layer. *Dalbergia* sp. was the first settler in other place. There were several intermediate types between *Acacia* or *Dalbergia* forests and *Shorea* forests, though they were not surveyed at this time.

iii) *Schima wallichii* forest

Schima wallichii forests are located above the montane *Shorea* forest. Around Makwanpur Garhi, at 800–900 m altitude, *Shorea* forests were observed on south- and east-facing slopes and *Schima* forests on north- and west-facing slopes. Coverage of the 1st layer was 60–80 %. *Castanopsis tribuloides*, *Machilus duthiei*, *Juglans regia*, *Quercus spicata*, etc., had larger proportions in some quadrats, though they were not common. The second layer was negligible. The shrub layer was not developed well, though it consisted of a fairly large number of species. The herb layer was developed in Makwanpur Garhi (Plot No. 77) and Nagarjun lower plots (Plot Nos. 1–3). *Carex* sp. and mosses were dominant in the former plot but there was no commendable dominant species in the latter. The difference may be partly due to the difference of the time of survey. On the other hand, the herb layer was not developed well in the Nagarjun higher plot (Plot No. 4). The upper limit of the *Schima* forests was 1800–1900 m in altitude.

A forest of *Juglans regia* was developed on the north-facing concave slope (Plot

No. 2). It was considered as a local modification of the *Schima* forest affected by topography.

iv) *Pinus* forest

This is a localized forest on south-facing slopes in lower to middle altitudes up to 2000 m. *Pinus roxburghii* and *P. griffithii* were the dominant species. The former appeared at lower elevations than the latter. Subsidiary components were usually negligible. But in Nagarjun (Plot No. 9), there was a second layer consisting purely of *Schima wallichii*, suggesting the succession to *Schima* forest from *Pinus*. The forest floor was covered with litter and well grazed. The shrub layer was not well developed. In the herb layer, the dominant species was *Pogonatherum panicum* in *Pinus roxburghii* forests and *Selaginella involvens* in *P. griffithii* forests.

v) Evergreen Oak forest

Generally, this type of forests developed on the north- or west-facing slopes. The south-facing slope was usually occupied by *Quercus semecarpifolia*, *Rhododendron arboreum* or *Quercus lanuginosa* forests. The lower limit of this forest was probably 1700 m in altitude. *Q. lineata* was common in most of the forests; *Q. glauca* was subsidiary, and *Q. lamellosa* was dominant at a certain place. The second layer had considerable coverage but the composing species were different from place to place. The shrub layer was fairly dense, *Listea pulcherrima* and *Machilus* sp. being most common. Usually they were the sprouts from cut stumps suggesting human disturbance. Another fairly common species was *Arundinaria maling*, though its coverage was quite scarce. The herb layer was dense. *Oplismenus compositus* was dominant in Chisapani Garhi, *Strobilanthes atropurpureus* and *Carex cruciata* in Phulchoki and *Ainsliaea pteropoda* in Chandragiri.

vi) Various types of broad-leaved forests

Local substitutions for evergreen oak forests consisting of broad-leaved species were observed in several places. The dominant species was different from place to place. *Machilus duthiei* was dominant in Plots No. 8 and 49, *Lindera bifaria* in Plot No. 34, and *Symplocos pyrifolia* in Plots No. 103–105. *Carpinus viminea* was dominant in the secondary forest developed after disturbance (Plot No. 67). *Sarcococca hookeriana* was dense in several plots as a shrub component. The herb layer was usually well developed and *Carex* spp. were dominant in most places.

vii) *Quercus semecarpifolia* forest

This forest was widely observed from 2000 to 3000 m in altitude. The 1st layer was dense and consisted exclusively of *Q. semecarpifolia*. The 2nd layer was not developed well, but it was denser in the lower than in the higher altitude. The shrub layer showed similar features and tendencies in different plots, though it did not have apparent dominant species, but *Arundinaria* increased at lower altitudes. The herb layer consisted of an average of 10 species and was dense. The dominant species were different in different plots. They were *Athyrium* sp. and *Ainsliaea pteropoda* in Chilime, *Bistorta amplexicaulis* and *Strobilanthes nutans* in Langtang, *Strobilanthes atropurpureus* in Phulchoki and *Hedychium ellipticum* in Chandragiri. This forest mixed with evergreen oak forests at lower altitudes and with *Tsuga*

dumosa forests at higher altitudes.

