On May 30, 2001 the California legislature passed a bill making it illegal to play illegal games online. According to a summary in RISKS, "The bill would fine first-time transgressors $25 per transaction (not conviction) and $100 per transaction thereafter. Companies (anywhere) convicted of catering to Californians could be liable for $1000 per transaction and 90 days in jail. The bill supposedly specifically allows prosecutors to go after offshore corporations."

NEW EFFORT TO CURB ONLINE GAMBLING
After three unsuccessful attempts at reining in the $1.6-billion Internet gambling industry, members of Congress are trying again, this time with a package bill that attempts both to ban online gambling completely and to block the ability of online casinos to collect bets through credit cards, checks or electronic fund transfers. In the past, gambling companies have evaded credit card restrictions by passing off gambling transactions as non-gambling purchases. The congressmen introducing the current legislation are Representatives Bob Goodlatte, Jim Leach, John LaFalce and Senator Jon Kyl. Goodlatte says that Internet gambling "is sucking billions of dollars out of the country. It's unregulated, untaxed, illegal and offshore, and we need legislation to address that problem." ADVERTISERS TURN TO ONLINE GAMING TO BOOST BRANDING
Traditional corporations, including General Motors, Honda and PepsiCo, are turning to online videogames to get their message out, targeting the 145 million consumers who are active computer and videogame players, according to a study by the Interactive Digital Software Association. "Forget your image of a gamer being a teenage punk with a skateboard and loud music," says the president of an advertising agency that specializes in targeting the 18-34 age group. IDSA's survey found that 42% of frequent game players are older than 35, while 30% are in the 18-34 range. The online games cost advertisers between $150,000 and $500,000 to create, depending on the graphics, says one game developer, who predicts the next wave will include other media, including cell phones and pagers. One scenario under discussion involves a player receiving pages during the day instructing him or her to log on to the game because the player's character is in danger. GEO-LOCATION SOFTWARE FINDS PEOPLE ON THE NET
"Geo-location software" is the next wave in collecting information from online users, tracing the connection route to locate the city where a user is logging on. The software is raising new questions among privacy advocates, who worry that geo-location capabilities infringe on both a user's anonymity and his or her access to information. "Right now oppressive governments around the world are not able to keep information away from their citizens as they had (before the Internet)," says David Sobel, general counsel for the Electronic Privacy Information Center. One industry likely to benefit from the technology is online gambling, which is expected to generate $6 billion worldwide by 2003. Legitimate gambling sites could restrict access to only residents of states and countries where such activities are legal. In June, the state of Nevada moved forward on legislation to consider making online gambling legal within state borders. (Financial Times 2 Aug 2001)

2001-09-10 **online gambling penetration hacking data diddling code modification algorithms corrupted illegal winnings**

RISKS 21 67

Peter G. Neumann summarized an article about a hacked online-gambling site:

"The article is on risks in on-line gambling, and particularly CryptoLogic, Inc., a Canadian on-line casino games developer that has been hacked. One of their sites had been "fixed" so that craps and video slot players could not lose, with winnings totalling $1.9 million. Every dice throw turned up doubles, and every slot spin generated a perfect match. Whether it was an insider attack or a penetration is not clear from the article. (We noted the likelihood of hacking of Internet gambling sites in RISKS-19.27, 1 Aug 1997, not to mention my 1995 April Fool's piece in RISKS-17.02.) Interesting question: which laws against hacking will apply to subversions of illegal Internet gambling parlors? Who gets to prosecute remote attacks on off-shore operations?

BRITISH TV TO OFFER REAL-TIME GAMBLING
Two British digital television platforms are planning to launch real-time interactive gambling services in an effort to boost revenues and attract the loyalty of couch-potato bettors. Both Telewest and ITV Digital will use SportXction software developed by U.S. software maker Interactive Systems Worldwide. SportXction allows bets to be placed at key points in television programming -- in particular during sports events where, for example, a player is about to take a penalty shot in soccer or serve in tennis. The UK's interactive TV industry is betting on gambling to help it win back some of the billions of pounds spent on subsidizing and selling digital TV to British consumers. "Many broadcasters now realize that their future success will be based upon incremental revenues generated from new, compelling and distinctive services," says Global Interactive Gambling CEO Cees Zwaard, whose company is partnering with Telewest on its interactive gambling venture. COMPANIES GAMBLE ON ONLINE WAGERING
A growing number of companies are developing online gambling technologies, betting that cyberwagering will be legalized in the U.S. in the not-too-distant future. Interactive Systems Worldwide has designed interactive-television gambling software for German media firm Kirch Group that will enable European sports fans to bet from their own living rooms, and Interactive chairman Barry Mindes expects it will be available for this year's soccer World Cup. Interactive Systems is now working on a handheld gambling device and is hoping to introduce an online "contest" concept in the U.S. based on the gambling software. Under current U.S. law, online gambling is prohibited but TV viewers can enter contests to win prizes such as a car. Mindes envisions users answering a list of questions posed by an advertiser to rack up credits that could then be used for playing the game. (Wall Street Journal 14 Jan 2002)

MOBILE GAMING SET TO BOOM
Almost half of all European mobile phone customers will be using their handsets to play games by 2005, according to a recent Forrester Research report, as users take advantage of snazzy new handsets and upgraded wireless networks. "The increase in wireless bandwidth and better phones will attract more firms to offer mobile games. Just as an increase in Internet-ready PCs pushed more companies to offer Web services, a bigger audience for mobile games will make firms like Eidos Interactive and Electronic Arts follow in the footsteps of Riot Entertainment and Picofun," says the report. As more games become available, the number of mobile game users is anticipated to rise from 5 million currently to 130 million by 2005. And while most of these players will be young, older gamers are expected to join the fun next year as classic 1970s- and '80s-era games, such as Pong, Frogger and Space Invaders, are revamped for the mobile platform. However, in order to capitalize on this new source of revenue, "operators must curb their greed," warns the report, saying that to ensure developers to continue to produce the games, operators must share their revenues with them. Forrester predicts that over the next five years, ad agencies will begin to acquire their own game development groups to create games for advertising and branding purposes. Television and film studios will also jump into the mix, with mobile games based on shows such as "Who Wants to Be a Millionaire?" (ElectricNews 31 Jan 2002)

2002-06-18 **credit card online gambling bank block abuse fraud**

NewsScan; http://www.nytimes.com/2002/06/15/business/15GAMB.html 90

CREDIT CARDS BANNED FOR INTERNET GAMBLING
Citibank has agreed to block use of its credit cards for Internet gambling after New York State regulators said the bank could face criminal prosecution for aiding in the promotion of online gambling, which is illegal in New York. Citibank, with 33 million Visa and MasterCard holders, is the largest credit card issuer in the United States. Citibank also agreed to pay $400,000 to nonprofit agencies that provide gambling counseling. Other major credit card issuers, including Providian Bank, have already said they will try to block use of their cards for Internet gambling. Like other credit card issuers, Citibank is motivated to block the transactions for additional reasons, such as the "increased potential for fraud loss" and higher "delinquency rates" on the online gambling charges. NewsScan

GREEK COURT REVERSES BAN ON VIDEO GAMES
The first case to test the new Greek law banning people from playing video games in public places has been thrown out of court, setting the country's legal establishment on a collision course with the state. Legislation passed in July forbade the games as part of a drive to stamp out illegal gambling, but it has been harshly criticized by the Internet community for not making a distinction between gaming and interactive gambling. Under Greek law, gambling is permitted only in licensed casinos, and the draconian legislation was enacted in response to an unlicensed slot-machine scandal that had embarrassed the government. The two Internet café owners charged with violating the ban could have faced jail sentences of up to three months and fines of $4,950 each, as well as the loss of their business licenses. Greece's Internet Café Owners Union welcomed the ruling, but say that their business has dropped precipitously since the law was passed. Computer usage in Greece is one of the lowest in the European Union, and Internet cafés have been credited with helping to expand access. (BBC News 10 Sep 2002)

MGM LAUNCHES ONLINE CASINO
Las Vegas resort operator MGM Mirage has quietly launched an online casino, becoming the first major U.S. gambling company to do so. Its site is open to all for free play, but only residents of the UK, Portugal, Spain, Ireland, South Africa and New Zealand are allowed to open accounts and bet real money. The online casino office is located on the Isle of Man, an island-nation off the coast of Great Britain that has licensed four other Web casinos. The MGM Mirage site uses layers of database-searching software designed to verify that gamblers are who — and where — they say they are, and regulators and auditors on the Isle of Man and in London also monitor the network of systems. MGM is hoping that its move will encourage other large casinos to go online, but at the same time, online gambling is running into stiff opposition in Congress, where a bill passed on Tuesday would make it a crime for a gambling business to accept credit cards, checks or fund transfers in connection with unlawful Internet gambling. Gambling industry analysts predict that online casinos are likely to become an established niche in the market, where approximately 1,800 largely offshore Internet gambling sites already generate $3.5 billion in annual revenues, according to Bear Stearns. 2004-05-31 **offshore online gambling prosecution domestic support services international law first amendment rights litigation**

http://www.nytimes.com/2004/05/31/technology/31gambling.html?th=&pagewanted=print&position=

In early April 2004, United States Marshals seized $3.2M in advertising fees paid to the Discovery Communications Corporation for TV ads promoting the online gambling service ParadisePoker.com. Online gambling is illegal in the United States, but offshore gambling facilities cannot be attacked because the countries where they reside do not consider them illegal. Under international law, the doctrine of dual criminality requires equivalent crime laws in order to extradite people accused of a crime in one jurisdiction from the jurisdiction where they reside. Therefore, federal law enforcement authorities are cracking down on online gambling by attacking American companies who provide services to those offshore organizations. Critics of the new campaign argue that US law is inconsistent with respect to online gambling because not all states make it illegal. In addition, some analysts raised First Amendment rights arguments. Others complain that seizing foreign funds is a violation of international law.

2006-04-12 **gambling electronic slot machines wireless reprogramming manipulation vulnerability corruption theft cheating**

RISKS; NYT; http://tinyurl.com/ou6jf 24 24

CASINO CAN REPROGRAM SLOT MACHINES IN SECONDS

As an enormous operational improvement, the 1,790 slot machines in Las Vegas's Treasure Island Casino can now be reprogrammed in about 20 seconds from the back-office computer. Previously this was an expensive manual operation that required replacing the chip and the glass display in each machine. Now it is even possible to have different displays for different customers, e.g., changing between "older players and regulars" during the day and a different crowd at night ("younger tourists and people with bigger budgets". (Slot machines generate more than $7B revenue annually in Nevada.) Casinos are also experimenting with chips having digital tags that can be used to profile bettors, and wireless devices that would enable players to gamble while gamboling (e.g., in swimming pools!). . . .

There are various risks of interest to RISKS. Regulators are concerned that machines might be "invaded by outsiders", while bettors are concerned that casinos could be intentionally manipulating the odds -- for example, giving preferential treatment to high rollers. Internal and external manipulation are clearly potential issues, which of course could be exacerbated by compromisible wireless security. By Nevada law, odds cannot be manipulated while someone is playing, although with four-minute timeouts before and afterward, machines may be reprogrammed on the fly.

If it were still April Fools' Day, I might suggest that the slot machines could be reprogrammable for use as voting machines on election day. That way you could have instant payoff if you vote the right way.

2000-01-25 **credit card fraud theft online auction**

ZDNet http://www.zdnet.com/zdnn/stories/news/0,4586,2427490,00.html

A new scam involving online auctions and an offshore bank was reported in January. Steps in the fraud:
* Scam artist advertises expensive electronics on auction site and posts specific price as well for direct sale.
* Buyer agrees to purchase equipment.
* Thief proposes to send equipment directly to buyer's address in return for pledge to wire price to bank if product is OK.
* Using the buyer's detailed information (name, address, phone number), thief opens account with Web retailer.
* Arranges to ship equipment to buyer but pays for product using a stolen credit-card number.
Results:
* Buyer now has stolen equipment in possession.
* Owner of stolen credit-card has expensive charge for product never received.
* Thief has money in offshore bank.

