ABSTRACT

The Montane Cordillera Ecozone of British Columbia and southwestern Alberta supports a diverse fauna with over 2,000 species of butterflies and moths (Order Lepidoptera) recorded to date. By far the best known group of Lepidoptera is the butterflies with 173 species in the Ecozone; the approximately 15,000 species locations of butterflies in the Ecozone makes it one of the best groups of insects to examine distribution patterns within the Ecozone. The Lepidoptera fauna of the Ecozone is reviewed in terms of diversity, state of knowledge of the major groups, origins of the fauna, post-glacial and relict patterns, recent changes in distribution, and endangered and threatened species.

INTRODUCTION

The Order Lepidoptera, the butterflies and moths, is among the more diverse insect groups in the Montane Cordillera Ecozone with more than 2,015 species recorded in 67 families, this representing about 43% of the Lepidoptera fauna of Canada. As was discussed in the analysis of the Lepidoptera fauna of the Mixedwood Plains Ecozone in southern Ontario and Quebec (Lafontaine, 1996), our knowledge of the Lepidoptera varies greatly from group to group, and only some groups are sufficiently well known to be used effectively in biodiversity studies.

LEPIDOPTERA DISTRIBUTION DATA SOURCES

Detailed distributional information has been published for only a few groups of Lepidoptera in western Canada. Scott (1986) gives good distribution maps for butterflies in North America but these are generalized shade maps that give no detail within the Montane Cordillera Ecozone. A series of memoirs on the Inchworms (family Geometridae) of Canada by McGuffin (1967, 1972, 1977, 1981, 1987) and Bolte (1990) cover about 3/4 of the Canadian fauna and include dot maps for most species. A long term project on the "Forest Lepidoptera of Canada" resulted in a four volume series on Lepidoptera that feed on trees in Canada and these also give dot maps for most species (McGugan, 1958; Prentice, 1962, 1963, 1965). Dot maps for three groups of Cutworm Moths (Family Noctuidae): the subfamily Plusiinae (Lafontaine and Poole, 1991), the subfamilies Cuculliinae and Psaphidinae (Poole, 1995), and the tribe Noctuini (subfamily Noctuinae) (Lafontaine, 1998) have also been published. Most fascicles in The Moths of America North of Mexico series (e.g. Ferguson, 1971-72, 1978; Franclemont, 1973; Hodges, 1971, 1986; Lafontaine, 1987; Munroe, 1972-74, 1976; Neunzig, 1986, 1990, 1997) are useful for identifying various moth groups but have little detailed distributional information. Check lists of the Macrolepidoptera of British Columbia (Jones, 1951) and the Lepidoptera of Alberta (Bowman, 1951) list most species but have limited distributional information. The recently published Butterflies of Canada (Layberry et al., 1998) is based on a distributional database on the butterflies of Canada maintained at the CNC which contains more than 90,000 records from public and private collections in Canada. The Butterflies of Canada includes dot maps for every species. In addition to these references, the vast amount of unpublished distributional information contained on the specimens in the Canadian National Collection (CNC) in Ottawa has been critical to the preparation of this analysis of Lepidoptera. These sources form the basis of the analysis of distribution patterns discussed below.

LEPIDOPTERA CLASSIFICATION AND HABITS

The terms "butterfly" and "moth" are often thought of as the two natural groups that make up the order Lepidoptera but in reality the butterflies are only one of many Lepidoptera lineages; butterflies are more closely related to the larger moths than either group is to the more primitive families of moths. The butterflies and the larger moths are often associated in a group called the "macrolepidoptera". The families of smaller moths are referred to as "microlepidoptera". While the macrolepidoptera probably represents a natural group, the microlepidoptera is more a grouping of convenience that lumps together many different families of small-sized, primitive moths. For convenience of discussion, we have arranged the 67 families of Lepidoptera into three groupings that represent different habits and different levels of knowledge.

*To be cited as:

J.D. Lafontaine and J.T. Troubridge. 1998. Moths and Butterflies (Lepidoptera). Chapter: Assessment of species diversity in the Montane Cordillera Ecozone in Smith, I.M., and G.G.E. Scudder, eds. Assessment of species diversity in the Montane Cordillera Ecozone. Burlington: Ecological Monitoring and Assessment Network, 1998.

The first group is the microlepidoptera (GROUP I), which includes 49 families of mostly small-sized moths with larvae that are concealed feeders. The microlepidoptera families can be arranged in four subgroups on the basis of larval habits. The first of these subgroups is 12 families (best illustrated by the large family Gracillariidae) that are the “leaf miners”. The larvae are called leaf miners because they feed on the chlorophyll between the upper and lower leaf surfaces; this results in a characteristic clear patch in the leaf where the green chlorophyll has been removed. Many species can be identified in the larval stage by considering both the shape and position of the mine on the host plant and the identity of the host. The adults have narrow wings like those of a mosquito (wing expanses of 5-10 mm are typical), usually with a wide hairlike fringe. The leaf mining microlepidoptera are generally rarely collected and poorly known, especially in western North America. The second subgroup of microlepidoptera are the “case-bearers”. Four families (Adelidae, Incurvariidae, Tineidae and Coleophoridae) are small, narrow-winged moths, like the leaf-miners, but the larvae conceal themselves in a case made from of silk and debris; the larvae are often miners when small and build a case when they get larger. A fifth family of case-bearers, the Psychidae, or bagworms, are larger; the moths are broader winged, usually 10-12 mm in our species but up to 40 mm in the southern US; the females of most species are wingless and remain in the case to mate, lay their eggs and die. The third subgroup of families is the borers, in which the larvae may bore in the stems of plants, or in the flower heads and fruit. These are varied in size and appearance; the ghost moths (family Hepialidae) are large moths with 25 to 100 mm wingspans; the clear-winged moths (family Sesiidae) are wasp mimics; most other families (e.g. Carposinidae, Momphidae) are small, drably coloured moths similar to leaf-miners. The fourth and largest subgroup of the microlepidoptera are leaf-rollers. Most members of the large families Tortricidae, Gelechiidae, and Pyralidae fall into this category. The adults are generally larger than leaf-miners (wing expanses of 15-30 mm are typical) and the wings are more triangular in shape with only a narrow fringe. The larvae most commonly roll or fold a leaf and tie it with silk, or tie several leaves together, and feed in the protected enclosure. This group includes agricultural pests (e.g. European Corn Borer, *Ostrinia nubilalis*; Oblique-banded Leafroller, *Choristoneura rosaceana* (Figure 1); Codling Moth, *Cydia pomonella*), forest pests (e.g. Western Spruce Budworm, *Choristoneura occidentalis*), and household pests (e.g. Indian-Meal Moth, *Plodia interpunctella*). A total of 737 species of microlepidoptera are known from the Montane Cordillera Ecozone. The actual number of species in the Ecozone is probably at least double this number because of our poor knowledge of the leaf mining microlepidoptera. A significant portion of the recorded microlepidoptera are known from only one or two localities in the area so little can be said of range limits or distribution patterns.

The second major division of the Lepidoptera is the macrolepidoptera which contains the larger moths and the butterflies. For discussion purposes, we treat the macrolepidoptera in two groups, the “macromoths” (GROUP

II) and the butterflies (GROUP III). The 12 families of macromoths contain 1105 species in the Montane Cordilleran Ecozone, this comprising 93% of the entire known macromoth fauna from British Columbia (see Table 1).

Figure 5. Larvae of the Western Tent Caterpillar (Lasiocampidae) are important forestry pests.

Figure 8. Larvae of the Old World Swallowtail (Papilionidae) are brightly coloured.

Figure 6. Larvae of the Gypsy Moth (Lymantriidae) are important forestry pests.

Two families, the inch-worms (Geometridae) and cutworms (Noctuidae) make up 90% of the Group III fauna. The cutworms alone, with 696 known species in the Ecozone, make up 33% of the entire Lepidoptera fauna. The larvae usually are exposed when feeding but are usually protected by spines (Saturniidae), tufts of hair (Arctiidae (Figure 2), Lymantriidae, Lasiocampidae, some Noctuidae), or cryptic colouration (Geometridae, Drepanidae, Notodontidae, most Noctuidae (Figure 3)).

Figure 9. The larva of the Atlantis Fritillary (Nymphalidae) is protected by branching spines.

Many noctuid larvae hide during the day in the soil and leaf litter and come out at night to feed (Figure 4). This group includes our largest Lepidoptera with the Ceanothus Silk Moth (*Hyalophora euryalis*) having a wingspan up to 13 cm. Typical wingspans of most macrolepidoptera are between 25 and 40 mm although some species may be as small as 12 mm (e.g. Noctuidae: *Hypenodes*). This group contains some very familiar pests such as Tent Caterpillars (Lasiocampidae: *Malacosoma*) (Figure 5), Tomato Hornworm (Sphingidae: *Manduca quinquemaculata*), introduced into the

Ecozone from farther south, Gypsy Moth (Lymantriidae: *Lymantria dispar*) (Figure 6), Armyworm (Noctuidae: *Pseudaletia unipuncta*) Speckled Green Fruitworm (Noctuidae: *Orthosia hibisci*) (Figure 7), and Corn Earworm (Noctuidae: *Helicoverpa zea*). Unfortunately, only a few groups of macrolepidoptera are popular with amateur collectors so distributional information on most families remains rather spotty. Popular groups are the Sphinx (Hawk Moth) family (Sphingidae), the Giant Silk Moths (Saturniidae), Tiger Moths (Arctiidae), and a group of cutworm moths called Underwing Moths (Noctuidae: genus *Catocala*).

