WEIGHT four pounds and an half. Head fmall, covered with a naked wrinkled red fkin, befet with black brifles. This gives it fome refemblance to a Turkey; from which it derives one of the names. The noftrils are very large, and pervious: the whole plumage is dufky, dafhed with purple and green : legs of a dirty flefhcolor: claws black.

Thefe birds are common from Nova Scotia to Terra del Fuego; but
Description.

Place. fwarm in the hotter parts of America; and are found in the inlands, where they are faid to be far inferior in fize to thofe of North America.

In the warm climates they keep in vaft flocks. Perch at night on rocks or trees; fitting with difhevelled wings to purify their bodies,
which are moft offenfively fetid. Towards morning they take flight, foaring at a vaft height, with the gentle motion of a kite; expecting notice of their banquet by the tainted effluvia of carrion, excrements, or any filth. They have moft fagacious noftrils, and fmell their prey at a vaft diftance; to which they refort from all quarters, wheeling about, and making a gradual defcent till they reach the ground. They do not confine themfelves to dead animals, but feed on Snakes, and fometimes on Lambs. They are very tame, and, while they are at their meals, will fuffer a very near approach.

In the torrid zone, particularly about Cartbagena, they haunt inhabited places, and are feen in numbers fitting on the roofs of the houfes, or walking along the ftreets with a nuggifh pace. In thofe parts they are ufeful, as the Ibis in Egyptz. devouring the noifome fubjects, which would otherwife, by the intolerable ftench, render the climate fill more unwholefome than it is.

When thefe birds find no food in the cities, they are driven by hunger among the cattle of the neighboring paftures. If they fee a beaft with a fore on the back, they inftantly alight on it, and attack the part affected. The poor animal attempts in vain to free itfelf from the devourers, rolling on the ground with hideous cries : but in vain; for the Vultures never quit hold, till they have effected its deftruction. Sometimes an Eagle prefides at the banquet, and keeps thefe cowardly birds at a diftance, until it has finifhed its repaft.

Mifchievous as they are in a few inftances ${ }_{2}$ yet, by: the wife and beneficent difpenfations of Providence, they make in the hot climates full recompence, by leffening the number of thofe deftructive animals the Alligators, which would atherwife become intolerable by their multitudes. During the feafon in which thefe reptiles lay their eggs in the fand, the Vultures will fit hid in the leaves of the trees, watching the coming of the female Alligator to depofit its eggs, who then covers them with fand, to fecure them, as the imagines, from all danger: but no fooner does fhe retire into the water,
than the birds dart on the fpot, and with claws, wings, and beak, tear away the fand, and devour the whole contents of the depofitory.

No birds of this genus are found in northern regions of Europe or $A f i a$, at left in thofe latitudes which might give them a pretence of appearing here. I cannot find them in our quarter of the globe ligher than the Grifon Alps *, or Silefia $\dagger$; or at fartheft Kalifh, in Great Poland $\ddagger$. Certainly the Count De Buffon was mifinformed as to the habitation of the fpecies, which he afcribes to Norvay \|. In the Ruffian dominions, the Bearded Vulture of Mr. Edwards, iii. tab. Io6. breeds on the high rocks of the great Altaic chain, and beyond lake Baikal§; which may give it in Europe a latitude of 52. 20, in Afia of $55^{\circ}$

```

VARIES a little from the Britifs fpecies, and is much fuperior in fize. The length three feet three inches ; of wing, twentyfive inches.
Feathers on head, neck, and back, brown, edged with dirty white : chin white: breaft and belly brown, fpotted with white : coverts of wings brown, clouded; primaries black : tail dufky; the middle mottled with white: legs feathered half down.
Phaer. Very common in the northern parts of America, and endures its fevereft winters, even as high as Nervfoundland. Thefe birds prey on fea fowls, as well as land, and on young Seals, which they feize floating, and carry out of the water.

Eagles, and all forts of birds of prey, abound in America, where fuch quantity of game is found. Multitudes are always feen below the falls of Niagara, invited by the carcafes of Deer, Bears, and other animals, which are fo frequently hurried down in attempting to crofs the river above this ftupendous cataract.
This fpecies is very frequent in Kamt $\int_{\text {chatka }}$; and is found during fummer even on the Arctic coaft : is very common in Rufia and Sibiria; nor is it more rare about the Cafpian fea, where they breed on the loftieft trees.

Br. Zool. i. $\mathrm{N}^{0} 43$.

White-tailed Eagle, Edrw. i. ı.-Lev. Mus.
L'Aigle commun, De Bufön, i. 86,-Pl. Enl. 40g.-Lev. Mus.

THE whole plumage is of a dufky-brown: the breaft marked with triangular fpots of white; in which it varies from the Britifb kind: the tail white, tipt with black; but in young birds dulky, blotched with white: legs covered to the toes with foft ruft-colored feathers: vent feathers of the fame color.

Inhabits Hudfon's Bay, and northern Europe as far as Dronthein *. Place。 Is found on the higheft rocks of the Uralian chain, where it is not covered with wood $\dagger$; but is moft frequent on the Sibirian, where it makes its neft on the loftieft rocks. It is rather inferior in fize to the former ; but is a generous, fpirited, and docile bivd. The independent Tartars train it for the chace of Hares, Foxes, Antelopes, and even Wolves. The ufe is of confiderable antiquity; for Marco Polo, the great traveller of 1269 , obferved and admired the diverfion of the great Cbam of Tartary; who had feveral Eagles, which were applied to the fame purpofes as they are at prefent $\ddagger$. I muft add, that the Tartars efteem the feathers of the tail as the Beft they have for pluming their arrows.

The Kalmucs ufe, befides this fpecies of Eagle, that which the Frencb call fean le Blanc \|, and alfo the Lanner; all which breed among them: but people of rank, who are curious in their Falcons, procure from the Bafcbkirians the Gyrfalcon and the Peregrine, which inhabit the lofty mountains of the country §.

88. BLACK cherked Eagle.
T. With a dufky and blue bill; yellow cere: head, neck, and breaft, of a deep afh-color: each cheek marked with a broad black bar paffing from the corner of the mouth beyond the eyes : back, belly, wings, and tail, black.: legs yellow, feathered below the knees.

Is about the fize of the laft. Communicated to me by the late Tay lor White, Efq; who informed me that it came from Nort亏 America. Is defcribed by Mr. Latham, i. 35, $\mathrm{N}^{\circ} 10$; and feems to be the fpecies engraven by $M$. Robert, among the birds in the menagery of Louis XIV.
89. White. herdebeagle。

Falco Leucocephalus, Lin. Sy/f. 124.
Bald Eagle, Lawfon, 137.-Catefoy, i. 1*. Brickell, 173.-Latham, i. 29.-Lev. Mus.
Le Pygargue a tête blanche, De Bưfon, i. 99.-Pl. Enl. 41I.-Lev. Mvs.
BIL L, cere, and feet, pale yellow: head, neck, and tail, of a pure white : body and wings of a chocolate-color. It does not acquire its white head till the fecond year.

This Eagle is leffer than the foregoing fpecies, but of great fpirit:
Manders. preys on Fawns, Pigs, Lambs, and fifh : is the terror of the Ofprey, whofe motions it watches. The moment the latter has feized a fifh, the former purfues till the Ofprey drops its prey; which, with amazing dexterity, it catches before it falls to the ground, be the diftance ever fo great. This is matter of great amufement to the inhabitants of North America, who often watch their aerial contefts. This fpecies frequently attends the fportfman, and fnatches up the game he has fhot, before he can reach it.

Thefe birds build in vaft decayed cypreffes $\dagger$, or pines, impending over the fea, or fome great river, in company with Ofpreys, Herons, and other birds: and their nefts are fo numerous, as to refemble a fookery. The nefts are very large, and very fetid by reafon of

* Le Pygargue a tête blanche, De Buffon, i. 29. Pl. Enl. 4rio + Cateßjo
the reliques of their prey. Lawfon fays, they breed very often, lay. ing again under their callow young; whofe warmth hatches the eggs. In Bering's inle they make their nefts on the cliffs, near fix feet wide, and one thick; and lay two eggs in the beginning of $\mathfrak{f} u l y$.

THIS moft beautiful and farce fpecies is entirely white, except the tips of the wings, which are black. We know nothing of this bird, but what is collected from Du Pratz*. The natives of Louifiana fet a high value on the feathers, and give a large price for thofe of the wings; with them they adorn the Calumet, or pipe of peace. Different nations make ufe of the wings, or feathers of different birds; but, according to Hennepin, always decorate it with the mof beautiful.

The Calumet is an inftrument of the firt importance among the Americans. It is nothing more than a pipe, whofe bowl is generally made of a foft red marble $\dagger$ : the tube of a very long reed, ornamented with the wings and feathers of birds. No affair of confequence is tranfacted without the Calumet. It ever appears in meetings of commerce, or exchanges; in congreffes for determining of peace or war ; and even in the very fury of a battle. The acceptance of the Calumet is a mark of concurrence with the terms propofed; as the refufal is a certain mark of rejection. Even in the rage of a conflict this pipe is fometimes offered; and if accepted, the weapons of deftruction inftantly drop from their hands, and a truce enfues. It feems the facrament of the Savages ; for no compa\&t is ever violated, which is confirmed by a whiff from this holy reed. The Dance of the Calumet is a folemn rite which always confirms a peace, or precedes a war. It is divided into three parts: the firf, appears an act of devotion, danced in meafured time: the fecond, is a true reprefentation of the Pyrrhic dance $\ddagger$ : the third, is attended with fongs expreflive of the viftories they had obtained, the nations they had conquered, and the captives they had made.

[^1]go. White Eagle,

CAEvtiget.

From the winged ornaments of the Calumet, and its conciliating ufes, writers compare it to the Caduceus of Mercury, which was carried by the Caduceatores, or meffengers of peace, with terms to the hoftile ftates. It is fingular, that the moft remote nations, and the moft oppofite in their other cuftoms and manners, fhould in fome things have, as it were, a certain confent of thought. The Greeks and the Americans had the fame idea, in the invention of the Caduceus of the one, and the Calumet of the other. Some authors imagine; that among the Greeks the wings were meant as a fymbol of eloquence. I rather think that the twifted Serpents expreffed that infinuating faculty; and that the emblem was originally taken from thefatal effect the rhetoric of Satan had on our great mother, when he affumed the form of that reptile, which the higheft authority repre. fents as more fubtile than any beaft of the field. On this the heathen mythology formed their tale of Fupiter taking the figure of a Serpent, to infinuate himfelf into the good graces of Olympias; who, like Eve, fell a victim to his perfuafive tongue. As to the wings, it is moft probable that they were to fhew the light of difcord; which the reconciled parties gave, with all the horrors of war, to the air, and iport of the winds.

The Oole, or Eagle, is a facred bird among the Americans. In, cafe of ficknefs, they invoke this bird to defcend from heaven (which; in its exalted flight it approaches nearer than any other) and bring. down refrefhing things; as it can dart down on its rapid wing quick as a flafh of lightning *.

F.
With blue cere, and feet: head, and lower part of the body, white: upper part brown : two middle feathers of the tail plain brown; the reft barred with white and brown.

This, in all refpects, refembles the Europeon kind. Notwithftanding it is fo perfecuted by the Bald Eagle, yet it always keeps near its haunts. It is a fpecies of vaft quicknefs of fight; and will fee a filh near the furface from a great diftance *: deicend with prodigious rapidity, and carry the prey with an exulting fcream high into the air. The Eagle hears the note, and inftantly attacks the Ofprey ; who drops the fifh, which the former catches before it can reach the ground, or water. It fometimes happens that the Ofprey perifhes in taking its prey; for if it chances to fix its talons in an óver-grown fihh, it is drawn under water before it can difengage itfelf, and is drowned.

It is very frequent in Kantfobatka; and in fummer, even under the Aritic zone of Europe and Afic. Is very common in Sibiria, and fpreads far north; probably common to the north of America, and Afa. Is rare in Rufia. It is likewife very frequent as low on the Wolga as the tract between Syfrain and Saratoff, where they are faid to be the fupport of the Ern Eagle, as they are of the White-tailed Eagle in America, each living by the labors of the Ofprey. The Tartars have a fuperftition, that a wound from its claws is mortal, either to man or fifh, and confequently dread its attack $\dagger_{\text {。 }}$

- That agreeable traveller, the reverend Dr. Burnaby, adds, that it is often feer relting on the wing for fome minutes, without any vifible change of place, before it defcends. Travels in America, 2d ed. p. 48.

That which I faw in the Leverian Mufeum, was fuperior in fize to
Place, the Europeane. Mr. Lavefon fays, they abound in Carolina:- are fpirited birds, but leffer than thofe of Mufcovy. Is common in that

A WHITE VA=
RIETY.

Excellentfor falconry. country, and Sibiria. Dr. Pallas adds, that there is a large white variety on the Uralian mountains, mottled with brown and yellow. Thefe are yet more frequent in the eaft part of Sibiria; and in Kamt chatka they are entirely white. Thefe are the beft of all Hawks for falconry. They extend to the river Amur; and are ufed by the emperor of Cbina in his fporting progreffes, *, attended by his grand falconer, and a.thoufand of the fubordinate. Every bird has a filver plate faftened to its foot, with the name of the falconer who had thecharge of it; that in cafe it fhould be loft, it might be brought to. the proper perfon: but if he could not be found, the bird is delivered to another officer, called the Guardian of loft birds; who keeps it till it is demanded by the falconer to whom it belonged. That this great officer may the more readily be found, among thearmy of hunters, who attend the emperor, he erects a ftandard in the: moft confpicuous place $\dagger$.

The emperor often carries a Hawk on his hand; to let fly at any: game which prefents itfelf; which are ufually Pheafants, Partridges, Quails, or Cranes. Marco Polo faw this diverfion about the year.

$$
\text { Bello ii. \&7\% } \quad \text { - Bergerom, } 75,76
$$

1269*; a proof of its antiquity in thefe parts, when it formed fo regular and princely an eftablifhment in the ftate of this great eaftern monarch; the origin of which might have been in fome long preceding age. The cuftom of carrying a Falcon extended to many countries, and was efteemed a diftinction of a man of rank. The Welfh had a fäying, that you may know a gentleman by his $H a w k$; Horfe, and Grebound. In fact, a perfon of rank feldom went without. one on his. hiand. Harold; afterwards king of England, is painted going on a moft important embaffy, with a Hawk on his hand, and a Dog under his arm $\dagger_{\text {o. Henry VI. is reprefented at his nuptials, at- }}$ tended by a nobleman and his Falcon $\ddagger$. Even the ladies were not without them, in earlier times; for in an antient fculpture in the church of Milton Abbas, in Dorjetpire, appears the confort of King Atbelfan with a Ealcon on her royal fift § tearing a bird : and, perhaps to indulge his queen in her paffion for the diverfion, he demanded of my countrymen (befides an immenfe tribute) fome of their moft excellent Hounds, and of their beft Hawks : which proves the high efteem in which our. Dogs and Falcons were held in thofe early days.||.

American Buzzard, Latham, i. 50.-LEv. Mu.s.

F.
With a dufky bill, and yellow cere : head, lower part of the neck, and chin, brown, mixed with white : breaft and belly white, varied with long ftripes of brown, pointing downwards: femoral feathers very long, white, and marked with long dentated ftripes of pale brown : upper part of the neck, and back, of a very. deep brown : coverts and tertials brown, barred or edged with white: primaries dufky, barred with cinereous : tail of a pale ruft-color ${ }_{2}$, marked near the end with a dufky narrow bar:- legs yellow. Size. of the Gofbarw:

Inhabits North America. Sent from Carolina to Sir Abton Levero. Piaces.

* Bergeron, 75.76. $\quad \dagger$ Monumens de la Monarchie Francoife, i. 372: $\ddagger$ Mri.

yor. Leveriano $F$. With a dufky bill, greatiy hooked: head friped with browa and white : upper part of the body and wings of a deep brown: each feather elegantly marked at the end with a large white fpot: the whole under fide of the body white : the outmott feathers of the tail marked with nine white, and the fame number of dufky bars; middle feathers with dufky and cinereous: the wings extend beyond the end of the tail : legs ftrong and yellow.
Place. Size of a Buzzard. Sent to Sir Afpton Lever from Carolina.

Barred-breafted F, Latbam, i. 56, No ${ }_{2} 6 .-$ LEv. Mus。
F. With a nender dufky bill; yellow cere; and legs, head, and neck, of a yellowifh white, ftreaked downwards with dufky lines: back of a deep brown, edged with ruft-color: leffer coverts of wings ferruginous, fpotted with black; primaries and fecondaries black, fpotted on each fide moft diftinctly with white : breaft and belly of a light tawny; the firft ftreaked downwards with black; the laft traverfed with deeper tawny : tail fhort and dufky, croffed by feven narrow bands of white; the two neareft to the ends more remote than the others: legs weak. Lengeth twenty-two inches.
Puack. Inhabits Long Ifland. This is a new fpecies, preferved in Mrso Blackburne's Mufeumo.

Afh-colored Buzzard, Edrw. ii. 53-Latham, i. 55, N ${ }^{\circ}$ 35.48; No 28.-D6 103. Buzzardi Buffon, i. 223 .<br>Falco-Buteo. Quidfogel, Faun, Suec. No 60:-Br. Zool. i. 5.4-Lev. Mus.

F.
With a dufky bill, and bluifh yellow cere: head, and hind part of the neck, of a cinereous brown, ftreaked with yellow : back brown; lower part and rump barred with ruft-color, fometimes with white: the coverts of the wings brown ; the greater and fcapulars fpotted with white; the three firf quil-feathers black, white at their bafes; the interior webs of the reft blotched with black and white: the throat and breaft yellowifh, marked thinly with oblong brown fpots : belly white, varied with great fpots of brown: feathers of the thighs long, white, croffed with fagittal bars of yellow : tail marked with about nine bands of black and light cinereous; the tip white: legs fhort, ftrong, and yellow. Length two feet two inches.

The American varies in fize, and fometimes nightly in color; but Place, in both has fo much the habit of the Englifs Buzzard, as not to merit feparation. It is called in Nezv York, the great Hen Hawk, from its feeding on poultry. It continues there the whole year. Lays in May five eggs : the young fly about the middle of $\mathcal{F} u n e$. It is alfo an inhabitant of Hudfon's Bay and Newfoundland; and in Europe as high as Sondmor, in Norway; where, from its attacking the Eagle, it is called Orne-Falk. Migrates, before winter, from Sweden. Is farce in Rufla; and very; few are found in Sibiria. Is found in. winter as low as Worone $f f^{*}$ *.

104. Planio F. With the bill black: fiead dufky : nape fpotted with white : back, and coverts of wings, and tail, of an uniform deep brown: under fide of the neck, breaft, and belly, and thighs, deep brown, nightly fpotted with white: primaries dufky : inner webs marked with great oval fpots of white, mottled with brown : middle feathers : of the tail plain brown; inner webs of the reft mottled with white; . exterior webs and ends flightly edged with the fame : legs ftrong: : yellow? Wing reaches near the length of the tail. Length, from bill to: tail, two foot one.
Phaceo. Inkabits Hydjon's Bay.
165. Marbsy

March Hawk, Edru, iv. 291:-Lathann; i. go.-Lev. Mivs.-BL. Müs.
F. With a bluifh bill ; orange cere, orbits, and legs: irides hazel $1:$ a black line extends from the corner of the bill beyond the: eyes; above that is another of white, which encircles the cheeks, and: meets in front of the neck : head, throat, and upper. part of the breaft, varied with black and ruft-color: back, and coverts of the: wings, brown: rump white : breaft and belly, and thighs, of a bright ferraginous: tail dufky brown, croffed by four black. bands : legs ftrong, thick, and fhort; which are fpecific diftinctions from the sext. Lexgth two feet.
Pasce. Inhabits Penfyloania: frequents, during the fummer, marhy places; where it feeds on the fmall birds, Frogs, Snalkes, and Lizards, At approach of winter.quits the country.

Br. Zool. i. $\mathrm{N}^{\circ}{ }_{59}-$-Edw. iii. 107.-Latbam, i. $\mathrm{N}^{\text {is }} 75,7 ; \mathrm{A}^{2}$, and $\mathrm{N}^{\circ} 34$, is a seb. Ringrasl. rult-colored variety.
Falco Pygargus, F. Hudfonius, Lin. Syf. 128.-Muller, $\mathrm{N}^{\circ}$ 72.-Be. Mus.
F. With a duky bill and yellow cere : a white line over each eye:
head, upper part of the neck, and back, dulky brown : coverts and primaries of the fame color; the inner fides of the laft white: breaft, belly, and thighs, whitif, marked with ferruginous fpots: vent and rump white, encircling the root of the tail: the middle feathers of the tail dufky; the next of a bluifh afh-color ; the outmoft white, all marked tranfverfely with orange bars: legs long, and very flender.

This fpecies is fuperior in fize to the Britifl Ringtail ; but having moft of the characters of that bird, we doubt not but that it is the fame. Like the European kind, flims along the ground in fearch of prey, which is Mice, Frogs, and fmall birds. Builds its neft indifferently on the ground, or on the lower parts of trees. It is fubject to vary to a deep ruft-color ; plain, except on the rump and tail.

Inhabits Hudfon's Bay. Weight, in Hudjon's Bay, feventeen ounces Size and Place. and a half. Length twenty-one inches. Extent three feet feven. Is very common in the open and temperate parts of Ruffia and Sibiria; and extends as far as lake Baikal*. It is not found far in the north of Europe. Linneus omits it among the birds of his country; but Mr. Brunnick defcribes one, which had been fhot in lat. 58, on the little ifland of Cbriftianfoe $\dagger$.
F. With a black bill; yellow cere: head of a deep brown: back
107. Winter: white : the coverts of the wings dufky, edged with dull white; thofe on the ridge with orange; ends of the primaries dufky; the other parts barred with brown and white : breaft and belly white, marked with heart-hhaped fpots: thighs fulphur-colored, fpeckled with

Size.
Place:
108. Swallowtailed.
dufky: vent feathers white: tip of the tail white; then fucceeds a broad duiky bar; the remaining part barred with brown, tawny, and black: legs long, and very flender.

Is of an elegant form, and about the fize of the Ringtail.
Inhabits the province of New York: appears at approach of winter, and retires in the fpring. Bl. Mus.

Mr. Latbam's northern Falcon, $\mathrm{N}^{\circ} 62$, feems to differ from this: only in age, or fex.

Hirundo maxima Peruviana, avis prædatoris calcaribus inftructa, Feuillee vog, Peru, tom. ii. 33.
Herring, or Swallow-tailed Hawk, Lawfon, 138.-Brickell, 175-Catefy, i. 4* Le Melan de la Caroline, Briffon, i. 418.-De Buffon, i. 221.
Falco Furcatus, Lin. Syf. 129.-Latham, i. 60.-Lev. Mus.
F. With a black bill, lefs hooked than ufual with rapacious birds; bafe of the bill hid in feathers, and briftly: the eyes large; irides red : head, neck, breaft, and belly, of a fnowy whitenefs : back, coverts of wings, and fcapulars, black, gloffed with purple and green : inner webs of the primaries and fecondaries white towards their bafe ; the tertials white : tail of the fame color with the back; and moft extremely forked; the outmoft feather above eight inches longer than the middlemoft: the legs yellow.

This moft elegant fpecies inhabits only the fouthern parts of $N$ orth America; and that only during fummer. Like Swallows, they feed chiefly flying; for they are much on wing, and prey on various forts. of infects. They alfo feed on Lizards and Serpents; and will kill the largeft of the regions it frequents with the utmoft eafe. They quit North America before winter. We are not acquainted with their retreat. It probably is in Peru:- at left we have the proof of one being taken in the South-fea, off the coalt which lies between $Y l o$ and Arica, in about the latitude 23 fouth, on September IIth, by the reverend the Father Louis Feuillee *.

- Journal des Obferv, Erc, vol, ii, 33,
F. With.

F. With dufky bill : head, cheeks, neck, breaft, and belly, white, rog. Buzzardet. marked with large brown fpots, more fparingly difperfed over the breaft and belly: leffer coverts brown; the others colored like the head: primaries dulky: thighs white, with fmall fagittal fpots of brown: tail dukky, barred and tipt with white : legs yellow. Length fifteen inches. It has much the habit of the Buzzard; but the legs in proportion are rather longer.

In the Leverian Mufeum. Except in the almoft uniform color of the tail, Mr. Latham's fpecies, p. 97, N ${ }^{\circ} 83$, agrees with this.

Little Hawk, Cate/by, i. 5.-Latham, i. i10, ${ }^{0}$ 94• Emerillon de Cayenne, Buffon, i. 2g1.-Pl. Enl. No 444. Falco Sparverius, Lin. Syf. 128.-Lev. Mus.-Br. Mus.

## Male.

F. With bluifh bill, and yellow cere: crown of fine light grey, with a red fpot in the middle; on the hind part a femicircle formed of round black fpots : cheeks white, bounded on each fide with a large black fpot: throat white: breaft of a pale yellow, fpotted with black : back of a brilliant bay, croffed by broad black bars: coverts of the wings of a beautiful grey, thinly fpotted with black; primaries black, fpotted on their inner webs with white: tail long; the middle feathers barred near the end with a black band, and tipt with white; the two exterior feathers white, croffed with three or four black bars: legs yellow.

Length eleven inches and a half. Weight only three ounces and an half. This varies in color from the female, in the fame manner as the European Keftrils.

Thefe birds inhabit America, from Nova Scotia to the Antilles; are active and fpirited. They prey on fmall birds, Mice, Lizards, and infects. The Female is the following.

Place.

Pigeon Hawk, Catefy, i. 3.-Pbil. Tranf. Ixii. 382.-Latham, i. 101, Falco Columbarius, Liž. Syj. 128.-Lev. Mus.-Bi. Mus.
F. With a dufky bill, and yellow cere: crown, back, and coverts of the wings and rump, of a bluifh grey, with the middle of each feather ftreaked with black: the hind part of the head fpotted with reddifh white: cheeks and under fide of the body white, with large oblong fpots of black : primaries and fecondaries dulky; their infides marked with great oval fpots of white: tail long; black tipt with white, and croffed with four bars of bluifh grey: legs yellow.

Its length is from ten to twelve inches. The weight fix ounces.
It inhabits America, from Hudfon's Bay as low as Soutb Carolina. In the laft it attains to a larger fize. In Hudfon's Bay it appears in May on the banks of Severn river, breeds, and retires fouth in autumn. It feeds on fmall birds; and on the approach of any perfon; flies
flies in circles, and makes a great fhrieking. It forms its neft in a rock, or fome hollow tree, with flicks and grafs; and lines it with feathers: and lays from two to four eggs, white, fpotted with red. In Carolina it preys on Pigeons, and young of the wild Turkies.
F. With a dufky bill: yellow cere and irides : head dufky, freaked with ruft-color: back and coverts of wings brown, edged with ruft; the primaries dufky afh-color, barred with black, and the inner webs marked tranfverfely with oval ferruginous fpots: tail long, of a deep cinereous, with four broad bars of black : breaft and belly dirty white, marked with oblong freaks of brown: legs yellow.

Length about ten inches. Weight fix ounces. In the marks and colors of the tail it much refembles the Sparrow Hawk : in the fpots on the breaft it agrees with the Englij/b Merlin.

Inhabits New York and Carolina. I have my doubts whether this is any more than a variety of the preceding, efpecially as the Englijp Sparrow Hawk varies with the fame colors.
F. With a bluifh bill; upper mandible anned with a fharp procefs; yellow cere : head, back, and coverts of the wings, and tail, a dufky brown, nightly edged with ferruginous: hind part of the neck fpotted with white: primaries dufky; inner webs marked with oval fpots of a pale ruft-color: tail fort, tipped with white; and barred with four broad dufky flrokes, and the fame number of narrow ones of white : the hind part of the head fpotted with white: from the chin to the tail whitifh, ftreaked downwards with diftinct lines of black: legs deep yellow.

A. Golben Eagee, Br, Zool. i. No 42.

Orn. Faur. Suec. ${ }^{\circ}{ }^{\circ}$ 54-LLev. Mus:
F. With a bluinh bill: plumage dulky and ruft-color: tail dufky brown, blotched at the bafe with ah-color: legs feathered to the toes. Weight about twelve pounds.
Place.
Inhabits Sweden; perhaps Norway. Found about the fouthern part of the Urallian mountains, and the mountains which border $S i$ biria on the fouth. Grows fcarcer towards the eaft.
B. Cinereous Eagle, Br. Zool. i. No ${ }^{45}$-Latham, i. 33 . Vultur Albiulla, Lin. Syff. 123.
F. With pale yellow bill, irides, cere, and feet: plumage light cinereous: body and coverts of the wings clouded with darker: primaries dukky: tail white.
Size, and Place. In fize equal to the Black Eagle. Inhabits Europe, as high as Iceland and Lapmark*. Is common in Greenland; but does not extend to America: at left, if it does, it varies into the White-headed Eagle, to which it has great affinity, in particular in its feeding much on fifh : the Danes therefore call it Fike-orn $\dagger$. Is common in the fouth of Ru/fia, and about the Volga, as far as trees will grow. Is very fcarce in Sibiria; but has been obferved in the eaftern parts about Nertfobink. It feems to be the fpecies called by the Tungufi, Elo;

- Lrems, 331. $\quad+$ Brumbick, $\mathrm{N}^{\circ} \mathrm{I} 2$.
which breeds on the banks of the Kbarioufowa, a river which falls into the Pen/bina fea *.

It inhabits Greenland the whole year, fitting on the rocks with flagging wing, and flies nowly. It makes its neft on the lofty cliffs, with twigs, lining the middle with moffes and feathers. Lays two eggs. Sits in the latter end of May, or beginning of $\mathcal{F} u n e$.

Thefe birds prey on young Seals, which they feize as they are floating on the water ; but oft-times, by fixing their talons in an old one, they are overmatched, and drawn down to the bottom, fcreaming horribly. They feed alfo on filh, efpecially the Lumpfifh, and a fort of Trout $\dagger$; on Ptarmigans, Auks, and Eider Ducks. They fit on the top of rocks, attentive to the motion of the diving birds; and, with quick eyes, obferve their courfe by the bubbles which rife to the furface of the water, and catch the fowls as they rife for breath.

The Greenlanders ufe their fkins for cloathing, next to their bodies. They eat the flefh, and keep the bill and feet for amulets. They kill them with the bow, or take them in nets, placed in the fnow, properly baited; or tempt them by the fat of Seals, which the Eagles eat to an excefs; which occafions fuch a torpidity as to. make them an eafy prey.

Spotted Eagle, Latbam, i. 38.
Le Petit Aigle, De Buffon, i. 91.-Br. Muso.
F. With a dufky bill and yellow cere : color of the plumage a ferruginous brown; the coverts of the wings, and fcapulars, elegantly varied with oval white fpots; on the greater coverts very large : primaries dufky; the ends of the greater white : breaft and belly of a deeper color than the reft of the plumage, ftreaked downwards with dull yellow : tail dark brown, tipt with dirty white : legs, feathered to the feet, which are yellow. Length two feet.

[^2]Is found in many parts of Europe, but not in Scandinavia: is frequent in Rufirs and Sibiria, and extends even to Kamtfchatka. Is lefs generous and fpirited than other Eagles; and is perpetually making a plaintive noife, from which it was ftyled by the antients Planga $\xi^{3}$ Clanga; and Anataria, from its preying on Ducks, which Pliny* defcribes with great elegance. The Arabs ufed to train it for the chace; but its quarry was Cranes, and other birds : the more generous Eagle being flown at Antelopes, and various quadrupeds. This fpecies was even itfelf an object of diverfion; and made the game of even fo fmall a Falcon as the Sparrow Hawk: which would purfue it with great eagernefs, foar above, then fall on the Eagle, and, faftening with its talons, keep beating it about the head with its wings, till they both fell together to the ground. This Sir Fobs Cbardin has feen practifed about Tauris.
D. Iceland Falcon, Gent. Mag. 1771, p. 297, fig. good.

F. With a ftrong bill, much hooked, and the upper mandible flarply angulated on the lower edges; cere bluifh: head of a very pale ruft-color, ftreaked downwards with dufky lines: neck, breaft, and belly, white, marked with cordated fpots : thighs white, croffed with fhort bars of deep brown: back and coverts of wings dufky, fpotted and edged with white : the exterior webs of the primaries dufky, mottled with reddifh white; the inner barred with white: the feathers of the tail croffed with fourteen or more narrow bars of dufky and white ; the dulky bars regularly oppofing thofe of white : the wings, when clofed, reach almoft to the end of the train : legs ftrong and yellow. The Length of the wing, from the pinion to the tip, fixteen inches.

- Lib, x. c. 3 ,

This fpecies is an inhabitant of Iceland, is the moft efteemed of any for the fport of falconry, and is, with the two following, referved for the kings of Denmark; who fends his falconer, with two attendants, annually into the inand to purchafe them. "They are caught by the natives; a certain number of whom in every diftrict are licenfed for that purpofe. They bring all they take, about Midfummer, to Bef.. fefted, to meet the royal falconer; and each brings ten or twelve, capped, and perched on a crofs pole, which they carry on horleback, and reft on the ftirrup. The falconer examines the birds, rejects thofe which are not for his purpofe, and gives the feller a written certificate of the qualities of each, which entitles him to receive from the king's receiver-general feventeen rixdollars for $F$, or the puref white Falcon; ten for E, or thofe which are left white; and feven for this fpecies*. This brings into the inland between two and three thoufand rixdollars annually $\dagger$.

They are taken in the following manner:-Two pofts are fattened in the ground, not remote from their haunts. To one is tied a Ptarmigan, a Pigeon, a Cock or Hen, faftened to a cord that it may have means of fluttering, and fo attract the attention of the Falcon. On the other poft is placed a net, diftended on a hoop, about fix feet in diameter. Through this poft is introduced a ftring, above a hundred yards long, which is faftened to the net, in order to pull it down; and another is faftened to the upper part of the hoop, and goes through the poft to which the bait is tied. As foon as the Falcon fees the fowl flutter on the ground, he takes a few circles in the air, to fee if there is any danger, then darts on its prey with fuch violence as to ftrike off the head, as nicely as if it was done with a razor. He then ufually rifes again, and takes another circle, to explore the place a fecond time: after which it makes another ftoop; when, at the inftant of its defcending, the man pulls the dead bird under the net; and, by means of the other cord, covers the Falcon with the net, at the moment it has feized the prey; the perfon lying

$$
\text { Bruznick, p.2. } E f^{+ \text {Olaffen, i. } 3 z_{0}}
$$

Manner of taking.
concealed behind fome ftones, or elfe lies flat on his belly, to elude the fight of the Falcon *.

As foon as one is caught, it is taken gently out of the net, for fear of breaking any of the feathers of the wings or tail; and a cap is. placed over its eyes. If any of the tail-feathers are injured, the falconers have the art of grafting others $\dagger$; which fometimes has occafioned a needlefs multiplication of fpecies.
'The Iceland Falcons are in the higheft efteem. They will laft ten or twelve years; whereas thofe of Norway, and other countries, feldom are fit for fport after two or three years ufe. Yet the Nor wegian Hawks were in old times in great repute in this kingdom, and even thought bribes worthy of a king. Geoffry Le Pierre, chief juticiary, gave two good Norway Hawks to King $70 b n$, that Walter. Le Madina might have leave to export a hundred weight of cheefe. Fobn, the fon of Ordgar, gave a Norroy Hawk to have the king's. requeft to the king of Norway, to let him have his brother's chattels; and Ralf Havoc fined to King Stephen in two Girfals (Gyrfalcons) and two Norway Hawks, that he might have the fame acquittance that his father had $\ddagger$.

Antiquityour
Falconry.

I cannot fix the precife time of the origin of falconry; the paffage in Arifoile, and the epigram in Martial, do by no means fix. it to the periods in which they wrote. The philofopher \|informs us, that " there was a diftrict in Thrace, in which the boys ufed to " affemble at a certain time of the year, for the fake of bird-catch" ing. That the fpot was much frequented by Hawks, which ss were wont to appear on hearing themfelves called: and would " drive the little birds into the bufhes, where they were caught " by the chilclren; and that the Hawks would even fometimes take"s the birds and fling them to thefe young fportfmen; who (after " finiffing their diverfion) gratefully beftowed on their affiftants "part of their prey." This tale may have fome truth at the bottom;

[^3]it being notorious that Larks, and even Partridges, will, by the terror of a Hawk paffing over them, lie fo fill as to fuffer themfelves to be taken by any paffenger. Here feems to have been no training of thefe Thracian Hawks, but a mere cafual concurrence of Hawks and fmall birds, which afforded now and then an amufement to the youth of the country. The thought expreffed on the antient gem, of little Genii engaged in the chace of Deer, affifted by an Eagie, may have originated from this ftory.

The Poet only defcribes another kind of bird-catching, in the following epigram on the fate of a Hawk:

> Prædo fuit volucrum, famulus nunc Aucupis, idem Decipit, et captas non $f$ bi, mœret, aves $\dagger$.

By the word decipit, it is plain that the Hawk was not trained; but was merely ufed as a ftale, either to entice fimall birds under a net, or to the limed twigs : the laft is a method fill in ufe in Italy. The Italians call it Uccellare con la Civetta; for inftead of a Hawk, they place a fmall fpecies of Owl on a pole, in the middle of a field; and furround it, at various diftances, with lime-twigs. The fmall birds, from their ftrange propenfity to approach rapacious fowls, fly around, perch on the rods, and are taken in great numbers $\ddagger$. A Hawk would Serve the purpofe full as well. Pliny mentions the ufe of bird-lime $\|$; and Longus, in his elegant romance of Dapbnis and Cbloe, employs the latter to catch little birds for his beloved §.

I cannot find any certainty of Hawks being trained for diverfion before the time of King Etbelbert, the Saxon monarch; who died in the year $760 \mathrm{\pi}$. He wrote into Germany for a brace of Falcons, which would fly at Cranes and bring them to the ground *, as there were very few fuch in Kent. This fhews how erroneous the opinion was, of thofe who place it in the reign of the emperor Frederic Bar-

$$

$$

baroffa*, who was drowned in 1189 . By the application of Etbelbert to Boaiface, archbifhop of Mentz, for the brace of Falcons, it is evi. dent, that the diverfion was in perfection in Germany before the year 752 , the time in which that prelate was martyred by the Pagans. It feems to me highly probable, that falconry was invented in Scytbia, and paffed from thence into the northern parts of Europe. Tartary is even at prefent celebrated for its fine breed of Falcons; and the fport is in fuch general efteem, that, according to Olearius, there was no but but what bad its Eagle or Falion $\dagger$. The boundlefs plains of that country are as finely adapted to the diverfion, as the wooded or mountanous nature of moft part of Europe is ill calculated for that rapid amufement.

The antiquity of falconry in Tartary is evinced by the exhibition. of the fport on the very antient tombs $\ddagger$ found in that country; in which are figured horfemen at full fpeed, with Hawks on their hands: others again, in the fame attitude, difcharging their arrows at their game, in the very manner of the antient Scytbians.
From Germany, falconry got footing in England; and became fo favored a diverfion, that even fanguinary laws were enacted for the prefervation of rapacious fowls. Edward III. made it death for the stealing of a Hawk: and to take its eggs, even in a perfon's own ground, was punifhable with a fine at the king's pleafure, and imprifonment for a year and a day. In the reign of fames I. the amufement was carried to fuch an extravagant pitch, that Sir Thomas Monfor is faid to have given a thoufand pounds for a caft of Hawks.

E. DUSKY. Falco Fufcus, Faun. Groen. $56, \mathrm{~N}^{\mathrm{B}} 34$. b.

Grey Falcon, Crantz, i. 78.-Egede, 64.
F. With dufky irides: lead-colored cere and feet: brown crown, marked with irregular oblong white fpots: forehead whitifh: cheeks blackin: hind part of the head and throat white : breaft and

Belly of a yellowifh white, Atriped downwards with dufky ftreaks: the back dunky, tinged with blue, the ends of the feathers lighteft, and fprinkled over with a few white fpots, efpecially towards the rump: wings of the fame colors, variegated beneath with white and black: the upper part of the tail dufky, croffed very faintly with paler bars; the under fide whitifh.

Leffer than the Collared Falcon.
Inhabits all parts of Greenland, from the remoteft hills to thofe

Size. Place。 which impend over the fea. They are even feen on the inlands of ice remote from fhore. They retire in the breeding-feafon to the fartheft part of the country, and return in autumn with their young. They breed in the fame manner as the Cinereous Eagle, but in more diftant places; and lay from three to five eggs. The tail of the young is black, with great brown fjots on the exterior webs.

They prey on Ptarmigans, Auks, and all the fimall birds of the country: have frequent difputes with the Raven, but feldom come off victors; for the Raven will, on being attacked, fling itfelf on its back; and, either by defending itfelf with its claws, or by calling, with its croaking, numbers of others to its help, oblige the Falcon to retire. The Greenlanders ufe the fkin, among many others, for their inner garments; the wings for brufhes; the feet for amulets: but fel dom eat the flefh, unlefs compelled by hunger.

It is alfo a native of Iceland.
F. Gyrfalcon, Br. Zool. $\mathrm{N}^{\circ} 47$, tab. xix.-Latham, i. 71, $\mathrm{N}^{\circ} 50 \mathrm{~A}$, and $\mathrm{N}^{\circ} 50 \mathrm{~B}$ \%. Ift paragr. and $83, N^{\circ} 69$.
Falco Illandus, Faun. Groenl. 58, No 35-Brunnick, Nris 7, 8.-Crantz, i. $7^{8 .}$-Egede, 64.-Horreborw, 58.-Lavv. Mus.
F. With a yellow cere : bluifh bill, greatly hooked : eye dark blue:: the throac of a pure white: the whole body, wings, and tail, of the fame color, moft elegantly marked with dufky.bars, lines; or fpots, leaving
leaving the white the far prevaling color. There are inftances, but rare, of its being found entirely white. In fome, the whole tail is croffed by remote bars of black or brown; in others, they appear only very faintly on the middle feathers: the feathers of the thighs are very long, and unfpotted: the legs ftrong, and of a light blue.

Its weight forty-five ounces Troy: length near two feet: extent four feet two. Of the fame manners and haunts with the former. Is very frequent in Iceland; is found in Lapmark ${ }^{*}$, and Norrway $\dagger$; and rarely in the Orknies, and Nortb Britain. In Afra, it dwells in the higheft points of the Urallian and other Sibirian mountains, and dares the coldeft climates throughout the year. It is kept, in the la-
VERTH HARDT. titude of Peterfourg, uninjured in the open air during the fevereft winters, when the Peregrine Falcon, ${ }^{\circ}{ }^{\circ} 97$, lofes its claws by the froft.

Mr. Hutcbins $\ddagger$ has often obferved it about Albany fort, where it appears in May, and retires before winter. It feeds on the white, and other Grous. This fpecies ought to be added to the American clafs.

This fpecies is pre-eminent in courage as well as beauty, and is the terror of other Hawks. It was flown at all kinds of fowl, how great foever they were ; but its chief game ufed to be Herons and Cranes.
G. Collared. Falco Rufticolus, Liz. Syft. 125.-Faun. Suec. No 56.-Faun. Groenl. $\mathrm{N}^{\circ} 34$.-Latbam, i. 56.
F. With a lead-colored bill, tipt with black: head broad and flat, ftreaked lengthways with black and white; on the cheeks the white predominates: the throat, under fide of the neck, and

Qaprey fouth of Norway $\dagger$; but does not extend farther. This fpecies, the Sea Eagle, Lanner, Buzzard, and Keftril, quit Sweden, in flocks, at approach of winter, and return in fpring $\dot{\ddagger}$. Of thefe, the Buzzard and Keffril winter at Woronefch, in Ruffa, in lat. $52 \|$; and, together: with the Lanner and Kite, about Afrakan §, in lat. 46. 30 ; but the far greater part of the Kites are fuppofed to retire into Egypt, being feen in September paffing by Conftantinople of, in their way from the north; and again in April returning to Europe**, to Shun the great:

[^4]heats of the eaft: They are obferved in vaft numbers about Cairo, where they are extremely tame, and feed even on dates, I fuppofe for want of other food ${ }^{*}$. They alfo breed there; fo that, contrary to the nature of other rapacious birds, they encreafe and multiply twice in the year; once in the mild winters of Egypt, and a fecond time in the fummers of the north. It makes its appearance in Greece in the fpring; and in the early ages, fays Arifophanes $\dagger$, " it governed " that country: and men fell on their knees when they were firft " bleffed with the fight of $i t$, becaufe it pronounced the flight of " winter, and told them to begin to fheer their vernal fleeces. The "Crane likewife, by its autumnal departure, warns the mariner to " hang up his rudder, and take his reft, and every prudent man to " provide their winter garments: and the Swallow again informed " them when they were to put on thofe of fummer. Thus, adds the "chorus of birds, are we to you as Ammon, Dódona, Apollo:" meaning, in thofe early days, that man confulted only thefe natural calendars, and needed no other than what they took from the flight of birds $\ddagger$, or the flowering of plants.

They inhabit England in all feafons. I have feen their young taken, the laft week in May, or firt in fune, in the great woods belonging to Sir Fofeph Banks, in Lincoln/bire; and have often obferved them in various places in the depth of winter.
I. Honey Buzzard, Br. Zool. i. No 56. -Latham, i. 52, No 33 . Falco Apivorus Slaghok, Faun. Suec. ${ }^{\circ} 65$.-Lev. Mus.
F. With an afh-colored head; dark brown above; below white, fpotted or barred with rufty brown: tail brown, barred with two dufky bars, remote from each other: legs ftrong and yellow : isill and cere black. Length twenty-three inches. Weight thirty ounces.

[^5]Inhabits as far north as the diftrict of Sondmor, in Norway *. Is found in plenty in the open parts of Rufia and Sibiria, near woods; and preys much upon Lizards.
K. Lanker, Br. Zool.i. No gi -Latham, i. 86.

Falco Lannarius, Fauns. Suet. No 62. -De Buffon, i. 243.
F. With a white line over each eye : cere and legs bluifh: breaft white, tinged with yellow, and marked with brown foots: primaris and tail dufky ; the firf marked with oval ruft-colored foots on the inner webs; the lat, on both.
Inhabits Iceland, the Froe ifles, and Sweden; the Tartarian defersand the Baraba. Breeds on very low trees. None in the north or eat of Sibiria. Much esteemed for falconry.

brown, edged with dull yellow: breaft and belly yellowifh white, marked with a few dufky ftreaks pointing downwards : thighs, legs, and toes, covered with plain yellow feathers: primaries dufky, barred with red:' tail of a deep brown, marked on each fide of the middle feathers with a large yellow circle, with a brown fpot in the middle. In fome, the feathers are yellowifh, obliquely barred with black. The horns, or ears, confit of only a fingle feather, which it can raife or deprefs at pleafire The wings reach beyond the end of the tail. Length fourteen inches. Weight fourteen ounces.

Found in plenty in the woods near Cbateaul Bay, on the Labrador coaft. It is alfo an inhabitant of the Falkland Ifands; fo probably is common to Nortb and South America. In Hudfon's Bay it is called the Moufe Hawk. It never flies, like other Owls, in fearch of prey; but fits quiet on a ftump of a tree, watching, like a Cat, the appearance of Mice. It breeds near the coaft; makes its neft with dry grafs upon the ground; and migrates fouthwards in autumn. Father Feriillée fpeaks of an Owl he found in Peru that has fome refemblance to this, particularly in the Hawk-like fhape of the bill. He fays it burrows under ground to a great depth, like a Rabbet; for which reafon he names it Ulula Cunicularia". It is very common in the northern and woody parts of Sibiria. Comes boldly to the night fires, and affaults men, when it is often killed with fticks.

In Europe it is found in Great Britain, and reaches to the Orkney ifles. Does not perch, but fits on the ground, on which it lays its eggs amidft the heath. Appears and difappears in Lincolnfire with the Woodcock. Perhaps migrates to Sweden or Norway, where it is alfo found, ancl even as high as Iceland $\dagger$. Flies and preys by day, in dark and cloudy weather. Friendly to the farmer, by being an excellent moufer. Does not fly far; but if difturbed, foon alights, and fits looking about; at which times its horns are very confpicuous. This circumftance hitherto unattended to ; fo that it has been ranked among the Earlefs Owls.

[^6]Little Owl, Cateßy, i. 7.-Latham, i. 123.
D. With yellow irides: horns, head, back, and wings, of a pleafant tawny red, ftreaked with black : the fcapulars marked with large white fpots: primaries barred with black, red, and white: breaft pale tawny, marked with oblong black fpots: tail red, barred with dulky: feet covered with feathers to the claws. Lencth ten inches and a half.

Inhabits New York, and as low as the Carolinas. Lives in the woods near the coaft.

> Latham, i. 126.-BL. Mus.-Lev. Mus.
O. With the face white, fpotted with brown: head, wings, and upper part of the body, mottled with ah-color and pale red: the fcapulars marked with great white fpots; as are the coverts of the wingș : the primaries with black and pale ferruginous: breaft and belly whitifh, varied with dufky ragged ftripes, pointing downwards : toes feathered to the claws. Length eleven inches.

Inhabits the province of Neru York. Breeds in Moy, and continues Pager. in the country the whole year.
** WITHOUT EARS.

0. 

With gloffy black bill, and claws much incurvated: bafe of ngowapacutay the bill befet with ftrong briftles: irides bright yellow : fpace between the eyes, cheeks, and throat, white : the ends of the feathers on the head black: fcapulars, and all the coverts of the wings, white, elegantly barred with dufky reddifh marks, pointing downwards: , primaries, 7
primaries, fecondaries, and tail feathers, irregularly fpotted and barred with pale red and black: back and coverts of the tail white, mixed with a few dufky fpots: breaft and belly dirty white, croffed with innumerable reddifh lines: vent white: legs feathered to the toes, which are covered with hairs. Weight five pounds: length two feet : extent four.
Place. Inhabits the woods about Hudjon's Bay: mákes its neft on the mofs, on the dry ground. The young are hatched in May, and fly in $9 u n e$; and are white for a long time after. Feeds on Mice and fmall birds. Called by the 'Indians, Wapacuibu, or the Spotted Owl. The Europeans fettled in the bay, reckon it a very delicate food.
820. SOOTY.

Bref.

Cinereous Owl, Latbam, i. 134, No19.-Br. Mus.
0. With a whitifh bill : 'bright yellow irides: cirčlets confift of elegant alternate lines of black and pale afh-color: head, hind part of the neck, and coverts of wings, footy, marked with narrow bars of dirty white : primaries deep brown, with broad bars, compofed of leffer of dufky and pale cinereous: tail moft irregularly marked with oblique ftrokes of brown and dirty white: the breaft and belly whitif, greatly covered with large oblong blotches of dufky brown: as a fingular mark, from the chin to the vent is a fpace, about an inch in breadth, entirely naked: legs feathered to the feet. Weighs three pounds : length two feet: extent four.

Inhabits Hudfon's Bry the whole year. Flies in pairs. Feeds on Mice and Hares. Flies very low; yet feizes its prey with fuch force, that, in winter, it will fink into the fnow a foot deep; and, with great eafe, will fy away with the American Hare, $\mathrm{N}^{\circ} 38$; alive in its talons. It makes its neft in a pine-tree, in the middle of $: M_{a y}$, with a few fticks lined with feathers; and lays two eggs, fpotted with a darkifh color. The young take wing in the end of fuly.

O.
With a head lefs in proportion than other Owls: irides yellow : whole plumage of a fnowy whitenefs, fometimes pure, oftener marked with dufky fpots: the legs and feet covered warmly to the very claws with long fnowy feathers of the moft delicate and elegant texture: the claws are of a fine contrafting blacknefs, very large and very crooked. Its length two feet; but it varies greatly in weight, from three pounds to one and a half.

It inhabits the coldeft parts of America, even as high as the remote Size. mountains in the icy centre of Greenland; from which, in intenfe cold, it migrates to the fhores. It adds horror even to that country, by its hideous cries, refembling thofe of a man in deep diftrefs.

It is rare in the temperate parts of Anerica, and feldom ftrays as low as Penfylvania or Louifiana. Is very common in Hudfon's Bay, in Norway, and Lapland. It fears not the rigor of the feafon, but bears the cold of the northern regions the whole year. It flies by day, and is fcarcely to be diftinguifhed from the fnow: it flies pretty fwiftly, and falls perpendicularly on its prey. Feeds on the White Grous, and probably on the Hares ; for to the laft circumftance it owes its Swedi/b name, Harfang. It preys alfo on Mice, and Carrion; and in Hudfon's Bay is almoft domettic, harbouring in places near the tents of the Indians.

Is farce in Rufia; grows more common on the Uralian mountains, and all over the north and eaft of Sibiria, and in its Afatic empire, even in the hot latitude of Aftrakan*; are very numerous in Kamtfchatka.

O.With pale yellow irides : bill whitifh brown: head light brown, fpeckled with white: back, and coverts of the wings, and fcapulars, of the fame color, marked in parts with white fpots: the breaft whitifh, varied with ruft-color: tail barred with white, and marked regularly on each web with circular white fpots: feet feathered to the claws. It varies in length, from eight to feven inches. The fmalleft I have feen is from Nova Scotia; which has white circlets about the eyes, and fewer white fpots on its plumage.

Inhabits from Hudfon's Bay to New York. Called by the natives of the firt, Sbipmofijh. Lives in all feafons among the pines: builds its neft half way up the tree : lays two eggs. Are moft folitary birds. Keep clofe in their retreat the whole day; but are moft active moufers during night. Frequent in Rufia; lefs fo in Sibiria.

S. With black bill and legs: head adorned with a reddifh cref: cheeks durky, fpotted with white : hind part of neck and back brown, inclining to red : throat and breaft of a yellowifh red: belly and vent of a fine afh-color: coverts of the wings black, edged with white ; primaries with white on their exterior fides: tail black, bordered on each fide, and tipt with white. Length fix inches and. a half: Extent about eleven.

Inhabits Canada. Placr.
S. With the bill nightly incurvated at the end, black, except the upper half of the lower mandible: crown, lower part of the upper fide of the neck, and the back, black : over each eye is a white line, extending to the very nape; beneath that one of black: from. chin to vent is wholly white: a narrow white circle quite encompaffes the neck: leffer coverts of the wings black; greater white, more or lefs dafhed down the fhafts with black : primaries dufky, fringed with yellowifh brown; fecondaries black, edged and tipped with white : tail black, a little rounded; the four outmoft feathers tipped with white : rump cinereous, the edges of the feathers grey : legs black. Length feven inches one-fourth.

Brought from Natka found in Nortb Amerisa. Communicated to Place me by Mr. Latham.

Br. Zool. i. No 72. -Latham, i. 167. Lanius Collurio, Faur. Suec. ${ }^{\circ} 81$.
Pie-grieche de la Louifians, De Buffon, i. 307.-Pl. Enl. 397.-Lev. Mus.
S. With grey crown and rump : ferruginous back and coverts of wings: black line acrofs the eyes: breaft and belly rofeate: tail black; exterior feathers edged with white : head and upper part of the Female dirty ruft-color; line over the eyes the fame color: breaft and belly dirty white, marked with dufky femicircular lines. Length feven inches and a half.
Place. Inhabits Ruffia; not Sibiria. Is found in Sweden and Cbriffianfoe. The Count De Buffon fays, he received one from Louifana. I imagine, that, as the Nowwegians give the Great Shrike and this a name, that they may be found in their country. The firft they call Klavert, the laft Hanvark. Mr. Ekmark has obferved both of them, only during fummer, in Eaft Gotbland; but is not certain whether they winter. Each fpecies appears in Italy in the fpring; retires in autumn.

A. Grey, Lanius Nengeta, Lin. Syf. 135.-Larbam, i. 183 . Grey Pye of Brafli, Edw. 318.
S. With the crown, hind part of the neck, back, and coverts of the wings, deep cinereous: a black line paffes from the bill through the eyes to the hind part of the head : greater coverts and fe-
condaries black, tipt with dirty white; primaries black: breaft ana belly light afh-color: tail black; ends of the outmof feathers white. Much larger than $\mathrm{N}^{\circ}$ 127, the common Great Shrike; and differs fpecifically.

Inhabits Ruffa, but is more frequent in Sibiria; where it lives in the forefts the whole winter. Taken and tamed by the fowlers; and kept by the Ruffans for the diverfion it affords in the manner of killing its prey. They flick a rod with a tharp point into the wall of a room, on which the Shrike perches. They turn loofe a fmall bird, which the former inftantly feizes by the throat, ftrangles, and then fpits it on the point of the tick, drawing it on with its claws and bill. Thus it ferves as many as are turned to it, and afterwards eats them, thus fufpended, at its leifure *. The Germans ityle it Wurckangel, or the Suffocating-angel. The old Englifh, Wariangel, which fignifies a bird of fome very mifchievous qualities; as is evident from Cbaucer.

> This Sompnour, which that was as ful of jangles,
> As ful of venime ben thife Wariangles t.

V. P A R R O T: Gen. Birds V.

izz. Carolina.<br>Parrokeeto, Lawuon; 142_Latham, i. 227:-Lev. Mus. Parrot of Carolina, Catefoy, i. 1 1.-Du Pratz, ii. 88. Pfittacus Carolinenfis, Liz. Syfti 141.-Brifon, iv. 350 . La Perruche a tete jaune, De Buffon, vi. 274. Lie Papegai a.tete aurore, De Bafon; vio 247.

PWith the forehead, ridge of the wings, and feathers round - the knees, orange : head and neck yellow: back, body, and coverts of wings and tail, green-: primaries dufky; mixed with blue and green; the upper exterior fides edged with yellow: tail very long and cuneiform : legs white. Length thirteen inches. Weight. three ounces and a half.

Inhabits the fouthern parts of North America, but never appears higher than Virginia. It is in general a migratory bird, even in Carolina; arriving at the feafon when mulberries are ripe, which they are very fond of, and which are the earlieft fruits of the country, except ftrawberries. They infeft, in autumn, the apple-orchards in vaf. flocks, and make great havock by fplitting the fruit for the fake of the kernels only, being very greedy of them; and the feeds of cyprefs and other trees. They devour too the buds of the birch.

Few of thefe tender birds continue in Carolina during the whole: year. They breed in hollow trees, in low fwampy grounds. When: taken, they eafily grow tame, but do not fpeak. Their inteftines are faid to be a fpeedy poifon to Cats.

The eggs of Parrots are roundifh, and generally of a pure white; thofe of the Maccaws fpotted, like the eggs of a Partridge. The: number ufually two: yet the Count De Buffongives an inftance of a

Perroquet;

## YLLINOIS PARROT.

Perroquet, in a ftate of confinement, which laid four eggs every fpring, during five or fix years: one of the eggs was addle; the others productive *.