viii) Dry Forest

There were two types of dry forest on the south- or west-facing slopes, in which *Rhododendron arboreum* forests were rather widespread, and *Quercus lanuginosa* forests were quite localized. A forest dominated by *Lyonia ovalifolia* was observed in Plot No. 98. It was considered as a variety of *Rhododendron arboreum* var. *campbelliae* forest.

1) *Rhododendron arboreum* forest

The altitude of this forest was the same as that of evergreen oak forest but this developed usually on south- or west-facing slopes. The forests were disturbed very much by human activity. *R. arboreum* formed the dense 1st layer, *Lyonia ovalifolia* was observed very sparsely in the forests. The average height of the 1st layer was 8–9 m and there was no 2nd layer. The shrub layer consisted of many species in which *Myrsine semiserrata*, *Daphne bholua*, *Eurya acuminata*, or *Arundinaria maling* was dominant from place to place. The herb layer was fairly well developed.

2) *Quercus lanuginosa* forest

This forest was localized on south- or west-facing steep slopes in the *Schima* and evergreen oak forest zones. The 1st layer consisted exclusively of *Quercus lanuginosa*. The 2nd layer was negligible in Nagarjun, but it was fairly developed in Phulchoki, consisting of *Lyonia ovalifolia*, *Quercus glauca* and *Rhododendron arboreum*. The shrub layer was scattered and did not have any dominant species. The herb layers were 30–50% in coverage. In Nagarjun, there was no dominant species, though there was an average of 11 species. On the other hand, in Phulchoki, the herb layer consisted of 6 species in average and *Ainsliaea pteropoda* dominated.

ix) *Abies spectabilis* forest

Abies forests were abundant from 3000 m to 3300 m. They were considerably disturbed especially near villages or kharkas as the timbers were used for house building. The 1st layer consisted solely of *Abies spectabilis*. *Rhododendron arboreum* var. *campbelliae* was common as the 2nd layer, but *R. barbatum* was much more abundant and denser in Plot No. 54. *Daphne bholua* was common as shrubs in most of these forests. In the herb layer, *Elatostema obtusa*, *Carex* spp. and mosses were common and abundant.

x) *Tsuga dumosa* forest

Tsuga forests appeared near the lower limit of *Abies* forests in some places from 2700 m to 3000 m in altitude. In Plot No. 32, which was the only *Tsuga* forest surveyed in this report, the 2nd layer consisted of *Ilex dipyrena*. The shrub layer was scanty, but *Pieris formosa* was frequent. The herb layer was quite dense. *Strobilanthes* sp. was abundant with 30% coverage, and *Carex* sp. and mosses were subsidiary.

xi) *Juniperus* forest

Juniperus recurva was sometimes mixed in *Abies spectabilis* forests. In Gosainkund region, it formed a pure forest with a 30 m high crown with *Rhododendron* spp. in the 2nd layer. Plot No. 55 was located at the foot of a hill covered with an *Abies*

forest. The second and shrub layers were lacking but the herb layer was dense. Mosses were dominant, and *Strobilanthes atropurpureus* was subsidiary. *Elatostema obtusa* showed considerable coverage.

xii) *Rhododendron arboreum* var. *campbelliae* forest

This forest developed from 2900 m to 3300 m in altitude. The crown was dense and *Rhododendron arboreum* var. *campbelliae* was the only dominant species. It also formed the 2nd layer in *Abies spectabilis* forests. Where places were once fired, such as Plot No. 112, *Rhododendron arboreum* var. *campbelliae* formed a dense 'crown' and *Abies* formed a very scattered 1st layer above it. In Chilime, *Arundinaria* sp. was observed as the shrub layer, and the herb layer was hardly developed. In Kaling-chok, on the other hand, the shrub layer was hardly developed, and the herb layer was quite dense dominated by *Elatostema obtusa* with subsidiary mosses and *Carex*.