The third group (GROUP III), a subset of the macrolepidoptera, is the butterflies. Six families of butterflies occur in the Montane Cordillera Ecozone and 173 species. The combination of colourful patterns, diurnal flight, and abundance of identification aids, has made butterflies the

Figure 11. The larva of the Common Sooty Wing (Hesperiidae) is covered by a dense layer of short hairs.

most popular insect group with amateur entomologists. As a result, the distribution of the butterflies in Canada in general and the Montane Cordillera Ecozone in particular is well known so it is these patterns that form the primary basis for the analysis of distribution patterns given below. As in the macrolepidoptera, most butterfly larvae feed exposed and

rely on cryptic colouration, warning colouration (Figure 8), or spines (Figure 9) for protection. The majority of butterfly larvae are covered with a dense layer of short hair that gives them a fuzzy appearance (e.g. Lycaenidae (Figure 10), Hesperiidae (Figure 11), Pieridae (Figure 12), and some Nymphalidae (Figure 13)) or are armed with impressive branching spines (e.g. most Nymphalidae (Figure 14)). Others, such as the Monarch (*Danaus plexippus*) (Figure 15) and some of the Swallowtails (Papilionidae) are toxic to predators and have a warning colouration. Many butterflies are powerful fliers and some are strongly migratory; however, only five butterfly species occur in the Ecozone as seasonal migrants.

LEPIDOPTERA DIVERSITY IN THE MONTANE CORDILLERA ECOZONE

The Montane Cordillera Ecozone supports a diverse fauna of butterflies and moths with 2,015 species recorded in 67 families. The impressive diversity of the Montane Cordillera Ecozone results from two factors: 1) the distinct ecological habitats within the Ecozone, and 2) the number of adjacent Ecozones that have small but diverse habitat extensions that extend into the Montane Cordillera Ecozone. The adjacent Ecozones that filter into the Montane Cordillera Ecozone are: 1) the Plains Ecozone, which extends into the Rocky Mountain foothills in southwestern Alberta and in a small area in British Columbia; 2) the Boreal Plains Ecozone, which extends through the Peace River district into the Fraser Basin and Fraser Plateau Ecoregions; 3) Boreal Cordillera Ecozone, which extends into the northern portion of the Montane Cordillera Ecozone and is probably best studied on Pink Mountain (Figure 16) at the extreme northern limit of the Montane Cordillera Ecozone; 4) the Pacific Maritime Ecozone with species from the Coastal Mountains occurring in the western portion of the Montane Cordillera Ecozone, particularly in the Lillooet area, and species from the Lower Mainland that extend along the Fraser River to Lytton and beyond.

Table 1 lists the 67 families of Lepidoptera known from the Ecozone in the three groups described above under

Figure 15. Larvae of the monarch (Nymphalidae) have warning colouration.

DISTRIBUTION PATTERNS

This analysis of distribution patterns of Lepidoptera of the Montane Cordillera Ecozone relies heavily on the distributional data from butterflies but other examples are included from the moths. For reference, a check list of the macro-moths and butterflies known from the Montane Cordillera Ecozone is included in appendices 1 and 2.

There are three main terrestrial habitat types within the Ecozone: 1) arid bunchgrass habitat characteristic of the Great Basin (Figure 17); 2) montane forests (Figures 18, 19); and 3) alpine tundra habitat above treeline (Figures 20-22). We examine each of these habitat types, and give examples of distribution patterns associated with them.

Arid bunchgrass habitat characteristic of the Great Basin occurs in the Ecozone primarily in five disjunct areas. The richest areas in terms of habitat and species diversity, is the Okanagan Valley, and to a lesser extent along the Similkameen River (especially near Keremeos (Figure 23)). More disjunct, and therefore more depauperate habitats are along the Fraser and Thompson Rivers (mainly from Kamloops to Lillooet (Figure 24)), farther north along the Fraser River (especially near Williams Lake (Figure 25)), and in extreme southeastern British Columbia and Waterton Lakes National Park in adjacent Alberta. Table 2 lists 16 species of butterflies most closely associated with Great Basin habitats and in which of these five areas they occur.

TABLE 2: Distribution of aridland butterflies

Species	Okanagan Valley	Similkameen Valley	Thompson/ Fraser Rivers	Williams Lake	SE BC and SW Alberta
<i>Hesperian juba</i> Juba Skipper	X	X	X	X	X
<i>Hesperia colorado</i> Western Branded Skipper	X	X	X	X	X

Figure 20. Acid soils in the alpine tundra of the Coast Range support many species of Ericaceae. The igneous rock has no buffering capacity.

Figure 23. Arid bunchgrass habitat in the Okanagan and Similkameen Valleys is being lost to orchards and vineyards (left) and destroyed by over-grazing (on the right).

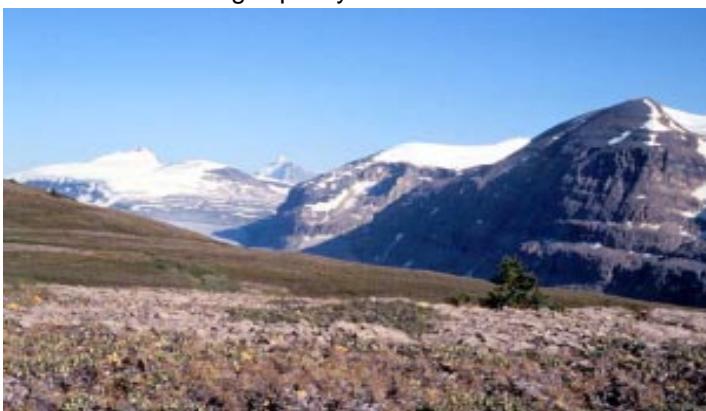

Figure 21. Alpine tundra in the Rockies and Purcells is mostly on sedimentary rock. The neutral soils grow different plants (thus different insects) than the acid soils of the Coast Mountains and Cascades.

The diversity is greatest in the Okanagan Valley, drops off slightly in the nearby Similkameen Valley, and more abruptly moving farther north to the more disjunct areas near Kamloops and Williams Lake. The arid slopes east of the Kootenay River in southeastern BC and Waterton National Park in southeastern Alberta, are near the American border but are not as closely associated with Great Basin habitat farther south as are the Okanagan and Similkameen

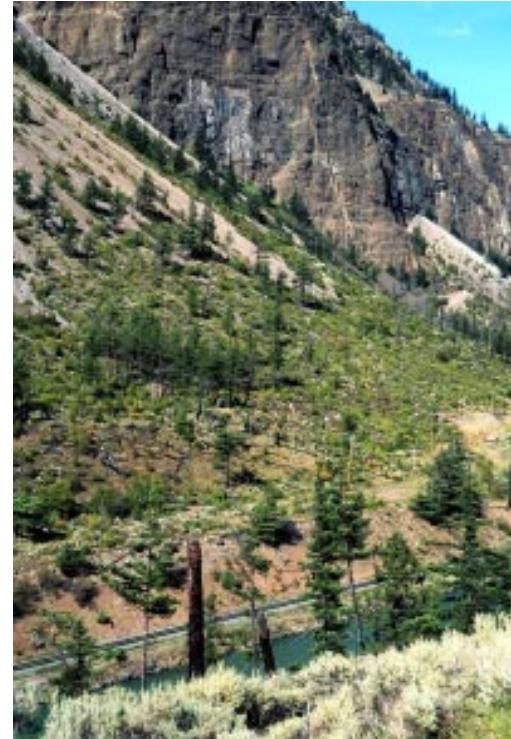

Figure 24. Arid bunchgrass/ponderosa pine habitat near Lillooet is home to a rich and diverse moth fauna.

Figure 25. Arid bunchgrass habitat near Williams Lake.