```

P. With a cinereous bill: orange-colored irides : forehead, cheeks, and fometimes the hind part of the head, of a rich orange: crown, upper part of the body, tail, and coverts of the wings, of a fine green : primarics green, edged externally with blue: breaft and belly of a yellowifh green : vent yellow : tail very long and cuneiform. Of the fame fize with the former. Perhaps differs only in fex ?

Inhabits the interior parts of North America, in the country of the
Placzo Illinois, fouth of lake Michigam: it is alfo met with in the Brazils. Is a lively bird ; but its voice not very articulate. Father Cbarlevoix met with fome on the banks of the Theatiki, a river that rifes a little fouth of lake Michigam, and runs into the Miffipi. He fays, that thofe he faw were only ftragglers, which migrated before winter; but that the main body paffed the whole year on the borders of the Mifjépi $\dagger$.
The Count De Buffon confines the whole genus of Parrots to exactly twenty-five degrees on each fide of the Equator $\ddagger$. It always gives me pain to differ in opinion with fo illuftrious a character; but I muft produce my authorities of their being common at far greater diftances. On the continent of America, two fpecies have been obferved by the Spaniards about Trinity Harbour, in the South Seas, in

Latitudes of Parrots.
north lat. 41. $7^{*}$. Dr. Forfer faw, in the raw, rainy latitude of Duky Bay, in New Zealand, 46 fouth, two kinds. In the neighborhood of Botany Bay, in New Holland, in fouth lat. 34, five fpecies were difcovered; among which, the greater variety of the fulphur-crefted Cocka$t o 0$ appeared in, amazing mulcitudes. But what is moft wonderful, a fmall fpecies of this tender genus is to be met with as low as Port Famine, in the ftreights of Magellan, in south lat. $53.44 \dagger$, in flocks. innumerable. They inhabited the vaft forefts of the country. Their food muft be confined to buds and berries; for no fort of fruittrees have been obferved there. The forefts likewife were frequently bounded by mountains, probably cloathed with eternal fnow.

C.With the point of the bill a little incurvated, with-a fmall - tooth on each fide, of a black color, gloffed with blue. It varies to white, and to pied. In the Feroe inles is a breed which are black and white, and are faid to keep in a place feparate from the common kind *。

The largeft of the genus. Weighs three pounds. Length two feet

$$
\mathrm{SIZE}_{0}
$$ two inches.

Very numerous as far north as Finmark, Iceland, and Greenland; Place: where it frequents the huts of the natives, and feeds on the offals of the Seals $\dagger$. Preys in concert with the White Bear, Arctic Fox, and Eagle. Devours the eggs of Birds, efpecially the Ptarmigan: eats fhore-fifh, and Shell-fifh : drops the laft from on high to break them, and get at the contents. Turns roundin the air, and is dexterous; changes its prey from its bill to its feet, or from its feet to its bill; by way of eafe. Eats alfo berries, and; when almoft famifhed, dried ikins and excrements. Neftles on high rocks, which overhang and afford a canopy. Couples in March; lays in April. Each preferves a diftrict to itfelf. The male fits in the day ; the female in the night: thie former fleeps clofe by its mate. Have ftrong affection to their young brood. Hearing its croaking echoed, repeats it; as if admiring its own note. At approach of forms, collects under fhelter of rocks.

Caught by the natives. Its fleih is eaten. The fkins reckoned the beft for cloathing : the wings ufed for brufhes : the quils fplit, are made into fifhing-lines. They alfo inhabit Newfoundland, and now and then appear as low as Virginia and Corolina*.

This bird is, among the American favages, an emblem of return of health. Their phyficians, or rather magicians, when they vifit a fick perfon, invoke the Raven, and mimic his croaking voice $\dagger$. The northern Indians, on the contrary, deteit this and all the Crow kind $\ddagger$. It inhabits Kamtfchatka and Sibiria; but not within the Afatir Arctic regions.

fpots: two middle feathers of the tail dufky; the reft ferruginous: has the fame loofe filky texture of feathers as the Jay. Size of a Stare.

Found as high as the forefts of Lapland. Is called by the Swedes, Placeo Lappfata and Olyckfugl; by the Norwegians, Gertrudsfogel; alfo Ulyksfuegl, from its being fuppofed to forebode ill-huck. Linneus, for the fame reafon, ftyles it Lanius Infaufulus; and in his Founa, Corous Infaufus*. It is common in the woods of the north of Ruffic and Sibiria. Is a moft audacious bird. Linnous relates, that in dining amidft the Lapland forefts, it would often fnatch away the meat befare him. Breeds in crevices of rocks. Feeds on worms and infects. Sings finely, and is often preferved in cages for its fong.

R O L L E. R. Gen. Birds XIII.

G. Garrulous, Br. Zool. ii. App. P. 53 Q quarto, 624 ofavo.-Latbam, i. $406 .-D_{5}$ Buffon, iii. 133.-Aldr. i. 395 -
Coracias Garrula, Spank-kraka, Bla-kraka, Faun. Suec. No $94-$
R. With a naked fpot beyond each ear: heaid, neck, back, breaft, belly, and greater coverts of the wings, of a light bluifh green : back ferruginous : coverts of the tail, leffer coverts of the wings, and lower parts. of the fecondaries, of a rich blue; primaries black above, blue beneath : middle feathers of the tail dirty green; the reft of a light blue : the exterior feathers on each fide much longer than the reft, and tipt with black: legs yellowifh. Size of a Jay.
This elegant bird is found not fpread, but as if it were in a ftream, from the fouthern parts of Norway to Barbary and Senegal: from the fouth of Rufia to the neighborhood of the Irti/b, only, in that empire; and foutherly, to Syria $\dagger$. In Sweden, it arrives with the Cuckoo;

[^10]Plaezo
retires.
retires at the conclufion of the harveft $\dagger$. It makes its neft in the birch, preferably to all other trees $\ddagger$; and in places where trees are wanting, fuch as Malta and Barbary, it forms its neft in clayey banks. Zinami fays it lays. five eggs, of clear green, fprinkled with innumerable dark fpecks $\|$. It feeds on fruits, acorns, and infects. Is a fhy bird; but, at times, is feen in company with Crows and Pies on the plough lands, picking up worms, and grains of corn. Scbwenckfelt fays, that in autumn it grows very fat, and is efteemed as a delicacy §. It is remarkably clamorous. Is migratory. M. Adanfon obferved them in Senegal, in flocks, in the month of September, and fuppofes they winter there of.

0With black bill and legs: plumage of a fine jetty blacknefs, except the leffer coverts of the wings, which are of a bright fcarlet, with the loweft row white. Length ten inches. The FeMALes are of a dufky color.
Inhabit from the province of New York to the kingdom of Mexico. In Nortb America they are called Red-winged Starlings, and Swamp. Black-birds; in Mexica, Commendadores. from their red thoulders, refembling a badge worn by the commanders of a certain spanifo order. That kingdom feems to be their moft fouthern refidence. They appear in Nerv York in April, and leave the country in OEZober. They probably continue the whole year in the

Placean

Mannergo. fouthern parts, at left Catefly and Lawfon make no mention of their departure. They are feen in flocks innumerable, obfcuring at times the very fky with their multitudes.. They were efteemed the peft of the colonies, making moft dreadful havock among the maize and other grain, both when new fown, and when ripe. They are very bold, and not to be terrified with a gun; for, notwithftanding the fportfiman makes flaughter in a flock, the remainder will take a short flight, and fettle again in the fame field. The farmers fometimes attempt their deftruction, by freeping the maize in a decoetion
of white hellebore before they plant it. The birds which eat this prepared corn are feized with a vertigo, and fall down; which fometimes drives the reft away. This potion is particularly aimed againft the Purple Grakles, or Purple Jackdaw, which conforts in myriads with this fpecies, as if in confpiracy againft the labors of the hufbandman. The fowler feldom fhoots among the flocks, but fome of each kind fall. They appear in greateft numbers in autumn, when they receive additions from the retired parts of the country, in order to prey on the ripened maize.

Some of the colonies have eftablifhed a.reward of three pence a dozen for the extirpation of the Jackdaws : and in New England, the intent was almoft effected, to the coft of the inhabitants; who at

UsEs.

Nest. length difcovered that Providence had not formed even thefe feemingly deftructive birds in vain. Notwithftanding they caufed fuch havock among the grain, they made ample recompence, by clearing the ground of the noxious worms * with which it abounds. As foor as the birds were deftroyed, the reptiles had full leave to multiply: the confequence was the total lofs of the grafs, in 1749 ; when the New Englanders, late repentants, were obliged to get their hay from Penfylvania, and even from Great Britain.
The Red-winged Orioles build their nefts in bufhes, and among the reeds, in retired fwamps, in the form of a hang-neft; leaving it fufpended at fo judicious a height, and by fo wondrous an inftinct, that the higheft floods never reach to deftroy it. The neft is ftrong, made externally with broad grafs, a little plaftered; thickly lined with bent or withered grafs. The eggs are white, thinly and irregularly ftreaked with black.

Fernandez fays, that in Mexico they build in trees near towns; and both he and Catefly agree, that they fing as well in a ftate of confinement as of nature; and that they may be taught to fpeak. I agree with M. de Bufon, that, in cafe the manner of their nidification

[^12]is as Fernandez afferts, the difagreement in the different countries is very wonderful.

In Louifiana they appear only in winter, and are taken in a clapnet, placed on each fide of a beaten path made on purpofe, and ftrewed over with rice. As foon as the birds alight, the fowler draws the net, and fometimes takes three hundred at a haul. They are alfo eaten in the Englib colonies. Fernandez does not commend their flefh, which, he fays, is unpalatable and unwholefome.

Du Pratz fpeaks of two kinds: this, and another which is grey and black, with a red fhoulder, like the fpecies in queftion. I fufpect he forms out of the young birds, not yet arrived at full color, a new kind ; or perhaps a female bird : for I have received from Dr. Garden one under that title, which agrees with the defcription given by M. Du Pratz. Thefe are ftreaked with pale rufty brown: cheeks black : over each eye a white line : breaft and belly black, fpotted with pale brown : leffer coverts of the wings rich orange.

## White-backed Maize Thieves, Kalm, ii. 274. ${ }^{\circ}$

A
Species mentioned barely as above by Mr. Kalm, with the addition of their being lefs than the laft: that they fing finely, and appeared flying now and then among the bufhes near Saratoga; but that he faw them for the firft time near Nere Xork. As Mr. Kalm feems not to have had a diftinct fight of thefe birds, $i t$ is poffible that they are the White-winged Orioles of Mr. Latbam, ii. 440 : the coverts of whofe wings are white; the reft of the plumage entirely black. His fpecies came from Cayenne.

Baltimore bird, Catefy, i: 48 -Latham, i. $43^{2}{ }^{\circ}$

with white : breaft, belly, lower part of the back, and coverts of the tail, of a bright orange : primaries dufky, edged with white : two middle feathers of the tail black; the lower part of the reft of the fame color, the remaining part orange : legs black.

Female。

Place.

## 143. Bastard.

Head and back of the female olive, edged with pale brown: coverts of the wings of the fame color, marked with a fingle bar of white : under fide of the body, and coverts of the tail, yellow : tail dunky, edged with yellow. Length of this fpecies feven inches.

Inhabits from Carolina * to Canada $\dagger$. Sufpends its neft to the horizontal forks of the Tulip or Poplar trees, formed of the filaments of fome tough plants, curiounly woven, mixed.with wool; and lined with hairs. It is of a pear fhape, open at top, with a hole on the fide, through which the young difcharge their excrements, and are fed. In fome parts of North Anerica, this fpecies, from its brilliant color, is called the Fiery Hang-neft. It is called the Baltimore bird, from its colors refembling thofe in the arms of that nobleman.

It quits North America before winter, and probably retires to Mexico, the Xocbitototl of Fernandez $\ddagger$ feeming to be the fame fpecies.

Baftard Baltimore, Catefby, i. 49.-Latham, i. 433. Le Baltimore Batard, Brifon, ii, 111.-De Bufon, iiii 233.-Pl. Enl. 506. Oriolus Spurius, Lin. Syff, 162.-Bl, Mus.-Lev. Mus.

0. CWith the upper mandible of the bill black, the lower yel1. low : head, and whole upper part of the body, and coverts of the wings, cinereous; under fide entirely white: primaries brown on their exterior, orange on their interior fides: tail long; two middle feathers entirely cinereous, the others tipt with white: legs dufky. Length twelve inches.

Inhabits Nortb America. Arrives in New York in May. Makes its Placea. neft in fune, ufually in apple-trees; and lays four eggs, of a bluifh white color. The neft is made of fmall fticks and roots, and refembles greatly that of the Englifb Jay; but is fmaller. It retires from Nortb America in autumn.

This bird, as well as all the foreign Cuckoos, have only the generical character of the well-known European fpecies. They differ in their œconomy, nor have the opprobrious notes of that bird.

A. Exropean Cuckoo, Br. Zool. i. No 82. táb, xxxvi. fem.-Latham, i. 50 g . Cuculus Canorus, Gjok, Faun. Suec. No 96.
Le Coucau, De Buffon, vi. 305.-Lev. Mus.
C. With dove-colored head, hind part of the neck, back, rump. and coverts : throat, and under fide of the neck, of a pale grey: breaft and belly white, barred with black: primaries dufky; inner webs marked with white oval fpots: tail cuneiform ; middle feathers black, tipped with white; the reft marked with white fpots on each web. Female, Neck of a brownifh red : tail barred with ruft-color and black, and fpotted with white.

Inhabits all parts of Europe, as high as,Saltens Fogderie, in Norway*, within the Arctic circle; and even at Loppen, in Finmark $\dagger$. It is found equally high in $A f a$; and extends as far eaft as Kamtfcbatka. In all places it retains its fingular note, and its more fingular nature of laying its eggs in the nefts of fmall birds, and totally deferting them $\ddagger$. Of the above circumfance I beg leave to add a proof, which fell under my own notice in 7 une 1778 ; when I faw a young Cuckoo, almoft full grown (when I firft difcovered it) in the neft of a white Wagtail, beneath fome logs in a field adjacent to my houfe. The Wagtail was as folicitous to feed it, as if it had been its own offspring; for, many days after the Cuckoo fled, it was feen often perched on the adjacent walls, fill attended and fed by the Wagtail.

It arrives in the northern and eaftern parts of Aja, about the tenth of June.

W.With a bill of ivory whitenefs; great ftrength; three inches long : irides yellow : a conic creft, of a rich fcarlet color, on the hind part of the head: head, throat, neck, breaft, and belly, black: beneath each eye is a narrow ftripe of white, crooked at its beginning, running afterwards ftrait down the fides of the neck : upper part of the back, primary feathers, and coverts of the wings, black; lower part of the back, and the fecondaries, white: tail black.

This is a gigantic fpecies, weighing twenty ounces; and in bulk equal to a Crow.
Place.
Inhabits the country from New ferfey to the Brafils. Is in North Aneerica a fcarce bird; in South America more common. It breeds in the kingdom of Mexico in the rainy feafon; for which reafon Nieremberg ftyles it Picus Imbrifutus*. The Spaniards call them Carpenteros, Carpenters, on account of the multitude of chips which they hew out of the trees, either in forming their nefts, or in fearch of food, infects, and worms, which lurk beneath the bark. They are very deftructive to trees; for they have been known to cut out a meafure of chips in an hour's time $\dagger$. Inftinct directs them to form their holes in a winding form, in order the better to protect their nefts from the injury of the weather $\ddagger$.

quan-nor-ow, from the golden color of the fhafts and under fide of the wing feathers ".

The Swedifh Americans call it Hittock, and Piut $\dagger$; words formed from its notes. It is almoft continually on the ground; and never picks its food out of the fides of trees, like others of the genus : neither does it climb, but fits perched, like the Cuckoo; to which it has fome refemblance in manners, as well as form. It feeds on infects. Grows very fat, and is reckoned very palatable. It inhabits the ferfles, and other provinces to the fouth, the whole year.

H.With a black bill, three quarters of an inch long: crown, upper part of the neck, back, and coverts of the wings, of a moft refplendent variable green and gold: chin and throat of a fhining rich fcarlet, changing, as oppofed to the light, from gold to a full black; thefe feathers lie nearly as compacly as fcales : breaft and belly white; the fides green: middle feathers of the tail green; the exterior purple.

The chin, throat, and whole under fide, of the female, is white : the exterior feathers of the tail tipt with white.

This bird, fo admirable for its minutenefs, vaf fwiftnefs of flight, food, and elegance of form and colors, gave rife to numbers of romantic tales. They were not the Europeans alone, who were ftruck with its great beauty; the natives of America, to whom it was fo familiar, were affected with its gemmeous appearance, and beftowed on it titles expreffive of its refplendent colors. Some nations called it Ourifia, and Guaracyaba, or the Sun-beam; others, Guaraeygaba. or Hairs of the Sun; others again named it Huitzitzil, or Vicililin,

* This genus may be divided into thofe with ftrait and thofe with inclurvated bills 3
there being none of the laft in North America, the diftinction is omitted. but there being none of the laft in North America, the diftinction is omitted.
or the Regenerated; becaufe they believed it died annually, and was re-animated at the return of the flowers it fed on : that it fuck its bill into the trunk of a tree, and remained lifelefs for fix months; when the vital powers re-migrated, and reftored to nature one of its moft brilliant wonders.

It flies with a fwiftnefs which the eye is incapable of following. The motion of the wings is fo rapid as to be imperceptible to the niceft obferver. Lightning is fcarcely more tranfient than its flight, nor the glare more bright than its colors. It never feeds but upon wing, fufpended over the flower it extracts nourifhment from; for its only food is the honied juice lodged in the nectarium, which it fucks through the tubes of its curious tongue. Like the Bee, having exhaufted the honey of one flower, it wanders to the next, in fearch of new fweets. It admires moft thofe flowers which have the deepeft tubes. Thus the female Balfamine, and the Scarlet Monarda, are particular favorites. Whofoever fets thofe plants before the win. dow is fure to be vifited by multitudes of thefe diminutive birds. It is a moft entertaining fight to fee them fwarming around the flowers, and trying every tube of verticillated plants, by putting their bills into every one which encircles the ftalk. If they find that their brethren have been beforehand, and robbed the flower of the honey, they will, in rage, pluck off, and throw it on the ground.

The moft violent paffions animate at times their little bodies. They have often dreadful contefts, when numbers happen to difpute poffeffion of the fame flower. They will tilt againft one another with fuch fury, as if they meant to transfix their antagonifts with their long bills. During the fight, they frequently purfue the conquered into the apartments of thofe houfes whofe windows are left open, take a turn round the room, as Flies do in England; and then fuddenly regain the open air. They are fearlefs of mankind; and in feeding will fuffer people to come within two yards of them; but on a nearer approach, dart away with admirable fwiftnefs.

Fernandez Oviedo, an author of great repute, fpeaks from his own knowlege of the fpirited initinet, even of this diminutive bird, in defence
gefence of its young: "So that when they fee a man clime $y^{e}$ tree " where they have their nefts; they flee at his face, and ftryke hym " in the eyes, commyng, goying, and returnyng, with fuch fwyft" nefs, that no man woulde lyghtly beleeve it, that hath not feene " it *."

Father Cbarlevoix gives a more apocryphal inftance of the courage of this bird, in its attack on its difproportioned enemy the Raven. As foon as the laft appears, the Honcyfucker fies up like lightning, beds itfelf beneath the Raven's wing, and, piercing him with his needle-like bill, till the bird is heard to croak with agony, at length tumbles to the ground dead, either from the fall or the wound. This relation feems of a piece with the combar of the Wren with the Eagle, mentioned by Arifootle $\dagger$ : but, to do juftice both to the Frencis voyager and Grecion philofopher, I muft add, that each of them delivered their reports from oral evidence.

Many fables have been related of the melody of the fong of thefe

Note.

Nebts. birds. In fact, their only note is foreep, foreep, foreep; but the noife which they make with their wings, efpecially in the morning, when numbers are in motion, is a fort of buzz or found refembling that of a fpinning-wheel. Their note is chiefly emitted when they happen to ftrike againft each other in their flight.

Their nefts are found with great difficulty, being built in the branch of a tree, amidft the thick foliage. It is of elegance fuitable to the architects; formed on the outfide with mofs; in the infide lined with the down or goffamer collected from the Great Mullein, or Verbafcum Tbapfus; but it is alfo fometimes made of flax, hemp, hair, and other foft materials. It is of an hemifpherical fhape. Its inner diameter an inch : its depth half an inch. The female is faid to be the builder; the male fupplying her with materials. Each affifts in the labor of incubation, which continues during twelve days. They lay only two eggs, white, and as fmall as peafe. The firft is very fin-

## RED-THROATED HONEYSUCKER.

gular, and contrary to the general rule of nature; which makes, in all other inftances, the fimalleft and moft defencelefs birds the moft prolific. The reafons of the exception in this cafe are double. The fimallnefs of their bodies caufes them commonly to efcape the eyes of birds of prey; or if feen, their rapid flight eludes purfuit : fo that the fpecies is preferved as fully as if they had been the moft numerous breeders.

The Indians of Mexico, Peru, and Maynds, make moit exquifite pictures of the feathers of birds; but thofe of the Honeyfuckers form the moft brilliant part. Some ufe them as ornaments, and hang them as pendants in their ears, which give a blaze emulous of the Ruby and Emerald. In order to compofe pietures, the Indians draw off the feathers with fmall pincers, and with fine pafte moft artfully join them together. They difpofe them with fuch fkill, as to give the true lights and made to the performance, and imitate nature with the greateft fidelity. Thefe were meant to decorate the idols and temples; for, before the depreffion of the Indian fpirit by the tyranny of the Spaniards, religion, was, highly, cultivated among, the Mexicans and Peruvians; and, notwithftanding it was cruel, was attended with great fplendor.

The generical name (in the Brafilian tongue) of thefe birds, is Guianumbi. There are feveral fpecies, but only one which is found in North America. This kind is found from Canada, through that great continent, as low as Louifiana, and from thence to the Brafils. It breeds even in the northern climate of Canada; but retires not only from thence, but even from the warm provinces of Carolina, at approach of winter. In Hijpaniola, the mountains of Famaica, and the Brofils, countries where there are a perpetual fucceffion of flowers, they refide throughout the year.

T.
With the characters defcribed in the definition of the genus. - Color of the plumage dark, gloffed with variable copper color and green : coverts of the wings, and the quil-feathers, barred with black and white. Tail confifts of two orders; the upper, or fhorter, very elegant; the ground color a bright bay; the middle feathers marked with numerous bars of fhining black and green; the greatelt part of the exterior feathers of the fame ground with the others, marked with only three broad bands of mallard green, placed remote from each other; the two next are colored like thofe of the middle; but the end is plain, and croffed with a fingle bar, like the exterior.

The longer, or lower order, were of a rufty white color, mottled with black, and croffed with numerous narrow waved lines of the fame color, and near the end with a broad band.

$$
P_{p_{2}} \quad \text { Wild }
$$

Taxl.

Wild Turkies preferve a famenefs of coloring. The tame, as ufual with domeftic animals, vary. 'It is needlefs to point out the differences, in fo well-known a bird. The black approach neareft to the original flock. This variety I have feen nearly in a ftate of nature, in Richmond and other parks. A moft beautiful kind has of late been White varaety. introduced into England, of a fnowy whitenefs, finely contrafting with its red head, and black pectoral tuft. Thefe, I think, came out of Holland, probably bred from an accidental white pair; and from them preferved pure from any dark or variegated birds.

The frzes of the wild Turkies have been differently reprefented. Some writers affert, that there have been inftances of their weighing fixty pounds; but I find none who, fpeaking from their own knowlege, can prove their weight to be above forty. Foffelyn fays, that he has eaten part of a Cock, which, after it was plucked, and the entrails taken out, weighed thirty *: Lawfon, whofe authority is unqueftionable, faw half a Turkey ferve eight hungry men for two meals $\dagger$; and fays, that he had feen others, which, he believed, weighed forty pounds. Catefby tells us, that out of the many hundreds which he had handled $\ddagger$, very few exceeded thirty pounds. Each of thefe fpeak of their being double that fize, merely from the reports of others.

The manners of thefe birds are as fingular as their figure. Their attitudes in the feafon of courthip are very friking. The males fling their heads and neck backwards, briftle up their feathers, drop their wings to the ground, ftrut and pace moft ridiculoufly; wheel round the females, with their wings rufling aiong the earth, at the fame time emitting a ftrange found through their noftrils $\boldsymbol{s}_{\boldsymbol{x}}$ not unlike the
Notes. grurr of a great fpinning-wheel. On being interrupted, fly into great rages, and change their note into a loud and guttural gobble; and then return to dalliance.

The found of the females is plaintive and melancholy.

[^17]The paffions of the males are very ftrongly expreffed by the change of colors in the flefhy fubftance of the head and neck, which alters to red, white, blue, and yellowifh, as they happen to be affected. The fight of any thing red excites their choler greatly.

They are polygamous, one cock ferving or hens. They lay in the fpring; and will lay a great number of eggs. They will perfift in laying for a great while. They retire to fome obfcure place to fit, the cock, through rage at lofs of its mate, being very apt to break the eggs. The females are very affectionate to the young, and make great moan on the lofs of them. They fit on their eggs with fuch perfeverance, that, if they are not taken away when addle, the hens will almoft perih with hunger before they will quit the neft.

Turkies greatly delight in the feeds of nettles; but thofe of the purple Fox-glove prove fatal to them *.

They are very ftupid birds; quarrelfome, and cowardly. It is diverting to fee a whole flock attack the common Cock; who will for a long time keep a great number at bay.
They are very fwift runners, in the tame as well as the wild fate. They are but indifferent flyers. They love to perch on trees; and gain the height they wifh, by rifing from bough to boulgh. In a wild ftate, they get to the very fummit of the loftieft trees, even for high as to be beyond the reach of the mulquet $\dagger$.

In the flate of nature they go in flocks even of five hundred $\ddagger$ 。 Feed much on the fimall red acoms; and grow fo fat in March, that they cannot fly more than three or four hundred yards, and are then foon run down by a horfeman. In the unfrequented parts bordering on the $M i \int_{f} / \mathrm{I}_{\mathrm{p}} i$, they are fo tame as to be fhot with ever a piftol $\|$.

They frequent the great fwamps $\S$ of their native country; and leave them at fun-rifing to repair to the dry woods, in fearch of

[^18]Irascible。

Polygamous.

Swift:
Perchaigh.

Gregarious.

Haynts.
acorns, and various berries; and before fun-fet retire to the fwamps to rooft.

The flefh of the wild Turkey is faid to be fuperior in goodnefs to the tame, but redder. Eggs of the former have been taken from the neft; and hatched under tame Turkies; the young will fill prove wild, perch feparate, yet mix and breed together in the feafon. The Indians fometimes ufe the breed produced from the wild, as decoybirds, to feduce thofe in a ftate of nature within their reach *.

Wild Turkies are now grown moft exceffively rare in the inhabited parts of America, and are only found in numbers in the diftant and moft unfrequented fpots.
The Indians make a moft elegant cloathing of the feathers. They twift the inner webs into a flrong double thread of hemp, or inner bark of the mulberry-tree, and work it like matting. It appears very rich and gloffy, and as fine as a filk fhag $\dagger$. They alfo make fans of the tail; and the French of Louifana were wont to make umbrellas by the junction of four of the tails $\ddagger$.

When difturbed, they do not take to wing, but run out of fight. It is ufual to chafe them with dogs; when they will fyy, and perch on the next tree. They are fo flupid, or fo infenfible of danger, as not to fly on being fhot at; but the furvivors remain unmoved at the death of their companions $\#$.
Turkies are natives only of America, or the New World; and of courfe unknown to the antients. Since both thefe pofitions have been denied by fome of the moft eminent naturalifts of the fixteenth century, I beg leave to lay open, in as few words as poffible, the caufe of their error.
Belon §, the earlieft of thofe writers who are of opinion that thefe birds were natives of the old world, founds his notion on the defcription of the Guinea Fowl, the Meleagrides of Strabo, Atheneus, Pliny, and others of the antients. I reft the refutation on the excel-

[^19]lent

Ient account given by Atbencus, taken from Clytus Milefius, a difciple of Arifotle, which can fuit no other than that fowl. "They want, fays he; " natural affection towards their young. Their head is " naked, and on the top is a hard round body, like a peg or nail: " from their cheeks hangs a red piece of flefh, like 2. beard: it has " no wattles, like the common poultry: the feathers are black, fpot. "s ted with white: they have no fpurs: and both fexes are folike, as "s not to be diftinguifhed by the fight." Varro* and Pliny $\dagger$ take notice of the fpotted plumage, and the gibbous fubftance on the head. Atbencus is more minute, and contradists every character of the Turkey: whofe females are remarkable for their natural affection; which differ materially in form from the males; whofe heads are deftitute of the callous fubitance; and whofe heels (in the male) are armed with fpurs.

Aldrovandus, who died in 1605, draws his arguments from the fame fource as Belon; I therefore pafs him by, and take notice of the greateft of our naturalifts, GESNER $\ddagger$; who falls intora miftake of another kind, and wifhes the Turkey to be thought anative of India. He quotes Elian for that purpofe; who tells us, "that in India are " very large poultry, not with combs, but with various-colored crefts; " interwoven like flowers: with broad tails, neither bending, nor " difplayed in a circular form; which they draw along the ground, "s as Peacocks do when they do not erect them: and that the " feathers are partly of a gold color, partly blue, and of an emeraid "color ॥."

This, in all probability, was the fame bird with the Peacock Pheafant of Mr. Edwards, Le Paon de Tibet of M. Briffon, and the Pavo Bicalcaratus of Linnaus. I have feen this bird living. It has a creft, but not fo confpicuous as that defcribed by Alian; but it has thofe ftriking colors in form of eyes: neither does it erect its tail like the

[^20]
## Peacock:

Peacock *. The Catreus of Strabo $\dagger$ feems to be the fame bird. He defcribes it as uncommonly beautiful, and fpotted; and very like a Peacock. The former author $\ddagger$ gives a more minute account of this fpecies, and under the fame name. He borrows it from Clitarcbus, an attendant of Alexander the Great in all his conquefts. It is evident from his defcription, that it was of this kind; and it is likewife probable, that it was the fame with his large Indian poultry before cited. He celebrates it alfo for its fine note; but allowance muft be made for the credulity of Elian. The Catreus, or Peacock Pheafant, is a native of Tibet, and in all probability of the north of India, where Clitarcbus might have obferved it; for the march of Alexander was through that part of India which borders on $\mathcal{T}$ ibet, and now known by the name of Penj-ab, or Five Rivers.

Not natives of Europe;

I fhall now collect from authors the feveral parts of the world where Turkies are unknown in the flate of nature. Europe has no fhare in the queftion, it being generally agreed, that they are exotic in refpect to our continent.

Neither are they found in any part of Afia Minor, or the Afatic TurKEY, notwithftanding ignorance of their true origin firft caufed them to be named from that empire. About Aleppo, capital of Syria, they are only met with domefticated, like other poultryill. In Armenia they are unknown, as well as in Perfia, having been brought from Venice by fome Armenion merchants into that empire $\S$; where they are ftill fo fcarce, as to be preferved among other rare fowls' in the Royal menagery 9 .

In India they are kept for ufe in our fettlements, and imported from Europe, as I have been more than once informed by, gentlemen long refident in that country.

Du Halde acquaints us, that they are not natives of Cbina; but were introduced there from other countries. He errs, from mifinformation, in faying that they are common in India.

[^21]I will not quote Gemelli Careri, to prove that they are not found in the Pbilippine inands, bsaafe that gentleman, with his pen, travelled round the world in his eafy chair, during a very long indifpofition and confinement*.

But Dampier bears witners that none are found in Mindanao t.
The hot climate of Africa barely fuffers thefe birds to exit in nor Africa: that vaft continent, except under the care of mankind. Very few are found in Guinea, except in the hands of the Europeans: the negroes declining to breed any, on account of their great tendernefs $\ddagger$.

Profper Alpinus fatisfies us that they are not found either in Nubia or in Egypt. He defcribes the Meleagrides of the antients; and only proves that the Guinea-hens were brought out of Nubia, and fold at a great price at Cairoll, but is totally filent about the Turkey of the moderns.

Let me in this place obferve, that the Guinea-hens have long been imported into Britain. They were cultivated in our farm-yards: for I difcover, in 1277 , in the grainge of Clifton, in the parifh of Ambrofden, in Buckingbambire, among other articles, via mutilones, and fex Arricanes famine if; for this fowl was familiarly known by the names of Afra Avis, and Gallina Africana \& Numida. It was introduced into Italy from Africa, and from Rome into our country. They were neglected here by reafon of their tendernefs and difficulty of rearing. We do not find them in the bills of fare of our antient feafts $\S$ : neither do we find the Turkey: which laft argument amounts to almoft a certainty; that fuch a hardy and princely bird had not found its way to us. The other likewife was then known here by its claffical name; for that judicious writer,

> Qq

Dro

Dr. Caius*, defcribes, in the beginning of the reign of Elizabeth, the Guinea fowl, for the benefit of his friend Gefner, under the name of Meleagris, beftowed on it by Arifotle $\dagger$.

Having denied, on the very beft authorities, that the Turkey ever exifted as a native of the old world, I muft now bring my proofs of its being only a native of the new ; and of the period in which it firft made its appearance in Europe.

The firt precife defcription of thefe birds is given by Oviedo; who: in 1525 drew up a fummary of his greater work, the Hiffory of the: Indies, for the ufe of his monarch Cbarles Vo. This learned man had vifited the Weft Indies and its inands in perfon, and payed particular, regard to the natural hiftory. It appears from him; that the Turkey was in his days an inhabitant of the greater inands, and of the main land. He fpeaks of them as Peacocks; for, being a new bird to him, he adopts that name, from the refemblance he thought they bore to the former: " But (fays he) the neck is bare of feathers, but os covered with a fkin which they change after their phantafie into se divers colours. They have a horn as it were on their front, and "haires on the breaft $\ddagger$." He defcribes other birds, which he alio calls Peacocks. They are of the gallinaceous genus, and known by the name of Curafao birds; the male of which is black, the female ferruginous.

The next who fpeaks of them as natives of the main land of the warmer paris of America, is Francifco Fernandez, fent there by Pbilip.II. to whom he was phyfician. This naturalift obferved them
Mexico. in Mexico: We find by him, that the Indian name of the male was Huexoloft, of the female Cibuatotolin: he gives them the title of Gallus Indicus, and Gallo-Pavo. As the Indians as well as Spaniards domefticated thefe ufeful birds, he fpeaks of the fize by comparifon, faying that the wild were twice the magnitude of the tame; and that they were fhot with arrows or guns $\|$. I cannot learn the time

[^22]when Fernandez wrote. It muft be between the years 1555 and $\mathbf{1 5 9 8}$, the period of Pbilip's reign.

Pedro de Ciefa mentions Turkies on the Ifthmus of Darien*. Lery, a Portuguefe author, afferts that they are found in Brafil, and gives them an Indian name $\dagger$; but fince I can difcover no traces of them in that difigent and excellent naturalit Mercgrave, who refided long in that country, I muft deny my affent. But the former is confirmed by that able and honeft navigator Dannier, who faw them frequently, as well wild as tame, in the province of Yucatan $\ddagger$, now reckoned part of the kingdom of Mexico.

In North America they were obferved by the very firt difcoverers. When Renè de Loudonniere, patronized by Admiral Coligni, attempted to form a fettlement near the place where Cborlefiowen now ftands, he met with them on his firft landing, in 1564 , and by his hiftorian, has reprefented them with great fidelity in the Vth plate of the recital of his voyage $\|$. From his time, the witneffes to their being natives of this continent are innumerable. They have been feen in flocks of hundreds in all parts, from Louifiana even to Canoda: but at this time are extremely rare in a wild ftate, except in the more diffant parts, where they are ftill found in vaft abundance.
It was from Mexico or Yucatan that they were firft introduced into Europe; for it is certain that they were imported into England as early as the year 1524 , the 15 th of Henry VIII § . We probably received them from Spain, with which we had great intercourfe till about that time. They were moft fuccefsfully cultivated in our kingdom from that period; infomuch that they grew common in every farm-yard, and became even a difh in our rural feafts by

[^23]Vhen first iho troduced into Europe.
the year 5585 ; for we may certainly depend on the word of oid Tuffer, in his account of the Cbritmas hufbandlie fare *.

Beefe, mutton, and porke, fhred pies of the beft, Pig, veale, goofe and capon, and Tiurkie well dreft:
Cheefe, apples, and nuts, jolie carols to heare, As then in the countrie, is counted good cheare.

But at this very time they were fo rare in France, that we are told that the very firt which was eaten in that kingdom appeared at the nuptial feaft of Cbarles IX. in 570 .

They are now very common in all parts of Rufia, but will not thrive in Sibiria. Are cultivated in Sweden, and even in Norway, where they degenerate in fize $\ddagger$.

Place.

Manners.

Srom Mr. BarTRAM.

In fize thefe birds obferve a medium between a Phearant and a Partridge. Length I foot 5 inches.

They inhabit North Anerica, from Hudjon's Bay ${ }^{*}$ to the Carolinas, and probably to Louifana $\dagger$.

The hiftory of this fpecies is very curious: all which I beg leave to tranfribe from Mr. Edzoards, according to the accounts given him by Mr. Bortram and Mr Brooke, who had frequent opportunity of obferving its manners; to which I fhall add another, borrowed from the Travels of the Baron La Hontan.
"He is (fays Mr. Bartram) a fine bird when his gaiety is dif" played; that is, when he fpreads his tail like that of a Turkey" cock, and erects a circle of feathers round his neck like a ruff, " walking very ftately with an even pace, and making a noife fome" thing like a Turkey; at which time the hunter muft fire immedi" ately at him, or he flies away directly two or three hundred yards, " before he fettles on the ground. There is fomething very remark" able in what we call their thumping; which they do with their " wings, by clapping them againt their fides, as the hunters fay. "They fand upon an old failen tree, that has lain many years on the " ground, where they begin their ftrokes gradually, at about two fe"conds of time diftant from one another, and repeat them quicker " and quicker, until they make a noife like thunder at a diftance ; " which continues, from the beginning, about a minute; then ceaf" eth for about fix or eight minutes before it begins again. The " found is heard near half a mile, by which means they are dif"covered by the hunters, and many of them killed. I have fliot " many of them in this pofition; but never faw them thump, they " moftly feeing me firt, and fo left off. They commonly exercife ** in thumping fpring and fall, at about nine or ten in the morning,

* Pbil. Trank. 1xii. 393.
$\dagger$ The accounts given by Boffu, Engl. ed. i. 95. and by Du Pratz, ii. are too flight for us to determine the fpecies they mean. Cbarlervoir, in his account of Ganada, vol. v. defrribes it very well.
se and four or five in the afternoon. Their food is chiefly ber-
" ries and feeds of the country : their flefh is white, and choice
"food. I believe they breed but once a year, in the fpring, and "c hatch twelve or fourteen at a brood; which keep in a company
"s till the following fpring. Many have attempted to raife the young " ones, and to tame them ; but to no purpofe. When hatched under "c a hen, they efcape into the woods foon after they are hatched, "6 where they either find means to fubift, or perifh."

The hiftory of this bird is thus further illuftrated by Mr. Brooke Mr. Broogr. of Maryland, in Nortb America: "The ruffed Grous, or Pheafant, " breeds in all parts of Maryland, fome countries on the Eaftern ${ }^{6 c}$ More excepted. . They lay their eggs in nefts they make in the ${ }^{6}$ leaves, either by the fide of fallen trees, or the roots of ftanding "e ones. They lay from twelve to fixteen eggs.: the time of incu-
" bation is in the fpring; but how long their eggs are hatching " I cannot fay; but probably it is three weeks, the time that a " Dunghill Hen fits. I have found their nefts when a boy, and have ${ }^{\text {sc }}$ endeavoured to take the old Pheafant, but never could fucceed: "fhe would almoft let me put my hand upon her before fhe would "quit her neft; then by artifice the would draw me off from her eggs, ${ }^{\text {se }}$ by fluttering juft before me for a hundred paces or more; fo that ${ }^{s c}$ I have been in conftant hopes of taking her. They leave their " nefts as foon as they are hatched; and I believe they live at ${ }^{\circ}$ firft on ants, fmall worms, \&cc. When they are a. few days old, ${ }^{\circ}$ of they hide themfelves fo artfully among the leaves, that it is dif"r ficult to find them: as they grow up, they feed on various berries, "f fruits, and grain of the country : grapes they likewife are fond of or in the feafon; but the Pheafant is more particularly fond of the ivy${ }^{56}$ berry. I do not know any other animal that feeds on this berry: ${ }^{66}$ I know it is poilon to many. Though the Pheafant hatches ${ }^{66}$ many young at a time, and often fits twice a year, the great numca. ber and variety of Hawks in Maryland feeding on them, prevents ${ }^{\text {ce. }}$ their increafing faft. The beating of the Pheafant, as we term it, Te. is a noife chiefly made in the fpring of the year by the cock-bird ${ }_{3}$
"s it may be diftinetly heard a mile in a calm day : they fwell their " breafts like the Powting Pigeon, and beat with their wings, which " make a noife not unlike a drum in found; but the Pheafant fhor${ }^{6}$. tens each founding note, till they run one into another undiftin" guihably, like friking two empty bottles together."
La Hontan.
In order to perfeet, as far as I am able, the hiftory of this bird, I Ihall give a quotation from Baron La Honton's Voyages to Nortb America, publifhed in Englif, (vol. i. p. 67.) where he fpeaks of a bird found near the lakes of Coneda, which, I think, can be no other than the above-defcribed, though the names given them difagree.

La Hontan fays," I went in company with fome Canadefe on «f purpofe to fee that fowl flap with its wings: believe me, this fight "s is one of the greateft curiofities in the world; for their flapping " makes a noife much like a drum, for about the fpace of a minute; ${ }^{68}$ then the noife ceafes for half a quarter of an hour; after which " it begins again. By this noife we were directed to the place where " the unfortunate More-hen fat, and found them upon rotten moffy "s trees. By flapping one wing againft the other they mean to call " their mates; and the humming noife that enfues thereupon may "e be heard half a quarter of a league. This they do in the months " of April, May, September, and OElober; and, which is very re" markable, the More-hen never flaps in this manner but upon " one tree. It begins at break of day, and gives over at nine " o'clock in the morning, till about an hour before fun-fet, then " it flutters again, and continues fo to do till night."
Mr. Graham:
To thefe accounts I beg leave to add the following, out of the Pbilofopbical Iranfactions; which informs us, that this fpecies of Grous bears the Indian name of Pukee, or Pufpukee, at Hudjon's Bay, on account of the leannefs and drynefs of their Hefh, which is extremely white, and of a very clofe texture; but when well prepared, is excellent eating. They are pretty common at Moofe Fort and Henly Houfe; but are feldom feen at Albany Fort, or to the northward of the above places. In winter they feed upon juniper-tops, in fummer on goofeberries, rafpberries, currants, cranberries, $\mathcal{E}^{\circ} c$. They are nos.
migratory; ftaying all the year at Moofe Fcrt: they build their neft on dry ground, hatch nine young at a time, to which the mother clucks as our common hens do; and, on the left appearance of danger, or in order to enjoy an agreeable degree of warmth, the young ones retire under the wings of their parent.

Urogallus minor fufcus cervice plumis alas imitantibus donata, Catefoy, App. tab. i. 18c. Pinnateqo Tetrao Cupido, Lin. Syjf. 274.-Latbam. La Gelinote hupèe d'Amerique, Brifor, i. 212.-Lev. Mus.-Bl. Mus.

GR. With head, cheeks, and neck of a reddifh brown, marked with dufky lines: chin and throat of a pale rufty brown: on the head is a fmall creft: on each fide of the neck a moft fingular tuft (five feathers in each) gradually lengthening to the fifth. which is about three inches long: the upper feathers ferruginous, and white; the lower black: back and fcapulars black and pale ruft-colour; the former fpotted with white: breaft and belly barred with white and pale brown : tail barred with pale brown and black.

Legs covered with foft brown feathers : toes naked and peetinated.
Size of a Pheafant. A peculiar fpecies, not to be confounded with the preceding ${ }^{\text {*. }}$. Defcribed from the real bird by Mr . Caiefly; and by myfelf from the fpecimens in Mrs. Blackburn's cabinet; which were: fent from the province of Comnecticut. Is frequent about a hundred miles up Albany river, in Hudfon's Bay.

The tufts, which diftinguifh this fpecies from all others, are rooted high on the neck, not far from the hind part of the head., . The bird has the power of erefting or dropping them at pleafure. When difturbed, it would fpread them horizontally, like little wings; at other times let them fall on the fides of the neck $\dagger$. It is probable, that they affift in running or flying, or perhaps both, as the real wings are very fhort, in proportion to the weight of the body. Thefe appendages are peculiar to the cock, and almoft the only difference between it and the hen.

GR. With the head, cheeks, and hind part of the neck, varied with reddifh brown and black: the back and coverts of the tail of the fame color: the fcapulars and great coverts of the wings ferruginous, fpotted with black, and great fpots of white: primaries black, fpotted with whice: breaft and fides white, elegandy marked with fagittal fpots of black: belly white : tail fhort and cuneiform; the two middle feathers two inches longer than the others: the tail is of the fame color with the back, only the exterior feathers are fpotted with white: the legs are covered with foft and long feathers, extending over the pectinated toes, which would be otherwife naked.

The Length of this fpecies is feventeen inches: the Extent of wings twenty-four: Weight two pounds.

Inhabits Hudfon's Bay; and, according to Dr. Mitcbel, the unfrequented parts of Virginia; but none have been brought over to England from any other place than the Bay.

Linnaus confounds this with the Wood Grous, or Cock of the Wood *. Comparifon will fhew with how little reafon the Comte De Buffon + makes it to be the female of the next fpecies, our Spotted Grous. If the female of that was not afcertained, the difference in the form of the tail would be fufficient to eftablifh a diftinction; by which it approaches neareft to the European Pheafant of any bird in North America.

[^26]The Indians about Hudfon's Bay call this Ppecies the Au Kufkow. It continues there the whole year ; lives among the fmall larch buhes, and feeds, during winter, on the buds of thac plant and the birch; in the fummer, on all forts of berries. The females lay from nine to thirteen eggs. The young, like others of this genus, run as foon as hatched, and make a puling noife like a chicken. They differ chiefly from the cock, in having lefs of the red naked fikin over the eyes. The cock has a fhrill crowing note, but not very loud. When difturbed, or while flying, it makes a repeated noife of cuck, cuk; and makes a noife with the feathers of its-tail like the cracking of a fan. The flefh of thefe birds is of a light brown color, plump, and very juicy.

Plumageo.
Doubly feathered.

Inhabits Hudfon's Bay, Neruforndland, and Canada. Is called By the Englib of Hudfon's Bay, the Wood Partridge, from its living in pine woods. Thefe birds are very ftupid; fo that they are often knocked down with a flick; and are ufually caught by the natives with a noofe faftened to a ftake. In fummer they are very palatable; for in that feafon they feed on berries. In winter they live on the fhoots of the fpruce-fir, which infects the flef with a very difagreeable tafte. If it is true, that this fpecies lays but five eggs *, it is a flrange exception to the prolific nature of the genus.

    GR. With a black bill: fcarlet eye-brows, very large in the male; in the female far lefs confpicuous. Head, neck and: part of the back, coverts of the tail, and fcapulars, deep orange, crofled with numerous dunky lines, and often marked with great blotches of white : belly, legs, and middle feathers of the tail, white: the reft of the tail dufky, tipt with white: the fhafts of the quill feathers black: the legs and toes warmly clad with a very thick and long coat of foft white feathers : the claws broad and flat, adapted for digging.
    Such is the fummer drefs: in winter they change their color to white, or, more properly fpeaking, moult, and change their colored plumes for white ones. By a wonderful providence, every feather, except thofe of the wings and tail, becomes double; a downy one fhooting out at the bafe of each, as expreffed in the plate, which gives an additional protection againft the cold. In the latter end of February, the fummer plumage begins to appear firf about the.

* Pb. Tr. 1xii. 390.
rump, in form of brown fumps *, the firf rudiments of the coat they affume in the warm feafon, when each feather is fingle, fuitable to the time. I ought to have obferved before, that the Spotted Grous allo changes its fingle for double feathers at approach of winter, notwithftanding it undergoes no change of color.

The Weight of this fpecies is twenty-four ounces: its Length fixteen inches and a quarter: Extent twenty-three.

Thefe birds are met with round the globe, within and without the arstic circle, and as high as lat. 72 , in the countries round Ifudfon's Bay, and as low as Newfoundland; in Norway; perhaps in the N. of the Ruffan dominions in Europet, and certainly in Afa all over Sibiria, as far as Kamtfcbatka, and in the illands which lie between that country and America. Finally, they abound in Lapland and Iceland; and I repeat, with certainty, that Norway has fupplied me with this fpecies, which was fent to me by the late Mr. Fleifcber, of Copenbagen, along with the leffer kind, which proved to be the fame with the White Grous of the Alps, and the Ptarmigan of the Highlands of Scotlond. Each of the varieties of the Norwegian birds were in their fummer drefs; and differed moft materially in fize as well as color, the one being in all refpects-like the American kind: the leffer agreed in every point with that which I defcribe, $\mathrm{N}^{\circ} 95$, vol. i. of my Britif Zoology.

The natives diftinguifh the kinds. The larger, which inhabits forefts, is feyled by them Skorv Rype, or the Wood Grous; the leffer, which lives in the mountains, is called Field Rype, or the Mountain Grous $\ddagger$. They all burrow under the fnow; and form extenfive walks beneath. There they feed, efpecially in Lapland, on

## - Drage's Voy. ii. 9.

$\dagger$ The feathers of the Rulfian kind, whichfoever it was, in early times, about Pechora, were an article of commerce, and were fold for two pence of their money. per Pood, or 38 lb . Purcbas, iii. 536.
$\ddagger$ The Ruffan White Grous inhabits indifferently woods, mountains, plains, and marfhes. The Briti $\mathrm{B}_{\mathrm{B}}$ fpecies or variety is in $R u / \sqrt{2} a$ about half the fize of the Sibirian kind.

Size.

Place。

Norway.

Norwegians distinguish Two kinds.
the feeds of the dwarf birch *, and in the feafon on variety of berries of mountain plants. During winter they are taken and brought to Bergen by thoufands; are half roafted, and put into firkins, and traniported to ocher countries $\dagger$.

The leffer variety is not unknown in America. The fort here defcribed is found in amazing quantities, efpecially about Hudfon's Bay, where they breed in all parts along the coafts, make their nefts on dry ridges on the ground, and lay from nine to eleven eggs, powdered with black.

This is the only fpecies of Grous in $N$. America to which Providence hath given that warm protection to its feet, evidently to fecure them againft the cold of their winter lodgings: and, as they are greatly fought after by Eagles, Owls, and other birds of prey, a fine provifion is made for their fafety, by the change of color, which renders them not to be diftinguifhed from the fnow they lie on.

Every morning they take a flight into the air directly upwards, to thake the fnow from their wings and bodies. They feed in the mornings and evenings, and in the middle of the day bafk in the fun. In the morning they call to one another with a loud note, interrupted; feeding in the intervals, and calling again.

In the beginning of OEFober, they affemble in flocks of two hundred, and live much among the willows, the tops of which they eat; whence they are called WillowPartridges. About the beginning of December they appear in lefs plenty, retiring from the flats about the fettlements on Hudfon's Bay to the mountains, where in that month the fnow is lefs deep than in the lowlands, to feed on cranberries and other berries $\ddagger$. In Greenland they refort in fummer to the mountains for the fake of the crowberries $\|$, which they eat even with the leaves of the plant. In winter they defcend to the fhores, where the winds fweep the fnow off the rocks, and enable them to pick up a fuftenance.

[^27]They are an excellent food, and much fearched after by the $E_{u}$ ropeans in Hudjon's Bay. They are generally as tame as chickens, efpecially in a mild day: fometimes they are rather wild; but by being driven about, or fhot at with powder, they grow fo weary, by the fhort flights they take, as foon to become very tame again. Sometimes the hunters, when they fee the birds likely to take a long flight, imitate the crying of a Hawk, which intimidates them fo much, that they inftantly fettle. When the female is killed, the male can fcarcely be forced from the body of its mate *.

The ufual method of taking them is in nets made of twine, twenty feet fquare, faftened to four poles, and fupported in front in a perpendicular direction with fticks. A long line is faftened to thefe props, the end of which is held by a perfon who lies concealed at a diftance. Several people are then employed to drive the birds within reach of the net, which is then pulled down, and often covers at one haul fifty or feventy. At this time they are fo plentiful, that ten thoufand are taken for the ufe of the fettlement from November to the end of April. In former days, they muft have been infinitely more numerous; for Sir Thomas Button relates, that when he wintered there in 1612, he took eighteen hundred dozens of thefe and other fowl $\dagger$ : but this is a trifle to the fuccefs of M. Feremie, who afferts, that there were eaten in one winter, between himfelf and feventy-nine others, ninety thoufand Grous, and twenty-five thoufand Rabbets $\ddagger$.

The Laplanders take them by forming a hedge with the boughs of birch-trees; leaving fmall openings at certain intervals, and hang in each a fnare. The birds are tempted to come and feed on the buds or catkins of the birch; and whenever they endeavour to pals through the openings they are inftantly caught.

[^28]184. Rock. OCK Gr. With a black line from the bill to the eye. In all other
parts of the plumage of the fame colors with the White, $\mathrm{N}^{\circ} 183$; but inferior in fize by one third.

Differs in nature. Feeds on the tops of fmall birch. Frequents only the dry rocky grounds, and the larch plains. Makes a fingular fnoring noife, with its neck ftreched out, and feemingly with difficulty. Is very numerous in the northern parts of Hudfon's Bay, and never vifits the fouthern end, except in very hard weather. Never takes fhelter in the woods, but fits on the rocks, or burrows in the fnow. Is inferior in goodnefs to the preceding.

Female $\quad$ Length of the female only two feet two: color ferruginous and black, difpofed generally in bars.

Notwith-

Notwithftanding the opinions of Linnous and the Count De Buffon, this fpecies is unknown in Nortb America. Its moft foutherly habitation, as far as I can difcover, is the Arcbipelago, it being Plaego found in the iflands of Crete and of Milo. One was fhot in the laft, perched on a palm-tree, on whofe fruit it probably fed. I fufpect that it does not extend into Afra Minor; for Doctor Ruffell does not enumerate it among the Syrian birds. As the Tetrao, which Athencus* calls a fort of Phealant, was found in the antient Media, it may ftill be met with in the northern part of Perfa. If Ariffotle intends this fpecies by the words Tetrix and Ourax $\dagger$, it was likewife found in Greece; but he applies thofe names only to a bird which lays its eggs on the graffy ground, and fays no more.

