

**PLANTS+ OF THE BLACK  
RANGE  
OF NEW MEXICO  
VOLUME THREE  
ARRANGED BY ENGLISH COMMON NAME**

**THIS CHECKLIST RECOGNIZES THE  
PLANT COLLECTING EFFORTS OF  
ANNA ISABEL MULFORD  
IN THE BLACK RANGE DURING  
1895.**

# PLANTS+ OF THE BLACK RANGE OF NEW MEXICO

AN ANNOTATED CHECKLIST  
EDITION ONE OF VOLUME THREE

This checklist of the plants (including a few lichen and other non-plant species) of the Black Range of southwestern New Mexico draws from a variety of sources. It is a work in progress and undoubtedly contains errors. If you encounter errors of substantive omission or commission or administrative errors (broken or incorrect links, spelling, etc.) please let me know at [rabarnes@blackrange.org](mailto:rabarnes@blackrange.org) so that the errors can be corrected in the second edition. Your help in this manner will be of benefit to the general community.

## Methodology

This checklist was put together in the following manner:

- ♦ A search of the [SEINet](#) data base (Arizona & New Mexico Chapters) was conducted to determine the possible species in the Black Range;
- ♦ A preliminary search of the [Consortium of North American Lichen Herbaria](#) data base was conducted to determine possible species in the Black Range (this work is incomplete);
- ♦ These listings were matched against the files of the [Vascular Plants of the Gila Wilderness](#) and the [photo galleries of the Black Range website](#);
- ♦ If there was a match, a link to the species page on the Vascular Plants of Gila Wilderness site and/or the appropriate page on [www.blackrange.org](http://www.blackrange.org) was entered in the notes column;
- ♦ A review of the Vascular Plants of the Gila Wilderness data base was conducted to determine if an image from the Black Range is included on the species page at that site. If so, the Vascular Plants of the Gila Wilderness was used to verify that the species can be found in the Black Range. In the notes column this is indicated by an entry for the location where the species was found followed by a '(V)';
- ♦ If the species is included in the photo galleries of the Black Range website, the location where the species was found was entered in the notes column followed by "(B)";
- ♦ For all species not verified for the Black Range in the review of Vascular Plants of the Gila Wilderness or the

Black Range website, a search for specimen sheets was conducted;

- ♦ If a specimen sheet from the Black Range was located for the species, an entry noting this was made in the notes column. The name of the collector and the general location where the specimen was collected was entered in the notes column as a link to the specimen sheet. Such entries are shown in dark blue.
- ♦ Species which are not verified for the Black Range are indicated by a light blue "cell filling" in the first cell in the species row.

## Disclaimers and Points of Clarification

In some cases, you may note that an entry from the Vascular Plants of the Gila Wilderness data base has been entered on the checklist but the initial cell of the species listing is filled in light blue indicating that the species was not verified for the Black Range following the process described above.

It is quite possible that most (perhaps close to all?) species listed in the Vascular Plants of the Gila Wilderness data base are found in the Black Range. But absent a clear documentation of that fact, we have highlighted them for more scrutiny - the light blue cell. On the flip side of the coin, there are some listings in this checklist which are not listed on the Vascular Plants of Gila Wilderness site.

We have attempted to adhere to a conservative definition of "the Black Range". Basically, it is the area confined by the major road systems which border the range; NM-59 in the north (taking in some of the area north of this highway); North Star Road on the NW side of the range; NM-35 from the junction of North Star to NM-152; NM-61 from NM-152 to US-180; US-180 to NM-26; NM-26 to NM-27; NM-27 to Hillsboro; and then roughly northward to Winston/NM-59. These general boundaries are shades of gray - City of Rocks State Park is included, the area to the east of US-180 is not included until the foothills are encountered; and the eastern foothills are included for roughly 5 miles west of Hillsboro and north.

**Black Range website photo galleries:** The images in the galleries have not been thoroughly vetted but are believed to be accurately identified.

In some cases the SEINet listing could not be verified for the Black Range, as noted above. There may be several reasons why this is the case, including inconsistencies found on the specimen sheets which clouded the area of collection and a certain lack of "search capability" on the part of the editor. Most importantly, however, the entries listed in light blue should serve as a guide for the efforts of future collectors.

Vascular Plants of the Gila Wilderness is the premier botanical website for southwestern New Mexico. We all owe a debt to Russ Kleinman and the many other contributors to that site for the work they have done (and regularly do).

