**Catalogo Generale  
Catalogue Général**

Nel 1972, a pochi chilometri da Milano, nasce Resistor. Specializzata nell'ingegnerizzazione e realizzazione di resistenze elettriche per applicazioni industriali, dal 1982 estende la propria attività al settore auto con la progettazione e produzione di candele per motori diesel.

Resistor è stata fra le prime aziende del settore ad ottenere la certificazione del proprio Sistema di Gestione per la Qualità. Oggi, Resistor è certificata secondo la norma UNI EN ISO 9001 dal 2000 e ISO/TS 16949 dal 2009.

L'Azienda, guidata da una politica trasparente e responsabile, si fonda sulla serietà e la competenza dei propri collaboratori e l'imprescindibile attenzione ai bisogni del Cliente. Da trent'anni, Resistor è partner di prestigio di clienti fidelizzati e pienamente soddisfatti.

Il know-how custodito nel DNA dell'azienda e la costante ricerca dell'eccellenza sono gli elementi primari dell'attività aziendale, che mira alla soddisfazione dei clienti e al miglioramento continuo della qualità di prodotti e servizi.

Resistor è sempre orientata ad investire in innovazioni ed in nuove e affidabili partnership per migliorare continuamente il proprio livello di competitività e offrire al cliente un sempre maggiore numero di prodotti, opportunità, soluzioni. Il miglioramento continuo rappresenta la base culturale, intellettuale e motivazionale dell'organizzazione. La capacità di sapersi mettere in gioco, ad ogni livello, rappresenta per noi il requisito necessario.

Con oltre 260 modelli differenti, Resistor soddisfa la totalità delle richieste nel settore auto. Le linee di produzione dedicate, costruite secondo lo stato dell'arte in materia, sono governate da un efficiente sistema di programmazione e pianificazione. Le rigorose procedure per l'accettazione del materiale in ingresso, gli oltre 70 test previsti dai piani di controllo e la severa applicazione delle tecniche statistiche SPC ed MSA garantiscono una qualità eccelsa e una difettosità inferiore ai 10 ppm.

Resistor, established in 1972 near Milan, and specialized in the engineering and manufacturing of Heater Elements for industrial application, in 1982 expanded its activity with the design and manufacture of Diesel Glow Plugs.

Resistor was one of the first companies in the field to obtain the ISO Quality Certification.

Today, Resistor is certified under the UNI EN ISO 9001(since 2000) and the ISO/TS 16949 quality standards (since 2009).

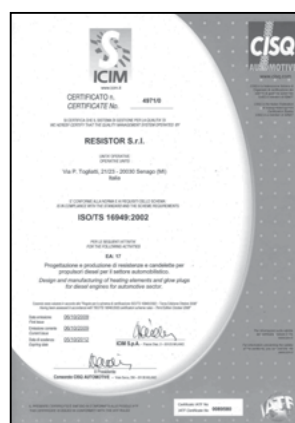

The Company, guided by a clear and responsible policy, is founded on the seriousness and expertise of its employees and on the continuous attention to the Customer's needs.

For over 30 years, Resistor has been a prestigious partner to consolidated and completely satisfied customers.

The company's know-how and the continuous pursuit of excellence are the primary elements of the company's activity, whose goal is customer satisfaction and continuous improvement of product quality and services.

Resistor has always been oriented to invest on innovation and on new and reliable partnership to continuously improve its competitive level and offer to the customer a wider range of products, opportunities, solutions. It is Resistor's cultural and motivational basis: the ability in being part of the game at any level is for us an essential requirement.

With a range including about 260 different models, Resistor covers the whole requests of the automotive sector. The lines dedicated to the manufacture of diesel glow plugs are managed by an efficient programming and planning system and constructed in accordance with the field state of the art. The extremely strict incoming goods inspection procedures, the over 70 tests foreseen in the control plans, and the strict application of statistical SPC and MSA techniques assure an excellent quality and less than 10 ppm product non-conformity.

Resistor, créé en 1972 près de Milan, et spécialisée dans l'ingénierie et la fabrication d'éléments de chauffage pour applications industrielles, en 1982 a élargi sa activité à et la fabrication de bougies de préchauffage pour moteurs diesel.

Resistor a été une des premières entreprises dans le secteur à obtenir la certification de la qualité ISO.

Aujourd'hui, la Resistor est certifié en vertu de la norme UNI EN ISO 9001 (depuis 2000) et l'ISO / TS 16949 des normes de qualité (depuis 2009).

La société, guidée par une politique claire et responsable, est fondée sur le sérieux et l'expertise de ses employés et sur l'attention constante aux besoins du Client.

Pendant plus de 30 ans, la Resistor a été un partenaire prestigieux de clients consolidés et entièrement satisfait.