Pliny gives a far clearer defcription of the Tetraones of Italy. Decet Tetraonas fuus nitor, abjolutaque nigritia, in fuperciliis cocci rubor. This certainly means only the cock of the Black Grous; which is diftinguifhed by the intenfe blacknefs and the brilliant glofs of its plumage, as well as by its fcarlet eyebrows, which is common to it and the Wood Grous; which laft is the fpecies defcribed by the ancient naturalift ; truly in fome refpects, hyperbolically in others. He fays it is of the fize of a Vulture, and not unlike it in color $\ddagger$. Both thefe affertions approach the truth; for the upper part of the body has a dufky or footy look, not unlike that of the Vulture of the Alps. But when he fpeaks of its being the heavieft bird next to the Oftrich, we fee plainly he goes beyond all bounds.

It is a fpecies found in moft parts of the wooded and mountanous countries of Europe, and extends even to the arctic Lapmark §: is common in Rufiz and Sibiria; in the laft are found greater and leffer varieties. It is found even as far as Kanitjchatka.

[^29]B. Spurious $\mathrm{Gr}_{\mathrm{r}}$. Tetrao Hybridus. Racklehane. Rofagis Raflate, Faunt. Sules. N${ }^{2}$ 20zo

GR. With a fpotted breaft and forked tail. In fize equal to the hen of the preceding. Is much farcer, more timid, and its note very different. Linncus fays it is a mixed breed between the WOOD and Black Grous; but his account of it is obfcure.
C. Black Grous, Br. Zool. i. No 93.

Tetrao ${ }^{\text {us }}$, Pliniz.
Tetrao Tetrix, Orre, Faun. Suec. No 202.
Le Petit Tetras ou Coq de Bruyere a queue forchue, De Buffor, ii. 210.-Pl. Enfo. 172, 173.

GR. With a white fpot on the fhoulders, and white vent feathers : reft of the plumage of a full black, gloffed with blue : tail much forked, exterior feathers curling outwards. Weight near four pounds. Length one foot ten inches.

Female weighs but two pounds. The tail is Ilightly forked and: Short: the colors ruft, black, and cinereous.
Place. Inhabits Europe, as high as Lapland: extends over Ruffia and Si biria as far as birch-trees grow, of the catkins and buds of which: it is very fond. Feeds much on the populus balfamifera*, which gives its flefh a fine flavor. In northern Europe, this and the laft fpecies live during fummer on whortle-berries; and feed their young with gnats. In fummer the males perch on trees; and animate the forefts with their crowing. In winter they. lie on the ground, become buried in the fnows, and form walks beneath, in which they?
often continue forty days *. They are at prefent taken in fnares : but in Lapland were formerly fhot with arrows $\dagger$.

During winter, there is at prefent a very fingular way of taking the Black Grous in Sibiria. In the open forefts of birch, a certain number of poles are placed horizontally on forked flicks : by way of allurement, fmall bundles of corn are placed on them; and not remote, are fet certain tall bafkets of a conic fhape, with the broadeft part uppermoft : within the mouth is placed a fmall wheel, through which paffes an axis fixed fo nicely as to admit it to play very feadily, and permit one fide or the other, on the leaft touch, to drop down, and again recover its fituation. The Black Grous are foon attracted by the corn on the horizontal poles; firft alight on them, and after a fhort repaft fly to the bafkets, attempt to fettle on their tops, when the wheel drops fideways, and they fall headlong into the trap, which is fometimes found half full.
D. Ptarmigan, Br. Zool. i. No 95.

Tetrao Lagopus. Suecis Snoripa. Lappis Cheruna, Faun, Suec. No 203. Le Lagopede, De Buffon, ii. 264, tab. ix.

GR. With the head, neck, back, fcapulars, and fome of the coverts of the wings, marked with narrow lines of black, afhcolor, and ruft, intermixed with fome white: wings and belly white: outmoft feathers of the tail black; thofe of the middle cinereous, mottled with black, and tipt with white. The male has a black fpot between the bill and the eye; which in the female is fcarcely vifible. One which I weighed in Scotland was nineteen ounces. Another weighed by Mr. Ray, in the Grifons country, only fourteen. It regularly changes its colors at approach of winter.

[^30]Inhabits Greenland, Iceland, Lapland, all Scandinavia, and Rufia; but I believe does not extend to Sibiria or Kamtfchatka. This, from its haunts, is called by the Norwegians, Ficlde Rype, or Mountain Grous. But in Ruffia it inhabits indifferently woods, mountains, plains, and marfhes. Its feathers were formerly an article of commerce. It is taken among the Laplanders, by the fame ftratagem as the White Grous, $\mathrm{N}^{\circ} 183$.

The Greenlanders catch it in noofes hung to a long line, drawn between two men, dropping them over the neck of this filly bird. They fometimes kill it with frones; but of late oftener by fhooting. It is faid, that when the female is killed the male unwillingly deferts the body*.

The Greenlonders eat it either dreffed, or half rotten, or raw, with feals lard. The inteftines, efpecially thofe next to the rump, and frefh drawn, are reckoned great delicacies. They alfo mix the contents with frefh train-oil and berries; a luxury frequent among thefe people. The fkins make a warm and comfortable fhirt, with the feathers placed next to the body. The women formerly ufed the black feathers of the tail as ornaments to their head-dreffes.
E. Rehusax. Montin, in Acz. Pbyfogr. Lund. i. 150.
$G R$. With neck ruft-colored, fpotted with black: back and coverts of tail black, varied with rufty ftreaks: breaft divided from the lower part of the neck by a dark thade : reft of the breaft and vent white; the hen fpotted with yellow: primaries white: tail black; end whitifh : thighs white, with fome rufty fpots: legs feathered to the toes: toes naked, covered with large brown fcales. Size of a fmall Hen.

\author{

- Faun. Groml. p. $117_{0}$
}

Inhabits both the woods and alps of Lapland. Lays thirteen or fourteen reddifh eggs, marked with large brown fpots, When difturbed, fies away with a loud noife, like a coarfe laugh. The Keron, or common Ptarmigan, on the contrary, is filent. The Keron inhabits the Alps only.

$$

B. Quail, Br. Zool, i, No 97-Wachel, Faun. Suec. No 206.-Lev. Mus.-Bl.Mus. IS found no further north than Sweden. It appears there in the. beginning of the leafing montb (May); and is neither heard or feen there in autumn or winter, unlefs it fhould, as Linneus fuppofes, migrate to the fouthern province, or Scbonen, or retire to the Ukraine, Wallacbia, \&cc *.

Quails fwarm fo greatly, at the time of their migration, about the Dnieper, and in the fouth of Rufia, that they are caught by thoufands, and fent to Mofcow and Peterfourgb in cafks. They are common in all parts of Great Tartary; but in Sibiria only in the fouth, as their paffage is hindered by the lofty fnowy mountains. It is faid they winter beneath the fnow; and in great frofts, to be found torpid in the Ant-bills. Beyond lake Baikal, the Quails exactly refemble thofe of Europe, but are quite mute. Thefe are ufed by the Cbinefe in fighting, as we do Cocks.

- Anurg. Acàd. iv. 592.
XVIII. B U S T A R D. Gez. Birds: XXXIX.

IAm forry that I have it not in my power to do more than afcertain that a bird of the Bustard genus is found in North America. Captain King was fo obliging as to inform me, that he faw on the plains near Norton Sound, N. lat. $64 \frac{1}{2}$, great flocks of a large kind. They were very fhy ; ran very faft, and for a confiderable way before they took wing; fo that he never could get one fhot.
I often meet with the word Outarde, or Buflard, among the Frenclo voyagers in North America; but believe it to be always applied to a fpecies of Goofe.
The Great Buftard, Br. Zool. i. No 98 , is frequent over all the defert of Tartary, and beyond lake Baikal. Is a folitary bird; but collects into fmall flocks at the time of its fouthern migration, and winters about $A$ fracan ${ }^{*}$.

A. Lesser Bustarb, Br. Zool. i. ${ }^{o} 99$.

Tetrao Tetrax, Faun. Suec. No 1 g6.
La Petite Outarde ou la Cane-petiere, De Buffon, ii. 40.-Pl.Enl. 10.25.-Lev.Mus. B. With crown, back, fcapulars, and coverts of the wings, ferruginous and black; primaries black at their ends, white at their bottoms; the fecondaries quite white: neck black, marked near the top and bottom with a white circle : breaft and belly white: middle feathers of the tail croffed with ruft and black, the reft white. Female entirely ferruginous and black, except wings and belly. Size of a Pheafant.

Appears in Sweden rarely in the fpring: not traced further north. Very frequent in the fouthern and fouth-weft plains of Rufia, and in fmall focks when it migrates. Continues a good way into the deferts of Tartary; but is never feen in Sibiria.

P.With a black bill : red irides: head, and hind part and fides of the neck, of a flaty blue; on each of the laft a large fhining golden fpot : coverts of the wings of a dark blueifh grey, marked with a few black fpots: quil feathers brown : tail of a great length, and: cuneiform: the middle feathers duky grey, the next paler, the outmoft white. Weight nine ounces.

Thefe birds vifit the provinces of Nortb America in moft amazing: numbers every hard winter. They appear in greater or leffer numbers, according to the mildnefs or feverity of feafon; for: when the weather proves mild, few or none are feen.in the fouthern parts. Neceffity alone obliges them to change their quarters, in fearch: of: Food. acorns, maft, and berries, which the warmer provinces yield in vaft abundance. When they alight; the ground is foon cleared of all efculent fruits, to the great lofs of the hog, and other maft-eating animals. When they have devoured'every thing which has fallen on the furface, they form themfelves into a great perpendical column, and by rotation keep flying among the boughs of the trees, from? top to bottom; beating down the acorns with their wings, and fome
or other, in fucceffion, alight on the earth and eat *. The fpecies of food they are fondeft of is the fmall acorn, called the Turkey acorn, it being alfo a favorite food of thofe birds. In Canado théy do vaft damage in autumn, by devouring the corn, before they begin their fouthern flight $\dagger$.

They build their nefts in trees, and coo like the Engli/b W:ld Pigeon; and lay two eggs. They breed in the more northern parts, from the country fouth of Moofe Fort, in Hudjon's Bay $\ddagger$, to that between Fort Frederick and Fort Anne, and the woods about the river Onandago $\|$. During the time of incubation and nutrition, they feed firt on the feeds of the $\S$ red maple, which ripens in May; and after that, on thofe of the elm $\mathbb{\Phi}$. It appears by thofe accurate obfervers, Mr. Bariram and Mr. Kalm, that they continue in their breeding-places till the middle at left of fuly: the firft having feen them in $\mathcal{F}$ une ; the laft, the 1gth of $\mathcal{F}$ tuly. Mr. Hutcbins affures me, that they continue in the inland parts of Hudfon's Bay till December; and when the ground is covered with fnow, feed on the buds of juniper.

As foon as thefe birds find a want of food, they collect in vaft flocks, and migrate to fuch places as are likely to fupply them with fubfiftence. The multitudes which appear during the rigorous feafons are fo immenfe, that the mention of them, unlefs fupported by good authority, would feem incredible. They fy by millions in a flock; and in their paffage literally intercept the light of the fun for a confiderable fpace. As foon as one flock has paffed, another fucceeds, each taking a quarter of an hour before the whole flock is gone. This continues, in fome feafons, for three days without any intermifion ${ }^{* *}$.

The inhabitants of New York and Pennfylvania are frequent witneffes of the phenomenon, and kill numbers of thefe migrants from

Nests.

Migrations.

Vast numbers.
their baiconies, and the roofs of their houfes. When they alight on trees to rooft, they often break the limbs of ftout oaks, unable to fupport the weight of the crowds which perch on them. The ground beeneath the trees on which they have lodged a night, is covered with their dung to a confiderable depth *.

Foffelyn, who obferved thefe Pigeons in 1638 , in Nere England, before they were difturbed by population, fays, he has feen flights of them moving at Michaelmas to the fouthward, four or five miles long, fo thick that he loft fight of the fun. He adds, that they maturn. return in fpring; and that they join neft to neft, and tree to tree, by their nefts, for many miles together, in the woods $\dagger$. Kalns mentions their paffage through Ferfey in March.

The inhabitants of North America profit by this kind gift of Providence, and fhoot them in their paffage; for they are very fat, and excellent meat. The Indians watch the roorting-places; go in the night, and, knocking them down with long poles, bring away thoufands. Formerly, you could not go into a little Indian town, in
Their oil. the intericr parts of Carolina, but you would find a hundred gallons of Pigeons oil or fat, which they ufe with their mayz, as we do butter $\ddagger$. They fcorn to obtain that ufeful article from the quiet employ of the dairy; but are fond of the fimilitude, provided it could be obtained by any means fuitable to their active fpirit.
M. du Pratz hit upon an ingenious expedient of taking them on rooft, by placing under the trees veffels filled with flaming fulphur; the fumes of which afcending, brought them fenfelefs to the ground in perfect fhowers.

I fhall conclude this account with what was communicated to me by the late Mr. Abton Blackburne, from his own obfervations, or thofe of his friends, who were eye-witneffes to the wondrous facts related of there birds.

* Lawfon, 44.-The Rev. Mr. Burnaby relates the prodigious flights he faw pafling in September, foutherly, over Newu England. He adds, he fcarcely met with any other food in the inns he was at. p. 132.

## "New York, June 21, 1770.

" I think," fays Mr. Blackburne, "t this as remarkable a bird as " any.in America. They are in vaft numbers in all parts, and have " been of great fervice at particular times to our garrifons, in fup" plying them with fref meat, efpecially at the out-pofts. A " friend told me, that in the year in which $2 u b b e c$ was taken, the " whole army was fupplied with them, if they chofe it. The way " was this : every man took his club (for they were forbid to ufe " their firelocks) when they flew, as it was termed, in fuch quan" tities, that each perfon could kill as many as he wanted. They " in general begin to fly foon after day-break, and continue till " nine or ten o'clock; and again about three in the afternoon, " and continue till five or fix: but what is very remarkable, they " always fly wefterly. The times of flying here are in the fpring, " about the latter end of February or the beginning of Marcb, "s and continue every day for eight or ten days; and again in the "fall, when they begin the latter end of $\mathcal{F u l y}$ or the beginning of "Auguft. They catch vaft quantities of them in clap-nets, with "ftale pigeons. I have feen them brought to this market by facks" full. People in general are very fond of them; and I have heard "s many fay they think them as good as our common Blue Pigeon; " but I cannot agree with them by any means. They tafte more "c like our Quceft, or Wild Pigeon; bur are better meat. They " have another way of killing them-They make a hut of boughs " of trees, and fix ftale Pigeons on the ground at a fmall diftance " from the hut. They plant poles for the Wild Pigeons to light " on when they come a falling (as they term it) which they do " every morning in the feafon, repairing to the marfhes near the "fea-fide; then the perfons in the hut pull the ftale Pigeon, when " the birds will alight in vaft numbers on the poles, and great " multitudes are fhot. Sir William Jobnfon told me, that he killed * at one fhot with a blunderbufs, a hundred and twenty or thirty.
"Some years paft they have not been in fuch plenty as they ufed "s to be. This fpring I faw them fly one morning, as I thought " in great abundance; but every body was amazed how few there " were; and wondered at the reafon.
"I muft remark one very fingular fact: that, notwithftanding the " whole people of a town go out a pigeoning, as they call it, they " will not on fome days kill a fingle hen bird; and on the very " next day, not a fingle cock (and yet both fexes always fly " wefterly); and when this is the cafe, the people are always affured "s that there will be great plenty of them that feafon. I have been "at Nicgara when the centinel has given the word that the "Pigeons were fying; and the whole garrifon were ready to run over " one another, fo eager were they to get frefh meat."

The breaft of the female of a dirty white.
A. The Leffer, Edw. 78.

DIFFERS from the former in having a white line over each eye; and in being fomewhat inferior in fize. Famaica*.
B. Varied. Tetronpan, Feraanaez, 38:

WITH a fpotted breaft ; probably a young bird of one of the others.
Thefe birds fhun the cold parts of America; and are found from the province of New York as far fouth as Mexico and the Antilles. They are fo impatient of the rigorous feafon, as to retire at approach of winter from all the provinces north of Carolina or Virginia. In the firft they inhabit the whole year. They vifit Nere York in April, or the beginning of May, but are rather fcarce in that part of America: they breed there in Fune, and lay five or fix blue eggs, thickly fpotted with dull red.

They build often in fruit trees $\dagger$; are very familiar, and love to be converfant about dwellings; and, during fummer, ufually dèliver
their fong perched on the chimney's top. During breeding feafon, are very fhy, and will defert their neft if any one looks on the eggs*: but are fometimes preferved, and brought alive to England.

During fummer they feed on berries, mulberries, and other fruits, and infects. In winter, when orher food is fcarce, on the berries of the Dogwood $\dagger$. When tamed, feed on every thing.
Varrous Song. Thefe birds are perhaps the firft among the chorifters of the woods; and are jufly famed not only for the variety, fulnefs, and melody of their own notes, but their imitative faculty of the notes of all other birds or animals, from the Humming-bird to the Eagle. They will even imitate the found of other things. I have heard of one, confined in a cage, that would mimic the mewing of a cat, the chattering of a magype, and the creaking of a fign in high winds. The Mexicans call them Cencontlatolli $\ddagger$, or the birds of four hundred tongues, on account of their valt variety of notes and imitative powers. In the warmer parts of America they fing inceffantly from March to Auguf, day and night, beginning with their own compofitions, and then finifhing by borrowing from the whole feathered choir, and repeat their tunes with fuch artful fweetnefs, as to excite pleafure and furprize. The fuper-excellence of their fongs makes ample amends for the plainnefs of their piumage.

They may be faid not only to fing, but dance: for, as if excited by a fort of extafy at their own admirable notes, they gradually raife themfelves from the place where they fland, with their wings extended, drop with their head down to the fame fpot, and whirl round with diftended wings, accompanying their melody with variety of pretty gefticulations §. They are birds of vaft courage; and will attack any large bird.
 Fatefy.

195. Ferruge nous.

Plage.

Inhabits North America, from Hudjon's Bay to Natka Sound, on the weftern coaft; and fouth as low as Carolina. Quits the warmer parts in the fpring, and retires north to breed. Appear in pairs in Hudjon's Boy, on Severn River, at the beginning of May. At Moofe Fort, thefe birds build their neft, lay their eggs, and hatch their young, in fourteen days; but at Severn fettlement, which lies in 55, or four degrees more north, the fame is not effected in lefs than twenty-fix days *. They are alfo very common in the woods near St. Fobn's, in Nerefoundland.

They arrive in New York in February, and lay their eggs in May, and quit the country in OEFober: in each country where they pars the fummer, they adapt their retreat to the time in which winter fets in.

They make their nefts with roots, mofs, $\& x$. ; and lay five eggs, of a moft lively fea-green colour. The cock is moft affiduous in affifting its mate in making the neft and feeding the young; and in the intervals chears her with its mufical voice.

Like the Euglibh Fieldfare, they come and go in large flocks. They have two notes; one a loud fream, like the Miffel-bird: the other, a very fweet fong, which it delivers from the fummit of fome lofty tree.

They feed on worms, infects, and berries. Mr. Catefby brings a proof, that it is not the heat of the feafon alone that forces them away. He had, in Virginia, fome trees of the Aluternus, in full berry; the firft which were known in America: a fingle Fieldfare was fo delighted with them, as never to quit them during the whole fummer.

They are called in America, the Robin; not only from the rednefs of the breaft, but from their actions and tamenefs, as I have obferved in thofe kept in aviaries.

Bergen. They migrate in great numbers into Britain at Micbaelwas, and depart about the beginning of March; but I have no certainty of the place they come from. Multitudes are found in all feafons in Polond ${ }^{*}$ : multitudes alfo migrate from other places to the Polifh woods in autumn. Perhaps the woods in all thofe countries may be overcharged with them, fo that annually numbers may migrate into other places, without being miffed by the inhabitants. Pontoppidan fays, that Fieldfares are in great flocks in autumn, when berries are moft plenty $\dagger$. Poffibly, after they have exhaufted the woods, they may migrate to us, compelled both by cold and want of food. They appear conftantly in the Orknies, near the approach of winter, in their way fouth, and feed during their refidence in thofe illes on the berries of empetrum nigrum, arbutus alpina, and woa urf, and thofe of the juniper. They arrive in England about Michaelmas, and leave it early in March. 'They are frequent in the forefts of Rufha, Sibiria, and even Ramtfolotka, as is the Redwing Thrusir. Both vifit Syria $\ddagger$, and both migrate into Minoria in the end of October, and winter in that climate §.

207. PRIB. Chatterer, Cätefay, i. 46.-Edw. 242.-Br. Zool. i. No 112. Le Jafeur de la Caroline, Brifon, ii. 337.-De Bufon, Oif. iii. 441.Latham, ii. 93.-Lev. Mus.-Bl. Mus.

CH. With a black bill : black band of feathers acrofs the forehead, extended on each fide of the eyes towards the hind part of the head: head crefted; color of that and neck a pale reddifh brown: chin black: back deep brown: rump grey: coverts of wings cinereous: quil feathers dufky; ends of the feven laft tipt with wax-like, or enameled appendages, of a bright fcarlet color:: tail dusky, tipt with bright yellow : breaft whitif : belly and thighs of a light yellow: legs black. Length feven inches. Female wants the fcarlet appendages to the wingso-
Place. Inhabits America, from Nova Scotia to Mexico and Cayenne *. The Mexican name is Coquantototl. Fernondez $\dagger$ fays, it lives in the mountanous parts of the country. Feeds on feeds; but is remarkable neither for its fong, or the delicacy of its flefh. It migrates. in flocks to Nere York the latter end of March; breeds there in, May and fune; and retires fouth in flocks in November.

The differences between this bird, and the Chatterers of the: old continent, are thefe:-it is about an inch inferior in length : it wants the rich yellow on the wings; but, as a recompence, has the fame beautiful color on the belly.

The European varieties are found as high as Drontbeim, and appear in great numbers during winter, about Peterfourg and Mofcow, and in all parts of Ruffia, and are taken in flocks. They do not breed there: retiring to the very aretic circle for that purpofe. It is faid, that they never have been obferved beyond the river Lena: and that they are much fcarcer in Sibiria than Ruffa. Mr. Bell faw fome about Tobolgi in December $\ddagger$. The navigators found them, September 1778, on the weftern coaft of America, in lato. 64. 30.: long. 1.98. 30.

RR. With each of the mandibles crooked, and croffing each other at the tips: wings, head, neck, and body, of a full red: wings and tail dufky: the coverts croffed with two white lines.

The Female is of a dirty green: rump of a deep yellow: the colors of each fex vary wonderfully; there being farcely two which agree in the degree of hades of red or green: but the bills are fufficient diftinctions from all other birds.

Inhabits the northern latitudes of Nortb America, from Hudjon's Place. Bay to Newfoundland. Mr. Edwerds mentions one taken off Greenland; but that individual muft have been driven there by a ftorm, fince it could never have fubfifted in that woodlefs region, its food being the kernels of pine-cones, apples, and berries.

Thefe birds arrive at Severn river in Hudfon's Bay, the latter end of May; but fo greatly affect a cold climate, as to proceed even more northward to breed. They return in autumn at the firft fettingin of the froft. Their habitations are the forefts of pines.

They are found in all the evergreen forefts of Rufia and Sibiric. In Scandinavia, as high as Drontbeim. In England they anly appear in certain years. I do not find that they migrate in any part except in America.

The American fpecies varies from the European in being much. lefs; and in the two white lines acrofs the wings.

| Pine Grosbeak, Br. Zool. i. No 114،-Edru. 123. Le Dur-bec, De Buffon, iii. 444-Pl. Enl. 135 . Loxia enucleator. L. Canadenfis, Lin. Syje. 299, 304. Tallbit, Swank-Papgoia, Faun. Suec. No 223.-Latúant, |

|  |  |

GR. With a very ftrong thick bill, hooked at the end: head, and upper part of the body, of a rich crimfon; each feather marked with black in the middle: leffer coverts incline to orange; the others dufky, croffed by two white lines: the primaries and tail duky : lower part of the neck, breaft, and belly, of a pale crimfon: vent cinereous: legs black. Female of a dull dirty green; twice the fize of the Englifb Bullfinch.
Prace. Inhabits Hudfon's Bay ${ }^{*}$, Newfoundland, and Canada, and as far as the weftern fide of North America: vifits Hudfon's Bay, in April: frequents the groves of pines and junipers: fings on its firft arrival, but foon grows filent : makes its neft on trees, at a fmall height from the ground, with fticks, and lines it with feathers. Lays four white eggs, which are hatched in June. The clerk of the California obferved there birds firft on the 25 th of fanuary: they fed on the poplar tree $\dagger$. It is remarked, that birds of plain colors only inhabit the frigid climates: but this gay bird is an exception.

It is likewife an inhabitant of the northern parts of Europe, as far as Drontbeim: and in Afa, in all the pine forefts: is frequent in Sibiria, and the north of Rufia: is taken in autumn about Peterfourg, and brought to market in plenty. In fpring it retires to Lapland.

I have feen them in the pine forefts near Invereould, in the county of Aberdeen, in Scotlond, in the month of Auguf; therefore fufpect they breed there.

GR. With a light red bill; bafe encompaffed with black feathers: head adorned with an upright pointed creft: head, neck, and body, of a rich fcarlet color: wings and tail of a dark and dull red. Female of a much duller hue, with brown cheeks and back: belly of a dirty yellow. Length nine inches.

Inhabits the country from Nerofoundland to Louifana. Is a hardy Placto and familiar bird: very docile. Lives much on the grain of mayz, which it breaks readily with its ftrong bill. Lays up a winter provifion of that grain; and conceals it very artfully in its retreat, firft with leaves, and then with fmall branches, with an aperture for an entrance *.

Their fong is remarkably fine; fo that they are called the Virginian Nigbtingale. They fit warbling in the mornings, during fpring, on the tops of the higheft trees $\dagger$. They alfo fing when confined in cages, and are much fought on account of their melody. In a fate of confinement the female and male are at fuch enmity, that they will kill one another. They feldom are feen in larger numbers than three or four together. I have heard that their note is toned not unlike that of a Throftle; and that when tame, they will learn to whiftle. Arrives in the Ferfies and New York in the beginning of April; and during the fummer, haunts the magnotios: fwamps. In autumn retires to the fouth.

[^35]Crefted Cardinal, Brown's Illuffr. tab. xxiii.

$G^{R}$. With a moft elegant upright pointed cref: that, head, and neck, of a moft rich fcarlet: fides of the neck, breaft, and belly, white : upper part of the neck, back, wings, and tail, dark grey: legs flefh-color.

Size a little:inferior to the laft. Is faid to have a foft feeble note *.

forked; three outmoft feathers white; the third black, tipt with white; the reft wholly black : legs black : hind claw long, but not fo ftrait as that of the Lark. Weight one ounce five drams: Length fix inches and a half: Extent ten.
Place. The earlieft of the migratory birds of Hudjon's Bay. Appeared in 1771, at Severn fettement, on April inth; flayed about a month or five weeks; then proceeded farther north to breed *. Return in September; flay till Novernber, when the fevere frofts drive them fouthward. Live in flocks: feed on grafs feeds, and are converfant about dunghills: are eafily caught, under a fmall net baited with oatmeal, and are very delicate meat. I am not certain of the winter retreat of thefe birds out of Hudjon's Bay; but having feen one of this fpecies among thofe fent to Mrs. Blackburn from New York, I imagine that they fpread over the more fouthern parts of North America in the rigorous feafon, as they do over Europe in the fame period.

Thefe birds have a fummer and a winter drefs. The firf we have defcribed. Againft the rigorous feafon they become white on: their head, neck, and whole under fide: great part of their wings, and the rump, affumes the fame color: the back, and middle feathers of the tail, are black. But Linnous, who was very well acquainted with this fpecies, fays, that they vary according to age and featon. Mr. Grabam fent to the Royal Society two fpecimens; one in its fummer feathers, which exactly anfwered to our Tawny Bunqing, $N^{\circ} 121$; the other, to our Snow Bunting, $N^{0}$ 122, in its. winter feathers. On this evidence, I beg the readers of the Britijl ifles to confider the above as one and the fame fipecies.

Hudfon's Bay is not the fartheft of their northern migrations.
Greeniand。 They inhabit not only Greenland $t$, but even the dreadful climate of Spitzbergen, where vegetation is nearly extinct, and fcarcely any but cryptogamious plancs are found.' It therefore excites wonder, how

[^36]birds
birds, which are graminivorous in every other than thefe froftbound regions, fubfift: yet are there found in great flocks, both on the land and ice of Spitzbergen *. They annually pafs to this country by way of Norway: for in the fpring, flocks innumerable appear, efpeciaily on the Norwegian ines: continue only three weeks, and then at once difappear $\dagger$. As they do not breed in. Hudfon's Bay, it is certain that many retreat to this laft of lands, and totally uninhabited, to perform in full fecurity the duties of love, incubation, and nutrition. That they breed in Spitzbergen is very probable; but we are affured that they do fo in Greenland. They arrive there in April, and make their nefts in the fifures of the rocks, on the mountains, in May: the outlide of their neft is. grafs; the middle of feathers; and the lining the down of the Arctic Foir. They lay five eggs, white, fpotted with brown: they fing finely near their neft.

They are caught by the boys in autumn, when they collect near the fhores in great flocks in order to migrate; and are eateri dried $\ddagger$.

In Europe they inhabit, during fummer, the moft naked Lapland Alps ; and defcend, in rigorous feafons, into Sweden, and fill the roads and fields; on which account the Dalecarlians call them Illworsfogel, or bad-weather birds. The Uplanders, Hardvarsfogel; expreffive of the fame. The Laplanders ftyle them Alaipg. Olaus. Magnus fpeaks of them under the name of Avicule nivales $\$$, but mixes much fable in his narrative: he perches them alfo on trees: whereas they always fit upon the ground: .

Leems \| remarks, I know not with what foundation, that they fatten on the flowing of the tides, in Finmark, and grow lean on the ebb. The Eaplanders take them in great numbers in hair fpringes, for the tables, their flefh being very delicate.

They feem to make the countries within the whole artfic circle

[^37]their fummer refidence; from whence they overfiow the more fouthern countries in amazing multitudes, at the fetting-in of winter in the frigid zone. In the winter of $1778-9$, they came in fuch multitudes into Birfa, one of the Orkney inands, as to cover the whole barony; yet, of all the numbers, hardly two agreed in colors.

North of Britarno

Russia. Sibiria.

Germany

Lapland, and perhaps Iceland, furnifhes the north of Britain with the fwarms that frequent thofe parts during winter, as low as the Cbeviot hills, in lat. 55. 32. Their refting-places, the Feroe ines, Sebetlend, and the Orknies. The highlands of Scotlond, in particular, abound with them. Their fights are immenfe; and they mingle fo clofely together, in form of a ball, that the fowlers make great havock among them. They arrive lean, foon become very fat, and are delicious food. They either arrive in the highlands very early, or a few breed there; for I had one fhot for me at Invercould, the Ath of Augrif. But there is a certainty of their migration, for multitudes of them often fall, wearied with their paffage, on the veffels that are failing through the Pentland Frith *.

In their fummer drefs they are fometimes feen in the fouth of England + , the climate not having feverity fufficient to affect the colors ; yet now and then a milk-white one appears, which is ufually miftaken for a white Lark.
$R u f i a$ and Sibiria receive them, in their fevere feafon, annually, in amazing flocks, overflowing almoft all Ruffia. They frequent the villages, and yield a moft luxurious repaft. They vary there infinitely in their winter colors; are pure white, fpeckled, and even quite brown $\ddagger$. This feems to be the influence of difference of age more than of feafon.

Germany has alfo its fhare of them. In Auftria they are caught, and fed with millet, and afford the epicure a treat equal to that of the Ortolan §.

[^38]Fringilla

Fringilla Hudfonias, Forfer.-Ph. Tranf. 1xii--Latham, ii, 666. Snow-bird, Catefly, i. 36.-Lev. Mus.-Bl. Mus.

B.With a white fhort bill: blue eye: head, neck, wings, body, and tail; of a footy blacknefs, edged with rult: breaft, belly, and vent, of a pure white: exterior fides of the primaries edged with white; of the fecondaries, with pale brown: exterior webs of the outmof feathers of the tail white: of the fpecimen defcribed in the Tranfactions, the two outmoft are wholly white, and the third marked with a white fpot; the reft dufky. Length fix inches and a half: Extent nine: Weight half an ounce.

Appears near Severiv fettlement not fooner than June: flays a fortnight: frequents the plains: feeds on grafs feeds : retires into the arctic parts to breed. Returns to Hudfon's Bay in autumn, in its paffage to the fouth. Migrates into New York, where it continues the whole winter. Appears in the fouthern provinces, as low as Carolina, but chiefly in fnow, or when the weather is harder than ordinary ${ }^{*}$. Arrive in millions, in very rigorous feafons, and fly about the houfes and barns to pick up the corn. Frequent the gardens, and the fmall hills, to feed on the fcattered feeds of grafs. Are called by the Swedes, Snovogel, or Snow-bird; by the Americans, Cbuck-bird $\dagger$. They do not change their colors in any feafon of the year. Are efteemed very delicate meat.

black; exterior edge of the outmoft feathers white; and a large white fpot on the end of the three firt: middle feathers entirely black.

Female of a rufty brown : belly white, bounded by dirty yellow: irides in both fexes red. Length eight inches and a half.
Place, Inhabits New Tork and Carolina. Has a pretty note.
225. Rice.

> Maia Fernandez, 56. C. ccxix.-Wil. Orn. 386.-Raii Syh. Av. Rice-bird, Hortulanus Carolinenfis, Cateßy, i. 14.-Edw. 291. Emberiza oryzivora, Lin. Syf. 311 .-Lathant, ii. 288, 289. L'Ortolan de la Caroline, Brifon, iii. 282. L'Agripenne, ou l'Ortolan de Riz, De Buffon, iv. $337 \cdot-$ Pl. Enl. $388 .-$ Lev. Mus. $\quad$-BL. Mus.
B. With the head, and whole under fiche of the body, black: hind part of the neck in fome pale yellow; in others, white: coverts of the wings, and primaries, black; the laft edged with white: part of the feapulars, leffer coverts of the wings, and rump, white : back black, edged with dull yellow : tail of the fame colors, and each feather fharply pointed: legs red. Length feven inches and a quarter.

Head, upper part of the neck, and back, of the Female, yellowifh brown, fpotted with black: under part of a dull yellow: fides thinly ftreaked with black. The bird defcribed by le Comte de Buffon, under the title of l'Agripenne de la Louifiane *, feems to be no other than a female of this fpecies, varied by having fome of the fecondary feathers wholly white.
Plage. Thefe birds inhabit in vaft numbers the inland of Cuba, where they commit great ravages among the early crops of rice, which precede thofe of Carolina. As foon as the crops of that province are to their palate, they quit Cuba, and pafs over the fea, in nuw merous flights, directly north; and are very often heard in their paffage by failors frequenting that courfe. Their appearance is in

September, while the rice is yet milky; and commit fuch devaftations, that forty acres of that grain have been totally ruined by them in a fmall time.

They arrive very lean; but foon grow fo fat, as to fly with difficulty; and, when fhot, often burf with the fall. They continue in Carolina not much above three weeks, and retire by the time the rice begins to harden. They are efteemed to be the moft delicate birds of the country. I am informed, that the male birds have a fine note.
It is very fingular, that, among the myriads which pay their autumnal vifit, there never is found a fingle cock-bird. Mr. Catefby verified the fact by diffecting numbers, under a fuppofition, that there might have been the young of both fexes, which had not arrived at the full colors; but found them all to be females, which are properly the Rice-birds. Both fexes make a tranfient vifit to Carolina in the fipring. It is faid, that a few ftragglers continue in that country the whole year.
Rice, the periodical food of thefe birds, is a grain of India*: it probably arrived in Europe-(where it has been much cultivated) by way of Baitria, Sufia, Babylon, and the lower Syria $\dagger$. The time in which it reached Italy is uncertain: for the Oryza of Pliny is a very different plant from the common Rice; but the laft has been fown with great fuccefs about Verona for ages paft; and was imported from thence, and from Egypt $\ddagger$, into England; until, by a mere accident, it was introduced into Carolina. It was firft planted there about 1688, by Sir Natbaniel Gobnfon, then governor of the province ; but the feed being fmall and bad, the culture made little. progrefs.

Chance brought here, in 1696, a veffel from Madagaffar; the mafter of which prefented a Mr. Woodward with about half a bufhel, of an excellent kind $\S$; and from this fmall beginning fprung an

- Raii Hift. Pl. ii. ${ }^{1446 .}+$ Strabo, lib. xv. p. $1014 . \quad \ddagger$ Anderfon's $D_{i c I .}$ ii. 327. § The fame, 238 -and Catefy, ii. Account of Carolina, xvii.
immenfe fource of wealch to the fouthern provinces of America; and to Europe relief from want in times of dearth. Within little more than half a century, a hundred and twenty thoufand barrels of Rice have been in one year exported from South Carolina; and eighteen thoufand * from Georgia : and all from the remnant of a fea fore, left in the bottom of a fack!-Ought I not to retract the word chance, and afcribe to Providence fo mighty an event from fo. fmall a caufe?

## 226. Painted.

Painted Finch, Catefy, i. 44.-Larwon, 144 .
Emberiza ciris, Lin. Syfe. 313.-Edw. 130, 173 .
Le Verdier de la Louifiane, dit vulgairement le Pape, Brifon, iii. zoo. App. 74* -Pl. Eul. 159.—De Buffon, iv. 176.—Latbam, ii. 206.-Levv. Mus.一 Bt. Mus.
B. With the head, and hind part of the head, of an exquifite deep blue: orbits fcarlet: back, greater coverts, and fecondaries, green: primaries dufky : the upper orders of leffer coverts of a fine blue; the lower, orange: rump, and whole under fide of the body, of a rich fcarlet; the fides declining into yellow : tail dukky, edged with green.
This beautiful fpecies is fome years in arriving at the height of its colors. At firt is of a plain brown, like a hen Sparrow; in the next flage, becomes blue; in the third, attains the perfection of its gay teints.

The Female is brown, and has over its plumage a tinge of green.

- American Traveller, 95, 101.-In a news-paper of laft year, I met with the following article:-A Gentleman died lately in Carolina, without any nearer relation than a third coufin. He determined to leave his eftate, confifting of three fine plantations, to fome perfon whofe public deferts would juftify fuch a ftep. The Gentleman, on confideration, determined in favour of Mr. Abby, a gentleman in the province, whofe anceftor had introduced the culture of rice, by which Carolina had increafed fo amazingly in wealth, declaring at the fame time in his will, that if there had been any living perfon to whom his country was equally obliged, in the fame line of peace, he would have preferred him. Mr. Aßby, on his death, which happened lately, took poffefion of the Gentleman's eftate, in confequence of this will.-How much morerational is fuch a conduct, than endowing colleges or hofpitals !

$$
3 A=\quad \text { With }
$$

Inhabits Carolina in the fummer-time; but migrates in winter perhaps as far as Vera Cruz, in Spanifb America, where the Spaniards call it Maripofa pintada, or the Painted Butterfly. It chufes a tree for neftling equal to its own elegance of form and color ; affecting the orange for that purpore.

F.With the front black : crown blueifh-grey : cheeks, throat, and breaft, reddifh: upper part of the back tawny; lower, green: wings and tail black, marked with white. Female of duller colors: breaft of a dirty white.

Is found as high as Drontheim. Both fexes continue in England the whole year. By admirable and unufual inftinct, in Sreeden the females, to a bird, collect in vaft flocks at the latter end of September, defert their mates, and, paffing through Scbonen, Denmark, Holftein, and Holland, vifit feveral parts of Europe. They reach Holland about a fortnight after Michaelmas, and at that time afford great amufement to the gentry at their country houfes, in taking them while they fit at tea in their pavilions. They fpread nets among their plantations, and ftrew the ground with hemp-feed, by way of bait. The birds arrive, and perch by thoufands in the trees: then alight on the ground, hungry, and inattentive to the danger. The nets are clofed by the pulling of a cord by the perfons in the pavilions; and.
multitucies are thus taken. Thofe which efcape, continue their route to Flanders, France, and Italy. The males continue in Sweden, and enliven its rigorous winter with their chearful twitter. Towards fpring, they receive additional fpirits; perch on every tree, and animate with their notes every fpray, expecting the arrival of fpring, and of their mates. The laft return invariably the beginaing of April, in fuch numbers as almoft to darken the fkies; join their conforts, perform their nuptials, retire to the woods, increare and multiply *.

