

**Taxonomical and morphological studies on the genus *Calamintha* Miller (Lamiaceae) in Turkey**Sevim ALAN<sup>\*1</sup>, Atila OCAK<sup>2</sup><sup>1</sup> Anadolu University, Faculty of Pharmacy, Pharmaceutical Botany, Eskişehir, Turkey<sup>2</sup> Osmangazi University, Faculty of Science & Letters, Department of Biology, Eskişehir, Turkey**Abstract**

The genus *Calamintha* Miller is represented in the Flora of Turkey by 9 species and altogether 13 taxa six of which are endemic. In this study, 13 taxa belonging to the genus *Calamintha* have been examined taxonomical and morphological properties and the relationships of the following species were investigated: *Calamintha grandiflora* (L.) Moench, *C. betulifolia* Boiss. & Bal., *C. tauricola* P. H. Davis, *C. pamphylica* Boiss. & Heldr. subsp. *pamphylica*, *C. pamphylica* subsp. *davisii* (Quezel & Contandr.) Davis (end.), *C. pamphylica* subsp. *alanyense* S. Alan & A. Ocak (end.), *C. piperelloides* Staph (end.), *C. sylvatica* Bromf. subsp. *sylvatica*, *C. sylvatica* subsp. *ascendens* (Jordan) P. W. Ball, *C. nepeta* (L.) Savi subsp. *nepeta*, *C. nepeta* subsp. *glandulosa* (Req.) P. W. Ball, *C. incana* (Sm.) Boiss., *C. caroli-henricana* Kit Tan & Sorger. In morphological studies, descriptions of each taxon have been given and general appearance of plants and their, leaf, bract, flower, calyx, corolla and fruit shapes have been illustrated. According to the results, a new identification key widening the limits for *Calamintha* species has been prepared and presented in the section of morphological results.

**Türkiye *Calamintha* Miller (Lamiaceae) cinsi üzerine taksonomik ve morfolojik bir çalışma****Özet**

Türkiye Florası'nda *Calamintha* Miller (Lamiaceae) cinsi 6'sı endemik olmak üzere 9 tür ve 13 takson ile temsil edilmektedir. Bu çalışmada *Calamintha* cinsine ait 13 takson sistematik ve morfolojik yönden incelenmiş, birbirleriyle olan yakınlık dereceleri saptanmaya çalışılmıştır. Çalışılan taksonlar şunlardır: [*Calamintha grandiflora* (L.) Moench, *C. betulifolia* Boiss. & Ball, *C. tauricola* P. H. Davis (end.), *C. pamphylica* Boiss. & Heldr. subsp. *pamphylica*, *C. pamphylica* subsp. *davisii* (Quezel & Contandr.) Davis (end.), *C. pamphylica* subsp. *alanyense* S. Alan & A. Ocak (end.), *C. piperelloides* Staph (end.), *C. sylvatica* Bromf. subsp. *sylvatica*, *C. sylvatica* subsp. *ascendens* (Jordan) P. W. Ball, *C. nepeta* (L.) Savi subsp. *nepeta*, *C. nepeta* subsp. *glandulosa* (Req.) P. W. Ball, *Calamintha incana* (Sm.) Boiss., *Calamintha caroli-henricana* Kit Tan & Sorger]. Morfolojik çalışmalarında türlerin tanımları verilip, bitkilerin genel görünüşleri, yaprak, brakte, çiçek, kaliks, korolla ve meyve şekilleri ilave edilmiştir. Elde edilen sonuçlara göre *Calamintha* türlerinin daha geniş varyasyon sınırlarını içeren yeni ayırt edici morfolojik sonuçlar bölümünde verilmiştir.