Son know-how et la recherche continue de l'excellence sont les éléments principaux de l'activité de l'entreprise, dont le but est la satisfaction du client et l'amélioration continue de la qualité des produits et services.

Resistor a toujours été orientée à investir sur l'innovation et sur des nouveaux et fiable partenariats pour améliorer constamment son niveau de compétitivité et à offrir au client une gamme toujours plus grande de produits, des opportunités et des solutions. C'est la base culturelle et de motivation de Resistor: la capacité de faire partie du jeu à n'importe quel niveau est pour nous une exigence essentielle.

Avec une gamme comprenant environ 260 modèles différents, Resistor couvre l'ensemble de la demande du secteur automotive. Les lignes utilisées pour la fabrication de bougies de préchauffage diesel sont gérés par une programmation efficace et le système de planification et construit selon le dernier état de l'art. Les procédures très strictes d'inspection de marchandises entrant, le plus de 70 essais prévus dans les plans de contrôle et l'application stricte des statistiques de la CPS et techniques MSA assure une excellente qualité et moins de 10 ppm de produit non-conformité.

# LE CANDELETTE A INCANDESCENZA

Nei motori diesel l'accensione avviene per autocombustione a temperature superiori ai 650°C. L'aumento della temperatura è dato dalla compressione dell'aria nel cilindro che, a seconda dei motori, passa da 1 bar, pressione ambiente, a 20/30 bar, con la conseguente combustione del gasolio.

Nella fase di avvio, a motore freddo, con le pareti dei pistoni e delle camere di combustione fredde, parte del calore, prodotto dalla compressione, viene assorbito in misura tale da impedire la possibilità di autocombustione. Le candele funzionano come fonte addizionale di calore per sopperire a queste perdite. Superata questa fase d'avvio, il calore sprigionato dalla combustione, riesce a mantenere la temperatura minima per l'autocombustione, ma le condizioni rimangono critiche, infatti il gasolio brucia male con presenza di fumo nero e odore di nafta, questo fino al momento in cui il motore non ha raggiunto la temperatura di regime. Questa situazione sussisteva con le candele monofilo di prima generazione.

Nei motori moderni vengono montate candele di nuova generazione dette di pre e post-riscaldamento che, tramite uno speciale filamento, regolano la temperatura nel tempo così da poter rimanere accese più a lungo.

Grazie a questo tipo di candela, il motore diesel risulta poco rumoroso, inodore, parco nei consumi e con bassissime emissioni di ossidi dannosi. Questo tipo di candele sono composte da una struttura a doppio filamento:

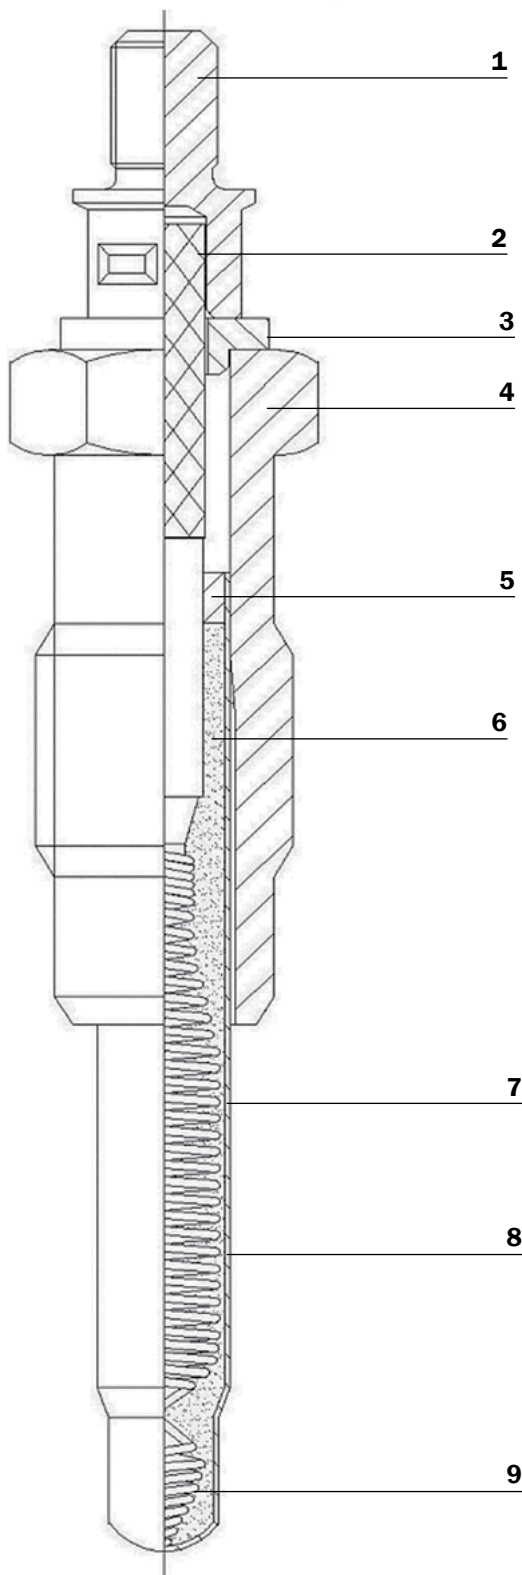

**□ Il primo, è un filamento di regolazione, che permette un'autoregolazione dell'intensità della corrente che l'attraversa in funzione della temperatura raggiunta;**