France has its refident Chaffinches, as well as England: many alfo winter in Italy: many come there in April, and migrate in OEtober $\dagger$ : perhaps into Minorca, where it arriyes in OEtober, and continues is that ifland the whole winter $\ddagger$ 。

```

FL. With a black bill and head; the crown divided lengthways by a ftripe of fcarlet; in fome, yellow : back afh-color : wings dufky, edged with white: tail black, tipt with white: under fide of the body white : legs black. Size of a Redwing Thrufh.

This fecies appears in New York in April: lays five white eggs, fpotted with ruft-color: builds in low bufhes: makes its neft with wool, and fome mofs, and lines-it with fmall fibres of roots: leaves the country in Auguf: obferves the fame time of migration in the fouthern provinces. Mr. Catefly gives fo very good an account of its manners, and fingular fpirit, that I beg leave to exprefs it in his own words:-" The courage of this little bird is fingular. He purfues " and puts to flight all kinds of birds that come near his ftation, " from the fmalleft to the largeft, none efcaping his fury; nor did I " ever fee any that dared to oppofe him while flying, for he does not " offer to attack them when fitting. I have feen one of them fix "s on the back of an Eagle, and perfecute him fo, that he has "s turned on his back into various poftures in the air, in order to get "rid of him; and at laft was forced to alight on the top of the ss next tree, from whence be dared not to move, till the little "Tyrant was tired, or thought fit to leave him. This is the "conftant practice of the cock, while the hen is brooding: he fits " on the top of a bufh, or fimall tree, not far from her neft; near " which, if any fmall birds approach, he drives them away; but "s the great ones, as Crows, Hawks, and Eagles, he won't fuffer to ss come within a quarter of a mile of him without attacking them.
"They have only a chattering note, which they utter with great "s vehemence all the time they are fighting.
"When their young are flown, they are as peaceable as ocher "s birds. It has a tender bill; and feeds on infects only. They are "tame and harmlefs birds" They build their neft in an open " manner, on low trees and fhrubs, and ufually on the faflafras" tree."

Le Tyran de la Louifiane, De Buforn, iv. 5 $^{83}$.-Latham, ii. 358.
FL. With a long flat beak, hooked at the end : head and back cinereous brown: throat clear flate-colour : belly yellowifh: primaries bright bay: on the greater coverts fome lines of white: tail long, of a cinereous brown. Rather inferior in fize to the laft.

Inhabits Carolina, and as high as Nere York; and migrates at approach of winter : probably into Famaica; the fame kind being found there, where, from its note, it is called Whip Tom Kelly. Has great affinity with the preceding: perhaps they differ only in fex. Makes a pendulous neft, -ufually in appletrees, and hangs it between the horizontal fork of fome bough, beneath the leaves. It is moft curioully formed with cotton and wool, lined with hair and dead grafs; and wonderfully bound to the branches by a certain thread, like mofs, twifted round them, and likewife all about the outfide of the neft. Lays five eggs, white, thinly fpotted with deep ruft-color. Le Gobe-Mouche brun de Virginie, Brifan, ii. 365 . Mufcicapa Carolinenfis, Lin. Syjf. 328.
Le Moucherolle de Virginie, De Buffon, iv. $5^{62,-L e v . ~ M u s .-B L . ~ M u s . ~}$
FL. With a black crown: upper part of the body, wings, and tail, blueih grey: the tail cuneiform, marked with numerous dufky bars : under fide of the body of a pale grey: vent ferruginous: legs brown. Larger than a Lark.

Inhabits New York and Carolina. Mews like a kitten; from which arofe its name. Lives among bufhes and thickets. Feeds on infects. Makes the outfide of its neft with leaves and matting ruhes; the infide with fibres of roots. Lays a blue egg. Has a great firit, and will attack a Crow, or any large bird. Mr. Latbam faw one which was brought from Kamtfcbatka, which differed from this only in having no ruft-color on the vent.

Mufcicapa Canadenfis, Lin. Syf. 324.-Latbam, ii. 354.
Gobe-Mouche cendrè de Canada, Brifon, ii. 405. tab. xxxix.-D\& Buffon, iv. 538. -Catefly, i. 60.

FL. With a cinereous head, fpotted with black; a yellow fpot between the bill and the eyes; and beneath each eye a black one :
the upper part of the body cinereous; the lower, yellow, marked on the under fide of the neck with fimall black fpots: the tail of a cinereous brown, with the exterior webs afh-colored.

Inhabits Canada.

FL. With a yellow fpot on each fide of the bill: head a cinereous green: back and coverts of the wings of a pale green; crofs the laft are two bars of white: primaries and tail dulky, edged with green : throat of a pale afh-color: middle of the belly white: fides of a fine yellow.

Sent from New, York by Mr. Blackburne, under the name of the fmall Green Hanging Bird. It comes there in May, breeds, and etires in Auguft: and is a fcarce fpecies. Bl. Mus.

FL. With a dulky head : back of a dull cinereous olive : quil feathers and fecondaries dufky; the laft edged with white: breaft of a pale afh-color : belly of a whitifh yellow: tail durky; exterior web of the exterior feather white: legs black.

Sent from the fame place, under the title of The Small or Common Pbaby Bird, or Bee-eater. Appears the latter end of March, or beginning of April; lays five white fmall eggs: difappears in Auguft. Eats Bees. Bl. Mus.

FL. With the crown, upper part of the neck, and body, of a dirty olive : throat and ridge of the wing of a very rich yellow : breaft and belly white, tinged with yellow: primaries and tail of a bright olive green.

Inhabits New York. Bu. Mus.

LWith yellow cheeks and forehead: breaft and belly white: de head divided by a line of black; another paffes beneath each eye, bounding the throat, which is yellow : acrofs the upper part of the breaft is a broad black mark; beneath that is a tinge of red: upper part of the neck, and coverts of the wings and tail, are ferruginous: back brown: primaries dufky : two middle feathers of the tail brown; the reft black; thofe on the outfide edged with white: legs dufky: head of the Female dufky. Larger than the common Lark.

Inhabit the large plains of feveral provinces, and breed there. They appear on our fettlements in IHudJon's Bay in May, and proceed farther north to breed. Feed on grafs-feeds, and the buds of the fprig birch. Run into fmall holes, and keep clofe to the ground; whence the natives call them Cbi-cbup-pi-fue.

In-winter they retire to the fouthern provinces in great flights; but it is only in very fevere weather that they reach Virginia and Carolina. They frequent fand-hills on the fea-fhore, and feed on the fea-jide oats, or uniola panicula. They have a fingle note, like the Sky-lark in winter.

They are alfo found in Poland; in Ruffia and in Sibiria more frequent : in both are very common during winter; but retire to the north on approach of fpring, except in the north-eaft parts, and near the high mountains.

 With the forehead and crown of a bright yellow : from the bill extends through the eyes a band of black,' bounded on each fide with white: chin, throat, and lower fide of the neck, black : brealt and belly white : upper part of the neck, back, rump, and leffer coverts of the wings, of a light blueifh grey; the greater coverts, and lower order of leffer, of a bright yellow, forming a great fpot in each wing : primaries and tail of a deep afh-color; inner webs of the outmoft feathers of the tail fpotted with white.
Place. A paffenger, like the former, through Penfylvania,-Latham, ii. 46I.
297. Green. Green black-throated Fly-catcher, Edw. 300.-Latbam, ii. 484. Le figuier à cravate noire, De Buffon, v. 298.—Brifon, App. 104.
W. With yellow cheeks and fides of the neck : black throar, under fide of the neck, and fides under the wings : upper part of the breaft yellowifh; lower, and belly, white: head, and upper fide of the body, of an olive-green : coverts of the wings of the fame color, marked with two bars of white : primaries and tail dufky; the inner webs of the firft edged with white; of the three outmoft feathers of the tail, fpotted with white.
Place. Appears and migrates in the fame manner as the other,

Red-throated Fly-catcher, Edzo 301.
La figuier a poitrine rouge, De Buffon, v. 308.-Briffon, Add. 105. Motacilla Penfylvanica, Lin. Syf. 333.-Latham, ii. 489.
298. BLOODY:
S.DE.

W.With a yellow crown: white cheeks: a fmall black mark pafling under each eye : throat, and whole under fide of the body, white, except part of the breaft, which is of a blood-red, which color extends along the fides under the wings : hind part of the head black : back and rump dulky, edged with yellowih green : coverts of the wings, and primaries, dunky; the firft marked with two bars of white : tail dufky, with a white mark on the exterior feathers. Female wants the black fpot on the hind part of the head, and thofe on the back; in other refpects agrees with the cock.
Attends the preceding fpecies in their fhort paffage through. Pen. Piacso fylvania.

Little blue-grey Fly-catcher, Edw. 302.
Ia figuier gris de fer, De Buffon, v. 309.-Brifon, App. 107.
M. Cærulea, Lin. Syft.337.-Latbam, ii. $49^{\circ}$.
W. With the head and whole upper part of the body of a blueifh late-color: wings brown; a few of the fecondaries edged with white : over each eye a narrow line of black : tail dufky; two outmoft feathers white; the third on each fide tipt with white. Female wants the black Atripe over the eyes: and the colors of the tail, and upper part of it, brownifh.

Appears in Penfylvania in March. Builds its neft in April, with
299. Chrulfano.

Pbacs. huks from the buds of trees, down of plants, \&xc. coating it with lichens, and lining it with horfe-hair. It continues in the country
all fummer, and retires fouth at approach of winter; perhaps to Cayenne, where the fame fpecies is found *.

## 300. WORM-

 EATER。$p_{\text {lace }}$
301. YellowTAIL.

Worm-eater, Edw. 305.-Latbam, ii. 499 .
Le Demi-fin. Mangeur de vers, De Buffon, v. $325^{\circ}$
W. With the crown of a reddifh yellow, bounded by a line of a lighter; beneath that, another of black; and through the eye, from the bill, a third of yellow, bounded beneath by a dufky ftroke: cheeks, throat, and brealt, of a yellowifh red, deepeft on the breaft, fading towards the belly, which is white: upper part of the neck, back, wings, and tail, of a deep olive-green : legs flehcolored. Bill of this fpecies is much thicker than others of the genus.

Does not appear in Penfylvania till $\mathcal{F u l y}$, in its paffage northward. Does not return the fame way; but is fuppofed to go beyond the mountains which lie to the weft. This feems to be the cafe with all the tranfient vernal vifitants of Penfylvania.

Yellow-tail Fly-catcher, Edw. 257.
W. With an afh-colored crown : hind part of the neck, coverts of the wings, and the back, of an olive-green : rump cinereous; fometimes that and the head of the fame color with the back: throat, under fide of neck, breaft, and belly, white; the fides of the breaft dafhed with ruft-color: fides, under the wings, yellow : on the lower part of the primaries a large bed of yellow : two middle feathers of the tail brown; the reft yellow, tipt with brown.

Taken on its paffage, with other birds (before defcribed) of this genus, off Hifpaniola, at fea, fuppofed to be on their way to their winter quarters in 7 amaica, and other illands.

M. Oenanthe. Stenfquetta, Faun. Suec. $\mathrm{N}^{0}$ 254.-Latbam, ii. 465. Le Motteux, ou Cul blanc, De Buffon, v. 237.-Pl. Enl. 554.-LEv. Mus.
W. With head and back grey, tinged with red: from the bill to the hind part of the head, acrofs each eye, is a broad bar of * black; above that a line of yellow : breaft and belly white, tinged with yellow : rump and lower half of the tail white; the end black. Female wants the black bar acrofs the eyes: lefs white on the tail, and the colors in general are duller.

A fpecies which extends from the fultry climate of Bengal* to the frozen region of Greenland. Is migratory, at left in the temperate and frigid zones. Goes even in fummer as high as beyond the Arctic circle, in Europe and Afa, wherever the country is rocky. In Greenland, is converfant among rills of water. Feeds on infects and worms, efpecially thofe of places of interment ; is therefore detefted by the natives $\dagger$. Breeds in that country in $\mathcal{F} u n e$. Is found in Iceland and the Feroe illands. On its firf appearance in Sweden, the peafants expect to be freed from the fevere nocturnal frofts $\ddagger$. Its winter retreat unknown.

$S^{W}$. With its whole plumage black, gloffed moft richly with variable blue and deep purple: wings and tail of a duller color: legs and feet naked, large, and ftrong; three toes only ftanding forward, not all four, as in the European kind. In Size far fuperior to the Englif Swift; but the wings in proportion fhorter.

The colors of the Female are lefs gloffy on the upper part of the body; below of a dirty white: : in fome, the ridge of the wings is white, and the breaft grey. Such is the fpecimen engraven by $\mathrm{Mr}_{0}$. Edwards; which I fufpect to be a young bird, and not to differ in fpecies, although it may in fex, from that of Mr. Catefby; for I have had opportunity of examining both male and female from New York. Imuft alfo unite the Louifine of the Count De Buffon; to this fpecies.

Inhabits North America, from Hudfon's Bay to Soutb Carolina and Louifana. Appears in New York in April.: Leaves the province the latter end of Auguft. By the felf-intereft of mankind, they are welcome guefts, and provided with lodgings, in form of earthen pots or boxes, placed on the outfides of the houfes, againft their arrival, and fometimes with empty calabafhes hung on the tops of poles $\dagger_{\text {. }}$ In thefe they make their nefts, and lay four or five eggs. In return for thefe benefits, they are the guardian of the poultry; driving.

- Strom. a $_{49}$ †. Larwan, 144 . away ${ }_{3}$.
away, and purfuing with great noife, Crows, Hawks, and all kinds of vermin. On the approach of any thing noxious, they fet up a loud note; which the chickens confider as an alarm, and inftantly run under thelter.

334. SWIFT。

Br. Zool. i. Ne $171 .-L$ atham, ii. 584. Swift, or Diveling, Lawfon, 145 . Hirundo apus. Ring-Swala, Faun. Suec. 272. Le Martinet noir, $D_{e}$ Buffon, 643.-Pl. Enl. 542.-BL. MUs.
$S^{W}$. With a very fmall bill: white chin: all the plumage befides duiky: all the toes ftanding forward.
According to Mr. Lawfon, inhabits Carolina. Found in vaft abundance beyond lake Baikal, on the loftieft rocks; chiefly about the river Onon, where a variety with a white rump is very common. Extends in Europe as high as Drontheim.

335. Aculeatebe American Swallow, Cate $B y$, i. 8. Chimney Swallow, Kalm. ii. 146. Hirundo pelafgia, Lin. Syf. 345.-Latbam, ii. 583.

Le Hirondelle brune acutipenne, De Buffon, vi. 699.-Pl. Enl. 726. -Lev. Muso-Bl. Mus.
$S^{W}$. With the bill fhort, broad, and black : head, upper part of the neck, and wings, dufky : breaft cinereous: back, tail, and belly brown : tail even at the end; extremities of each fhaft naked and fharp-pointed: wings extend far beyond the tail: legs longer than common to this tribe, and naked a little below the knee, Length five inches and a half.
Elacko Inhabits many parts of North America. Arrives in New York and Penfluania in May; fomtimes early, fometimes late in the month. Builds in chimnies, forming a moft curious neft, with bits of fmall fticks, cemented by peach-tree gum. It is open at top, and forms about a third of a circle. Lays four or five eggs in fune, and quits the
country in Auguf. They often ftick clofe to the chimney-wall by their feet, and fupport themfelves by applying their fharp tail to the fides. They make all day a great thundering noife, by flying up and down the funnel.

It is remarkable, that three fpecies of the American Swallows, in general feek the protection of houfes for their places of building their nefts, ovation, and nutrition; yet it is very certain, that before the arrival of the Europeans they mult have had recourfe to rocks or hollow trees for thofe purpofes; for the miferable hovels of the Indians had neither eaves for the ufes of the 33rft and $33^{\circ} \mathrm{th}$ fpecies, nor chimnies for that of the bird in queftion. The two firt mult therefore have fixed their neft againft the face of fome precipice, as fome of the Houfe Swallows do at prefent in America, and this fpecies does about the fteep rocks about Irkut $/ k$ in Sibiria. The inftinct that directs part of this genus to fly to the protection of mankind, as foon as opportunity, unknown to preceding broods, offered, is as wonderful as it is inexplicable.

The Comte De Buffon mentions another of this fpecies *, which is found in Louifana. It differs only in the fuperior length of the wings, from the bird I defcribe: I therefore can confider it but as a mere variety.

XXXII. GOATSUCKER. Gen, Birds, LVI.

Goatfucker of Carolina, Catefoy, i. 8.
Eaft India Bat, or Mufqueto Hawk, Larufon, 144.
L'Engoulevent de la Caroline, De Buffon, vi. 532.-Latham, ii. 592.

G.With the head, back, breaft, and coverts of the wings, elegantly mottled with black and bright ruft-color, and fpotted with large ragged black marks: the fcapulars of the fame color, here and there fpotted with white : on the lower part of the back is a mixture of a hh -color: primaries and fecondaries moft beautifully varied with narrow bars of black and ferruginous: the four middle feathers of the tail barred and mottled with the fame colors; as are the external webs of the three ourmoft on each fide; but the inner webs of a fnowy whitenefs. Wings, when clofed, reach little farther than half the length of the tail. Length twelve inches: Extent twenty-four.

I received this fpecies from Doctor Garden of Cbarleftown, South Carolina; where it is called, from one of its notes, Cbuck, Cbuck Will's widow; and in the northern provinces, Whip poor Will, from the refemblance which another of its notes bears to thofe words. This, Mr . Kalm fays, is the fancy of the Europeans; for the real found is likeft to Whipperiwhip, with a ftrong accent on the firf and laft fyllable *. It begins its note about the time that the cherry-trees begin to bloffom; or near the 22d of April, in the Ferfies; probably fooner in the fouthern provinces. Mr. Blackburne obferved them firft, in the province of New Xork, in May. Adds, that they lay two eggs on the bare ground; and that they will fcarcely quit them on the neareft approach. They difappear in Auguft.

Their food is entirely infects, which they catch night and morning, at the time in which they emit their fong. They never fettle
on high trees; but on bufhes, rails, or the fleps of houfes, which they frequent, as infects fwarm more, near to habitations, than other places. They give their note fitting : if they fee an infect pafs, they fly up, catch it, and then fettle again, and renew their fong. Ofttimes numbers perch near one another, make a vaft noife, repeating their fong as if in emulation. They continue their call till it is quite dark : their note ceafes during night; but commences at the dawn, and is continued till the fun rifes, when they again defift for the whole day ${ }^{*}$. I muft add, that, befides thefe notes, it has that ftrange found refembling the turning of a great fpinning-wheel; probably common to the whole genus $\dagger$.

They are extremely rare towards the fea-fide; but fwarm towards the mountains. Doctor Garden never got but this one. Mr. Clayton confirms their fcarcity in the maritime parts of the provinces; and favors us with the following account of them.
"I never heard but one in the maritime parts; though my abode " has been always there; but near the mountains, within a few mi" nutes after fun-fet, they begin, and make fo fhrill and loud a noife, "s which the echoes from the rocks and fides of the mountains increafe " to fuch a degree, that the firft time I lodged there I could hardly "get any fleep. The fhooting them in the night is very difficelt; " they never appearing in the day. Their cry is pretty much like " the found of the pronunciation of the words Whip poor Will, with " a kind of a cbucking between every other, or every two or three " cries; and they lay the accent upon the laft word Will, and left of " all upon the middle one.
" The Indians fay, thefe birds were never known till a great "s maffacre was made of their country folks by the Engli/h, and that " they are the departed fpirits of the maffacred Indians. Abundance "c of people here look upon them as birds of ill omen, and are very

Caprimulgus Europeus. Nattikafwa. Quallknarran, Faun. Suec. No 274. - Latham, ii. 593 .
L'Engoulevent, De Buffon, vi. 512.-Br. Zool. i. No -Lev. Mus.-Bl. Mus. $^{\text {2 }}$
G. With head and back elegantly ftreaked with narrow lines of black and grey, and with a few long oblong ftrokes of black and ruft : belly barred with black and grey: wings black; each web finely marked with rufty fpots: near the ends of the three firft primaries, a large oval white fpot : tail dufky, with regular fpots, mottled with ruft and black; ends of the two firft feathers white. Female wants the fpots on the wings and tail.

It is found in Europe as far north as Sondmor, and is common all overSibiria and Kamtfcbatka; and lives not only in forefts, but in open countries, where it finds rocks or high banks for nelter.

Place.

## 347. Lattle Egret.

La grande Aigrette, De Buffon, vii. 377.-Pl. Enl. 925.-Lalbam, iii.
H. With a long flender creft: bill and legs black: whole plumage of a filvery whitenefs: the feathers on the back inexpreffibly elegant, long, filky, narrow, and with unwebbed plumes, hanging over the wings and tail; the fame kind are pendent from the breaft. Of double the Size of the European fpecies. Length of which, from bill to the tip of the tail, is two feet ${ }^{*}$.

Inhabits Louifana and Guiana. Does not frequent the fhores; but the vaft moraffes and overflown tracts, where it neftes on the little ifles formed by the inundations. The Guivitinga of the Brafilians $\dagger$ is probably the fame fpecies. It extends to the Falkland ifles; for Bougainville obferved thefe Egrets, which he firt thought were common Herons. They fed towards night, and made a barking noife $\ddagger$.
The feathers of the Great Egret would prove a valuable article of commerce, being very much fought after for the ornamental part of drefs.

Br. Zool. ii. App. No vii.-Ardea Garzetta, Lin. Syf. 237.-Latbam, iii. L'Aigrette, De Buffon, vii. 372. tab. xx.-Pl. Enl. go1.-Lev. Mus.
H. With yellow irides: a creft with fome fhort and two long pendent feathers : whole plumage of a delicate filvery white: feathers on the breaft and fcapulars very delicate, loofe, and unwebbed : legs a blackifh green. Weicht about one pound. Length to the tip of the tail two feet.

[^45]Is frequent in Nere York and Long Ifland: about the Black and Cafpian leas; but feldom farther north. Are found in France, and the fouth of Europe. Migrates into Aufria in fpring and autumn *. Is frequent in Senegal, Madagafoar, Ihe de Bourbon, and Siam $\dagger$.

L'Aigrette rouffe, De Buffon, vii. 378.-Pl. Enl. 902.-Latham iii.
11. With the body of a blackifh grey: the filky long feathers of the neck and back of a rufty red. Length about two feet.

Inhabits Louifiana.

Small Bittern, Catefby, i. 80.-Ardea virefcens, Lin, Sy/f. 238.-Latbam, iii. Le Crabier vert, De Buffon, vii. 404.-Lev. Mus.-Br. Mus.
H. With a green head, and large green creft: bill dufky above, yellow beneath : throat white : neck a bright bay, freaked before with white: coverts of the wings dufky green, edged with white: tail and primaries dufky: feathers on the back cinereous, long, narrow, and filky: belly of a cinereous red: legs yellowift. The colors of the Female lefs brilliant : wings fpotted with ruftcolor. It wants the long filky feathers. Length eighteen inches.

Inhabits from New LTork to South Carolina. Ufually fits, with its long neck contracted, on trees hanging over rivers. Feeds on fmall fin, frogs, and crabs. From the laft, the French call feveral of thefe Herons Crabiers.

They are fuppofed to migrate, even from Carolina, at approach of winter.

CROWNED.

LOUISIANE, BLUE, \&c. HERON.
Le Crabier roux à tête \& queue vertes, De Bufon, vii. 407.-PPl. Enl. gog.Latham, iii.

H.With the crown and tail of a dull green : the neck and belly red, tinged with brown : coverts of the wings dufky green, edged with tawny: the back covered with long fender feathers, faintly dafhed with purple.
Inhabits Louifiana.

Blue Bittern, Catefy, i. 76.-Le Crabier bleu, De Bufon, vii. 398Ardea Cærulea, Lin. Sjff. 238.-Latham, iii.-Lev. Muś.
H. With a blue bill, dufky at the point: head and neck of a changeable purple; the firft adorned with a beautiful creft of long nender feathers : the remainder of the plumage entirely of a fine deep blue : from the breaft depend feveral long feathers: the back is covered with others a foot in length, hanging four inches beyond the tail ; they are filky, and of the fame fine texture with thofe of the creft : the legs are green. Weight fifteen ounces.

It appears, but not in numbers, in Carolina, and that only in the fpring of the year. Its winter refidence feems to be famaica*.

Crefted Bittern, Cateßy, i. 79 -Ardea Violacea, Lin. Sy/t. 238.-Latbam, iii. Le Crabier gris de fer $\mathrm{r}_{0}$ De Bufon, vii. 399.
H1. With a black, ftrong, and thick bill: crown of a pale yellow: from the hind part iffue three or four long flender white feathers, erigible at pleafure ; fome are fix inches long: a broad white fripe runs from the corner of the lower mandible as far as the ears : the reft of the cheeks and head are of a blueifh black: heâd, breaft, belly, and coverts of wings, of a dufky blue: the primaries brown, tinged with blue: the back friped with black, mixed witk

* Slanne's Hift. Jarraaica, ii. 315 。
white: from the upper part arife tufts of elegant nender filky feathers, falling beyond the tail : the legs and feet yellow. Weight one pound and a half.

This fpecies appears in Carolina in the rainy feafons: but their native places are the Bahama inlands, where they breed in amazing numbers, amidft the bufhes in the rocks. They are called by the inlanders Crab-catchers, as they chiefly live on thofe cruftaceous animals. They are of great ufe to the inhabitants; who take the young birds before they can fly, and find them delicious eating. They fwarm fo on fome of the rocky inles, that two men, in a few hours, will fill a fmall boat with them, raking them when perched on the rocks or bufhes; for they will make no attempt to efcape, notwithftanding they are full grown.

H.With a black ftrong bill: crown dufky: cheeks and chin 353. Ash-cororwhitifh : neck of a pale cinereous brown, ftreaked before with white: back, wings, and tail, cinereous, clouded round each feather with dufky: feathers on the fides of the back long and broad, hanging over the ends of the wings : belly white: legs yellowih. Length two feet one inch.

Inhabits New York. Arrives there in May: breeds, and leaves the country in Oetober:-Bl. Mus.-Latham, iii.
11. With a bill about two inches long: crown, back, and tail, of an uniform dufky color: hind part of the neck and cheeks rufty and black: chin and throat white : fore part of the neck marked with ftreaks of white and black: coverts of the wings, with ftreaks of black and yellowifn white : ridge of the wing white: primaries duflsy.-Lev. Mus.-Latham, iii.

Another, in the fame Muifeum and fame cafe (probably differing only in fex) has, from the lower mandible, a white line bounding the lower part of each cheek: the greater coverts of the wings and 3 M
fcapulars
fcapulars dufky, each feather tipt with white. In other refpects it agrees with the former: the legs of each ate greenifh : the form of their bodies flender and elegant. Lencth, from bill to the tip of the tail, about feventeen inches.
Place. Sent to Sir Abton Lever from North America.

Le Pouacre de Cayenne? Pl. Enl. 939.-Latbam, iii.
H. With a dufky frong bill : head, neck, breaft, and belly, whitin, elegantly freaked downwards with fhort fine lines of black; the crown and hind part the darkett: upper part of the back flreaked with white; the lower dufky and plain:: the whole wing of the fame color : the leffer coverts marked with fmall yellowifh fpots; the greater coverts marked with a white fpot at the end of each feather, forming, acrofs the wings, two rows: the primaries edged with dull white; the ends tipt with the fame: tail dufky: legs of a deep dirty yellow. Lencth about twenty-two inches.
Plaçs. Doctor Garden, of Soutb Carolina, favoured me with this bird. From the characterific lines of white fpots in the wings, I do not doubt but that the Brown Bittern of Catefby, i. 78, is the fame * with this: notwithftanding, it would hardly be known, had he not preferved the fpots in his very bad figure of it. He fays it frequents ponds and rivers in the interior part of the country remote from the fea.-Lev. Mus.

$$

No augural attention is paid to them there; yet Hefiod directs the Grecion farmer "to think of ploughing whenever he hears the an"nual clamor of the Cranes in the clouds "."
Place, Inhabits all Rufia and Sibiria, even as far eaft as the river Anadyr; and migrates even to the Arctic circle. None feen in Kamtfcbatka, except on the very fouthern promontory, which they probably make a refting-place, on their re-migration; Kamt fchatka being deflitute of ferpents and frogs, on which they feed in countries where corn is unknown. They lay two blueifh eggs on the rufhy ground: the young are hatched late; and as foon as they can ly attend their parents in their fouthern migration :

Potura te, Nile, Grues.
For Egypt is generally fuppofed to be the great winter quarters of thefe birds. Previous to their retreat, they affemble in amazing numbers, choofe their leader, foar to a confiderable height, and then, with continued clamor, proceed to their defigned place. Miltono when he touches on this wonderful inftinct of nature, defrribes cheir progrefs with equal truth and elegance.

Part loofely wing the region: part more wife, In common, rang'd in figure ( $p$ ) wedge their way, Intelligent of feafons, and fet forth Their aery caravan, high over feas Flying, and over lands with mutual wing Eafing their flight. So fteers the prudent Crane Her annual voyage, borne on winds; The air flotes as they pafs, fann'd with unnumber'd plumes,

B. Sibirian
B. Sibirian Crane. Grus Lencogeranos, Pallas Iitn, ii. gi4,-Eatbam, iii.

QT. With a red bill like the former, ferrated near the end: face naked beyond the eyes : coverts and primaries black : all the reft of the bird of a fnowy whitenefs: legs red. Its HEIGHT is four feet and a half.

Inhabits the vaft morafes of Sibiria, and every part where lakes abound; and penetrates far north into the boggy forefts about the Ifchim, Irith, and Oby. Makes its neft among the inacceffible reeds, with layers of plants. Lays two great grey eggs, ftreaked with numerous dunky lines. Makes a clamorous noife, and that frequently, efpecially during its flight. Feeds on fmall fifh, frogs, and lizards. Winters ufually about the Cafpian fea. Obferved to migrate in fpring northward along the courfe of the Wolga, always in pairs *.
C. White Stork. Ardea Ciconia. Storck, Faun. Suec. No 162,-La Cigogne, De Buifon, vii. 253.-Pl. Enl. 866.-Latham, iii. -Lev. Mus.
H. With red bill and legs: primaries black: the reft of the plumage white : fkin of the color of blood. Larger than the common Heron.

Inhabits moft parts of Europe, except England. In the weft of

Place.

Plage, Ruffia, is not found beyond 50 degrees north, nor to the eaft of Mofcow. It appears in Sreeden in April; retires in Auguft $\dagger$ : does not reach Norway, unlefs tempeft-driven.

This fpecies is femi-domeftic: haunts towns and cities; and in many places falks unconcerned about the ftreets, in fearch of offals and other food. Removes the noxious filth, and clears the fields of ferpents and reptiles. They are, on that account, protected in Hollaids; held in high veneration by the Mabomedans; and fo greatly.

[^46]refpected were they in old times by the Theffalians, that to kill one of thefe birds was a crime expiable only by death *.

The Storks obferve great exactnefs in the time of their autumnal departure from Europe to more favorable climates. They pafs a fecond fummer in Egypt, and the marfhes of Borbary $\dagger$ : in the firft they pair, and lay again, and educate a fecond brood $\ddagger$. Before each of their migrations they rendezvous in amazing numbers; are for a while much in motion among themfelves; and after making feveral fhort flights, as if to try their wings, all of a fudden take flight with great filence, and with, fuch fpeed, as in a moment to attain fo great a height as to be inftantaneounly out of fight. The beautiful and faithful defcription which the Naturaírst's Poet \|l gives of this annual event, ought not by any means to be omitted.

Where the Rbine lofes his majeftic force
In Belgian plains, won from the raging deep By diligence amazing, and the ftrong Unconquerable hand of Liberty, The Stork-assembly meets; for many a day Confulting deep and various, ere they take 'Their arduous voyage thro' the liquid fk . And now, their route defign'd, their leaders chofe, Their tribes adjutted, clean'd their vigorous wings; And many a circle, many a fhort eflay, Wheel'd round and round, in congregation full The figur'd fight afcends, and riding high The aerial billows, mixes with the clouds.
D. Black Stork. Ardea nigra. Odenfwala, Faus. Suec. No ${ }^{1}$ 63.-Latbam, iii. La Cigogne noire, De Buffon, vii. 271.-Pl. Enl. 399•
H. With the bill, legs, and fkin, red: head, neck, body, and wings, black, gloffed with blue: breaft and belly white. About the Size of the former.

[^47]Inhabits

Inhabits many parts of Europe. It is not uncommon in the tem- Place. perate parts of Ruffia and Sibiria, as far as the Lena, where lakes and moraffes abound. Migrates to warmer countries in autumn. Is a folitary fpecies. Preys on fifh, which it not only wades for, but, after hovering over the waters, will fuddenly plunge on its prey. It alfo eats beetles and other infects. Perches on trees: and builds its neft in the depths of forefts.

Thefe birds pafs over Sweden in the fpring in vaft flocks, flying towards the extreme north. They fometimes reft in the moors at night; but it is reckoned a wonder, if any one is found to make its neft in the country. They return fouthward in autumn ; but, in. both their paffages, foar fo high as to appear fmall as fparrows.*.

* Aman Acad. iv. 58 g .

Wood Pelecan, Catefly, i. 81.-Latham, iii. Curicaca, Marcgrave, 191.-De Buffon, vii.276.-Pl.Enl. 868.-Brifor, v. 335. ' Tantalus Loculator, Lin. Sy/t. 240.

I.With a bill near ten inches long; near feven in girth at the 1- bafe; ftrait till near the end, where it bends downwards: fore part of the head and face covered with a bare dulky blue fkin: hind part of the head, and the whole neck, of a pale yellowifh brown : under the chin is a pouch capable of containing half a pint: the greater primaries, and fome of the greater coverts, are black gloffed with green; the reft of the wing, back, and belly, white: tail fquare, fhort, and black: legs very long, black, and femi-palmated. The body of the Size of a Goofe.
Appears in Carolina, at the latter end of fummer, during the great rains, when they frequent the overflown favannas in vaft flocks; but retire in November. They perch erect on tall cyprefs and other trees, and reft their monftrous bills on their breafts for their greater eafe. They are very ftupid and void of fear, and eafily fhot. Fly nowly. Their food is herbs, fruits and feeds, fifh, and water infeets; notwithftanding which they are excellent eating.

The refidence of thefe birds, the reft of the year, is Brafil, Guiana*, and perhaps other parts of South America.

$$

1. With a fender incurvated bill, and naked fkin on the face, both of a pale red color: the whole plumage of the richeft fcarlet, only the ends of the wings are black: legs pale red. In Size fomewhat larger than the Eug lifb Curlew.

* Des Marcbais, iii. 326.

Frequent the coafts of the $\dot{B} a b a m a$ inands. Are common in Eaf Florida: in Georgia are frequent in the months of $\mathcal{F i l l}_{\text {il }}$ and $A u$ uguff; after which they retire fouthward. A few are feen in the fouth of Cerolina, and the parts of America within the tropies, and very feldom to the north. Thefe birds perch, like the former, upon trees, and make a moft refplendent appearance. They lay their eggs in the tall grafs. When firt hatched, the young are of a dunky color: their firt change is to afh-color; then to white; and, in their fecond year, to columbine; and with age acquire their brilliant red. In Guiana it is often domefticated, fo as never to leave the poultry yard. It fhews great courage in attacking the fowls, and will even oppofe itfelf to the cat. The flefh is efteemed excellent. Its rich plumage is ufed by the Braflians for various ornaments.

Brown Curlew, Catefly, i. 83.-De Buffon, vii. 42.-Latham, iii.
Tantalus Fufcus, Lin. Syj. 242 .
I. With the bill fix inches and a half long, refembling the former : bill, face, and legis, red : neck, upper part of the back, and tail, of a cinereous brown: lower part of the back, breaft, and belly, white.

White Curlew, Catefy, i. 82.-De Bufon, vii. 41.-Pl. Enl. 915.-Latbam, iii. Tantalus Albus, Lin. Syjf. 242.

1. With the face, bill, and legs, like the former: the whole plumage of a fnowy whitenefs, except the ends of the four firft primaries, which are green. -The flefh and fat is of faffron-color.

Thefe birds arrive in South Carolina, with the Wood Ibis and the Brown Curlew, in great numbers, in September, and frequent the low watery tracts: continue there about fix weeks, and then retire fouth to 'breed. This fpecies goes away with egg. There was a fufpicion, that the Brown and the White differed only in fex; but experiment proved the contrary. The white kind are itwenty ${ }_{3} \mathrm{~N}_{2}$ times

black and brown: legs black, Length, to the tip of the tail, eleven inches.

Plaee.

Inhabits Nortb America, as low as Carolina*. Migrates to the Labrador coaft, about a week after the Efkimause Whimbrels, in its way to Nere York; but not in fuch numbers. Found in Iceland and the north of Europe; but are fcarcely feen in Ruflia. Very frequent in Sibiria, where they breed in the north: They extend alfo to Komitcbatka, and as far fouth as the Sandwich inles : in the laft it is very fmall. I have feen, which I fuppofe to be young, a variety with black breafts : and fometimes a very minute back toe.

Chattering Plover, Catefoy, i. 71.-Le Kildir, De Buffon, viii, g6.-Latbam, iii. Charadrius Vociferus, Liñ. Syf. 253.-Lev. Mus.-Bl. Mus.

PL. With a broad black bar, extending from the bill, beneath each eye, to the hind part of the head: orbits red: forehead, and fpace before and beyond the eyes, white: fore part of the crown black; the reft brown : a white ring encircles the throat and neck; beneath that another of black; under that fucceeds, on the breaft, two femicircles, one of white, another of black; all below is white : back and coverts of wings brown: primaries dufky : the feathers on the rump are orange, and extend over three parts of the tail ; the lower part of which is black. Size of a large Snipe.

Inhabits New York, Virginia, and Carolina; where they refide the whole year. Are the plague of the fportfinen, by alarming the game by their fcreams. They are called in Virginia, Kill-deer, from the refemblance their note bears to that word. Migrate to Never: York in the fpring: lay three or four eggs : ftay late.

- Lawfon, 140.-Catefzy, Appa

Br. Zool. ii. No $211 .-$ Le Pluvier à collier, De Bufon, viii. 90.-Plo. Enl. 921. Charadrius Hiaticula, Strandpipare, Faun. Suec. No 187.-Latham, iii. -Lev. Mus.-Bl. Mus.

PL. With a fhort bill; upper half orange-color; the end black: crown light brown : forehead, and a fmall face behind each eye, white: from the bill, beneath each eye, extends a broad bar of black: the nect is encircled with a white ring; and beneath that is another of black: coverts of wings of a pale brown : primaries dufky : tail brown, tipt with lighter: legs yellow.
Almoft all which I have feen from the northern parts of Nortb America, have had the black marks extremely faint, and almoft loft. The climate had almoft deftroyed the fpecific marks; yet, in the bill and habit, preferved fufficient to make the kind very eafily afcertained. The predominant colors were white, and very light afhcolor. Weicht near two ounces. Length, to tip of the tail, feven inches and a half. Thofe of the weftern coafts of North America are much fmaller.

Inhabits America, down to famaica* and the Brafils; in the laft it is called Matuitui $\dagger$, where it frequents fea-fhores and eftuaries. Is found in fummer in Greenland: migrates from thence in autumn. Is common in every part of Rufia and Sibiria. Was found by the navigators as low as Owybe, one of the Sandiwicb ines, and as lightcolored as thofe of the higheft latitudes.

PL. With the bill an inch long ; black towards the end; red towards the bafe : forehead black : crown black, furrounded with a circle of white: throat white : neck and breaft of a very light afh-colored brown, divided from the belly by a dufky tranfverfe ftroke: belly and vent white: back, fcapulars, and coverts of the wings, ci-

G.With the head and upper part of the neck, body, and coverts of: the wings, of a fine deep olive green: primaries and tail dufky:: breat and belly cinereous: vent white: legs gieen. Weight of the male fifteen ounces: length fourteen inches.

Inhabits New York; and as low as Carolina: does not crofs the Baltic: rare in Denraark: inhabits Ruflia, and the weft of Sibiria ${ }_{3}$ : but not the eaft.

A. Crare, Br. Zool. i. No ${ }_{216}$.-Rallus crex. Aingfnarpa; Kornkraka, Faun. Suec. $\mathrm{N}^{\mathrm{d}}$ 1940. Le Rale de Terre, Genet, ou Roi des Cailles, De Buffon, viii. 146.-Plo Enl. 750.Latbam, iii. -Lev. Mus.-Bl. Mus.
C. With the crown, hind part of the neck, and back, black, edged with bay : coverts of wings plain bay: tail of a deep 'bay: belly dirty white : legs cinereous. When lean weighs fix, when fat eight ounces.

Inhabits Europe, even as far north as Drontbeim. Notwithftanding it is fo fhort-winged a bird, and a bad fier, yet it is found in fummer in the Schetland ifles; not uncommon in the temperate parts of Rufia and Sibirin, but none in the north, or towards the fhores. Where Quails are common, in thofe countries this bird abounds; and the contrary where Quails are fcarce. The Crakes depart at the fame time with the Cranes. The Tartars obferve how ill adapted the firt are for a long flight; therefore believe that every Crane takes a Crake on iss back, and fo affifts, the migration*.

## XLVII. FLAMMANT. Gen. Birds, LXXXI.

Flamingo, Catefoy, i. 73.-Phænicopterus ruber, Lin. Syf. 230.-Le Flammant, ou le Phènicoptere, De.Buffon, viii. 47.5.-Pl. Enl. 63.-Latbam, iii. -Lev. Mus.

FL. With the upper mandible extremeily convex, ridged, and floping to a point ; the under very deep, and convex on the upper part; the edges of both furnifhed with numerous teeth: fpace between it and the eyes naked: neck very long : tail hort: primaries black: all the reft of the plumage of a fine crimfon color ; but the European birds, which are the only I have feen, are rofeate: legs very long : toes webbed : hind toe very fmall. The attitude is erect: and its मelght ufually five feet.

Thefe birds inhabit Louifiana*, the Babama illands, and thofe of the Wef Indies; and frequent only falt waters. They live in flocks, and are uncommonly tame, or rather ftupid. A perfon who can ftand concealed may hoot as many as he pleafes; for they will not arife at the report of the gun ; but the furvivors will ftand as if aftonifhed : nor will they take warning at the fight of the flain; but continue on the fpot till moft of them are killed. Such is Catefoy's account. But the honeft and intelligent Dampier gives a very different one; and fays that they are extremely thy, and very difficult to be fhot.

They build their nefts in flallow ponds; and form, for that purpofe, with mud, hillocks with a broad bafe, which appear about a foot and a half above the water: thefe taper to the top, in which the birds make a hollow for the eggs. They lay two, and cover them with their rump, their legs refting beneath the water. As foon as the young are hatched they run very faft, but cannot fly till they are full grown $t$. They are for a long time of a grey color, nor do they attain that of red till near two years.

* Du Pratz 3i. 81. $\quad$ Voyages, i. 71.

They fand upright, and in a row; fo at a diftance look like a file of foldiers. They feed on the feeds of water-plants : not fihh. Their月efh is good, notwithftanding it is lean, and looks black. Dampier alfo bears witnefs to the delicacy of the tongues; which, fays he, are large, and furnifhed with a knob of fat at the root, the fo much boafted morfel. Apicius, a Roman, probably cotemporary with Tiberius, had the honor of firt introducing them to table : the fame perfon whom Pliny fo forcibly figmatifes with the title of Nepotums. altifzmus gurges*.

The Flammant inhabits feveral parts of the old world: fuch as fome of the coafts of the Mediterranean fea; the Cape De Verd iflands;

Placesin Europe and Asia. and the Cape of Good Hope. They are common on the fhores of the Cafpian fea, on the Perfian and Turcomannian coafts: repairing in flocks to the mouth of the river $Y$ Cmba; and fometimes to that of the $Y$ aik ; and alfo to that of the Volga, below Ajtracain.

- WITH SHORT LEGS.

## "XLVIII. ALBATROSS. Gen. Birds, LXXXII.

453. Wandering. Diomedea Exulans, Lin. Syj. 214.-Pl. Enl. 237.-Latbam, iiio

Albatrofs, Edw. 88.-Pallas, Spicil. Zool. Fafe. v. 28.
Tfchaiki of the Kamtfchatkans, Lev. Mus.-Bl. Mus.

ALB. With a ftrong bill, finking a little in the middle; hooked. at the end of the upper mandible, abrupt at that of the lower; noftrils covered with a ftrong guard, and opening forward ; color red; tip dufky: the plumage, in fome, wholly dunky, with the color moft intenfe on the upper part; others again have their under fide entirely white: the tail is rounded : legs and feet of a dufky red: the webs dulky.

Albatrosses differ greatly in fize. Whether they differ in fpecies I cannot determine. They weigh from twelve to twenty-eight pounds : and vary in extent of wings, from feven feet feven inches to ten feet feven.

The white and the brown variety or fpecies appear annually in flocks of thoufands, about the end of Fune, and fpread over the whole Ochotfcban fea, the gulph of Penfcbinfi, and the Kurile inands; but very rarely on the eaftern coaft of Kamtfcbaika. They alfo arrived in great numbers about Bering's Ifland, at the time when Steller was preparing to depart from his long confinement, after the fhipwreck of his illuftrious commander. He failed from thence on the roth of Auguft. This coincides with the re-migration of thefe birds, who retire from the former places about the end of $7 u l y$ or the middle of Auguft. Their arrival is the certain forerunner of fifh. It is probable that they purfue their prey northward, as they do not return the fame way. They fpread to the coafts of Anerica *, and tend
*Seen the ath of $\mathcal{F}^{\prime}$ ', in lat. 56.30 , off the weftern coait of America.-Ellis's Foy. i. 292.
from each continent to their breeding-places in the fouthern hemifphere, which they may arrive at by the feafon of fummer in that adverfe part of the globe.

They feek the northern fhores, in purfuit of the vaft fhoals of falmon which frequent thofe diftant places. They are the molt voracious of birds; and will fo fill themfelves with fifh, that fometimes a large one will hang half out of their mouths till thofe in their ftomach are digefted. They will be at times fo loaden with food as to become incapable of flying; and even fo ftupified, as to be readily hunted down by boats, or transfixed in the water by darts: neither can they arife till they have vomited up their prey, which they ftrive to do with all their might.

The Kamtfcbatkans are very folicitous about the capture of thefe birds, not fo much for the fake of their flefh (which is very tough and dry, and never eaten unlefs hunger compels) but on account of the inteftines, which they blow into bladders, in order to form floats for their nets. They angle for the Albatroffes as they do for the fcaly race, baiting with a whole filh, a large hook fixed to a long cord. This they fling into the water, when there is an inftant conteft among thefe greedy birds, which fhall firft lay hold of it *.

They have only the veftige of a tongue ; which is one of the characters of the Gannet, Corvorants, and other voracious birds. Their voice, like that of the Pelecan, refembles the braying of an afs.

The voyage which there birds undertake, from perhaps almott the extremity of the fouthern hemifphere to that of the northern, urged by inftinct, to attend the migration of certain fifhes, is very amazing. They arê, indeed, feen in April and May off the Cape of Good Hope $\dagger$, fometimes foaring in the air with the gentle motion of a Kite, at a ftupendous height; at others, nearer the water, watching the morions of the Flying Fifh; which they catch while thofe miferable beings fpring out of their element to fhun the jaws of the Coryphenes.

[^53]$$
3 \mathrm{~T}_{2} \quad \text { hase }
$$

Mannerfo.

Caituise.

Migramonso.

I have not authority to fay that fome of them do not refide about the Cape the whole year: but I am acquainted with only two places in which they breed; one is the Falklond illands, the other the coaft of Patagonia *. In the firft, they begin to lay their eggs in October, the fpring of thofe regions, and continue that function about a month. They build their nefts with fedges, in form of a haycock, about three feet high, leaving a hollow in the fummit for the egg; for they lay but one, which is four inches and a half long, white, with fome fmall obfcure fpots at the thicker end. They are conItantly watched while on their nefts by multitudes of Hawks, who no fooner fee the Albatrofs quit its neft, but they inftantly dart down and carry off the egg. This obliges them to lay another, and prolong the feafon of incubation.

The remaining part of the fummer they wander over all parts of the Antarctic feas; and were feen as low as lat. 67.20. in the middle of our fanuary $\dagger$; and have been feen in feveral fucceffive months to the northward, fhunning the winter of their native hemifphere, and feeking warmth and food in the remote climate of Kamt/cbatka.

Steller takes notice of fome birds which the Ruflans rank under the name of Glougbpicbi. He fays they are found in great numbers on the inles between Afia and America; that they were of the fize between an Eagle and a Goofe, had a yellow crooked bill, and their plumage of the color of umber, fpotted with white. He alfo faw numbers feeding on a dead whale. And in croffing the Pencbian fea, he obferved feveral flying : fome white, others black $\ddagger$. All thefe I fufpect to have been different forts of Albatrosses; which may have wandered here; for the Antarctic voyagers obferved at left three fpecies in their approaches towards the fouthern pole $\|$.

- This account is given by a diftinguifhed officer in our navy, who had vifited there iflands.

With a black bill, marked with one furrow : whole upper fids of the body black; the under, from chin to tail, white. Weight only eighteen ounces. Length fifteen inches and a half. Extent twenty-five.
peace.
Br. Tool. ii. $\mathrm{N}^{\circ} 231$. -Alca Pica, Lin. Syjt. 210.-Latham,.iii.
Alca Unifuleata, Brannich, $\mathrm{N}^{\circ} 102$. -Muller, $\mathrm{N}^{\circ} 13^{8}$.

Inhabits the north of Europe; and the fame countries with the former. It extends farther fouth than any of the genus; being found on the coafts of Candia, the antient Crete ; where it is called Vutbamaria, and Calicatczu $\ddagger$. In Greenland neither of them frequent the bays till the intenfe cold fets in; but live in the fea, reforting, in the

[^55]breeding feafon, to the cliffs in flocks, where each knows its fation. Feed on the cancer pedatus, and other marine infects; and grow very fat. In winter, refort to the bays to feed; but at night return to fea. Vie with the Eider-duck, in point of utility to the Greenlanders. The flkins are ufed for cloathing: the raw fat is fucked as broth: the flefh, half putrid, is much admired : and the whole fowl, dreffed with the inteftines in it, efteemed a high delicacy.

They are taken in the fea with darts; or, chaced in canoes, are driven on flore, and killed by the perfons who wait for them; or are taken in nets made of fplit whalebone. They are the chief food of the natives during February and Narch*。

The Alca Balthica of Brunnich, $\mathrm{N}^{\circ} 15$, is a variety of theie birds, only wants the white line from the bill to the eyes.

Br. Zool. ii. No 232.-Edzu. 358.-Le Macareux, Pl. Enl. 275 -Latbam, iii. Alca Arctica, Faun. Suec. No 141, Lev. Mus.-Bl. Mus.
A. With a fhort bill, deep at the bafe, ridged, triangular, ending in a fharp point; bale ftrongly rimmed; upper part blueifh grey; lower red; both furrowed tranfverfely : crown, and upper part of the body, wings, and tail, black : cheeks white, bounded by grey: breaft and belly white : legs orange-colored. Weight twelve ounces. Length twelve inches. Extent twenty-one.

Inhabits all the coafts of northern Europe, the icy fea, and all the way to Kamt $\int c b a t k a$; where they are larger and blacker than ufual, and their crown cinereous. Found in the Feroe ines, where they are called Lunda; extends to Iceland, Greenland, and Spitzbergen. Catefby enumerates this fpecies, and fays that the Great Auk, and RazorBris, frequent the coats of Carolinu during winter $\dagger$. In the fame feafon, numbers of thefe birds, and the Razor-bills, frequent the coaft of Andalufia; but difappear in the fpring. It is fuppofed that they continue fwimming from the northern parts in fearch of food; the fifh of the fofter latitudes not retiring to the great deeps out of their reach, as is the cafe with the finh of more rigorous climates.

A.
With a fhort, black, convex, and thick bill : whole upper part black: cheeks and lower parts white : fcapulars ftreaked downwards with white: legs dirty greenih white t webs black : throat of the male is black. In Size not fuperior to that of a Blackbird.

Inhabits the north of Europe, as far as Spitzlergen; but I believe: does not extend to Afar. Frequent in Greenland. Dives well. Is always putting its bill to the water as if drinking. Grows very fat in ftormy weather, when the waves bring finall Crabs and little fifh near the furface. Is called in Nerofoundland the Ice-bird, being the barbinger of ice *. Varies to quite white; and fometimes is found with a reddifh breaft. Is called by the Dutch, Rottet, from its note.
430. Antient. A. With a black bill, crown, and throat: on each fide of the head a flort whitif creft: on the hind part of the neck arenumbers of white, long, loofe, and very narrow feathers, which give it an aged look: wings, back, and tail, footy: breaft and belly white. Size of the former.
Place, Inhabits from the weft of North America to Kamtfchatka and the Kurile inands.-Pallas, MS.-Lev. Mus.

[^56]A. With

A．With the bill black and ridged：crown，upper part of the neck，back，wings，and tail，dufky：under fide of the neck and breaft of a deep iron grey ：belly of a dirty white ：legs dulky． Size of the Water Ouzel．

Seen in vaft multitudes about Bird Ifand，between Afra and Ame－ rica．

Alca Cirrhata，Pallas，Spicil．Zool．fafc．v．7．tab．i。－Latbam，iii． －Lev．Mus．

A．With a ftrong thick bill，of a fub－triangular form，arched， hooked near the end；the lower mandible truncated；the upper mandible，near the bafe，rifing into a diftinct prominence：the bill of the male marked with three furrows ；of the female with two：its colors a fine red，yellow，and corneous：from the fides of the head are two long filky tufts of a yellow color，falling down the fides of the neck to the back：cheeks white：the reft of the plumage entirely black；lighteft beneath ：legs of a bright red．In Size fuperior to the Puffin Auk．
Inhabits only the fhores of Kamtccbatka，the Kurile inands，and thofe intervening between Kamt $f$ chatka and America．
In manners this fpecies greatly refembles the Puffin．Lives all day at fea，but at no great diftance from the rocks ：comes on fhore at night ：burrows a yard deep under ground，and makes there a neft，with feathers and fea plants：is monogamous，and lodges there the whole night with its mate．Lays one white egg，in the latter end of May or beginning of Yune．Bites fiercely when taken． Feeds on Crabs，Shrimps，and fhell－fifh，which it forces from the rocks with its ftrong bill．
The females of Kamt $f$ coatha copy from this bird the fafhion of hanging，from behind each ear，tufts made of lips of the white part of the fkins of the Glutton．Thefe are reckoned the moft valuable

Mannerso
prefent a lover can give his miftrefs, or a hufband to his wife, and the ftrongeft proof of affection.

Their magicians formerly ufed to recommend the bills of this bird, mixed with thofe of the Puffin, and the parti-colored hairs of Seals, as a powerful amulet. The diftant inlanders ftill bear the bills in their helmets and caps, and make their garments of the fkins; but the Kamtfobatkans at prefent make no ufe of any part but the eggs, which are a common food; the flefh being hard and infipid.
A. With an oval bill, or the upper and lower parts convex, and of a bright red color : from the remote corner of each eye is a very flender tuft of fine white feathers, hanging down the neck : the head and upper part of the body dufky ; the lower whitifh, varied with black edges : legs dirty yellow : webs durky. About the Size. of the Little Auk.
Place. Inhabits Kanutfcbatka, the ines towards Fapan, thofe towards America, and the weftern fhores of America, in great abundance. They fwim in flocks; but never, unlefs tempeft-driven, go far from the rocks, to which they refort towards night, and fhelter themfelves in the fiffures or holes, without keeping any certain neft. Are the moft ftupid of all birds, and caught by the natives in this ridiculous manner :-towards evening they put on their garment with great neeves, pull out their arms, and leave the fleeves diftended, which the birds will creep into by flocks, and thus become an eafy prey.

The fupidity of this fpecies has often been the falvation of mariners failing by night in thefe dangerous parts; being often warned of the neighborhood of a dreadful rock, by thefe birds flying on board their veffel, miftaking it for their defigned lodging. They lay one, egg, uncommonly great for their fize; it is of a whitifh color, fpeckled with brown, dufky, or yellow; and is efteemed for its delicacy.

CRESTEDAND DUSKYAUK.

Alca Criftatella, Pallas Spicil. Zool. fafc. v. 18. tab. iii.-Latbam,- iii.

AWith a fcarlet bill : upper mandible convex, and end hooked; and near the angle of the mouth a fcarlet heart-fhaped fubftance : on the forehead rife fome upright feathers; and above that a fine creft of longer feathers, curling forwards: head and neck black: behind each eye hang a few narrow feathers: back black, marked with dufky ferruginous flrokes: rump hoary: wings footy: under fide of the body of a dufky cinereous caft: legs livid : webs dulky. Size of the Miffel Thrufh.

Frequent on Bird Ifland, between Afia and America.

Alca Tetracula, Pallas Spicil. Zool. fafc. vo 23. tab. iv,-LLatbam, iii.

A.With a fmall arched bill, durky and yellow : above the bafe, on the forehead, the feathers divide into two points: beyond each eye is a whitifh defcending line, in which are a few fetaceous feathers: general color of the bird dufky: belly hoary: on the hind part of the head and neck, and near the tail, a few rufty marks: tail very fhort, dulky, and fome of the feathers tipt with ferruginous: legs livid: webs intenfely black. Length eleven inches. Extent eighteen.

Frequent about Kamtfcbatka, the Kurile inles, and thofe fituated towards America. Live in flocks on the rocks; but appear at fea folitary : moft ftupid, and clumfy. Can fcarcely fly; or ftand, except they reft againft the rocks, where they lodge in the fiffures the whole night, or in burrows, which they make with great facility. They fwim and dive admirably well. Are exceedingly bad food; but are eaten by the almoft-famifhed natives.

Colymbus Septentrionalis, Lin. Sy/f. 220.-Latham, iii. -Lev. Mus.

D.
With head and chin of an uniform grey: throat, and lower fide of the neck, of a dull red: upper part grey, ftreaked with black: upper part of body, wings, and tail, dulky: back and coverts of wings fpotted with white : breaft and belly white: legs dußk. Weight three pounds. Extent three feet five. Length, to the tip of the tail, two feet.

Found in the north of Europe and Iceland, along the northern coaft of Ruffa, Sibiria, and Kamt $f$ chatke; but does not haunt the inland lakes. Inhabits the rivers of Hudjon's Bay during fummer. Prey much on the fifh entangled in the nets; but are often caught themfelves in their rapid purfuit of the fifh. Mr. Hutchins took fourteen out of a fingle net in one tide. Numbers of every fpecies of Diver are frequently taken in this manner about Hudfon's Bay.

Br. Zool. ii. No 24 I ,-Colymbus Arcticus, Lomm. Faun. Suec. N ${ }^{\circ}{ }_{150}$. Le Lumme, \&c. De Buffon, viii. 261.-Latbam, iii. -Lev. Mus.
D. With bill, forehead, and cheeks, black : hind part of the neck cinereous: fides of the neck ftreaked downwards with black: fore part varying with black, purple, and green : back and coverts of wings dufky; the firft marked with fquare, the laft with round white fpots: breaft and belly white: tail black: legs partly red, partly dufky.

This, and the preceding, inhabit Hudfon's Bay *, the north of Europe, and Tceland. Few in Rufia : but frequent in the inland lakes of Sibiria, efpecially thofe of the Arciic regions; but in the wandering feafon fpread over all latitudes.

The Norwegians remark the fagacity of thefe birds, in prefaging the change of weather. When the flies are big with rain, they fly wildly about, and make the moft horrible hoarfe noife, ' fearing that the fwelled waters-fhould invade their neft; on the contrary, in fine weather, their note is different, and feemingly in an exulting frain. The Norwegians think it impious to deftroy, or even to difturb, this fpecies*.

The Sroedes have lefs fuperfition: they drefs the fkins; which, when prepared, fhew in the clearef manner, on the infide, the quincuncial difpofition of feathers. They are exceedingly tough, and are ufed for gun-cales and facings for winter-caps $\dagger$.

white fpot: breaft and belly of a rufty afh : tail brown, white at the bafe: legs black and fcaly : claws black, fharp, ftrong, and hooked like thofe of a Kite. Lengith two feet. Extent four and a halfo Weight three pounds.
Place. Inhabits Europe very locally; only from Fould and Unft, two of the Scbetland ines, to the Feroe ines, Norway, and as far as Iceland. Its manners, fuch as its great courage, and fiercenefs in defending its young, in driving away the eagle from its haunts; and, as is firmly afferted by Mr. Scbroter, a furgeon in the Feroe ifles, its preying on the leffer water fowl, like a rapacious land bird; are fully defcribed in the Britiß Zoology. They abound about Port Egmont, in the Falkland iflands, and are therefore ftiled by navigators, Port Egmont Hens: They have been obferved in many parts of the Pacific ocean, as low. as lat. $3^{66 .} 5^{6}$ fouth, to the eaft * of Nerw Zeland; and as high, in the fame hemifphere, as lat. $67.15 \dagger$. The navigators found them in great plenty, in their breeding feafon, in the latter end of December, about Cbriftmas Sound, in Terra del Fuego, making their nefts in the dry grafs. They have not been remarked in other parts of the globe, nearer than the Scbetlands.
B. Glaucous, Larus Glaucus, Erunich, $\mathrm{N}^{\circ}$ 148.—Muller, $\mathrm{N}^{\circ}$ 169.-Faun. Groenh. No $6_{4}$-Latbann, iii.
G. With a yellow bill, and orange fpot near the end: head and lower part of the body white : back and wings of a fine hoary grey; primaries darkeft, and tipt with white: legs of a pale fulvous hue. In Size fuperior to the Herring Gull.
Riace. Inhabits Norway, Lapmark, Iceland, Greenland, and Spitzbergen. Is called by the Dutch, Burgermeifter, being the mafter of all other fea fowl. It builds its neft high on the cliffs: preys on dead whales: attends the Walrufes, in order to feed on their dung; and, as Frederic

- Cook's Voy. Howwkfrwortb's Coll. ii. 283. † Forfer's Voy. i. 10g.

Martens afferts, will even deftroy and eat the young of the Razor-bills. It alfo feeds on fifh; and does not defpife the berries of the Empetrum Nigrum. It is almof continually on wing; and makes a hoarfe noife, like the Raven.
C. Silvery. Larus argentatus, Brunnich, $\mathrm{N}^{\circ}$ 149.-Latbam, iiio.

G.With a white head and neck, flreaked downwards with cineres ous lines: back and under part of the body like the former fpecies: lower part of the primaries greyifh; upper black; the tips white: bill yellow, with an orange fpot. Size of the Herring Gull. This and the former feem nearly:
Inhabits Norway.
D. Tarrock, Br. Zool. ii. No 2 II.-Larus tridatylus, Faur. Suec. No ${ }^{157}$ - -La Mouettetachetée, De Buffon, viii. 424.-Latbam, iii. -Lev. Mus.

G.With a ftrong, thick, black bill : with white head, neck, breaft, and belly: behind each ear a black fpot: on the hind part of the neck a black crefcent: back and fcapulars blueifh grey: ten middle feathers of the tail white, tipt with black; outmoft quite white: a protuberance inftead of the back toe. Size of the former.

Inhabits Europe quite to Iceland and Spitzbergen; the Baltic and White fea; and again in Kamtfchatka.

## E. Red-legged.

G.With blood-red bill and legs: head and neck white, mottled about the former: back and coverts of wings fine grey: leffer coverts mottled: under fide of body and the tail white; the laft tipe with black. Size of the Black-cap Gull.

A bird of this fpecies was brought from Kamt $\int$ chatika. Another of the fame kind has been fhot in Anglefey.

Plact.

Br. Zool. ii. No 2 57.-Procellaria glacialis, Faun. Suec. No 144.—Petrel de l'ille de St. Kilda, Pl. Enl. 59.-LLatbam, iii. -Lev. Mus.

P.With a ftrong yellow bill: head, neck, tail, and under fide of the body, white : back and coverts of wings cinereous : primaries dufky: legs of a pale yellow. Rather larger than the Common Gull.
Abound in the feas of Spitzibergen and Greenland, and common in thofe between Kamt fcbatka and America: the latter are darker colored than the former. They are equally abundant in the fouthern hemifphere. Captain Cook found them among the ice, in his voyage towards the fouth pole, in lat. $64.55^{*}$; in lat. 59 , to the fouth of the infe of Nerw Georgia $\dagger$; and even in the moderate climate of lat. 34.45, not remote from the Cape of Good Hope $\ddagger$. They keep chielly in the high feas, and feed on dead whales, or any thing that offers on the furface; but will, with their ftrong bills, pick the fat out of the backs of living whales, efpecially of the wounded; whofe bloody track they will follow by hundreds, to watch its rifing. Their fight refembles running on the top of the water; for which reafon the Norwegians call it Hav-beft, or Sea-horfe; and Storm-fugh, or Storm-fowl, as being fuppofed to be a prefage of tempefts. The Dutch call it Mallsnucke, or the Foolifh Fly, from their multitudes, and their ftupidity. They very feldom come to land, unlefs they chance to lofe their way in the mifts, which are fo frequent on the coaft of Greenland during the month of Auguij. They breed on the broken rocks about Difco, and remote from the main land.

They are, by reafon of their food, exceffively fetid; yet the flefh is ufed as a food by the Greenlanders, both raw and dreffed. The fat

* Cook's Voy. S. Pole, i. 252. $\quad$ Forfer's Voy. ii. $534^{\circ} \quad \ddagger$ Forfier, i. 52.
is
is alfo eaten, and ferves to fupply their lamps with oil. The prey of thefe birds being chiefly the blubber of cetaceous fifh, it is quickly converted into oil, which ferves the Fulmars for a double end; as a fuftenance for the young, and a defence againft their affailants; for they fpurt it, on being feized, out of their mouths and noftrils, into the faces of the perfons who lay hold of them. The Greenlanders take them by darting them in the water.

Lathant, iii. -Lev. Mus.
P. With a dufky bill, more flender than that of the former: head, wings, and whole upper part of the body, of a footy blacknefs: lower part, from chin to tail, and the inner coverts of the wings, white : legs weak, compreffed; whitifh before, dulky behind. Length fifteen inches. Extent thirtyoone. Weight feventeen ounces.

Inhabits the northern parts of Europe, Iceland, and Greenland. Confort with the laft in Greenland: and, in mifty weather, quite coverthe fea. It extends, in the Atlantic ocean, to America, and again almoft to the Cape of Good Hope *; and is alfo found in the fouthern. hemifphere, having been feen in fouth lat. 13. 13; in Captain Cook's. paffage from Eafter ifland to Otabeite $\dagger$ : and again, in numbers, as low as cape $D e f e a d a$, in fouth latitude $53 \ddagger$.
P. With the whole upper and under parts of a cinerous grey: bill er, deep grey : exterior webs of primaries dufky; interior, light grey: tail forked, and of a light grey. Lengrie nine inches.

Taken among the ice between $A f a$ and America.

DWith the lower part of the bill black; upper part, and fpace - between that and the eyes, covered with a naked yellow fkin : eye-lids naked and yellow : whole plamage pure white: legs black, Length, to the tip of the tail, four feet ten. Extent feven feet three. Weight from thirteen to fixteen pounds.

Thefe birds inhabit the northern world, as high as Iceland, and as Places low as the foft climate of Greece, or of Lydia, the modern Anatolia, in Afia Minor: it even defcends as low as Egypt *. They fwarm, during fummer, in the great lakes and marfhes of the Tartarian and Sibirian defarts; and refort in great numbers to winter about the Cafpian and Euxine feas. Thofe of the eaftern parts of Sibiria retire beyond Kamt/cbatka, either to the coafts of America, or to the illes north of Fapan. In Sibiria, they fpread far north, but not to the Arctic circle. They arrive in Hudfon's Bay about the end of May: breed in great numbers on the fhores, in the illands, and in the inland lakes; but all retire to the fouthern parts of North America in autumn, even as low as Carolina and Louifiana. Mr. Lawfon, who was no inaccurate obferver, fays, that there were two forts in Carolina: the larger is called, from its note, the Trumpeter. Thefe arrive in great flocks to the frefh rivers in winter; and, in February, retire to the great lakes to breed: the leffer are called Hoopers, and frequent moftly the falt water. The Cygnets are efteemed a delicate difh. The Indians of Louifana make diadems for their chieftains with the large feathers: the leffer are woven into garments for the women of rank. The young of both fexes make tippets of the unplucked fkin.

They breed in great multitudes in the lakes of Lapland; and refort towards the more fouthern parts of Europe, during the fevere feafon. Breed even in the Orkney ifles.

How TAKEN IN ICELAND.

In Iceland they are an object of chace. In Auguft they lofe their feathers to fuch a degree as not to be able to fly. The natives ,at that feafon, refort in great numbers to the places where they moft abound; and come provided with dogs, and active and ftrong horfes, trained to the fport, and capable of paffing nimbly over the boggy foil and marfhes. The fwans will run as faft as a tolerable horfe. The greater numbers are taken by the dogs, which are taught to catch them by the neck, which caufes them to lofe their balance, and become an eafy prey. Great ufe is made of the plumage : the flefh is eaten; and the fkin of the legs and feet, taken off entire, looks like fhagreen, and is ufed for purfes. The eggs are collected in in Ramtschatia. the fpring for food \%. In Kamtfobatka, where they abound both in winter and fummer, they are alfo taken with dogs, in the moulting feafon; or killed with clubs. During winter they are taken-in the unfrozen rivers, and form a conflant difh at the tables of the natives \(\dagger\).
Specrpic distinctions.

This fpecies has feveral diftinctions from the fpecies which, we, in England, call the Tame Swan. In Ruffa this fpecies more fitly clames the name, it being the kind moft commonly tamed in that empire. The Whiftling Swan carries its neck quite erect : the other fwims with it arched. This is far inferior in fize. This has twelve ribs on a fide; the Mute \(\ddagger\) only eleven. But the moft remarkable is the ftrange figure of the windpipe, which falls into the cheft, then turns back like a trumpet, and afterwards makes a fecond bend to join the lungs. Thus it is enabled to utter a loud and fhrill note. The other Swan, on the contrary, is the moft filent of birds; it can do nothing more than hifs, which it does on receiving any provocation. The vocal kind emits its loud notes only when flying, or

\section*{*Olafen, i. i18. + Defcr. Kamtfcbatka, 495.}
\(\ddagger\) We change the name of the Tame Swan into Mute, as the former name is equivocal, and this fecies emits no found.
calling: its found is, whoogh, whoosh, very loud and Mrill, but not difagreeable, when heard far above one's head; and modulated by the winds. The natives of Iceland compare it to the notes of a violin: in fact they hear it at the end of their long and gloomy winter, when the return of the Swans announces the return of fummer: every note muft be therefore melodious which prefages the fpeedy thaw, and the releafe from their tedious confinement.

It is from this fpecies alone that the antients have given the fable of the Swan being endued with the powers of melody : embracing

Vocal Swan of the Poets.

Tame Swan, Br. Zool. ii. No. 265.-Anfer Cygnus, No. 107. B.-Latbam, iiio. 470. Muteswin. -Lev. Mus.
D. With a deep red bill, and black incurvated nail at the end : a triangular naked black fkin between the bill and the eyes: at the bafe of the upper mandible a large black rounded protube-
rance : legs black: whole plumage of a fnowy whitenefs. Weight fometimes twenty-five pounds.

Plase.

The Mute Swan, or that which we call Tame, is found in a wild ftate in fome parts of Rufia; but far more plentiful in Sibiria. It arrives, in fummer, later from the fouth, and does not fpread fo far north *. Thofe which frequent the provinces of Gbilan and Mafenderan, on the fouth of the Cafpian fea, grow to a vaft fize, and are eiteemed great delicacies. The Mabometans hold them in high veneration \(\dagger\).

Edw. 151 .-Catefy, i. 91.-Anas Canadenfis, Lin. Syf. 198.—Pbil. Traw. Ixii. 412.-Latham, iii. -Lev. Mus.-Bl. Mus.
D. With an elevated black bill : head, neck, primaries, and tail, black: from the throat paffes, along the cheeks to the hind part of each fide of the head, a triangular white fpot: bottom of the neck, vent feathers, lower belly, and coverts of the tail, white: breaft, upper belly, back, and wings (except primaries) of a dufky brown: legs of a deep lead-color.

Inhabit the northern parts of North America. Immenfe flocks appear annually in the fpring in Hudfon's Bay, and pafs far to the north to breed; and return fouthward in the autumn. Numbers alfo breed about Hudfon's Bay, and lay fix or feven eggs. The young are eafily made tame. M. Fabricius fufpects that they are found, during fummer, in Greenland \(\ddagger\). They proceed, in their fouthern migration, as low as Soutb Carolina, where they winter in the ricegrounds. The Englifb of Hudfon's Bay depend greatly on Geefe, of thefe and other kinds, for their fupport; and, in favorable years, kill three or four thoufand, which they falt and barrel. Their arrival is impatiently attended; it is the harbinger of the fpring, and the month named by the Iirdians the Goofe moon. They appear ufually at our fettlements in numbers, abcut St. George's day, O. S. and fly.
- Doctor Pallas. . \(\dagger\) Extracts, iii. 7 8. \(\ddagger\) Faun. Groenl. p. 66.
northward
northward to neflle in fecurity. They prefer illands to the continent, as further from the haunts of men. Thus Marble Ifland was found, in Auguf, to fwarm with Swans, Geefe, and Ducks; the old ones moulting, and the young at that time incapable of fying *.
The Englifb fend out their fervants, as well as Indians, to fhoot thefe birds on their paffage. It is in vain to purfue them: they therefore form a row of huts made of boughs, at muiquet-fhot diftance from each other, and place them in a line acrofs the vaft marfhes of the country. Each hovel, or, as they are called, ftand, is occupied by only a fingle perfon. Thefe attend the fight of the birds, and on their approach mimic their cackle fo well, that the Geefe will anfwer, and wheel and come nearer the ftand. The fportfman keeps motionlefs, and on his knees, with his gun cocked, the whole time ; and never fires till he has feen the eyes of the Geefe. He fires as they are going from him, then picks up another gun that lies by him, and difcharges that. The Geefe which he has killed, he fets up on fticks as if alive; to decoy others; he alfo makes artificial birds for the fame purpofe. In a good day (for they fly in very uncertain and unequal numbers) a fingle Indian will kill two hundred. Notwithftanding every fpecies of Goofe has a different call, yet the Indians are admirable in their imitation of every one.
The vernal flight of the Geefe lafts, from the middle of April until the middle of May, Their firk appearance coincides with the thawing of the fwamps, when they are very lean. The autumnal, or the feafon of their return with their young, is from the middle of Ausuft to the middle of Oitiober \(\dagger\). Thofe which are taken in this latter feafon, when the frofts ufually begin, are preferved in their feathers, and left to be frozen for the freth provifions of the winter ftock. The feathers conftitute an article of commerce, and are fent into England.

\section*{Place。}

Obferved by Mr. Hearné, in Hudfon's. Bay. Is in Europe a northern. bird. Breeds in great numbers in Lewis, one of the Hebrides, and is moft deftructive to the green corn. Migrates at the latter end of Auguft, in floeks innumerable, into the wolds of rorkfoire, and. into Lincolufbire; and among them are fome white *. They all. difappear in the fpring. The appearance and difappearance of this kind in Auftria is fimilar \(\dagger\). Wild Geefe are feen flying over, but: very rarely alight in the Orknies:

t Kramer Anim. Auftr. 339.
}
BEUE-WINGED GOOSE.
afh-color : rump and vent white : middle feathers of the tail durky, tipt and edged with white; the outmoft almoft entirely white : legs Aefh-colored: claws black. Length two feet nine. Extent five feet. Weight fometimes ten pounds.

Inhabits the north of Europe, Afia, and America, and migrates into Hudfon's Bay. Frequents, during winter, Soutb Caroliza, and particularly the rice grounds, where it gleans the droppings of the harveft. This fpecies breeds in the fens of Lincolnfirire, and never migrates from that county. They are feen, early in the fpring, flying over Sweden, to the Lapland moors, and to the eaftern and fouthern parts of Icelond; in which quarters of that inand alone they breed *. Return in autumn: make a fhort ftay along the hores; but never winter in Sweden \(\dagger\). Abound in Rufia, Sibirio, and Kamtfchatka; but breed chiefly in the north.

> Edw. 15 2.-Anfer Cærulefcens, Lin. Syf. 196:-Latbarn, iii. -Lev. Mus.
D. With a red elevated bill : crown yellowifh; reft of the head and neck white ; the hind part of the lart fpotted with black; in fome the fpots are wanting; bafe of the neck, breaft, fides under the wings, and back, of a deep brown: coverts of the wings and tail of a light blueifh afh-color: belly and vent white : primaries dufky : fcapulars and tail white and grey, difpofed in ftripes: legs red. In Size rather leffer than the common Tame Goofe.

Migrates into Hudjon's Bay, and re-migrates like the former. The Indians have a notion, that to avoid the cold, it flies towards the fun, till it finges its pate againft that luminary. Few go very far north; but are moft numerous about Albany Fort; where, on the contrary, the Snow Geese are very fcarce.

Place.
475. Bering. D. With a yellow excrefcence at the bafe of the bill, radiated in. the middle with blueih black feathers: round the ears a fpace- of greenifh white: eyes black, encircled with yellow, and rayed with black: back, fore part of the negk, and belly, white: wings black: hind part of the neck blueifh. Size of a common Wiid Goofe.-Steller's Defcr. *

Obferved by Mr. Steller, in Fuly, on the ifle of Bering. They probably came from America. It is the remark of that great naturalift, during his ftay on that inland, that Geefe of various kinds migrated this way to and from America to Afa, in vaft flocks. In the fpring they came from the weft, in autumn from the eaft; which proves, that the Water-Fowl of thefe latitudes prefer, for breedingplaces, the Afatic waftes to thofe of America.

White Brant, Lawfon, 147.

DWith an elevated bill; upper mandible fcarler; lower whitifh: forehead yellowifh : head, neck, and body, of a fnowy whitenefs : primaries white at the bottoms, black to the tips: leffer coverts ufually cinereous, with dufky tips: legs and feet deep red. The young Geefe are blue, and do not attain their proper colors in lefs than a year. Length two feet eight inches. Extent three feet and a half. Weight between five and fix pounds.
This fpecies is common to the north of \(A f / a\), and to Nortb America. They appear in flights about Severn river in Hudfon's Bay, in the middle of May, on their way northward; return in the beginning of September with their young, and flay about the fettlement a fortnight; and proceed, about the tenth of October, flying very high, fauthward to pafs the winter. They come in flocks of thoufands; quite cover the country; rife in clouds, and with an amazing noife. They vifit Carolina \({ }^{*}\) in vaft flocks; and feed on the roots of fedge and grafs, which they tear up like hogs. It ufed to be a common practice in that country, to burn a piece of a marh, which enticed the Geefe to come there, as they could then more readily get at the roots; which gave the fportfman opportunity of killing as many as he pleafed. In Hudfon's Bay thoufands are annually fhot by the Indians for the ufe of the fettlement; and are efteemed excellent meat.
They arrive in the earlieft fpring, before any other fpecies of Water-fowl, in immenfe flights, firt about the river Kolyma. Their

FOOD.

Migrations.
courfe is from the eaft, tending to the frozen ocean; and fpreading to the eftuaries of the 7 ana and Lena before the ice is broken up. Finding the want of fubfiftence, they bend their journey a little fouthward, in fearch of the infeets and plants which abound in the inland lakes and moors. In this manner they penetrate as low as Fakut, and very rarely farther, except in very fmall detachments, which ftray towards the Olecma, and fometimes by accident to the junction of the Witim with the Lena. They make very little ftay in thofe parts; but again tend directly to the Arctic coafts of Sibiria, where they breed; but they do not take the fame route, keeping more eafterly, towards the fana and Indigirka. It is obfervable, that shey never migrate weftward beyond long. 130 , a little beyond the mouth of the Lena: neither is their migration by fo high a latitude as Kamtccbotka, where they are extremely rare *; or their flight over that country may be fo lofty as to render their courfe imperceptible. In the beginning of winter they are feen flying at a great height over Silefia; but it does not appear that they continue there, being only on their paffage to fome other country \(\dagger\).

The general winter quatters of this fpecies feems to be the temperate and warm part of North America.

They are the moft numerous and the moft ftupid of all the Goofe race. They feem to want the inftinct of others, by their arriving at the mouths of the Arctic Afratic rivers before the feafon in which they can poffibly fublift. They are annually guilty of the fame miftake, and annually compelled to make a new migration to the fouth in queft of food, where they pars theirtime till the northern eftuaries are freed from the bonds of ice.

They have fo little of the fhynefs of other Geefe, that they are taken in the moft ridiculous manner imaginable, about fakut, and the other parts of Sibiria which they frequent. The inhabitants firt place, near the banks of the rivers; a great net, in a ftrait line,

\footnotetext{
- Schowenkelt An, Sitegice \(215^{\circ}\)
}
or elfe form a hovel of fkins fewed together. This done, one of the company dreffes himfelf in the fkin of a white rein-deer, advances towards the flock of Geefe, and then turns back towards the net or the hovel; and his companions go behind the fock, and, by making a noife, drive them forward. The fimple birds miftake the man in white for their leader, and follow him within reach of the net, which is fuddenly pulled down, and captivates the whole. When he chufes to conduct them to the hovel, they follow in the fame manner; he creeps in at a hole left for that purpofe, and out at another on the oppofite fide, which he clofes up. The Geefe follow him through the firft; and as foon as they are got in, he paffes round, and fecures every one*. In that frozen clime, they afford great fubfiftence to the natives; and the feathers are an article of commerce. Each family will kill thoufands in a feafon. Thefe they pluck and gut; then fling them in heaps into holes dug for that purpofe, and cover them with nothing more than the earth. This freezes, and forms over them an arch; and whenever the family has occafion to open one of thefe magazines, they find their provifion fweet and good.