xiii) *Rhododendron campanulatum* forest

This forest was frequently found as the 2nd layer of *Abies spectabilis* forests near its upper limit, but generally it formed a dense thicket on the timber line. The forest did not have the 2nd and shrub layers. In the herb layer, mosses dominated

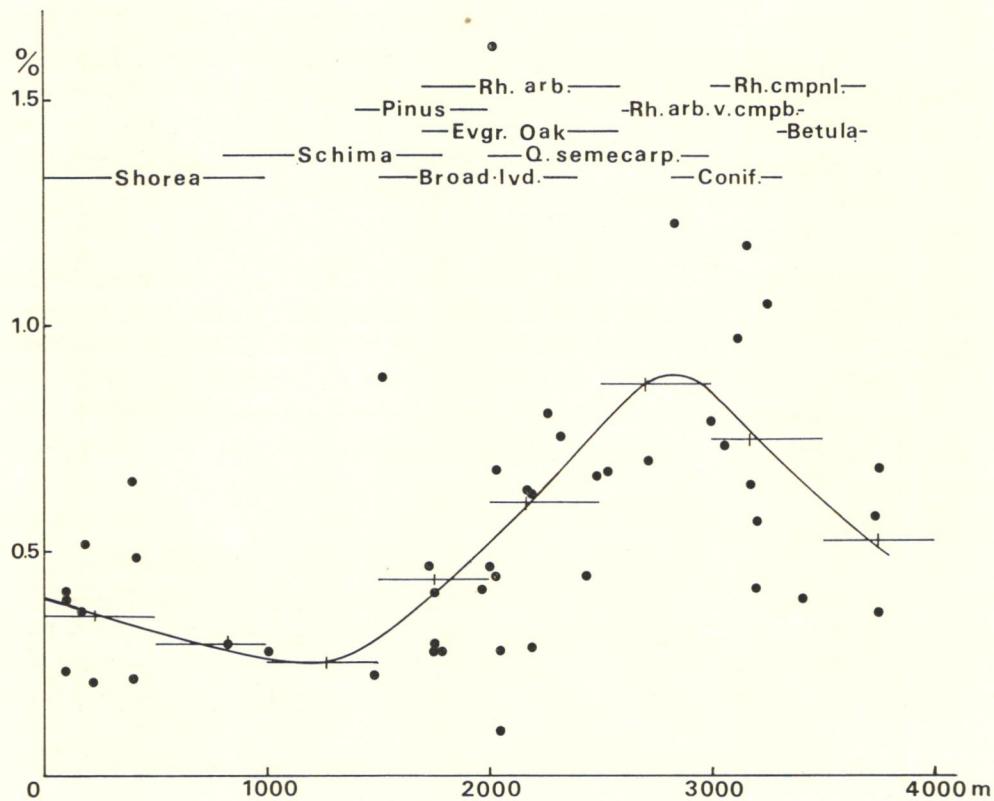

Fig. 80. Altitudinal distribution of the percentage of basal areas (BAR) and principal forest types. The horizontal bars crossed by a short line indicate the average basal area and the average altitude of plots for every 500 m.

