

PROCEEDINGS OF THE OCEAN DRILLING PROGRAM

VOLUME 114 SCIENTIFIC RESULTS SUBANTARCTIC SOUTH ATLANTIC

Covering Leg 114 of the cruises of the Drilling Vessel *JOIDES Resolution*,
East Cove, Falkland Islands, to Port Louis, Mauritius, Sites 698-704,
11 March 1987-13 May 1987

Paul F. Ciesielski, Yngve Kristoffersen, Bradford Clement,
Jean-Pierre Blangy, Robert Bourrouilh, Jason A. Crux, Juliane M. Fenner,
Philip N. Froelich, Ernest Hailwood, David Hodell, Miriam E. Katz,
Hsin Yi Ling, Jürgen Mienert, Daniel Müller, C. Jonathan Mwenifumbo,
David C. Nobes, Marisa Nocchi, Detlef A. Warnke, and Frances Westall
Shipboard Scientists

Bradford Clement
Shipboard Staff Scientist

Editorial Review Board:
Paul F. Ciesielski, Yngve Kristoffersen, Bradford Clement, Ted C. Moore

Prepared by the
OCEAN DRILLING PROGRAM
Texas A&M University

Elsa Kapitan Mazzullo
Volume Editor

in cooperation with the
NATIONAL SCIENCE FOUNDATION
and
JOINT OCEANOGRAPHIC INSTITUTIONS, INC.

This publication was prepared by the Ocean Drilling Program, Texas A&M University, as an account of work performed under the international Ocean Drilling Program, which is managed by Joint Oceanographic Institutions, Inc., under contract with the National Science Foundation. Funding for the program was provided by the following agencies at the time of this cruise:

Department of Energy, Mines and Resources (Canada)

Deutsche Forschungsgemeinschaft (Federal Republic of Germany)

European Science Foundation Consortium for the Ocean Drilling Program (Belgium, Denmark, Finland, Iceland, Italy, Greece, the Netherlands, Norway, Spain, Sweden, Switzerland, and Turkey)

Institut Français de Recherche pour l'Exploitation de la Mer (France)

National Science Foundation (United States)

Natural Environment Research Council (United Kingdom)

University of Tokyo, Ocean Research Institute (Japan)

Any opinions, findings, and conclusions or recommendations expressed in this publication are those of the author(s) and do not necessarily reflect the views of the National Science Foundation, the participating agencies, Joint Oceanographic Institutions, Inc., Texas A&M University, or Texas A&M Research Foundation.

It is recommended that reference to the whole or to part of this volume be made in one of the following forms, as appropriate:

Ciesielski, P. F., Kristoffersen, Y., et al., 1991. *Proc. ODP, Sci. Results*, 114: College Station, TX (Ocean Drilling Program).

Ciesielski, P. F., 1991. Biostratigraphy of diverse silicoflagellate assemblages from the early Paleocene to early Miocene of Holes 698A, 700B, 702B, and 703A: subantarctic South Atlantic. In Ciesielski, P. F., Kristoffersen, Y., et al., *Proc. ODP, Sci. Results*, 114: College Station, TX (Ocean Drilling Program), 49–96.

Effective Publication Dates of ODP *Proceedings*

According to the International Code of Zoological Nomenclature, the date of publication of a work and of a contained name or statement affecting nomenclature is the date on which the publication was mailed to subscribers, placed on sale, or when the whole edition is distributed free of charge, mailed to institutions and individuals to whom free copies are distributed. The mailing date, *not the printed date*, is the correct one.

The mailing dates of recent *Proceedings of the Ocean Drilling Program* are as follows:

Volume 127 (*Initial Reports*): September 1990

Volume 128 (*Initial Reports*): September 1990

Volume 129 (*Initial Reports*): December 1990

Volume 115 (*Scientific Results*): September 1990

Volume 116 (*Scientific Results*): September 1990

Volume 117 (*Scientific Results*): February 1991

Distribution

Copies of this publication may be obtained from Publications Distribution Center, Ocean Drilling Program, 1000 Discovery Drive, College Station, Texas 77845-9547. Orders for copies will require advance payment. See current ODP publication list for price and availability of this publication.