```
D. With a hort, black, elevated bill : head, neck; and upper part of the breaft; black: a white fpot marks each fide of the neck near its junction with the head: primaries and tail black: belly, fcapulars, and coverts of the wings, cinereous, clouded with a deeper: coverts of tail and the vent white: legs black.

Is frequent in Ifudfon's Bay. Breed in the inlands, and along the \(P_{A C E}\) coafts ; but never fly inland. Feed about high-water mark. Return towards the fouth in vaft flocks in autumn. Probably they winter in Carolina; for Lawfon mentions a Grey.Brent frequent in

\footnotetext{
- The Bemt fbatkans ufe the fame method in taking Geefe. Defrro Kamt fbatka, 496.
}
that feafon*. During winter, they fwarm in Holland and in Ireland: in the firft, every eating-houfe is full of them : in the laft, they are taken in flight-time, in nets placed acrols the rivers ; are fattened, and reckoned great delicacies. They appear in fmall flocks in Hoy Sound, in the Orknies; but do not continue there: on the contrary, they winter in Horra Sound, in Scbetland, in flocks of two hundred, and are called Horra Geefe \(\dagger\). They retire from Europe to breed in the extreme north. A few, after flying over Sweden, ftop on the borders of Lapland; but the great bodies of them continue their flight even to the moft northern inles of Greenland \(\ddagger\), and to Spitzbergen. Fly in the fhape of a wedge, and with great clamor. Feed on grafs, water-plants, berries, and worms. Cannot dive. Barentz found multitudes fitting on their eggs, about the 2 Ift of \(\mathcal{F}\) une 1595 , in the great bay called Wibe \(\mathfrak{F} a n z\) Water; and, to his amazement, difcovered them to be the Rotganfen, which his countrymen, the Dutch, fuppoled to have been generated from fome trees in Scotland, the fruit of which, when ripe, fell into the fea, and were converted into Gonlings I. Thefe birds arrive every year in the eaft part of Sibiria, in order to breed; but are not feen to the weft of the Lena, nor yet in Ruflia.

; Le Millouin, Pl. Enl. 303.-Lev. Mus.-Be. Mus.
D. With a lead-colored bill : head and neck bright bay : breaft and upper part of the back black: reft of the back, fcapulars, and coverts of wings, pale grey, ftreaked tranverfely with lines of black:

\footnotetext{
-Sirom. \(243^{\circ}\)
}
primaries dufky: belly grey and brown : tail deep grey : legs leadcolored. In the Female the head rufty brown: breaft rather darker: belly and coverts of wings cinereous: back like that of the male : legs lead-colored. Length nineteen inches. Extent two feet and a half. Weight one pound twelve ounces.

Inhabits North America, in winter, as low as Carolina *; and, I believe, is the Red-headed Duck of Lawfon. Is found, in Europe, as high as Drontheim. Is met with in the great rivers and lakes in all latitudes of the Ruflan empire. A frefh-water Duck, and of exsellent tafte.

Black-billed Whitling Duck, Edw. 193 t.-Latham, iii.
Anas Arborea, Lin. Syf. 207.-Whiflers, Catefy, App. xxxvii--Larufon Carobina, 149.-LIv. Mus.
D. With a black bill, and crown lightly crefted : cheeks brown : hind part of the neck dufky; fore part white, fpotted with black : back and wings brown; coverts fpotted with black: tail and its coverts black: breaft of a dark reddifh color, fpotted with black: belly white, mixed on the fides with black: legs long, and of a lead-color; hind claw placed high up the leg. Leffer than a Tame Duck. Defcribed from Mr. Edwards.

Inhabits South Carolina and Famaica. Is, from its voice, called the Whifling Duck: perches on trees. Placed here merely on the authority of the name given it by Larefon and Catefly. The laft fays, that it frequents the coafts of Carolina during winter; which'makes me doubt, whether Mr. Edruards's bird, a native of Famaica, is the fame : for it may be held as a rule, that the water-fowl of hot climates never retire in winter to colder; and that thofe of Arctic climates almoft generally retire from them into warmer. Clouds of birds annually quit Hudfon's Bay, and other fevere climates, at approach of winter; fock the different latitudes of North America;

and return in fpring to encreafe and multiply. To the conftitutions of the Summer Duck, a very few other water-fowl, and to many landbirds, the warm temperature of the Caroinas is climate fufficiently north. They are driven, by the exceffive heat and arid foil of the Autille's and Guiana, to the moilt favannas and woods of thefe provinces, there to difcharge the firt great command. Mus.-BL. Mus.
D. With the ridge and nail of the upper mandible black; lower part fcarlet : on the head a beautiful creft, hanging half down: and ge neck, and beginning at the bafe of the bill; upper part fhining purple; beneath that a line of white; then fucceeds purple; and that again is bounded by white: cheeks purplifh and green: throat, and part of the neck, pure white : from the hind part of the neck a bead of purple divides the white, and points towards the throat : reft of the neck and breaft ferruginous, fiotted with white triangular fpots:belly white: feathers of the fides, which hide part of the wings \({ }_{3}\); elegantly marked downwards with incurvated lines of black and white : back deep brown, gloffed with copper and green : primaries dufky : fecondaries refplendent blue : coverts of the tail, and tail itfelf, dufky, gloffed with green: legs dirty orange. Head of the Female of a deep brown; crefted, but not fo much as the Drake : back deep brown: cheeks brown: behind each eye a white fpot : throat white : neck and breaft reddifh brown, with white fagittal fpots : belly white. Lengthis from the bill to the tip of the tail, near nineteen inches. Extent about thirty.

This moft elegant fpecies is found from Nerw York to the Antilles; and alfo in Mexico. It paffes the fummer in Carolina; and in a fingular manner makes its neft in the holes made by Woodpeckers in the loftieft trees, which grow near the water, efpecially the deciduous cyprefs. When the young are hatched, they are conveyed
down on the backs of the old ones, to whom the Ducklings adhere clofely with their bills. It often neftles on the bodies or boughs of trees which have fallen over the ftreams which run up the woods. It appears in New York, in the latter end of February or beginning of March, and retires towards the fcuth at approach of winter. They are very delicate eating. The Mexicans call it 1 zztaElzonyayaubqui, or the bird of the various-colored bead. It is there migratory. The natives feign that, from the fituation of its legs, it cannot ftand.

Le Canard de Miclon, Pl. Enl. 954.-Lev. Mus.-BL. Mus.

D.With bill black, orange in the middle: forehead, fides of the head, and neck, pale brown, dafhed with rofe-color: beneath each eara large dufky fpot points downwards : hind part of the head and neck, throat, and breaft, white: back and belly black : fides and vent feathers white: fcapulars long and white: coverts of the wings gloffy black: primaries dufky: fecondaries dark rufty brown: two middle feathers of the tail black, and four inches longer than the others, which are white: legs red. Female; crown dufky: cheeks white:
white: reft of the head, neck, back, and breaft, coverts of the wings, and primaries, deep brown: fcapulars and fecondaries rufty: belly white: tail and legs like thofe of the Male.

Inhabits to the extreme north. Breeds in Hudfon's Bay and Greenland, among the ftones and grafs : makes its neft, like the Eider, with the down of its own breaft; which is equal in value to that of the Eider, if it could be got in equal quantity; but the fpecies is fcarcer. It lays five eggs: fwims and dives admirably: and feeds on fhell-fifh, which it gets in very deep water. Flies irregularly, fometimes fhewing its back, fometimes its belly. Continues in Greenland the whole year, in unfrozen places*: but there are feafons fo very fevere, as at times to force them towards the fouth. Thofe which breed between Lapland and the polar circle, are often driven into Sweden, and the neighborhood of Peterfourg: thofe from the coaft of the Icy fea, as low as lat. 55 ; but on the fetting in of froft, retire Atill further fouth, unlefs where fome open fpots remain in the rivers. Vifit the frelh-water lakes in the Orknies, in OEFober, and continue there till April. At fun-fet they are feen, in great flocks, returning to and from the bays, where they frequently pafs the night, and make fuch a noife as to be heard fome miles in frofty weather. Their found is like Aan-gitche, and is faid not to be difagreeable. Steller, who obferved them in Kamstchatka \(\dagger\), fays, that their larynx has three openings, covered with a thin (I fupofe valvular) membrane, which forms the fingularity of the voice. La Sarcelle de. Feroe, or the Feroe Teal, of M. Brifon \(\ddagger\), is probably conjectured, by M. Brunnich, to be only a variety of this fecies: feemingly a female. .

}

A. GREAT GOOSE. With a black bill, tawny at the bafe : a dufky body; white beneath : fcarlet legs. Of a vaft Size, weigh-ing near twenty-five or thirty Ruifian pounds.
Place. This fpecies is found in the eaft of Sibiria, from the Lena to Kamtfchatka: and is taken in great numbers, together with the Red-neck-

Takzin in Glades. ed Goosé, in glades, as we do.Woodcocks in England. The Geefe in the day-time repair to the corn-fields and meadows: in the evening refort to the lakes, to wafh themielves and pars the night. The Sibirians generally fix' on a place where there are two or three lakes near each other, and cut between each an avenue through the thick birch woods of the country, If there is not the advantage of adjacent lakes, the avenue is made through the woods which border the fides of any which the birds frequent. At the entrance of the glades, on each fide, a tall birch-tree is left ftanding, and all' their branches ftripped away : from the tops of thefe naked trees is placed a ftrong net, which fills the breadth of the avenue: this net is capable of being dropped or raifed at pleafure, by means of certain long cords which run along the top; and the ends of which are held by a man who conceals himfelf in the high grafs. The Geefe commonly leave the lakes an hour before fun-rife; and, as they do not chufe to fly high at that feafon, prefer going through the avenues; and with their long extended necks frike into the nets, which are fuddenly dropped; and twenty, and often more, of the Geefe are taken at a time. All forts of Ducks, and other water-fowl, are: taken in the fame manner *.
- Pallas's Travels, ii. 325, 326.
3. Chinese Goose. Anfer Cygnoides, Lin. Syjf. 194. B.-Swan Goofe, Wil. Oino 360. -Raii. Syn. av. 138.-Brifon, vi. 280.-Latbam, iii. -Lev. Mus.

D.With a black bili, and a large protuberance at the bare, biggef in the males : on the chin is a naked, pendulous, black k in : from the crown to the back a black line rurs down the hind part of the neck: the reft of the neck and breatt is of a cream-color, often dafhed withtawny: belly white: between the bafe of the bill and the eyes is a white line: the back and wings deep grey: tail of the fame color, with whitifh tips: legs red: in fome the bill is of the fame color. In Length often reaches to three feet three.

This fpecies is found wild about lake Baikal; in the eaft of Sibiria; and in Kamtfcbatka. They are very commonly kept tame in moft parts of the Ruffan empire. Will produce, with the Common Goofe, a breed which preferves an exact medium between both fpecies. As an exception to the remark that a mulifh race will not breed, thefe frequently couple with one another, and with the genuine kind*. They are frequent in Cbina: are very ftately birds, therefore are dignified with the title of Swan Goofe.

0
UR fpecies in all refpects refembles the American, except in having a white line above and beneath each eye, and in yanting the humeral ftripe of white, which the latter has.

In Europe it is found as high as Iceland; and even in that fevere Plack。 climate lays from thirteen to nineteen eggs *. The American fpecies appears to be far lefs prolific. Found in the Ruffian empire, in the fame places with the Garganey.

EVIII. PELECAN*. Gen. Birds, XCIII.
505. Great. Pelecanus Onocratolus, Lin. Syf. 215.-Ediw. 92.-Ph. Tranfo Ixii. 419.

P.With a bill fifteen inches long, flat, dilated near the point, with a hook at the end, and a ridge from that to the bafe running along the middle; on the midway of the ridge rifes a bony procefs, an inch and feven tenths high, three inches broad at the bafe, and only two tenths of an inch thick. In fome are feveral leffer proceffes between this and the point: a vaft naked membranaceous pouch extends from the point of the lower mandible, widening gradually, and extending ten inches down the front of the neck: on the hind part of the head is a tuft of very narrow delicate feathers, not very difcernible, as they ufually lie flat: the reft of the head and neck is covered with moft exquifitely fine down, and very thick fet: the reft of the plumage white, except the primaries and: baftard wings, which are black: legs flefh-color. The largeft of web-footed Water-Fowl. Some are fuperior in Size to a Swan. One was killed off Majorca, which weighed twenty-five pounds. Their extent of wings from eleven to fifteen feet. Notwith?tanding their great bulk, they foar to a moft furprifing height. This is owing to the amazing lightnefs of the bones, which, all together, do not weigh a pound and a half. Add to this, the quantity of air with which its body is filled, which gives it a wonderful fpecific lightnefs.

One of the birds from which this defription was taken, was fhot at Augufa in Soutb Carolina, a hundred and fifty miles from the

\footnotetext{
- This genus, in the Br. Zool. is called by the more familiar name of Corvorant, there being none of the Pelecan fpecies in Britain.
}
fea. It agrees entirely with the Pelecan of the old continent, except in the bony proceffes on the bill. The other was fent, with other birds, from Hudjon's Bay, to the Royal Society. Inftead of the bony proceffes on the bill, was a tuft or fibrous fringe, fufficient to identify the fpecies. This fpecies extends over moft parts of the torrid zone, and many parts of the warmer temperate. Is found in Europe on the lower parts of the Danube, and in all parts of the Mediterranean fea, almoft all Africa, and Afa Minor. Are feen in in= credible numbers about the Black and Cafpian feas ; and come far up the rivers, and into the inland lakes of the Afiatic Ruffan empire; but grow fcarcer eaitward, and are feldom met with fo far north as the Sibirian lakes; yet are not unknown about that of Baikal. They are common on the coait of Nere Holland, where they grow to an enormous fize *. They feed upon fifh; which they take fometimes by plunging from a great height in the air, and feizing, like the Gannet: at other times, they fifh in concert, fiwimming in flocks, and forming a large circle in the great rivers, which they gradually contract, beating the water with their wings and feet, in order to drive the fifh into the center; which when they approach, they open their vaft mouths, and fill their pouches with their prey, then incline their bills, to empty the bag of the water; after which they fwim to fhore, and eat their booty in quiet. As the pouch is capable of holding a dozen quarts of water, a guefs may be made of the quantity of fifhes it can contain. The Frenclo very properly call them Grand-gofiers, or Great-tbroats. It is faid that when they make their nefts in the dry deferts, they carry the water to their young in their valt pouches, and that the lions and beafts of prey come there to quench their thirft, fparing the young, the caufe of this falutary provifion. Poffibly, on this account, the Egyptians ftyle this bird the Camel of the River; the Perfans, Tacab, or the Water-carrier.

```

Wil. Orn. 330--Pelecanus Graculus, Faun. Suec. No 146 .-Latbam, iii. -Lev. Mus.

```
P. With head and neck black, gloffed like filk with green: the
back and coverts of wings of the fame color, edged with purplifh black: belly dufky and dull; the middle cinereous: tail confifts of twelve feathers, dufky, gloffed with green : legs black: middle claw ferrated. Length two feet fix. Extent three feet eight. Welght four pounds.

Frequent in many parts of Great Britain. Found in Sweden, Norway, and Icelond.

> Br. Zool. No 2930 -Pelecanus Carvo, Haffs-tjader, Fauzo Suec. No 45-m 509. Corvorantio Latham, iii. -Lbvo.Mus.-BL. Mus.
P. With a narrow bill, hooked at the end : a fmall dilatable pouch under the chin; feathers at its bafe white, in the male: head and neck of a foozy blacknefs, fometimes ftreaked with white : coverts of wings, back, and fcapulars, deep green, edged with black, gloffed with blue : breaft and belly black: on the thighs of the male a. tuft of white : tail confifts of fourteen feathers, and is rounded. Weight feven pounds. Length three feet four. Extent fourfeet two.

Extends over all parts of the northern hemifphere, even to Grecsland, where it continues all the year. The natives ufe the jugular pouch as a bladder to float their darts after they are flung. The fkins. are ufed in cloathing; the fiem is eaten; but the eggs are fo fetid as to be rejected, even by the very Greenlanders.. There birds are taken either by darts on the water; by fnares dropt down the precipices, and placed before their haunts; or, in winter, they are taken while afleep upon the ice. Are found in all the temperate latitudes of: the Ruflian empire, and in immenfe numbers on the fhores of the Russian Empinzo Gafpian fea*. Reach.even to Kamtfchatka. I believe this to be the

\footnotetext{
* Extrads i. 164i-ii. 405.
}
the kind which the Cbinefe train for filhing. They keep numbers, which fit on the edge of their boats; and, on a fignal given, plunge under water, and bring up their prey, which they are unable to fwallow, by reafon of a ring placed by their mafters round their necks *.

Mrs. Blackburn received this fpecies from New Kork. There are great flocks in Carolina, efpecially in March and April, when the herrings run up the creeks; at which time they fit fifhing on the logs of wood which have fallen into the water \(\dagger\).
\[
\begin{aligned}
& \text { Br. Zool. ii. No 293.-Pelecanus Baffanus. Naut is, Jaen Von Gent. Faumo } \\

\section*{CRESTED CORVORANT.}
particularly, in numbers about Nerw Zealand and Nero Holland *. Captain Cook alfo faw them in his paffage from England to the Cape of Good Hope \(\dagger\), and remoter from land than they had been feen elfewhere. Among thofe obferved in the South Sea, is the variety called Sula + , with a few black feathers in the tail and among the fecondaries. Found not only on the Feroe illands, but on our coafts, one having been brought to me a few years ago, which had fallen down wearied with its flight. A moft ample account of the manners of the Gannet is given in the Br. Zool.

A. Crested Corvorant. Shag, Br. Zool. ii. No 292.-Eiatbam, iii.

Pelecanus Criftatus. Top-flarvc:Brunzich, No 123 .-Faun. Groenl. No 5.8.-Levy. Nevso. -BL. Mus.
P. With a narrow dufky bill, hooked at the end : irides fine green : on each fide of the head is a long tuft of dufky feathers reaching beyond the crown : head, neck, and lower part of the back, of a fine and gloffy green: the upper part of the back, and coverts of the wings of the fame colory edged with purplifh black: belly dukky: tail confifts of twelve feathers, dukky tinged with green. Length two feet three. Extent three feet fix. Weight three pounds three quarters.

Inhabits, in Great Britain, the vaft precipices about Holybead; Plíce. and is found in Norsoay, Iceland \(\|\), and in the fouth of Greenland ;
* Cook's Firft Voy. ii. 382.-iii. 439, 627. \(\quad+\) Cook's Voy. towards the South Pole, i. 10, 11. \(\ddagger\) Wil. Orn. 331. \|Olafen, ii, tab, xxxix. qI Feun. Groenl. \(\mathrm{N}^{\circ}{ }_{58}{ }^{8}\).
but in the latter is fcarce. The places which it inhabits are covered with its filthy excrements. The Greenlanders therefore call it Tingmingkpot, or the bird afficted with a loofenefs. It differs 'from the Shag in having a creft, and in being leffer. The Norweogians are well acquainted with both fpecies, and diftinguifh them by different names*. I have feen feveral of the Shags fhot among the Hebrides, but not one was crefted. On the authority of the northern naturalifts, I therefore §eparate them.

Bu Violet Corvorant. Pelecanus Violaceus, Pallas MS. Lifi.-Latham, iii.
P. With the body wholly black, gloffed with violet color.

SACE
Found about Kamtcibatka and the ifles.
C. Redfaced Corvorant. Ouril of the Kamtichatkans, Defcr. de la Kamtfibatkas 493.-Latbam, iii.
P. With a nender bill; upper mandible black; lower red : from
the bill to the eyes is a fpace covered with a blueifh red naked fkin : round each eye a white cutaneous circle : head crefted : head, neck, and middle of the back, of a deep gloffy green: on the fore part of the neck a few white nender feathers: fides of the back and fcapulars gloffed with purple: wings dufky: belly glofled with green: tail, confifting of twelve feathers only, is dufky: over each thigh is a tuft of white feathers: legs black. Length of one I meafured thirty-one inches. Steller compares its fize to that of a Goofe.
到ace. Inhabits the high precipices on the coafts of Kamifchatka. Is very flow in rifing; but when on wing, flies moft rapidly. Feeds on fifh. During night they fit in rows on the cliffs, and often in their fleep fall off; and become the prey of Arstic Foxes; who lie in
- Brunnigh, \(\mathrm{N}^{\circ}\) 121, 123.
wait for thefe birds, which are a favorite food of thofe animals. They lay in fune. Their eggs are green, and of the fize of thofe of a Hen. They are very bad tafted, and are not eafily drefled; yet are fo acceptable to the Kamtfcbatkans, that, at the hazard of their necks, they will climb to the moft dangerous places in fearch of them, and often fall and lofe their lives. They catch thefe birds with nets, in which they are entangled in the places where they reft. They are alfo caught in fnares, with a running noofe hung to the end of a pole, with which the fowlers creep quietly towards the birds, and fling it round their necks, and draw them up the rock. The reft of the flock are fo ftupid, that, notwith-flanding they fee the fate of their companions, they remain, fhaking their heads, on the fame fpot, till they are all taken. The flefh is exceffively hard and finewy. The Kamtfchatkans cook it after their fafhion, by putting the bird, without plucking or gutting, into a hole filled with fire; and when it is done enough, draw off the fkin, and make on it a favory repaft.

HAVING gone through the clafs of birds, let me remark, that there is the greateft probability, that numbers of thofe of Kamtfcbatka are common to North America; and that they pafs there the feafons of migration; but not having actual proof of their being found on the new continent, \(\overline{\mathrm{I}}\) am obliged to place them in the fe appendages to each genus. The time may come, when it will be found neceffary to remove them into the American fections. It is alfo likely, that numbers may feek a more fouthern retreat, and fock Japan and Cbina with their periodical flocks. I have done as much as the lights of my days have furnifhed me with. In fome remote age, when the Britifb offspring will have pervaded the whole of their vaft continent, or the defcendants of the hardy Ruffens colonized the weftern parts from their diftant Kamtfchatke, the road in future time to new
\[
-4 F \quad \text { conquefts: }
\]
conquefts : after, perhaps, bloody contefts between the progeny of Britons and Ruffine, about countries to which neither have any right; after the deaths of thoufands of clamants, and the extirpation of the poor natives by the fword, and new-imported difeafes, a quiet fettlement may take place, civilization enfue, and the arts of peace be cultivated: learning, the luxury of the foul, diffufe itfelf through the nation, and fome naturalift arife, who, with fpirit and abilities, may explore each boundary of the ocean which feparates the Afatic and American continents; may render certain what I can only fufpect; and, by his obfervations on the feathered tribe, their flights and migrations, give utility to mankind, in naval and œconomical operations, by auguries which the antients knew well to apply to the benefit of their fellow-creatures. He may, perhaps, fmile on the labors of the Arctic Zoologift (if by that time they are not quite obfolete); and, as the animate creation never changes her courfe, he may find much right; and, if he is endowed with a good heart, will candidly attribute the errors to mifinformation, or the common infirmity of human nature.

\section*{ADVERTISEMENT.}

EINCE the publication of the ArEitic Zoology, fo much new matter has been pointed out to me by friends, or occurred from my own thoughts or reading, as to furnifh me with materials for a Supplement. This I fend into the world in order to render the work as perfect as poffible; and, in cafe the public fhould call for a new edition, to take away caufe of complaint from the purchafers of the firt, of not being made partakers of any improvements fuch an edition might receive.

To enlarge the American Zoology as much as poffible, I have flung the Reptiles and the Fifhes of the northern part of that vaft continent into a fyftematic form; and, by permifion of Mr. Benjamin Wbite, have added, from the labors of the learned Fobn Reinhold Foirfier, the Catalogue of the animals of North America *. How fmall a part is this of the Zoology of our loft dominions! May what I have done be an inducement for fome learned native to refume the fubject! and I fhall without envy fee my trivial labors loft in the immenfity of new difcoveries. Vain thought! for ages mutt pafs, ere the neceffary perfection can be given, ere the animated nature which fills the fpace between the Atlantic and Pacific oceans can be inveltiryated. Ages muft pafs, before new colonization can puif its progrefs weftward: and even then, civilization, eafe, and luxury, muft take place,
ere thefe fudies, in which ufe and amufement are fo intimately blended. can be carried into full effect.

But in the interim, let the American philofopher do what is: in his power; let him fearch the ill-explored feas, lakes, rivers, and forefts, of his country; and his labors will be amply repayed. The tract between the Allegany or Appalacbiaiz chain and the ocean, will for theprefent be ample field for the moft adventurous naturalift. Let me entreat him to be expeditious, that \(I\) may have fome chance of receiving the pleafure of knowing that \(I\) could animate any one to thefe laudable purfuits. But my electrical fire is too weak to be felt at fuch a difance : I want the potent emanations of a Linnesus, which dart-from pole to pole. My faculty has been various : in a few inftances I may have been fortunate enough to have met with, at home and abroad, fome excellent conductors, which have caught and carried. on the impulfive ftroke; which have at left roufed natural hiftory from the palfied ftate into which it was falling, on the lofs of its illuftrious fupport.

I muft myfelf have been very negligent, in the moment I forgot an acknowlegement to the Reverend Mr. William Coxe, for the great fervices. he rendered to me by his various communications refpecting Rufia; and other northern countries: I hope he will receive this late refpect; with proper allowance for my forgetfulnefs.

Mr. Samuel Oedman of Wermdon, near Stockibolm, with the utmoft liberality, fpontaneoufly fent to me a number of valuable remarks on the quadrupeds and birds of Sweden, which the reader will receive the benefit of in the courfe of this work.

I muft thank the ingenious Mr. Lienten, late of Goettingen, and at prefent engagedias metallurgift in the vaft copper-works in my neigh-borhoods
borliood, for various fervices, in tranlating from the German feveral paffages which appear in the following pages.
I have been often reproached for not giving a map with the Arctic Zoology. I have now complied with the defire: and given two, engraven by that excellent artif Mr. William Palmer, the engraver of thofe in Captain Cook's laft voyage; and of an admirable map of the Americen and Afatic. part, formed by the nuch-lamented, the late Captain James King. Thefe maps have been the foundation of mine; with certain additions from that which illuftrates the voyage of Lord Mulgrave towards the north pole.. I have taken the liberty of making fome night alterations ; and have made the addition of feveral names, peculiarly adapted to the work they are defigned to explain.. The coaft from the lcy Cape to the mouth of the Copper Mine River, is layed down from imagination, and the fame from thence to Greenlond, except in a few places where it had been. flightly feen by navigators. A little to the eaft of the Copper Mine River, the fea is made to advance fomewhat more inland, on a conjecture of \(\mathrm{Mr}_{\mathrm{o}}\). Hearne's, that a river which falls into the Copper Mine River from the eaft, is much nearer to the fea than the mouth of the Copper River itfelf. I have been obliged to go far lower than lat. 60 , which I profefledly defigned to limit my northern enquiries: but had I, in my maps, rigidly adhered to that defign, I muft have omitted great part of America, the glorious field of the difcoveries of our immortal Cook. Thofe of the Ruffans are attended to, and nothing neglected that could fing light on the attempts. of this bufy age.

\section*{ARCTIC ZOOLOGY.}

IN my land travels I have never failed pointing out the places of Alaughter refulting from a ftrife for fuperiority between rival nations, or the luft of power in princes, or of gain in the mercantile world, or the want of due fubmiffion to lawful goverument in the people, or the madnefs of enthufiafm, or the pride of nations too often arifing from an unfortunate feries of fuccefles over neighbors deftined to flourifh in their turn. Providence feldom fails punifhing an abufe of its favors. Britain at this moment feels the fcourge, the juft chaftifement of its want of moderation.

I muft not overlook the great naval actions of our countrymen, which often LVO ftained our narrow feas with gore. Mention may be made in this page of the fierce conteft between the fleet of Philip de Valois, confifting of four hundred fhips manned with forty thoufand men, and that of Eward III. confifting of two hundred and fixty, commanded by the king in perfon. The action happened off Shys, in Yune 1340. Victory declared for the Engliß. The carnage of the enemy was prodigious, and chiefly owing to the number, fkill, and courage of the Englifh archers. Thirty thoufand were killed or drowned, and above two hundred and thirty of their largeft fhips taken: the lofs of the Englifh very inconfiderable. This fignal victory gave occafion to the noble of that monarch, by which he aflerted the dominion of the fea, and fovereignty of France. He appears completely armed in the middle of a fhip at fea; in his right hand is a fword, in the left a fhield, with the arms of England and France; the royal ftandard difplayed at the ftern*.

The obftinate contefts on the coafts of Holland, during the time of the Englifo commonwealth, and in the fucceeding reign of Cbarles II. were attended with torrents of the bravelt blood of both the contending nations. The Dutcb fought not merely for glory, or the fweets of commerce, but latterly pro aris et focis. Delenda eft Carthago was the maxim of one of Cbarles's minifters, which animated the Dutch to death or vietory. Naval fkill and defperate valour never were fo ftrongly exhibited by any people. The combatants often fought with fleets of eighty or a hundred line of battle fhips of a fide, furnifhed with every infernal engine which the fubtlety of an animated enemy could invent. The great De Witte, foldier and ftatefman, firf introduced chain fhot in the celebrated fight of four days, which ended in the defeat of the \(D_{\text {utch, }}\), on their own coaft, on Fune 4th, 1666, notwithftanding we fuffered fo greatly by its ravages among our rigging. The Dutch commanders were De Ruyter and Van Tromp, of different factions on fhore, and mortal enemies; at fea they thought only of their country. \(D_{e}\) Ruyter even faved his rival from the over-powering fire of the \(E_{n g} l i / h\); having a mind fuperior to the ruining of a party at home, at the expence of his country's welfare!!!
The elder Van Tromp, the glory of Holland, loft his life in a fierce engagement off the Texel, Fuly 29th, 1653 . Satiety of flaughter parted the combatants, and actual wearinefs. Van Tromp fell fword in hand, fhot through the heart, in the very inftant of encouraging his men to refift to the laft moment of their lives. This was afight of three days! this was the true period of obftinate contef.

A dreadful battle commenced off Leoffoff, in Suffolk, on Fune 3 d, 1665 , be. tween the \(D_{u t c h}\) under the command of Opdam, and the Englifh led by the duke of York, before a crown had deprived him of his courage: he fought with the trueft and moft perfevering bravery. The battle proved decifive. Opdam's fhip was blown up: three \(D u t c h\) admirals, befides him, were killed. - It is faid that the victory would have been more brilliant, but that during the night of purfuit, after the engagement, orders were pretended, in the duke's name, to flacken fail: they were unfortunately obeyed, and the total deffruction of the \(D_{\text {utch }}\) fleet prevented. This affair was ill enquired into: but not the left imputation fullied the character of his highnefs. We might be content with the victory. The Dutch loft thirty fhips: eight thoufand men were taken. We loft but one fhip, and had only eight hundred men killed or wounded. Many perfons of rank were flain on board our fleet. The earl of Falmouth, a worthlefs favorite, Lord Mufkerry, and Mr. Boyle, of the noble family of Burlington, were killed on the quarter
feck by one Chot; and the duke was covered with their gore, and even hurt by their fplinters. Fames Ley, earl of Marlborough, and Cbarles Wefon, earl of Portland, fell in the action: the veteran admiral Lawfon died foon after of his wounds.

On May 28th, 1672, a furprize of the duke of York by De Ruyter, in Southwould, alias Solebay, on the fame coaft, brought on a battle, fuftained on both fides with unparalleled valour and obftinacy. The Dutch had the difadvantage, but nothing decifive followed; yet the death of the earl of Sandwich, fecond in command, would have caft a gloom over the greateft victory. This nobleman poffeffed the higheft character of any of his time, for courage, abilities, munificence, and goodnefs. He fought in the Royal fames, of a hundred guns; flew Van Gbent, a Dutch admiral, and beat off his fhip; funk another great fhip; fent to the bottom two of the enemy's fire-fhips. Five hundred men (half of his crew) lay on the decks weltering in blood. A third fire-fhip fucceeding, this illuftrious hero was drowned in attempting to fave himfelf; and his fhip was blown up, with the remainder of his gallant companions. His body was found, and all due honors payed to it by his lamenting fovereign and grateful countrymen.

In the late fatal war, when Britain had all Europe to contend with, as fecret or open enemies, aiding the defection of its own long-foftered children, the Dutch drew on themfelves an indignation which perhaps it might have been prudent to fupprefs. The fates exerted their reliques of naval life; which emitted its laft fparks on Auguf 5th, 1781, off the Dogger Bank. Our gallant veteran, viceadmiral Hyde Parker, commanded our little fleet of fix hips of the line, oppofed to eight two-deckers commanded by admiral Zoutnan. The Dutch, difufed to arms for a long feries of years, collected their antient valour : neither the Britifb nor Belgic lion feemed to have degenerated: the Dutch loft one fhip of the line, fent to the bottom. The reft fought the fafety of the Texel, and never more sindicated the dominion of the fea.

In thofe feas off the coaft of Norfolk, Yumzes II. when duke of York, had the ill fortune to efcape fhipwreck, to have clofed a life of glory, and to have prevented the calamities which befel himfelf, his pofterity, and kingdoms, which a conduct of which he had begun to give fymptoms, brought upon them. In the fort of exile he was obliged to take to Scotland, on May 5th, 1682, his frigate ftruck on the Lemon and Ore. His Highnefs, with fome few, were preferved: feveral people of quality perifhed: Malevolence fays, that the duke called out to fave his dogs, his priefts, and his favorite, the lord, afterwards duke of, Marloorough. His Blighnefs certainly had not the gift of prefcience, or he would not have B2.
clafled,
clafed, in his faving orders, his Grace with the moft faithful of animals! The duke fhewed on this occafion his ufual intrepidity. A medal was ftruck of a finking fhip, with the motto, impavidum feriunt. The heroifm and loyalty of the common men who were left behind, had the fulleft clame to every honor. On feeing their popular and beloved commander out of danger, they gave three loud. cheers, and on the third funk exulting to the bottom.
4.

I propofe as examples of magnificent fcenery on the coaft of Scotland, Boddam caftle, Dunby head, and Finlater caftle, in the Reverend Mr. Cordiner's Views in Nortb Britain: the Bullers of Buchan, and the arched rock near to them; the perforated pyramid near Banff, and the infulated column off Caithnefs, in the fame gentleman's Letters on the Scenery and Antiquities of the North of Scotland.

The great Gaffendus obferved the aurora barealis, in 1621, near to Aix, in Provence \({ }^{*}\). But they had been long before feen in Greenland, and well defcribed by the author of the Speculum Regale; of whom we know no more than that he was a perfon of diftinction in the Norvegian court, about the latter end of the thirteenth, or beginning of the fourteenth century, and refided as far north as Helgeland.

In about lat. 53, I may draw a line from the North Sea to the oppofite part of the kingdom, which will comprehend a fmall part of the north of Norfolk, the greater part of Lincolnhire, Nottingham/birc, Derbybire, the moor-lands of Stafford/bire, all Cbefhire, Denbigh/hire, Finthbire, Caernarvonhire, and Anglefey. Beyond this line nature hath allotted to the northern part of thefe kingdoms certain plants, of which I am about to make an enumeration, which are rarely or never found to trangrefs that line to the fouth. Thofe which are neareft the fouth fhall be firft taken notice of.

Galeum boreale. Fl. Angl. i. 70. Fl. Scot. i. 1 I6 t.
Pulmonaria maritima.
Ribes alpinum.
Athamanta meum.
Juncus triglumis.

The following catalogue is of plants，which in our ifland feem to affect ftill more northern fituations，or I may fay are not found to the fouth of Yorkfhire；
and，refpecting Grect Britain，a few feem to be nearly local．
Cynofurus cæruleus．
Cornus herbacea．
Alchemilla alpina，

Primula farinofa.
Azalea procumbens. In Scotland only.
Selinum paluftre. Inclines to the fouthern part of this clafs.
Ligufticum Scoticum. Scotland only.
Sibbaldia procumbens. The fame.
Trientalis Europea.
Vaccinium uliginofum.
Pyrola fecunda.
Andromeda polyfolia.
Arbutus uva urfi. Not farther fouth than the woods near Hexbam; again not till we reach Peebles, Rofshire, and the ine of Skie.
alpina. In Scotland only.
Saxifraga cerpitofa.
Stellaria nemorum.
Cherleria fedoides. Breadalbane and Baikeval, in the ifle of Rum.
Sedum villofum.
Rubus faxatilis.
Dryas octopetala, Found in Scotland and Ireland only.
Actæa ficicata.
Gnaphalium fupinum. Omitted in the Flora Scotica, having been difcovered after the publication. In the north of Scotland.
Satyrium repens. In the north of \(S_{\text {cot }}\) land.
Ophrys corallorhiza, The fame.
cordata. York/bire, Lancafbire, ifle of Man, and Scottifb highlands.
Cypripedium calceolus. Near Ingleton and Clapham, in Yorkßirc.
Ericaulon decangulare. In the ifle of Skie only.
Betula nana. From Clydefdale to Rofsfire.
Pinus fylveftris. At prefent native only in the Scottib highlands.
It is to be remarked, that notwithftanding none of thefe plants are to be difcowered in Great Britain, fouth of the line above drawn; yet moft if not all of them are to be found in very fouthern latitudes on the continent. Numbers are inhabitants of Provence, and other warm provinces in France *. Is it owing to fimilitude of foil, or of expofure, in diffimilar climates, which fhould occafion in different places the production of the fame plants? Or what fhould forbid the growth of fimilar plants in places nearly contiguous, and occafion their appear-

\footnotetext{
* See Lanark's Flore Francoije。
}
ance almoft inftantly on a neighboring fpot? Without reminding one of the guef tion put by the wifeft of men on a like embarraffiment:
\(\mathrm{W}_{\text {HY }}\) fhould one earth, one clime, one ftream, one breath,
RAISE this to firength, and ficken that to death*?
Almoft every one of thefe plants is again found in a climate very oppofite to the mild provinces which border on the Mediterranean fea; for there is fcarcely one which I have enumerated which is not met with in Sweden, or in Lapland, and fome even in the diftant Iccland \(\dagger\).

The chimara monfrofa of Linnaus has been taken off the Schetland iflands about two years ago. It is a moft fingular fifh; and is common to thefe and the Norzvegian feas, where the Danes call it Solvebaen, and Hav-kat. It is found from the Sound to Drontbeim, perhaps Iceland, for the Icelanders have a name for it, Geirnyt. It grows to the length of two feet and a half. The reader will find it well figured in Mr. Afcanius's Icones, tab. xv. in the acta nidrofiana, if tab. 5, 6; and in Clufius's Exotics, 137. A drawing of that taken on our coafts, by my friend Mr. George Paton, of Edinburgh, was with his ufual kindnefs communicated to me.
A fine fpecimen of the Aferias caput medufa, Br. Zool. iv. \(\mathrm{N}^{\circ} 73\), was taken Oct. 1785 off Lumna, one of the Schetland ifles, and when frefh was of a moft vivid orange color. Mr. Paton.

The Afterias Equefris of Linneus, figured in Linckius, tab. xil. fig. 21, was lately difcovered by the Reverend Mr. Cordiner, in the fea near Banff. It confifted of five fhort thick rays. Thofe, and the upper part of the center, covered with large obtufe papille, longeft on the fides of the rays. The color deep brown. Its diameter, from the tip of one ray to that of another, nine inches.

Feroe has many fubfances in common with Iceland, which evince its having been vulcanic. The Honourable Cbarles Grevil, a gentleman not lefs diftinguifhed by his knowlege than his urbanity, thewed me fome very fine tuberofe calcedonies from thence, mixed with lava and \(t u f a\), and other calcedonies fratified. Likewife fome very beautiful zeolites, both cryftallized and fheafy.

I here introduce a very curious account of the eruption of fire in Ieeland, men8\%1\%

XL tioned in this page, tranflated from the Danifa account of Mr. Magnus Stephenfen, and communicated by the friendfhipof the ingenious Mr. Folm IVhiteburfo.

}

\section*{An Account of the Eruption of Fire in Iceland.}

U
 of the earth, in the weftern part of the province of Shaptarfiall, which increafed more and more until the irth. It was fog great that the inhabitants were under the neceflity of quitting their houfes, and lying at night in tents upon the open ground. All chis time there was obferved a continual froak or feam arifing out of the earth, in the northern and uninhabited parts of the country. Three fire-fpouts broke out, of which that in the north-weft was the greateft: one of thefe fpouts broke out in Ulfarfdal, a little to the eaft of the river Skapta; the other two were a little weft of the river Hwerfisfliôt. Thefe three fire fpouts, after they had rifen to a confiderable height in the air, were collected into one ftream, which rofe fo high as to be feen at the diftance of 34 miles*, and upwards. The whole country, for double that diftance all about, was continually covered with a thick fmoak and feam not to be defcribed.

The 8th of \(\mathcal{F}\) une gave fufficient notice of the above-mentioned fire fpouts breaking out, for upon that day the fire became vifible. It was mixed with prodigious quantitics of brimftone, fand, pumice-fones, and afhes, which, being thrown up with great force, noife, and fhaking of the earth, were fcattered in the neighborhood of the fpouts; and a part of them being blown about by the wind (which at that time was very high) all over the country, fell in the fields, villages, and towns, at a confiderable diftance. The whole atmofiphere was filled with fand, duft, and brimftone, fo thick as to occafion a continual darknefs. The pumice which fell in the villages, being red hot, did confiderable damage. Along with the pumice fones there fell a great quantity of a dirty fubftance like pitch, rolled up fometimes in the form of fmall balls, and fometimes like rings or garlands. The falling of thefe hot fubfances was attended with great mifchief, as they totally deftroyed all manner of vegetation that they came near.

Upon the third day of this dreadful fhower, the fire became very vifible, and came out fometimes in a continued ftream, and fometimes in flafhes or flames, which were feen at the diftance of 30 or 40 miles, accompanied at the fame time with a noife like thunder: this continued the whole fummer. Upon the fame day that the fire firft broke out, there fell a very great quantity of rain in all shat neighborhood, which did almoft as much harm as the fire; inafmuch as

\footnotetext{
* The reader will obferve, that the difances mentioned here are in the meafure of Danifb miles, twelve of which make one degree; fo that each Danifla mile is nearly five and three quar. cars of our fatute miles.
}
the great quantity of cold water, that ran in vaft flreams upon the hot ground, tore up the earth in large cakes, and carried it down into the lower fituations: befides, the water of this rain was flrongly impregnated with falts of differen \({ }_{t}\) kinds, and fulphur, which it had acquired in falling through the immenfe cloud of fmoak before defcribed; and was fo fharp and poifonous as to occafion a confiderable fmarting, if it fell either upon the hands or face. At a greater diftance from the fire there was a great coldnefs in the atmofphere; and in fome places there was a very heavy fall of fnow, fo that it lay upon level ground about three feet deep; in others fo great a quantity of hail, as to do very confiderable damage to the cattle, and every thing that was out. The grafs, and all manner of vegetables, which were already fcorched by the heat, fand, and pumice ftones, were covered over with a thick cruft of brimftone and footy matter. The great heat of the freaming fire, meeting with fo large a body of water, occafioned fuch a vapour and fteam in the air, as to darken the fun, which appeared like blood *, and the whole face of nature feemed to be changed. This lafted feveral days, the fand and pumice ftones deftroying all the crops that were upon the ground, the moment that they fell burning up every thing that they touched : the whole country was laid wafte, the cattle dying for want of food; and the furviving or efcaping inhabitants flying from the horrid fcene, betook themfelves to other parts of the country, where they might hope for fafety, and left all their flock and goods a prey to the outrages of there two turbulent elements.

When the firc firft broke out, there was a very confiderable increafe of water in the river Skapta, upon the eaft fide of which one of the fire fpouts was fituated, as was mentioned above: a fimilar overflow of water was obferved, at the fame time, in the great river Piorfa, which runs into the fea a little to the eaftward of the town Orebakke, and into which the river Tuna, after having run through a large tract of barren and uninhabited land, empties itfelf.

Upon the in th of \(\mathcal{F}\) une the river Skapta was totally dried up in lefs than twentyfour hours, and the day following a prodigious ftream of liquid and red hot lava, which the fire fpout had difcharged, ran down the channel of it, which is very deep, having large rocks and high banks on each fide, the whole length of its courfe. This ftream of lava not only filled the deep channel above mentioned, but overflowing the banks of it, fpread itfelf over the whole valley, covering all the low grounds in its neighborhood; and not having any fufficient outlet to empty itfelf by, it rofe to a very great height, and over-ran all the neighboring country, infinuating itfelf between the hills, and covering fome of the lower ones. The hills here are not continued in a long chain or feries, but are fepa-
* In the fame fummer the fun had a fimilar appearance in Great Britain, and the fame ob. feurity of air rejgred in molt parts of our illand.
sated from one another, and detached; and between them run little rivulets or brooks: fo that, befides filling up the whole of the valley in which the river Skapta ran, the fiery fream fpread itfelf for a confiderable diftance on each fide, getting vent between the above-mentioned hills, and laying all the neighboring country under fire. The fiery lake, getting frefh and greater fupplies from the fpouts, now ran up the courfe of the river, and overflowed all the lower grounds above; and, as it proceeded upwards; it.dried the river, until the ftream was ftopped againft the fide of the hill from whence the river takes its rife. The lava now rofe to a prodigious height, and the fiery lake overflowed all the village of. Buland; the church, houfes, and every thing in its way being confumed : thofe who knew the fituation of this village, upon what high ground it ftands; would be aftonifhed to think that it could have been overflowed. Two other farm houfes in the fame parifh of Buland, at about a mile and an half from the village, northward, were likewife deftroyed, and three lives loft in both of them. The whole of this parifh, which was highly cultivated land, is now totally demolifhed. The fiery lake ftill increafing, and fpreading itfelf out in length and breadth, overflowed all the country for fix miles in width. When all this tract of land was converted into a fea of fire, the lava ftretched itfelf towards the fouth; and getting vent through the channel of the river Skapta, down which it rufhed with great impetuofity (being confined within the narrow compafs between the high: banks before defcribed, for about a mile) it came into a more open place, where it goured itfelf forth in prodigious torrents with amazing velocity and force; fpreading itfelf now towards the fouth, tearing up the earth, and carrying along with it on its furface flaming woods, and whatfoever it met with: in its courfe it laid wafte another large diftrict of land. The ground wherever it came was broke and cracked, and emitted large quantities of fmoak and ffeam long before the fire reached it; fo great was the heat : and every thing near the edge of the fiery lake was either burnt up, or reduced to a fluid ftate. In this fituation matters remained from the 12 th of \(\mathcal{F}\) une till the \(\mathrm{I}^{\text {th }}\) of Auguff. The fiery lake now no longer fpread itfelf, but remained burning neverthelefs; and when any part of thefurface by cooling was crufted over, the fire from below broke the cruft, which tumbling amongft the melted fubftance, was rolled and toffed about with a prodigious noife and crackling; and in many parts of its furface fmall fpouts, or at left ebullitions, were formed, which continued for fome length of time.