**Anahtar kelimeler:** *Labiatae*, *Calamintha*, Taksonomi, Revizyon, Türkiye

## 1. Introduction

The genus *Calamintha* Miller spread out in the Europe, Central Asia, Mediterranean region, North Africa and America (Bonnier, 1959; Bown, 1995). *Calamintha* taxa are distributed most in the South, West and North Anatolia in Turkey and it is represented by nine species and four subspecies. *Calamintha pamphylica* Boiss. & Heldr. subsp. *alanyense* S. Alan & A. Ocak has been published in 2007 (Alan et al., 2007). Six species are endemic to Turkey. These are *C. tauricola*, *C. pamphylica* ssp. *pamphylica*, *C. pamphylica* ssp. *davisi*, *C. pamphylica* ssp. *alanyense*, *C. piperolloides*, *C. caroli-henricana* and all of them are perennial except for *C. caroli-henricana* (Davis & Leblebici 1982; Davis et al, 1982; Duman, 2000). The ratio of endemism is over 45%. The first systematical study about the genus *Calamintha* took place in Flora Orientalis. It was described under the section *Eucalamintha* with three subsections nine species. Eight of them had been collected in Turkey. Furthermore, several the genus had been treated as synonymous with some other genera such as *Acinos* Miller, *Clinopodium* L., *Satureja* L., and *Melissa* L. in different floras (Anzalone et al., 1982; Boissier, 1879; Butcher, 1961; Clapham et al.; 1981, Hayek, 1928; Hegi, 1964; Martin, 1965; Meikle, 1985; Quezel & Santa 1963; Rechinger fil. 1943; Rechinger 1982; Schmeil & Fitschen, 1960; Silic, 1979; Shishchkin, 1977; Stojanov et al., 1967; Strid and Tan, 1991; Tutin et al., 1972; Webb, 1966). The most comprehensive treatise of the genus about *Calamintha* of Turkey is in the Flora of Turkey (Davis & Leblebici 1982). Later, *Calamintha caroli-henricana* was added to the Flora of Turkey as a new species (Davis et al., 1988). *Calamintha* is known as “Güzel Nane, Dağ Nanesi, Miskotu, Tibbi Miskotu, Yabani Oğulotu” in Turkey and used as a folk medicine. *Calamintha* species are used as stimulant, antispasmodic, emmenagogue, digestive, antiseptic, diaphoretic, expectorant and for strengthening central nervous system (Baytop, 1999; Bonnier, 1959; Bown 1995). They are also used for stomach ache, throat diseases, and kidney disorders and as a spice (Grieve, 1982; Viney, 1994). This study is a part of PhD Thesis named “Taxonomical, Morphological Anatomical and Chemical Studies on *Calamintha* (Lamiaceae) Genus in Turkey”. In this study, *Calamintha* materials belonging to 13 taxa growing in Turkey were investigated on systematically and morphologically.

## 2. Materials and methods

The materials for the study were collected from different populations in Turkey between 2001-2004. Voucher specimens are kept at the Herbarium of the Anadolu University, Faculty of Pharmacy (ESSE). The related specimens at the herbaria ISTE, ANK, HUB, EGE, OUFE, AKDU, AEF were also investigated. Species identifications were carried out using the Flora of Turkey and the East Aegean Islands (Davis & Leblebici, 1982). Each species was described by using samples which were softened in water before measurements. 15 samples were assessed for taxonomic characterizations. The measurements given in descriptions were obtained according to the large areas of related organs and the leaves. Morphological illustrations of organs as leaves or flowers were made by a Wild M5A stereomicroscope with a drawing tube.

## 3. Results

In the present study, different variation limits have been determined for leaf, bracteol, calyx and corolla sizes, flower numbers, eglandular and glandular hairs of *Calamintha* species growing in Turkey and were compared with the Flora of Turkey (Table 1). According to these data, the morphologic differences among the species have been found and arranged as a new key.

### 1. Annual

#### 1. Perennial

- 2. Stems 10-90 cm, leaves camptodromous, calyx 13- veined, corolla 5-20 mm, calyx prominently hairy at throat, upper calyx teeth shorter than the lower calyx teeth
- 3. Median leaves 4-16x3.5-14 mm, densely tomentose, entire or scarcely notched, corolla 5-10 mm, pedicillate on very short or obsolescent peduncles

#### 9. *caroli-henricana*

#### 8. *incana*

- 3. Median leaves 7-55x5-30 mm, puberulous, serrate-crenate-dentate, corolla 5-20 mm, peduncles conspicuous
- 4. Corolla 12-20 mm, calyx 5-8.5-(11)mm, lower calyx teeth 1.5-4 mm, densely long-ciliate

#### 6. *sylvatica*

- 4. Corolla 5-12 mm, calyx 2.5-7 mm, lower calyx teeth 0.9-3 mm, sparsely short-ciliate