**Il secondo, è un filamento incandescente, che permette, per alcuni secondi, di raggiungere la temperatura circa di 1000°C e quindi di innescare l'autocombustione;**

La combinazione permette di aumentare la longevità della candela e di garantirne l'affidabilità totale in tutte le condizioni climatiche.

# CANDELETTE AUTOREGOLANTI

- 1 - Terminale filettato;
- 2 - Elettrodo
- 3 - Isolatore
- 4 - Corpo candelette
- 5 - Anello isolante
- 6 - Ossido di magnesio
- 7 - Stelo resistivo
- 8 - Spirale di controllo
- 9 - Spirale di riscaldamento

## Struttura e proprietà delle candelette

Le moderne candelette sono composte da un corpo candelette, da un elemento riscaldante con all'interno una spirale di regolazione e una di riscaldamento e da un terminale per la connessione elettrica. L'elemento riscaldante è pressato nel corpo candelette per impedire la fuoriuscita dei gas, ed è isolato dal terminale, per la connessione elettrica, da un isolatore. La candelette è alimentata da una batteria ed è controllata da una centralina elettronica.

## La spirale di riscaldamento e la spirale di regolazione

Il principio fondamentale delle moderne candelette consiste nella combinazione di una spirale riscaldante e una spirale di regolazione, unite tra di loro all'interno di uno stelo resistivo. La spirale riscaldante rappresenta la parte anteriore dello stelo resistivo ed è la parte riscaldante. La spirale di regolazione rappresenta la parte posteriore ed aumenta la sua resistenza elettrica in base alla temperatura, permettendo la regolazione della corrente e della temperatura. In altre parole la spirale di regolazione e quella di riscaldamento sono collegate in serie tra di loro. La spirale di riscaldamento è saldata sulla guaina dello stelo resistivo, mentre quella di regolazione è fissata sul terminale della connessione.

## Protezione della spirale di riscaldamento e della spirale di regolazione

Le spirali sono compresse e isolate elettricamente tramite dell'ossido di magnesio. L'ossido di magnesio è meccanicamente compresso all'interno della guaina, a tal punto che le spirali sono come cementate. Questo permette allo stelo resistivo di resistere a tutte le vibrazioni. Le singole spire delle spirali sono distanti tra di loro qualche decimo di millimetro. L'ossido di magnesio impedisce che si possano toccare, in modo che non vi possa essere un corto circuito che distruggerebbe lo stelo resistivo, il che sarebbe inconcepibile.

# THE DIESEL GLOW PLUGS

The diesel engines ignite for spontaneous combustion at temperatures above 650°C. The rising of the temperature is given by the compression of the air into the cylinder that, depending on the engines, passes from the pressure of 1 bar to 20/30 bars with the consequent combustion of the gasoil.

During the ignition phase, with cold engine, cold walls of the pistons and cold chamber of combustion, part of the heat produced by the compression is absorbed and lost preventing the possibility of spontaneous combustion. The glow plugs work as additional source of heat to compensate for those losses. After the ignition phase, the heat emitted by the combustion is able to keep the lowest temperature for spontaneous combustion, but the conditions still remain critical: in fact the gasoil does not burn properly and causes black smoke and smell of naphtha; that goes on until the engine reaches the temperature for optimal running. That situation was usual with the single coil glow plugs of first generation.

Modern engines are equipped with glow plugs of new generation, called of pre- and post-heating; those glow plugs are able to run longer thanks to a special filament that keeps the temperature regulated longer.