Valleys. No similar comparison is possible with the moth fauna because only the Okanagan Valley and the Kamloops area have been adequately collected and there is a great need for selective studies even there. Rich Okanagan habitats like the *Purshia tridentata* slopes east of Vaseaux Lake in the Bighorn Sheep preserve, the diverse habitats on Anarchist Mountain east of Osoyoos, and the extensive sagebrush areas at White Lake west of Penticton, have barely been studied for moths. Because of the loss of natural habitat in most of the Okanagan Valley, it is critical to determine the true nature of the diverse Lepidoptera fauna that survives there, which areas are critical, and which other arid habitats in British Columbia that they occur, in order to assess topics like threatened and endangered moths and habitats in British Columbia. Some species are widely distributed in both the Great Basin and Great Plains areas and occur throughout southern BC and Alberta wherever suitable habitat occurs. Some examples of this are Acmon Blue (*Icaricia acmon*), Boisduval's Blue (*Icaricia icarioides*), Arrowhead Blue (*Glaucopsyche piasus*), and Melissa Blue (*Lycaeides melissa*). Montane forests are probably the most dominant habitat in the Montane Cordillera Ecozone. These

tend to be dominated by Douglas-fir but support and impressive array of other conifer species, as well as areas of deciduous forests, especially poplars and cottonwoods. Montane forest distributions fall into two categories, with exceptions for host specific species limited to specific areas. The two range types are Boreomontane species and Montane Cordillera species. Typical ranges for Boreomontane species include both the boreal forest zone across most of central Canada and the comparable habitat in the western mountains. Most of these species occur in relatively mesic habitats like spruce forests. Some range as far south in BC as south-central BC (such as north and east of Kamloops), south to the higher areas of Manning Park and extreme north of Washington State, and some extend down the Rocky Mountain system to northern New Mexico and the White Mountains of eastern Arizona. Montane Cordillera species typically occur through most of the montane areas of western United States, often in more xeric habitats such as pine forests, and occur northward in BC to central BC and occasionally to southern Yukon. In some instances closely related species occupy these two general ranges and occasional hybrids may occur where their ranges come together near Kamloops. Examples of Boreal/Montane species pairs are the White Admiral (*Limenitis arthemis*) and Lorquin's Admiral (*Limenitis lorquini*), and the Canadian and Western Tiger Swallowtails (*Papilio canadensis* and *Papilio rutulus*). A more restricted type of montane distribution are species with ranges that extend northward in the Cascades Range from northern California into the southwestern part of the Ecozone in the Manning Park area (the Okanagan Range Ecoregion). The Indra Swallowtail (*Papilio indra*) and Hoffmann's Checkerspot (*Chlosyne hoffmanni*), are examples of this pattern. Arctic and alpine tundra habitat occurs above treeline throughout the Ecozone. This includes associations with mesic alpine habitat in most of the Ecozone that is characterized by species that occur in the mountains of western United States and Canada, and dry tundra habitat, mainly in the Rocky Mountain rain shadow in Alberta, where the ranges of many arctic species extend southward into the Ecozone. Some species more commonly associated with arctic habitat extend into the northern portion of the Ecozone, and include Eversmann's Parnassian (*Parnassius eversmanni*) (Figure 26), Palaeno Sulphur (*Colias palaeno*) (Figure 27), and Polaris

Figure 26. Eversmann's Parnassian (*Papilionidae*) is an arctic species that enters the Ecozone in the north.

Figure 27. The Palaeno Sulphur (*Pieridae*) is an arctic species that enters the Ecozone in the north.

Figure 28. The Polaris Fritillary (*Nymphalidae*) is an arctic species that enters the Ecozone in the north.

Figure 29. The Dingy Fritillary (*Nymphalidae*) is an arctic species that follows the Rocky Mountains into the USA.

Figure 30. The Polixenes Arctic (*Nymphalidae*) is an arctic species that follows the Rocky Mountains into the USA.

Fritillary (*Boloria polaris*) (Figure 28), while others like the Dingy Fritillary (*Boloria improba*) (Figure 29) and the Polixenes Arctic (*Oeneis polixenes*) (Figure 30) extend down the drier east slopes of the Rocky Mountains to southern Alberta. Many other species are less specific and occur in alpine habitats throughout the Ecozone; these include moths such as *Merolonche lupini* (Figure 31), *Lasionycta poca* (Figure 32), and *Lasionycta luteola* (Figure 33).

Figure 31. *Merolonche lupini* (Noctuidae) is a subalpine species that occurs throughout the Ecozone.

Figure 32. *Lasionycta poca* (Noctuidae) is an alpine species that occurs throughout the Ecozone.

Figure 33. *Lasionycta luteola* (Noctuidae) is an alpine species that occurs throughout the Ecozone.

LEPIDOPTERA MIGRANTS/VAGRANTS

Only about 20 species of Lepidoptera occur in the Ecozone as seasonal migrants. Five of these are butterfly species (3 % of the butterfly fauna); this compares with 100 species of Lepidoptera and 30 species of butterflies (21 % of the fauna) in the Mixedwood Plains Ecozone in southeastern Canada (Lafontaine, 1996). The number of tropical and subtropical moths and butterflies that migrate northward each summer is much greater in eastern North America than in the west. The Atlantic Coast and Mississippi Valley form natural flyways for migrants, whereas the complex patterns of mountain ranges, desert areas, and diverse habitats in western United States and Canada seem to limit the northward movement of species. The most famous of the migrants is the Monarch (*Danaus plexippus*) (Figure 34); the population in the Montane Cordillera Ecozone overwinters in California, whereas those that occur in central and eastern Canada overwinter in Mexico. The Painted Lady (*Vanessa cardui*) (Figure 35) is another regular migrant. Three others, the Sachem (*Atalopedes campestris*), the American Lady (*Vanessa virginiensis*) (Figure 36), and the Variegated Fritillary (*Euploea claudia*) (Figure 37), are infrequent

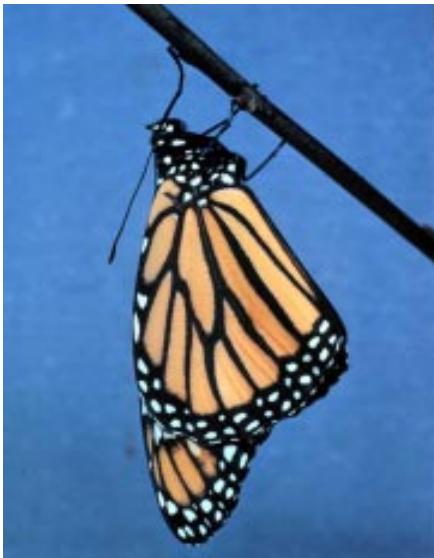

Figure 34. The Monarch (Nymphalidae) overwinters in California and is becoming less common in the Ecozone.

Figure 35. The Painted Lady (Nymphalidae) is a regular visitor to the Ecozone.

Figure 36. The American Lady (Nymphalidae) is an infrequent visitor to the Ecozone.

migrants in the Ecozone. Another group of powerful fliers, the Sphinx Moths (Sphingidae), includes only two migrants (*Agrius cingulata* and *Hyles lineata* (Figure 38)) in the Ecozone compared with 9 migrant species in the Mixedwood Plains Ecozone. Two other families of Lepidoptera show a fair proportion of vagrant species: the Noctuidae and Pyralidae. Among pest species of Noctuidae that migrate regularly into the Montane Cordilleran Ecozone are the Corn Earworm (*Helicoverpa zea*), Variegated Cutworm (*Peridroma saucia*), and Black Cutworm (*Agrotis ipsilon*). Among the Pyralidae, two pests species are migrants: the Alfalfa Webworm (*Loxostege cereralis*) and Beet Webworm (*Loxostege sticticalis*). Only a few species of microlepidoptera other than Pyralidae are migratory, the most famous one being the Diamond-back Moth (*Plutella xylostella*) which sometimes migrates in huge swarms numbering many millions of moths and has even reached Greenland. Some authors (e.g. Smith, 1994) believe that the spread of this species has been greatly aided by man and list it as an introduced species in British Columbia.

Figure 37. The Variegated Fritillary (Nymphalidae) is an occasional visitor to the Ecozone.

Figure 38. The White Lined Sphinx (Sphingidae) regularly visits the Ecozone.

RECENT CHANGES IN DISTRIBUTION

Recent changes in Lepidoptera distribution involve both expanding ranges and contracting ranges. Natural changes in distribution can be difficult to detect because they tend to be slower and more subtle than the dramatic changes caused by man. Unfortunately, most expanding ranges involve introduced species and most contracting ranges relate to the destruction of natural habitats.

INTRODUCED SPECIES

British Columbia has a disproportionately high number of introduced species. A list of 67 exotic species in British Columbia was given by Smith (1994) and this list is discussed and expanded in appendix four, bringing the current total to 90. A significant proportion of these species were first introduced into North America in the Vancouver area, and others that were introduced eastern North America have been introduced into the west independently from Eastern Asia, or secondarily from eastern North America, through the Vancouver area. This number is more than double the number of introduced species found in the Mixedwood Plains Ecozone. Most of the introduced Lepidoptera species in British Columbia are restricted to the Pacific Maritime Ecozone, mainly the greater Vancouver area, and have not been able to spread over the mountains into the interior. The exceptions to this generality are agricultural pests, especially those associated with fruit trees and grapes, that have been transported to into the interior, probably with nursery stock.

Native Species

Changes in distribution among native species is much more difficult to document because it requires the use of negative evidence. For example, if a species has moved into an area, or has withdrawn from an area, these can only be demonstrated if the lack of collections can be taken as valid evidence that the species is, or was, absent. Although several species of butterflies are believed to have been extirpated from the Pacific Maritime Ecozone (Guppy et al., 1994), none is known to have disappeared from the Montane Cordilleran Ecozone. One species, the Mormon Metalmark (*Apodemia mormo*) (Figure 39), considered endangered in British Columbia (Guppy et al., 1994), was previously known from the Okanagan and Similkameen Valleys. It has disappeared from the Okanagan Valley, but is expanding its range in the Similkameen Valley along 50 km of roadside near the US border where its larval food plant, Snow Buckwheat (*Eriogonum niveum*), is spreading (Layberry et al., 1998). The Sandhill Skipper (*Polites sabuleti*) was first found in British Columbia in 1975 when a number of colonies were discovered in abandoned lots in and around Penticton (Garland, 1977). The species continues to abound in these areas and has now been found elsewhere in the Okanagan as well. The fact that this species was not previously collected in the Okanagan, despite relatively heavy butterfly

collecting, and the disturbed habitats that it frequents, suggests that this species may have moved into the area recently from northern Washington where it has been known to occur for many years.