The "verification listing" has no other significance than the fact that the indicated source was used for initial verification. It does not indicate, for example, that the specified location is the best location to see the species.

Scientific names may be subject to challenge. The species name used here generally follows the nomenclature used in Vascular Plants of the Gila Wilderness. In some cases speciation determinations may be in dispute. In some cases the "generally accepted name" may be in dispute.

Unless there is no accepted English common name for a species, at least one of the most common names is listed.

### Other Volumes

This checklist is the third volume of a three-volume set. All three volumes present the same information (except there will be minor variations due to digital updates which occurred between the publication dates of the various volumes) but it is arrayed differently.

- ◆ In the first volume, plant species are listed in alphabetical order by family name, and then by

scientific species name (Latin binomial). That volume includes a listing of the plant collectors who collected the specimens referenced in the checklist.

- ◆ In the second volume, species are listed in alphabetical order by scientific species name (Latin binomial). That volume also lists the sites most frequently referenced in the checklist and provides a general description of their locations.
- ◆ In the third volume, species are listed in alphabetical order by English common name. Therefore, multiple entries are possible for each species.

We currently anticipate that the second edition will be issued in 2022.

Your help in improving this, the first edition, will be reflected in the second edition. No further editions are planned at this time.

### Copyright

This checklist is not available in hard copy; you can not buy it. It is free. If you have a copy, please forward it to anyone who might like to have it. The Black Range website does not accept advertisements nor does it accept monetary donations. It is "not-for-revenue". It is about sharing knowledge. This publication is available as a .pdf on the [Black Range Website](#) or in magazine format at our [bookcase](#).

This publication is offered to you under a Creative Commons non-commercial license; you are free to use it for whatever non-commercial purpose you wish. Copyright will be aggressively enforced and penalties exercised in the case of any unauthorized commercial use.

## Anna Isabel Mulford

Dr. Anna Isabel Mulford (1848-1943) received her undergraduate degree from Vassar College in 1886 and her Ph.D., in Botany, from Washington University in 1895. She was the first student to receive a doctorate at that University. The topic of her dissertation was her research on the agaves of the United States. It served as the basis for her book, A Study of the Agaves of the United States, published by the

Missouri Botanical Garden. Her work is an excellent example of how interconnected the world of science can be. In her acknowledgments (for the book above) she mentions Mearns, Townsend, S. B. Parish (see Jan. 2021 issue of the Black Range Naturalist), Wilcox, Macauley, Wooton, and many others.

She collected widely in the United States: 1892 in Idaho, 1892 in Colorado, 1895 in New Mexico, 1898 in Utah, as well as many other locales/dates. During 1895, she collected extensively in the area of the Black Range, from Silver City to the west to Hillsboro and Lake Valley in the east, from Deming in the south to the north part of the range. During her research she discovered several new species.

In "A Study of the Agaves of the United States" she also provides some perspectives on human cultural history as it relates to the uses of various plants. For instance in her discussion of *Agave palmeri* she notes:

"The species most eagerly sought after by the Apaches are *A. Palmeri*, and *A. applanata Parryi*. Mr. Coville gives a very interesting account of the use of even the small *A. utahensis* by the Panamint Indians. The process of cooking seems to be much the same in all cases. A large pit is prepared and lined carefully with small smooth stones. A fire is kept up within the pit until the stones are thoroughly heated, and then raked out leaving the pit ready for use. The plants are trimmed until nothing is left except the hearts, which consist of the sweet juicy stalks and young leaves. These are heaped on the hot stones in the pit, covered over with grass and earth and left to steam for two or three days. By this time all except the fibrous tissue is reduced to a jelly-like mass, very palatable and nutritious. Captain Bourke states that the Apaches put in the pit a plug made of the stalk of the plant. This they pull out as a test, and if the end of the plug is cooked the squaws decide that the whole mass

is." (page 61 of cited work - capitalization of the latin binomial as in the original)

Other descriptions of this process follow in her work. Other uses of the Agave, in the making of rope, for instance, follow.