Library of Congress 87-642-462

Foreword

By the National Science Foundation

The scientists of the Ocean Drilling Program (ODP) have embarked on what could prove to be one of the most important earth science initiatives of the decade—an initiative rivaling in scope and impact the exploration of the frontiers of outer space. The program explores our planet's last frontier—the Earth's structure and history as it is revealed beneath the oceans. The scope of the program's scientific goals excites the imagination, challenges the intellect, and enhances the spirit of cooperation among peoples in countries around the world.

Between 1872 and 1876, HMS *Challenger* undertook the world's first major oceanographic expedition. That expedition greatly expanded man's knowledge of the world's oceans and revolutionized our ideas about planet Earth. From 1968 to 1983, another ship named *Challenger* logged more than 375,000 miles on 96 voyages across every ocean for the Deep Sea Drilling Project (DSDP), operated by Scripps Institution of Oceanography. Among the project's many remarkable discoveries were the confirmation of seafloor spreading and the establishment of the relative youth of the seafloor, thus verifying the dynamic and changing nature of the Earth's crust.

Today, the Ocean Drilling Program, which began in 1983, brings new resources to bear on scientific ocean drilling. A new drillship is in operation—the *JOIDES Resolution*—one of the world's most modern and best equipped drillships with enhanced capability for drilling and coring in polar areas and rough weather, expanded laboratory space, facilities for more scientists, and a major drill-hole logging program. The name of the ship was derived from the international scientific partnership that directs the program—the Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES)—and from the flagship of Captain Cook's second voyage to the Pacific Ocean in the late 18th century. Texas A&M University is responsible for science operations in the program, and Lamont-Doherty Geological Observatory is responsible for the logging program.

The Ocean Drilling Program truly has international participation. In 1975, the International Phase of Ocean Drilling began with member nations—the U.S.A., U.S.S.R., Federal Republic of Germany, Japan, United Kingdom, and France—all providing funds and scientific guidance for the project. Today, ODP partners include the U.S.A., the Canada/Australia Consortium for the Ocean Drilling Program, France, the Federal Republic of Germany, Japan, the United Kingdom, and the European Science Foundation, which represents Sweden, Finland, Norway, Iceland, Denmark, Belgium, the Netherlands, Spain, Swit-

zerland, Italy, Greece, and Turkey. The National Science Foundation, with funds contributed by the United States and international partners, supports the scientific operations and planning for the ODP through a contract with Joint Oceanographic Institutions, Inc. (JOI).

The information gained by the program leads to a better understanding of the Earth and its dynamic processes. Drilled sediment cores and logs reveal clues to past climatic history and tie into parallel studies of paleoclimates from glacial ice cores drilled on the continents. Understanding these sediment cores will enable scientists to complete the map of major geologically active regions of the Earth, and to identify processes that lead to dynamic change such as earthquakes, volcanic eruptions, and mountain and continental growth. We are far from being able to predict such changes accurately now; but with the new tools and understanding, the accuracy of such predictions can be improved. This better understanding of the Earth's system(s) will allow us to identify regions of potential mineral and energy resource development, an issue of worldwide human interest. The Ocean Drilling Program is not in itself aimed at finding resources, but the knowledge of the Earth's processes that is gained through such a basic research program will inevitably provide pieces of information required for such resource discovery and exploitation.

The program is fully under way in its aim to further the understanding of the Earth's dynamic systems. People of our planet will benefit directly and indirectly from this research in both their daily living and work activities. This multinational endeavor will perhaps foster other cooperative efforts in science or among societies. The Ocean Drilling Program has distinguished ancestors in the original *Resolution* and *Challenger* expeditions and the Deep Sea Drilling Project. The National Science Foundation is proud to be playing a leading role in this program, and we are looking forward to significant and innovative science for many years to come.

Erich Bloch
Director
National Science Foundation

Washington, D.C.

Foreword

By Joint Oceanographic Institutions, Inc.

This volume presents results from the Ocean Drilling Program (ODP), where scientists use a specially equipped ocean drilling ship to sample and measure the properties of the submerged part of the Earth's crust. These data are then synthesized with other information to yield new insights into earth processes.

These results address the scientific goals of the program, which include providing a global description of geological and geophysical structures and materials, studying in detail areas of major geophysical activity such as mid-ocean ridges and the associated hydrothermal circulations, and studying passive and active continental margins. In addition, the ODP data support the study of sea-level and ocean-circulation changes, the effects of the Earth's orbital variations on climate, and the study of processes and mechanisms of evolution from the biological records in the cores which are recovered from drilling.