The river Skapta, that we have talked fo much about, is fituated on the north and north-weff fides of the province of Sidu; it takes its rife in the north-eaft, and running firft weftward, it turns to the fouth, and falls into the fea in a fouth-eaft direction. The confined part of its channel, that we have before made mention of \({ }_{3}\) is an unintersupted ftretch of about four miles in length; being in fome places

200 fathoms deep (as in the neighborhood of Swartanup, where the river cuts through a hill), in others 150 or 100; and in fome parts 100 , in others 50,40, and 30 fathoms broad. Along the whole of this part of its courfe the river is very rapid, though there are no confiderable cataracts or falls above two feet each. There are feveral other fuch confined channels as this in other parts of Iceland, but this is the greateft and moft confiderable in all its dimenfions. This channel was filled to the brink, and from thence the lava fpread itfelf over the village Skaptardal, confumed the houfes and every thing in its way, and deffroyed the woods and meadow lands: this place is fituated on the eaft of the river, upon a rifing ground. The ftream then went forwards to the fouth, by the village marked \(A\), which is at the fouth end of the narroweft part of the channel, and ftretched itfelf between two hills to the eaft. The whole of this village, with all its meadow and wood lands, was alfo totally deftroyed. Upon the 12th of fune, the lava having ruat through the narrow part of the channel, and obtained an outlet, it ftretched itfelf out in breadth towards the fouth-weft, as far as the eaft fide of the hills in the province Skaptartunga; and alfo to the weft fide of Sidu, and the fouth-weft of Medalland to wards the eaf. Juft as the lava begun to overflow this flat country, and had got out of the channel of the river, the perpendicular height of its edge was 70 fathons. Proceeding now fouthwards, the lava deftroyed the church and town of Skal, and all the neighboring grounds: in this place a prodigious noife was heard when the lava overipread the low lands, and noifes like thunder have continued ever fince, till the 12 th of \(A u g u f\). It then came to the village of \(S_{\text {wina }}\) dalur, which lies in a fouth-weft direction from Skal; and having with a corner deffroyed that, it was ffretched out farther to the weft, and over-ran the village of Hvammar, which ftands on a pretty high rifing ground on the weft fide of the river; but before the fire had reached thefe two villages, they were both overflowed with the water that had been turned out of its courfe, by the lava damming up the river when it firft came into the channcl. Procceding forward, the lava overflowed the village \(N e z\), and all the grounds belonging to it: from thence it came to Villungar, and turning more fouthwardly, came near to the village Leilvôlla; a little to the north of which, after having deftroyed a great quantity of grafs land and wood, it entered into the channel of the great river Kudafiot ; and kept a fouth courfe along the eaft fide of it till it came down near to the village of Hraun, where this branch fopped. A little above the place where this arm went into the channel of the river Kudafiot, a corner of the lava fretched itfelf out to the fouth-eaft, and came to a place called Eyfribrun, eaft of Hraun. From Skal, which we mentioned jut now, the lava taking an eaftward direction,
ran by the fide of a hill called Holtfiall, and deftroyed the village Holts, which ftood upon a fine level ground, and was furrounded with very rich corn and pafture land. Proceeding eaflward, it came to a village called Heid; and deftroying a quantity of meadow land and wood belonging to that village, it went on down the river Skapta, between the two hills Heilderflapa and Dalberftapa, which lie on each fide of the river, and deftroyed the villages Hunkabakke, Holmur, and Dalbcar; and proceeded on eaftward towards the village Nyibear, within a hundred yards of which it ftopped. In this courfe there is a very great cataraet of the river Skapta, about 14 fathoms high, where the lava falling down, was thrown about, together with the ftones which it tore up, to a very confiderable diftance. From Dalbear the ftream of lava went fouthward, over that large tract of land called Hrauns-melar, quite down to Efrifteins-myri, the edge of it to the eaft paffing by Lutandabals, Lutandafit, and Rofa. In paffing over this broad tract of land the fire did confiderable damage, for the whole was good and rich meadow and pafture land. The ftream of lava went within 30 fathoms of Efrifteins-myri, on the weft; and falling into the channel of the river Steins-myrifiot, which is among the larger ones, it filled the whole valley between Efrifeins-myri and Sydrifeinsmyri, going on in an eaftward direction : thefe two villages are totally deftroyed \(y_{y}\) although the edge of fire only approached within 100 fathoms of them. The main body of the lava from this place went in a fouth-weft direction, and came to the village Hnaufer; which, although it was not deftroyed by the fire, yet was overflowed by the water of the two rivers Steins-myrifitiot and Fegdaquif being dammed: up. Here the lava ftopped on the fouth; and its edge goes all the way from Eyftribrun before mentioned, north of Stadarbolt, to Strandarbolt. In this neighborhood the lava deftroyed five villages; namely, Holmafel, with its church; Botna, Holma, Efrifiồta, and Sydrifliôta; befides a great quantity of corn and meadow. lands, with woods and other property belonging to the villages fouthward.

The fpouts ftill continuing to fend forth immenfe quantities of frefh lava, and all the paffage to the fouth or low lands being fhut up, the lava fpread itfelf to the north and north-eaft, over a tract of land eight miles long and fix broad. All this place is barren and uninhabited, fo that no obfervations were made how the fiery fiream proceeded; all weknow is, that it dried up the rivers Tuna and \(A x a f y r d i\), The lava, on account of the high hills on the eaft of Hwerfisfiot, could proceed no farther in an eaftward direftion; for thefe hills form a continued chain for three miles in length, running in a direction north and fouth. There was then no other outlet for the' lava than the channel of the river Hwerfisfiöt : this branch broke out from the main bedy about a quarter of a mile north of 1 tridalur and Wy/ridolur, two villages fituated oppofite to each other, on each fide of the river:
the lava running between thefe two villages, followed the courfe of the river, and paffed between two others, Therna and Selialand, about a mile lower down; coming then into an open and level ground, it fpread itfelf out, and formed a fmall lake of fire, about two miles long and one broad; lying in a direstion a little weftwardly from the fouth. The only damage done by this branch was the de, ftruction of the corn and grafs land, and fome wood; no villages having fuffered. Upon the 16th of Auguf this branch fiopped.
It appears then, from the whole, that the utmoft extent of the ground covered with lava, and making the appearance of a fiery lake; was fifteen miles long, and feven broad, in its utmoft extent. The edge of it, reckoning all that part fouth of Buland, with ail its inequalities on the fouth fide, is upwards of thirty miles long; what it may be on the north is not known, as nobody chufes to venture himfelf near that part as yet. The perpendicular height of the edge is from 16 to 20 fathoms, fo that wherever it came it covered every village it met with, as well as feveral hills; and thore which, on account of their great height, it did not cover, were melted down by it, fo that the whole furface was in a fluid ftate, and formed a lake of fire, in appearance like red hot melted metal.
The whole number of villages totally deftroyed are 20 or 21, ether by the fireor the water overflowing them. About 34 are very materially hurt, having their lands and woods burnt up; but moft of them may be furnifhed with frefh. ground being taken up in their refpective neighborhoods. Befides villages, there are feven parifh churches and two chapels defroyed. In the whole there were 220 lives loft by the fire, and 21 by water. The rivers that were dried up are twelve; namely, Tuna, Axafaydi, Hwerfisfiôt, Skapta, Steins-myrifiốt, Landla, Melquif, Green-laekur, Tungu-laeker, Fedaquif, Kararvikar/b-urdur, and Hraunfä.

Befides this immenfe fire, there happened two other circumftances that are equally wonderful. Two iflands have been thrown up. One of theie was thrown up in the month of February 1784, where there was before upwards of 100 fathoms deep water; it lies about fixteen miles from the land, fouth-weft from \(\mathrm{Rei}_{\mathrm{i}}\) kianefe in Iceland, and about eight miles from the clufter of inlands called Gierfugla. By the laft accounts this ifland continued burning with great vehemence, and fent forth prodigious quantities of pumice, fand, and other matters \({ }_{2}\) fimilar to other burning mountains. The ifland is fomewhat above half a mile in circumference, and full as high as the mountain Efian in Eceland. The other ifland which has been thrown up, is at a greater diftance from Iceland to the north . weft, lying between Iceland and Greenland: it has burnt without intermiffion, day. and night, for a confiderable time, like the other; is very high, and larger in cir-. cumference than the other.

We have alfo fome very indubitable accounts, partly by the relation of failors, and partly by letters from Trondbeim in Norway, that before the fire broke out in Iceland, there was a very remarkable eruption in the uninhabited parts of Greenland; and that in the northern parts of Norway, oppofite to Greenland, the fire was vifible a vaft while. Thefe accounts were ftrengthened by a letter from Iceland, bearing date the 2 If of September; which fays, that when the wind was north there fell a great quantity of afhes, pumice, and brimAtone, upon the north and weft coafts of Iceland; and that this continued for the whole fummer, whenever the wind was in that quarter; and that the air was always very ftrongly impregnated with a brimftone fmell, and thick fmoak.

But to return to Iceland. Ever fince the firft breaking out of the eruption, the whole atmofphere has been loaded with finoak, fteam, and fulphureous vapours. The fun became at times wholly invifible, and, when it could be feen, was of a reddinh or bloody colour. The fifheries are moft of them deftroyed; for the banks where the fifh ufed to be, are fo fhifted and changed, as not to be known again by the fifherment ; and the fmoak fo thick, as to prevent them from going far out to fea, for there is no feeing any object at above the diftance of fifty fathom. The water of the rain falling through this finoak and fteam, is fo impregnated with falt and brimftone, as to deftroy the hair, and even the \(\mathbb{1 k i n}\), of the cattle; and all the grafs in the whole ifland is fo covered with the footy and pitchy matter before defcribed, that the moft of it is deftroyed, and what is left is fure poifon for any cattle that eat of it; fo that thofe which have efcaped the fire are now dying for want of food, or poifoned by the unwholefome remains of the vegetables. Nor are the inhabitants, in many refpects, more free from dangers than the cattle. Many have loft their lives by the poifonous quality of the fmoak and fleam of which the whole atmofiphere confifted; particularly old people, and fuch as had any weaknefs or complaint of the breaft and lungs.

During the fall of the fharp rain which we have before made mention of, there was obferved at Trondheim, and at other places in Norway, and alio at Faroe, an uncommon fall of fharp and falt rain, which was fo penetrating that it totally deftroyed the leaves of the trees, and every vegetable it fell upon, by forching them up, and caufing them to wither. At Faroe there fell a confiderable quantity of afhes, fand, pumice, and brimftone, which covered the whole furface of the ground whenever the wind blew from Iceland; and the diftance between thefe two places is at leaft eighty miles. Ships that were failing between Copenbagen and Norway were frequently covered with afhes and brimRone, which ftuck to the fails, mafts, and decks, befmearing them all over

\section*{ICELAND.}
with a black and pitchy matter. Many parts of Holland, Germany, and other countries in the north, obferved a brimftone vapour in the air, accompanied withr a thick frnoak; and there fell in fome places a light grey-colored fubftance upon the earth every night, which, by its yielding a blueifh flame when thrown on the fire, evidently appeared to be fulphureous: upon thofe nights in which this fubtance fell in any quantity, there was obferved to be little or no fall of dew. Thefe appearances continued more or lefs all the months of \(\mathfrak{f u l y}\), Auguf \(f_{\text {, and }}\) September.

A more particular account of thefe appearances, and the periods when they were obferved, are publifhed in the Berlin Advertifer, No. 96, 1783, and the following numbers, in fome of which there is a very accurate account of the two iflands that were thrown up; but I have not feen them.

I fhall conclude with giving you a catalogue of all the known eruptions in. Iseland.

By the great map of Iceland, made by the direction of the king of \(D_{\text {enmark, }}\) and completed in 1734 , by Cnopf, military furveyor, it appears that fome of the jokkuls, or mountains, cafed with ice, have been fwallowed up by the convulfions of the earth, in very diftant periods. Thofe of Breida-merkar and Skeida, in Skaftafield Sy/fel, are given as inftances.

Probably the great vatns, or lakes, with which Iceland abounds, may have been once the fite of fuch finkings of mountains. The ingenious friend to whom I am indebted for the preceding tranfations, records feveral inftances in other parts
of the world *. In the ifland in quention, that vaft lake Myvatn may have been one; its bottom is entirely formed of lava, divided by deep cracks, which give fhelter during winter to the abundance of trouts this lake is flocked with. It is only five fathoms deep, but originally was of a vaft depth. In 1728 it was nearly filled by an eruption of the great mountain Krafle: the fiery fream took its courfe toward Myvatn, ran into it with a horrible crackling and hiffing; and this phænomenor continued till 1730 , when it ceafed, being by that time exhaufted.

The mountains of Iceland are of two kinds, primitive and pofterior; the firft confift of ftrata, ufually regulariy, but fometimes confufed, laid on each other. They are formed of different forts of ftone, without the left fymptom of fire. Some are compofed of different forts of faxum arenarium, or fand, or free fone; petrofilex, or chert, flaty or fiffile flone, and various kinds of earths, and boles, and featitce; different forts of breccia, or conglutinated ftones; jafpers of different kinds; refracting fpatbum, or what is ufually called Iccland cryftal; the common rhomboid \(f\) pathum ; chalcedonies ftratifed, and botryoid; zeolites of the moff elegant kinds; chryftals, and various other fubftances that have no relation to vulcanoes. Thefe primitive mountains are the jokkuls or ice mountains, and are of fuperior height to the others.
The higheft is reckoned rather more than a thoufand fathoms high. This is AFfian, or Rios, which confifts of great and irregular rocks of a dark grey color, piled on each other.
The centrical height of the Enneberg is five hundred fathoms; of the Snafiald Tokkul, is about two thoufand two hundred and eighty-feven yards; of the Sncefalds nes, or promontory of Snafiald, is from three to four hundred fathoms. Thing/man-beide, and Thor/keforde-beide, are rocks very unequal in height; thofe which have been meafured are from two to three hundred fathomis, and others are full five hundred fathoms high; and the two Eifberges are to the eye much higher.

Hornftrand, or the coalt by the north cape nord, is very high ; from three to four hundred fathoms. The fine rocks of Drango are moft picturefque ftacks, feven in number, of a pyramidal fhape, rifing out of the fea at a fmall diflance from the cliffs; four are of a vaft height, and form a moft magnificent fcenery.

The Snafiald is a mountain of great height; its outkirts confift of enormous rocks piled upon others. Eaftward begins the Eijorge, foaring to a vaft and lofty point. Many parts of this mountain have felt the effects of fire: in fome of the melted rocks are large cavities. Buda-klettur, a rock at one end of this mountain, is alfo vulcanic, and has in it a great cavern hung with falactita.
* Wbitehur \(\beta\) on the Earth, fecond edit. 7T, 72n

D
Solvakamar

Solvabamar is a tremendous range of vulcanic rocks, compofed entirely of hags, and covered in the feafon with fea fowl. It is endlefs to name all the places which bear the marks of fire, in various forms, either by being vitrified, changed. to a fiery color, ragged, and black; or bear the marks of having run in a fmooth Aoping courfe for miles to the fea, and hardened into memorials of the horrible: phænomenon.

The inand produces molt forts of the lava which other vulcanic places have shrown up; the dark grey perforated kind, fimilar to the toadfone of Derbybire; the Iceland agate, or pumex vitreus, both the niger and viridis: fome have conjectured this to have been the lapis obfedianus of the antients, which they formed into flatues*. The fineft I ever faw was brought from \(V\) ulcano, off the coaft of Sicily, but it feems very ill calculated for fculpture. The pumex vulcani is alfo found here, the cinerarius, and the arenaceus. Befides the futurbrand, jet is found here in quantity.

Certain iron ores are found in different parts; and that elegant copper ore, the malachites, with a naturally polifhed green furface rifing into tubera, is not unfrequent. Horrebow fpeaks of native filver; but the mineral wealth of the ifland will probably be long latent. The flavery under which the poor natives labor, will ever difcourage from effecting a difcovery, of which others are to reap theadvantage.

A ftratum of fulphur is found near Myvatn, from nine inches to two feet in thicknefs; it is partly of a lemon colour, and partly of a deep orange. Immediately over the fulphur is a blue earth; above that a vitriolic and aluminous earth; and beneath the fulphur a firatum of reddifh bole. This fulphur has been worked and refined by the commercial company of Copenbagen. Semipellucid, and I think genuine native fulphurs, are unknown in Iceland.

Basaltes, in variety of forms or degrees of cryftallization, are found in many parts of Iceland, from a cracked furface, to a completion of the columnar fhape.

Hueravalle is fpoken of by Ollaffen as the moft furprifing collection of boiling water, or jet d'eaux, in the ifland. The mountain grafs grows in plenty near them ; and not far from the burning bugel, or tumulus, formed round one of thefe jets, is a lake in which fwans were fwimming; and in a fmall fpring were feveral trouts: fo near to each other is the cold and the boiling water. Eaftward and fouthward are great tracts of Kiol-braun, or tracts covered with vaft maffes of lawa. Hueravalle takes its name from buerfwa, to whirl round; wadirbwirfel
, Plinii Hift, Nat, lib, xxxys, c, xxva,
- Fignifies a whirlwind, and wattanwirfel a whirlpool *. Among the many fprings near Skallbolt, which are called quallen, two are very particular: one is on the weff fide, the other on the eaft fide: the Icelanders boil their milk, and drefs their meat, by their affiftance; and they ufe them alfo for wahing and fulling. They even calcine with them the dry bones of oxen or fheep.

The burning fountains have been taken notice of ( p .146 .) by the author of the Speculum Regale.

The fame author contends ftrongly, that Hecla ought to have the honor of being the feat of the damned, in oppofition to 厌tna; which he clearly proves by thefe arguments: ' De flammis Etncis famâ percepi quod admodum furent; ' hæ vero et lignum comburunt et tepram. Jam in Dialogo fancti Gregoris ' perhibetur in Sicilia, igneque ibidem ardente, pœenarum locum effe; in igne - vero, qui in Islandia flagrat, multo majore verifimilitudine concludi poffe reor ' certum pœenarum locum effe. Ignis enim Siciline, cum terram et ligna confu-- mat, vivas res fibi in alimentum convertit : lignum quippe vitam habet, utpote ' quod crefcat, virentiaque folia emittat; ac tandem mori incipiens, flaccefcat \({ }^{6}\) et arefcat : quamdiu autem viret, vivum dici meretur; et ubi flaccefcit, in extremis 6 agere. Vitam autem terra non de nihilo tribues, cum infignem fructuum co' piam proferat, quibus decidentibus et putrefactis, novos iterum fructus produ-- cit ; neque minus eapropter vivere dicenda eft, quod ex ipfa factæ fint omnes ' creature corporex. Horum utrumque, lignum nempe et terram, ignis Sicilife - comburit, iifque alitur. Ignis autem Islandire ligna terramve, quamvis ' in eum conjiciantur, non comburit; lapides autem et duriffima faxa, ut fuum ' alimentum, confumit, iifque nutritur non fecus ac ignis communis aridis lignis. - Nec tam dura cautes aut lapis invenitur, quin ceræ ad inftar liquefcant, ac - deinde, pinguis olei more, flammam concipiant ; ligna vero injecta dictus ignis - exterius tantum adurit, penitus nunquam confumit. Iccirco quoniam bic ignis - inanimatis folum creaturis, cujufmodi lapides et faxa effe novimus, amat accendi, - et rebus, qua a communi igne folent confumi, nutriri recufat, mortuus jure 6 dici meretur ; ideoque de ipfo, potius quarn aliis, verifimiliter concluditur, quod ' fit ignis infernalis, cum mortuæ fint omnes res quas infernus habet,'
There is at prefent a revival of the cod fifhery on the coaft of Iceland, from cur kingdom. About a dozen veffels have of late failed from the ine of Thanet, and a few from other parts of Great Britain. They are either floops or brigs, from fifty to eighty tons burden. A lugfail boat, fuch as is ufed in the herring fifhery, failed laft feafon from Yarmouth, thus equipped: The crew confifted of five men from the town, and five more were taken in at the Orknies. They had

\footnotetext{
* Ibre Glof. Sueogoth. 395.
}

D 2
twelve
twelve lines, of a hundred and twenty fathoms each, and two or three hundred hooks; fix heading knives, twelve gutting, and twelve fplitting knives. They take in eighteen tons of falt at Leith, at the rate of three tons to every thoufand fifh, of which fix or feven thoufand is a load for a veffel of this kind. They go to fea about the middle of April; return by the Orknies, to land the men; and get into their port in the latter end of Auguf \(\ell\), or beginning of September.

Pytheas fays, that Iceland lay fix days failing from Great Britain. A veffel from Tarmouth was, in the laft year, exactly that time in its voyage from the Orknies to Iceland. With a fair wind, it might be performed in far lefs time; but the winds about the Feroe inles are generally changeable.

The coaft of Embden is noted for the place on which commences the great turbot fifhery, which fupplies the market of our capital. It begins very early in April. The fifh come to the ground from the north, and move progreffively fouthward. Towards the latter end of April the fifhermen lay their long lines on the coaft of Holland; and towards the latter end of May they go on the Flemifo ceafts, and continue till the latter end of Auguft; about which time the turbots fpread, and are caught almoft half channel over. They extend even to our northern coafts, but not in numbers fufficient to encourage a ftationary fifbery. The Dutch draw from us large fums, honorably indeed; but the produce of their fihheries is in the hands of a few of our falefmen, who by help of what are called foreboats, which lie in the falt water off Gravefend, bring up to the London market juft the quantity of the fifh which they judge will be wanted; and by thofe means keep up the price, to the great injury of both rich and poor: the reft is fuffered to be fpoiled; and what might fill the hungry is flung over-board by the cruel monopolizers. Moft of the plaife fold in the metropolis are alfo bought from the \(D_{u t c h o}\) It is cufomary for our people to purchafe thefe fifh at fea: but the Dutch themfelves bring the turbots to Gravefend. It is computed that they annually import about eighty thoufand in the feafon, which continues from April to Auguft. The fifn with which the market is fupplied from November to March, is conveyed by land from Batb and Brifol. This may be hereafter treated of. The Dutch employ in their fifhery about fifty veffels, at an average burden of fixty tons. Had the act for taxing the tonnage of thefe veffels paft, it would have amounted to an exclufion. There is great reafon to believe that our own coafts would not have furnifhed turbots fufficient to anfwer the demands of the luxury of the times; the markets would have been worle fupplied; and the power of monopolizing increafed manyfold, by leffening the number of fifhermen. Thofe of Great Britain have every fea, in which they may by the law of nations fifh, open to
them. The proper bait may be purchafed at home; and provided we have fufficient quantity of fifh on our coafts, and exert ourfelves with the œeconomy and induftry of the \(D\) utch, we need never fear being rivalled by them.
The bait for thefe fifh is the leffer lamprey of the Br. Zool. vol, iii. No. 2; the petromyzon fuviatilis of Linseus. This is a fmall fifh, yet of great importance; it is taken in amazing quantities between Batterfea Reach and Taplow mills, a fpace of about fifty miles, and fold to the Duttch for the cod and other fifheries: 400,000 have been fold in one feafon for the purpofe. The price has been forty fhillings the thoufand: this year the \(D_{u t c h}\) have given three pounds, and the Englifh from five to eight pounds; the former having prudently contracted for three years at a certain price. Formerly the Thames has furnifhed from a million to twelve hundred thoufand annually*. An attempt was lately made in parlement to fling the turbot fifhery entirely into Britijh hands, by laying ten hillings a ton duty on every foreign veffel importing turbot into Great Britain : but the plan was found to be derived from felfif motives, and even on a national injuftice; the far greater quantity of turbots being difcovered to be taken on the coafts of Holland and Flanders, from whence the Dutch are fuppofed to import annually to the London markets about 80,000 fifh.

In the prefent century it has been proved by experiments, that the Baltis has an under-current like the ftreights of Gibraltar. An able feaman, belonging to one of our frigates, went in a pinnace to the middle of the channel, and was violently hurried away by the current : foon after he funk a bucket, with a large ball in it, to a certain depth, which gave a check to the boat's motion; and finking it fill lower and lower, was driven a-head to windward againft the upper ftream, which had been forced through the found by fome ftrong gale. The current aloft was not above four or five feet deep; and the lower the bucket was funk, he found the under ftream the ftronger \(t\).

The herrings frequented the Livonion and Courland fhores in equal multitudes, till the year 1313, when they drew near thofe of Denmark \(\ddagger\). They deferted the Baltic for fome centuries, but in 1753 began again to make their appearance on the \(\&\) wediff coaft, and are caught among the rocks and ifles (none at fea) from Gottenbourg to Stromftad, a fpace of thirty-five leagues; and none farther north or fouth. In the beginning of the fifhery they appeared about the end of \(\begin{gathered}\text { fuly } \\ y\end{gathered}\)

\footnotetext{
* See thefe, and many other curious particulars, in the Reports of the Committees for our Fifleries, 1786.
t fames's Hiat, Gibraltar, I, 233. I Anderfan's Dict. Comm. I. 102. 152.
}
or the beginning of Auguf, but have gradually altered their feafon, and of late are feldom feen before the beginning of November; neither are they fo fat as when they appeared early. In \(\mathbf{1 7 8 1}^{1}, \mathbf{1} 36,649\) barrels of falted herrings were exported to different parts of the Baltic and eaft fea, the Madeira, and \(W_{e} /\) Indias, and France, and the Mediterranean; befides 14,542 barrels of herring oil : but the oil is of very inferior quality to that of whale or liver oil. Formerly the Swedes, fent great quantities of herrings to Cork, from whence they were refhipped to the \(W_{e f \text { I }}\) Indias \({ }^{*}\). This part of the trade has entirely ceafed. Poffibly thefe new fifheries may have operated with other caufes, to leffen thofe of Great Britain; but I am informed that thefe capricious fifh begin already to appear in the Baltic in far lefs quantities than ufual.
exr. - But Sweden exceeds us in the number of frefh water filhes. Befides the leffer, and pride lampries, the rel, the barbot, bullbead, perch, ruffe, three-fpined and ten-fpined fickleback, the locbe, or cobitis trenia, lately difcovered in the Trent; the trout, cbar, grayling, gwiniad, pike, carp, tench, bream, crucian,.rud, roach, graining, cyprinus dobula (Lin. 528), and bleak, which the reader may find in the Britifb Zoology; it has the ferlet, or acipenfer ruthenus, tranfported from the Wolga by Frederic I. blennius raninus, or ablkuffa, perca lucioperca or gioes, cobitis fofflis, filurus glanis or mabl, the greateft of frefh water fifhes. Salmo wimba, S. albula or fíckloeja, cyprinus a/pius, or afp. C. idus, or id. C. ballerus, or blicka, C. griflagine, or faem, C. wimba, C. idbarus, C. farenus, or faren, C. cultratus, or Jkierknif, C. biorkna, or bicorka, and the C. aphya, or mud, are all inhabitants of the Swedifl lakes and rivers, and defcribed in the Fauna Suecica, and many of them figured in the beautiful hiftory of fifhes by Mr. Bloch. Sweden wants our famlet, barbel, gudgeon, cbub, graining, and minnow. The carp is a naturalized fifh, and is befides frequently brought there alive out of Germany.

Since the beginning of the prefent century, about an hundred and fifty or two hundred Indian merchants, from the province of Multan, refide at A/racan, and carry on a great trade in pretions ftones; they live in a large fone caravanferni. As they die away, or incline to return home, a fupply is fent from India by their chief, felected from among their relations. As they have no females from their country, they keep, during their refidence at Afracan, Fartarian women, but the contract is only during that time. They are a fine race of men, and are highly efteemed for the integrity of their dealings.
* Third Report of the Committee on the Britiß Fifheries.

The whirlpool called the Maclfrom is only quiefcent one quarter of an hour, at high and low water ; and then alone the fifhermen venture to pafs : on the return or retreat of the tide, fuch is the fury of its vertiginous motion, that whatfoever comes within a confiderable diftance of it, is drawn in and forced to the bottom, where it remains for fome hours, after which the fhivered fragments appear on the furface. Boats, and even fhips, have been fwallowed up by it: whales have been known to be caught within the vortex ; their ftruggles to free themfelves from the danger, and their piteous bellowings, are faid to furpafs all defcription. The folution of this phænomenon is now rendered very eafy. Itlies in the midft of the ifles of Loeffort, in a narrow channel, between the ine of Mokoe and that of Ver; the depth of water is between thirty-fix and forty fathoms, but on the fide next to \(V_{e r}\) fo fhallow, as not to give paflage to a veflel without danger of fplitting on the rocks. All the bottom is vaftly craggy, fhooting into ftoney fires, which appear at low water above the furface; over them the flood and ebb roll with amazing rapidity; and whirl round with a noife equal to that of the greatest cataracts, fo that the roaring may be heard feveral miles diftant*. So fimply may be explained that wonder which philofophers have fyled the navel of the fea.; fuppofing it to have been an abyfs which funk here, and rofe again in the gulph of Bothnia.

The lakes Sig, Onda, and Wigo form fucceffive links from the lake Onega to the White Sea. The lake Saima almof cuts Finland through from north to fouth; its northern end is not remote from lake \(O n d a\), and the fouthern extends very near to the gulph of Finland; a fpace of near forty Swedifh, or two hundred and fixty Englifh miles. Thefe probably were part of the bed of the antient streights which joined the White and the Baltic feas.

From the weftward; read, to the weftward.
The extent of the gulph fream is fuppofed to be as far as Nantucket fhoals, which are not lefs than a thoufand miles from the gulph of Florida.

Let me remark, from Dr. Blagden \(\uparrow\), the fingular difference of warmth in the gulph ftream, from that of the fea which limits its edges. In the month of April, in north latitude 33, and weft longitude from Greenwich 76, fomewhat to the north of Charlefozun, the heat of the ftream was found to be at left fix degrees greater than the water of the fea through which it ran. From obfervations

IXXo,

EXZ1F。
made on the heat, it fhould feem that the breadth of the ftream was about twenty degrees ; and that it retains, for fo great a part of its courfe, the heat it had acquired in the torrid zone: which proves the amazing velocity with which it runs. A purfuit of thefe remarks may be of no fmall utility to navigators who may have occafion to pafs this fingular current.

Let me not conceal that Lapland enjoys every native fruit of Great Britain; the currant, the ftrawberry, the bilberry, the cranberry, and the cloudberry: which put it on an equality with our own climate, before the introduction of foreign fruits among us. If we can clame the puckering floe, and crab, we have not much to be proud of; while the Laplanders may boaft their ackermurie (rubus arcticus) which with its nectareous juice, and vinous flavour, fo often fupported the great Linneres in his arduous journies through the deferts of the country. They may alfo exult in having given to our gardens the grateful angelica archangelica; the imputed gift of angels to men, and in Lapland the common inhabitant of the banks of every rill; the panacea and delight of the natives, and (preferved) a frequent luxury even in our moft fumptuous deferts.

In a philofophical circuit of the globe, it is eafy to obferve the exact proportion of neceffaries, animal or vegetable, which are allotted by the all-wife Providence to the demands of the inhabitants of the refpective climates. To fuch part of the Europeans who were deftined to active and exploring life; to the fubjection and civilization of diftant people, nearly unreclamed from a fate of nature ; the means of conveyance, for attaining fo defirable an end, were fup. plied and pointed out. In diftant ages, mof part of the world was on an equality: the canoe ferved the navigation of the then unpolifhed Briton and Gaul, as it does at prefent the Americans of the recent difcoveries. As the light of improvement fpread over the weftern world, the application and (in the cafe of prideexcited wars) the mifapplication of many of the works of nature, became the attention of mankind. The fupple willow covered with hides, or the rude tree hollowed into a floating trough, no longer contented the laudable ambition of mankind; we no longer fuffered our wants to be fupplied by the fhips of remote nations. We afpired to be our own carriers; we applied to our forefts for the means; and for that purpofe the oak firft felt the edge of the ax. Commerce and war, the confequence of wealth, increafed the demand, and fimulated to the utmoft improvement in naval affairs. Thefe arts fpread as far as Europe was inhabited by an enlightened race; but there is a line which feparates the rational from a lefs rational part of the human creation. The brave, the intelli-
gent Swedes and Norwegians, born to conquer, if not deftined to explore, art divided by a very narrow fpace from a race of men, the link the partition between the intellectual and animal creation. The Laplander, with few wants, and thofe to be fupplied only from the next foreft or lake, has no demands farther than for birch for his canoes, or materials for his fledges. Accordingly we find that every fpecies of tree, except the few I have mentioned, ceafe before they reach his torpid country. The oak, quercus robur, is not found even in Sweiten further than lat. 61. 30. It is met with farther north in Norway, in places near the milder air of the fea; but abounds in both kingdoms in their fouthern provinces. The forefts of Scania are full of excellent timber, oaks as well as other trees, pines and firs excepted; which give that province quite the appearance of England. It has few maffes of granite, few iron forges, which, with groves of pines, form the characteriftical face of Sweden. In Scania are placed the royal docks of Carlefcroon, the feat of the navy of the kingdom, in the neigh borhood of the forefts, its great fupport.

The Ash, fraxinus excelfor, is not found higher than Gefricia, or lat. 6I ; but in Norway is cuitivated only as high as Drontheim.

The Elin, ulmus campeftris, is fcarcely found beyond Geftricia.
The Lime, tilia Europea, is frequent in all the fouth of Sweden, but grows fearce towards the north. This is fuppofed not to have been an indigenous tree of Great Britain.

The Beech, fagus fylvatica. There are vaft forefts of this tree in Scania and Smoland; every where in Babus, but feldom found north of that province, or 1at. 59. This is the tree which Cofar, ftom mifinformation, denies to our ifland; but vaft mative woods are found in Buckinghambire, and fome adjacent counties. Not indigenous of our northern countics.

The Horneeam, carpinus betulus, is found in forefts; in Scania commonly, but more rare in Smoland, efpecially beyond \(V_{c x i 0}\), or about lat. 57.

The Aspin, populus tremula, is found from the higheft alps of Lapland, to the loweft places of Scania; the Laplanders call it fupp. Linnaus, in his Flora Suecica, refers to it in his Flora Lapponica, yet omits it in that admirable work, The rein-deer are very fond of the freh leaves, which are often gathered for winter food for cattle : the bark is made into meal for cattle, and the leaves and bark into a tea for calves, in Norway *.

\footnotetext{
* Cunncr's Fl. Norveg. No exxxvin,
}

The White Poplar, populus alba, is fcattered over Scania, but is not a native, having been introduced there with the Black Poplar, populus nigra, of late years, and bears the winter very well in Upland. It is doubtful whether thefe are natives of Scotland.

The Maple or Sycamore, acer pfeudoplatanus, is found in"the fouthern parts of Sweden, and rarely on the mountain Hyka in Dalecarlia, one of its northern provinces. It grows in Romidale and fouthern Norway more frequently; is cultivated in Drontheim. Mr. Ray fufpects it not to be a native of England.
The Little or Common Maple, acer campefire, is rarely found above two Swedifb miles from Lund; poffibly not a native Swedifb tree: the largeft I ever faw was at the duke of Argyle's, at Inverary.

All the above are found in fome part or other of Great Britain, more auficicioully favored by nature for the growth of trees and plants than northern Sweden. No blame can reft on any nation, to whom the fun has denied its fuller influence: let fuch exult in vigor of body and acutenefs of intellects, perhaps fuperior to thofe on whom it darts its enervating beams, and beftows every fpecies of enfeebling luxury.
I requeft leave to make, by the following catalogue, a comparifon between the climate of Sweden and that of England. Thefe plants bear the utmof feverity of our cold ; yet are obliged in Sweden to be fheltered, during winter, under the protection of a green-houfe. A few fpecimens, out of a number, will fuffice.

One other fhrub, which refifts the fevereft of the Englifh winters, is preferved in Szeden, during that feafon, in the tepedarium or dry fove, without tan: this is the common laurel, or prunus laurocerafus. I may add the ciffus ladaniferus, which grows with great vigor on the rocks of the beautiful inclofure called Arcadia, near the town of Conwy, belonging to my friend Owen Holland, Efq.
Pine-apple, the bromelia ananas, has been introduced into Sweden, and fruit cut at the feat of Baron de Geer, at Leuffad. Peaches, nectarines, and apricots, are fheltered during winter ; but, notwithftanding art is ufed, travellers do not commend them. Apples, pears, plums, and cherries, are cultivated only in the fouthern parts; but (the cherries excepted) afford a very indiferent fruit. In Scot-
land they fucceed very ill: nonpareils and golden rennets will not ripen even at Edinburgh without the help of a wall. Yet in the middle of \(:\) Auguf 1769 , I have feen, at Caftle Braun, in Rofsfire, in about lat. 57.42, Turkey apricots, orange nectarines, and a foft fmall peach, againft a common wall, ripe: but at the fame time other peaches, nectarines, and green-gages, far from maturity.
Notwithfanding England is fo noted for its vaft produce of apples, yet fuch is its demand for them, that it imports great quantities from Normandy, and even North Einerica. In \({ }_{7} 85\) the duty at the cuftom-houfe amounted to 565 l . 16 s . at the duty of about 2 s . per bufhel; that was in a year of fcarcity : but in the preceding year, which was remarkable for its plenty, it amounted to 278 l. II s .

Wood-ftrawberries are the moft delicious fruit in Sweden, and abound in moft amazing quantities. The great Linnews kept himfelf free from a fit of the gout for feveral years by the liberal eating of this fruit.

In refpect to the production of Ceres, it may be faid, that the goddefs extends her bounty in form of wheat with a fparing hand, and that only in the fouthern provinces. Barley is the general food of the common people; and in the fub-alpine parts of the country, oats alone will attain maturity *.

Winter begins in Sweden with what are called the Jarnnatter or iron nights, which feldom, exceed three or four, and happen between the 19 th and 3 fft of Auguft, in the latitude of \(U_{p} f a l\). After thefe, barley ceafes to grow, and the plants which require a green-houfe are no longer fuffered to be abroad. Waterfowls almoft of every denomination difappear in autumn. In October, the bear, badger, hedgehog, and mole, retire to their winter quarters. In the fame month is the firft appearance of ice. In November is alternate fnow and ice, an unpleafant thaw, and rain. The ditches are filled with water, till the fnow takes firm poffeffion of the ground, and winter reigns uninterrupted for many months. Between the 20th and 28th of February are the days of Acel; the ice on the lakes cracks longitudinally, the timbers of the houfes fnap with a great noife, and horfe-dung fpurts out icy particles a foot high. In March begins the unpleafing fpring : the fnow begins to melt againft the walls, the ice is loofened from the flones, and the bills begin to appear of their own color. Inundations of fnow-water, in April, cover the ground; the rivers are unbound, and the ice floats down. Birds of various kinds return ; the fight of the wheat-ear confirms the flight of any more fevere froft, except the few leaden nights in May; after which fummer is confirmed, and the return of birds is completed. In \(\mathfrak{F u n e}\) are the brazen nights, which, with the beaden, reach Sweden eight days after they are felt in Lapland, on the thaw of its frow. Thefe are the revolutions of a Swediff year.
\[
\text { * Amen. Acad. III. } 77
\]

Among the Lithopbytes is that elegant madrepore or coral, called the madrepora pertufa, Al7. Nidr. Iv. tab. ir. fig. I. The ifis hippuris-tab. iv. fig. 8. The gorgonia lepadifera-I i. tab, ix. fig. 2. Gorgonia placomus-ifi. tab. I. fig. r. which grows to a vaft fize. Another fpecies of gorgonia, with fender cylindrical branches, figured in the AEF. Nidr. i1. tab. ix. fig. I. The vaft alcyonium arboreum-IV. tab. xi. fig. I; and fome cther feecies fent to me by the late bifhop Pontoppidan, from the Norwegian feas; among which fhelter infinite numbers of marine animals. On one, I firft difcovered a concha anomia in the recent flate, which Linnesus named the anomia retufa, Vol. I. p. 115r. No. 225.

Among the animals which Linnefus calls vermes, is found the pennatulus nirabilis, Faun. Suec. No. 2265; and a very fingular long-fpined ecbinus with a fmall body, engraven by the above-cited worthy but credulous prelate. As a member of the royal fociety at Drontbeim, in Norway, I wifh my brethren would be ftimulated to a due attention to the wonders that furround them, and form a local mufeum, confined to the fubjects of that extenfive kingdom.

Exotic fruits flung on the coafts of Norway, which I have not defcribed in my voyage to the Hebrides, are the following:

Pods of the calfia fifulofa.
The kidney-fhaped nut of the anacardium occidentale.
Fruit of the cucurbita lagenaria, pifdia erytbrina, and the cocos nucifera.
The account of the fifhes of the Norwegian fea may be thus improved.
Among the fifhes which have hitherto fhunned our fhores, are the raia clavata, Muller, No. 209. Squalus fpinax, No. 312 ; length from twenty inches to three feet : the back is purple, the belly flat and black: it is found in the muddy vallies of the fea, of one or two hundred fathoms deep, off Cbrifianfand. Sq. centrina, 3i3, which extends to the Mediterranean, the Pefce Porco of the Italians. The chimera monftrofa, 320 , a moft fingular fifh. Syngnathus typhle, and aquoreus, 324, 325. The regalecus glefue, fild kong, or king of the herrings, 335; Afcan. Icon. tab. xi ; found about Glafver, near Bergen, a molt uncommon eelThaped fifh, from ten to eleven feet in length, with a dorfal fin extending the length of the back, and uniting with that of the tail; its pectoral fins filiform, ovated at their ends, and one third the length of the body. Gadus brome, 34 I , is from two to three fect long: an article of commerce frequent on all the coaft. G. dipterygius, or byrke lang, 346. Blennius raninus, et fufcus, 359, 360. Echincis remora, 361 , which extends to the Eaft and IWeft Indies. Coryphana novacula, 362, common to the Mediterranean. Coryph. rupefris, 363 , which has alfo been taken

LXXVI。
taken near Gibraltar. Gobius jozo, 365. Pleuronectes cynogloffus, limanda, et linguatula, 372, 375, 377. Sparus erytbrinus, 380. Labrus fuillus, 381. Percanorvegica, 390, Afcan. Icon. tab. xvi. a red fpecies, very fat and nourifhing, which grows to the length of two feet and a half, peculiar to the Norden fields. P. lucioperca, 391, a fifh of the lakes. Scomber pelagicus, 398 ; Lin. 495. which poffibly is found even at Jamaica. Silurus azotus, 404 , the foekat of the Norwegians, Pontoppidan II. tab. IV. p. 150; Catefby, 11. p. 23 : and falmo arcticus, or capelan, a fpecies fo abundant about Nevvfoundland.

The falmo filus or fll, 418 ; Afcan. Icon. tab. xxyv. is the only fpecies of falmon which never quits the fea: is excellent food, but full of bones: a fcarce fpecies, and grows to the length of two feet; of a pale brown color on the back, with filvery belly and fides. The falmo kuimund, Afcan. Icon. xxiri. is taken only in the river Randsford: grows to the length of two feet; of a purple color, fpotted with filver, and minute black fpots : unlike other trouts, it never quits its ftation.

The cod-fifh in theefe feas grow to the weight of fifry pounds, and from two to four feet in length : a fingle ovary of there fith has been known to weigh fourteen pounds, and tō contain nine millions of eggs: we need therefore never fear exhaufting the fpecies. Ship-loads of the fpawn are annually fent to France.

The coaft of Finmark is attended, for a confiderable way, with a chain of ifles like that of Norway.

In refpect to the temperature of the fummer air in Spitzbergen, Lord Mulgrave makes thefe remarks:-At the noon of July 20th, in lat. 80. 30. long. 3.26. the mercury flood at 37 ; at midnight at \(33 \frac{7}{2}\); and in lat. 80.37 . at noon at 48 . In lat. 80. 4. long. 2. 12. on 'fuly 16th, at noon at 49 , at midnight at 48. This was the greateft degree of warmth felt in this arctic region during the voyage.

Coals are alfo found in Spitzbergen; by means of which, feven people, left there accidentally, were enabled to bear the feverity of the winter.
Lxxxix. In the enumeration, add, beneath Orknies;
\[
\begin{array}{ccc}
\text { Perfect. } & \text { Imperfect. } & \text { Total. } \\
\text { Holland has } 809 . & 275 . & \text { 1084. }
\end{array}
\]

Before I quit Spitzbergen, let me add, that to the fouth of Statz ifland, and about ten leagucs diftant, is Hope ifland; of a fingular form, nine leagues long, and only half a mile broad ; divided into five very high mountains, gradually de-
creafing in height from the north-eaft. On the north is good anchorage in twenty fathom water. 'The fouth fide has a rocky bottom, and for fome way to the eaft and weft the fea is fhallow. At the north-eaft end is a hollow, the haunt of walrufles, and of myriads of gulls and other feamowls, which darken the air with their numbers.

The Dwina is navigable to a great diftance, even to Wologda, a thoufand
XCII.

XCII, point is a difinguifhed promontory; between them are the three ffters, conic rocks of a grotefque appearance. From thence to Tana bay is high and craggy land, and a bold fhore. The river Tana falls with a prodigious noife into the end of the bay, forming a noble cataract; like the Alten, it rifes far in Lapland, and, after a long courfe through alps and moraffes, here has its difcharge. Among the leffer rivers which feed it, fome were famous for beavers and pearls. The Laplanders had thercfore, in 1652, this river committed to their fpecial care. The Tana is the moft celebrated of any in the north for its falmon; they are diftinguifhed by their depth, fhortnefs, and fuperior excellency. The fifhery begins early in the fpring, and, by the laws of Norway, muft end in fourteen days after the feaft of St. Jobn the Baptift.

To the eaft of this is Wardoe, an illand remarkable for having on it the moft northern fortrefs in the world, and of unknown antiquity, built at the extremity of Norwegian Finmark. It commands a fine harbour, and probably was built to protect the fifhing trade, the only object it could have in this remote place. It has caufed an affemblage of about three hundred Norwegian cottages, the habitations of fifhermen. Beyond the adjacent promontory, Domefnefs, the fea runs weftward, and forms a deep bay. The river \(P\) as is the boundary between the

\footnotetext{
* Northern Pilot, page 59.
}

Mufcovitifb and Norzuegian dominions. Kegor, or fifhers ifland, feretches along the fhore a little to the eaft of the mouth of the Pcos. A vaft hollow fea is obferved off this inand, arifing from the N. W. and N. E. winds. Let it be remarked, that the land takes a fouthern trend from the north. cape to the extiome of the White Sea; and the hills gradually decline in height, and the ines diminifh in number. Kola, a vaft river, opens a little to the eaft of Kegor, and is about a mile broad near the town of Koln, above feven leagues from its mouth. This, above two centuries ago, was the great refort of Engli/b and Dutch, who carried on a great trade in falmon and fifh-oil\%. The oil is extracted from the livers of the fharks, fuch as the brugde, baa-mer or banking fhark, Br. Zool. HII. No. 41 ; the baa-fkiardin or white fhark, Er. Zool. III. No. 42 ; and the baabrand or blue fhark, No. 43. All thefe fpecics having for a long time been taken for this purpofe \(\dagger\), chiefly in the winter, and by the natives. Cod-fifh, holibuts, and moft of the valuable fifh of the Germon fea, abound as far as this high latitude. Even the tunny is found to purfue the mackarel into thefe cold feas \(\ddagger\). The fmall ifle of Kilduyn lies a little to the eaft of the Kola; and farther on the Sem-oftrowow, or feven iflands; not far from which is the river Arzina, memorable for the fate of our illuftrious countryman, Sir Hugb Willoughby, who, in May 1553, failed from Ratcliff, on the firf voyage for the difcovery by fea of Mufoovia by the north-eaft, a country at that time fcarcely known to the reft of Europe. In Auguft he was feparated from his conforts in this high latitude, and driven by tempefts into this part, where he was found, the fpring following, by fome Ruffian fifhermen, with all his crew, frozen to death. His more fortunate confort Ricbard Cbancelior, captain and pilot major, purfued his voyage, and renewed the difcovery of the IVhite Sea, or bay of St. Nicholas, a place totally forgotten fince the days of Oether. The circumftances attending his arrival exactly refemble thofe of the firft difcovercrs of Anerica. He was ftruck with aftonifhment at the barbarity of the Rufzan inhabitants. They, in return, ftood amazed at the fize of his fhip; they fell down and would have kiffed his feet : and when they left him, fpread abroad the arrival of " a ftrange nation of fingular gentle" neffe and courtefie." He vifited in fledges the court of Bafloviiz II. then at Mofoov, and layed the foundation of immenfe commerce with this country, for a feries of years, even to the diftant and unthought-of Perfia.

It is fingular, that fo very little has been preferved concerning that very illuftrious characier, Sir Hugh Willoughby. It appears that he was fon of Sir Henry IVillougbly, knight and banneret, by his third wife Elen, daughter of Gobn Eger-

}
fon of Wrine Hall, in Cbefhire, Efq. Sir Hugh married Fane, daughter of Sir Nicholas Strelley, of Strelley, in the county of Nottingbam, Knt.; by her he had a fon named Henry, of whom I do not find any account. They were originally of Rifeley, in Derbyfbire; Sir Hugb is filed by Cambden, of Rifeley. Thoroton adds the fame title to an anceftor of the fame chriftian name, who died in 149 r . They changed their refidence to Wollaton, in Nottingbambire, the princely and venerable feat of Lord Middleton, who aequired it by the marriage of his anceftor, Sir Perceval Willoughby, with Brigitta, daughter and fole heirefs of Sir Francis Willoughby, founder of that noble pile. The portrait of the celebrated Sir Hugh is to be feen there; a whole length, in very large breeches, according to the fafhion of the times, in a room hung with velvet, with a table covered with velvet, and a rieh carpet. From his meagre appearanee, the fervant tells you, that it reprefents the attitude, \&ec. in which he was found ftarved. This trivial account is all that is left of fo great a name.

The river \(O b\) rifes from the Altine, or, as the \(R u y\) fans call it, the TelefRoe, a large lake; it fwarms with fifh. In lat. 6r. it receives the river Irtiche: at this junction the \(O b\) divides into two channels, and runs feparated for a long tract; unites again, and near Berefow, its fream is broken by numbers of fmall ines. Near Obdorofkoe Ofrog it takes an eaftern courfe, and difcharges itfelf into the great bay of its own name.

The Irtifche has alio a moft extenfive courfe: it rifes in lat. 47. runs through the great lake Saifan, takes a north-wefterly direation, and in lat. 58. 12. reeeives another great river, the Tobol: and on the forks of thefe rivers, on the northern fide of the Irtijibe, ftands Tobolki, the prefent capital of Sibiria.

In the gulph of Kara are taken the faimo kundBa, Pallas Itin. III. No. 46; the nawaga, a fort of whiting; falmo autumnalis or omul, pleuronctes glacialis; and the cottus foorpius, rum/Ba, or father lafher, Br. Zool. III. No. 99.

The Mollufca and Vermes, which extend to the gulph of Kara, the beginining of the Icy fea, are, the apbrodita fquammata, nereis cylindraria, actinia equina et fenilis, afcidia globularis, Pallas Itin. III. App. No. 57; buccinum glaciale et undatum, murex antiquus et canaliculatus, and the tellina atra.

The monoculus arcticus, Pallas Itin. III. Apṕp. No. 58. fwarms in the lakes near the Icy fea, and is the great fupport of the multitudes of water-fowl which make them their fummer retreat. Among the Zoophytes of the Frozen ocean are the efchara foliacsa, fertularia dishotoma et cupre/Jina, alcyonium digitatum et gelati-
nofum, and the Jpongia oculata, and infundibulum. And of the Fucus tribe, the fac cbarinus, edulis, quercus, ceranoides, aculeatus, glacialis, and truncatus, Pallas Itin. III. \(\mathrm{N}^{\text {ris }} 135\) and \(\mathrm{I}_{3} 6\); and the ulva intefinalis.
xcyi. Befides the Argali and the Musk, the Ogotona Hare, Hiju. 2uad: No. 249; the Caraco Rat-No. 299; the Garlic - No. 315; and perhaps the Economic-313, firt appear to the eaft of the fenefei; and the Ibex or WildgOAT again begins to fhew itfelf, after the long interval of the vaft tract between this country and the Carpathian mountains.

When the ice breaks in lake Baikal, the faimo oxyrhynchus, and the lenki, lay their fpawn in the fandy fhores, but in fummer retire into the deep water.

The callionymus baikalenfis is a fifh peculiar to the lake; is about nine inches long, of a moft foft and tender texture, and flowing with oil: it is never caught in nets, or any way alive. It inhabits the vaft fubaqueous caverns of the lakes, at great depths, particularly near the northern fhores, in places three or four hundred fathoms deep. They are never feen but when they have been difturbed by the violent fummer forms, when they are feen floating on the furface, or fung in vaft heaps on the fhore, particularly on the Pojolkijh, and the mouth of the Seling The people extract oil from them, which they fell to the Cbinefe.

The falmo autumnalis or omul, is taken in the lake in \(\mathcal{F}\) une and \(\mathcal{F u l y}\), in its paffage fill farther fouth.

Vaft quantities of the fkins of the onifous trachurus are feen floating on the furface of lake Baikal; a fpecies of infect which abounds on the rocky fhores, and is the food of the falmo lenok-and for. Pallas Itin. III. 293. and App. No. 54 .

The Bear Islands were farther explored in 1763 , by the two land furveyors, Andrejef Leontief, and Lyfof. They began their journey on March sth, from Nifchne Kowimfkoi, in fledges drawn by dogs: on April 22d they reached the fhore of the Icy fea, and oppofite to the mouth of the river Krefozva, went on the ice in a ftrait direction to the firf ifland; on landing they found it to confift of finall yellowifh gravel, overfpread with rocks of granite of immenfe bignefs, but productive of nothing but mofs and fhort grafs like the tundra, or the great northern tract on the continent. They found there the remainder of a jurt or tent, made of the floating timber which abounds in this part of the fea. It did not feem of Ruflian confruction, therefore muft have been built by fome of the natives of the continent, who came here for the fake of the chace of fea animals.

In one part of the ifle is a lofty hill of a moft rugged form ; having to the eaft a dreadful precipice. This illand feemed fifty verfts long and forty broad.

They afterwards vifited four other ifles; near to the third was a rock feparated about eleven fathoms from the fhore, connected by the fhore, at low water, to the ifland. It confifted of brittle granite, and was about ten yards high. About fix yards from the bottom was a declivity, on which were placed ten fir trees with their roots upwards; over the roots were placed planks covered with gravel, along the fides were boards fix fpans high, and over the whole had been a roof, now fallen down, formed of fmall pieces of floating timber, faftened with leathern flraps, and covered with gravel : it bad one entrance from land, another from fea; and was about five fathoms and a half long, and four broad, and of moft coarfe workmanfhip. On the fame ifle were traces of a hut, and \(\mathbf{t}\) wo cellars, -No animals were feen on them but polar bears and ar cric foxes.

By the accounts of thefe adventurers, the fartheft iffe muft extend far to the eaft, for they affert, that it lay oppofite to the bay of Tfchaoút. On this ifland the provifions for their dogs began to fail. They were obliged to fet out on their return on the 12 th of April. Their whole journey, and their return to the continent, was comprehended in five or fix days. Ncue Nordifche Beytrage, I. 23 r.

I fhall endeavour to make fome addition to the accounts of the \(\mathcal{T}\) fobut \(f\) chi given CXII. by Captain Cook, from two relations preferved in the Neue Nordifche Beytrage; as any thing relative to fo remote a people cannot but be acceptable.
The firtt is from the journal of the Coffack Nicolai.Daurkin; who, by private direction from his commander, feigned a defertion from the Ruflan poft on the Anadyr, to the neareft poft of the \(T \mathcal{c} c h u t \delta c h i\), was well received by them, and continued with them from 'fuly 20 th, 1763 , to the winter of the fame year. This journal relates chiefly to the ifles intermediate between Afa and Ancrica, in Bebring's flreight. In October, when the fea between the Afatic and American land was frozen, he procured a fledge and a couple of rein-deer, and, attended by one of the TJchutfchi, who had adopted him as a kinfman, paffed over to the firft ifland, and arrived there in five or fix hours. The inhabitants received them very kindly; but inftantly afked for fome tobacco leaves; which being prefented to them, they in return prefented the travellers with fome of their cloathing made of furs. The natives wore dreffes made of the fk ins of rein-deer; and lived on the flefh of whales, wairufes, and feals. For want of wood, they dreffed their food by means of lamps, made of a ftone hollowed on the top, into which they poured trainoil, and into that they put a wick made of a foft mofs, a fort of /phagnum or,bogmofs, tied with flrings, made of the bowels of animals: with thefe lamps they nos F 2 only
only dreffed therr meat, but alfo warmed themfelves. The natives of this ifle are called by the \(\tau \int c b u t \int c h i\), Acbillaet.
On the fecond ifle live the fame kind of people, who call it Pejerkely. The chief of them bore each fide of the lips of their children, and introduce into them pieces of the teeth of the walrus : in other refpects, they are cloathed like the natives of the firf ifle. Thefe were the two iflands feen in the ftreights by Captain Cook, but were neither named or vifited by him. Thefe people had intercourfe with the \(\mathcal{T} f\) chut \(f b i\); for in one of the engagements which Colonel Paulutzki had with them in \(\mathbf{~ 7 3 1}\), he found one of the iflanders among the flain *, with his lips bored as before defcribed.