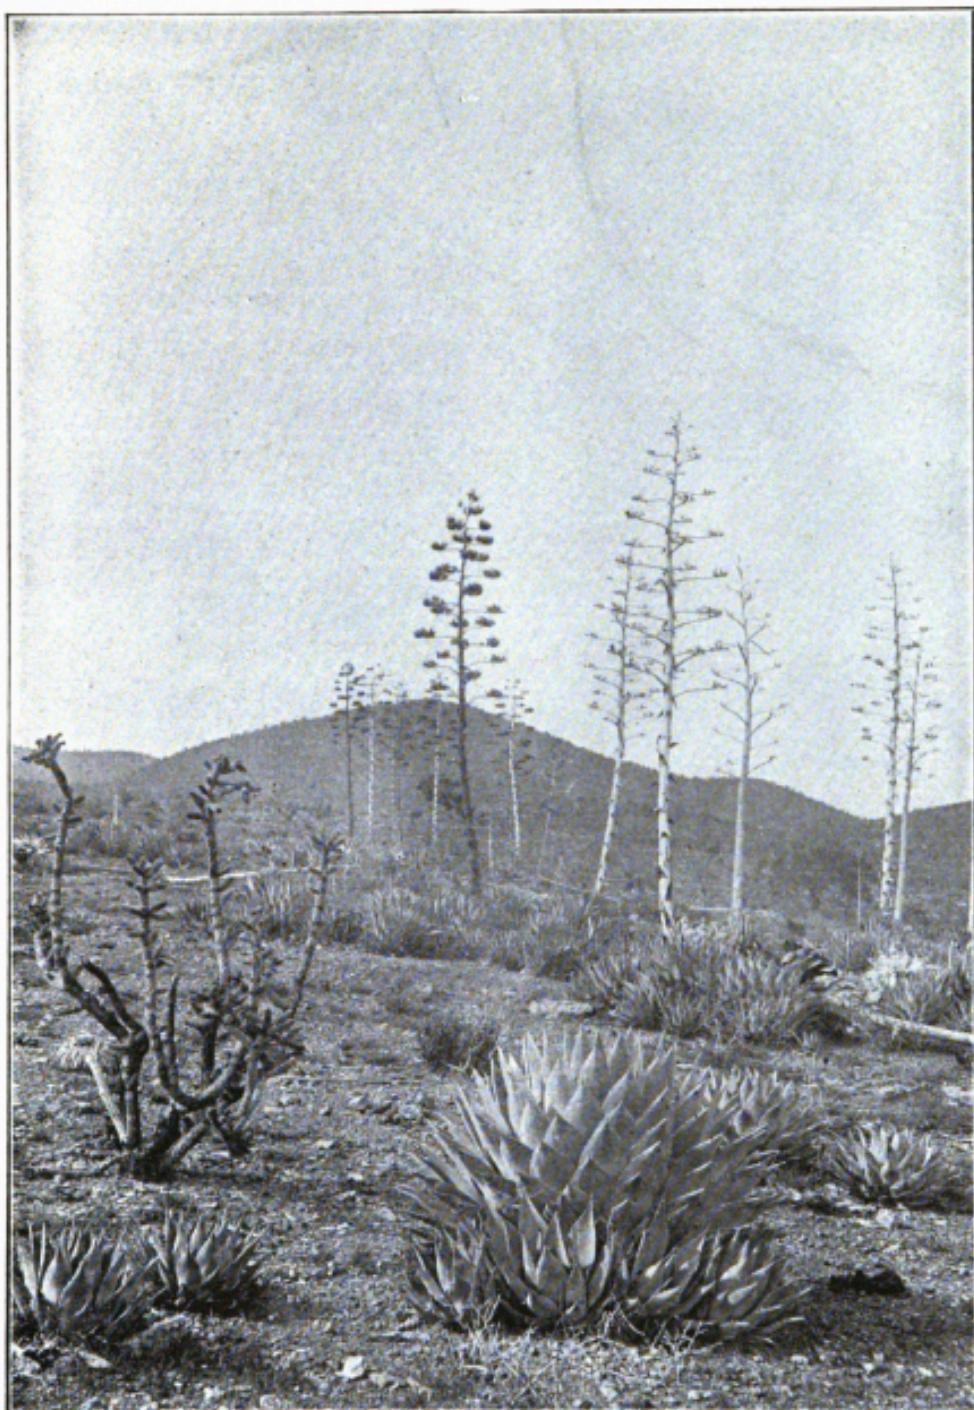

"Professor Toumey's letter already referred to goes on to say that the epidermis and fibers, separated by the squaws from the edible portion of the mescal, are not thrown away, but are taken by the men, thoroughly washed and cleansed, and the fibers well separated, so that they can be made into ropes. Each man takes a quantity of these fibers, and begins to twist. When the strands are of sufficient length, they are tied to trees, and the men backing away from the trees continue to add fibers and to twist. Their work is assisted by small sticks, about a foot long and larger and heavier at one end. By fastening the small end to the rope close to the hand, the twist made is given a greater force by the motion of the heavy end in flying round and round. When the ropes are of the required length, the loose ends are pegged to the ground and left for several days to dry. Professor Toumey writes that hundreds of these ropes were staked out in the camp that he visited." (pp. 62-63 of cited work)