ENDANGERED AND THREATENED SPECIES

Other than butterflies, most species of Lepidoptera are not well enough collected or regularly monitored in the Montane Cordillera Ecozone to determine whether or not they are endangered or threatened. Many species of moths, especially among the microlepidoptera, have only been collected once or twice in the Ecozone, and may well turn out to quite common in the right habitat. Since so much of the original bunch-grass habitat of the Okanagan Valley has been eliminated, it is possible that some of the many moths known only from this area in Canada might be endangered but there has been so little moth study in the area that it is not possible to determine this for any species. It is quite possible that some species of moths disappeared from Canada before we ever knew that they occurred here and that some species previously recorded in Canada may no longer occur. Many species occur in this type of habitat in northern Washington but are unknown in Canada. Some of these may yet be found here, others may already have been extirpated. The only moth species in the Montane Cordillera Ecozone that is either endangered or extirpated is the cutworm *Copablepharon hopfingeri*. This species was historically known only from a few small dune areas in Washington and one near Robson, BC. Efforts to rediscover the species at the known and other sites have been unsuccessful. In BC, the dunes at the previously known sites have been so altered that it is unlikely the species still occurs at them, although it still survives near the type locality in Washington State.

Two reports on butterflies of conservation concern in British Columbia (Guppy and Shepard, 1994 and Guppy et al., 1994) identified 52 species and subspecies of concern in British Columbia. Of these, 17 occur in the Montane Cordillera Ecozone. One (*Egleis Fritillary, Speyeria egleis*) was reported from Canada in error (Layberry et al., 1998) and a second, the Viceroy (*Limenitis archippus*) has been extirpated from British Columbia. The Viceroy is primarily a butterfly of eastern United States and southern Canada east of the Rocky Mountains but a thriving population existed in central Washington and the southern interior of British Columbia until 1916, but the population declined rapidly between 1916 and 1920 with only occasional reports of the species in BC until 1930 and in Washington until 1940 (Guppy et al., 1994). The reason for the decline of the western population of the Viceroy is unknown since its habitat, roadside and streamside willow and poplar areas are abundant. Of the 15 species of concern remaining, four are classified as "endangered", two as "threatened", six as "vulnerable", and three as unknown. The four endangered species are: Mormon Metalmark (*Apodemia mormo*), Behr 's Hairstreak (*Satyrium behrii*), Sooty Hairstreak (*Satyrium*

fuliginosum), and Grey Copper (*Lycaena dione*). The Mormon Metalmark, known at present only from the Similkameen Valley and discussed above under species with expanding ranges, should probably now be considered as vulnerable rather than endangered but the status of the species needs to be monitored. Behr's Hairstreak is known only from the southern Okanagan Valley where it is closely associated with remaining stands of its larval host plant Antelope Brush (*Purshia tridentata*). Sooty Hairstreak is known from the Similkameen Valley, Anarchist Mountain in the southern Okanagan, and Waterton National Park in southwestern Alberta; it occurs on dry brushy slopes where lupines, the larval host plant, occurs. The Grey Copper is primarily a Great Plains species occurring from western Ontario to western Alberta with a single colony known in British Columbia at Elizabeth Lake near Cranbrook. The larva feeds on Dock (*Rumexspp.*). The two "threatened" species are the Sonoran Skipper (*Polites sonora*), restricted to the Similkameen Valley, and the California Hairstreak (*Satyrium californicum*), which occurs mainly in the Similkameen and Okanagan Valleys.

Figure 39. The Mormon Metalmark (Riodinidae).

The six "vulnerable" species are: Nevada Skipper (*Hesperia nevada*, Similkameen and Okanagan Valleys), Indra Swallowtail (*Papilio indra*, Manning Provincial Park near Allison Pass), Lilac-bordered Copper (*Lycaena nivalis*, Okanagan Valley), Western Green Hairstreak (*Callophrys affinis*, Okanagan Valley), Eastern Tailed Blue (*Everes comyntas*, south-eastern Kootenays), and Gillette's Checkerspot (*Euphydryas gillettii*, East Kootenays). Of these the Eastern Tailed Blue tends to be sporadic and invasive at the northern edge of its range, being common only in southern Ontario, so its continued existence in BC needs to be monitored. Finally three species are listed by Guppy et al. (1994) as "unknown" (Alberta Fritillary, *Boloria alberta*, Magdalena Alpine, *Erebia magdalena* (Figure 40), and White-veined Arctic, *Oeneis bore* (Figure 41)). All three belong to the group of species associated with dry alpine tundra in western Alberta and have only rarely been recorded in the Montane Cordillera Ecozone in British Columbia. The Alberta Fritillary has an extremely small range in southwestern Alberta with two locations in adjacent BC. The White-veined Arctic is widespread in northern Canada and northern BC with its range extending southward in the Rocky Mountains

to southwestern Alberta and one location in adjacent BC. The Magdalena Alpine occurs locally in the Rocky Mountain region of the United States from Montana to New Mexico; in Canada it has been recorded only at four locations, two in the Wilmore Wilderness Area in Alberta, one near McBride and one in Stone Mountain Provincial Park in British Columbia. The remote nature of the habitat of these three species in the Ecozone is the reason for the "unknown" status, but known colonies should be monitored and additional colonies reported.

Figure 40. The Magdalena Alpine (Nymphalidae) occurs on scree slopes in the Rocky Mountains.

Figure 41. The White Veined Arctic (Nymphalidae).

It is clear that the most critical areas in the Montane Cordillera Ecozone, in terms of habitat frailty, habitat loss, and threatened and endangered species are the Okanagan and Similkameen Valleys. This is obvious from the butterflies and we can only speculate that the same would be true of the moths, which outnumber butterflies in diversity by a 10:1 ratio in the Ecozone, and probably outnumber them by 20:1 according to the expected moth/butterfly ratio given by Lafontaine and Wood (1997).

CONCLUSIONS

The Montane Cordillera Ecozone supports a diverse fauna of butterflies and moths with 2,015 species recorded, 43% of the entire Lepidoptera fauna of Canada.

Our knowledge of the Lepidoptera fauna of the Ecozone in terms of distribution, abundance, habitat requirements, and life history, varies greatly from group to group. These data are well known only for a few groups such as the butterflies and some families of large moths (e.g. Giant Silk Moths (*Saturniidae*) and Sphinx Moths (*Sphingidae*)). Other groups, such as Cutworm Moths (*Noctuidae*), Tiger Moths (*Arctiidae*), Geometer Moths (*Geometridae*), and Prominent Moths (*Notodontidae*), are moderately well known, at least in terms of general distribution and abundance. Most of the 49 families of Microlepidoptera are poorly known in the Ecozone; although the species diversity of families such as Pyralidae, Tortricidae, Hepialidae, Limnacodidae, and Hepialidae are probably about 80% known.

The impressive diversity of the Montane Cordillera Ecozone results from two factors: 1) the distinct ecological habitats within the Ecozone, and 2) the number of adjacent Ecozones that spill over the geographical borders into the Montane Cordilleran Ecozone. The adjacent Ecozones that filter into the Montane Cordillera Ecozone are: 1) the Plains Ecozone, which extends into the Rocky Mountain foothills in southeastern Alberta and in a small area in southwestern British Columbia; 2) the Boreal Plains Ecozone, which extends through the Peace River district into the Fraser Basin and Fraser Plateau Ecoregions; 3) Boreal Cordillera Ecozone, which extends into the northern portion of the Montane Cordillera Ecozone and is probably best studied on Pink Mountain; 4) the Pacific Maritime Ecozone with species from the Coastal Mountains occurring in the western portion of the Montane Cordillera Ecozone, particularly in the Lillooet area, and species from the Lower Mainland that extend along the Fraser River to Lytton and beyond.

There are three main terrestrial habitat types within the Ecozone: 1) arid bunchgrass habitat characteristic of the Great Basin, which occurs in the Ecozone primarily in the Okanagan Valley, and to a lesser extent along the Similkameen River (especially near Keremeos), along the Thompson River (mainly near Kamloops), and along the Fraser River (especially near Williams Lake); 2) montane conifer forests, mainly those of the Rocky Mountain system, which extends from Colorado to Yukon, and the Cascades Range that extends from northern California into the southwestern part of the Ecozone in the Manning Park area (the Okanagan Range Ecoregion); and 3) alpine tundra habitat above treeline throughout the Ecozone, which includes both mesic alpine habitat in most of the Ecozone that is characterized by species that occur in the mountains of western United States and Canada, and dry tundra habitat, mainly in the Rocky Mountain rain shadow in Alberta, where the ranges of many arctic species extends southward into the Ecozone.

Most of the threatened and endangered species in the Ecozone are associated with Great Basin bunchgrass habitat, especially those restricted to the Okanagan Valley where much of the original habitat has been converted to agricultural use.