Daurkin mentions two ranks of Tfchutcbi; one who have herds of rein-deer, and others which have none; the laft live in holes below ground, and fubfift on the flefh of fea animals entirely : but the others, in certain feafons, apply themfelves to the chace of fea bears, walrufes, whales, and belugas, or the white dolphin.

The fecond journal was made by Iwan Robelef, a Kafak Stonik, or a Cofack, who commanded a hundred men. In 1779 he was difpatched', like the former, as a \(\int\) py into the country of \(T T_{\text {chut }} f_{c} b i\); on the 20 th of May he reached the \(S_{\text {erdzs }}\) kamen, in the bay of Notfchan. He obferved there, that the natives poffeffed of rein-deer treated thofe who had none as the Ruflans do their vaflals, and obliged them to fifh for them, and to furnifh them with train-oil, and the flefh of feahorfes; for which they fupplied them with that of the rein-deer.

On fuly \(\mathbf{1 7}\) th, Robelef reached the village Fagacgein, and from thence croffed a bay, eight verfts broad, to the village Nernegin : here the Tfchut/ibi mentioned to him the arrival of Captain Cook, in 1778 , and the intercourfe, as related by Captain Cook, in vol. II. p. 447, of his voyage. Robelef fixes the latitude of the place where he received his account in 65. 48. and in longitude 206. 30 . The fame people remembered alfo the vifit paid to them by Bebring, feveral years before, when forty of the natives vifited his hips in four leathern boats. Two important circumftances in the annals of the country.

Robelef alfo vifited the two intermediate ifles; one he calls Imoglin, which was five verfts long, and two broad. It had two villages, containing two hundred and three males, and a hundred and ninety-five female inhabitants. It lay forty verfs from the Affatic fhore. The fecond ine he calls Ijelgin: its length was three verts; its breadth one and an half: its diftance from Imoglin, three verfts; from America about thirty. Its number of inhabitants eighty-five males, and feventy-nine females. The chief of this ifle was a native of America.
- Decouyertes faites par los Ruffes, I, 172.

He affured Robelef of a fact too curious to be omitted - that there was a colony of Ruffinns, which have been long fetted on that continent: that they are dittinguifhed from the Americans by their long beards, and by their language : that they can write, fay their prayers out of books, and worfip pictures. Robelef wifhed earneftly that the chieftain would bring him over to his countrymen ; but was told he did not dare to do it, leaft Robelef fhould come to any mifchance, for which he fhould be anfwerable to the \(\mathcal{T}\) chut fchi.

RObelef was alfo told by a Tfchutfohi, who had formerly crofied to America for the fake of trade, and made acquaintance with a perfon, who afterwards vifited him in the ifle of lmoglin, and brought to him a board, on which was written on one fide red characters, on the other black; and faid he had it from people with beards, who defired him to deliver it to the Ruffians who were in garrifon at Anadir/k; and that the purport of it was to obtain iron from them. The Ruffants of that garrifon had a tradition, that out of feven kotches or veffels, which once failed from the mouth of the Lena, along the coafts of the Icy fea, to double the \(T\) colutfcbi point, three were never more heard of. Thefe they believe to be the founders of this colony : but whether it has any better foundation than the fory of the \(W_{e} / / b\) fettlement in North America, by the fons of Owen Gwynedd, in 1170 , appears to me a matter of great doubt.

Robelef informs us, that there is no vifible ebb or flow in the Streights of Behring, and only a moderate current, running in fummer from the Eaftern ocean northward into the Icy fea, and about Augufl turns to the fouth, and brings with it the floating ice. He adds, that the tide on the \(T \mathcal{T}\) chut \(f\) chi nofs flows fix feet.

The \(T \mathcal{T}\) chut \(f\) chi gave Robelef much information refpecting the topography of the oppofite coaft of America: from thefe accounts a map* is formed (with the affiftance of that by Captain Cook), in which is placed a vaft river, emptying itfelf into the Icy fea a little to the fouth of Cape Mulgrave; then making a bend foutherly, and taking a very long courfe in that direction. Its banks are made as full of towns and villages (all of them named), as the banks of the Thames; nor are the coafts, from its mouth to Norton found, made lefs populous; and thofe from point Shallow Water to Shoalness vie in that refpect with all the preceding. As Captain Cook met with no fuch marks of population, I muft fufpend my belief till thefe coafts have been farther explored; whiche the fpirit of curiofity, which now reigns, makes me not defpair of feeing effected.
* See vol. IV. of Neme Nordijble Beytrage, and the whole narration, at p, 305.

The Tfchutfchi country is overgrown with yellow and white mofs, which nourifhes vaft flocks of wild rein-deer. Thefe animals are accuftomed, in May or \(\mathcal{F}\) une, as foon as the Anadyr is clear from ice, to fwim over the river by thoufands, to the cold woodlefs countries towards the Icy fea, to fave themfelves from infects; and they retire again in Auguft, and the beginning of Septeriber, to the woods, to change their horns. The neighboring inhabitants take the advantage of their migration, to kill great numbers of them for their provifions. The people are at this time particularly careful to avoid making much noife, or caufing fmoke in thofe parts where the rein-deer pafs; and watch the firft harbingers of their arrival. The hunters affemble in fmall boats, and when the herd of rein_ deer is crofing the river, they row amongft them, and kill with lances as many as they can, which amount often to feveral hundreds. The herds crowd, during three whole days, fo clofe together, that they cannot efcape; but after three days the whole march is over, except by chance a fingle deer is now and then feen. The greateft number of rein-deer killed in this encounter are females (Wafbenki), which cannot fo eafily make their efcape, with their young ones, as the bucks, who are always foremoft, and retire therefore fooner. The rein-deer in there eaftern parts are in general much fimaller than elfewhere in Sibiria, the largeft buck weighing no more than four puds, and a female about two and a half. The flefh, which is dried for preferving, is tied together in bunches, which contain two deer, and each bunch weighs a pud and half or two puds*.
cxyxili.
Steller found, on Behring's ifland, two hundred and eleven fpecies of plants, of which more than a hundred grow in Sibiria, and other mountanous countries; many are common to the eaftern fide of Kamtfchatka and America. Brufh-wood is only met with in the broadeft part of the inland. Near the northern part are fome fmall alders with fharp-pointed leaves, and fome wild rofes. The betula nana grows in the marfhes; and on the hills are fome fmall junipers, and the forbus ascuparia or wicken tree.

The plants, not enumerated in the lift of thofe of this inland, are
\[
\begin{array}{l|l}
\text { Mimulus luteus. } & \begin{array}{l}
\text { Cornus herbacea. } \\
\text { Fumaria. }
\end{array} \\
\text { Epilobium anguftifolium. } \\
\text { Pleris pedata. } & \text { Cochlearia danica. } \\
\text { Polypodium fragrans. } & \text { Pulmonaria maritima. } \\
\text { Andromeda polyfolia. } & \\
\text { * A pud is } 40 \text { Rufan pounds, or }{ }_{3} 6 \text { Engli/b. Mrv. Cox. }
\end{array}
\]
\[
M A \mathrm{E} \mathrm{~N}^{\prime} \mathrm{S} \text { I S L E. }
\]

The Ofiaks, to this day, in their dances put on mafks, change their dreffes frequently, and imitate the forms of beafts and birds, and often in a maniner fo ftriking and fatirical, that one is furprized to hear of fo perfect a pantomine among fuch a favage people. But would not ignorance or fuperftition afcribe to a fupernatural metamorphofis thefe temporary expedients to deceive the brute creation, or to afford amufement to their countrymen by thefe frolicfome mafquerades? The Americans may carry themfelves thus dreffed into the field of battle, as the Apulian hunter did, who fell by the hand of Camilla. Drefs and arms were fimilar ;

Caput ingens oris hiatus,
Et malæ texere lupi, cum dentibus albis:
Agreftíque manus armat farus.
The height of the mountain on Mayen's ifle is fo great, that it may be feen at the diftance of thirty leagues. Many parts of the coalt are from twenty to thirty fathoms high. The fea at the north end is often frozen ten miles from the fhore; and on one part of the ifle are three ftupendous icebergs, or mountains of ice. Off the north-eaft end are alternate calms, and fudden gufts of wind like whirlwinds, which make navigators fhun the approaching it from that quarter.

The bottom of the fea round the ine is rocky and uneven, and of very various depths. There are places where there is only fix or feven fathom water, with a black fand, poffibly vulcanic; and at a fmall diftance is water of three hundred fathoms. In other parts the bottom is rocky, and moft unfit for anchorage : a few creeks, pervious by difficult and narrow inlets, are capable of affording fhelter, in this horrible foot, to a few fhallops; but fhips muft anchor without, and then with the moft fedulous circumfpection.

The fhips deftined for the Greenland whale-fifhery often vifit this ifland firft, for the fake of the feals, which are here in great numbers upon the ice. They are killed for the fake of the oil, which is extracted from their blubber; and for their fkins, which, after being falted, are kept in cafks, and ufed in England for making of boots and hhoes. Our thips leave their ports in February or March, and arrive off the ifland in March or Aprit, according to the time of their departure; and if they arrive in the firft month, they generally find the fea full of ice; but that depends on the winds, for certain winds force it away, and leave the water clear. The flips ufually continue in this fea till the beginning of May, when they ftretch away to the eaft, and apply themelves to the whale-filhery, 113 about latitude 79 , and even to that of 8 J .

GLXXYIF。

Bontakos

CIXI.
cLXXVII.
cesxix.

CISEXVVII.
cxc.

Bontakoe is the name of an ifle in lat. 73.30. not far from the coaft of Greenland. I faw it in a map of \(N\). and S. America, publifhed by Mr. Sayer, in 1775. A little to the north of it is a promontory, the date of the difcovery of which is 1605. This is all I learn of it.
\(\mathrm{D}_{\text {Avis's }}\) ftreights is frequented by fome of our whale-filhers: they fail from England (e. g.) Yarmoutb, the beginning of March, arrive there about the middle of April, and go up the ftreights two hundred leagues, towards \(D i f{ }_{c o}\) bay, 'or North-eaft bay, ufually called by the feamen North-eaft Bite. In thefe parts the whales are larger, but fewer than in the Spitzbergen feas. Seals there are alio fcarcer. It is fingular that no intelligence is to be obtained concerning Baf. fin's bay, from thefe navigators.

The following journal of the fhip Yarmouth, hews the expedition with which the Greenland whale fifhery is carried on.

April I Ith. Sailed from Yarmouth roads.
16. Off Lerwick, Schetland.
21. Fall in with the firft ice, about lat. 70.
27. Killed fome feals. Working backwards and forwards through the ise to the northward.
May 15. Off Fair. Foreland, lat. 78.
17. Killed the firft whale.

Fune 20. Killed the feventh.
23. Took departure for England, from lat. 75. 3I. long. 7.

Tuly 8. Anchor in Yarmoutb roads.
Munck never reached beyond lat. 63. 30. A cruel fate attended this able feaman. Being ftill perfuaded of the poffibility of a north-weft paffage, he engaged feveral opulent people in the defign, who equipped two veffels, and committed them to his care. On taking leave of his prince, Chriftian IV. fome difcourfe arofe concerning his late expedition. The king ungeneroufly reproached him with being the caufe of its mifcarriage. Munck, indignant at the afperfion, anfwered his majefty with warmth, on which the king ftruck him with his cane. Munck was fo affected, that he took to his bed, refufed all food, and died of grief at the unjuft ufage he had experienced *.

The thermometer has been known, in Hudfon's bay, to rife out of doors to 85, on the 12th of \(\mathcal{F u l y}\), and to link in the month of Fanuary to 45 below the cy-
pher, in a glafs regulated according to Farenbeit's fcale. It has been obferved by Mr. Hutchins, that on the 6 th of \(\mathcal{F} u y\); 1775 , the quickfilver rofe as high as 99 ; and once in the fame month, for an hour or two, even to ro3. In refpect to cold, the quickfilver begins to congeal when it has funk to about 40 below the cypher; but the fpirit thermometer continues to fhew a degree of cold fo low as \(4^{6}\). The former remarks were made by Mr. Wales, at Prince of Wales's fort, in lat. \(58^{\circ} 55^{\prime}\), correfpondent to the fouthern part of the Orknies. Thofe iflands lie furrounded by the fea:Hudfon's bay has to the weft a tract of continent extending in the narroweft part above thirty-five degrees, covered the whole winter with fnow; and to the north a fill more rigorous climate, a fea perpetually infefted with ice: fo let the wind blow either from the weft or from the north, it is fure to bring with it the moft fevere effects. From the province of \(N_{\epsilon w}\) York to this in queftion, the ground remains covered with fnow the greateft part of the winter; later or earlier, as the country approaches or recedes from the fouth. The predominant winds are from the weft, and thofe blow above three quarters of the year : but the north or northeafterly winds are obferyed to be the vehicles of fnow. The north-wefterly bring the fevereft cold.

The middle provinces are remarkable for the unfteadinefs of the weather, or the quick tranfitions from heat to cold. Snow falls in quantities in Virginia, but does not lie above a day or two; yet even after a mild, or indeed, a warm day, the river Potowmoc has been frozen over in one night, ftrong enough to be paffed, and that in places where it was two miles broad; and fames river, where it has been three miles broad. Thefe alterations are owing to the above-cited caufe, the fudden arrival of the chilling winds of the north-weft.

The provinces of Soutb Carolina and Florida are fubject to vaft heats and furious whirlwinds, hurricanes, burfts of thunder, and fatal lightnings. Mr. Henry Ellis found the thermometer in Georgia at 105, in one of the fummer months : a heat fo far fuperior to that of the human body, even in that climate, that Mr . Ellis could not raife it above 97 by the application of it to his body. On December roth it was at 86 , yet the next day fell as low as 38 . Well might Mr. Ellis remark the deleterious effect of thefe extraordinary changes on the human frame *.
The united fury of the thunder, lightning, and whirlwind, cannot be better illuftrated than by the defcriptive inftance which happened in South Carolina, with which Dr. Garden, with his ufual liberality, favored me; and of which he was an eye witnefs.
* Phil. Tranf. 1. 754; 755.
G
- Before
- Before I fay any thing of that tremendous whirlwind which I mentioned to s you in converfation, the particulars of which you defire, I fhall obferve that - Carolina, in common with other warm climates, is fubject to occafional tem' pefts of various forts; fuch as fevere thunder ftorms, hurricanes, whirlwinds, - \&c. of different ftrength and violence. Thunder ftorms and gufts happen at 6 all times of the year, particularly in the fummer time; but there are fome, of 6 the moft dreadful force and appearance, that happen chiefly in the fpring and 6 autumnal months. They generally rife between the weft and north, and - gradually advance, with accumulating thicknefs, always in a contrary direc6 tion to the wind, which ftrengthens as the guft approaches, and rifes in the 6 atmofphere with deep and fullen darknefs, pregnant with frequent burfts of 6 fharp lightning, darting its tremendous forks in all directions. Every kind of 6 animal feeks fhelter and rereat. The wind increafing, and the clouds rolling: 6 on from contrary quarters, the oppofing elements by their furious approach and
' violent contention produce a gencral uproar and darknefs; and the atmofphere
6 is hurried into eddies and whirlwinds, that fill the air with duft, leaves, and
6 branches of trees, and every other light body that lies in their way; fo that an - almoft total darknefs takes place, before the important cloud, rolling on, at - length burfts over you, and pours down fpouts and torrents of rain, mingled - with almoft unintermitting peals of thunder, and the moft alarming flafhes of - lightning, pointed and forked, which frequently ftrikes boufes, and fhivers in \({ }^{6}\) pieces the loftieft and fouteft trees. During the florm, heaven and earth ' feem to be in contention; and yet no fooner is its force fpent, than all is fun-- fhine, calmnefs, and tranquillity.-Thefe gufts generally happen in the after-- noon and towards evening, though I have feen them at all times of the 24 6 hours.-But, entirely independent of fuch ftorms, whirlwinds of different forts s 'arife in various parts of the country; and taking fometimes a rectilinear, and
- fometimes an irregular and varied direction, proceed through the country, mark-

6 ing their progrefs (if of great ftrength and violence) by an avenue in the woods,
6 of a greater or lefs extent according to their diameter, where every tree, plant,
- building, \&c. are torn up, broken, and laid flat; till at length the whirling
- column either fuddenly lifts itfelf up, and vanimes in the air ; or gradually di' minifhing in force, bulk, and diameter, totally difappears. Small whirlwinds
6 of this kind are frequent in the hotteft weather : thofe of large fize and great
- force fortunately bappen felcomer; but their tracks are now and then feen in the.
\({ }^{6}\) woods, and may be followed for miles.
- Of this kind, commonly known under the title of Typhons, a moft vio. \({ }^{6}\) lent one paffed down ABley River, on the 4th of May 1761, and fell upon the ' fhipping in Rebellion Road with fuch fury, as to threaten the immediate defruc' tion of a large fleet lying there ready to fail for Europe.
- This terrible phænomenon was feen by many of the inhabitants of Charlef.
' town, coming down Wappoo Creek, refembling a large column of fmoke and
' vapor, whofe motion was very irregular and tumultuous, as well as that of the
' neighboring clouds, which appeared to be driving down nearly in the fane
' direction (from the fouth-weft), and with great velocity. The quantity of
6 vapor which compofed this impetuous column, and its prodigious velocity, gave
' it fuch a furprifing momentum, as to plow Abley River to the bottom, and to
' lay the channel bare, of which many perfons were eye witneffes. When it - came down Abley River it made fo great a noife, as to be heard by moft of the ' people in town, and was taken by many for conflant thunder; its diameter at ' that time was generally judged to be about three hundred fathoms (though from
' what I have fince known of the breadth of the river, I am confident it muft
6 have been nearer double); and in height, to a perfon in Broad-freet, Charlefown,
' it appeared to be about forty-five degrees, though it encreafed in magnitude
' and height during its progrefs to Rebellion Road. As it pafled the town, nearly
' about the conflux of Cooper and ABley rivers, it was joined by a column of the ' fame kind, though not of the fame magnitude, which came down Cooper
' River. Though this laft was not of equal ftrength or impetuofity with the
' other, yet, on their meeting together, the tumultuous and whirling agitations
c of the air were feemingly much greater; infomuch that the froth and vapor
' raifed by its fides in the river, feemed to be thrown up to the apparent height ' of thirty-five or forty degrees towards the middle; whilft the clouds, which were - now driving in all directions to this place, appeared to be precipitated into the ' vortex, and whirled around at the fame time with incredible velocity: juft 6 after this it fell on the fhipping in the Road, and was fcarce three minutes in its ' paffage, though the diffance is near two leagues. Five veffels were funk out' right ; his majefty's fhip the Dolphin, which happened to be at anchor juft on " the edge of the column, and all others in that fituation, loft their mafts; the ' other unfortunate five, which lay in the direct line of its progrefs, were inftan' taneoufly funk. Whether was this done by the immenfe weight of this column 'preffing them into the deep? or was it done by the water being fuddenly - forced from under them, and thereby letting them fink fo low, as to be im' mediately covered and ingulphed by the lateral mafs of water? This tremen-
' dous column was feen upwards of thirty miles fouth-weft from Charlefown,
- where it arrived twenty-five minutes after two o'clock, P. M. making an ' avenue in its courfe of great width, tearing up trees, houfes, and every thing
' that oppofed; great quantities of leaves, branches of trees, even large limbs,
' were feen furioufly driven about and agitated in the body of the column as it ' paffed along. When it paffed Rebellion Road, it went on the ocean, which it
- overfpread with trees, branches, \&c. for many miles, as veffels arriving from
' the northward fome days afterwards informed us. The fky was overcaft and
- cloudy all the forenoon: about one o'clock it began to thunder, and con-
' tinued more or lefs till three. The mercury in Farenheit's thermometer, at
' two o'clock, ftood at \(77^{\circ}\); by four o'clock the wind was quite fallen, the fun
- fhone out, and the \(1 k y\) was clear and ferene, and not a veftige of the dreadful
' fcene remaining, but the difmafted and difmantled veffels in the Road.'
cxciv. That curious body the Labrador fone, which reflects all the colors of the peacock, is found there in loofe maffes. The late Mr. La Trobe fhewed me a piece of exquifite beauty, finely polifhed, which he procured from the laudable miffions in that country. It is, according to Mr. Kirwan, a foldt-fpat, fofter than the common kind.

I muft acknowledge my obligations to vice admiral Campbel, for the trouble he took in procuring, during his government, the following accounts from the different divifions of the great ifland of Nervfoundland; and fome additions to the. manner of carrying on its moft important fifhery.

Within the circuit of fixty miles of the fouthern part, the country is hilly, but not mountanous. The hills increafe in height as they recede from the fea; their courfe is irregular, not forming a chain of hills, but rife and fall abruptly.

The coafts are high, and the fhores moft remarkably bold. The fame may be faid of almoft every part of this vaft ifland.
The country is much wooded, and the hills (fuch which have not flat tops, to admit the rain to ftagnate on them) are cloathed, with birch, wich hazel, Spruce, fir, and pine, all fmall; which is chiefly owing to the inhabitants taking off the bark to cover the fifh ftages. This peninfula is fo indented by the fine and deep bays of Placentia, St. Mary, Conception, and Trinity, that it may be eafily penetrated in all parts, which is done for the fake of fowling, or the procuring of fpars for mafts, oars, \&c.

The ifland is on all fides more or lefs pierced with deep bays, which peninfulate it in many places by ifthmufes moft remarkably narrow.

The mountains on the fouth-weft fide, near the fea, are very high, and termisate in lofty headlands. Such are Chapeau rouge, a moft remarkably high promontory; Cape St. Mary's, and Cape le Hune. Such in general is the formation. of the ifland: on the north-eaft, moft of the hills in the interior parts of the country terminate pyramidally, but form no chain. The interior parts of the country confift chiefly of moraffes, or dry barren hummocks, or level land, with frequent lakes or ponds, and in fome places covered with ftunted black fpruce. The rivers of Newfoundland are unfit for navigation, but they are of ufe in floating down the wood with the fummer floods. Still the rivers and the brooks are excellent guides for the hunters of beavers, and other animals, to penetrate up the country; which as yet has never been done deeper than thirty miles. Near the brooks it is; that timber is commonly met with, but feldom above three or four miles inland, and in vallies; the hills in the northern diftrict being naked and barren.

In fome parts of Newfoundland there is timber fufficiently large for the build. ing of merchant fhips : the bulk is made of juniper, and the pine furnifhes mafts and yards; but as yet none has been found large enough for a maft for a large cutter.

The fifhery is divided into two feafons: that on the fliore, or the fhore feafon, commences about the 20th of April, and ends about the roth of Oatober; the boats fifh in from four to twenty fathoms water.

The moft important, the bank-filhing feafon, begins the Ioth of May, and continues till the laft of September, and carried on in thirty to forty-five fathoms depth of water.

Banking veffels have failed from St: Fohn's to the bank as early as the 12 th of April. At firft they ufe pork or birds for a bait; but as they catch fifh, they fupply themfelves with a fhell fifh called clams, which is found in the belly of the cod. The next bait is the lobiter; after that, the herring, and the launce, Br. Zool. III. No. 66, which laft till fune, when the capelon comes on the coaft, and is another bait. In Aivulf the fquid comes into ufe, and finally the herring again.

The greateft number of cod-filh taken by a fingle fifherman in the feafon, has been twelve thoufand; but the average is feven thoufand. The largeft filt which has been taken was four feet three inches long, and weighed forty-fix pounds.

A banking veffel of ten thoufand finh ought to be filled in three weeks, and fo in proportion; and eighty quintals ( 112 lb . each) for a boat in the fame time.

In 1785, five hundred and forty-one Engli/b veffels fiffied on the bank; a number exceeding that of the Freuch,

A heap of dried finh twenty feet long, and ten wide, and four deep, contains three hundred quintals. Such an heap fettles, in the courfe of forty-eight hours after it is made, about r-r2th.

An extraordinary fplitter will fplit five quintals of fifh in an hour. The average in that time is two.

There is no fifing, during winter, on account of the inclemency of the feafon. It is fuppofed that the fifh in a great meafure quit the banks before that time, as in general they are very fearce when the fifhing veffels go upon the banks early in the fpring.

There are a few fmall towns on the coafts, which have gardens fown with Englifh pulfe; but many of the inhabitants quit the country in winter.

An admiral, or fome fea officer, is governor of Newfoundland. He fails from England in May, and returns by the 3 oth of November.

RLASTER CLIFES. remarkable cliffs of plafter, lofty precipices, and extremely white.

The gut of Canfo divides Nova Scotia from Cape Breton. It is not above a mile
wide: it opens into Chedabucto Bay, which penetrates far into land. Cape Canfo forms the moft eaftern point on this fide of the gut; the land trends far to the weft;

BEAVERHAR. ROUR.

The coafts of Nova Scotia are, in general, rude and rocky, with fome variations. It is peninfulated by the Atlantic ocean and gulph of St. Laurence, and joined to the main land by a narrow ifthmus. From Bay Vert, on the northern fide, the fhore is bounded with red cliffs, with beaches beneath, as far as Port Lutirel, and the fame to a remarkable high rock, called, from its flape, The Barn. Cape George terminates the coaft to the eaft. This promontory is iron-bound, and very high, its fummit afpiring to four hundred and twenty feet above the fea. This, with Point Hood on the Cape Breton fide, forms a great bay. On the weftern thore, between Cape George and the entrance of the gut of Canfo, are moft from Canfo to Torbay breaks into feveral white rocky heads. Beaver Harbour is guarded by moft picturefque ifles, rounded, with wooded tops. As far as Halifax it varies, with banks of red earth, or white infulated rocks: the capes and external ifles are bounded with black flaty rocks, running generally out in fits from eaft to weft, from the Rugged Ifands to the Devil's Ifle. Off Halifax are remarkably high red cliffs, linked with beaches: from thence to Cape Sable, an ifland which forms the moft weftern extremity, is often broken, rocky, and white; but from Port Haldimand to Cape Sable the land appears level and low, with a fhore of exceedingly white fand.

3HLEDESABLE. About twenty-three fea leagues from Cape Canfo, in lat. 44, lies the fingular Ifle de Sable, or of Sand. It is in fhape of a bow, in length about eight leagues,
and not above a mile and half broad in the broadeft part. In the middle is a narrow pond of fea-water, running about half the length, which is filled every. tide from the fea's rufhing through a little gut on the north fide. This pond contains multitudes of feals, fome flat fifh, eels, \&cc. and has about twelve feet depth at low-water. The entrance is often choaked with fand by a frong north wind, and cleared by the next fouthern blaft. This ifland lies on a vaft fand bank, on which the water gradually deepens to fify fathoms. At each end is a bar; the water breaks on them often maft high : and there is, befides, a furf beating continually on the fhore, to be heard in calm weather feveral leagues. No boats can approach the ifland without rifque. Landing is practicable on the north fhore only, and that only in calm weather. The north bar breaks, in bad weather \({ }_{2}\), feven or eight leagues from the fhore; and thoufands of fhips have been loft about this place. M. De Barres * was two years in furveying this fatal tract, and his fervices have been lately rewarded by the government of the ifles of St. Fobn and Cape Breton. The whole ifle confilts of fine white fand mixed with white tranfparent ftones, but coarfer than in the adjacent foundings: the face is much broken, and hove up into little hills, knobs, and cliffs, wildly heaped together. In the hollows are ponds of frefh water, frequented at times by variety of fowls. On the fkirts grow juniper and blue berries in their feafon, and cranberries all the year. Here are no trees, but plenty of beach grafs, wild peafe, \&cc. which ferve to fupport the horfes, cows, and hog's, which run about in a ftate of nature. Wrecks and drift-wood afford fewel. The whole inte has a ftrange appearance; for the fandhills have a conoid fhape, are milk white, and fome of them are a hundred and forty-fix feet above the level of the fea.

I quit this fingular fpoi to return to Cape Sable, juft beyond which commences bay of fundy. the great bay of Fundy, with infinite variety of picturefque and fublime fcenery. The bay divides at the bottom into two others, the bay of Mines, and that of Cbignecto; and, like the reft of the coaft of this province, has numbers of fine harbours. Far from the fhore of every part of Nova Scotia extends a fkirt of fand, with deep water, and fine anchorage; but the harbours are moft fecure retreats. Grand Manan ifle is very lofty, and lies in the mouth of the bay of Fundy, nearer to the weftern fide. The bay of Si. Mary, which lies on the eaftern, is guarded Petit passage. by an extent of land and iflands; the entrances between two of them, diftinguifhed by the name of the Grand and Petit Pafage, are particularly noble, very lofty, with vaft mural fronts, and their tops finely cloathed with trees.

\footnotetext{
* To this gentleman's labors we owe the accurate charts of thefe and fome other parts of North America, the moft elegant and magnificent work of its kind extant.
}
views. The gut or entrance into the harbour of Amapolis Royal is narrow, and has not lefs grandeur, neither is it wholly diffimilar. The ife of Haute, which lies in the middle of the approach to the bay of Mines, rifes fublime and with mural fides out of the water, and is crowned with trees: from it is feen valt variety of beautiful feenery; fuch as Cape Chigneetr, Cape Doré, and Cape Split; the laft named from the vaft columnar rocks which rife before it to an amazing height. Nearly oppofite is Partridge Ifand, remarkable for the inclined difpofition of its rocks. Cape Blow-inedown is another great precipice, not far to the eaft. Between thefe the flream of the current runs at the rate of five or fix knots, even at neap tides. The tides in parts of the bay of Fundy rife to an amazing height, and force themfelves into the great creeks with a bore or head from fifty to feventy-two feet high, and with prodigious rapidity. Hogs, which feed along the fhores, are much more fenfible of its approach than mankind : they are obferved to litten,' to prick up their ears for fome time, and then run off at full fpeed.

The bay of Cbignecto is the laft. This runs far inland, and is feparated by the ifthmus from the gulph of St. Laurence. If we reckon to Bay Vert, it is only twenty miles in breadth; but if we compute the fpace between Petendiac river and Shediac, on the fide of the gulph, only fourteen. From hence the flore extends to the fouth-weft ; and we retain as far as the river St. Croix.

> CLASSI. QUADRUPEDS.

THE Elk has deferted the fouth of Sweden for a confiderable
\[
\text { P. } 17
\] time; ftill fome are found in the forefts near Stockbolm, more or fewer, according to the year, for they are a fort of vagabond animals. . The chace is entirely referved for the nobility or gentry; and even they are prohibited from killing them before the 24th of Auguft, under penalty of fifty rix-dollars, or 11 l. 13 s. 4 d. The inhabitants dillike them greatly as neighbors, fo much mifchief do they do in the cultivated grounds. In May, Fune, and fuly, they are fo bold, that the people are obliged to drive them away with blows of a ftick: after that they are more difficult of approach. In Fermtland, a province of Norland, their chace is free to every one. The largeft Elk Mr. Oedman ever heard of, weighed eleven hundred and fixty pounds. A fawn of this fpecies, taken very young, is capable of being eafily tamed, and may be made as familiar as a dog; but the male becomes fierce when it is in heat, at left if it is not caftrated. It will drink greedily of wine, if given to it; and when it gets drunk, it will frort
it out of its noftrils. In a wild ftate, this animal feeds on the lichens bark of the afpen poplar, the grey and the goat willows: when tame \({ }_{p}\). it eats hay, and is very fond of peas ftraw; but the laft muft be given in fimall quantity, as it is apt to produce a fatal coftivenefs. When the female is clofely purfued by the dogs, it will fling itfelf into the water with its fawn, and will continue fwimming with it for many hours. She rarely brings more than one at a time. During winter, when the ground is covered with fnow, the hunter cloaths himfelf with white linen, in order to render himfelf lefs. vifible.-Mr. Oedman.
22. Wild Rein-deer are very farce in the north of Sweden: the Wolves: having almoft extirpated this fine and ufeful animal. It is certain that horfes cannot bear the fmell of the Rein; they will, even on. the firft perception, become unmanageable, fo that the riders cannot without difficulty keep them from running away with them. -Mr . Oedman.
27. It is pofitively faid by Siernhook, in his treatife De jure Sueonum: vetufto, that in old time Stags were unknown in Sweden, and that they were introduced there but a little before the time of Guflauns: Erickfon, who began his reign in 1521 . Such Stags (fays he, to diftinguifh them from the Rein-deer), which are now found in our fouthern provinces. Let me add, that it is certain that they have alfo long fince reached Norway.-P.

Fallow-deer feem not to have been natives of Sweden; there are none in the forefts, but which have efcaped out of the king's parks: fuch as thofe near the capital; in the inle of Oeland; that of Wefengore, in lake Wetter; and at Omberg. Even Stags are rare in a ftate of nature and thofe only in the forefts of Smaland. -Mr . Oedman.

Ross are at prefent found fcarcely any where but in the foreft of Smaland, and that buit rarely. The female brings only two at a time: the buck will defend itfelf with courage againft the dogs, when driven to extremity. They never make a ring when they are hunted, but run ftrait forward, two or three Swedifh miles, or twelve or eighteen Englifs; and then return along their former track: but fo fatigued as feldom to efcape. -Mr . Oedmon.

Mr. Hutcbins was prefented, by the Weabipouk Indians, with a Deer four feet eight inches long, and three feet two high. It was entirely white, except the back, which was mottled with brown. The fur was fhort and fine, like that of the Ermine. The Indians, in their manner of exprefion, faid it came from a place where there was little or no day.-P.

In many parts of Sweden the number of Wouves has been confiderably diminifhed by placing poifoned carcafes in their way: but in other places they are found in great multitudes. Hunger fometimes compels them to eat lichens; thofe vegetables were found in the body of one killed by a foldier, but it was fo weak, that it could fcarcely move. It probably had fed on the lichen vulpinus, which is a known poifon to thefe animals.

Madnefs, in certain years, is very apt to feize the Wolf. The confequences are often very melancholy. Mad Wolves will bite Hogs and Dogs, and the laft again, the human fpecies. In a fingle parifh fourteen perfons were victims to this dreadful malady. The fymptoms are the fame with thofe attendant on the bite of a mad dog. Fury fparkles in their eyes; a glutinous faliva diftils from their mouths; they carry their tails low, and bite indifferently men and beafts. It is remarkable that this difeafe happens in the depth of winter, fo can never be attributed to the rage of the dog-days.

H2 Often,

Often, towards fpring, Wolves get upon the ice of the fea, to prey on the young Seals, which they catch anleep: but this repart often proves fatal to them; for the ice, detached from the fhore, carries them to a great diftance from land, before they are fenfible of it. In fome years a large diftrict is by this means delivered from thefe pernicious beafts; which are heard howling in a moft dreadful manner, far in the fea.

When Wolves come to make their attack on cattle, they never fail attempting to frighten away the men by their cries; but the found of the horn makes them fly like lightning.-Mr. Oedman.

When the Arctic Fox has been in purfuit of the wandering Lemmus, p. 136. ArCE. Zool. it fometimes lofes its way home, and has been taken in places far from its natural haunts. The late Mr. Kalm has left an inftance of one being taken in Weftrogotbic. Profeffor Retzius favored me with an account of one fhot, on the 27 th of laft October, near to Lund, in lat. 55. 42.

Mr. Hutchins informed me of a whitifh grey Fox, no larger tharr a Hare, common among the Arcbitbinue Indians: four thoufand of their ikins have been fent in one year to the factories.

The Lynx is the moft formidable enemy which the Sheep has: it is pretended that they only fuck the blood; but it is pretty certain that they alfo devour the liver and lungs, for thofe parts are often found eaten. The little Kat-lo or Lynx is very fcarce ; its fur is efteemed more valuable than that of the greater or Warglo. It is fuppofed to be a particular fpecies.-Mr. Oedman.

Doctor Pallas muft have been mifinformed as to the color of the Bears of Kamtfobatka; for Captain King, who faw feveral, affured
me, that they are of a dun brown color; and feed chiefly on fifh, or berries. They are far from rejecting animal food. Even mankind become their prey, when preffed by hunger; and they will hunt the natives in fuch cafes by fcent, and prowl out of their ufual tracts for that purpofe. At thofe times, or when wounded, they are exceedingly fierce*. It is faid that they give chace to the Argali with great addrefs : they know that they have no chance of taking them by fpeed; the Bears therefore climb up the rugged mountains, and gain the heights above the fpots where the wild Sheep feed. They with their paws fing down pieces of rock upon the herd, and, if they happen to maim any, defcend and make a repaft on the lamed animal \(\dagger\). When the Bears find plenty of food, they will not attack the human kind: yet if they find a Kamtfchadale aneep on the ground, they will through wantonnefs bite him feverely, and fometimes tear a piece of flefh away. People thus injured are called dranki, or the fayed \(\ddagger\).—P.

Place between the Common Weefel and the Stoat, this fpecies, newly difcovered by Mr. Helenius, Profeffor at Abo, in Sweden.

Muftela nivalis.-Fennorum Nirpa Lumiko, Lumitirka, Nov. Acz. Acad. Reg. Scient. Suet. vi. 1785. p. 212.-Lappon. Seibbfh.-Rufis Lafka.
W. With large canine teeth : body in fummer grey, with a tincture of rufous : tail of the fame color: belly white. Length from the tip of the nofe to the bafe of the tail fix inches and a half: tail an inch and a half. Shape of the Stoat.
Inhabits the north of Finland and Lapland. Lives during the fummer in the forefts; in winter frequents villages and houfes. Feeds on mice, fmall birds, their eggs and young; eats alfo frogs. Is itfelf the prey of rapacious birds, and of the Ermine or Stoat. In winter changes to white, the whifkers; and a feiw hairs in the tail, excepted. Has not the
foetid fmell of the Weefel and Stoat. Is taken in traps baited with a moufe, or fimall bird. The Ikin is equal in price to that of the Ere mine.-Profeffor Retzius.
24. The common Englifb Hare is found in Sweden, and is perhaps the only kind in the fouthern part. Profeffor Retzius is of opinion, that it does not differ in fpecies from the Varying, No. 37. ArEt. Zool. I have given my reafons, in the Tour to Scotland, and my Hifory of Quadrupeds, vol. II. p. 370 , for differing from his refpectable opinion.
In Sweden the common Hare is in fummer of a dufky brown: in winter becomes cinereous. In that ftate, I have feen a brace fent over to England. In Scania they are twice as large as they are in the northern parts of Sweden, i. e. than thofe I call the Vorying.

The Beaver is extremely fcarce in the lower part of Sweden. Mr. Oedman recollects but one inftance, and that was in Weftrogotbia. It was fo little known there, that the common people regarded it as a prodigy.
109. The Caqua, or Canada Porcupine, feeds much on the bark of pines or juniper : it is their food the greateft part of the year, and the buds of willows their chief fupport the reft. In walking it drags its tail along the ground. Indians difcover them by the track they make, but chiefly by the unbarked trees.

The Wenufr, or Qubeec Marmot, feeds on coarfe grafs. It burrows in the earth in a perpendicular manner. The Indians take it by pouring water into the holes, which forces it out.-P.

Five varieties of Seals are found in the Baltic. It is made a doubt whether they are not even diftinet fpecies.
The firft is the Grey Seal, Grat Siäl, which when juft born is wholly yellow: but that color foon grows obfcure, and the fkin becomes va-
ried with fpots or waved lines. This variety is the large of thofe which inhabit the Swedifh feas.

The fecond is the Houtkàl. This, when juft dropped, is more white, and never changes, unlefs to a tinge of pearl color, when it has ceafed growing. It never attains the fize of the former, lives feparate from \(i t\), and is more timid.

Thefe two variecies live on the high feas, and feed on herrings, medufe, and blennies. During winter they retire under the ice, through which they form holes by blowing on it, let the thicknefs be ever fo great. In fummer they mount on the fand-banks to fleep.

The Seal called the Wikare gris, and Wikare noir, are two varieties, which fleep on fhore. The two preceding fometimes fleep in the fea, keeping their heads above water; they fleep fo found that the hunters. can reach and harpoon them in that fituation. The Wikare feeds chiefly on the gafterofeus aculeatus, Lin. three-fpined ftickleback, \(B r\). Zool. III. No. 129. and becomes fo fat, that when killed it cannot fink to the bottom. The young of the Black Wikare are conftantly black; thofe of the Grey Wikare always grey.

Fifthly. The Morunge is always ftriped (tigré). This. fpecies is of late years fo diminifhed, that for ten years paft there has not been feen one in all the Swedifb archipelago.

If theif five are varieties, they are certainly varieties which live always feparated, and never mingle with one another.

The chace of the Seals in the gulph of Botbnia, is as remarkable as that of the Greenlanders. In the fpring, when the rivers of Lapland force with their ftream, into the fea, vaft maffes of ice, the Grey Seals and Hautkalls retire upon them. The hunters never neglect the opportunity of taking them : they find out thefe floating mountains, which, according to Mr. Hjarne, are twelve or fourteen fathoms in thicknefs below water, and of a great extent. The hunters lay in provifions for-
fix wecks, and a hearth to drefs their meat on. They then moor their boat to one of thefe mountanous pieces of ice, the hollows of which are filled with Seals. They cloath themfelves in white, to render themfelves lefs fufpected by thofe animals. They alfo whiten their boats with lime; and fleep in them during night, and thus pars ten or twelve days among the ice, till they difcover the Seals. When they hear a certain crackling, they confider it as a fign that the piece of ice is about to fall to pieces; they guard againft the confequences, and feek another; and fo continue rowing from one piece of ice to another, in fearch of the Seals, till they have exhaufted every objet of the chace.-Mr. Osdman.

\section*{V O L. II.}

> CLASSII. BIRDS.
DIV. I. LAND BIRDS.

> HE Falco Metancetos, and the F. Fulvus of Linneus, or my Black Eagle, are the fame; the F. fulvus being only the young of the firt. It is a fcarce fpecies in Sweden.-Mr. Oedman.

The Osprey returns into Sweden later than the Kite. Mr. Oediwan flings new light on the hiftory of this bird: he fays that it breeds on the tops of the higheft trees, and makes its neft with wonderful art, of the twigs of the fir tree, and lines the bottom with polypodies. It lays three eggs, of the fize of thofe of a Hen, marbled with ruft-color. It brings fifh and ferpents to feed its young; and even eels of a vaft fize : this makes its neft very foetid. It does not prey on birds, but on fifh only. It defends its neft with great fpirit.
F. with a very fharp bill, furnifhed with a large and pointed procefs in the upper mandible: cere yellowifh: head, front of the neck, breaft, and belly, white ; each feather marked along the fhaft with a ftreak of brown ; the narroweft are on the head: back and coverts of the wings of a dirty blueifh afh-color; edges of the feathers whitifh, and many of them tipt with the fame : primaries dufky; exterior webs blotched with
white, interior barred with the fame: tail of the fame color with the back, and barred with white; the bars do not reach the fhafts, and, like thofe in the Iceland Falcon, oppofe the dark bars on the adverfe fide:. legs blueifh. Length two feet two inches.

This fine fpecies inhabits Hudfon's Bay: is new, and to be placed. in p. 202.

Is to be placed among the American birds, having been difcovered to be an inhabitant of Hudfon's Bay.

Fulius Firmicus, a celebrated writer in aftrology, who dedicated his books to Mavortizs Lollianus, conful in 354, affirms, that whofoeverwere born under the influence of Mercury and Virgo, would be ftrong and induftrious, and be well fkilled in breeding fine horfes, and in: training Hawks and Falcons, and other birds ufeful in bird-catching, \&rc. By this it appears, that actual falconry was in ufe long before the time I imagined.

The Erne, or Cinereous Eagle, the Valtit Albicilla of Linn tus, is the firt year wholly dufky, even to the bill, cere, and tail. In the fecond year the cinercous color commences, teffelated with black; the tail becomes white; and the end of its feathers for fome time tipped with black.

It is very eafily made tame : will attach itfelf to its mafter, diftinguifh him from others, and receive him with many marks of endearment. When hungry, repeats the founds, tack tack; and when fatisfied with food expreffes its content, by a repetition of the fame note. Is particularly fond of fifh: is a fuggifh and cowardly fpecies, and will be put to fight even by the Turkies.-Mr. Oednzan.

The Golden Eagle has been taken, twenty-five years ago, in Scania, of a fnowy whitenefs; it is ftill alive - Profeffor Retzius.

The Kite is the firt of the migratory birds which appears in Sweden in the fpring. Mr , Oedman.

The Kestril breeds not only in ruins but in hollow-trees. Mr. Oednan.

The Strix Aluco of Linnews; La Hulote, de Bufon, I. 358 ; Plo Enl. 441, is a bird of Swoeden, omitted in the Arctic Zoology. I never met with it, therefore borrow the defcription from Mr. Latbom's Ornithology.

The head is large: irides dufky: circle of feathers round the eyes greyif: upper part of the body deep iron-grey, fotted with black and white: breaft and belly white, ftriped down with ragged black ftrokes: legs and feet covered with feathers, white, with numerous black fpecks: tail barred with reddif aifh and black: the firt feather of the wings exceeds the reft by two or three inches: the wings reach beyond the end of the tail.

This fpecies lays, in April, from three to five eggs, of a fnowy whitenefs: the young are blind to the tenth day, and are covered with filthy red warts. The female parent feeds them with mice. They fly towards the end of fuly. The note of the young is like the noife of granthing one's teeth. The old fly in the moft quiet manner, and make no fort of noife: they feed on fmall birds, but vetches have been found in their flomach. In the fummer they live in the woods; towards winter return to the neighborhood of houfes. It refufes to eat in captivity, and lofes its life with its liberty. If one of its young is taken away, it removes the reft to another place.

The Short-eared Owe, Arci. Zool.11. No. 1i5. appears to me to be La Cbouette of the Comte de Buffon, and his Moyen Duc, ou Hibou, tab. 29. of the Pl. Enlum. In p. 102. of my Indexes to his Ornitbologie, and the \(P l\). Enl. I have endeavoured to clear up the confufion, which the illuftrious writer has introduced on the fubject.
\[
\mathrm{I}_{2} \text { Doctor }
\]

OWL. SHRIKE. RAVEN:
Doetor Tiengmalm, an able ornithologift, refident near Stockbolm, lately difcovered a new fecies of Owl, of the fize of a Blackbird. The bill duiky, tipped with white : from its corners, to each eye, is a line of black : the irides yellow : the circlet of feathers round the eyes is white, mixed with dunky: head grey, ffriped with white, and furrounded with a dufky circle fpotted with white and dufky: primaries dufky, barred with white: breaft and belly white, varied irregularly with dufky: marks : tail above, of a duky grey, ftriped with white : toes feathered to the claws ; grey, with pea-fhaped fpots of white.

The Little Owl appears in Sweden with the firt rays of the fun: its voice is a moft acute whiftle, by the imitation of which, fmall birds are readily collected together.

The Red-backed Shrike returns to Sweden the latter end of April: makes its neft in low bufhes, in form of a cup, near a quarter of a yard in diameter, of wool, foft dry grafs, \&xc. with amazing art. The young are long before they fly : the tafk of feeding the young refts chiefly on the female; and principally the food confifts. of infects of the bymenopiera order. Their food is not confined to thofe, for Mr . Oedman has feen about the nefts the exuviæ of thoufands of hornets. The female defends its neft ftoutly, yet at other times is very timid: the male with great affection feeds its mate, when the latter is on the duty of incubation; and during that time is rarely feen at home. When the female has quitted the neft, the male undertakes the care of the young; fitting for their protection in the top of fome neighboring tree: the fcmale fits in fearful filence: its mate elevates its voice. This fpecies feeds chiefly on infects, feldom on fmall birds. -Mr . Oedman.

The Raven in winter lives: in Sweden, in flocks, near the fhores of the fea, to fupport icfelf on whatfoever the waves fling up. The ruftics
ruftics efteem it a bird of ill omen, efpecially when it is heard croaking near the houfes of the fick. They fear fhooting this bird, under a notion that it will fpoil their gun.-Mr. Oedman.

The Carrion Crow is never feen farther north than Norcopin, lat.
245. 58. 45-Mr. Oedman.

The Rook has not been obferved in Sweden, except in the fouthern province of Scania, and the inle of Oland.- Mr . Oedinan.

It is very fingular, that the Hooded Crow, when it migrates, at the approach of winter, out of Smoland, retires into Upland, a province three degrees to the north of the former: there it lives during winter, near the fhores, in the manner of the Raven. It is a bird detefted by the natives. Feeds on the eggs of the wild Geefe and Ducks. Is driven away from the illes by the Black-backed Gull.-Mr。 Oedman.

The Jackdaw is feldom met with beyond Helfingeland, a province lying between lat. 6 r . and 62.33 . Inhabits towers, but often ufes the deferted nefts of Woodpeckers.-Mr. Oedinan.

The Nutbreaker comes very late into Sweden; and ftays there till the nuts are gathered. Is not to be feen beyond Upland. Hazel nuts rarely are to be met beyond Gefle, lat. 60. 45 : they have indeed been planted, by Mr. Hozjfrom, at Skellefla, near the arctic circle : they endured the winter, but did not bear fruit. The nuts of Oland are greatly fought after in Sweden, and thought there as fweet as almonds.Mr. Oedman.

The Jay is eaten in Sreeden; and taken in fpringes, baited with the berries of the mountain afh, or forbus aucuparia.-Mr. Oedman.

The Green Woodpecker inhabits the wooden fteeples of Sweden, as well as trees. - Mr. Oedman.

The Hoopoo is called the Harfogel, or Soldier-bird, not from its creft but its note, uttering, as it runs on the ground, the note opp,opp,opps, thrice repeating it, then haftens moft fwiftly to another fpot, and repeats the fame. Opp, in the Swedifb language, fignifies the fame as \(T_{0}\) Arms! hence this bird has been ftyled the omen of war,-Mr. Oedman.

The Great Grous* is very eafily tamed if taken young, and is fed with corn. The males, in a domeftic flate, emit the fame note all the year, which in a wild fate they only ufe in the feafon of love. When a cock of this fpecies is fhot in the woods, its widows are heard to utter a note inexpreffibly miferable at their lofs. In the love feafon the females have been found fo greatly overpowered with the all-ruling paffion, as to lay themfelves on the ground, foliciting the company of the males, with their ufual note; and fo intent on the expected joys, as to neglect their own fafety fo much, that the peafants have actually taken them up in their hands. -Mr . Oedman.

The Spurious Grous, or Racklebanen of the Swedes, is a breed between the cock of the Black Grous, and a female of the Great Grous ; its note partakes of both fpecies. It is reftlefs, conftantly moving from tree to tree; is therefore hated by fportmen, as it gives other birds notice of their approach. This variety is well figured by. Doctor Sparman, in his Minfoum Carlfonianum, tab. xy.-P.

The Brack Grous in the winter-time fills its craw with the catkins of the birch, before it retires under the fnow; and by this means can fuftain life feven days without any other food.-Mr. Oedman.
* I change the trivial, wOOD to that of GREAT, as it is not peculiar to this. ipecies to inhabit woods.

The cock of the Black Game has been known in Sweden to cover the common domeftic Hen, which did produce a barren fpurious breed.

The Great Bustard is very common in Scania, or Scbonen; but Profeffor Retzius informs me, he never faw nor heard of it in that province.

The Stare winters in Denmark, but fometimes never quits Scania.Mr. Oedman.

The Water Ouzel is ufed by the Rufians as a remedy againft the dropfy. The whole bird, unfeathered, is reduced to afhes in a pot; it is taken in one dofe, and acts as an abforbent.-Mr. Oedmaan faw it fucceed beyond all expectation in an afcites: his father, a gentleman eighty vears of age, almoft fuffocated with a quincy, and with his fomach greatly fwelled, was reftored to health in four days by this fimple remedy only, and has furvived, in good health, feven years fince the trial.

The fong of the Redwing differs from that of the mufical Thrush z \(_{3}\) in moft effential notes.-Mr. Oedman.

Mr. Argillander obferves, in the Act. Stockbolin, 1786, that the 343. Golden Oriole returns to Savolax, in Finlond, in the end of May, and retires in September:- that it is much more frequent in the north of that province than the fouth, living in the birch woods along the coafts. Two males attend one female: is it therefore biandrous? During fummer, they keep by threes or fours together: towards autumn the flocks increafe in numbers : foretel ftorms by an alteration in their whiftle. They fly like Thrufhes: are timid birds, yet very irafcible, and will bite very hard: are fo tenacious of life, that one which was fhot through by two great fhots, lived two days. The flefh is as good as, that of the Thrufh. -Mr . Oedmarn.

347 and 354.
348.

Doetor Tengmalm obferves, that the Haw Grosbeak, and Crossbile, come alternately in vaft flocks, but never appear at the fame time.

The Pine Grosbeak is the firt year of an orange color, the fecond of a fcarlet.

The Lesser Redpole migrates in flacks of above two hundred, about Micbaelinas, and not one female amongft them. -Mr . Oedman.

The Pred Fly-catcher returns to Sweden in April: lives near the water: lays five eggs, in the hollows of trees.-Mr. Oedman.

The Spotted Fly-catcher, Br. Zool. I. No. i34. returns later.Mr. Oedman.

The Figeater, Motacilla Ficedula, is not found in Sweden, Limanéus being fomehow or other miftaken.-Mr. Oedman.

The Golden-crested Wren, and Common Wren, never quit Sweden in the winter. The laft lives during that feafon in the thickeft bufhes.-Mr. Oedman.

The Pettychaps vifits Sweden in the middle of May.
The Scotch Warbler, or M. Acredula, is difcovered by Doctor Tengmalm to be no other than a young yellow Wren.-M. Trochilus. Mr. Oedman.

The Azure Titmouse is found in Sweden, at the farm of Sueby, in Sodermanland; and figured in that elegant work, by Doctor Sparman, before cited. tab. xxv.-P.

In the fame work, tab. xxr. the fame gentleman defcribes and figures a new fpecies of Bunting, under the name of Emberiza Maelbyenfis.
byenfis. It was difcovered on the eftate of Count Carlfon, at Maelby, in Sodermanland. The bill and legs are reddifh : the crown, cheeks, and fore part of the neck, are cinereous: between the eyes and noftrils is a white fpot: the chin and vent white: lower part of the breaft, belly, and thighs, ruft-colored: back and coverts of wings ruft-colored and black: primaries dufky, edged with ruft: in the tail ten feathers; the fix middlemoft wholly black; the two outmoft, on each fide, have the upper pars of their interior parts white; the reft black.-Dr. Sparman.-P.

\section*{D I V. II. W ATER-F O WL.}
441. \(\quad\) in the Sroon-Bill may be made thefe additions:-They are found jowa, where they refort to feed on the freth-water muffels. When they are difturbed, they rife high into the air, and affume an oblique and winding form, which no noife can difcompofe or break. Their plumage, efpecially in their flight, exhibits a moft dazzling whitenefs. I do not trace them farther fouth than Aleppo, which is one of their winter retreats.

Notwithflanding their fifhy food, they were formerly efteemed a delicacy. A grove at Sevenbrys, near Leyden, was, in the middle of the laft century, one of their breeding-places; and was rented from the lord of the foil, by a perfon who made a profit of their young. But when I was there, in 1765 , I found that the grove had been long cut down, and the birds quite driven away. They are never feen in England, except by accident.
442. The Hooping Crane breeds in the north, in unfrequented places, near the fides of lakes; and makes its neft on the ground with grals and feathers: lays two white eggs, and fits twenty days. The young are firt yellow, and by degrees become white. They feed on infects and worms, which they get from the bottoms of fhallow ponds.

The Great White Heron is gregarious; and may be feen in Carolina, perched on trees, in flocks of thirty or more.

Red-billed Heron, Latbam; v. 93-CCatefy, i. 77.-Le crabier à bec rouge, de Buffor, vii. 401 .
H. With a red bill, two inches and three quarters long. Irides yellow : legs green : plumage of a fnowy whitenefs. Length eighteen inches:

Inhabits during fummer Carolina. Frequents rivers and ponds. Fecels on fifh, frogs, \&c. Retires fouth at approach of winter.

The Bittern of Hudjon's Bay does not bellow like the Englifo.
To the Sibirion Crane may be made thefe additions:-It makes a noife like the Whifling Swan. It is very fhy, and difficult to approach; the moment it fees a man, be he ever fo far off, it inftantly rifes into the air, which refounds with its cries. Its great height giving it the advantage of feeing all round to a confiderable diftance; the fportfman is therefore obliged to ufe great caution. The left ruftling of the reeds fets it on its guard. He therefore approaches it under fome cover, or when the bird is bufied in taking the fmall fifhes, on which it feeds. Apprehenfive as it is of men, it is fearlefs of dogs, and will attack them with great fury, which gives the mafter opportunity of making his fhot. In the breeding feafon it is quite intrepid, and will guard its young with great courage, and with its fharp bill become a very dangerous opponent to the perfon who attempts its neft. The male and. female alternately protect the young. Thofe of the firf year are of the color of ochre; in the fecond they become white: the fkin is as red. as the bill. They are frequently reared with the young of other Cranes. at Tobol/ki, and other parts of Sibiria, and will agree with them very well; but will grow enraged at the fight of children, and eagerly attack them. This fpecies poffibly extends to Clina, a bird, extremely like it, being frequently feen on the Cbinefe paper.