The taxonomic structure of Agave which she presents has changed somewhat in the last 120 years. Of particular note to us in the Black Range is the treatment of *A. applanata* as a species which included *A. parryi*. In speaking of *A. parryi* she notes the following specimens:

"New Mexico, Copper Mines, E . H . Emory, October 19th, 1846 . . . This plant was discovered by Lieut. Emory, October 18, 1846, near the Copper Mines, Santa Rita Mts., New Mexico, on his famous trip to California. He states that "the Apaches make molasses of the plant, and cook it with horse meat." Both Dr. Parry and Dr. Palmer also state that it is the plant used by Indians of the 35th Parallel for making "Mescal", but Dr. Wilcox asserts that the *A. Palmeri* is the only species used in Arizona for that purpose, and also that the cattle will only nibble the *A. Parryi* but that they eat the *A. Palmeri*." (pp 84-85 of cited work)

Dr. George Englemann, in "Notes on Agave", in *Transactions of the Academy of Science of St. Louis, Vol. III, 1868-1877*, printed in 1878, p. 312, added a bit more about the Emory specimen (below).

of the Gila River; fl. June and July.—The botanical history of this species is similar to that of most of the larger Agaves, the material for whose definition must be gathered piecemeal and from many different sources. Oct. 19, 1846, a fruiting specimen was collected near the "Copper Mines" by Lieut. Emory, in the California expedition (see p. 310), l. c. p. 59, now preserved in the Torrey herbarium and mentioned in the Mex. Bound. Botany as a short and broad-leaved form of *A. Americana*. In 1865 Dr. E. Coues sent flowerbuds from Fort Whipple, which seem to