BIDS FOR VIRGIN MARY CHEESE SANDWICH CANCELED

The folks at eBay were no believers in this cheesy miracle: half of a 10-year-old grilled cheese sandwich whose owner claimed it bore the image of the Virgin Mary. Diana Duyser put the sandwich up for sale last week, drawing bids as high as $22,000 before eBay pulled the item on Sunday night. The page was viewed nearly 100,000 times before being taken down. An e-mail Duyser received from eBay said the sandwich broke its policy, which "does not allow listings that are intended as jokes." (The Age 17 Nov 2004)

Reuter

The notorious fabrication, the "Franklin Diary" first surfaced in 1934 in a US pro-Nazi publication; it purports to quote Ben Franklin as an anti-Semite. Despite repeated debunking, the fraudulent document continues to circulate in the neo-Nazi underground, including KKK networks. It has recently been quoted in Hamas materials and seems to be kept alive today by repeated postings on the Internet. The Franklin Institute in Philadelphia has been swamped with phone calls about this document, which is described as being kept there.

2000-02-18 **hate speech Web Internet censorship government law regulation restriction international**

Inter Press Service

In February, an international seminar in Geneva ("Expert Seminar on Remedies Available to the Victims of Acts of Racism, Racial Discrimination, Xenophobia and Related Intolerance and on Good National Practices in this Field,") examined how national governments can fight racism without infringing on freedom of speech. Participants pointed out that censorship of hate speech is not far removed from the anti-democratic censorship practiced by totalitarian regimes worldwide. Self-regulation doesn't seem to work very well, especially with radically different levels of tolerance for expression of unpopular ideas. The conference concluded that as long as the US First Amendment protects racist and hate-spewing sites based in that country, international efforts at control are doomed.

YAHOO TO BE PROACTIVE IN POLICING COMMERCIAL POSTINGS

Yahoo has adopted a new "proactive" monitoring program that will use software to accomplish an initial review of all commercial postings on its auctions, classified sections, and shopping areas. If the software detects any postings that appears to violate the site's policies hateful or violent material, it will give the senders the opportunity to revise their submissions or appeal the rejection to a human reviewer. Yahoo has been under pressure from human rights groups to take a more proactive stance against auctions of Nazi memorabilia and similar kinds of activities, and believes its new monitoring process will show that it has "thought about these issues in good faith." The monitoring will apply only to the commercial side of Yahoo and not to its discussion groups or home pages: "There we want to promote inclusiveness. We don't want Yahoo deciding who can or cannot speak in public debates." (New York Times 3 Jan 2001)

TERRORIST LIFE, INTERNET-STYLE

In recent months sites like azzam.com, almuhajiroun.com, and qassam.net have been set up for terrorists to "make the Internet our tool," and although service providers frequently shut them down they usually reappear someplace else: al-Qaeda's Arabic site alneda.com has reemerged in the past five weeks on different servers in Malaysia, Texas, and Michigan. Most suspected terrorist sites are written in Arabic, proclaim hatred for the U.S., and call on militant Muslims to kill Americans and attack U.S. interests. But there are exceptions: the Islamic alsaha.com site has posted comments accusing bin Laden of being "a disgrace to our religion" and accusing him of having made "a mockery of everything we believe." Do these terrorists have day jobs? The site azzam.com offers the following advice to those who want to fight "the Jewish-backed American Crusaders" without disrupting their own employee benefits plans: "If you are working, either resign from your job and take a year off or request unpaid leave from your employer. Many large companies offer unpaid leave to their employees for periods ranging from two months to one year. That way you can fulfill your obligation [of jihad] and not have to give up your job." DHS IAIP Daily; http://abcnews.go.com/Technology/wireStory?id=1925141 23

REPORT: HATE GROUPS USE U.S. INTERNET SERVERS.

Hate groups around the world, including Islamic militants, often use Internet servers based in the U.S. to send propaganda and instructions to followers, according to a report released Thursday, May 4, by the Simon Wiesenthal Center (SWC). The Center said it had logged some 6,000 Websites in the past year used by racists and bigots to incite violence. Extremist anti-Americans often find it easier and cheaper to use a site hosted in America since the U.S. has free speech and little Internet censorship. Recently, the center also has been intercepting an increased number of online tutorials and how-to manuals aimed at sympathizers who might actually be recruited to carry out attacks. SWC press release: http://www.wiesenthal.com/site/apps/nl/content.asp?c=fwLYKnN 8LzH&b=312458&content_id={433F72C6-2173-4360-8981-0BB7B508C4 87}&notoc=1 SWC's interactive report will be available for purchase May 2006: http://www.wiesenthal.com/site/pp.asp?c=fwLYKnN8LzH&b=242023

INTERNET COULD BE HAZARDOUS TO YOUR HEALTH
A survey conducted by Holly Cardamone, a Melbourne, Australia nurse and communications consultant, indicates that most Web sites that dispense health-related information fail to meet basic standards of impartiality and accuracy. Cardamone evaluated the top 100 Web sites returned in Yahoo searches on breast cancer, diabetes and depression, using the international Health On The Net Foundation's code of conduct. The code's guidelines address issues relating to the authority of the information given, user confidentiality, openness about corporate sponsorship, and emphasis on treating the information as complementary to medical treatment, rather than replacing it. Forty-two of the sites presented useful information: "Such sites contained quality, appropriate information with potentially lifesaving content such as explanations of the symptoms of depression, and healthy recipes for diabetics," says Cardamone. But the other 58 were a disappointment, containing unverified information. Meanwhile, other researchers have cited the growing phenomenon of "cyberchondria" — hypochondriacs who feed their health obsession with information from the Web. Such people are especially drawn to multiple choice quizzes that provide diagnoses based on a list of symptoms. (Sidney Morning Herald 16 Sep 2003)

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml?articleID=60402476

E-MAIL SCAMS EXPLOIT HOMELAND SECURITY AND SOLDIERS KILLED IN IRAQ.

Federal authorities are investigating two e-mail scams, including one targeting families of soldiers killed in Iraq, that claim to be connected to the Department of Homeland Security (DHS). Both of the online pleas for help -- and money -- link themselves to the Immigration and Customs Enforcement (ICE) bureau's Website. ICE is one branch of DHS. In one scheme, e-mail sent to families of U.S. soldiers killed in Iraq include a link to the bureau. The e-mail seeks to recover money from a friend of the slain soldier. In the other, the e-mail identifies itself as being sent by a federal agent trying to track down funds looted from the Iraqi Central Bank by Saddam Hussein's son. The e-mail also links to the bureau Website. Both e-mail campaigns are bogus and people are urged to ignore and delete them.

1998-02-17 **hacker threatening e-mail harassment**

UPI, EDUPAGE, New York Times

Richard Machado, a 19-year former college student, was charged with ten counts of threatening Asian Americans via e-mail. In a brilliant display of logic, his attorney argued that he should be charged with only one count of hate e-mail because the multiple hate messages were sent out in a single operation. By this logic, someone who kills several people in one incident using a machine gun ought to be charged with a single count of murder because the trigger was held down only once. In November, the jury deadlocked 9:3 in favor of acquittal and the judge declared a mistrial. The key argument of the defense was that because the defendant was bored and not actively involved in hate groups, his hate messages should be ignored. Machado was finally convicted in February 1998, setting an important precedent for governing behavior in cyberspace.

1998-03-29 **Internet gambling prosecution wire fraud**

EDUPAGE

US federal prosecutors charged several cybergambling joints with violation of laws prohibiting interstate wire communications of bets. The International Internet Gaming Association announced that it was working on recommendations for complying with national laws on this issue. [Comment from MK: There was no explanation of how a gambler can determine if a game of chance being run via the internet involves any chance at all; for example, a program giving the appearance of a card game of chance could easily evaluate all bets made during one round and rig the results so that no bettor would win. "Mechanical" games such as roulette wheels that are in fact simply programs could easily be manipulated to provide fraudulent probabilities that would translate into higher earnings for the house. If, as Garrison Keilor of Minnesota Public Radio's _Prairie Home Companion_ says, "Lotteries are a tax on those people who were never good at arithmetic," then online gambling is a tax on people who never stopped believing in Santa Claus.] In July, the huge international gambling company GTECH announced plans for Internet lotteries supposedly structured to exclude participation by US residents. At the end of July, the Senate passed Sen. J. Kyl (R-AZ)'s anti-online-gambling bill 90-10.

1999-11-29 **stalking harassment law enforcement Internet police investigation prosecution**

The Guardian

Duncan Campbell, writing in The Guardian (1999-11-29, p. 13), reported on the increasing threat of cyber-stalking. A new report by the Attorney General of the United States warned that obsessive stalkers are increasingly turning to the Internet as a tool in their campaigns of harassment. A couple of high-profile cases:

* Gary Delapenta was jailed for six years in July for having posted a young woman's address as that of a fictional sado-masochistic woman; at least six men tried to break into his victim's house. Delapenta was tricked into communicating with the victim's father, who trolled the Net looking for him and turned over enough evidence to the FBI to allow an arrest.

* Duwayne Comfort, a post-graduate student at the Catholic University of San Diego, CA was arrested after police set up a camera in the university computer lab to trace the sender of threatening e-mail messages to five women students. Comfort also hacked into the university records and lowered his victims' grades. Due to Comfort's need for a serious heart operation, he was given only a year's suspended sentence.

The US Department of Justice published a report in August on cyber-stalking; it was posted online at <http://www.usdoj.gov/ag/cyberstalkingreport.htm>.

2001-06-27 **e-mail SMTP headers IP address reverse lookup electoral fraud forgery impersonation criminal prosecution charges no contest nolo contendere plea Internet MS-Word properties sheet GUID globally-unique identifier**

RISKS 21 50

A report from a RISKS correspondent (name not supplied) told a story of technobumbling in the political fray of Minnesota:

Christine Gunhus, wife of former U.S. Senator Rod Gram (R-MN) pled "no contest" to charges of criminal violations of Minnesota election code. She used a pseudonymous Hotmail e-mail account to send disparaging propaganda about her husband's rival -- but failed to notice that the "X-Originating-IP:" header shows the IP address of the sender. A simple reverse IP lookup identified "the AT&T WorldNet user who repeatedly used the 'Katie Stevens" Hotmail account by connecting from Gunhus' home number. In addition to the compromising headers, the e-mail included MS-Word documents as attachments, and those documents listed Christine Gunhus as an author. The Globally Unique Identifiers (GUIDs) in the attached Word documents; "[the] GUID includes the Ethernet MAC address. Prosecutors last August obtained a search warrant to seize Gunhus' computer, from which they could extract the MAC address if the Ethernet card was still the same."

The correspondent adds an interesting comment about the effects of such stupid dirty tricks on anonymous or pseudonmous speech: "The Minnesota Civil Liberties Union reasonably argues that a criminal law that bans sending pseudonymous messages is unconstitutional. A Supreme Court decision, McIntyre v. Ohio Elections Commission < http://www.epic.org/free_speech/mcintyre.html >, says that a prohibition on the distribution of anonymous campaign literature violates the First Amendment. The state law seems to be ecumenical in its application: A Republican has used it to attack the Sierra Club < http://www.fcregister.com/ziegler11_6_00.htm >.

2001-08-07 **bank credit card fraud countermeasures identification authentication I&A mutual protocol failure design spoofing impersonation**

RISKS 21 59

Michael Bacon identified a problem in the credit-card fraud countermeasures used by his bank. Called by someone claiming to be the bank's fraud department to check on unusual buying patterns, he requested a method of verifying _their_ identity before revealing his authentication information. Apparently no one had ever thought of checking to see if the caller were legitimate bank employees. He settled the problem in an imaginative way: "After much discussion and calling two supervisors, we agreed that they would tell me the last two purchases I had made on that card (approximately 1 hour and 20 minutes beforehand respectively from two different stores). If they could, then they were probably from the bank, and I would authenticate myself to them." He added, "The RISKS are clear. You supply some 'secret' data to the bank so that they can authenticate you when you call them. But there is no simple way to authenticate the bank when it calls you. You can't ask for the number and call them back, because you have no way of authenticating the number given. They're ex-directory, so you can't confirm it through Enquiries, and they withhold the number so the CLI doesn't show! If you blindly supply the data (as clearly many people do), then you may be divulging to a crook the 'secrets' necessary to authenticate yourself to the bank. The bank has not thought to provide any means of authenticating themselves. I suspect this to be endemic."