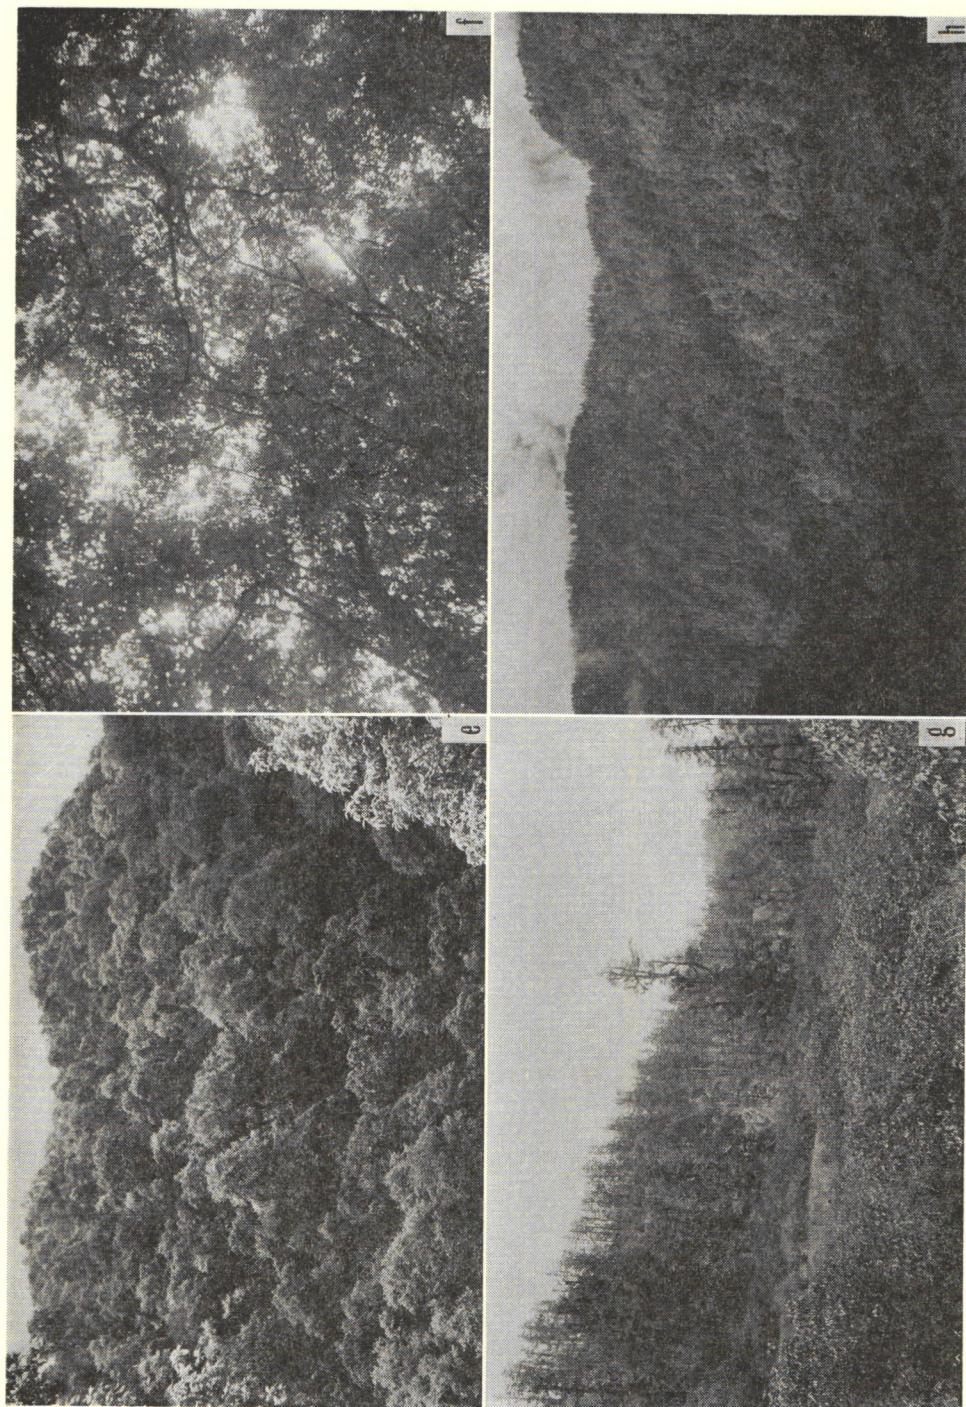

Fig. 82. e. Mixed broad-leaved forest. Nagarjun, 2000 m. f. Mixed broad-leaved forest. Para Gaon, 2400 m. g. Forest of *Abies spectabilis* and scrub of *Rhododendron campanulatum*. Tingoang, 3200 m. h. *Abies spectabilis* forest. Kalingchok, 3600 m.

in most places, but *Carex cruciata* dominated at lower altitudes. This type of forest was observed from 3000 m to 3700 m in altitude.