Thanks to that new type of glow plugs, the diesel engines are less noisy, without odour, moderate in the consumptions and with low emissions of harmful oxides. Those glow plugs are structured with double-coil technology:

**the first one is a filament of regulation, that allows a self-regulation of the intensity of current that crosses it in function of the reached temperature;**

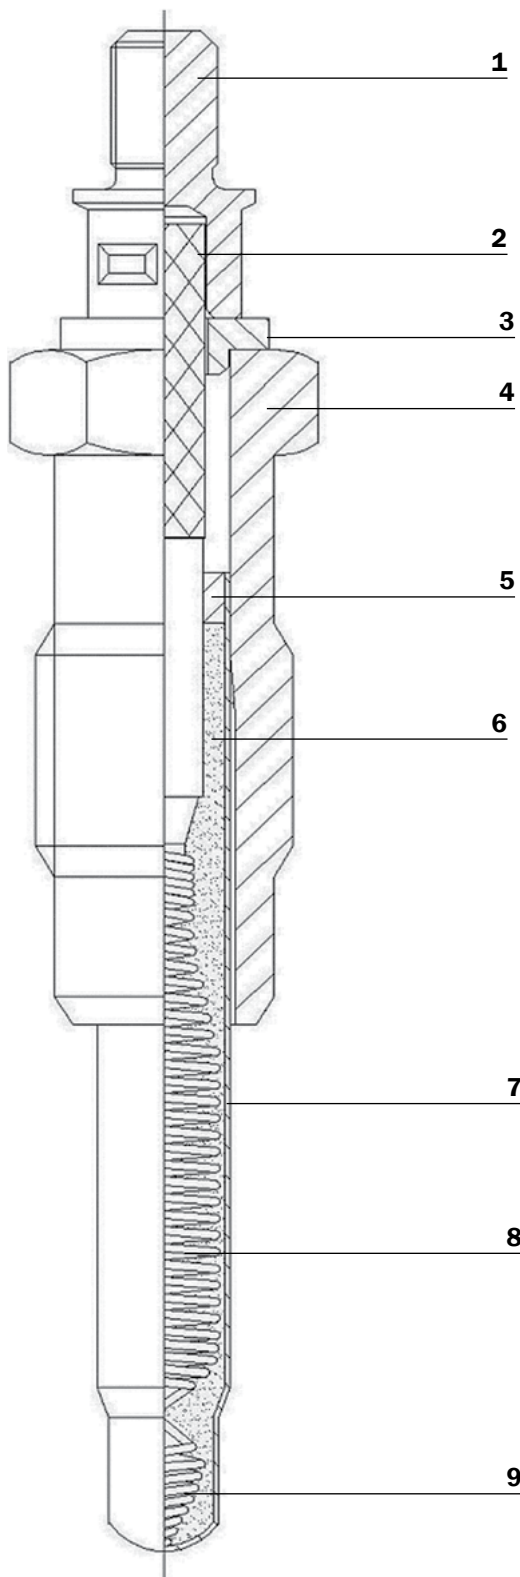

**the second one is an incandescent filament that allows to reach the temperature of 1000°C about for some seconds and then to start the spontaneous combustion.**

That combination increases the longevity of the glow plug and guarantees its total reliability under all the climatic conditions.

# SELF-REGULATING SHEATHED HEATER PLUGS

- 1 - Terminal threaded
- 2 - Electrode
- 3 - Seal
- 4 - Plug body
- 5 - Seal ring
- 6 - Magnesium oxide
- 7 - Sheat resistite stem
- 8 - Control spiral
- 9 - Ignition spiral

## Structure and properties of the sheathed heater plug

The modern sheathed heater plug consists in the main plug body, the heating element with the heating and regulating coils and the connecting bolt. The non-corrosive glow tube is pressed into the housing in such a way that gases cannot escape. The plug is also sealed by O-ring at the connecting part.

The heater plug draws its electricity from the battery and is controlled by an electronic heating-time control unit.

## The heating coil and regulating coil

The fundamental principle of a modern sheathed heater plug consists of the combination of a heating coil and regulating coil in one joint resistor element. The heating coil and the front part of the heating element comprise the heating zone. The resistance of the regulating coil at the rear increases with the temperature and thus the current and temperature are regulated downwards. Or in other words: the heating coil and the regulating coil are electrically switched in series and welded together. Both coils have positive but varying temperature-resistance factors. The regulating coil has a high coefficient and the heating coil a low one. The heating coil is welded into the dome of the glow tube, the regulating coil is fastened to the conducting connecting bolt.

## Protection of the heating coil and regulating coil

The entire coil is packed tightly into a compressed, electrically insulating, but very heat-conductive ceramic powder, which is normally magnesium oxide. The powder is mechanically compressed to such an extent that the coil is fixed as if cast in cement. This makes it so sturdy that the heating coil's and regulating coil's wires permanently withstand all vibrations. Even though the individual windings are only separated from each other by a few tenths of a millimetre, coil shorts cannot occur and a short circuit with the glow tube, which would destroy the plug, is inconceivable.

# LES BOUGIES DE PRÉCHAUFFA- GE DIESEL

Dans les moteur diesel l'allumage se produit pour une combustion spontanée à des températures supérieures à 650° C. L'augmentation de la température est donnée par compression de l'air dans le cylindre, laquelle, selon les moteurs, va de 1 bar pression ambiante, jusqu'à 20/30 bar, résultant de la combustion du diesel.