DECEIT, NOT TECHNOLOGY, IS THE REAL MENACE TO SECURITY
Reviewing Kevin Mitnick's new book "The Art of Deception: Controlling the Human Elements of Secrecy," Simson Garfinkel writes in the Christian Science Monitor: "Although some will accuse Mitnick of creating a handbook that teaches crooks how to break into organizations, the truth is that we all need to understand these con games to protect against them. To stress this point, his last two chapters contain policies, procedures and training that companies can implement to further protect themselves. In keeping with his premise that the most damaging security penetrations are the result of deceit - not technical penetration - almost none of Mitnick's suggestions is technical in nature. The most important recommendation is that when somebody contacts you claiming to be from your organization, you need to verify that they are working for your organization no matter whether they are asking for your help, offering to help you, or just trying to be friendly." (Christian Science Monitor 3 Oct 2002)

2004-02-26 **e-mail spoofing stop solutions Microsoft Yahoo**

NewsScan

PUTTING AN END TO SPOOFING

To stop Internet "spoofing"— the sending of mail from someone who pretends to be someone else — Microsoft and Yahoo are each developing systems aimed at authenticating senders of e-mail, as are companies such as America Online, Sendmail, Brightmail, and Amazon. Microsoft's proposal (Caller ID for E-mail) would require Internet service providers to submit lists of unique numeric addresses for their mail servers so that, on the message receiving end, software could check a database to verify that a message actually originated from one of its registered machines. Yahoo's proposal (DomainKeys) would use encryption to digitally sign messages, and if the sender or message content were altered the signature would get rejected. Experts predict that some combination of the techniques will be ready for use later this year. Margaret Olson of the Email Service Provider Coalition's technology committee says that once enough service and software providers adopt the technology, "getting unauthenticated mail delivered will be extremely difficult." (AP/USA Today 26 Feb 2004)

2004-03-01 **electronic mail e-mail security privacy authentication identity spoofing**

NIPC/DHS

February 26, Associated Press — Companies work on E-mail identity system.

With a simple adjustment in your e-mail software, you can pretend to be anyone. This is known as spoofing. To close that loophole, Microsoft and Yahoo! Inc. are each developing systems aimed at authenticating senders of E-mail. America Online is testing a third. "Having E-mail come in, and not really being able to identify where it comes from, this is a huge security hole," Bill Gates, of Microsoft, said this week in announcing specifications for his proposal. Microsoft's proposal, known as Caller ID for E-mail, calls for Internet service providers to submit lists of unique numeric addresses for their mail servers. On the receiving end, software would check a database to verify that a message said to come from an e-mail provider actually originated at one of its registered machines. In January, AOL began testing a similar system called Sender Policy Framework (SPF), which checks a different part of the message. Yahoo's proposed solution would use encryption to digitally sign messages. If the sender or message content is altered, the signature gets rejected. Issues to be worked out for all three systems include how to properly send E-mail from cybercafes, hotels, and public Wi-Fi hotspots and how to preserve privacy when using anonymous re-mailers, which are used by whistleblowers and others to intentionally mask the origin of messages.

2004-10-27 **caller ID spoofing impersonation Website open security privacy implication White House call origination spoof**

DHS IAIP Daily; http://www.securityfocus.com/news/9822

October 27, SecurityFocus — New Caller ID spoofing site opens.

A new Website offers subscribers a simple Web interface to a caller ID spoofing system that lets them appear to be calling from any number they choose. Called "Camophone," (www.camophone.com) the service functions much like the Star38.com (www.star38.com) site that struggled with an abortive launch last month: a user types in their phone number, the number they wish to call, and the number they'd like to wear as a disguise. The system instantly dials back and patches the call through with the properly-forged caller ID. The Star38.com site relaunched this week as a tool offered exclusively to law enforcement officials and "intelligence agencies." In contrast to Star38, Camophone is open to anyone with a PayPal account, at a rate of five cents per minute, pre-paid. The Camophone site performed as advertised in a test by SecurityFocus, in which a reporter made phone calls appear to originate from the White House switchboard.

1C2 Identity theft

Category 1C2 Identity theft

2000-01-16 **identity theft case studies prevention**

Los Angeles Times

Caitlin Liu of the Los Angeles Times published a thorough report on identity theft on January 16 (front page). In one case, 22-year-old San Diego college student Jessica Smith had her car stolen — with her handbag inside. Although the car and bag were recovered, someone stole her identity. She nearly got fired from her new job when a background check showed that "she" had outstanding warrants for prostitution. She was unable to obtain credit, phone service or even to rent an apartment. With the help of a sympathetic police investigator, Smith was able to prove her innocence of the charges — a reversal of the usual burden under criminal law, where usually the state has to prove guilt. She obtained judicial documents explaining that her identity had been stolen; nevertheless, she has been hauled into police stations to be fingerprinted to prove that she is indeed the person authorized to carry those documents.

Image Data LLC, an identity-fraud prevention service based in Nashua, NH, commissioned a study in September 1999 that suggested that one out of five Americans or a member of their family have been victimized by identity fraud. [Readers should always be wary of statistics that report how many "members of your family" or "people you know" have particular characteristics: it is possible that a single person can be reported by multiple people. The over-counting bias increases as a function of sample size and of social relationships among the sample population.]

2000-07-18 **identify theft privacy social security number SSN database disclosure Web**

RISKS 20 95

Given the foolish reliance of many credit-card companies and financial institutions on one's mother's maiden name as an authentication mechanism, the State of Texas has recently taken a giant step in increasing identity theft: they put birth records on the Web. Bill Tolle reported to RISKS, "Go to < http://userdb.rootsweb.com/tx/birth/general/search.cgi > .Enter `Smith' as Surname. Leave all other fields blank. The search engine will return 35,072 names (first, last, and middle) with birth dates and the Mothers Maiden name (first, last, and middle) and Father's name (first, last, and middle)."

2000-09-25 **identity theft fraud government**

RISKS 21 07

Peter G. Neumann reported a shocking case of irresponsibility at a government service: "An AP item (seen by me on the front page of the *Palo Alto Daily News*, 25 Sep 2000) says that the California Department of Motor Vehicles issued over 100,000 fraudulent drivers' licenses in 1999, and typically makes little or no effort to check the validity of the 900,000 duplicate license requests it receives each year. Examples include duplicate licenses issued to people of the wrong race or the wrong gender, and in one case bogus duplicates of a particular individual's license to 18 different people. The driver's license is called a ``breeding document'' for identity thieves, leading to financial fraud, ruined credit, purchases of firearms by felons, and other misuses. DMV officials claim that implementing an on-line photo-retrieval system would cost $3 million over the next two years. This seems like a useful system — especially if it were used pervasively."

IDENTITY THIEVES MAY HAVE OPENED AN ACCOUNT FOR YOU
Fraud investigators are reporting that one of the common strategies used by identity thieves is to open a new account with a utility company under the name of the person whose identity they are trying to assume. The address on the account could be anywhere, because utility companies typically check only names and credit worthiness. Another trick used by scam artists is to generate bogus credit card numbers and then attach the real names and addresses of the people whose identity they plan to steal. By doing this they are relying on the fact that the verification process of online merchants is usually restricted to name, address, and phone number, and doesn't reveal until later the fact that the credit card number is a work of fiction. (USA Today 16 Jan 2001)

RISKS 21

Keith A Rhodes wrote in RISKS about a system penetration at Indiana University that raised fears of identity theft: "A user browsing from Sweden stored music and video files on a server at Indiana University that had apparently been left unprotected after a crash. IU realized it had a problem when huge increases were noted in network traffic. In the process, they also noted that a file of over 3,100 student names and SSNs had been copied from the server. Associate Vice President Perry Metz contacted the Social Security Administration about what might be an appropriate reaction, and said that they told him ``it's unlikely and unusual for someone who has your Social Security number to be able to do anything with it. Normally, financial institutions require additional information." [Is that reassuring to RISKS readers? Sources: Swedish hacker breaches IU server; Culprit stored music, video files on system and also downloaded private student data, AP item 28 Feb 2001, and article by John Meunier, *Herald-Times*, 28 Feb 2001; PGN-ed]"

2001-03-20 **identity theft impersonation fraud public records confidentiality Web**

RISKS 21 29

RISKS moderator Peter G. Neumann wrote a brief summary of a recent arrest with implications for theft of identity; his item started with the punning title, "Identity theft: Forbes-ing a head?" His comments were as follows:

>In RISKS, we have for many years been warning about the burgeoning increase in identity theft. The following case could foster a broader awareness of the depth of the problem, but then again most folks still seem to have their heads in the sand -- unless they have already been burned.

Abraham Abdallah was arrested on 7 Mar 2001, a 32-year-old Brooklyn NY high-school dropout working as a busboy, and already a convicted swindler. Although he was arrested as he was picking up equipment for making bogus credit cards, he is suspected of already having stolen millions of dollars. In his possession were SSNs, addresses, and birthdates of 217 people whose names appeared in a Forbes Magazine itemization of the 400 richest people in the U.S. He reportedly also had over 400 stolen credit-card numbers, and had used computers in his local library to access of the Web for information gathering. He is being held on bail of $1M. His activities were detected after an e-mail request to transfer $10M from a Merrill Lynch account, whereupon authorities found mailboxes he had rented in various names and other evidence. His defense attorney said Abdallah is innocent, and that prosecutors had ``made an unfair leap from possession of this information to an inference that there was an attempt to take money." 2001-03-21 **identity theft impersonation government documents national identifier driver's license public access confidentiality**

RISKS 21 29

Peter V. Cornell reported in RISKS on the recent declaration of the California driver's license and ID card as the primary identification document for the state. Mr Cornell wrote, "Courtesy of the California legislature, *anyone* who has a fake California drivers license with YOUR correct data, but with *his* picture and *his* version of your signature, can steal your money in many different ways. For example, if he knows your Social Security Number, bank, and account number, (easily obtained online or by mail theft) he can walk into any branch office and receive cash. Tens of thousands have been stolen from my (no longer existent) Wells Fargo accounts. . . . With that fake drivers license, that fraudster becomes YOU. All he need do is write a bad check drawn on another bank's bogus name account set up for that purpose, with the victim (you) as payee. He then walks into (in my case) a Wells Fargo branch and, impersonating the victim, cashes the check. When the check bounces, Wells Fargo (probably others, too) simply debits the victims account."

In addition, writes the correspondent, "The banking industry has arranged the law (California Commercial Code Sections 4401-4407 and 3101-3119) to ensure that the customer takes the hit. So that, among other conveniences, THE LAW allows banks to rely *solely* on the CDL data to confirm the identity of a customer with no risk exposure whatsoever. 'IF THE CUSTOMER PROVES' means you must sue the bank. They have it written so you'd lose anyway, but the amounts, however painful, are not nearly enough to pay a lawyer."

In riposte, attorney John Noble contributed a detailed rebuttal of Cornell's description of the California Commercial Code. He wrote, in part, "Mr. Cornell's description of the CA Commercial Code leaves out the good parts. An account may be debited if the item was 'properly paid,' i.e. 'authorized' in fact. If the item was not authorized, the customer need only notify the bank within a reasonable time after receiving his statement to have the account re-credited -- the burden is on the bank to prove that the endorsement was genuine, which is impossible. Banks typically ask the customer to sign an affidavit; and they pull the video sequence of the transaction at the teller window to confirm that the customer did not cash the check himself (the unlikely exception to the impossibility of proving the endorsement was genuine). Mr. Cornell points to Code provisions that require the victim to "prove" that the bank failed to exercise 'ordinary care.' But the provision only applies to losses caused by the customer's failure to review his bank statement and report an unauthorized debit within a reasonable time. In effect the bank is strictly liable for unauthorized debits during the first 6-8 weeks on little more than the customer's insistence that they were unauthorized. But if the customer doesn't look at his statement and report the unauthorized transactions disclosed on the statement, the bank's liability is cut off and the customer is stuck with the additional losses. The reasons for this are obvious. Only the customer is in a position to know that the debit was unauthorized. If he doesn't look at his statements, and the same guy is cleaning him out month after month, whose fault is that? In addition, the law has to take into account the possibility that the customer is having his own checks cashed by a third party. . . . The moral of the story: review your bank statements -- it's part of the deal."

2001-03-25 **identity theft social security number SSN fraud driver's license theft law enforcement justice system probation**

RISKS 21 31

Tom Goltz described a theft of his identity in some detail in RISKS:

>I am white. I have held a California driver's license in the past, but that license has been inactive for over two years since I established residency in another state.

In October of last year, a black male obtained a fake California driver's license with my name on it and his picture. The driver's license ID # he used belongs to a white female. The address is a Commercial Mail Receiving Agency in Costa Mesa CA, which the state doesn't normally allow. The fake also contained two spelling errors.

This person used this ID and my social security number to open a dozen different credit accounts in my name at various locations around the Los Angeles area. He was using a cell phone with a phone number based in the 603 area code as his residence phone.