#### 7. *nepeta*

- 2. Stems 5-60 cm, leaves craspedodromous, calyx 11-veined, corolla 8-40 mm, calyx glabrous at throat, upper calyx teeth equalling than lower calyx teeth
- 5. Median leaves 12-75x10-40 mm, ovate-elliptic, with 6-13 teeth per side, calyx tube slightly curved, corolla 15-40 mm, inflorescence 3-40 cm, 2-20 flowered

#### 1. *grandiflora*

5. Median leaves 4-30(-32)x3-25 mm, ovate-elliptic, triangular, broadly ovate, with (2-)3-7 teeth per side, calyx tube straight, corolla 8-26 mm, inflorescence 1-24 cm, 2-10(-11) flowered
6. With (2-)3-5 teeth per side, median leaves broadly ovate, peduncles conspicuous, Labiateae type glandular hairs lack, corolla violet

### 3. *tauricola*

6. With 4-7 teeth per side, median leaves ovate, ovate-elliptic, usually obsolescent peduncles, Labiateae type glandular hairs, corolla lilac

### 2. *betulifolia*

7. Median leaves villous, densely long villose, short puberulent, 4-25(-32)x3-20(-25) mm, shallowly crenate-denticulate, distinctly crenate-dentate, with 3-7 teeth, upper calyx teeth recurved, 2-8(-11) flowered

### 4. *pamphylica*

7. Median leaves puberulent, 6-10 mm, margins obscurely serrulate, with 2-4 teeth, upper calyx teeth straight, 2 flowered

### 5. *piperelloides*

The morphological findings of *Calamintha* species and their couperisons have been presented in Table 1.

*Calamintha grandiflora* (L.) Moench (Figures 1 & 2)

Syn: *Melissa grandiflora* L., Sp. Pl. 592 (1753) *Satureja grandiflora* (L.) Scheele in Flora 26:577 (1843) *Clinopodium grandiflorum* (L.) Kuntze, Rev. Gen. 515 (1891) Ic: Fl. URSS 21: t. 23 f. 1 (1954); Polunin, Fls. Europe t. 114 no. 1154 (1969).

Perennial herbs. Stems ascending-erect, 14-60cm. Cauline middle leaves ovate-elliptic, (12-)15-60(-75)x10-40mm, with 6-13 teeth, craspedodromous. Inflorescence 3-40cm, 2-20 flowered. Calyx 6-15mm, distinctly 11 veined, tube slightly curved, hairy at throat, lower lip with 2 toothed, teeth 2.5-5mm, lower lip equalling than upper teeth. Corolla 15-40mm, pale or mauvish pink to red.

*Calamintha pamphylica* Boiss. & Heldr. (Figures 9-14)

Perennial herbs, trailing, ascending, 5-35(-45)cm, villous, long villose, short puberulent or sparsely puberulent, sparsely glandular or densely short-stalked glandular, cauline middle leaves triangular or deltoid, ovate-broadly ovate or triangular, 4-32x3-25mm, truncate-subcordate, broadly cuneate or rounded cuneate at base, margins shallowly crenate-denticulate, distinctly crenate-dentate or clearly serrate, with 3-7 toothed per side, craspedodromous, petioles long villous or pilose. Inflorescence 2-17(-20)cm, 2-12 flowered. Calyx 4-12mm, 11(-12)-13-veined, bilabiate or subbilabiate, divided to 1/4-1/8, upper lip 3 toothed, teeth 0.6-2mm, triangular, curved, acute-acuminate, short-ciliate margined, lower lip with 2 teeth, teeth 1-2.5(-2.8)mm, acuminate-subulate or subulate, lower lip equalling or longer than upper teeth, tube straight, outside villous, villos and short puberulent sparsely glandular or densely short-stalked glandular, sparsely pale dotted, inside of tube and throat glabrous. Corolla 11-26mm, pale lilac. Endemic.

1. Stems and petioles villous or long villose and short puberulent, sparsely glandular, leaves 4-25mm, margins shallowly crenate-denticulate, distinctly crenate-dentate, upper calyx teeth 1-2mm, acuminate-subulate, lower lip equalling than upper teeth
2. Median leaves triangular-broadly ovate, 4-18x3-15mm, margins shallowly crenate-denticulate, truncate-subcordate at base, petioles long villous

subsp. **pamphylica**

2. Median leaves ovate-broadly ovate or triangular, 5-25x4-20mm, margins distinctly crenate-dentate, broadly cuneate at base, petioles pilose

subsp. **davisii**

1. Stems and petioles sparsely puberulent, densely short-stalked glandular, leaves 10-32x5-25mm, margins distinctly serrate, upper calyx teeth 0.6-1mm, acute-triangular, lower lip longer than upper teeth

#### 4. Discussion

According to our results 9 species and 13 taxa of *Calamintha* grow in Turkey. *Calamintha* samples belonging to 13 taxa were evaluated systematically and morphologically, and familiarity degrees of these samples were recorded.