Au démarrage, le moteur est froid et avec les parois des pistons et chambres de combustion partie froide, partie de la chaleur, produite par la compression, est absorbé dans une telle mesure qu'il empêche la possibilité d'une combustion spontanée. Les bougies travaillent comme source de chaleur supplémentaire pour compenser ces pertes. Une fois cette étape initiale, la chaleur produite par la combustion peut maintenir la température minimale pour une combustion spontanée, mais les conditions restent critiques, parce que le combustible brûle mal avec la présence de fumée noire et l'odeur de l'huile, cela jusqu'à le moment où le moteur n'a pas atteint la température. Cette situation a existé avec les bougies mono-filament de première génération.

Dans les moteurs modernes sont montés bougies de nouvelle génération appelés de pré-et post-chauffage, qui, par un filament spécial, régissent la température dans le temps afin de rester allumées plus longtemps.

Avec ce type de bougies, le moteur diesel devient plus silencieux, inodore, plus économe de consommation de carburant et avec faibles émissions d'oxydes nocifs. Ce type de bougies sont composés d'une structure avec double filament:

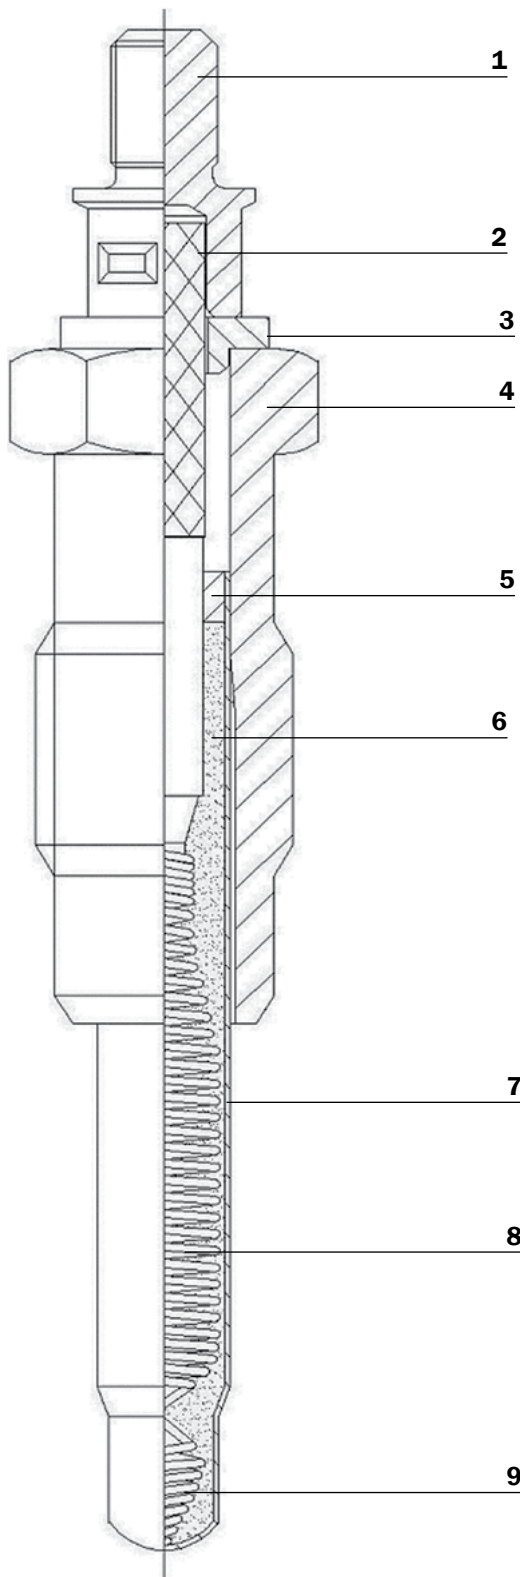

**Le premier est un filament de réglage, ce qui permet l'autorégulation l'intensité du courant qui le traverse en fonction de la température atteint;**

**Le second est un filament incandescent, qui permet, pendant quelques secondes, d'atteindre la température d'environ 1000° C et ainsi déclencher la combustion spontanée;**

La combinaison est conçue pour augmenter la longévité des bougies de préchauffage et d'assurer une fiabilité totale dans toutes les conditions météorologiques

# BOUGIES DE PRÉCHAUFFAGE GAINÉS ET AUTORÉGLABLE

- 1 - Connecteur fileté
- 2 - Conducteur électrique
- 3 - Joint isolant
- 4 - Corps
- 5 - Bague isolant
- 6 - Oxyde de magnésium
- 7 - Élément résistif
- 8 - Spirale de régulation
- 9 - Spirale de chauffage

## Structure et propriétés de la bougies de préchauffage gainés

Les bougies de préchauffage gainés modernes consiste dans le corps principale, l'élément de chauffage avec les spirales régulatrices et d'allumage et le boulon de connexion. Le tube non corrosif est enfoncée dans le boîtier de telle manière que les gaz ne peut s'échapper. La bougie est aussi scellé par O-ring à la pièce de raccordement.