If anyone had bothered to look, just about everything about this guy screamed fraud, yet he managed to steal $15,000 worth of merchandise (mostly jewelry).

Out of all these people who were supposed to be checking this information, only TWO found problems. One was a used car dealer who became suspicious when the check this guy gave for the down payment proved to be bogus. They refused to give the guy the car, but didn't bother to pursue the matter with the police. The other was store security at a Costco in Las Vegas, who tracked me down in New Hampshire and informed me that I had a problem. They detained the man, and turned him over to the police.

Sadly, the most he's going do is a couple of years probation - he didn't actually steal anything in Las Vegas, and the identity theft, although a crime in NV is not sufficient to assure jail time by itself. I discussed the matter of extraditing the varmint to California with Las Vegas police, but they told me that it was unlikely that California would bother for something that would only net the offender probation there as well. According to the LV police detective, in California, you have to be charged with stealing over $50,000 before you'll do any jail time.

It's no wonder this crime is exploding...it's low risk, extremely profitable, and trivial to implement.

Oh yes...how did he get my name and social security number? He told the Las Vegas police that he purchased the information on the street for $500.<

2001-05-11 **social security number SSN drivers license permit state federal law identity theft privacy government legislation court ruling judgement**

RISKS 21 39

Brett Glass published a chilling report in RISKS about changes in federal law that _require_ applicants for state drivers' permits to submit their Social Security Numbers. Glass wrote, "What I found out was chilling. Not only does Federal Law -- thanks to the striking of a single word from a huge statute -- require that drivers submit their Social Security numbers when applying for licenses. It also requires that all of the information maintained about a driver by a state -- including that number -- be revealed to virtually all comers. Here are the details of these onerous laws, along with additional information about the laws in my particular state (which are typical of state laws throughout the country). I'll also describe the way in which one state is fighting the Federal laws that would require it to compromise its citizens' privacy and subject them to trivially easy identity theft."

It seems that changes in welfare reform legislation removed the word "commercial" from existing requirements that applicants for commercial drivers' licenses submit their SSN. In addition, amendments to the "Drivers' Privacy Protection Act" now require that "ALL of the information you submit to your state's DMV/DOT [be] available to *anyone* who claims that it's needed for any business purpose. If I wanted your driving records and SSN, all I'd have to do is walk into the courthouse and claim that you owed me a dollar." Athough the amended act "was challenged by the Alabama Attorney General on states' rights grounds and was ruled unconstitutional by a Federal district court" it was upheld by the Supreme Court of the United States.

Mr Glass provides much more extensive documentation and detail in his report.

2001-05-31 **identity theft social security number abuse**

NewsScan

IDENTITY THEFT
Identity theft is an increasing problem in the Information Age, and brokerage companies sometimes unwittingly sell dossiers to people using fake credit card and posing as other people. In one scam, thieves used an e-mail account and a stolen credit card number to purchase reports containing Social Security numbers, employment information and driving records, and were able to use this information to plunder bank accounts. One victim of identity theft said: "What has taken me a lifetime to build -- my trust, my integrity and my identity -- has been tainted. I don't know if I'm dealing with a 14-year-old messing around with a computer or if I'm dealing with organized crime." The Social Security Administration's inspector general says the power of the Social Security number makes it a valuable asset subject to limitless abuse, and calls that misuse has developed into "a national crisis." FINLAND MULLS PUTTING NATIONAL IDs ON CELL PHONES
The Finnish government is considering using SIMs -- the subscriber information modules inside every cell phone -- to take the place of its national identity card, and eventually even a passport. Under the plan, the computer chip embedded in every SIM would store personal information, transforming the SIM into a person's legal proof of identity. Of course the drawback would be what would happen if you lost your phone -- about 9,000 cell phones are left on the London Underground alone every year. The solution, according to Roger Needham, manager of Microsoft's British research lab, is to store the information on secure servers accessible via a WAP connection to the Web. The SIM in this case would store only a personal identifier -- an encryption key -- that the owner would have to punch in a PIN to use. The Finnish government is already taking the initiative with a national technical standard called FINEID. Currently FINEID uses a smart card and a card reader attached to a PC, but the plan is to migrate to an SIM, says Vesa Vatka of the Finnish Population Register Center in Helsinki. (New Scientist)

Security Wire Digest 4 26

Sandra Kay Miller reported on the growing identity-theft problem in the US in an article published in the Security Wire Digest. The Federal Trade Commission (FTC) noted that about 400,000 victims experienced identity theft in 2001. Miller pointed out that access to tax forms -- including electronically submitted documents -- is a valuable source of information for identity thieves. She wrote, "Last year, the General Accounting Office reported that during security audits, IRS firewalls on e-filing systems did not effectively restrict external access to network, stored unencrypted e-filed returns on systems, practiced poor password management and had very little intrusion detection capability." In addition, some commercial tax preparers also demonstrate shoddy security, although the leading firms seem to protect their clients' data.

MONSTER.COM WARNS JOB-SEEKERS ABOUT POTENTIAL ID THEFT

Monster.com, a job-seeker's Web service whose database holds a quarter of a million resumes, has issued an e-mail message to its customers warning that "regrettably, from time to time, false job postings are listed online and used to illegally collect personal information from unsuspecting job-seekers." What should job-seekers do to protect themselves? Monster.com advises them not to give out their social security, credit card or bank account numbers, not to disclose marital status or other information not relevant to their job qualifications, and to be especially careful when responding to job-postings from prospective employers outside the country. (AP/San Jose Mercury News 28 Feb 2003)

February 28, Associated Press — Monster.com warns job seekers of ID theft. An e-mail labeled a "critical service message" is being sent from Internet job board Monster.com to all active users of Monster's main site. It cautions that "from time to time, false job postings are listed online and used to illegally collect personal information from unsuspecting job seekers." Pam Dixon, a research fellow with the Denver-based Privacy Foundation, said the e-mail confirms a growing hazard for online job seekers. "It's not just on Monster. I've heard of this on all the major sites." Dixon said most of the cases she's familiar with involve job seekers who have provided credit card numbers, social security numbers or agreed to ship overseas materials that are prohibited from being sold outside U.S. borders. Company spokesman Kevin Mullins said he did not know exactly how many people would receive the e-mail, but that it is "definitely well into the millions." Monster, the nation's largest Internet job board, says it has 24.5 million resumes posted on its main site. Mullins said the warning was not precipitated by any specific incident. Instead, the company is merely trying to protect its users, he said.

2003-09-02 **identity theft microsoft e-commerce coalition ITAA fighting online financial institutions**

NewsScan

COALITION FORMED TO BATTLE IDENTITY THEFT
The Information Technology Association of America has organized a new coalition aimed at fighting identity theft. The Coalition on Online Identity Theft, which includes e-commerce giants Amazon, eBay and Microsoft among its members, plans to launch a public education program and will encourage its members to work more closely with law enforcement officials to fight online crime. According to the Federal Trade Commission, the number of U.S. consumers who complained about some sort of identity theft nearly doubled last year to 162,000, but the Gartner Group says that statistic only scratches the surface of the problem. It estimates that 3.4% of U.S. consumers — some 7 million adults — suffered some form of identity theft in the past year. A report issued by Gartner in July says that while a consumer education campaign may make online users more savvy, there's still a major problem in the way ID theft cases are handled by financial institutions, who tend to treat such fraud as the cost of doing business rather than a crime against their customers: "There is a serious disconnect between the magnitude of identity theft that innocent consumers experience and the industry's proper recognition of the crime. Without external pressure from legislators and industry associations, financial services providers may not have sufficient incentive to stem the flow of identity theft crimes." (CNet News.com 2 Sep 2003)

NewsBits; http://www.usatoday.com/tech/news/2004-01-05-ssn-id-theft_x.htm

Identity theft often begins with Social Security number

An article in USA Today for 15 January 2004 by William McCall of the Associated Press reviews excessive use of the Social Security Number. Despite increasing use of the identifier on commercial forms such as video-store rental applications, US residents have no legal obligation to reveal their SSN except for a few government, employment and fanking requirements. Retailers may refuse to grant services if a customer refuses to reveal the SSN, but the customer can take business elsewhere. Some untrained workers with access to SSN have been shown to reveal the information for unauthorized use; a reporter was able to acquire this information for two people with nothing more than providing his own street address.

2004-05-10 **identity theft social security numbers cards**

DHS IAIP Daily; http://www.suntimes.com/output/news/cst−nws−identity10.html

May 10, Chicago Sun-Times — State cracks down on identity theft.

In an effort to fight the growing problem of identity theft, the state of Illinois is cracking down on phony Social Security numbers on driver's licenses and ID cards. Secretary of State Jesse White said that Social Security numbers on four percent of Illinois driver's licenses and ID cards don't match records from the Social Security Administration. In many cases, there's no fraud involved. Examples of innocent mix-ups include motorists who use their middle names or change their names after getting married. However, from now on, motorists with suspect Social Security numbers will be required to prove their identity when they renew their licenses. The secretary of state is taking several other steps to combat identity fraud, in which someone steals the identity of someone else, often by assuming their name or other personal information. The office has stopped printing Social Security numbers on driver's licenses and is adopting more stringent document requirements. It also is using facial recognition programs that compare digital photos of motorists.

2004-05-11 **identity theft children fraud popularity increase**

DHS IAIP Daily; http://www.klas−tv.com/Global/story.asp?S=1859775&nav=168XN2 pW

May 11, KLAS-TV.com (NV) — Child identity theft gaining in popularity.

A new variation of identity theft is gaining in popularity, a variation law enforcement says is even tougher to crack. It's child identity theft -- a crime that can go undetected for years. Identity theft expert Roy Michael says over the past five years, about 500,000 cases of child identity theft have been uncovered. However, half of those cases have come in the past two years. Children are targets because thieves can often get a 10 to 15 year head start on law enforcement. In fact, most children who've had their identity stolen don't know it until they someday go to apply for credit, a student loan, or buy a car. That's why identity theft experts say every parent should run a credit check on their child. A child's identity can sometimes get into the wrong hands through unsuspecting sources, for example, clubs or sports in which they participate, because they may require proof of age.

DHS IAIP Daily;
http://www.smh.com.au/articles/2004/05/17/1084646119834.html

May 17, Sydney Morning Herald (Australia) — Westpac targeted by more scams.

Australian bank Westpac is once again being targeted by e-mail scams which seek to extract usernames and passwords used for online banking. Two e-mails are doing the rounds, purportedly from Westpac Service Center or Westpac Support. Both attempt to lure unsuspecting souls to the same site: 207.150.192.12/temp/artsplos/secur.html. Only users of Internet Explorer are vulnerable to the scam. As soon as one inputs a username and password and clicks on the "sign-in" link, the genuine Westpac home page comes up.

2004-05-19 **identity theft stolen social security numbers Utah**

DHS IAIP Daily; http://www.4utah.com/local_news/local_headlines/story.aspx?content_id=6C104ABD−79C2−4BC4−93FE−ED72A7D84923

May 19, ABC 4 (UT) — Scam using stolen social security numbers in Utah.

An ongoing investigation by federal and state agencies has found that 87 homes in Utah have been purchased using stolen Social Security numbers. So far, 21 individuals, all illegal immigrants, have been charged with felony crimes including identity theft, communications fraud, and forgery for their part in the scam. The scheme combines mortgage fraud with identity theft. Brokers target illegal immigrants in grocery store parking lots, and offer them the opportunity to buy a home despite their lack of credit or jobs. The undocumented workers then buy stolen Social Security numbers, which are used to find employment. The brokers, known as "flippers," then provide free down payments to the buyers, who use the Social Security numbers to qualify for mortgages. A lender then gives the buyer a loan based on an inflated appraisal of the home provided by an appraiser involved in the scheme. Eventually, the home buyer forecloses on the property and taxpayers are forced to cover the losses -- all 87 homes purchased in Utah were federally insured through the U.S. Department of Housing and Urban Development.

May 19, Reuters — Security provider jailed for identity theft.

A Connecticut man who installed home security systems has been sentenced to prison for using a client's personal information to finance a more than $200,000 spending spree, federal prosecutors said. Kenneth Moore, who owned Security Plus Associates in North Haven, CT, was sentenced to 43 months in federal prison and three years probation on Monday, May 17. U.S. District Judge Stefan Underhill also ordered Moore to repay $209,669.25. Moore used a client's name and social security number to secure financing for a $41,420 fishing boat and a $30,211 Mercedes Benz. He also opened credit card accounts with US Bank, First National Bank of Omaha, Shell Oil, Lowe's and Macy's. All of the cards were in the victim's name, but Moore provided his own address so the bills went to him, not the victim. Moore pleaded guilty to identity theft in February.