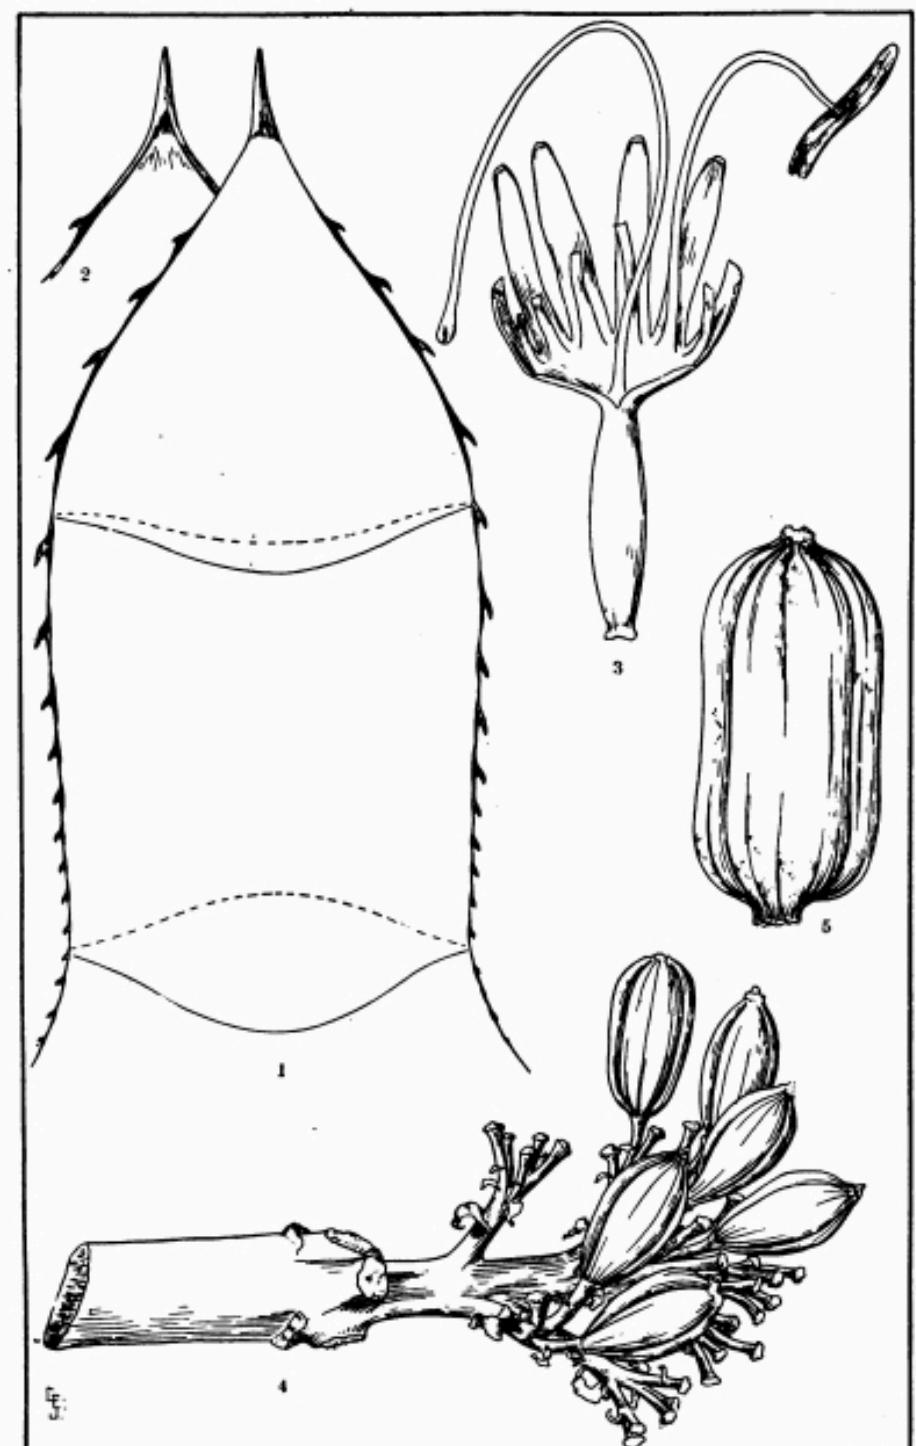

AGAVE APPLANATA, VAR. PARRYI.

Plate 38 from the cited work: *A. applanata parryi*. - From photograph taken by author near Copper Flats, New Mexico . *Opuntia arborescens* Engelm. is seen at the left .

In the [March 1894 issue of The Botanical Gazette](#) she reported on her collecting trip to Idaho in the summer of 1892. The intro to that article is shown here because it gives a good idea of the work being done at that time (albeit to the northwest of the Black Range):

"Notes upon the northwestern and Rocky mountain flora.  
I. - In the summer of 1892 I made a very interesting trip in the northwest. The months of June, July and August were spent in Idaho. My work in that state was done in the sage brush of the southern part, in the Owyhee mountains to the southwest, and in the highlands, foothills and mountains of the central and eastern portions. I traveled by railroad to the principal points, and by stage, carriage or horseback to more distant ones. Of course I walked a good deal. I was well provided with letters of introduction, and there was seldom any difficulty in procuring company whenever desirable, which was necessarily a great part of the time. During the entire season a collection of about eleven hundred species was made, two-thirds of which were from Idaho.

AGAVE APPLANATA, VAR. PARRYI.

Plate 39 from the cited work: *A. applanata parryi* – 1. Outer side of leaf of medium sized plant, X; 2. end-spine and margin from face of leaf; 3. flower, showing insertion of stamens, X 1; 4. portion of fruiting branch, X 3; 5. capsule, X1. Leaf from plant sent to Garden from Pinos Altos Mts.; flowers and fruit from Copper Flats, New Mexico. All collected by author.

Many of these are interesting from the fact that they show new and unexpected localities, and many for showing variations developed under changed conditions. Some plants seem to be quite new. I have learned to regard Idaho as a meeting place of various floras. There one meets with subarctic plants from the north which can even be traced to Siberia, and the Cacti and other southern plants are common. There is a large desert flora and also moist thickets and meadows with a most luxuriant vegetation. The Rocky mountain plants meet those of California. In general, I should say that its vegetation is most nearly allied to that of the Pacific slope. I wish to express my appreciation of the kindness and encouragement I received both from my friends east of the Rockies, and from those I was so fortunate as to make in the state. Had it not been for their efficient assistance I could not have reached many of the distant