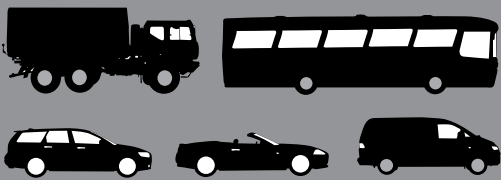

La bougie de chauffage tire son électricité de la batterie et est contrôlé par une unité de contrôle électronique en temps de chauffage.

## La spirale de chauffage et la spirale de régulation

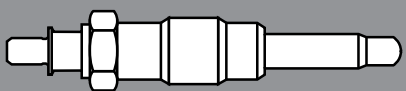

Le principe fondamental d'une bougies de préchauffage gainés modernes se compose de la combinaison d'une spirale de chauffage et une spirale de régulation dans un élément de résistance commune. La spirale de chauffage et la partie avant de l'élément chauffant comprend la zone de chauffage. La résistance de la spirale de régulation arrièr accroit avec la température et donc la courant et la température sont réglemmentée vers le bas. Ou en d'autres termes: la spirale de chauffage et celle de régulation sont électriquement soudés ensemble. Les deux spirales ont des facteurs de résistance positives mais divers à la température. La spirale de réglage a un coefficient élevé alors que celui de la spirale de chauffage est bas. La spirale de chauffage est soudé dans le dôme du tube de préchauffage, la spirale de régulation est fixée sur le boulon conduite de raccordement.

## Protection de les spirales de chauffage et de régulation

La spirale entière est emballé hermétiquement dans un comprimé de poudre de céramique, très conducteur de chaleur et isolé électriquement, qui est normalement l'oxyde de magnésium. La poudre est comprimée mécaniquement à un point tel que la spirale est fixe, comme si coulé dans le ciment. Ce qui le rend si solide que le filament des spirale de chauffage et de régulation résistent à toutes les vibrations de façon permanente. Même si les enroulements individuels sont séparés les uns des autres que de quelques dixièmes de millimètre, court-circuites de la spirale ne peuvent pas se produire et un court-circuit du tube à incandescence, ce qui pourraient détruire la bougie, est inconcevable.

# ISTRUZIONI DI MONTAGGIO

## DURANTE LA SOSTITUZIONE DELLE CANDELETTE SI DEVE FARE PARTICOLARE ATTENZIONE AI SEGUENTI PUNTI:

- Lasciare raffreddare il motore;
- Assicurarsi che la chiave per l'avviamento del motore sia in posizione OFF;
- I depositi di sporczia che si trovano sulla cava della candele non devono assolutamente cadere nella camera di combustione;
- Le candele devono essere rimosse utilizzando delle apposite chiavi a tubo;
- Le candele devono essere montate utilizzando delle apposite chiavi a tubo e per il serraggio, se possibile una chiave dinamometrica;
- I dadi per il collegamento elettrico della candele, devono essere stretti con la coppia di serraggio corretta, altrimenti se tale coppia di serraggio viene oltrepassata, è possibile che la candele venga danneggiata, provocandone il completo danneggiamento (la rottura del perno di collegamento o il surriscaldamento a causa della fessura anulare chiusasi);

## SMONTAGGIO CANDELETTE

- Smontare i dati di collegamento elettrico utilizzando una chiave a tubo (da 7mm o 8mm);
- Con un pennello pulire la cavità intorno alla candele senza smontarla;
- Smontare la candele con una chiave a tubo (a seconda del dado della candele la chiave può variare da 3/8" a 21mm);

## INSTALLAZIONE DELLE CANDELETTE DI PRERISCALDAMENTO

### Specifiche della coppia di serraggio consigliata per le candele RPOWER:

- 1 - Impiegare la chiave dinamometrica corretta per le candele ed il morsetto.
- 2 - Durante la fase di sostituzione delle candele, assicurarsi che eventuali olio o sporchie, etc., accumulati sull'esterno della candele smontata, non penetrino nel cilindro.
- 3 - Durante il montaggio delle candele, pulire il lato motore della flangia, ed assicurarsi che la candele sia allineata correttamente con la filettatura della testata dei cilindri.
- 4 - Assicurarsi che la candele sia posizionata correttamente ed avvitata a mano, fino al punto in cui non può più essere ulteriormente serrata.
- 5 - A questo punto, utilizzare una chiave dinamometrica per serrarla fino al valore di coppia illustrato nel diagramma sottostante.