BUSH SIGNS IDENTITY THEFT BILL

President Bush has signed into law an identity theft bill that will add two years to the prison sentences of criminals convicted of using stolen credit card numbers or other personal data to commit crimes. On top of that, the sentences of identity-theft violators who then commit acts of terrorism will be extended by an additional five years. The Federal Trade Commission estimates that 27.3 million Americans have been victims of identity theft in the last five years. (Washington Post 15 Jul 2004)

NewsScan

SMARTER SKIMMING DEVICE FOUND

A device designed to steal the personal details of ATM users was found in Sydney, Australia, by a customer who spotted the device and pulled it from the ATM. It had been in operation for three days, and may have recorded the confidential details of up to 1000 customers. The device, disguised to look like part of the ATM, uses a pin-hole camera to record the personal identification numbers of customers and a high-tech magnetic strip reader to steal the details on the card. Thieves can then use a decoder to burn the information onto any magnetic strip -- even a bus or train ticket -- and access users' bank balances. Police have found other machines used to rip off ATM users but the latest is by far the most hi-tech and devious. (The Australian, 16 Jul 2004) Rec'd from John Lamp

GLOBAL CRACKDOWN ON IDENTITY THEFT

More than 100 people have been arrested and 53 convicted in a global ID theft crackdown dubbed "Operation Web Snare" coordinated by the U.S. Justice Department. The operation involved some 150,000 victims who lost more than $215 million, according to Attorney General John Ashcroft -- a number he acknowledged represents only a small fraction of the crimes being committed on the Internet. Identity theft costs U.S. businesses more than $50 billion a year. "The Internet is stimulating the development of innovative products and services that were barely imaginable only a few years ago," says Deborah Majoras, chairwoman of the FTC which also took
part in the operation. "There is a risk, however, that these benefits will not be fully realized if consumers associate the Internet with fraudulent operators." (Reuters/CNet 26 Aug 2004)

2004-10-27 **ID identity theft Florida Chey Cobb Stephen Cobb public records Web disclosure access**

NewsScan;

SAFE & SOUND IN THE CYBER AGE: FLORIDA'S ID THEFT KIT
(by Chey Cobb & Stephen Cobb)

A few years ago, when the dot com bubble was still bubbling, legislators in the State of Florida got the 'technology bug' and mandated that all Florida counties put all public records on 'The Web.' We have no idea if the companies that make the hardware and software used to implement the mandate handed out campaign contributions to encourage this technology leap. But a lot of money has been spent on such technology in the years since, from dozens of high speed scanners to terabytes of storage and thousands of lines of Web code. The result? A large group of people, and even the country as a whole, is probably a lot less safe than it used to be. To understand why, take a look at a Web page we have put up to demonstrate: <http://www.privacyforbusiness.com/example1.htm> The link on the right shows you a prime example of what can happen when people don't fully grasp the relationship between privacy, technology, and human nature. Anyone on the planet with an Internet connection can now find intensely personal details about individuals who have lived in, or passed through, Florida. One such class of persons is elderly folk whose relatives have filed power of attorney (these records sometimes include banking data along with SSN and signature). Another worrying class of victims is U.S. military personnel. You can find out what their specialties are, their Social Security Numbers, addresses, relatives, signature, and so forth. The example we give is one of these, from Duval County, the most populous county in Florida. What you will see is the record as it appears on the Web, except that we added red ink to blot out key portions of the name of this particular person. If you go to the Duval County Web site, from any country in the world, you can find thousands of records just like this, with the name and SSN in place, NOT crossed out. Many of these people are not Florida residents, they just happen to have left the service while in Florida. The legislators who mandated this state of affairs were not alone in their failure to realize that "The Web" is the same "World Wide Web" you can access from anywhere, from Boca Raton to Bulgaria, Tampa Bay to Turkistan. A number of federal government agencies took the same leap off the cliff of commonsense in their eagerness to save money by automating public access to information. The basic mistake was to think of the Internet as the American public. Perhaps their Internet bubble was a Venn diagram in which the set of all U.S. citizens neatly coincided with the set of all Internet users. In the very early days of the Internet that might have been forgivable, but these days, when the evening news routinely pulls its footage from Islamic fundamentalist Web sites, you would think we'd all be a bit wiser. Apparently not. Consider how you get to these records, many of which are the perfect starting point for the crime of identity theft. You would think that you would need to know a specific person's name to find public records pertaining to them. But no, in Duval County you can simply ask to see all records of a particular type within a valid date range. In other counties you can't browse all records at once, but a very lame search mechanism lets you enter a single letter for a last name, like "A," and thus browse all persons whose name begins with "A," from Aarnem to Aziz. At some sites, including Duval, you don't even need a document viewer like Acrobat because the county provides one for you. Needless to say, we think this type of access to people's private information is wrong. Our government does not have the right to publish to the world our Social Security Numbers, signatures, and other personal details (and this doesn't even get into the whole issue of Florida juvenile records wrongly placed in the public domain). Things need to be changed. If anyone would like to contact us about efforts to effect changes we will try to do what we can to help. What sort of changes are needed? Well, expunging all Social Security Numbers would be a start, but even easier would be the requirement that you need to know the name of the person whose public records you are seeking. And personally, we see no reason for military discharge papers to be made available at the county level. Why not make that a responsibility of the branch of the armed services in which the person served? In the broader scheme of things Americans need to do some serious thinking about what 'public record' means. Stephen is sitting in a bar in Amsterdam right now, looking at military service records of people from Alabama to Wyoming. He's also viewing aerial photographs of properties in our Florida neighborhood, then pulling up the names and addresses of the owners, seeing what they paid for their homes and if their taxes are current. Does he have a right to do that? From there? And what about the fundamentalist who might be sitting next to him in that bar? [Chey Cobb, CISSP, the author of "Cryptography for Dummies" and "Network Security for Dummies," is a former senior technical security advisor to the NRO. Her email is chey at aug dot com. NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A7614-2004Oct28.html

IDENTITY THEFT SUSPECTS CAUGHT IN STING OPERATION

"Operation Firewall" -- an international law enforcement dragnet conducted by the U.S. Secret Service, the Justice and Homeland Security departments, the Royal Canadian Mounted Police, Europol and local police departments -- has led to the arrest of 28 individuals on suspicion of operating Web sites created to steal, sell and forge credit cards and ID documents. The sites operated under names such as Shadowcrew, Carderplanet and Darkprofits, and were hosted on multiple Internet servers outside the United States. The suspects are thought to have bought or sold about 1.7 million stolen information and counterfeit documents such as credit cards, driver's licenses, birth certificates and foreign and domestic passports. A MasterCard security executive familiar with the operations says, "We're talking about an international network that has new sites popping up all the time. These aren't high-tech individuals. All it takes is a computer, a little bit of knowledge, and these guys can do a lot of damage." (Washington Post 28 Oct 2004)

2004-11-22 **ACLU passport ID identity theft microchips privacy**

NewsScan; http://www.usatoday.com/tech/news/2004-11-22-hitech-passport_x.htm

ACLU ATTACKS MICROCHIP PASSPORT PLANS

The American Civil Liberties Union and some other privacy advocate groups are charging that international standards for "electronic" passports disregard a basic privacy approach protecting the security of the documents. New passports will have a chip containing the holders' name, birth date and issuing office, along with a "biometric" identifier that includes a photo of the holders' face. Barry Steinhardt of the ACLU says, "There's no security built into it. This will enable identity theft and put Americans at some risk when they travel internationally." A spokesman for the International Civil Aviation Organization and the State Department says those organizations are working on security concerns: "This is a process that is being implemented over the next few years, it is not something that happens overnight." The spokesman says that one way to fight identity theft is already in the standards, since the passports will have built-in encrypted authentication to let electronic readers know they are original documents and not forgeries. BREAK-IN AT SAIC RISKS ID THEFT

Monty Solomon contrtibuted a report from the _Washington Post_:

Some of the nation's most influential former military and intelligence officials have been informed in recent days that they are at risk of identity theft after a break-in at a major government contractor netted computers containing the Social Security numbers and other personal information about tens of thousands of past and present company employees.

The contractor, employee-owned Science Applications International Corp. of San Diego, handles sensitive government contracts, including many in information security. It has a reputation for hiring Washington's most powerful figures when they leave the government, and its payroll has been studded with former secretaries of defense, CIA directors and White House counterterrorism advisers.

Those former officials -- along with the rest of a 45,000-person workforce in which a significant percentage of employees hold government security clearances -- were informed last week that their private information may have been breached and they need to take steps to protect themselves from fraud.

David Kay, who was chief weapons inspector in Iraq after nearly a decade as an executive at SAIC, said he has devoted more than a dozen hours to shutting down accounts and safeguarding his finances. He said the successful theft of personal data, by thieves who smashed windows to gain access, does not speak well of a company that is devoted to keeping the government's secrets secure.…

EDUPAGE; http://online.wsj.com/article/0,,SB111455367943717582,00.html

CONCERNS MOUNT OVER SOFTWARE'S ROLE IN DATA BREACHES

A number of retailers are pointing to software used at store checkouts as the weak link in the rash of recent security breaches. Magnetic strips on credit cards include--along with the credit card number--a three-digit code. Knowing that code can allow criminals to create counterfeit cards with embossed names that do not match the name attached to the account number. With that, a crook could present a photo ID that matched the name on a card, while the charge goes against an entirely different account. Software that handles credit card purchases is supposed to delete card numbers and the three-digit codes after a transaction, but several retailers now say that the systems keep those numbers in memory. John Shaughnessy of Visa USA said that a computer system that retained those numbers would be extremely tempting for criminals. Some retailers have filed suits against the makers of the software, seeking compensation for losses resulting from recent hacks. At least one software company, Micros Systems, rejected retailers' contentions, saying its products do not store such information. Wall Street Journal, 27 April 2005 (sub. req'd)

FAKE ATMs IN ROMANIA USED FOR IDENTITY THEFT

Audacious thieves in Romania have constructed a complete automated teller machine (ATM), minus the cash box, to steal the details of account holders. Fake ATMs have appeared at apartment buildings or in areas of the capital where there are no banks. Usually criminals only place a fake panel over an existing ATM, and do not construct a complete machine. Romania's biggest bank, Banca Comerciala Romana (BCR), said customers should only use ATMs situated around bank branches. "Banks do not install ATMs in blocks of flats," BCR spokesman Cornel Cojocaru said.

EDUPAGE; http://www.nytimes.com/2005/05/18/technology/18data.html

STUDENTS SHOW EASE OF IDENTITY THEFT

Graduate students at Johns Hopkins University set out to see how much personal information they could collect on as many individuals as possible, using only the Internet and $50. The 41 students were in a course taught by Aviel D. Rubin, professor of computer science and technical director of the university's Information Security Institute, who divided them into groups of three or four and instructed them to use only legal, public sources of information. The exercise mimicked the activities of data brokers, such as ChoicePoint and LexisNexis, and the students were able to collect and aggregate vast amounts of information, even with limited time and budgets. Although Rubin was pleased that fewer Social Security numbers were among the data collected than he had anticipated, privacy advocates insisted that such information remains easy to obtain, posing enormous risk of identity theft. Even without Social Security numbers, the data collected represented for some individuals a very broad picture of who they are, where they live, and activities in which they participate. Such access to personal information worries many, including Sen. Ted Stevens (R-Alaska), who conducted a similar experiment, instructing his staff to try to steal his identity. Aside from information they discovered about Stevens, they were told they could buy his Social Security number for $65. New York Times, 18 May 2005 (registration req'd)

EDUPAGE;
http://www.theregister.com/2005/08/12/ny_security_breaches_disclosure/

NEW YORK ADDS DISCLOSURE LAW

New York State has enacted a law requiring corporate or public organizations to notify individuals in the event that personal information about them has been compromised. Similar in concept to a California law that went into effect two years ago, the New York law compels organizations that store sensitive information to contact consumers as quickly as is practical if there is evidence or suspicion that data including Social Security numbers or credit card numbers have been unlawfully accessed. At least 15 other states have passed similar legislation since California did. New York State Assembly member James Brennan, sponsor of the legislation, said, "If a person is not aware that he or she has been a victim of identity theft, then the damage done could be severe and irreversible," noting that the sooner people are made aware of security breaches involving sensitive data, the better their chances are of avoiding the worst repercussions. 2005-12-07 **study identity theft risk exaggerated ID Analytics fraud detection**