The Ocean Drilling Program is a partnership of scientists and governments. Overall scientific policy and management guidance is provided by Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES), which consists of committees and panels made up of representatives of the participating institutions and other scientific and engineering experts. The JOIDES Executive Committee (EXCOM) provides general oversight; the JOIDES Planning Committee (PCOM) is the focal point for all scientific planning for the ODP and is key to the scientific success of the program.

The PCOM has a network of panels and working groups which screen drilling proposals, evaluate instrumentation and measurement techniques, and assess geophysical survey data and other safety and siting information. PCOM uses the recommendations of these panels and committees to select drilling targets, to specify the major scientific objectives of each two-month drilling segment or leg, and to provide the science operator with nominations for co-chief scientists. The science operator, Texas A&M University, in turn is responsible for planning the detailed ship's operations, actual drilling schedules, and final scientific rosters, which are developed in close cooperation with PCOM and the cognizant panels.

Many of the scientific goals can be met only with new technology. Thus the program has identified engineering goals, which include the ability to start a hole and to core on bare rock at mid-ocean-ridge sites, to drill in high-temperature and corrosive regions typical of hydrothermal areas, and to core in high latitudes with minimum interference from high seas and sea ice. To meet these needs, the program operates a specially equipped drillship, the *JOIDES Resolution*, which contains laboratories and equipment that are state-of-the-art, and carries a major new logging program.

The ship, registered as SEDCO/BP 47 after her owners and her length in feet (144 meters), is 70 feet (21 meters) wide, and has a displacement of 16,595 long tons. Her derrick towers 200 feet (61 meters) above the waterline, and a computer-controlled dynamic-positioning system stabilizes the ship over a specific location while drilling in water depths up to 27,000 feet (8230 meters). The drilling system collects cores from beneath the seafloor with a derrick and drawworks that can handle 30,000 feet (9144 meters) of drill pipe. More than 12,000 square feet (1115 square meters) of space distributed throughout the ship is devoted to scientific laboratories and equipment. The ship sails with a scientific and technical crew of 50 and a ship's crew of 65.

Logging is a major part of the overall operation. The program provides a full suite of geochemical and geophysical measurements for every hole deeper than 1300 feet (400 meters). For each such hole, there are lowerings of basic oil-industry tools: nuclear, sonic, and electrical. In addition, a borehole televiewer is available for imaging the well-bore wall, a 12-channel logging tool provides accurate velocity and elastic property measurements as well as sonic waveforms for spectral analysis of energy propagation near the well bore, and a vertical seismic profiler records reflectors from below the total depth of the hole.

Texas A&M University serves as science operator for the Ocean Drilling Program. In this capacity, they operate and staff the drillship to collect cores from JOIDES-designated sites from around the world. The science operator also ensures that adequate scientific analyses are performed on the cores by maintaining the shipboard scientific laboratories and by providing logistical and technical support for shipboard scientific teams. Onshore, Texas A&M manages scientific activities after each leg, is curator for the cores, distributes samples, and coordinates the editing and publication of the scientific results. Lamont-Doherty Geological Observatory (LDGO) of Columbia University manages the program's logging operations, which include processing the data and provision of assistance to scientists in data analysis. The ODP Data Bank, a repository for geophysical data, is also managed by LDGO. Core samples from ODP and the previous Deep Sea Drilling Project are stored for future investigation at three sites: ODP Pacific and Indian Ocean cores at Texas A&M University, ODP and DSDP Atlantic and Antarctic cores at Lamont-Doherty Geological Observatory, and DSDP Pacific and Indian Ocean cores at Scripps Institution of Oceanography.

International oversight and coordination are provided by the ODP Council, a governmental consultative body of partner country representatives, chaired by the United States, which periodically reviews the general progress of the program and discusses financial plans and other management issues. Joint Oceanographic Institutions, Inc., a nonprofit consortium of U.S. oceanographic institutions, serves as the National Science Foundation's prime contractor and manages the ODP. JOI is responsible for seeing that the scientific objectives and plans are translated into scientific operations consistent with JOIDES recommendations and budgetary constraints.

Scientific achievements of the ODP already include new data on early seafloor spreading and how continents separate and their margins evolve. We have new insight into glacial cycles and the fluctuations of currents throughout geological time. Technical achievements include the first bare-rock coring, and logging data more accurate and complete than ever before. JOI is pleased to have played a facilitating role in the Ocean Drilling Program.