### ! NON UTILIZZARE UN LUBRIFICANTE PER FILETTI!

Se sulla filettatura viene applicato uno strato di lubrificante per filetti, quale del grasso, la resistenza tra la candele e la testata dei cilindri sarà inferiore, e provocherà quindi un eccessivo serraggio.

! Un serraggio superiore ai valori delle coppie illustrati nella tavola qui sopra potrebbe provocare danni alla candele ed al motore.

! La rottura delle candele è spesso causata da tensione eccessiva e/o surriscaldamento. Le candele sono progettate per lavorare tra gli 850 e i 1200 gradi centigradi. Un eccessivo e prolungato passaggio di corrente può causare il surriscaldamento della candele generando rigonfiamento, rottura o bruciatura della medesima, portando cioè all'immediata rottura. Un relè difettoso può essere causa di un guasto delle candele, pertanto è necessario verificare l'intero sistema prima di sostituire le candele.

### SPECIFICHE DI COPPIA CONSIGLIATE PER L'INSTALLAZIONE

	Dimensione filetto	Coppia consigliata
Filetto corpo candele	M8x1,00	8-12 Nm
	M9x1,00	8-12 Nm
	M10x1,00	10-15 Nm
	M10x1,25	10-18 Nm
	M12x1,25	15-22 Nm
	M14x1,25	20-27 Nm
	M14x2,00	20-27 Nm
	M18x1,50	30-40 Nm
Filetto terminale	M4x0,7	1-1,5 Nm
	M5x0,8	3-4 Nm

# MAINTENANCE AND REPLACE- MENT

## WHEN REPLACING GLOW PLUGS, SPECIAL ATTENTION MUST BE PAID TO THE FOLLOWINGS ASPECTS:

- leave to cool the engine;
- make sure that the key for the starting of the engine is on OFF position;
- dirt around the hole for the plug must not fall into the combustion chamber under any circumstances;
- glow plugs must be removed by using special plug box wrench;
- glow plugs must be fitted by using special plug box wrench and tightened, if possible, by using a torque wrench;
- the power connection nuts for the electric connection of the glow plug, must be tightened to the correct torque. Otherwise, the glow plug may be damaged by excessive torque. This can result in irreparable damage to the plug (connecting stud shear or overheating due to closed annular gap);

## REMOVING THE GLOW PLUG

- remove the power connection nuts by using a plug box wrench (7mm or 8mm);
- by using a brush, clean the hollow around the glow plug without removing it;
- remove the glow plug with a plug box wrench (the key can vary from 3/8" to 21mm, according to the nut of the glow plug);

## GLOW PLUG INSTALLATION

### Recommended torque specification for RPOWER glow plugs:

- 1 - Use the correct wrench for the Glow Plug and
- 2 - When changing glow plugs, make sure that oil, dirt etc. on the outside of the disassembled glow plug does not enter into the cylinder.
- 3 - When mounting the glow plug, clean the engine side of the flange and make sure the glow plug is correctly inline with the thread of the cylinderhead.
- 4 - Make sure the plug is correctly positioned and tighten it by hand until it cannot be tightened any further.
- 5 - Then, use a torque wrench to tighten it accurately to the torque showed in the chart below.

### ! DO NOT USE A THREAD LUBRICANT!

If a thread lubricant such as grease is coated on the thread, the resistance between the glow plug and the cylinderhead will be less -> resulting in over tightening

! Tightening more than the torques shown in the table could result in damage to the glow plug and engine.

! Glow plug failure is most commonly caused from over voltage and/ or excessive heat. Glow plugs are designed to operate between 850 to 1200 degrees. When the electrical current to the glow plug is held too long it can lead to overheating which will cause the glow plug to swell, split or burst and cause immediate failure. Overly advanced injection timing, leaky injectors, or running gasoline in your engine will cause the combustion temperature to get hot enough to damage the glow plug.

A faulty relay and controller can also cause glow plug failure so it is advisable to check out the entire system before changing to new glow plugs.

### RECOMMENDED INSTALLATION TORQUE SPECIFICATION

	Thread size	Recommended torque
Glow plug	M8x1,00	8-12 Nm
	M9x1,00	8-12 Nm
	M10x1,00	10-15 Nm
	M10x1,25	10-18 Nm
	M12x1,25	15-22 Nm
	M14x1,25	20-27 Nm
	M14x2,00	20-27 Nm
Terminal	M18x1,50	30-40 Nm
	M4x0,7	1-1,5 Nm
	M5x0,8	3-4 Nm