EDUPAGE; http://money.cnn.com/2005/12/07/technology/id_study.reut/

STUDY SAYS RISK OF ID THEFT EXAGGERATED

A new study conducted by California-based fraud detection company ID Analytics found that the risk of identity theft may not be as high as many believe it to be. The company analyzed data concerning four incidents in which sensitive information for roughly 500,000 people was compromised. ID Analytics followed the data for six months and found that the risk of having your identity stolen based on compromised information is relatively small. Further, the study showed that the greater the number of people affected in a breach, the lower the chances were that anyone would have their identity stolen. The company went on to say that efforts to notify every individual affected when sensitive information is illegally accessed might be doing more harm than good. Rather than notify everyone, according to ID Analytics, a company should spend its time and money helping consumers who are actually affected by a data breach. CNN, 7 December 2005

SPY VERSUS SPY: UNBLOCK THAT CALL-BLOCK

A new computerized service from a company called Star38 will allow callers to create false outbound phone numbers and thereby fool call block software. Customers of the new service will be able to go to the company's Web site to enter the number they want to call and the number they want to appear on the caller ID screen of the recipient's phone. Some privacy-rights advocates are concerned that angry former spouses, stalkers or fraud artists could use the service for mischief, but Robert Atkinson of the Institute for Tele-Information at Columbia University, comments: "Some people see caller ID as an invasion of their privacy, while others see it as a protection of their privacy. It's spy versus spy." (New York Times 2 Sep 2004)

New York Times

NEW WAY TO TRAVEL THE WEB WHILE LEAVING FEW FOOTPRINTS
Privacy software maker Privada today is expected to unveil its Web Incognito service, a $5-a-month, all-encompassing online anonymity protector. The service protects online users' privacy by encrypting outgoing information and directing it to the Privada service, where the data is cloaked before being sent to its destination. The service covers e-mail, online chat, Web browsing, and online purchases. Responses from Web sites or e-mail recipients go back through the Privada service before being sent to the user. The service does not hinder users' ability to surf the Web, as users' cookies are stored by the service. Privada CEO Barbara A. Bellissimo says the company may draw the ire of privacy rights groups because the company plans to share the identities of users with law enforcement officers who have valid warrants. "Our service is for protecting the privacy of consumers, not for hiding criminals or criminal activities," Bellissimo says. (New York Times 08/16/99)

NewsScan

PENTAGON CONSIDERED PLAN TO END ANONYMOUS NET ACTIVITY
After the head of DARPA, the Defense Advanced Research Projects Agency, wondered why it was not possible after the 9-11 terrorist attacks to trace hostile Internet communications back to the origin, a series of technical discussions were initiated, and those discussions led to a proposal called eDNA: "We envisage that all network and client resources will maintain traces of user eDNA so that the user can be uniquely identified as having visited a Web site, having started a process or having sent a packet. This way, the resources and those who use them form a virtual 'crime scene' that contains evidence about the identity of the users, much the same way as a real crime scene contains DNA traces of people." But the project was argued against by a number of angry participants, such as security consultant Mark Seiden who said: "Before people demand more surveillance information, they should be able to process the information they already have. Almost all of our failures to date have come from our inability to use existing intelligence information." DARPA has decided to discontinue funding of the project, and explained that it had been "intrigued by the difficult computing science research involved in creating network capabilities that would provide the same levels of responsibility and accountability in cyberspace as now exist in the physical world." 2005-10-06 **blogger Delaware lawsuit shield identity First Amendment free speech anonymity cyberspace**

EDUPAGE; http://www.nytimes.com/2005/10/06/technology/06blog.html

DELAWARE COURT SHIELDS IDENTITY OF BLOGGER

The Delaware Supreme Court has rejected an effort to identify an anonymous blogger accused of defamatory remarks online. Patrick Cahill, a councilman in the city of Smyrna, had sought the blogger's identity from Comcast following several unflattering postings on the person's blog. Although a lower court judge had denied the blogger's request for protection, the Supreme Court said that court had applied the wrong standard. In the absence of substantial evidence of defamation, Cahill's petition to identify the blogger will be denied, according to the high court. In the ruling, the court said it found for the blogger to protect against what it called "the chilling effect on anonymous First Amendment Internet speech that can arise when plaintiffs bring trivial defamation lawsuits primarily to harass or unmask their critics." An attorney for the blogger said that statements on electronic bulletin boards and blogs are not generally considered factual but are seen as individuals' opinions. The court's judgment, however, did not identify the medium as pertinent in its application of legal standard. New York Times, 6 October 2005 (registration req'd)

2005-12-11 **anonymity defamation libel risk threat Wikipedia free online encyclopedia**

RISKS 24 12

ANONYMITY AND BAD WIKIPEDIA CONTENT
John Seigenthaler Sr. (a former editor of *The Tennessean* in Nashville, and founder of the First Amendment Center) was startled to find an entry on himself in Wikipedia that included defamatory false personal information about him -- for example, suggesting that Mr. Seigenthaler had been involved in the assassinations of John and Robert Kennedy. Mr. Seigenthaler then wrote an op-ed article in *USA Today*, noting among other things that he was especially annoyed that he could not track down the perpetrator because of Internet privacy laws.

The culprit's IP address led to his employer by Daniel Brandt of San Antonio -- who has been a frequent critic of Wikipedia after reading false information about himself! See his www.wikipedia-watch.org.

This led Brian Chase in Nashville to admit having written the offensive material as a joke, stating that he thought that Wikipedia was a "gag" Web site.

[Abstract by Peter G. Neumann]

Dr Neumann adds:

Coincidentally, that story broke on about the same day that the December 2005 issue of the *Communications of the ACM* came out, the inside back cover Inside Risks column of which is "Wikipedia Risks" http://www.csl.sri.com/neumann/insiderisks05.html -- written by four long-time RISKS contributors, Peter Denning, Jim Horning, David Parnas, and Lauren Weinstein who are on my ACM Committee on Computers and Public Policy. This case points up just one of the risks associated with Wikipedia noted in the Inside Risks article, namely that of having an encyclopedia contributed by thousands of volunteers, with few controls on content.

RISKS contributor Ian Halliday follows up (RISKS-24.13) by saying he does not buy Brian Chase's argument:

The claim that "he thought Wikipedia was a gag site" (RISKS-24.12) seems unlikely, and I see it on a par with those who say "no, I was just doing research" when caught hacking/visiting dubious web sites. Yet this seems to have caught the attention of some parts of the media who don't usually see visiting those sites as plausible research. The suggestion is that it is reasonable for somebody to be so mistaken as to think Wikipedia is a "gag" site. While some of the information there may not be 100% accurate, it's hard to see how this apparently mistaken view can be seen as a genuine defence.

2005-12-11 **GAO government accountability office bad WHOIS database anonymity spamming scamming phishing privacy**

RISKS; http://www.internetnews.com/ent-news/article.php/3569521 24 12

WHOIS DATABASE RISKS

A U.S. Government Accountability Office (GAO) report in Nov 2005 says that there are roughly 2,310,000 Web addresses for which the owner or contact information is unknown. That represents 5% of all .com, .net, and .org domain names. This provides anonymity for spammers, scammers, phishers, and other illegal activities, and untraceability for malware-containing sites.

[Abstract by Peter G. Neumann]

Dag-Erling Smørgrav rebuts (RISKS-24.13):

It also provides relative anonymity for people like paralegal Pamela Jones, who operates groklaw.net, an award-winning web site dedicated to reporting on and analyzing "legal events important to the [Free and Open Source Software] community". Her relentless digging into the SCO lawsuits has made her the target of harassment and defamation by SCO and its supporters, such as journalist Maureen O'Gara -- ask Google for the sordid details.

Also in RISKS-24.13, Dave Bell remarks:

I just hope that the GAO knows the difference between "unknown" and "withheld". My domain name is registered in the UK, and because of UK and European data protection laws applying to personal data, the WHOIS doesn't return certain information.

POP-UP ADS 'KICK THROUGH'
Pop-up ads are becoming increasingly annoying, and the latest twist will make it harder for Web users to simply ignore them. A new technique called "kick through" enables advertisers to direct a person to another Web site if they simply move their cursor across the ad — no clicking is necessary. Many people are complaining that the new ads are overstepping the boundaries of an already intrusive form of online advertising. "When I tried to close the window it kicked me to the site, which is really annoying when I have six windows open and three of which were not by my own doing," says one irate victim. Orbitz, which appears to be the only advertiser currently using the kick through, defends its strategy: "The enormous success for Orbitz is directly related to these pop-unders. There's an enormous segment of the population that are appreciating these ads," says Mark Rattin, creative director for Otherwise, which devised the ads for Orbitz. He says there's only a 30% chance that viewers will be kicked through to the Orbitz site by rolling over the ads. (CNet News.com 20 Dec 2002)

2003-02-27 **Canada Internet Service Provider ISP e-mail scam fraud**

NIPC/DHS

February 25, Reuters — Canada's Sympatico targeted in Internet scam.

Company officials at Sympatico, one of Canada's biggest Internet service providers (ISP), said Tuesday that organizers of a scam had sent out fraudulent e-mails to some 1,900 of Sympatico's 1.4 million customers last week. The e-mails told customers to fill out an online form to correct an error in their billing information and directed them to a fake site which asked for details, including driver's license, credit card and bank numbers and security codes. The fake site has since been shut down. "We did take immediate action to minimize the impact. E-mails that were going out to our customers were stopped and we contacted the ISP that was hosting this particular site," said Andrew Cole, a spokesman for Bell Canada. Cole said those who filled out the online forms should contact the police, their banks and credit card issuers. The company does not know who was behind the scam. "What we do know is the site was hosted in the United States. However, the e-mail itself was relayed through Japan...law enforcement and Bell security are certainly looking into the source," he said. He said the company did not think it was necessary to e-mail all of its customers, but that it had included several warnings about it on its sites. Sympatico.ca is owned by BCE Inc.'s Bell Canada unit, Canada's largest phone company.

'VIRAL MARKETING' STOOPS TO NEW LOW
Internet security company Sophos is warning of a new marketing scheme reported by its Australian tech support team, which tricks users into visiting a Web site featuring free comic video clips and then installs software that sends out e-mails from their computers to people listed in their address book. The Web site, run by Curacao-based Avenue Media, uses ActiveX to display a humorous video clip and at the same time downloads an additional software component called "Internet Optimizer" onto the PC, which then sends the e-mails. Peter Ducklin, head of technology at Sophos' Asia Pacific division, says: "What tricks a lot of people is that the ActiveX control which kicks the process off is digitally signed. Many users assume that a program which has been signed in this way is automatically both trustworthy and desirable. Ironically, even though Internet Explorer presents a 'security warning,' many people treat this as some kind of a 'security approval' and are more inclined to go ahead." (ZDNet Australia 16 Jul 2003)

2004-01-05 **phishing scam Bank of England e-mail fraud credit card money**

RISKS 23 12

VISA CUSTOMERS HIT BY PHISHING EXPEDITION SEEMINGLY FROM BANK OF ENGLAND

RISKS 23.11 included a scrambled summary of a phishing scam; the correction in 23.12 from Simon Hogg included the following clarification:

As I'm sure many of the RISKs readers are aware, the Bank of England is a Central Bank and hence does not issue its own Visa (or any other credit cards) at least for consumers. Similarly, it doesn't operate consumer bank accounts. I suppose you could say that the Bank of England is equivalent to the Federal Reserve, *not* Bank of America. Therefore the BoE is unlikely to be a 'victim' in the ordinary sense of the word.

Therefore, I thought there was something a bit fishy with the PGN version saying that the "This was reportedly the first time BoE was victimized by a "phishing" expedition that apparently fooled about 5% of their Visa customers into divulging their card and PIN numbers."

Looking at the original news story the 'phishing' quote apparently relates to a different episode, "A campaign that targeted Visa credit card holders was said to have fooled one in 20 victims into divulging their personal details, including their card and pin numbers" *i.e. not the BoE e-mail itself*.

The point of the story is to say that lots of people were sent an e-mail with an executable attachment with the message "Please install our special software, that will remove all the keyloggers and backdoors from your computer." The implication (for the sender the hopeful implication) was that since the e-mail was apparently from the BoE, the software was in some way 'official'. Imagine the same e-mail in the US from someone@federal-reserve.gov.