APPENDIX 1

Appendices 1 and 2 list the macro-moths and butterflies of British Columbia. The species that do not occur in the Montane Cordillera Ecozone are preceded by an asterisk, followed by a number code indicating which Ecozone from which they are recorded (1 = Boreal Plains Ecozone, mainly the Peace River area; 2 = Northern BC, mainly the Boreal Cordillera Ecozone but with a few records from the Taiga Plains Ecozone; 3 = Pacific Maritime Ecozone). Species believed to have been introduced into the Ecozone by man are preceded by "Intro.". The number preceding each species is the check list (MONA) number in the Check list of the Lepidoptera of America north of Mexico (Hodges et al., 1983). After the main lists, there is a list of 13 (plus 1 undescribed) additional macro-moths and 7 butterflies that occur in the Ecozone in the Alberta Rockies but have not yet been reported from the Ecozone in British Columbia. Most species listed are supported by voucher specimens in the Canadian National Collection in Ottawa. A literature citation is given for 29 macro-moths and 11 butterflies that we believe to be validly recorded but there is no voucher material in the CNC; most of these species are in the collections of the Royal British Columbia Museum, Victoria, the University of British Columbia, or the National Museum of Natural History, Washington, DC. Included in the totals are 20 additional undescribed noctuids, which we recognize as occurring in British Columbia.

MACRO-MOTHS OF BRITISH COLUMBIA - 1185

DREPANOIDEA

DREPANIDAE - 11

Thyatirinae - 7

- 6235 *Habrosyne scripta* (Gosse)
- 6237 *Pseudothyatira cymatophoroides* (Gn.)
- 6240 *Euthyatira pudens* (Gn.)
- 6241 *Euthyatira semicircularis* (Grt.)
- *³ 6242 *Ceranemota improvisa* (Hy. Edw.)

- 6243 *Ceranemota fasciata* (B. & McD)
- 6248 *Ceranemota albertae* Clarke

Drepaninae - 4

- 6251 *Drepana arcuata* Wlk.
- 6252 *Drepana bilineata* (Pack.)
- 6253 *Eudeilinia herminiata* (Gn.)
- 6255 *Oreta rosea* (Wlk.)

GEOMETROIDEA

GEOMETRIDAE - 329

Archierinae - 2

- 6256 *Archiearis infans* (Moesch.)
- 6257 *Leucobrephos brephoides* (Wlk.) (McGuffin, 1988)

Ennominae - 134

- 6265 *Protitame matilda* (Dyar)
- 6270 *Protitame virginalis* (Hulst)
- 6272 *Eumacaria latiferrugata* (Wlk.)
- 6279 *Itame occiduaria* (Pack.)
- 6280 *Itame andersoni* (Swett)
- 6283 *Itame sulphurea* (Pack.)
- 6286 *Itame brunneata* (Thunb.)
- 6287 *Itame anataria* (Swett)
- 6288 *Itame quadrilinearia* (Pack.)
- 6290 *Itame loricaria* (Evers.)
- 6292 *Itame exauspicata* (Wlk.)
- 6296 *Itame plumosata* B. & McD.
- 6304 *Itame bitactata* (Wlk.)
- 6306 *Itame decorata* (Hulst)
- 6308 *Itame colata* (Grt.)
- 6321 *Epelis truncataria* (Wlk.)
- 6324 *Elpiste lorquinaria* (Gn.)
- 6327 *Semiothisa perplexata* (Pears.)
- 6330 *Semiothisa ulsterata* (Pears.)
- 6338 *Semiothisa adonis* (B. & McD.)
- 6341 *Semiothisa bicolorata* (F.) (Jones, 1951)
- 6343 *Semiothisa sexmaculata* (Pack.)
- 6344 *Semiothisa signaria* (Hbn.)
- 6346 *Semiothisa unipunctaria* (Wright)
- 6349 *Semiothisa banksianae* Fgn.
- 6364 *Semiothisa setonana* (McD.)
- 6370 *Semiothisa curvata* (Grt.)
- 6371 *Semiothisa nubiculata* (Pack.)

(Layberry et al., 1998)

3961 *Erynnis persius*(Scudder, 1863) - Persius Duskywing

3962 *Pyrgus centaureae*(Rambur, 1840) - Grizzled Skipper

3963 *Pyrgus ruralis*(Boisduval, 1852) - Two-banded
Checkered Skipper

3966 *Pyrgus communis*(Grote, 1872) - Common Checkered
Skipper

3977 *Pholisora catullus*(Fabricius, 1793) - Common
Sootywing

Heteropterinae

3982 *Carterocephalus palaemon*(Pallas, 1771) - Arctic
Skipper

Hesperiinae - Branded Skippers

4007 *Oarisma garita*(Reakirt, 1866) - Garita Skipperling

Intr. 4012 *Thymelicus lineola*(Ochsenheimer, 1808) -

European Skipper

4019 *Hesperia juba*(Scudder, [1871]) - Juba Skipper

4020 *Hesperia comma*(Linnaeus, 1758) - Common Branded
Skipper

4020.1 *Hesperia colorado*(Scudder, 1874) - Western
Branded Skipper

*₁ 4020.2 *Hesperia assiniboia* (Lyman, 1892) - Plains
Skipper

4035 *Hesperia nevada*(Scudder, 1874) - Nevada Skipper

4036 *Polites peckius* (W. Kirby, 1837) - Peck's Skipper

4037 *Polites sabuleti*(Boisduval, 1852) - Sandhill Skipper

4039 *Polites draco*(W.H. Edwards, 1871) - Draco Skipper

4041 *Polites themistocles*(Latrelle, [1824]) - Tawny-edged
Skipper

4043 *Polites mystic*(W.H. Edwards, 1863) - Long Dash
Skipper

4044 *Polites sonora*(Scudder, 1871) - Sonoran Skipper

4049 *Atalopedes campestris*(Boisduval, 1852) - Sachem

4054 *Ochlodes sylvanoides*(Boisduval, 1853) - Woodland
Skipper

4078 *Euphyes vestris*(Boisduval, 1852) - Dun Skipper

4105 *Amblyscirtes vialis*(W.H. Edwards, 1862) - Common
Roadside Skipper

APPENDIX 2

BUTTERFLIES OF BRITISH COLUMBIA – 177

HESPERIOIDEA

HESPERIIDAE - Skippers - 29

Pyrginae - Pyrgine Skippers

3870 *Epargyreus clarus*(Cramer, [1775]) - Silver-spotted
Skipper

PAPILIONOIDEA - True Butterflies

PAPILIONIDAE

- Parnassians and Swallowtails 10

Parnassiinae - Parnassians

- 4153 *Parnassius eversmanni* Ménétriés, 1851 - Eversmann's Parnassian
 4154 *Parnassius clodius* Ménétriés, 1855 - *Clodius* Parnassian
 4155.1 *Parnassius smintheus* Doubleday, [1847] - Rocky Mountain Parnassian

Papilioninae - Swallowtails

- 4166 *Papilio machaon* Linnaeus, 1758 - Old World Swallowtail
 4167 *Papilio zelicaon* Lucas, 1852 - Anise Swallowtail
 4168 *Papilio indra* Reakirt, 1866 - Indra Swallowtail
 4176.1 *Papilio canadensis* Rothschild & Jordan, 1906 - Canadian Tiger Swallowtail
 4177 *Papilio rutulus* Lucas, 1852 - Western Tiger Swallowtail
 4178 *Papilio multicaudatus* Kirby, 1884 - Two-tailed Swallowtail
 4179 *Papilio eurymedon* Lucas, 1852 - Pale Swallowtail

PIERIDAE - Whites and Sulphurs 27

Pierinae – Whites

- 4187 *Neophasia menapia* (C. & R. Felder, 1859) - Pine White
 4191 *Pontia beckerii* (W.H. Edwards, 1871) - Becker's White
 4192 *Pontia sisymbrii* (Boisduval, 1852) - Spring White
 4193 *Pontia protodice* (Boisduval & Leconte, 1829) - Checkered White
 4194 *Pontia occidentalis* (Reakirt, 1866) - Western White
^{*2} 4195.1 *Pieris angelika* Eitchsberger, 1981 - Arctic White
 4195.2 *Pieris marginalis* Scudder, 1861 - Margined White
 4195.3 *Pieris oleracea* Harris, 1829 - Mustard White
 Intr. 4197 *Pieris rapae* (Linnaeus, 1758) - Cabbage White
 4200 *Euchloe ausonides* (Lucas, 1852) - Large Marble
 4201 *Euchloe creusa* (Doubleday, [1847]) - Northern Marble
 4203.1 *Euchloe lotta* Beutenmüller, 1898 - Desert Marble
^{*3} 4206 *Anthocharis sara* Lucas, 1852 - Pacific Orangetip
 4206.1 *Anthocharis stella* W.H. Edwards, 1879 - Stella Orangetip

Coliadinae - Sulphurs

- 4209 *Colias philodice* Godart, 1819 - Clouded Sulphur
 4210 *Colias eurytheme* Boisduval, 1852 - Orange Sulphur
 4211 *Colias alexandra* W.H. Edwards, 1863 - Queen Alexandra's Sulphur
 4211.1 *Colias christina* W.H. Edwards, 1863 - Christina Sulphur
 4212 *Colias occidentalis* Scudder, 1862 - Western Sulphur
 4213 *Colias meadii* W.H. Edwards, 1871 - Mead's Sulphur (Layberry et al., 1998)
^{*2} 4214 *Colias hecla* Lefèvre, 1836 - Hecla Sulphur
 4215.1 *Colias canadensis* Ferris, 1982 - Canada Sulphur