D. James Baker

Joint Oceanographic Institutions, Inc.

Washington, D.C.

Preface

The *Scientific Results* volumes of the *Proceedings of the Ocean Drilling Program* contain specialty papers presenting the results of up to one and one-half years of research in various aspects of scientific ocean drilling. I acknowledge with thanks the authors of the papers published in this volume, who thereby have enabled future investigators to gain ready access to the results of their research.

Each of the papers submitted to a *Scientific Results* volume undergoes rigorous peer review by at least two specialists in the author's research field. A paper typically goes through one or more revision cycles before being accepted for publication. Our goal is to maintain a peer-review system comparable to those of the most highly regarded journals in the geological sciences.

The Editorial Review Board for a *Scientific Results* volume is responsible for obtaining peer reviews of papers submitted to the volume. This board usually is made up of the two co-chief scientists for the cruise, the ODP staff scientist for the cruise, and one external specialist who is familiar with the geology of the area investigated. In addition, the ODP staff editor assigned to the volume helps with any manuscripts that require special attention, such as those by authors who need assistance with English expression.

Scientific Results volumes may also contain short reports consisting of good data that are not ready for final interpretation. Papers in this category are segregated in a section in the back of the volume called Data Reports. Although no interpretation is permitted, these papers ordinarily contain a section on methodology or procedures. Data Report papers are read carefully by at least one specialist to make sure they are well organized, comprehensive, and discuss the techniques thoroughly. A paper that has undergone regular peer review is not eligible for later consideration as a Data Report.

In acknowledgment of the contributions made by this volume's Editorial Review Board, names of the individual Board members are listed on the title page. Reviewers of manuscripts for this volume, whose efforts are so essential to the success of the publication, are listed in the front portion of the book, without attribution to a particular manuscript.

On behalf of the Ocean Drilling Program, I extend sincere appreciation to members of the Editorial Review Boards and to the reviewers for giving so generously of their time and efforts in ensuring that only papers of high scientific quality are published in the *Proceedings*.

TABLE OF CONTENTS

VOLUME 114—SCIENTIFIC RESULTS

Acknowledgments	1
SECTION 1: TECTONICS AND GEOPHYSICS	
1. Islas Orcadas Rise and Meteor Rise: the tectonic and depositional history of two aseismic plateaus from Sites 702, 703, and 704 (synthesis)	5
C. A. Raymond, J. L. LaBrecque, and Y. Kristoffersen	
2. On the tectonic history and origin of the northeast Georgia Rise (synthesis)	23
Y. Kristoffersen and J. LaBrecque	
3. An estimate of heat flow on the Meteor Rise, Site 704	39
D. C. Nobes, J. Mienert, C. J. Mwenifumbo, and J. P. Blangy	
SECTION 2: STRATIGRAPHY—MICROPALEONTOLOGY	
4. Biostratigraphy of diverse silicoflagellate assemblages from the early Paleocene to early Miocene of Holes 698A, 700B, 702B, and 703A: subantarctic South Atlantic	49
P. F. Ciesielski	
5. Late Pliocene–Quaternary quantitative diatom stratigraphy in the Atlantic sector of the Southern Ocean	97
J. M. Fenner	
6. Taxonomy, stratigraphy, and paleoceanographic implications of Paleocene diatoms	123
J. M. Fenner	
7. Calcareous nannofossils recovered by Leg 114 in the subantarctic South Atlantic Ocean	155
J. A. Crux	
8. Late Eocene to early Oligocene calcareous nannofossil assemblages from Sites 699 and 703, subantarctic South Atlantic Ocean	179
M. Madile and S. Monechi	
9. Preliminary results from Hole 704A: Arctic–Antarctic correlation through nannofossil biochronology	193
G. Gard and J. A. Crux	
10. Latest Miocene to Quaternary biostratigraphy and paleoceanography, Site 704, subantarctic South Atlantic Ocean	201
C. A. Brunner	
11. Late Miocene to Holocene planktonic foraminifers from the subantarctic South Atlantic	217
C. Pujol and R. Bourrouilh	
12. Planktonic foraminiferal biostratigraphy and paleoenvironmental interpretation of Paleogene faunas from the subantarctic transect, Leg 114	233
M. Nocchi, E. Amici, and I. Premoli Silva	