I think the problem here is wider than a standard someone@aConsumerBank.com e-mail since it is apparently from a 'trusted' central bank (the one who controls the 'normal' banks) but it doesn't cause any direct 'damage' to the apparent sending agency.

So, three apparent risks;

1. Mis- / Dis-information (scaremongering?), accidental or otherwise, caused by incorrect summary of other news stories.

2. E-Mails apparently from a trusted source (common / usual RISKs here, but the 'trusted source' in this case is a 'super-trusted source').

3. For me the most worrying RISK is that the UK's "National High-Tech Crime Unit" came out with the very enlightening statement "We have opened the attachment, but we have so far not been able to find out what it does, if anything." How many programmers does it need to be able to analyse a piece of code to be able to work out what it does? Anti-virus labs are pretty good at this, so why not the Government-funded anti-crime 'specialists'? At least they are apparently being honest here(!).

NewsScan

A PROACTIVE APPROACH TO 'NO PHISHING'

Netcraft, based in the U.K., has launched an anti-fraud service aimed at preventing "phishing" — the practice of luring unsuspecting users to counterfeit banking sites where they're encouraged to divulge their credit card or other financial information. The company keeps a database of about 20 million home pages as well as a record of all registered Web site names. It then scours its copies of the Net's DNS records for suspicious entries related to or using its customers' name and alerts the legitimate name holder when it finds something. "It gives you the opportunity to try to pre-empt attacks," says Netcraft director Mike Prettejohn, rather than relying on customers to alert banks to online scams. (New Scientist 5 Jan 2004)

2004-01-28 **spam e-mail address hacking cracking images CAPTCHA pornography Website redirection phishing**

RISKS 23 17

PORN VIEWERS WORK FOR HACKERS

Contributor Robin Burke summarizes an article about an online hack. Hackers are defeating the "CAPTCHAS" technique used to stop robots from registering for online services. Human beings can read what a CAPTCHA image asks for, and do its bidding, but robots can't because they're not intelligent enough. Now, hackers are "routing the CAPTCHA image to a page that advertises free porn." Viewers of these porn sites are given access to more free porn only after they decode a CAPTCHA image and complete a form to explain the image. Bots then use information from these porn-site forms to register for online services by seeming humanly intelligent.

&e=2&u=/ap/20040401/ap_on_hi_te/online_scams

April 01, Associated Press — Companies sharpen tech tools to counter scams.

As Internet scams, also known as phishing, proliferate, companies are sharpening technological tools to counter them. Education alone, many agree, isn't enough. Anti-phishing software is apt to soon be added to the arsenal of digital shields forged to stop spam, viruses and hacking. Security companies are also building tools for banks and merchants to use behind the scenes. Phishing scams have been around for years but have in recent months become more numerous — and sophisticated. Scammers now copy and paste Web coding from real sites like Citibank's to give their fraudulent messages and the sites they lead to an aura of authenticity. They register Internet addresses that look real, subbing the letter "l" with the numeral "1," for instance. A few messages even carry ads for that aura of authenticity. The Anti-Phishing Working Group, formed in October by industry and law enforcement, identified 282 new phishing scams in February, up from 176 a month earlier. About 70 percent have been traced to eastern Europe or Asia, said David Jevans, the group's chairman.

DHS IAIP Daily; http://straitstimes.asia1.com.sg/asia/story/0,4386,249296,00.html

May 05, The Straits Times (Singapore) — Online credit card fraud rocks Indonesia.

A briefing released by VeriSign, a U.S.-based company that monitors Internet activity, in January said that as more and more people around the globe go shopping online, the number of fraudulent transactions or transaction attempts has skyrocketed. An increasing number of fraud 4 attempts is being traced back to Indonesia. The VeriSign report also said that when researchers looked at the ratio of fraud attempts to total transactions from any single country, Indonesia topped the list. One reason why this type of crime is growing in Indonesia, experts said, is the proliferation in recent years of loosely regulated warnets, the local version of cybercafes. Most Indonesians cannot afford home computers and many who need to use the Web frequent the thousands of warnets in urban centers. Donny Budi Utoyo, of the Information Communication Technology Watch group, said, "the warnets do not keep a register of users and what they're doing while online. These kiosks present the perfect shields for offenders." The criminals' growing sophistication adds to the problem. Many criminals have formed syndicates with people living in other countries to better their chances of making money and avoid being traced.

2004-05-06 **phishing banking scam theft**

DHS IAIP Daily; http://www.reuters.com/newsArticle.jhtml?type=reutersEdge&st oryID=5062630

May 06, Reuters — Billions of phishing scam e-mails sent monthly.

Fraudulent e-mails designed to dupe Internet users out of their credit card details or bank information topped the three billion mark last month, according to one of the largest spam e-mail filtering companies. Over the past nine months, the monthly volume of phishing e-mails has risen nearly ten-fold to 3.1 billion worldwide in April, San Francisco, CA-based e-mail filtering firm Brightmail said. Brightmail said its spam filters sift through 96 billion e-mails each month. Police suspect organized crime gangs from Eastern Europe are the main culprits in the multi-billion dollar racket. The economic toll from phishing cost U.S. banks and credit card companies $1.2 billion in 2003, Gartner Research said on Thursday, May 6. The Gartner study projected 1.78 million Americans reported giving personal information or financial details about themselves to the fraudsters. Police say the scam is concentrated on English-speaking countries such as the UK, U.S. and Australia, but is expected to target new territories as more people transact and bank online.

May 14, The Age (Australia) — Phishers strike with a new trick.

Phishers in recent scam cases have created a fake address bar in the Web browser, making the e-mail look even more legitimate, according to a media release from the SurfControl Internet Research Center. The e-mail, targeting customers of US Bank, was issued on Wednesday, May 12. The Sydney-based research center says this new technique makes it even harder to identify if the e-mail is fake. In the latest scam, users who click the link in the spam e-mail are taken to a page that displays a fake address bar containing the real US Bank Website address. This address bar has been constructed to overlap the users existing address bar that normally identifies that the address was the scammer's server. Phishers use a Javascript code that calculates where the address bar is located on the user's Web browser, so it can be covered with the allegedly "legitimate" address details, the research center says.

May 18, IDG News Service — Phishing scam reports skyrocket in April.

Reports of a type of online crime known as "phishing" surged last month, according to figures from a computer security industry group. The Anti-Phishing Working Group (APWG) received reports of more than 1,100 unique phishing campaigns in April, a 178% increase from the previous month, according to figures shared with the IDG News Service. The large increase comes on the heels of a 43% rise between February and March, and financial services and retail companies were hit particularly hard, said Dan Maier, director of product marketing at Louisville, KY-based Tumbleweed Inc. and an APWG spokesperson. Although each report recorded by the APWG corresponds to a unique phishing campaign, the type of attack that's used may not be new in every case, Maier said. In fact, the APWG has evidence that phishing Web pages are being traded online, in the same way that e-mail addresses are traded and sold by spammers. The growing problem also points to increasing interest in the scams by malicious hacking groups and organized crime, Maier said.

May 19, Kommerant (Russia) — Citibank Russia hit by phishing scam.

Citibank distributed a statement Tuesday, May 18, denying it was involved in a mass e-mailing of letters requesting more precise credit card information. A client who clicked on the link ended up on a phony Citibank Website where he was asked to enter his card number and PIN code. This type of fraud is known as "phishing," and was the first such case in Russia and a number of clients have already taken the bait. "These messages were actually sent to Citibank clients by frauds," the bank warns in its statement. Citibank's Russian branch was not only the first bank in Citigroup, but also in Russia to have these letters sent in its name. Citibank President Allan Hirst promised that, "in the event of receiving notification from clients of a loss of funds, Citibank is prepared to act in the interests of the client on an individual basis in evaluating each notification." However, the client's best chance of keeping his money in this case is to block the card on time.

DHS IAIP Daily; http://www.finextra.com/fullstory.asp?id=11879

May 21, Finextra Research — Fake order confirmations provide new phishing twist.

UK security outfit SecureTest is warning of a new twist on the familiar phishing scam, in which fake e-mail order confirmations direct recipients to a Web server that writes a malicious file to the user's PC. The e-mail, a bogus order confirmation for an IBM Laptop PC, tells the recipient that their bank account has been debited for $1969.03 and provides a link to check or cancel the order. Following the link leads to a Web server which exploits an unpatched weakness in Microsoft's Internet Explorer to write a potentially malicious file to the user's hard drive. Ken Munro, managing director at SecureTest, says the malicious code exploits a known threat which is listed by some of the major anti-virus vendors. "The danger here is in the new format for the scam, and the new form of social engineering," he says. "Many people, on receiving an e-mail saying their bank account has been debited for $1969.03 will at least click on the link and take a further look."

DHS IAIP Daily; http://gcn.com/vol1_no1/daily−updates/26054−1.html

May 26, Government Computer News — Treasury issues phishing schemes alert, advice.

The Department of Treasury on Wednesday, May 26, warned against schemes in which identity thieves spoof government agencies and financial firms to gain sensitive and financial information from unsuspecting consumers in a report that also offers some tips on how to prevent "phishing." Recent phishing e-mails have purportedly come from government agencies, legitimate financial-sector firms, Internet auction sites and electronic payment services. The government agencies include the Federal Deposit Insurance Corp., the Office of the Comptroller of the Currency, the Securities Investor Protection Corp. and others. A recent private-sector report found that 1,125 instances of phishing were reported in April, 180 percent more than in March. The report found that financial-services Websites are the most commonly spoofed. Treasury's report is on "Lessons Learned by Consumers, Financial Sector Firms, and Government Agencies during the Recent Rise of Phishing Attacks." "The report gives consumers even more information on how to detect, prevent and mitigate the effects of the identity theft scheme known as phishing, a crime that costs American consumers and businesses billions of dollars every year," said Assistant Secretary of Treasury Wayne Abernathy. 2004-05-26 **identity theft credit offers snail mail financial services federal reserve**

DHS IAIP Daily;
http://www.yorkweekly.com/news/05262004/biz_nati/18181.htm

May 26, Wall Street Journal — Federal Reserve scrutinizes credit offers.

With billions of credit solicitations mailed to consumers each year, the Federal Reserve is trying to figure out whether the offers for preapproved credit are fueling identity theft and encouraging consumers to take on excessive debt. While federal law lets lenders and insurance companies offer credit to consumers based on personal data from credit reports, the Federal Reserve is weighing whether the government needs to beef up a program that lets consumers block release of their credit reports. Evan Hendricks, editor of Privacy Times, a Washington-based newsletter, said it is easy for identity thieves to pick up preapproved solicitations by rifling through mailboxes. They can fill out the forms with a new address -- theirs -- and wait for the card to show up. While most credit companies won't send new cards to a new address, some credit unions and others do. Even if a thief can't obtain a credit card, the information in the solicitation itself is valuable, Hendricks said. An offer for a platinum card means a great credit rating, and a thief can sell that personal information to a "fence" who compiles the data and helps other identity thieves.

2005-01-18 **phishing policy e-mail URL link authenticity**

RISKS 23 68

A REAL PHISHING PAL

Tim Huckvale contributed this observation about the gap between security advice and performance:

I just received an e-mail from PayPal warning me that my credit card was about to expire. Naturally my first thought was that it was a phishing trip, but closer inspection showed it to be genuine.

It ended with the following warning:

> -
> PROTECT YOUR PASSWORD
>
> NEVER give your password to anyone and ONLY log in at
> https://www.paypal.com/. Protect yourself against fraudulent websites
> by opening a new web browser (e.g. Internet Explorer or Netscape) and
> typing in the PayPal URL every time you log in to your account.
>
> -

Typing in the URL is excellent advice. Such a shame that they defeated it by making the link clickable.

2005-02-15 **phishing redirection URL identity theft eBay trick subterfuge**

RISKS 23 73

EBAY REDIRECTS TO PHISHERS FROM THEIR OWN SITE

Pete Krawczyk found another exploit that might fool naïve users of eBay. He wrote:

>eBay fraudsters have a new trick up their sleeve: using eBay's servers to link to a fraudulent web site.

In the past, it was easy to pass a URL through a decoder and find that the actual server hosted behind a URL was not owned by eBay, since phishers would use @, %40, or other domain misdirection tactics. However, I recently received an eBay fraud mail that contained the following URL, which has been edited to point to Google:
http://cgi4.ebay.com/ws/eBayISAPI.dll?MfcISAPICommand=RedirectToDomain&DomainUrl=http://www.google.com/

As you can see, that URL will access cgi4.ebay.com, and eBay will gladly hand the browser over to Google for further action. That URL can be trivially changed to any web site.

