# **GLOBAL 2005**

**Nuclear Energy Systems for  
Future Generation and Global Sustainability**

October 9-13, 2005  
Tsukuba International Congress Center,  
Tsukuba, Japan

**Official Program**

## **Background**

The GLOBAL conference series was started in 1993. During the first decade of the GLOBAL conference series, from 1993 to 2003, circumstances surrounding the use of nuclear systems have gradually but surely changed. Improvement in the total cost of nuclear power generation, and resolution of difficult fuel cycle concerns are allowing the world to favorably consider nuclear power generation. Progress in the repository projects for safe disposal of high-level radioactive wastes in the United States of America and some other countries has begun to demonstrate a feasible solution to the central issue of the back-end of the fuel cycle. New trends in energy utilization, such as the notable technical progress of the hydrogen fuel cells, have suggested additional opportunities for nuclear technologies with respect to the carbon-free hydrogen production. Under the changing circumstance in this decade, extensive research and development projects for reactor technology, fuel cycle technology, as well as transmutation technology have progressed in various countries. The projects include international Generation IV (Gen-IV), US's Advanced Fuel Cycle Initiative (AFCI), Japan's Feasibility Study (FS), IAEA's Innovative Nuclear Reactors and Fuel Cycle (INPRO) and so on.

Based upon achievements in this past decade, substantive and quantitative discussions on the theme of new nuclear technologies can be expected to continue in the new decade of the GLOBAL series, and GLOBAL 2005 will be the starting point of this.

## **Conference Scope**

The GLOBAL series has successfully provided a global forum for discussions about the future nuclear energy systems with emphasis on the advancement of the fuel cycle technologies. Based on this traditional principle, GLOBAL 2005 will cover a wide range of subjects related to the advancement of nuclear technologies, providing up-to-date information. This conference concentrates on advanced system concepts, reactors, fuels, materials, reprocessing, partitioning & transmutation, waste management, nuclear utilization, and other related innovative technologies. Special emphasis will be placed on the status and results of the international studies for developing next generation systems. It will also be a good opportunity for review and discussion of the related national policies, plans and status, international cooperation, as well as the common world issues, such as the assurance of non-proliferation, prevention of nuclear terrorism, achieving favorable public perception, public education, and fostering of next generation technical experts.