xiv) *Betula utilis* forest

This forest was observed in the zones of *Rhododendron arboreum* var. *campbelliae* forest and *Abies spectabilis* forest and was localized on north-facing slopes where the ground was filled with huge rocks. Coverage of the 1st layer was 80% in average consisting exclusively of *Betula utilis*. The second layer was lacking. The shrub layer mainly consisted of *Sorbus foliolosa*, *Lonicera* sp. and *Rhododendron campanulatum* in Langtang and of *Arundinaria* sp. in Kalingchok. Mosses dominated as ground cover everywhere; *Cacalia quinqueloba* was prominent in Langtang, and *Bistorta affinis* and *Senecio pteropodus* in Kalingchok.

Basal Area

The basal areas of various forest types from the subtropical to subalpine were surveyed for the first time in Nepal. They are shown in Table 57 and Fig. 80. The basal areas for every 500 m elevation are shown in Table 58. As it is clear in Fig. 80, the BAR has its maximum at ca. 3000 m alt. with a value of about 0.9%. The minimum of BAR is observed at ca. 1200 m with a value of about 0.25%. After this minimum, BAR shows a gradual increase toward lower altitudes. This phenomenon was first observed by our survey, though it is not certain whether this minimum is the result of human activity or natural tendencies because the number of plots surveyed was insufficient.

Table 1. List of surveyed plots and their environmental conditions arranged by numerical order of plot number.
 (Size of quadrat 10m x 10m. 20m x 20m for the plots with double asterisk (**))

| Plot No. | Quadrat No. | Date/ Month in 1970 | Altitude m | Exposure | Gradient | Relative Light Intensity % | Place Name | Forest Type | Remarks |
|----------|-------------|---------------------------|---------------|----------|----------|-------------------------------------|-----------------|----------------------------------|---|
| 1 | 7 | 24/4 | 1530 | S75E | 40 | 57 | Nagarjun | <i>Schima</i> | Soil dried, hard, light brown with less humus. |

| <i>Lonicera purpurascens</i> | (10, 10, 12), (13, 22, 11, 10, 8), (10, 9, 12) | 1607 | 2.5 |
| <i>Sorbus foliolosa</i> | (30, 10), 15, (11, 5) | 1371 | 2.1 |
| | Total & Basal Area % | 64731 | 0.5079 |
| Plot No. 35, 10m x 10m x 2, alt. 3750m | | | |
| <i>Betula utilis</i> | 56, 146, 56, 16, 57, 65, 54, 93, 63, 88, (78, 43), 98, 67 | 80622 | 90.5 |
| <i>Sorbus foliolosa</i> | 33, 32, (40, 17), (39, 11), (19, 12), (44, 10), 17 | 8474 | 9.5 |
| | Total & Basal Area % | 89096 | 0.3647 |
| Plot No. 36, 10m x 10m x 1, alt. 3750m | | | |
| <i>Betula utilis</i> | 133, 143, 175, 103 | 79372 | 91.8 |
| <i>Rhododendron campanulatum</i> | (17, 11), 17, 12, (12, 11), (31, 31), (28, 33, 34) | 6059 | 7.0 |
| <i>Lonicera purpurascens</i> | 12, (13, 14, 14), (11, 8, 8, 7) | 1003 | 1.2 |
| | Total & Basal Area % | 86434 | 0.6882 |

Table 58. Relative Basal Area in Every 500m Elevation.

| Sector (m alt.) | Number of Surveyed Plot | Average Altitude of Surveyed Plots | Average Relative Basal Area (%) |
|-----------------|-------------------------|------------------------------------|---------------------------------|
| 0 | | | |
| 500 | 9 | 231 | 0.3564 |
| 1000 | 2 | 820 | 0.2920 |
| 1500 | 1 | 1265 | 0.2530 |
| 2000 | 7 | 1750 | 0.4323 |
| 2500 | 13 | 2172 | 0.6019 |
| 3000 | 3 | 2700 | 0.8694 |
| 3500 | 9 | 3178 | 0.7487 |
| 4000 | 3 | 3750 | 0.5203 |