13. Planktonic foraminifer biostratigraphy of Campanian-Maestrichtian sediments from Sites 698 and 700, southern South Atlantic281
B. T. Huber	
14. Oldest Cretaceous planktonic foraminifers from Hole 700B299
I. Premoli Silva	
15. Rare and unknown noncalcareous microfossils recovered from Leg 114 sites303
J. Fenner	
16. Tripylean radiolarians from the subantarctic Atlantic311
H. Y. Ling	
17. Cretaceous (Maestrichtian) radiolarians: Leg 114317
H. Y. Ling	
18. Occurrence of <i>Bolboforma</i> (Algae, Chrysophyta) in the subantarctic (Atlantic) Paleogene325
D. Spiegler	

SECTION 3: PALEOMAGNETIC STUDIES

19. Magnetostratigraphy of Sites 699 and 700, East Georgia Basin337
E. A. Hailwood and B. M. Clement	
20. Magnetostratigraphy of sediments from Sites 701 and 702359
B. M. Clement and E. A. Hailwood	
21. Magnetostratigraphy of Sites 703 and 704, Meteor Rise, southeastern South Atlantic367
E. A. Hailwood and B. M. Clement	
22. Paleomagnetism of igneous rocks drilled on Leg 114387
E. A. Hailwood and N. Vashisht	

SECTION 4: ISOTOPIC STUDIES AND PALEOCEANOGRAPHY

23. Stable isotopic and carbonate stratigraphy of the late Pliocene and Pleistocene of Hole 704A: eastern subantarctic South Atlantic409
D. A. Hodell and P. F. Ciesielski	
24. Fine-fraction carbonate oxygen and carbon isotope results from Site 704: implications for movement of the Polar Front during the late Pliocene437
G. A. Mead, D. A. Hodell, D. W. Müller, and P. F. Ciesielski	
25. Late Miocene to earliest Pliocene (9.8–4.5 Ma) paleoceanography of the subantarctic southeast Atlantic: stable isotopic, sedimentologic, and microfossil evidence459
D. W. Müller, D. A. Hodell, and P. F. Ciesielski	
26. Synthesis of oxygen and carbon isotopic results from Site 704: implications for major climatic-geochemical transitions during the late Neogene475
D. A. Hodell, D. W. Müller, P. F. Ciesielski, and G. A. Mead	
27. Early Paleogene benthic foraminiferal assemblages and stable isotopes in the Southern Ocean481
M. E. Katz and K. G. Miller	

SECTION 5: SEDIMENT-ACCUMULATION RATES AND SPECTRAL ANALYSIS

28. Biogenic opal and carbonate accumulation rates in the subantarctic South Atlantic: the late Neogene of Meteor Rise Site 704 515
P. N. Froelich, P. N. Malone, D. A. Hodell, P. F. Ciesielski, D. A. Warnke, F. Westall, E. A. Hailwood, D.C. Nobes, J. Fenner, J. Mienert, C. J. Mwenifumbo, and D. W. Müller
29. Milankovitch cycles and nonlinear response in the Quaternary record in the Atlantic sector of the Southern Oceans 551
D. C. Nobes, S. F. Bloomer, J. Mienert, and F. Westall
30. Short-term spectral analysis of downhole logging measurements from Site 704 577
C. J. Mwenifumbo and J. P. Blangy

SECTION 6: SEDIMENTOLOGY

31. Ice rafting, glacial-marine sediments, and siliceous oozes: South Atlantic/subantarctic Ocean . . 589
D. A. Warnke and C. P. Allen
32. History of ice rafting at Leg 114 sites, subantarctic/South Atlantic 599
C. P. Allen and D. A. Warnke
33. Pliocene-Holocene Polar Front Zone in the South Atlantic: changes in its position and sediment-accumulation rates from Holes 699A, 701C, and 704B (synthesis) 609
F. Westall and J. Fenner

SECTION 7: PHYSICAL PROPERTIES AND DIAGENETIC STUDIES

34. Stratigraphy, depositional environment, and diagenesis of sediments at Site 700 inferred from downhole measurements 649
C. J. Mwenifumbo and J. P. Blangy
35. Lithologic control of physical-property interrelationships 657
D. C. Nobes, J. Mienert, and G. J. Dirksen
36. Physical properties of sediments beneath Polar Front upwelling regions in the subantarctic South Atlantic (Hole 704A) 671
J. Mienert and D. Nobes
37. Diagenesis of siliceous particles in subantarctic sediments, Hole 699: possible microbial mediation 685
C.L.V. Monty, F. Westall, and S. van der Gaast
38. The problem of porosity rebound in deep-sea sediment cores: a comparison of laboratory and *in-situ* physical-property measurements, Site 704, Meteor Rise 711
D. C. Nobes, C. J. Mwenifumbo, J. Mienert, and J. P. Blangy