- 4216 *Colias nastes* Boisduval, 1834 - Labrador Sulphur
 4218 *Colias palaeno* (Linnaeus, 1761) - Palaeno Sulphur
 4220 *Colias interior* Scudder, 1862 - Pink-edged Sulphur
 4221 *Colias pelidne* Boisduval & Leconte, 1829 - Pelidne Sulphur
 4222 *Colias gigantea* Strecker, 1900 - Giant Sulphur

LYCAENIDAE

- Coppers, Hairstreaks, and Blues -39

Lycaeninae - Coppers

- 4251 *Lycaena phlaeas* (Linnaeus, 1761) - American Copper
 4252 *Lycaena cuprea* (W.H. Edwards, 1870) - Lustrous Copper
 4253.1 *Lycaena dione* (Scudder, 1869) - Grey Copper (Layberry et al., 1998)
 4259 *Lycaena heteronea* Boisduval, 1852 - Blue Copper
 4261 *Lycaena dorcas* W. Kirby, 1837 - Dorcas Copper
 4262 *Lycaena heliooides* (Boisduval, 1852) - Purplish Copper
 4263 *Lycaena nivalis* (Boisduval, 1869) - Lilac-bordered Copper
 4264 *Lycaena mariposa* (Reakirt, 1866) - Mariposa Copper

Theclinae - Hairstreaks

- 4276 *Satyrium behrii* (W.H. Edwards, 1870) - Behr's Hairstreak
 4277 *Satyrium fuliginosum* (W.H. Edwards, 1861) - Sooty Hairstreak
 4279 *Satyrium californicum* (W.H. Edwards, 1862) - California Hairstreak
 4280 *Satyrium sylvinum* (Boisduval, 1852) - Sylvan Hairstreak
 4280.1 *Satyrium titus* (Fabricius, 1793) - Coral Hairstreak
^{*1} 4285 *Satyrium liparops* (Leconte, 1833) - Striped Hairstreak (Layberry et al., 1998)
 4288 *Satyrium saepium* (Boisduval, 1852) - Hedgerow Hairstreak
 4305 *Callophrys affinis* (W.H. Edwards, 1862) - Western Green Hairstreak
 4307 *Callophrys sheridanii* (W.H. Edwards, 1877) - Sheridan's Hairstreak
 4310 *Callophrys spinetorum* (Hewitson, 1867) - Thicket Hairstreak
^{*3} 4311 *Callophrys johnsoni* (Skinner, 1904) - Johnson's Hairstreak
 4312 *Callophrys rosneri* (K. Johnson, 1976) - Rosner's Hairstreak
 4313 *Callophrys barryi* (K. Johnson, 1976) - Barry's Hairstreak
 4322 *Callophrys augustinus* (Westwood, 1852) - Brown Elfin
 4323.1 *Callophrys mossii* (Hy. Edwards, 1881) - Moss's Elfin
 4324 *Callophrys polia* (Cook & Watson, 1907) - Hoary Elfin
 4329 *Callophrys eryphon* (Boisduval, 1852) - Western Pine Elfin
 4336 *Strymon melinus* Hübner, [1818] - Grey Hairstreak

Polyommatinae - Blues

- 4361 *Everes comyntas* (Godart, [1824]) - Eastern Tailed Blue (Layberry et al., 1998)
4362 *Everes amyntula* (Boisduval, 1852) - Western Tailed Blue
4363 *Celastrina ladon* (Cramer, [1780]) - Spring Azure
4366 *Euphilotes battoides* (Behr, 1867) - Square-spotted Blue
4371 *Glauopsyche piasus* (Boisduval, 1852) - Arrowhead Blue
4372 *Glauopsyche lygdamus* (Doubleday, 1841) - Silvery Blue
4374 *Lycaeides idas* (Linnaeus, 1761) - Northern Blue
4375 *Lycaeides melissa* (W.H. Edwards, 1873) - Melissa Blue
4376 *Plebejus saepiolus* (Boisduval, 1852) - Greenish Blue
4378 *Icaricia icarioides* (Boisduval, 1852) - Boisduval's Blue
4380 *Icaricia acmon* (Westwood & Hewitson, [1852]) - Acmon Blue
*₂ 4383 *Vacciniina optilete* (Knoch, 1781) - Cranberry Blue
4384 *Agriades glandon* (de Prunner, 1798) - Arctic Blue

RIODINIDAE - Metalmarks

- 4402 *Apodemia mormo* (C. & R. Felder, 1859) - Mormon Metalmark

NYMPHALIDAE

- Brush-footed Butterflies

Nymphalinae - Tortoise Shells, Anglewings, etc.

- 4422 *Polygonia satyrus* (W.H. Edwards, 1869) - Satyr Comma
4423 *Polygonia faunus* (W.H. Edwards, 1862) - Green Comma
4427 *Polygonia gracilis* (Grote & Robinson, 1867) - Hoary Comma
4428 *Polygonia oreas* (W.H. Edwards, 1869) - Oreas Comma
4429 *Polygonia progne* (Cramer, [1776]) - Grey Comma
4430 *Nymphalis vaualbum* (Denis & Schiffermüller, 1775) - Compton Tortoiseshell
4431 *Nymphalis californica* (Boisduval, 1852) - California Tortoiseshell
4432 *Nymphalis antiopa* (Linnaeus, 1758) - Mourning Cloak
4433 *Nymphalis milberti* (Godart, [1819]) - Milbert's Tortoiseshell
4434 *Vanessa virginensis* (Drury, 1773) - American Lady
4435 *Vanessa cardui* (Linnaeus, 1758) - Painted Lady
4436 *Vanessa annabella* (Field, 1971) - West Coast Lady
4437 *Vanessa atalanta* (Linnaeus, 1758) - Red Admiral

Argynninae - Fritillaries

- 4447 *Euptoieta claudia* (Cramer, [1775]) - Variegated Fritillary (Layberry et al., 1998)

- 4450 *Speyeria cybele* (Fabricius, 1775) - Great Spangled Fritillary

- 4451 *Speyeria aphrodite* (Fabricius, 1787) - Aphrodite Fritillary

- 4456 *Speyeria zerene* (Boisduval, 1852) - Zerene Fritillary

- 4457 *Speyeria callippe* (Boisduval, 1852) - Callippe Fritillary

- 4459 *Speyeria atlantis* (W.H. Edwards, 1862) - Atlantis Fritillary

- 4459.1 *Speyeria hesperis* (W.H. Edwards, 1864) - Northwestern Fritillary

- 4460 *Speyeria hydaspe* (Boisduval, 1869) - Hydaspe Fritillary

- 4461 *Speyeria mormonia* (Boisduval, 1869) - Mormon Fritillary

- 4462 *Boloria napaea* (Hoffmansegg, 1804) - Mountain Fritillary

- 4463 *Boloria eunomia* (Esper, [1799]) - Bog Fritillary

- 4464 *Boloria selene* (Denis & Schiffermüller, 1775) - Silver-bordered Fritillary

- 4465 *Boloria bellona* (Fabricius, 1775) - Meadow Fritillary

- 4466 *Boloria frigga* (Thunberg, 1791) - Frigga Fritillary

- 4467 *Boloria improba* (Butler, 1877) - Dingy Fritillary

- 4469 *Boloria epithore* (W.H. Edwards, [1864]) - Pacific Fritillary

- 4470 *Boloria polaris* (Boisduval, [1828]) - Polaris Fritillary

- 4471 *Boloria freija* (Thunberg, 1791) - Freja Fritillary

- *₂ 4471.1 *Boloria natazhati* (Gibson, 1920) - Beringian Fritillary

- 4472 *Boloria alberta* (W.H. Edwards, 1890) - Alberta Fritillary (Layberry et al., 1998)

- 4473 *Boloria astarte* (Doubleday & Hewitson, [1847]) - Astarte Fritillary

- 4475 *Boloria chariclea* (Schneider, 1794) - Arctic Fritillary

Melitaeinae - Checkerspots and Crescents

- 4481.1 *Phyciodes cocyta* (Cramer, [1777]) - Northern Crescent

- 4482 *Phyciodes batesii* (Reakirt, 1865) - Tawny Crescent (Layberry et al., 1998)

- 4483 *Phyciodes pratensis* (Behr, 1863) - Field Crescent

- 4487 *Phyciodes pallidus* (W.H. Edwards, 1864) - Pale Crescent

- 4488 *Phyciodes mylitta* (W.H. Edwards, 1861) - Mylitta Crescent

- 4492 *Chlosyne palla* (Boisduval, 1852) - Northern Checkerspot

- 4496 *Chlosyne damoetas* (Skinner, 1902) - Damoetas Checkerspot

- 4497 *Chlosyne hoffmanni* (Behr, 1863) - Hoffmann's Checkerspot (Layberry et al., 1998)

- 4517 *Euphydryas chalcedona* (Doubleday, [1847]) - Variegated Checkerspot

- 4520 *Euphydryas editha* (Boisduval, 1852) - Edith's Checkerspot

Limenitidinae - Admirals

- 4521 *Euphydryas gillettii* (Barnes, 1897) - Gillette's Checkerspot (Layberry et al., 1998)