The White Stork is never feen farther north in Sweden than Scania.

The Bay Ibis has been feen of late years in the inle of Oland. This fecies begins to form a fettlement there, and to return annually. -Mr. Oedman.
\[
\text { K } 2 \quad \text { The }
\]

MARBLED GODWIT.

HUDSONTAN GoDV1T.

The female Woodcock may be diftinguifhed from the male by 2 narrow ftripe of white along the lower part of the exterior web of the outmoft feather of the wing. The fame part, in the outmoft feather of the male, is elegantly and regularly fpotted with black and reddifh white. In the baitard wing of each fex is a fmall pointed narrow feather, very elaftic, and much fought after by painters as a pencil.

The Dusky Snipe is to be reckoned among the Swedif birds, one having been killed near Stockholm.-Mr. Oedman.

Length nineteen inches. Bill orange, four inches long, black towards the tip: plumage on the upper parts of the body brown, marbled and fpotted with rufous white: cere and chin white: quills, rufous cream-color, marked with minute brown fpecks: the whole of the under parts of the body pale rufous; the breaft and fides very pale, tranfverfely barred with dufky waved lines : vent rufous white : tail rufous, croffed with fix or feven brown bars: legs black.

Inhabits Hudfon's Bay. Communicated by Mr. Latham.
Length nearly feventeen inches: bill three, bending a little upwards; the bafe half pale, the reft black: crown blackifh, fpotted and ftreaked with dufky white: fides of the head, and back part of the neck, nearly the fame, but paler : lore dulky : over the eye a white ftreak: chin whitifh : back and fcapulars dufky brown, fpotted with rufous white: leffer wing coverts brown; in the middle paler, and marked with a few fpots of white: larger coverts, plain afh-color: quills black, with white fhafts, the bafes of them, from the fourth, white for one-third of their length : rump white: the whole of the under parts, from the chin to the vent, fine rufous bay, waved acrofs with dufky lines: tail feathers white at the bafe, and dufky the reft of their length : legs black.

Inhabits Hudfon's Bay with the laft. Communicated by Mr. Latbanz. 10

The

The Alwargrim breeds in all the moraffes of Smoland: thofe which migrate to the Swedifb Alps, return at Micbaeinas, and re-migrate through Helfingeland, where thoufands of them are feen covering the fields.-Mr. Oedman.

The Spotted Gallinule, Br. Zool. II. No. 215 , appears in Hud. fon's Bay in May; retires in Oitober: lurks about the rivers and lakes: lays ten or twelve white eggs under fome bufh. Length eight inches; in weight not three ounces.

The Common Gallinule is found in Sweden, but omitted in its Fauna.-Mr. Oedman.

I guefs that the Red-necked Grebe is found in Sweden, it being figured by Dr. Sparman, tab. ix. of Muf. CarLJon. He calls it Colymbus Parotis.

Mr. Oedman, like myfelf, has feparated the Guillemots from the Divers. The young birds are diftinguifhed, to their third year, by the foftnefs of their nails.

Lesfer Guillemot, Br. Zool.iii: No. 235-Latham v. 331.-Ringuia, Brunnich, No. 110.
G. With a black, fender, and weak bill, two inches and a half long: crown, and all the upper part of the body, wings, and tail, dufky moufecolor: tips of the fecondaries white : from the chin to the vent white : legs black. Length fixteen inches; extent twenty-fix; weight nineteen ounces.

Inhabits Iceland, and poffibly all the other northern coafts of Eurcope; frequents the Britijb, feas only in winter; are feen with the Black-billed Auks, in flocks innumerable, in the Fisth of Forth, in purfuit of fprats; are alfo feen on the coafts of Nortb Wales, and Devonflaire, in the fame feafon.

The excrements of the Black Gullemot, in the Normegian feas, are of a fcarlet color, occafioned, as is fuppofed, by its feeding on the afcaris verfpellis, or rodant. .
526. The Caspian Tern has been lately difcovered near Stockbolin. It returns to the Baltic before the Black-backed Gull. Lays three egogs on the bare rock; white, thinly painted with black.-Mr. Oedman.

Mr. Oedman has confidered the different fpecies of Gulls with more attention and judgment than any other naturalift. On his remarks I make the following corrections of my own miftakes, and thofe of moft other ornithologifts.

The Wagel is only a young Herring Gull, not arrived at its full plumage. The Silvery, or Larus Argentatus, on the reverfe, is a very old bird of the fame kind, whitened by age and cold. The eggs of the Herring Gull, in Sweden, are darker colored than thofe of Eingland.

The Kittiwake, or Three-toed Gull, undergoes three alterations of color. In the firt ftage of its life, its plamage is much mixed with black, and is at that time the fame with my Tarrock.

In its fecond ftage, is the fame with the Kittizoake; and in the laft, is the fame with the Larus Riffa.

The Laughing Gule has been feen only very lately on the Baltic fea.

Mr. Oedman fays, that the Ivory Gull merits the name of fnowy, from its fuperlative whitenefs.

The Glaucous Gull breeds on the rocks of the Baltic fea, and muft be placed among the birds of Sweden. It lays three blueifh eggs, with fome large black fpots. They are yery fharp at the leffer end.
The Winter Gull, Br. Zool. II. No. 248, has been difcovered to be the young of the common Gull, not arrived at its full plumage.

\section*{P E T R E}

This fpecies of Gull was difcovered by Mr. Hutcbins, in Hudfon's Bay. Its bill is black, and three inches long: head, neck, breaft, and belly, of an uniform brown : primaries black; coverts and fcapulars brown, marked with white: tail black, fpeckled and tipt with white. Length twenty-three inches; extent four feet anda half; weight two pounds and a half. Perhaps a young Skua Gull : the natives call it Keajb.

To the genus of Petrel may be added the following fpecies.
Lathan, vi. 396.-Quebrantahueffos, Boug. Woy. 63.-Cook's Woy. ii. 205.-Forfer's Voy. 516.-De Buffon, ix. 519.
P. With a very ftrong bill, four inches and a half long, much hooked at the end, and of a fine yellow, like that of polifhed box; the tube reaches to the commencement of the hook. At the corners of the mouth is a naked yellow fkin : the crown is duky: hind part of the neck and back light brown, mottled with dirty white: wings, fcapulars, and tail, an uniform dufky brown: fore part of the neck, breaft, and belly, white: legs fhort, ftrong, and of a greyifh yellow: the fpur very ftrong and fharp. Length forty inches; extent of wings feven feet: equal in body to a goofe.

Thefe birds are very common off the weftern coaft of Nortb America, and in the fea between that continent and Kamtfchatka, and quite cover the rocks of the intervening chain of ifles with their numbers. Steleer faw multitudes feeding on a dead whale, two hundred verfts from land. They fpread over the ocean like the little fpecies of Petrel, and like it is the harbinger of ftorms. Sailors diflike their appearance, and call them Motber Cary's Geefe, as they do the leffer kind her Cbickens. Mother Cary was probably a witch, protectrefs of thefe ominous birds : for feamen as well as landmen had their belief in the weird fifters, who

Hand in hand,
Pofters of the fea and land.
They often appear the day before a from, fometimes fkimming the furface of the water, following the courfe of the waves with expanded and feemingly motionlefs wings; as the winds increafe fo do their numbers; gathering round the fhip, fometimes flying round, at others floating on the waves, but always keep near, till the recturn of fair weather *.

They are found as high north as the Kamztcchatkan feas; and along the weftern coafts of America, in different places, as low as Staaten land. They have been feen in the northern hemifphere in March, April, and May. In the fouthern, for example, in Terra del Fuego, and Kerguelin's ifland, in December. They are very foolifh birds; and were found in the laft place fo tame, as to fuffer the feamen to knock them on the head with fticks. The Rufians, on account of the ftupidity of thele birds, call them Gloupicbi \(\dagger\). They feed on the carcafes of feals, whales, or any others they meet with. M. Bougainville intimates, that they alfo prey on live birds; for he fpeaks of them as the enemy of certain kinds frequent on the Fabkland ines \(\ddagger\). From the valt frength of their bills, they certainly are a redoubtable foe: the Spaniards, from that circumftance, call them Quebrantabuefos, or the Bone-breaker \(\|\). Our circumnavigators eat of them, and call them a good food.

It is very probable that they migrate, with the Albatros, into the fourthern hemifphere, and breed there. The eggs of the Pintado Petrel were found on Kerguelin's land in December. A fmall blue fpecies, and a fmall black one, were alfo feen at the fame time afhore there \(\S\). This. concurrence of four fpecies of a genus, which is never found on land, minlefs at the feafon of breeding, renders certain that this is one of the

\footnotetext{

}
places, and December one of the months in which they perform the firt great command of perpetuating their race.

> Lathan, vi. 408.-LEv. Mus.
P. With a black bill, an inch and a half long: chin, throat, and fpace round its bafe, of a pale filvery grey, minutely fpeckled with dufky: crown, upper part of the neck, back, wings, and tail, of a footy black, a little hoary on the back : whole lower part of neck and body of a hoary afh : tail rounded at the end : legs, and one third of the length of the webs, very pale : the reft of the webs and the joints of the toes black. Length thirteen inches.

From a fecimen in the Leverian Mufeum, fuppofed to come from the weftern fide of North America.
Latham, vi. 416.-Br. Muf.
P. With a dufky bill, an inch and an half long: inftead of tubular noftrils, only two fmall apertures : upper part of the body dufky black, lower white: fides of the neck mottled with brown and white: edges of the middle coverts of the wings whitifh : legs placed as far behind as the vent, dufky on their outfides, pale on the inner : two inner toes yellowifh : webs orange. J_ength thirteen inches.

Inhabits Nootka found; and Cbrifmas inle, in the Pacific ocean, lat. 1. 59. north. long. 202. 30. Eaft.

The Goosander fears lefs the cold than the ice, the laft preventing

BLACK-TOED.

DUSKY

PLACE。
537. it from feeding: one was feen in Helfingeland, in the month of fanuary, in the moft intenfe cold. It returns among the firft birds in the fpring. It lays fourteen eggs, fometimes in hollow trees, fometimes under buhnes. The males, in the month of \(\mathcal{F u l y}\), often fleep on the water with their heads under their wings. They feed chiefly on Blennies.

The Mergus Cafor of Linnesus, is the female of this fpecies.
L.

The

RLUE.

The Minute Merganser, Are7. Zool. II. p. 540. A. is the female of the Smew.

The Red-breatted Goofander arrives later in Sweden than the Great Goofander. It has fuch a predilection for the color of red, that the fhooters ufe dogs of that tinge, and even cover their bodies with red cloth or linen, when they are engaged in the purfuit of this fpecies.

Mr. Hutchins adds two fpecies to this Genus, difcovered by him. in Hudjon's Bay.

The head of the firft is of a dark brown. From the orbits is a whitifh brown ftroke, extending backwards, and ending in a large pendent creft; the upper part of it brown, the lower black : greater and leffer coverts, fcapulars, and tail, black: fecondaries of the fame color, but each web is broadly edged with white : chin fpeckled with black and white : breaft bluilh grey, lightly mottled with white : belly white: vent tawny: beyond the junction of the thighs with the body are a few black feathers marked: with red: legs dunky yellow. Weight twenty-three ounces. Length feventeen inches and a half.

This fpecies arrives in the bay in Mcy, as foon as the rivers are open. Makes its neft about the lakes, with grafs, lined with feathers pulled from its own brealt : retires when the rivers are frozen.

The next is called by the natives Waw pero ne way fe pis. Has a black, long, nender bill: forehead and crown of a fhining black, and the feathers long: abour the ears are fome dirty white feathers : throat and belly white : breaft and vent blue : the hind part of the neck inclines to brown : primaries, fcapulars, baftard wing, and leffer coverts, dark blue: greater coverts blue, marked with a white fpot: fecondaries white on the outfide, blue on the inner: tail black, fhort, and rounded: legs blue. Weight fourteen ounces. Length fourteen inches.

Arrives in Hudfon's Bay in Fune: lays ten fmall white eggs, and makes its neft on the top of fome ftump of a tree, near the fides of ponds, and forms a cavity by fcraping away the rotten wood: hatches in Fuly, and immediately conveys its young to the water: retires in October.

Swans were twice feen, in April, in Nootka found, flying northward, towards their breeding-places. Thefe birds accompany the Geefe in their vernal vifit to Hudfon's Bay, in flocks of about nine: are very numerous inland, but alfo breed along the coaft.

The Grey Lag Goose appears as foon as the fun has force enough to melt the ice; that is in May. They alight and feed on the grafly fpots: they collect in flocks of twenty, or thirty: ftay about three weeks: feparate into pairs, and refort along the coafts to breed. In Fuly they moult, at which time the Indians knock them down with fticks. Some are brought alive to the factories, where they are fed with corn, and thrive greatly. About the middle of Auguft the Geefe return to the marfhes with their young, and continue there till September.

The Blue-winged Goose is very numerous about Albary Fort, but grows more fcarce towards the north. The head and neck of the male is of a pure white.

Brent Geese ftay about three months in Hudfon's Bay, and are very numerous.

The Velvet Duck is always on the fea, and never on the lakes. have been found frefh layed in the beginning of \(7 u l y\). They are white, and about eight or ten in number. This fpecies lays them under the juniper bufhes, and covers them clofe with its elaftic feathers. The young dive moft admirably. The mother fights in defence of them, but refigns them to the victor, They live entirely on fhells.

The Scoter appears in Sweden in the earlieft fpring, ready for its migration towards the extreme north.

The Long-tailed Duck is the true Alfogel of the Swedes, not the Pintail. Linneus has formed two fpecies out of it, and I have defcribed a young male as its female; fo great are the variations of plumage in different flages of life. I have feen many, but all of them fuffed. Mr. Oedman, who has had opportunity of examining multitudes frefh from the fhot, thus defcribes an old female.

The bill is black, fometimes furrounded with a pale circle, fometimes plain: the region of the eyes white : crown, and a certain fpace on each fide of the neck, durky : round the lower part of the neck is a whitifh collar: breaft mixed with dufky and grey, growing gradually hoary till it is loft in the whitenefs of the belly: fhoulders varied with dufky, rufous, and grey : back and rump black, fprinkled tranfverfely with grey : primaries dufky : the coverts mixed with grey: tail fhort and cuneiform.
The crown and neck of the young female is black, fprinkled with white : acrofs the bill is a band of red: fpace round the eyes cinereous, edged with white : throat, bottom of the breaft, and belly, white : back dufky-afh : tail dufky, white on its fides. It may be obferved, that the younger the bird is, the more it is tinged with rufous : and that the long feathers in the tail are the character of the male.-Mr. Oedman.

The Western Duck, and another, fuppofed to be its female, have been killed at one fhot, in a river in Ofter-Gotland, and are both engraven in the Muf. Carlfon, tab. vir. viri.

The Female is entirely ferruginous, marked with dufky and black: the bill and legs black: the primaries, and greater coverts, dufky, fome of the latter tipt with white. Has much refemblance to the Red Duck of the Arctic Zoology, II. p. 576. N.

Loggerhead T. Catefly, ii. 40.
T. With a large head, with a triple order of plates from the back to the fides.
This fpecies ranges from the Babamas midway to the Azores; having been ftruck, fleeping on the water, in lat. 30. north. Are very voracious, bold, and very foul feeders. They live much on fhells, and have ftrength to grind or break with their mouths the ftrongeft buccina. Their feif is rank, and little efteemed.

The Trunk Tortoife, Cate \(B y\), ii. 40. vex, grows to a great fize: the fleh rank, but much oil is extracted from it, which alone makes it valuable.

Defcribed, but never feen, by Mr. Cateßy, who gives the above ac. count from relation.

New Tortoife. Soft-fhelled Turtle, Pb. Tr. 1771. p. 266.
1. With a depreffed body; in the middle hard and boney, towards the edges flexible, and refembling thick tan-leather; in many parts tuberculated: the fernum fmooth and white, reaching, in form of a faddle, about two thirds the length of the lower part, the reft covered with a fkin.

Head
\[
T \quad O \quad R \quad T \quad O \quad I \quad S \quad E .
\]

Head triangular; nofe flender, produced like that of a mole: the neck thick, long, retractile: Irides lemon-colored, lively : have a fkin like a nictating membrane.

Fore-feet with five toes, and two fpurious; ftrong claws on the chree firf: Hind-feet with the fame number of toes and claws, with only one fpurious: ikin of the legs loofe, wrinkled, dufky green: TAIL fhort and thick.

Inhabits no further north than the rivers of Savanush and Alatamocha, in Soutb Carolina; alfo thofe of Eaff Florida: grows to a great fize, to feventy, and even a hundred pounds in weight. Is very ftrong, fwift, and fierce ; and, if attacked or difturbed, will raife itfelf on its legs, and leap forward, to bite the affailant, with great fury and violence. The flefh is very delicate, and even preferable to that of the Green Tortoife.

This fpecies (with beautiful drawings taken from the live animal) were communicated by Doctor Garden, late of Clarleftown, and defcribed and engraven in the Pbilofophical Tranfactions.
T. With a fmall Head, depreffed: upper mandible hooked: eyes near the end of the nofe : middle row of fcales obtufely pointed: Sternum lozenge-fhaped; joined to the fides by aftrong membrane: Toes five before, four behind: legs fquamofe and plicated: length of head and neck fix inches and a half: body nine: Tail five and a half, cultrated, fcaly, and at top ftrongly ferrated.

Inhabits the rivers of New York. Seen in the collection of Mr. Tho. Bolton, near Halifax.

Tefudo Carolina, Lin. 352 .-GGron. Zooph. No. 77.
Land Tortoife from Carolina, Edzu. 205.-Larvfon, 133.
I. With a blunt nofe : long thick neck covered with a purplifh fkin: - irides yellow: body very convex ; fcales large, marked with concentric lines; color brown, chequered with yellow: five toes on the fore M 3 feet;

\]
T. With a blunt head: flat fmooth fhell, divided into thirteen vering almoft the whole belly: five toes on the fore feet, four on the hind, webbed, and furnifhed with claws: tail flender, with a hard horny point.

Inhabits Penflvania and Corolina. Lawfon praifes it as an excellent food, efpecially in May and June. Their eggs are alfo very good, but they are the prey of fo many animals, that few arrive at perfection.

Br. Zool. HI. 9. Genus II.
Rana ocellata, Lin. 356.
Bull Frog, Lawfon, 132.-Catefly, ii. 72.-Kalan. ii. 170.
FR. With dufky red irides, furrounded with a yellow ring: the auricles covered with a thin circular fkin, forming a fpot behind each eye: four toes on the fore feet: five palmated toes behind. It grows fo large, fays Lawfon, that I have feen one with as much meat on it as a pullet. Color of a dufky brown mixed with yellowifh green, and fpotted with black : the belly yellowifh white, faintly fpotted.

Sit in pairs, at the fprings of finall rills; are fuppofed by the people of Virginia to be the purifiers of waters, and refpected as the genii of the fountains. If furprized, leap into the mouth of the fpring, and lie fecure. During
\[
F \quad R \quad O \quad G .
\]

During winter remain torpid under mud. In the fpring begin to bellow : the noife is like that of an enraged bull; and fo loud as to be heard, in a ftill evening, a mile. Will go three yards at a leap. Kolms fays, they frequent only ponds and ftagnant waters. All writers agree in their devouring little chickens, ducks, and gonings. They are edible. Some were brought alive, a few years ago, to England.

\section*{Water Frog, Catefly, ii. 70.}
\(H^{R}\). With large black eyes, and yellow irides: long limbs: upper part of the head and body of a dufky green, fpotted with black: from each eye to the nofe a white line : from each eye along the fides to the rump, a yellow line.

They frequent rivulets and ditches, which they do not quit for the dry land. It is faid they will fpring five or fix yards at a leap.

> Rana arborea, Lin. 357.
> Green Tree Frog, Cateßy, ii. \(71 .-\) Lãufon, 132 .

FR. Of a flender fhape: bright green color, marked on each fide with a line of yellow : eyes black; irides yellow : four toes before, five behind; at the end of each toe a round membrane, concave beneath, not unlike the mouth of a leech.

Lurk under the lower fides of leaves, even of the talleft trees, and adhere firmly, by means of the membranes at the ends of their toes; fticking to the fmootheft furface: a looking-glafs was held before one, at four yards diftance; it reached it at one leap, and ftuck clofely to it: At night thefe Frogs make an inceffant chirping, and leap from fpray to fpray in fearch of infects.

I believe this fpecies to be common to Anerica and the warmer parts of Europe.

E2. Land,

FR. With the appearance of a Toad: above grey or brown, fpotted with dufky ; below white, faintly fpotted: irides red: fhort legs.
Place. Frequent the high lands: feen moft often in wet weather, in the hottelt time of the day : leap: feed on infects, particularly the fire-fly, and ant. Sometimes the Americans balke and reduce this fpecies to powder, which, mixed with orrice-root, is taken as a cure for a tympany.
13. Cinereous. R. With the back gibbous, cinereous, and fmooth : belly yellow, and granulated: on each fide, from the nofe to the rump, is a white line: the fame on the outfide of the thighs and legs : toes bullated at their ends.
Place. Inhabits Carolina.
III. LIZARD.
44. Allegator.
L. \({ }^{W}\) With a vaft mouth, furnifhed with fharp teeth : from the back to the end of the tail ferrated: fkin tough and brown, and covered on the fides with tubercles. Grows to the length of eighteen feet.
Place. \(\quad\) This dreadful fpecies is found in the warmer parts of North America; and moft numerous as we approach the fouth, and the more fierce and ravenous. Yet in Carolina never devours the human fpecies, but on the contrary fhuns mankind; yet will kill dogs as they fwim the rivers, and hogs which feed in the fwamps. It is often feen floating like a \(\log\) of wood on the furface of the water, and is miftaken for fuch by dogs, and other animals, which it feizes and draws under water to devour at its leifure. Like the wolf, when preffed by long hunger,

\section*{L I Z A R D.}
it will fwallow mud, and even ftones, and pieces of wood. They often get into the wears in purfuit of fifh, and do much mifchief by breaking them to pieces.

They are torpid during the winter in Carolina, and retire into their dens, which they form by burrowing far under ground ; it makes the entrance under water, and works upwards. In fpring it quits its retreat, and reforts to the rivers, which it fwims up and down; and chiefly -feeks its prey near the mouth, where the water is brackifh.

It roars and makes a dreadful noife at its firf leaving its den, and againft bad weather. It lays a vaft number of eggs in the fand, near the banks of lakes and rivers, and leaves them to be hatched by the fun : multitudes are deftroyed as foon as hatched, either by their own fpecies, or by fifh of prey. In South America the Carrion Vulture is the inftrument of Providence to deftroy multitudes; by that means preventing the country from being rendered uninhabitable*.

> Lacerta fex-lineata, Lin. 364.
> Lion Lizard, Cate \(\beta y\), ii. 68.
I. Of a grey color, marked lengthways on each fide with three whitifh lines: long legs : very long tail, which it curls up, looking fierce at the fame time. The fize about fix inches.

Inhabits Soutb Carolinat, and the greater Antilles. Very inoffenfive. Remarkably agile, but is a prey to rapacious birds.

Green Lizard of Carolina, Larwon, 131.-Catefy, ii. 65.
86. Gresmo

17. SIREN.

Size.

Body and head anguilliform : two feet placed below the neck.
The Mud-Iguana, Ph. Tr. 1766. p. 189.
8. With anguilliform head and body : eyes minute: noftrils on the fides of the nofe : teeth fharp, ranged in tranfverfe rows, fit for biting or grinding: three openings to the giils, with three pennated appendages on each fide of the covers: the legs are in form of arms, placed high on the breaft, not remote from the throat: each foot has four divided toes, with a claw to each : the body covered with fmall fcales funk in gelatinous matter ; color dufky, but the fides dotted in lines with white : the tail compreffed, and, like that of an Eel, fupplied above and below with a ray-lefs fin.

Peculiar to the muddy fwamps of Soutb Carolina; lurking beneath the antient trunks of trees that impend over the water: makes a croaking noife : fragile, for if caft on the ground it breaks in three or four pieces.

Grows to the length of thirty-one incheso
DIV. If. WITHOUTEEET,

\section*{\(S \quad E \quad R \quad P \quad E \quad N \quad T \quad S\).}

With plates on the abdomen: plates and fcales beneath the tails a rattle at its end. Linnews.

\author{
Crotalus horridus, 16\%. Scutis, 23. Scutellis, Lin. 372. \\ Rattlefnake, Catefby, ii. 41.-Lawfors 128.
}
R. With a brown broad head : yellowifh brown back, marked with broad tranfverfe dentated bars of black : fcales rough : belly cinereous: the jaws furnifhed with fmall fharp teeth; four fangs in the upper jaw, incurvated, large, and pointed, the inftruments of death; at the bafe of each a round orifice, opening into a hollow, that near the end of the tooth appears again in form of a fmall channel: thefe teeth may be erected or compreffed: when in the action of biting, they force out of a gland near their roots, the fatal juice: this is received into the round orifice of the teeth, conveyed through the tube into the channel, and thence with unerring direction into the wound.

The tail furnifhed with a rattle, confifting of joints loofely connected; the number uncertain, depending, as is pretended, on the age of the animal, it receiving with every year a new joint. Authors mention forty and feventy*:

Rattlefnakes grow to the lèngth of eight feet, and, according to a news-paper acount, to fourteen.
- Kahn, in the Swedifh Medical Effays, 290.-PPh. Tr. abridg. vii. 412.

Swarn in the lefs inhabited parts of North America: now almoft extirpated in the populous; none found farther north than the mountains near lake Champlain*: but in the fouth infeft South America, even as far as Brafil \(\dagger\). Love woods and lofty hills, efpecially where the ftrata are rocky or chalky: the pafs near Niagara abounds with them. Being flow of motion, they frequent the fides of rills, to make prey of frogs, or of fuch animals that refort there to quench their thirft: are generally found during fummer in pairs : in winter, collect in multitudes, and retire beneath ground, beyond the reach of froft: tempted by the warmth of a fpring day, they are often obferved to creep out weak and languid: a perfon has feen a piece of ground covered with them, and killed with a rod between fixty and feventy; till, overpowered with the ftench, he was obliged to retire.

They couple in Auguft, and then are moft dangerous: are viviparous, and bring forth, in fune, about twelve young ones: between that and September they acquire the length of a foot.

Providence hath given mankind a fecurity againft the bite of thefe dreadful reptiles; for it does not often fail warning the paffenger of its. vicinity, by the rattle of its tail. In fine weather that monition is always given, in wet weather feldom, which gives the Indians a dread of travelling amidit the woods in rainy feafons.

It moves along with the head on the ground; but if alarmed, it fings its body into a circle, coiling itfelf with the head in the centre erect, and with the eyes flaming in a moft.terrific manner. Happily it may be eafily avoided: it is now in purfuit, and has not the power of fpringing at its affailant, like many of the innocent tribe.

It is difficult to fpeak of its fafcinating powers: authors \(\ddagger\) of credit defcribe the effects. Birds have been feen to drop into its mouth, fquirrels defcend from their trees, and leverets run into its jaws.

\footnotetext{
- Kalm's Travels, iii. \(48 . \quad\). Marcgrave, 240.
\(\ddagger\) Lawfon-Cateßy-Ph. Tr. abridg. ix. 56, \&c. vii. 410.-Briskel's Hif. Caroling, 144.-Brverley Virginia, 260.-Colden, i. 12.
}

Terror and amazement feem to lay hold on thefe littele animals: they make violent efforts to get away, ftill keeping their eyes fixed on thofe of the fnake; at length, wearied with their movements, and frightened out of all capacity of knowing the courfe they ought to take, become at length the prey of the expecting devourer, probably in their laft convulfive motion.

Rattlefnakes are apt to frequent houfes : every domeftic animal on their approach, as if by inftinct, takes alarm; dogs briftle, and the poultry creft their feathers; hogs only attack them, feeding on them with impunity. The brave Indians will alfo eat their flefh : a \(\mathrm{M}_{\mathrm{AN}}\), fays the Mobawk Sacbem, eats every thing without diftinction, dogs, fnakes, frogs, \(\mathcal{E}^{c} c .:\) it is womanifh to be delicate in the choice of food.

The bite of this Serpent is of the moft venomous kind ; if the wound is on a vein or artery, death enfues rapid as thought *; if in a flefhy part, there are hopes of a remedy; the moft efficacious, if done in time, is either the burning, or the cutting out the part affected. The fymptoms are, naufea, convulfions, fpitting of blood, and bloody ftools; lofs of the ufe of the limbs; fwellings, and difcolored fkin; fever, deliria; and, if the cure takes any length of time, difturbed reft, and dreams of the moft horrible kinds \(\dagger\).

The ufe of the famous Radix Senega, Amon. Acad. ii. 126, or Polygala Senega, Sp. Pl. ii. 990, which was once fuppofed to have been an effectual remedy againft the bite of this dreadful reptile is now exploded, but it fill maintains its character in feveral diforders. Its efficacy, particularly in pleurifies, is moft fully eftablifhed in Virginia: formerly near fifty out of a hundred died of that diftemper, but by the happy ufe of this root, hardly three out of the fame number have been loft.
* Kalm, in Swedib Med. Eflays, 282。 + Pb. Tir. yii. 410. \&ic. xi. 25 G. black with white edges.
Catefly doubts whether this is a diftinct fpecies, as ferpents fometimes change their marks with the change of their dkins.

Linneus's character of the number of plates and fcales, affures us of its fpecific difference.

Lefs venomous than the former.

Crotalus miliarius, \(13=3 \mathrm{I}_{0}=\) Lin. 272.
R. With cinereous body, with three rows of black fpots, and a red one between each of thofe on the back.
Linnewus quotes Catefhy, 42, for this fpecies; but his Cr. Durifus fuits that writer's defcription. Doctor Garden's name is prefixed to this, fo it is certain this fpecies or variety exifts.

\]
\(S^{N}\). With a roundifh head, turned-up nofe, a black crooked band between the eyes : a white crofs on the top of the head; with a black fpot in the middle: body black, fafciated with white: belly black. Inhabits Carolina.

> Water Viper, Catefly, ii. \(43 \%\) Horn-Snake, Larufon, 130.

SN. With a large head, fmall neck; fangs in the upper jaw a color of head and back dufky: belly fafciated with black and yellow.. At the end of the tail a.fmall horny fubitance.

Inhabits Carolina: fwims well, and is very dexterous in catching fifh. During fummer, numbers of them are often feen hanging in the boughs of trees over the rivers, watching the approach of filh or fowl, and frequently drop into boats paffing beneath. They plunge on their prey, and purfue it with great fwiftnefs; and, as foon as they catch it, fwim afhore to devour it: are called the Water Rattlefnakes, and are fuppofed to be as fatal in their bite. The little horn at the tail gives it a dreadful name, as if armed with death at both extremities.- The fuperftitious believe, that by a jerk of that part it can mortally wound any animal, and even caufe a tree to wither by transfixing the bark.

Catefly, ii. 48.-Coluber confrictor, Lin. \(3^{85}\).-Lazvon, 132.-Kalm, ii. 202.
SN. Wholly of a fhining black; it grows fometimes to the length of fix feet.
It is not only perfectly harmlefs, but extremely ufeful in clearing the houfes of rats, which it purfues with wonderful agility to the very roofs, and all parts of barns and outhoufes, for which good fervices it is cherifhed by the generality of Americans. It is alfo faid, that it will deftroy the Rattlefnake, by twifting round it, and whipping it to death. In the time of copulation it is extremely bold and fierce, and will attack mankind; but its bite has no more effect than a feratch with a pin. It is fo fwift that there is no efcaping its purfuit. Many ridiculous frights have happened from this innocent reptile. As every one in America is full of the dread of the Rattlefnake, they are apt to fly at the fight of any of the ferpent kind. This purfues, foon overtakes, and by twitting round the legs of the fugitive, foon brings him to the ground : but he happily receives no hurt, but what may refult from this fright: all the mifchief this fpecies does is to the houfewives, for it will fkim their milk-pans of the cream, and rob their hen-roofts of all the eggs.

VIII. STUR:

GEON.
70. Europeanion

Br. Zool. iii. 120. Genus VII:
Common Angler, Br. Zool. vol. iii. Na 5 s.

Br. Zool. iii. 124. Genus VIII.
Sturgeon, Br. Zool. iii. \(\mathrm{N}^{\circ}{ }^{\circ} 5\).

THIS is the fame fpecies with the European. They are found in great numbers, during fummer, in the great American rivers. They are very common in thofe of Carolina, but very rare in thofe of Florida. Are ftruck with fpears in the night, attracted by the light of torches made of the wood of the black pine. The fhores of the rivers are often. covered-with dead Sturgeons, which have been wounded, and died after efcaping from the harpoon. They are often obferved to leap to a confiderable height out of the water, and have been known to fall into the finall boats or canoes, and fink them; fo that it is very dangerous, to pafs in the places which are much frequented by thefe fifh, as there have been many inftances of people lofing their lives. In fome of the rivers of Virginia they are found in fuch multitudes, that fix hundred have been taken in two days, with no more trouble than putting down a pole with a hook at the end; to the bottom, and drawing it up again,

\footnotetext{
* Marcgraver 160.
† Grew's Mufewm, 86.
}
on perceiving that it rubbed againft a fifh*. The Americans may make confiderable improvements in the methods of taking Sturgeon, by confulting thofe ufed by the Tartars on the Wolga, who draw great advantage from their filheries, and the preparation of the caviar from the roe. Much oil may alfo be extracted from the fat entrails, which is flung away after clearing the caviar from them \(\dagger\).

Acipenfer hufo, Lin. 404.-Blofb. iv. 86. tab. cxxix.
71, Hives.
Saw, among the fubjects of Natural Hiftory tranfmitted to Mrs.
Ann Blackburne, from New York, fome young Sturgeons of a fmall fize : their nofes were blunt, and fhorter than thofe of the common Sturgeons: the number of tubercles on each fide were, in different fpecimens, which I counted, from five to eleven. In old filh thefe difappear, and the fides become quite fmooth. This is the fpecies which the Germons call Haufen, and the Ruffians, Bjeliuga, on account of the whitenefs of its color. They grow to a vaft fize: are found in the Danube, the Po, the Mediterranean fea, the Euxine, the Wolga, and the Cafpian fea; in the two laft in vaft abundance: and great profit is made from the ifing-glafs, iEtbyocolle, or filh-glue, which is prepared from the bladders of this fpecies, as well as that of the two other Sturgeons: and alfo from the flurus glanis, Lin. which may poffibly be found in the great Americon lakes.

I have reafon to think that the Americans poffers in their lakes all the three fpecies. A fmall one, weighing from fix to forty pounds, is frequent in the inland lakes of Ifudfon's Bay. This is likely to be the acipenfer rutbonus, Lin. 403; the ferlet of the Ruffians. Notwithftanding America has withdrawn itfelf from us, it is charity to point out the benefits they may enjoy, from the gifts of nature which they poffefs.

\[
Q_{2}
\]

Head
18. BALISTES.

Head compreffed, fmall. Eight teeth on each fide? the two foremoft the longelt. A narrow aperture or lit above the pectoral fins. Skin rough, fcales adhering tightly to it. Linnemus.

Bahama Unicorn fin, Cate \(/ y\) y, ii. 19. Baliftes monoceros, Lin. 404.

With an oblong body, fufiform, or thickeft in the middle: two fharp teeth in the upper, and four in the lower jaw, iffuing from the folid bone, covered with a thin k in : irides pale, encircled with blue : juft beyond the eyes, on the back, is a ftrong fharp and long fpine, to be erected or depreffed at pleafure ; reaching, when down, to the dorfal fin: color, brown olive, with irregular waving lines of blue, intermixed with fpots of black. Grows to the length of three feet.

Frequent among the coralline rocks of the Babama inles: feeds on the corallium porofum, and other coralline fubftances, and on fhells, which it grinds fmall. Efteemed poifonous.

Old wife, Cateßby, ii. 22. Baliftes vetula, Lin. 406.

B.With a deep body; fuddenly leffening near the tail: mouth projecting, furnifhed with about twelve long teeth : firft dorfal fin has three rays, or fharp bony pines: the firf ray of the fecond, very long: firft ray of the ventral fin fpiny: tail lunated, with the exterior ray on each fide of a vaft length : mouth furrounded with rich blue : two incurvated lines of blue extend from it towards the breaft: fecond dorfal fin, anal, and tail, duiky, edged with fine blue : body brown, with fix dufky lines from the back down the fides. Of the length of about two feet.

Swims nowly. Is good meat when the rough fkin is taken off.

Caper, pefce Baleftra, Salvian Pifc. p. 207.m-Grew's Mufoum, 113.
B. With a deep body: firft dorfal fin has three ftrong fpiny rays; the firft the longeft; the third remote ; that and the fecond very fhort. Second dorfal fin and anal placed oppofite; the rays foft; the fcales covered with fmall tubera, and difpofed in a cancellated or lattice form : tail even at the end.

This fpecies is common to the Mediterranean fea, and thofe about Bermudas. It is called at Rome, Baleftra, or the Crofsbow. No force can bring down the firft fpine of the dorfal fin; but on touching the foremoft and left, they all three drop fuddenly together, as a crofsbow is let off by the pulling of the trigger. The fame circumftance attends other fifhes of this genus.

Ten flender teeth, a linear aperture.
Body covered with a hard integument.
No ventral fins. Linnetus.

0STR. With a great head : nofe floping and pig-like : noftrils placed juft below the eyes, covered with a fmall flap: dorfal fin placed near the tail : anal corefpondent to it : back and fides brownifh yellow, and rough like fhagreen: belly flat, rough, and white: fides, near the tail fmooth.

Echeneis, Lin. 446. Genus clvir.

IIEAD. flat at top, marginated, and fulcated tranfverfely.
96. American.
R. Plact. Lact. x:-"

Cateßby, ii. 26.-Ecli. neucrates, Lin. 446. - Inhabits the ocean quite to North America: is often found adhering fo ftrongly to the fides of Sbarks and other great fifh, by means of the ftructure of its head, as to be got off with difficulty.

This fifh was believed, by all the antients, to have moft wonderful powers, and to be able, by adhering to the bottom, to arreft the motion of a fhip in its fulleft courfe; and in love affairs, to deaden the warmeft affections of both fexes*. Oppian gives an elegant account of its wondrous operations in the firf inftance; which we thall give from the trannation which Mr . Fobn Fones favored the world with from the \(O x\). ford prefs, in 1722.

The Surcking-Fifh beneath, with fecret chains, Clung to the keel, the fwifteft thip detains: The feamen run confus'd, no labor's fpar'd, Let fly the fheets, and hoift the topmoft yard. The mafter bids them give her all the fails, To court the winds, and catch the coming gales; But tho' the canvas bellies with the blaft, And boift'rous winds bend down the cracking maft,
* Plint lib. ix. ce 250

The bark ftands firmly rooted in the fea, And will, unmov'd, nor winds nor waves obey; Still, as when calms have flatted all the plain, And infant waves fcarce wrinkle on the main. No flip in harbor moor'd fo carelefs rides, When ruffling waters tell the flowing tides. Appall'd the failors flare, thro' ftrange furprize, Believe they dream, and rub their waking eyes. As when, unerring from the huntfman's bow, The feather'd death arrefts the flying doe, Struck thro', the dying beaft falls fudden down, The parts grow ftiff, and all the motion's gone; Such fudden force the floating captive binds, Tho' beat by waves, and urg'd by driving winds.

CORYPH ÆNA. Head floping, and truncated: the dorfal fin extending the length of the back. Linnewus.
\[
\text { Cate } / \Delta y \text {, ii. 18.-Novacula cærulea, Wil. } I \approx t b .214 .
\]

C.Wholly of a rich blue color: irides red: fcales large: tail in form of a crefcent : teeth fo clofely placed as to feem an entire bone. Length, fometimes above two feet.
Inhabits the feas of the Babama ines, and from thence to the line.

\section*{Catefoy, ii, 29.--C. Pfittacus, Lin. 448.}

With blunt teeth paving the mouth like that of the Wolf Fifh : irides confift of two circles, red and yellow : a blue circle furrounds the eyes: upper part of the head brown; lower part, and covers of the gill, blue, edged with red; a yellow fmall fpot is feen juft beyond each of the gills : a fcarlet froke points from them to the throat: body of a fine
XXI. CORY. PHCENE.

Catefly, ii. 17.-Sparus fynagris, Lin. 470.
G. With large eyes, and red irides: body taper, purple above and lighter below, elegantly marked lengthways with narrow yellow ftripes: pectoral fins purple: tail red: the other fins yellow. Grows to the length of a foot.

Cateflay, ii. 4.-Sp. rhomboides, Lin. 470.
C. Of a rhomboid form : yellow irides: whole body covered with large fcales of a deep grey color, and yellow, placed in alternate rows, forming longitudinal ftripes: fins and tail yellow : firft ray of the anal is a very ftrong fharp fine.

Found off the Babama ifles, and reckoned a delicate fpecies.

Cateby, ii. 36.-Sp. chryfops, Lin. 47 1.
(1. With yellow irides: large mouth : in the upper mandible one tooth before : in the lowertwo : body of a deep form, and brown, lighteft on the belly: covers of the gills, pectoral, ventral, and anal fins, light blue.

Sp. Argyrops, Lin, 471.-Zanthurus indicus, Wil. Iatb. App. 3.
G. With filvery irides: fore teeth conic: an oblong finus in the back: tail lunated : three firft rays of the dorfal fin extending far, and filiform.

Inhabits Jamaica and Cerolina.-Doctor Garden.

Pudding wife, Catefoy, ii. 12.-Sp. radiaus, Lin. \(47 \mathrm{z}_{\text {. }}\)
G. With red eyes, with fine crerulean radiations furrounding them: the head ftreaked alfo with blue: body olivaceous brown, each fcale edged with blue: dorfal and anal fin yellow, waved at top, and edged with blue: from one pectoral fin to the other, furrounding the belly, are four lines of blue and yellow, placed alternate: tail eyen, dufky, ending in a band of yellow. Grows to the length of fixteen inches.

Perhaps varies in color: this differing in fome refpects from the fpecimen communicated to Linneevs by Doctor Garden.

Inhabits the feas of Carolina.
\[
\text { Sp, Virginicus, Lin, } 472
\]

THE covers of the gills a little ferrated: one black band paffes from the fhoulders through the eyes to the lower jaw; another from the fhoulders along the fides to the pectoral fin : the body marked with parallel lines of blue, extending lengthways: the tail bifid, blunted at each extremity.
Inhabits Nortb America.-In Mr. De Geer's Mufeum.

Br. Zool. iii. p. 244. Genus XXVI.
Catffy, ii. 25.-Labrus anthies, Lin. 474.
\(W^{R}\) R. With red irides : upper part of the head duiky : covers of the gills purple : body reddifh brown, brightening into red to the belly, which is white tinged with red: dorfal fin brown; the others red: tail much forked and red, Length between one and two feet.

This is reckoned the moft poironous fifh of any about the Babama ifles. Many of thefe noxious fpecies are eatabie in fome places, of which the natives can give a near guefs, but are fometimes miferably T
139. Hana.

Place.
140. Venemous.
deceived. Mr. Catefby does not account for the caufe of the poifon; but gives a fact which leads to an explanation. He once procured a diver to bring up fome of the beautiful corals, which grow at the rocky bottoms of the fhallow fea round the Babama inles. They are of unipeakable clearnefs, and thew, even at the depth of twenty fathoms, a moft charming variety of groves of corals, keretophytes, aftroitæ, and fhells, animated with multitudes of fifhes of the moft glowing colors fporting among them. Many of the corals and fea plants are covered with a mucilaginous fubftance, which Catefby calls the coral in a foft and imperfect fate: it is in fact the fpawn of filh; a part often poifonous, when the fifh itfelf is poifonous; witnefs that of the Englif Barbel. The diver brought up fome of the corals thus benimed, and, to clean his hands from it, rubbed them on his belly. He was fuddenly taken with moft acute pains, and flung himfelf on the fands in moft diftracted poftures, till the pains left him, which was in about a quarter of an hour. There may be other animals which have noxious qualities, fuch as the fpecies of Mollufca, called Laplyfia, Medufa, and Holothuria, which may depofit their fpawn on the fea plants. The filh who haunt thofe places, greedily feed on it; receive the deleterious qualities, which often prove of fuch bad effect to the perfons who, happen to eat of them ; while the very fame fpecies of fifh, which has happened to feed in parts of the fea-free from this poifonous fubitance, are eaten with the utmoft fafety.

Poifonous fifh are not peculiar to thofe feas. Doctor Forfter, and others, the companions of Captain Cook's fecond voyage, fuffered feverely by eating, in the South Seas, the Sparus Erythrinus, a fifh quite innocent in the Mediterranean*. A new fecies of Tetrodon, taken in the fame feas, had fimilar effects. The Tenije of Gapan, the Tetrodon oceblatus of Linnetus, is a poifon that baffles all remedy: it is in that country the refort of fuicides. The fatal qualities lie in the inteftines, and fome other parts, which are carefully flung away before it is dreffed

\footnotetext{

S. With four beards on the lower lip: above the mouth, one on each - fide : back blueifh : ventral and anal fins red : tail bifid.

Inhabits Carolina.-Doctor Garden.
S. catus, Lin. 504.-S. Felis, 5c3.-Catefby, ii. 23.-Bagre, alia fpecies, Marcgrave, 173.
S. With four fhort beards on the lower jaw, and a very long one iffuing from under each eye: the dorfal fin fmall and conic; the fecond dorfal fin without rays, and fat: all the other fins fmall and red : tail forked and red: head round, and very ugly: mouth and gape very large : teeth fmall: fkin fmooth like that of an eel: upper part of the body dufky : lower, pale flefh color: in form round, thick, and clumfy. Grows to the length of two feet.

Inhabits the fea and rivers of moft parts of North America; preys on all forts of fmall fifhes, even thofe of its own kind. In tafte refembles an eel, and is much efteemed. Is a fifh of now motion. Probably, like the fifhing frog or angler, it tempts the fmall kinds to fport within reach of its great mouth, by the lure of its beards.

Linneus fays this fecies is found alfo in Afa.
XXXV. TEU. THYS.
S. With the head, fome of the fore part, and all the upper part, covered with fmooth angular boney plates: no teeth : the fides, to the tail, covered with plates placed perpendicularly, the middle of each is notched, and in the middle of the notch is a fharp hook; each of thefe bones lap over one another : tail round : belly foft and membranous : pectoral fins confift of only a ftrong bone, ferrated on each fide : the dorfal fin formed in like manner, but ferrated only on the upper fide; placed in a focket; and capable of being erected or depreffed at pleafure : the other fins formed like thofe of other fifhes. Length ten inches.

This fingular fifh was taken off New England, and depofited in Sis Hans Sloane's Mujeunn.

Head a little truncated.
Six branchioftegous rays.
Single row of teeth, of the fame length, placed clofely. Linneus.

Catefy, ii. 10.-T. Hepatus, Lin. 507.
T. Of a rhomboid form : finall projecting mouth : no teeth : dor \(\sqrt{2}\)
fin finy, extending from the top of the head almoft to the tail : head, covers of the gills, and whole body, covered with large fcales. Every part of the fifh is of a fine deep blue, but moft brilliant on the fins : tail broad and lunated. Length is fometimes twenty inches, Near the tail, on each fide, is a very ftrong and fharp-pointed bone, capable of being erected at pleafure; on the approach of the Barracuda, or any fifh of prey, it fets it up as a protection.

Br. Zool. iii. p. 284. Genus XXXIII.
Br. Zool. iii. \(\mathrm{N}^{0} 143\).
THIS fifh is frequent in the northern parts of America, but decreafes in number as it approaches the fouth. I believe none are found beyond New York.

Introd. ArEZ. Zool. cxcro

XXXVI. SAL。 MON.
164. Сомmon:
265. NAYMACUSY:

Place。
156. Trout.

Place.
267. Char.
168. Omiscomaycus.
Place.
169. Sea.

IT is by guefs that we place this here, on fuppofition that it is a fpecies of Albula, or Lavereitus, of authors. Lavefon fays, that it is found far up the rivers of Carolina; that it grows to the length of two feet and a half; and that it is very excellent meat.
171. Guiniad.

Place.
72. Sea-GuiNIAD.
173. Smelt.
174. SLENDER.

Sea Sparrow Hawk, Catefoy, ii. 2. fig. 2.-Salmo fotens, Lin. 513.
S. With a long flender body covered with brown fcales: fharp fimall teeth : belly whitifh : tail forked. Length fourteen inches.
Prace. Inhabits the feas of Carolina. I fuppofe, from the name which Lins.evs gives, that its fmell is very offenfive.

Salmo arcticus, Faun. Groenl. \(\mathbf{1 7 7 .}\) - Clupea villofa, Muller, No 425 -Lodna, Olaffn's 875. Capelang Iceland.-Capelan de l'Amérique Septentr. \(D_{\text {м }}\) Hamel, ii. 149. tab. xxvi.
S. With a pellucid fmooth head: firft dorfal fin placed in the middle of the back; pectoral broad, rifing under the gills, and extending to the belly: ventral fins large : anal very large, and angulated; more fo in the male than the female: tail forked: lateral line in the male briftly : the cover of the gills marked with a black fpot: the form.of its body thicker than that of the female: the color, above the lateral line, dull green; beneath, filvery fpeckled with black, and often tinged on the belly with violet. Seldom exceeds fix inches eight lines in length.

This fpecies fwarms off the coafts of Greenland, Iceland, and NewPlakig. foundlend: they are one of the great fupports of the Greenlanders, and a fort of defert alfo after their moft delicate repafts. They live at fea moft part of the year, but in April, May, \(\mathcal{F} u n e\), and \(\mathcal{F u l y}\), come in fhoals incredible into the bays; there they are taken in nets, refembling our fhrimp-nets, either from the fhore, or out of the boats, in fuch multitudes as quickly to make a lading. They are then dried on the rocks, put into facks, and preferved for ufe in the caves of the mountains, or under heaps of ftones. They are eaten in this form ; but many are dreffed frefh as foon as taken. It has the fimell of a cucumber, when newly caught. Authors have unjuftly attributed to it a bad fcent and noxious qualities.

Thefe lines, tranflated from the Norwegian, exprefs the difgufting attributes of this little filh:
" Bort Lodde med al din forgiftige ftanch," \(\mathcal{E} c\).
A way, Lodde, with thy poifonous itench, All the world wifhes thee pain and torment;

Thou art to us a rod and a fcourge,
Thou art a harlot pretending to fly,
In order to draw the unwary youth away with her out of town;
They run after her like the wanton he-goats after the females*.
They feed on the fmall crabs, and on conferve, which grow on the thores. In Greenland they fpawn in May, June, and July, and depofit the eggs on the fea plants: millions in that feafon follow the windings of the bays: the females go firft; the males follow, to give effeet to the fpawn: the bottom of the fea feems covered with it.

They are taken in vaft quantities in Nerwfoundland: they are fometimes preferved in barrels : often kept in brine, or half falted, for baits for the fifhery \(\dagger\).

The firft voyager who takes notice of them is Mafter Antbony Park\(b \operatorname{bur} A\), who vifited that inand in 1578 , and gives a very facetious account to his fhipmates of his art in charming thefe, and another finh he calls a Squid, into his power. I refer to Mr. Hackluyt, vol. iii. 133, for the account.
XXXVII. PIKE.
\#76. Common.
Place. FREQUENT in all the lakes from Hudfon's Bay to Carolina. Many of thefe finh are taken in the Baltic fea, and reckoned far more delicious than thofe of the lakes \(\ddagger\).
- Pontoppidan, ii. 133. + Du Hamel, ii. 151. 5 Prof. Retzius.
\[
\text { Catefy, ii. 2.-Efox vulpes, Lin. } 516 .
\]
P. With a wide mouth, and fmall fharp teeth : body covered with large thin fcales; brown above, white on the belly: tail very much forked. Length above fixteen inches.

Inhabits the feas of the Babama inles.

Catefoy, ii. 1.
P. With the body and head very much refembling the European Pike : eyes large: mouth very wide: under jaw longer thān the upper: four very large and fharp teeth in the front of the upper jaw ; in that of the lower, a fingle great and fharp tooth : two dorfal fins: tail large and forked: color a deep brown, whitifh on the belly. Grows to the length of ten feet.
Found in abundance about the feas of the Babomas, and as far as 7amaica. Swims exceedingly fwift, and is of dreadful voracity: will attack and devour men when they are bathing. The fleih has a difagreeable fmell and tafte, and is frequently poifonous; caufing great ficknefs, vomiting, intolerable pains in the head, and lofs of hair and nails: yet the liungry Babamans formerly were under the neceffity, at times, of feeding on it.

This fpecies, the Mullet, \(\mathrm{N}^{\circ} 185\), the Grunt, \(\mathrm{N}^{\circ} \mathrm{T}_{4} 1\), Snapper, \(\mathrm{N}^{\circ}{ }^{1} \mathrm{I}_{3}\). Parrot, \(\mathrm{N}^{\circ} 98\), Old Baliftes, \(\mathrm{N}^{\circ} 73\), and the Globe Tetrodon, \(\mathrm{N}^{\circ} 77\), extend to the coaft of Guinea; probably many others, natives of the warm parts of America, reach to congenial feas.
177. Fox.

Place。

Place。

P.With long dender jaws, armed with many fmall teeth: dorfal fin placed very near to the tail: whole body covered with hard boney fcales; thofe on the belly placed obliquely: back green: belly pale red : tail rounded; of a dirty red, fpeckled with black. Grows to the length of three feet.

Larefon fpeaks of a white Garfib with fcales knit together like armour. He adds, that the meat is very white, and looks liker flefh than fifh; that the Indians only efteem it: and that the gall is green, and a violent cathartic. I imagine Larwon calls it white in regard to the flefh, and that he means the fame fifh as Catefly.

Inhabits the rivers and frefh waters of Virginia.

P.With a flender body: long and flender nofe: the under mandible the longer : dorfal and anal fins oppofite: fcales very thin and diftinct; not layed over each other, nor boney.

Communicated by Doctor Garden to Linnaus : defcribed by the laft, after the preceding fpecies, with a doubt whether it is not a variety.

\[
\text { Er. Zool。 iii. No }{ }^{\circ} 60 \text { ? }
\]

HERRINGS leave the falt water in March, and run ip the rivers and fhallow ftreams of Carolina, in fuch numbers, that the inhabitants fing them afhore by fhovels full. Paffengers trample them under feet in fording the rivers. They are not fo large as the Englif, but exceed them in flavor when pickled: they turn red on being falted. Quere, if of the fame fpecies?

A wonderful inundation of fifh happens annually within the northern cape of Cbeafapeak Bay, where incredible numbers of various kinds are flung on fhore, which is covered with them three miles in length, and to a great depth. In the general fpawning feafon they are purfued by the multitudes of voracious fifhes, and thus are drove into deftruction. \(\mathrm{X}_{2}\) They

They are of all fpecies and fizes. People who live inland come in the feafon with carts, to carry away what they want. Such numbers are left to putrify, that the place has got the name of Magotty Point*。

[^55]:    * Doftor Pallas; to whom it was fent by a Moravian mifionary:
    + In the Britifh Zoology, ii. $\mathrm{N}^{\circ}{ }_{230}$, I made matter of wonder, the manner in which this bird placed its egg on the naked rock, with fo fecure a balance that it would not soll off. . Mr. Aikin referred me to the following paffage in Harvey de Generatione Anim. which moft clearly explains the caufe: "In the fame ifland" (the Bafs); fays he, "una mihi monftratur avis, quæ ovom duntaxat fingulare, five unicum, parit, " idemque fuper cujufdam lapidis acuti faftigium collocat (nullo nido, ant conquifitâ ${ }^{46}$ ftrue fuppofitâ), idque tam firmiter, ut mater abire \& redire, falvo ovo, poffit. Hoc ${ }^{31}$ autem fí quis loco dimoveat, nullâ arte poftea fabiliri poteft; quin inde devolutum " præceps in mare ruat. Locus nempè (ut dixi) cæmento albo incruftatur; ovamque, of cum nafcitur, lentâ \& vifcofâ madet humiditate, quâ citò concrefcente, tanquam or ferrumine quodam fubltrato faxo agglutinaturo."