The morphological results of *Calamintha* species are given in Table 1. According to these results, some properties of the species are as follows;

*C. grandiflora*, *C. betulifolia*, *C. tauricola*, *C. pamphylica*, *C. piperelloides*, *C. sylvatica*, *C. nepeta*, *C. incana* are perennial, *C. caroli-henricana* is annual (Davis et al 1988; Duman, 2000). The height of *C. grandiflora*, *C. betulifolia*, *C. tauricola*, *C. pamphylica*, *C. piperelloides* is shorter than the other species. In these species, leaf veins are craspedodramous, calyx 11(-12)-veined. In *C. sylvatica*, *C. nepeta* and *C. incana* leaf veins are camptodramous, and calyx 13-veined. For the perennial species, features of the plants such as plant height, stem form, leaf shape, number of tooth, venation form, peduncle size, calyx and corolla sizes, and their forms, and indumentum have been identified as diagnostic.

The largest leaf and flower sizes were observed in *C. grandiflora*. In *Calamintha betulifolia*, the stem is ascending, and the stem, leaves and calices are pruinose. In *C. tauricola*, stem is decumbent or ascending, and the stem, leaf and calyx are pruinose. The Labiate type glandular hairs are lacking. Numbers of leaf tooth (2)-3-5 and numbers of flowers 2-8(-10) are lower than the other species. The shortest inflorescence length (2-17 cm) is observed in *C. pamphylica*. The two subspecies of *C. pamphylica* can be differentiated with their leaf shape, covering hairs and leaf margins. Two subspecies of *C. sylvatica* can be distinguished by the properties of stem, lower teeth of calyx, length of corolla and number of flower. *C. nepeta* samples have larger limits than the other species with stem length (17-90 cm), inflorescence length [(0.5)- 1.5-43 cm], peduncle length (0.5-20 mm), and pedicel length (0.5-13 mm). The two subspecies of *C. nepeta* are differentiated by their verticillate appearance, leaf and peduncle sites, leaf margins, and indumentum characters. *C. incana* is significantly smaller than the other species with its characteristics such as leaf length, shape and margins, flower and peduncle length, calyx form, and indumentum.

On the other hand, different variation limits have been determined for leaf, bracteol, calyx and corolla sizes, flower numbers, covering and glandular hairs of *Calamintha* species as compared with those in the Flora of Turkey. According to these data, the morphologic differences among these species were found and arranged as a new key.

Particularly in *C. betulifolia*, *C. tauricola* and *C. pamphylica* more clear differences among the populations were observed and these differences are presented in the figures. According to the results of this study, *C. betulifolia*, *C. tauricola* and *C. pamphylica* can be defined as complex and close by related specimens. In *C. betulifolia* samples collected from İçel: Gözne population inflorescence length is longer (2-24 cm), and verticillasters number is more (2-12) than the others. The length of calyx upper teeth is shorter (0.5-1mm), and the shape is triangular. The lengths of upper and lower tooth are equal. In the other populations (İçel: Namrun, Tarsus: Güzeldere) upper teeth length is 1-1.5mm, shape acuminate-triangular and lower teeth are longer than upper. The length and width of bracts are longer and larger than the others (İçel: Namrun 5-15x1.5-12mm), (İçel:Gözne 2.3-30x1-20mm). While the leaf shape of the samples from İçel: Gözne is broadly ovate, base of the leaf is rounded cuneate-reniform, margins are crenate-dentate, leaf shape is ovate-elliptic, base is cuneate and margins are serrate in other populations(Figure 5). In the populations of *C. tauricola* while covering hairs of the samples collected from İçel: Mut are dense, long, crispat, and short-soft, the others (from İçel: Erdemli, Silifke, Antalya: Anamur) are sparsely, short and soft. Sizes of leaf, bract, and bracteol for the samples of Mut: Gülnar are longer and broader than the others (10-30x7-24mm), (7-25x4-21mm), 2-9x0.5-4mm).In other populations, they are shorter and more narrow (7-25x5-18mm), 5-18x3-14mm), (2-4x0.8-1mm) (Figure 8) According to this, *C. betulifolia*, *C. tauricola* and *C. pamphylica* may be defined as complex and similar species.