- 4522 *Limenitis arthemis* (Drury, [1773]) - White Admiral
 4523 *Limenitis archippus* (Cramer, [1776]) - Viceroy
 4525 *Limenitis lorquini* (Boisduval, 1852) - Lorquin's Admiral

Satyrinae

- Satyrs, Nymphs, Ringlets, Arctics, and Alpines

- 4583 *Coenonympha tullia* (Müller, 1764) - Common Ringlet
 4587 *Cercyonis pegala* (Fabricius, 1775) - Common Wood-Nymph
 4589 *Cercyonis stenele* (Boisduval, 1852) - Great Basin Wood-Nymph
 4590 *Cercyonis oetus* (Boisduval, 1869) - Small Wood-Nymph
 4591 *Erebia vidleri* Elwes, 1898 - Vidler's Alpine
 4592 *Erebia rossii* (Curtis, 1835) - Ross's Alpine
 4593.1 *Erebia mancinus* Doubleday & Hewitson, [1851] - Taiga Alpine
 4594 *Erebia magdalena* Strecker, 1880 - Magdalena Alpine
 4596 *Erebia discoidalis* (W. Kirby, 1837) - Red-disked Alpine
 *² 4597 *Erebia theano* (Tauscher, 1809) - Theano Alpine
 4599 *Erebia episodea* Butler, 1868 - Common Alpine
 4604 *Oeneis nevadensis* (C. & R. Felder, [1866]) - Great Arctic
 4605 *Oeneis macounii* (W.H. Edwards, 1885) - Macoun's Arctic
 4606 *Oeneis chryxus* (Doubleday & Hewitson, [1849]) - Chryxus Arctic
 4607 *Oeneis uhleri* (Reakirt, 1866) - Uhler's Arctic
 4608 *Oeneis alberta* Elwes, 1893 - Alberta Arctic (Layberry et al., 1998)
 4610 *Oeneis bore* (Schneider, 1792) - White-veined Arctic
 4611 *Oeneis jutta* (Hübner, [1806]) - Jutta Arctic
 4612 *Oeneis melissa* (Fabricius, 1775) - Melissa Arctic
 4613 *Oeneis polixenes* (Fabricius, 1775) - Polixenes Arctic
 *² 4613.1 *Oeneis rosovi* Kurentzov, 1960 - Philip's Arctic
 4613.2 *Danainae* - Milkweed Butterflies
 4614 *Danaus plexippus* (Linnaeus, 1758) - Monarch

Additional butterflies from the Montane Cordillera Ecozone in Alberta (7).

- 4018 *Hesperia uncas* W.H. Edwards, 1863 - Uncas Skipper
 4202 *Euchloe olympia* (W.H. Edwards, 1871) - Olympia Marble
 4256 *Lycaena hyllus* (Cramer, 1775) - Bronze Copper
 4278 *Satyrium acadicum* (W.H. Edwards, 1862) - Acadian Hairstreak
 4379 *Icaricia shasta* (W.H. Edwards, 1862) - Shasta Blue
 4454 *Speyeria edwardsii* (Reakirt, 1866) - Edwards' Fritillary
 4603 *Neominois ridingsii* (W.H. Edwards, 1865) - Ridings' Satyr

NOTE: Number of butterflies in Montane Cordillera (177 in BC - 11 not in Ecozone + 7 in Alberta = 173 in Ecozone).

NOTE: Jones (1951) lists 155 species of butterflies of which 14 have been reduced to subspecies status, 27 additional

species have been added, and 9 subspecies listed by Jones are now recognized as valid species, bringing the new total to 177.

APPENDIX 3

The following species were recorded from British Columbia in the Jones (1951) list. In the first list are species deleted from the list through synonymy or taxonomic splitting of species and are independent of the identity of British Columbia material.

In the second list are species deleted as misidentifications or probable misidentifications. These are species that are reported so far out of their known range that they can not be accepted without voucher material. Where the original material has been located and reidentified, the correct identity is indicated. All species are listed in their current generic placement with their MONA number.

Species deleted from Jones (1951) list through taxonomic revision.

- 6267 *Protitame hulstiaria* (Tayl.) (= *virginalis*, McGuffin, 1972)
 6589 *Iridopsis emasculata* (Dyar) (= *larvaria*, McGuffin, 1977)
 6730 *Euchlaena mollisaria* (Hulst) (= *johsonaria*, McGuffin, 1981)
 6906 *Nepytia canosaria* (Wlk.) (west pop. described as *freemanii* in 1963)
 7536 *Eupithecia multiscripta* (Hulst) (= *behrensata*)
 8034 *Gnophaelia latipennis* (Bdv.) ssp. *vermiculata* (Grt.) (*vermiculata* a valid species)
 8731 *Euclidia cuspidea* (Hbn.) (BC population as *ardita* Franch. in 1957)
 8737 *Caenurgina distincta* (Neum.) (= *crassiuscula*)
 8810 *Catocala cleopatra* Stkr. (= *faustina*)
 8819 *Catocala pura* Hulst (= *semirelicta*)
 8820 *Catocala nevadensis* Beutenmüller (= *semirelicta*)
 8828 *Catocala arizonae* Grt. (= *junctura*)
 8928 *Syngrapha selecta* (Wlk.) (BC material revised to *viridisigma*)
 9204 *Acronicta hesperida* Sm. (= *dactylina*)
 9206 *Acronicta leporina* (L.) (BC material revised to *vulpina*)
 9213 *Acronicta tartarea* Sm. (prob. only a melanic form of *grisea*)
 9263 *Acronicta distans* (Grt.) (= *impressa*)
 9279 *Merolonche ursina* Sm. (= *lupini*)
 9342 *Apamea multicolor* (Dyar) (= *vultuosa*)
 9348 *Apamea arctica* (Freyer) (= *amputatrix*)
 9349 *Apamea castanea* (Grt.) (= *amputatrix*)
 9362 *Apamea indocilis* (Wlk.) (= *remissa*)
 9364 *Apamea finitima* Gn. (= *sordens*)
 9367 *Apamea dubitans* ssp. *cogitata* (*cogitata* a valid species)
 9371 *Apamea indela* Sm. (= *inficita*)
 9376 *Apamea obscura* (= *niveivenosa*)
 9385 *Apamea mailliardi* (Geyer) (= *zeta*)
 9400 *Eremobina hanhami* (B. & B.) (= *claudens*)

- 9431 *Parastichtis discivaria* (Wlk.) (= *suspecta*)
 9438 *Hypocoena variana* (Morr.) (= *inquinata*)
 9456 *Amphipoea interoceanica* (Sm.) (BC material reidentified as *americana*)
 9519 *Hydraecia columbia* (B. & B.) (= *pallescens*)
 9656 *Platyperigea extima* (Wlk.) (= *montana*)
 9878 *Lithomoia solidaginis* (Hbn.) (N. Amer. material revised to *germania*)
 9890 *Lithophane ferealis* Grt. (= *petulca*)
 9911 *Lithophane torrida* (Sm.) (BC material revised to *pertorrida*)
 9965 *Xanthea lutea* (Ström) (revised to new species)
 9969 *Fishia evelina* (French) (= *discors*)
 9984 *Mniotype versuta* (Sm.) (= *ducta*)
 9985 *Mniotype miniota* (Sm.) (= *tenera*)
 10056 *Apharetra pyralis* (Sm.) (= *dentata*)
 10162 *Sympistis funesta* (Paykull) (= *funebris*)
 10273 *Polia discalis* (Grt.) (BC material revised to *piniae*)
 10308 *Trichordestra meodana* (Sm.) (= *liquida*)
 10310 *Papestra ingravis* (Sm.) (= *quadrata*)
 10332 *Anarta cordigera* (Thunb.) (N. Amer. material revised to *luteola*)
 10336 *Lasionycta leucocycla* (Stgr.) ssp. *poca* (*poca* a valid species)
 10361 *Lasionycta rainieri* (Sm.) (= *mutilata*)
 10431 *Faronta albilinea* (Hbn.) (= *diffusa*)
 10434 *Aletia luteopallens* (Sm.) (= *oxygala*)
 10524 *Nephelodes emmedonia* (Cramer) (N. Amer. Material reidentified as *minians*)
 10659 *Agrotis volubilis* Harv. (BC material reidentified as *obliqua*)
 10670 *Feltia ducens* (Wlk.) (= *jaculifera*)
 10718 *Euxoa colata* (Grt.) (= *lewi*)
 10726 *Euxoa esta* Sm. (= *atomaris*)
 10730 *Euxoa thanatologia* (Dyar) (= *adumbrata*)
 10764 *Euxoa stigmatalis* (Sm.) ssp. *atrofusca* (Sm.) (*atrofusca* = *tessellata*)
 10780 *Euxoa luteotincta* McD. (= *comosa*)
 10780 *Euxoa ontario* (Sm.) (= *comosa*)
 10780 *Euxoa quinque linea* of authors (= *comosa*)
 10785 *Euxoa holoberba* Sm. (= *infausta*)
 10785 *Euxoa sponsa* Sm. (= *infausta*)
 10786 *Euxoa perfusca* (Grt.) (= *satis*)
 10807 *Euxoa verticalis* (Grt.) (= *albipennis*)
 10809 *Euxoa lindseyi* Blkmre. (= *catenula*)
 10816 *Euxoa excellens* (Grt.) (= *perexcellens*)
 10822 *Euxoa andera* Sm. (= *hollemani*)
 10851 *Euxoa redimicula* (Morr.) (BC material revised to *aureipennis*)
 10865 *Euxoa exculta* (Sm.) (= *perpolita*)
 10866 *Euxoa incognita* Sm. (= *nomas*)
 10891 *Ochropleura plecta* (L.) (N. Amer. material revised to new species)
 10915 *Peridroma margaritosa* (Haw.) (= *saucia*)
 10917 *Diarsia cynica* (Sm.) (= *rubifera*)
 10923 *Protexarnis balanitis* (Grt.) (= *squalida*)
 10927 *Spaelotis havilae* (Grt.) (BC material revised to new species)
 10928 *Graphiphora haruspica* (Grt.) (= *augur*)
 10954 *Xestia collaris* (Grt. & Rob.) (= *bugrai*)