***Bouteloua aristiodoides*, collected in the Florida Mountains on August 27, 1895 (shown incorrectly in some data bases as 1995).**

***Aristida adscensionis*, collected at City of Rocks on September 4, 1895.**

**Collected in the Florida Mountains, east of Deming. *Bouteloua barbata* var. *barbata*. Shown with a collection date of August 1995 in data bases (should be 1895).**

and less accessible regions which I visited. Very special thanks are due to Drs. Bessey, Britton, Trelease and Coulter. They not only gave me the best sort of encouragement at the beginning of my trip, but have since extended to me the privileges of their respective herbaria and libraries. My interest and pleasure in the plants have been greatly increased by the very free use I have made of these fine opportunities, which have made my work possible."

In turn, Dr. Mulford provided us with the kindness of sharing her discoveries and knowledge.

# Plants+ of the Black Range - By English Common Name

Family	Scientific Name	Common Name(s)	Notes
Lamiaceae	<i>Prunella vulgaris</i> var. <i>lanceolata</i>	All, Heal	<a href="#">Vas Plants of Gila</a> <a href="#">www.blackrange.org</a> Hillsboro Peak Trail (B)
Fabaceae	<i>Acacia angustissima</i>	Acacia, Prairie	<a href="#">Vas Plants of Gila</a> <a href="#">www.blackrange.org</a> E. of Hillsboro (B)
Fabaceae	<i>Vachellia constricta</i> var. <i>paucispina</i>	Acacia, Western White-thorn	<a href="#">Vas Plants of Gila</a> <a href="#">www.blackrange.org</a> E of Hillsboro (B)
Fabaceae	<i>Acacia angustissima</i>	Acacia, Whiteball	<a href="#">Vas Plants of Gila</a> <a href="#">www.blackrange.org</a> E. of Hillsboro (B)
Euphorbiaceae	<i>Acalypha neomexicana</i>	Acalypha	<a href="#">Vas Plants of Gila</a> <a href="#">O. B. Metcalfe - Kingston</a>
Oleaceae	<i>Forestiera pubescens</i>	Adelia, Prairie	<a href="#">Vas Plants of Gila</a> <a href="#">William C. Martin - 1.5 m S of Wall Lake</a>
Agavaceae	<i>Agave parryi</i> neomexicana	Agave, New Mexico	<a href="#">www.blackrange.org</a> verification? E. of Hillsboro (B)
Agavaceae	<i>Agave parryi</i> var. <i>parryi</i>	Agave, Parry's	<a href="#">Vas Plants of Gila</a> <a href="#">R. Fletcher - Mimbres Mts.</a>
Asteraceae	<i>Agoseris aurantiaca</i>	Agoseris	<a href="#">Vas Plants of Gila</a>
Rosaceae	<i>Agrimonia striata</i>	Agrimony	<a href="#">Vas Plants of Gila</a> <a href="#">T. Dunbar - East Diamond Canyon</a>
Betulaceae	<i>Alnus oblongifolia</i>	Alder, Arizona	<a href="#">Vas Plants of Gila</a> Railroad Canyon (V) <a href="#">www.blackrange.org</a> Trail 134 off of Tierra Blanca Road (B)
Betulaceae	<i>Alnus incana</i> subsp. <i>tenuifolia</i>	Alder, Mountain	<a href="#">Vas Plants of Gila</a> <a href="#">W. C. Martin - nr Wall Lake</a>
Betulaceae	<i>Alnus incana</i> subsp. <i>tenuifolia</i>	Alder, Speckled	<a href="#">Vas Plants of Gila</a> <a href="#">W. C. Martin - nr Wall Lake</a>
Fabaceae	<i>Medicago sativa</i>	Alfalfa	<a href="#">Vas Plants of Gila</a> Exotic NM-152 e of Emory Pass
Berberidaceae	<i>Berberis haematocarpa</i>	Algerita	<a href="#">Vas Plants of Gila</a> <a href="#">www.blackrange.org</a> S. of Hillsboro (B)
Saxifragaceae	<i>Heuchera novomexicana</i>	Alumroot, New Mexico	<a href="#">Vas Plants of Gila</a> <a href="#">L. M. Shultz - Mimbres Lake</a>
Saxifragaceae	<i>Heuchera rubescens</i>	Alumroot, Pink	<a href="#">Vas Plants of Gila</a> <a href="#">www.blackrange.org</a> Hillsboro Peak Trail (B)
