

***Oldenlandia uniflora* L.**

Current status: N
Proposed status: PE

Submitted by: Tim Block and Ann Rhoads, Morris Arboretum, March 2010

Synonym: *Hedyotis uniflora* (L.) Lam. (Gleason and Cronquist 1991)

Habitat: wet soil of the Coastal Plain

Range: Long Island, NY to FL and TX and inland to MO

Description: spreading branched annual with sessile, alternate leaves; stems and leaves villous; flowers white, 2 mm wide; fruit a capsule with numerous small, angular seeds.

Pennsylvania Status: none, not previously known to be present in the state; we found it at Delhaas Woods, the largest remaining example of coastal plain habitat in PA (Rhoads, Spitz, and Meager, Delhaas Woods powerline right-of-way, 10/ 13/2009 - MOAR).

Identification Problems: none

Status in Other States: S1 in NY, KY, and MO; S2 in NC; S3 in NJ and MD; S4 in DE and VA

Global Status: G5

Rationale for Change: This species is a new state record; because it is a Coastal Plain species we suggest PE.