SECTION 8: INTERSTITIAL WATERS AND OTHER GEOCHEMICAL STUDIES

39. Interstitial-water chemistry: abyssal South Atlantic and East Georgia basins, Islas Orcadas and Meteor rises 719
P. N. Froelich, R. A. Mortlock, M. Mefferd, and J. Powers
40. Geochemical investigations of volcanic ash layers from southern Atlantic Legs 113 and 114 . . 733
H.-W. Hubberten, W. Morche, F. Westall, D. K. Fütterer, and J. Keller

SECTION 9: DATA REPORT

41. Relative abundances and ranges of select diatoms and silicoflagellates from Sites 699 and 704, subantarctic South Atlantic753
P. F. Ciesielski

SECTION 10: CORRECTIONS TO *SCIENTIFIC RESULTS* VOLS. 110 AND 113

Vol. 110: Figure 6: Sediment consolidation and permeability at the Barbados forearc781
E. Taylor and J. Leonard

Vol. 113: Figure 15: Consolidation characteristics of Weddell Sea sediments: results of ODP Leg 113783
W. R. Bryant and F. R. Rack

BACK-POCKET FOLDOUTS

Scientific Results: Volume 114: Chapter 12: Tables 3, 4, 5, and 6. Stratigraphic ranges and relative abundances of Paleogene planktonic foraminifers and other selected organisms in Holes 699A, 700B, 702A, 702B, and 703A.

ACKNOWLEDGMENTS

The success of ODP Leg 114 is a tribute to the technological and drilling capabilities of *JOIDES Resolution*, which during the course of this leg passed her first severe test of operational capability in a variety of adverse conditions. Drilling in the Southern Ocean region has historically met with great difficulties. In the subantarctic, the most significant of these are high seas and winds. Weather and sea conditions during Leg 114 resound like the tall tales of Hemingway's "old man of the sea": combined seas/swell of up to 40–50 ft, 40 days with occurrences of gales with 48-kt winds, etc. Through it all, the ship and her capable crew under the command of Captain Edwin Oonk prevented any significant loss of site time waiting on weather (1.5 days, or 3.8%). In many instances station was maintained even in 50-kt winds and 25–30-ft seas, much through the dedication, resourcefulness, and ingenuity of Operations Superintendent Mike Storms and SEDCO Drilling Superintendent Kenneth Horn.

The capability of *JOIDES Resolution* to operate efficiently under the conditions experienced by this leg is a credit to the efforts of those individuals who sought and obtained this vessel as the successor to *Glomar Challenger* of the Deep Sea Drilling Project. Because of their vision, Leg 114 experienced few of the weather-related operational difficulties that plagued DSDP high-latitude drilling in the subantarctic.

We also acknowledge the untiring efforts of the Southern Oceans Panel of ODP, under the direction of James Kennett, as an advocate for the current phase of Southern Ocean drilling (Legs 113, 114, 119, and 120) and for its assistance in formulating the scientific program of Leg 114. Particular thanks are deserved by John LaBrecque, whose geophysical expertise played a central role in the development of the scientific program and who further assisted in the post-cruise analysis of geophysical data. Critical site surveys were also made by John LaBrecque and Carol Raymond, under support to the former by NSF, Division of Polar Programs and NSF-ODP.

A great debt is owed to Brad Clement, the ODP staff scientist, for his shipboard assistance and leadership, as well as for his service on the Editorial Review Board for this volume. Similar service on the Editorial Review Board by Ted Moore also is much appreciated. The time-consuming efforts of our colleagues in the review of the manuscripts are acknowledged following the volume "Preface." Accepted manuscripts were prepared for publication by the ODP Publications Staff, to whose talents we are indebted.

Finally, we wish to express our appreciation to the large number of funding agencies in the various ODP member countries for their financial support. The U.S. researchers contributing to the volume gratefully acknowledge the grant assistance provided by JOI-USSAC in support of their research reported herein.