# MAINTENANCE AND REPLACE- MENT

## LORSQUE VOUS CHANGEZ LES BOUCHONS DEVRAIENT ACCORDER UNE ATTENTION PARTICULIÈRE AUX ÉLÉMENTS SUIVANTS:

- Laisser refroidir le moteur;
- Veiller à ce que la clé de démarrage du moteur est en position éteint;
- Les dépôts de saleté qui se trouvent dans la cavité de la bougie, ne doit pas tomber dans la chambre de combustion;
- Les bougies doivent être enlevées en utilisant la clé appropriée;
- Les bougies doivent être montées en utilisant la clé appropriée et serrées, si possible, avec une clé dynamométrique;
- Les écrous pour le raccordement électrique de la bougie doivent être serrées avec la couple de serrage correcte, sinon, si la couple est dépassée, il est possible que la bougie est endommagée, en provoquant des dégâts complète (casse de la tige de connexion ou la brûlure à cause de l'espace annulaire qui s'a serré);

## DÉMONTAGE DES BOUGIES

- Démontez les écrous du câblage électrique en utilisant une clé tubulaire (7mm ou 8mm);
- Utilisez une brosse pour nettoyer la cavité autour de la bougie sans démonter;
- Démontez la bougie avec une clé tubulaire (en fonction de l'écrou de la bougie la clé peut varier de 3/8" à 21 mm);

## INSTALLATION DE BOUGIES DE PRÉCHAUFFAGE

### Couple recommandé pour le bougies de préchauffage RPOWER:

- 1 - Utilisez la clé correcte pour la bougie de préchauffage et la borne.
- 2 - Lorsque vous remplacez les bougies de préchauffage, assurez-vous que l'huile, la saleté, etc. se trouvant à l'extérieur de la bougie de préchauffage démontée ne pénètrent pas dans le cylindre.
- 3 - Lorsque vous montez la bougie de préchauffage, nettoyez le côté moteur du flasque et assurez-vous que la bougie de préchauffage est bien en ligne avec le filetage de la culasse.
- 4 - Assurez-vous que la bougie est bien placée et serrez-la à la main jusqu'à ce qu'elle soit bloquée.
- 5 - Ensuite, utilisez une clé dynamométrique pour la serrer avec précision au couple indiqué sur le graphique ci-dessous.

### ! NE PAS UTILISER DE LUBRIFIANT POUR FILETAGES!

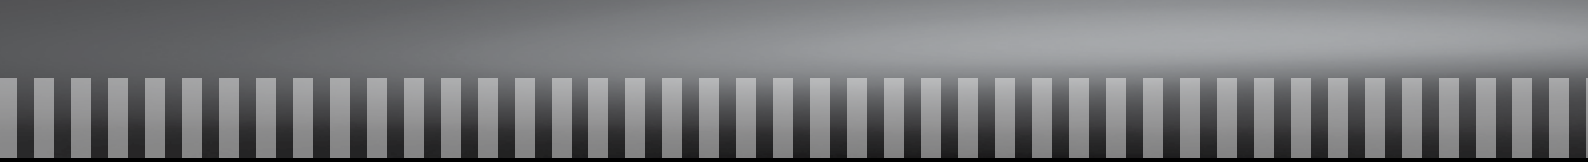

Si on applique un lubrifiant pour filetages ( huile de graissage, par ex.) sur le filetage, la résistance entre la bougie de préchauffage et la culasse diminuera -> ce qui entraînera un serrage trop important. ! Un serrage supérieur aux couples indiqués dans le tableau ci dessous peut endommager la bougie de préchauffage et le moteur.

! La défaillance d'une bougie de préchauffage se doit, la plupart du temps, au survoltage et/ou réchauffement excessif. Les bougies sont conçues pour un environnement entre 850 et 1200 degrés. Si la tension est appliquée pendant trop longtemps, les bougies peuvent fondre ou se fissurer, occasionnant ainsi la panne immédiate. Une surtension, des injecteurs qui fuient ou une fuite de carburant dans votre moteur peuvent augmenter la température de combustion jusqu'à endommager les bougies de préchauffage. Un dispositif de contrôle ou un relai défectueux peuvent aussi occasionner la défaillance de la bougie. Il est donc conseillé de vérifier le système complètement avant l'installation de nouvelles bougies de préchauffage.

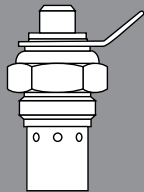

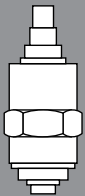

### COUPLE RECOMMANDÉ POUR L'INSTALLATION

	Dimension de filetage	Couple recommandé
Bougies de préchauffage	M8x1,00	8-12 Nm
	M9x1,00	8-12 Nm
	M10x1,00	10-15 Nm
	M10x1,25	10-18 Nm
	M12x1,25	15-22 Nm
	M14x1,25	20-27 Nm
	M14x2,00	20-27 Nm
	M18x1,50	30-40 Nm
Plot	M4x0,7	1-1,5 Nm
	M5x0,8	3-4 Nm