*C. pamphylica* is represented with two subspecies; subsp. *pamphylica* and subsp. *davisii* in the Flora of Turkey. *C. pamphylica* subsp. *pamphylica* grows in Alanya: Dim Çayı and Cebelleis mountain, in humid and shade fields, in rock crevices, near the rivers and under the waterfalls, at an altitude of between 1 and 230 m. Subsp. *davisii* is naturally distributed in Antalya: Kemer, Tekirova and Kumluca regions, in rock crevices, near the rivers or river beds, and also in humid and shady places, an altitude of at 50-557 m, under the *Pinus brutia-Cupressus sempervirens* forests. The samples collected from Alanya: Kargı river from on the isolated hillsides away from water, on chalk, sunny rock, crevices at sea level. The samples collected by Davis and Leblebici in Alanya: Kargı river population were treated as *C. pamphylica* subsp. *pamphylica* in the Flora of Turkey. We found differences in morphological and indumentum properties of *C. pamphylica* subsp. *pamphylica* from Kargı river. In Kargı river samples plant height is taller than the other taxa of the same species[8-35(-45) cm]. Stem, leaf and calyx are sparsely, short and soft hairy, and more densely glandular. Sizes of leaf and bract are longer and wide [(10-32x5-25 mm) (4-30x1.5-22 mm)]. Shape of leaf and bract are usually ovate. Basement is round cuneate. Margin is clearly serrate. Terminal is acute. Samples harvested from this population are more (2-11) flowered compared to (2-6) flowers in others. The shape of bracteol is linear-lanceolate, while the others are lanceolate-acuminata. Shape of the lower teeth of calyx is acute-triangular and longer than the upper teeth; however, in the other populations, lower teeth are shorter than upper teeth. While the length and shape of the upper teeth were determined for Kargı samples as 0.6-1 mm and acute-triangular, other populations were 1-2 mm and acuminate-subulate (Figures 13-14). Taking into account all morphological and ecological variations, we concluded that specimens obtained from province Kargı river can be presented as a new subspecies (*Calamintha pamphylica* subsp. *alanyense* S.Alan & A.Ocak).

*C. piperelloides* could not be found despite many excursions to the site of its type specimen. According to the Flora of Turkey, this species had been collected by Luschan in 1882 and identified from the type. In addition, the typus of *C. piperelloides* was requested from Vienna University and compared with the related species. It has been determined that *C. piperelloides* is related to *C. pamphylica* subsp. *davisii* in the description of Flora of Turkey and probably it has no distinguishable characters. The locality of this sample has been visited so many times, but it has not been found. According to the records *C. piperelloides* is different from the others due to its number of leaf teeth and glabrous for calyx throat.

Status of three species of *Calamintha* have been determined as endemic rare (R) plants, *C. caroli-henricana* is En: Endangered, *C. pamphylica* subsp. *pamphylica* and *C. pamphylica* subsp. *davisii* are in category NT: Near threatened, *C. tauricola* is in VU: Vulnerable. *C. piperelloides* is in K (not well known), DD: (data deficient), *C. betulifolia* is in non endemic rare (R) plants category, but in the group of insufficient data (DD). The results of our excursions and investigations are parallel to the earlier categorisation of these taxa (IUCN, 2001).

*C. grandiflora* and *C. nepeta* subsp. *glandulosa* have been defined as the most widely distributed and the highest ecologically tolerant species of Turkey.

The regions where *Calamintha* taxa are most populated are in South, West and North Anatolia in Turkey and the genus is represented by 9 species and 13 subspecies (Figure 27). *C. grandiflora* (B3 square) and Eskişehir, *C. nepeta* subsp. *nepeta* (A4, C4 squares) and Bartın, *C. sylvatica* subsp. *ascendens* (C5 square) are new records. *C. sylvatica* subsp. *sylvatica* samples harvested from Kocaeli and *C. nepeta* subsp. *glandulosa* samples harvested from Bartın and Kocaeli are harvested samples from these locations for the first time. *C. incana* is new record for C2 square.