- 10967 *Xestia elimata* (Gn.) BC material (revised to new species)
 10974 *Setagrotis plantifrons* (Sm.) (= *pallidicollis*)
 10975 *Setagrotis cinereicollis* (Grt.) (= *pallidicollis*)
 10995 *Cerastis cornuta* (Grt.) (BC material revised to *enigmatica*)
 11018 *Abagrotis sambo* (Sm.) (= *trigona*)
 11050 *Pronoctua pyrophiloides* (Harv.) (BC material revised to *peabodyae*)
 11052 *Ufeus electra* Sm. (= *plicatus*)
 11052 *Ufeus hulsti* Sm. (= *plicatus*)
 11063 *Pyrrhia umbra* (Hufn.) (= *adelia*)
 11082 *Schinia scutosa* (Hufn.) (= *nuchalis*)
 11190 *Schinia separata* (Grt.) (= *acutilinea*)

Species deleted from Jones (1951) list as probable misidentifications.

- 6248 *Ceranemota tearlei* (Hy. Edw.) (reident. as *albertae* Clarke)
 6305 *Itame denticuloides* (Hulst) (misident. southern species)
 6352 *Semiothisa granitata* (Gn.) (Eastern species)
 6401 *Semiothisa meadearia* (Pack.) (= *subminiata*, McGuffin, 1972)
 6461 *Stenoporia dissonaria* Hulst (misident. southern species)
 6582 *Anacamptodes vellivolata* (Hulst) (Eastern species)
 6684 *Drepanulatrix bifilata* (Hulst) (misident. southern species)
 6728 *Euchlaena effecta* (Wlk.) (misident., McGuffin, 1981)
 6733 *Euchlaena amoenaria* (Gn.) (misident., McGuffin, 1981)
 6798 *Ennomos subsignaria* (Hbn.) (Eastern species)
 7046 *Nemoria bistriaria* Hbn. (Eastern species)
 7047 *Nemoria rubrifrontaria* (Pack.) (Eastern species)
 7175 *Leptostales hepaticaria* (Gn.) (Southeastern US)
 7239 *Hydriomena pluviata* (Gn.) (incl. *transfigurata*) (both are eastern)
 7461 *Eupithecia subvirens* Dietze (misident. Calif. species)
 7463 *Eupithecia chiricahuata* McD. (misident. Arizona species)
 7602 *Eupithecia implorata* (Hulst) (misident. Calif. species)
 7603 *Eupithecia cestata* (Hulst) (misident. Calif. species)
 7641 *Lobophora montanata* Pack. (Southern Rockies)
 7701 *Malacasoma americanum* (F.) (Eastern sp. mislabelled or misident.)
 7724 *Coloradia pandora* Blake (escaped or mislabelled)
 8353 *Zanclognatha ochreipennis* (Grt.) (Eastern species)
 8618 *Drasteria graphica* Hbn. (Eastern species)
 8714 *Zale calycanthata* (J.E. Sm.) (Eastern species)
 9184 *Colocasia flavicornis* (Sm.) (Eastern species)
 9237 *Acronicta interrupta* Gn. (Eastern species)
 9243 *Acronicta ovata* Grt. (Eastern species)
 9392 *Luperina morna* (Stkr.) (misident. *venosa*)
 9529 *Aseptis perfumosa* (Hamp.) (Calif. species)
 9680 *Elaphria georgei* (Moore & Rawson) (Eastern species)
 9684 *Elaphria grata* Hbn. (Eastern species)
 9979 *Xylotype capax* (Grt.) (reident. as *acadia*)
 9996 *Brachylomia curvifascia* (Sm.) (misident. *thula*?)

- 10072 *Oncocnemis hayesi*Grt. (misident. *sandaraca*?)
 10187 *Cucullia solidaginis*(Stkr.) (= *serraticornis*; Calif. & AZ)
 10240 *Scotogramma densa*Sm. (would need a specimen)
 10244 *Discestra nevada*(= *ptilodonta*) (Great Basin and southern Rockies)
 10287 *Polia montara*(Sm.) (Southwestern US)
 10304 *Trichordestra legitima*(Grt.) (Eastern species)
 10341 *Lasionycta phoca*(Moesch.) (Eastern species)
 10363 *Lasionycta sedilis*(Sm.) (Colorado)
 10537 *Homorthodes mania*(Stkr.) (Arizona and New Mex.)
 10602 *Hexorthodes senatoria*(Sm.) (Arizona and New Mex.)
 10674 *Feltia subgothica*(Haw.) (misident. *jaculifera* ?)
 10687 *Copablepharon viridisparsum*Dod (reident. as *absidum*)
 10706 *Euxoa dissona*Mösch.) (Northeastern species)
 10725 *Euxoa feniseca*(Grt.) (= *fuscigera*, a Calif. species)
 11045 *Rhynchagrotis anchoceloides*(Gn.) (Eastern species)
 11091 *Schinia perminuta*(Hy. Edw.) (misident. *villosa* ?)
 11157 *Schinia biundulata*Sm. (escaped or mislabelled)

APPENDIX 4

Exotic Lepidoptera in British Columbia (Additions and corrections)

Smith -1994 gives a list of 67 exotic Lepidoptera species recorded in British Columbia, with the comment that this is only a partial list that has been extracted from four literature sources.

Four species must be deleted from this list since they are listed twice:

Coleophora fuscedinella (a synonym of *C. serratella*, which is also listed)
Cnephasia longana (listed twice)
Pardia cynosbatella (listed also as *P. cynasbatella* [sic])
Rhopobota naevana (listed twice)

Three species are native and occur in British Columbia naturally, the latter two as seasonal migrants:

Melanchna picta(Harr.)
Peridroma saucia(Hbn.)
Trichoplusia ni(Hbn.)

Four species appear to have been reported in error:

Cnephasia interjectana(Haw.)
Cnephasia stephensiana(Dbldy.)

Deidamia inscripta(Harr.)
*Papilio polyxenes*F.

To the remaining 56 species, the following 34 can be added, bringing the total of exotic species to 90

Coleophoridae

Colocephora mayrella(Hbn.) (Palaearctic)
Colocephora spinella(Schrank) (Palaearctic)
Colocephora trifolii(Curt.) (Palaearctic)

Gelechiidae

Scrobipalpa atriplicella(F. v. Röslerstamm) (Palaearctic)
Dichomeris marginella(F.) (Palaearctic)

Geometridae

Ennomos alniaria(L.) (Palaearctic)

Gracillariidae

Phyllonorycter blanchardella(F.) (Palaearctic)
Phyllonorycter mespilella(Hbn.) (Palaearctic)

Noctuidae

Apamea ophiogramma(Esper) (Palaearctic)
*Noctua comes*Hbn. (Palaearctic)
Calophasia lunula(Hufn.) (Palaearctic)
*Macronoctua onusta*Grt. (Eastern North. Am.)
Xestia xanthographa(F.) (Palaearctic)

Oecophoridae

Agonopterix alstroemeriana(Cl.) (Palaearctic)
Agonopterix nervosa(Haw.) (Palaearctic)
Depressaria daucella(L.) (Palaearctic)
Hofmannophila pseudospretella(Staint.) (Palaearctic)
Carcina quercana(F.) (Palaearctic)

Psychidae

Dahlica triquetrella(Hbn.) (Palaearctic)

Pyralidae

Achroia grisella(F.) (Palaearctic)
Aglossa caprealis(Hbn.) (Palaearctic)
Cadra cautella(Wlk.) (tropics)
Ephestia elutella(Hbn.) (Old World tropics)
Etiella zinckenella(Tr.) (Palaearctic)
*Pyralis farinalis*L. (Palaearctic)
Trachycera suavella(Zinck.) (Palaearctic)

Schreckensteinidae

Schreckensteinia festaliella(Hbn.) (Palaearctic)

Tineidae

Nemapogon granella(L.) (Palaearctic)

Trichophaga tapetzella(L.) (Palaearctic)

Tortricidae

Enarmonia formosana(Scop.) (Palaearctic)

Clepsis spectrana(Treitschke) (Palaearctic)

Yponomeutidae

Yponomeuta padella(L.) (Palaearctic)

Ypsolophidae

Ypsolopha dentella(F.) (Palaearctic)

Ypsolopha ustella(Cl.) (Palaearctic)