The RISK is obvious: allowing untrusted URL redirects in this case will fool many more people who may now believe that eBay is truly asking for account details, and may lead to further identity theft.<

2005-03-31 **Microsoft lawsuits John Doe phishing scams**

EDUPAGE; http://www.reuters.com/newsArticle.jhtml?storyID=8051350

LAWSUITS TARGET PHISHERS

Microsoft has filed 117 "John Doe" lawsuits against operators of Web sites involved in phishing scams. Phishers send e-mail messages that purport to be from a bank or other financial services institution. The e-mails tell recipients that they must visit a Web site and disclose personal information, typically under the pretense of updating account records or something similar. Disclosed information is then used for credit card fraud and other types of identity theft. Microsoft said it was filing the lawsuits in an effort to discover who is behind the largest phishing operations and put them out of business. Microsoft's Aaron Kornblum said, "We must work together to stop these con artists from misusing the Internet as a tool for fraud." Reuters, 31 March 2005

EDUPAGE; http://www.siliconvalley.com/mld/siliconvalley/12218576.htm

SOFTWARE HIDES PASSWORDS FROM PHISHERS

Two professors at Stanford University are set to unveil software designed to foil phishers by scrambling passwords entered into Web sites. John Mitchell and Dan Boneh developed the software, called PwdHash, to deal with the growing problem of Web sites that lure computer users into disclosing personal information. The software creates a unique password for each Web site a user visits. If the user goes to a bogus version of a legitimate Web site, the software creates a separate password, leaving the operator of the bogus site with a password that will not work at the real site. Previously, the pair of professors have written software that tries to identify fraudulent Web sites and notifies the user when such a site is suspected. San Jose Mercury News, 25 July 2005

RISKS; http://www.anti-phishing.org/Phishing-dhs-report.pdf ; 11

DHS ANTI-PHISHING REPORT

Online identity theft, a.k.a. "phishing," refers to attacks that exploit a wide variety of RISKS, using both technology and social engineering, to illicitly obtain and profit from confidential information. A new report on online identity theft, sponsored by the US Department of Homeland Security and SRI International, provides a holistic treatment of the subject. The report discusses technologies used by phishers, breaks down the flow of information in a phishing attack, identifies chokepoints at which an attack can be thwarted, and discusses technical countermeasures that can be applied at each chokepoint. While technology alone cannot solve the phishing problem, substantial opportunities to mitigate the losses are identified. The report is titled "Online Identity Theft: Phishing Technology, Chokepoints and Countermeasures."

2006-03-20 **Microsoft phisher target phishing scam bogus Web sites fraud theft trademark violation intellectual property rights issues**

EDUPAGE; 23
http://news.zdnet.co.uk/internet/security/0,39020375,39258528,00.htm

MICROSOFT TARGETS PHISHERS

Microsoft has announced its intention to use trademark laws to confront the operators of phishing scams. Phishers set up bogus Web sites designed to look like legitimate sites and trick users into entering confidential information. At a press conference in Brussels, Microsoft said it would level trademark-violation charges against outfits that pose as Microsoft sites such as Hotmail or MSN. The Global Phishing Enforcement Initiative will target more than 100 sites in Europe, the Middle East, and Africa. Also part of the initiative will be stronger ties between Microsoft and international law enforcement agencies, including Interpol, to fight phishers. Microsoft's strategy may prove more successful at defeating phishers than prosecutions that depend on evidence that the sites in question had actually defrauded users. Microsoft's legal approach would simply need to demonstrate that site operators infringed on the company's trademarks.

1999-05-06 **identity theft impersonation fraud credit card bank e-mail**

Globe and Mail (Canada)

Tyler Hamilton wrote a good review of identity theft in Canada's _Globe and Mail_ newspaper on May 6, 1999. The article included practical advice from Anne Cavoukian, Canada's Privacy Commissioner; excerpts:

HOW TO FOIL THE IDENTITY THIEVES

* Never send any personally identifying information in an E-mail. Look into buying encryption software that will ensure that the only eyes that see the message belong to the person you're E-mailing.

* When you go to a Web site, don't provide any identifying information, unless you and the business have established a trusting relationship. Banks, for example, are usually safe bets.

* Avoid chat groups and news groups, or at least use an alias when posting messages in these open areas on the Internet.

* Ask to be taken off commercial mailing lists.

* Ask your credit bureau to attach a "fraud alert" note to your records, meaning that any request to change or access information in your file must be followed up by a call to your home. If your credit bureau doesn't have a fraud alert service, ask why and explain its importance to the bureau.

* Finally, empower yourself on the Internet by buying privacy-enhancing technologies, such as "anonymizer" software. The software lets you surf the Web and engage in E-commerce transactions under a pseudonym without having to compromise your privacy.

The Securities and Exchange Commission (SEC) announced that it was hiring about 100 new officials to fight cyberspace fraud, of which 60 will police the Web. There were already 250 workers scanning the Web full time, said the Chairman, Arthur Levitt in mid-February 2000. He cited a "frightening" recent case in which a criminal hacker inserted false news of a merger on a company Web site. Stock manipulations include rumor-mongering to drive up the price of stock already held and also to drive down the price of stocks already sold on the futures market at a higher price than the desired target.

The U.S. Federal Trade Commission . . . [said] it's been working with other international organizations in an unprecedented global effort to crack down on fraudulent, get-rich-quick schemes that are promoted through the Internet. The sweep, which began in February, involved 28 countries and targeted 1,600 suspect Web sites. Typical scams included pyramid schemes, unrealistic investment opportunities and easy-money come-ons. Domestically, the FTC has enlisted the help of the Postal Service and the Securities and Exchange Commission enforcement units to assist in monitoring online fraud. FTC officials say the sites have now been warned that they must change their claims or it will attempt to have them shut down. "We're going to run them off the Web and where appropriate, put them in jail," says Drew Edmondson, attorney general of Oklahoma. (Financial Times 24 Mar 2000)

The U.S. Department of Justice and the Federal Bureau of Investigation are collaborating on the creation of an Internet Fraud Complaint Center, which will give consumers and businesses a one-stop shop for reporting incidents in which a computer was used for criminal activity, such as fraudulent claims made over a Web site, via e-mail, or in chat rooms. It will not cover crime in which computers were the target, such as the distributed denial of service attacks that crippled some major businesses' computers recently. Those problems should be addressed by the National Infrastructure Protection Center. (TechWeb 8 May 2000)

NewsScan, San Jose Mercury News http://www.sjmercury.com/svtech/news/breaking/merc/docs/011053.htm, Los Angeles Times http://www.latimes.com/business/20000518/t000046914.html

With the "Love Bug" virus providing a recent reminder of the problem of cybercrime and other kinds of mischief on the Internet, leaders from the Group of Eight countries . . .[met] to see what can be done, and the 41-nation Council of Europe is working with the U.S., Canada, Japan and South America to draft a treaty to standardize laws against Internet crime. Jonathan Fornici of the Internet security consulting firm AtomicTangerine says that governments need to write laws that make the punishment clear, because the way things are now, people know security violations are wrong — "but what's the repercussion?" In the Love Bug case, investigators in the Philippines delayed a raid for several days until prosecutors found a law that might apply. (AP/San Jose Mercury News 14 May 2000)

[When] Envoys from the world's leading industrialized nations and private business met . . . in Paris to discuss cooperation in fighting Internet-based crime, [there were] . . . widespread differences in national approaches [that] could stymie efforts. At the heart of those differences is the degree to which governments are willing to monitor the Net for illegal behavior, which inevitably occurs at the expense of citizens' privacy. In addition, e-commerce businesses tend to discourage more government involvement, which they view as a menace to both economic growth and individual liberty. On April 27, the Council of Europe published a draft treaty proposing uniform international law enforcement standards in cyberspace, including the requirement that all messages and content sent via the Internet be stored for three months before deleting. That proposal has met with mixed reactions among both governments and industry representatives. The U.S., which held observer status during the drafting, . . . [did not endorse] that proposal. USA Today

The British government . . . [said] its plans to allow security services to monitor Internet traffic . . . [would] not create an overly intrusive cyberspace spy agency, but civil liberties groups argue the Regulation of Investigatory Powers (RIP) bill would give police free rein to snoop on the Internet and could result in people being jailed for forgetting their passwords. The bill would require citizens to reveal encryption keys to the police or face a two-year jail term. "The police have to prove the encryption key was deliberately withheld," says a Home Office spokesman. "We're not talking about people going to prison for forgetting passwords... Interception of communications is only used on the authorization of the Home Secretary himself. And it's only used in defense of national security or on suspicion of serious crime, like narcotics smuggling or terrorism." (Reuters/San Jose Mercury News 26 May 2000)

[In July,] UUNet and Nokia . . . [participated] in a last-ditch effort to derail the controversial U.K. Regulation of Investigatory Powers Bill, which would allow law enforcement officials to require ISPs to intercept e-mail messages and other data on their systems. Individuals or companies sending encrypted data could be required to provide it in plan text or surrender a software encryption key to decode the message. UUNet called the legislation, to be debated today in the House of Lords, "fundamentally flawed" and "draconian," and added, "It would be tragic if by imposing a new requirement on ISPs, the U.K. were to make itself uncompetitive in the provision of Internet services. We would ask the government to step back and re-think the whole bill." Meanwhile, Nokia is the first company to voice concern over the legislation based on its impact on future wireless services. (Financial Times 12 Jul 2000)

[Also in July,] . . . . A government official argued that "the powers in the bill are necessary and proportionate to the threat posed by 21st century criminals, no more, no less." The bill has angered civil libertarians, and a spokesperson for Amnesty International in London said: "What this does is contravene a large number of fundamental rights in the European convention on human rights and other international standards, which include the right to privacy, the right to liberty, the right to freedom of expression, and the right to freedom of association." (New York Times 19 Jul 2000)

[At the end of July, the British] Parliament . . . passed legislation that will allow law enforcement authorities to demand records of Internet traffic for scrutiny by MI5, the country's domestic intelligence agency. The rationale for the new law is that it's necessary to counter the increasing technological sophistication of organized criminal efforts; however, one Labor Party dissenter said that certain provisions of the bill "are born of complacency, are unsatisfactory, and have little regard for the protection of privacy and commercial confidences." (AP/USA Today 28 Jul 2000)

Security Wire Digest 4 31

*PROSECUTOR SAYS HACK ATTACKS MUST BE REPORTED
Companies need to come forward and admit when they've been hacked, urged U.S. prosecutor David Green at Microsoft's Government Leaders' Conference last week. So long as companies fail to report attacks, the government will be limited in its ability to find culprits and bring them to justice, said Green, the principal deputy chief of the Department of Justice's computer crime division. "We have to make the reporting of these attacks the norm. We need corporate cooperation to report these sorts of vulnerabilities to law enforcement in order that they are able to deal with it," he told delegates, according to a published report. A key, he added, is creating a public-private partnership that promotes trust and honors confidentiality. Congress is currently considering legislation that would exempt security information shared with the government from the Freedom of Information Act.

2003-03-17 **Pakistan cyber crime wing security intelligence**

NIPC/DHS

March 13, Wired — Pakistan creates cyber crime wing.

A Pakistani security agency has launched a special wing to combat cyber crimes in part because the country had to rely on U.S. investigators to trace e-mails sent by the kidnappers of American journalist Daniel Pearl a year ago. "The purpose of establishing the National Response Center for Cyber Crimes is to stop misuse of the Internet and trace those involved in cyber-related crimes," Iftikhar Ahmad, spokesman for Pakistan's Interior Ministry, told the Associated Press on Wednesday. "The importance of this special wing was felt when Daniel Pearl was kidnapped, and his captors started sending e-mails to newspapers," he said. The Wall Street Journal correspondent disappeared on January 23, 2002, from Pakistan's southern city of Karachi. "The National Response Center for Cyber Crimes will play a key role in the days to come in tracing those terrorists who often use the Internet or prepaid telephone cards to communicate messages to their associates for carrying out acts of terrorism and other purposes," Ahmad said. The special wing has been established at the headquarters of an intelligence agency in Islamabad, Pakistan's capital.

NewsScan

U.S. CRACKS DOWN ON INTERNET FRAUD
The Justice Department has charged more than 130 people with perpetrating a variety of Internet scams, as well as identity theft and failure to deliver goods purchased online. The crackdown, dubbed Operation E-Con, involved more than 90 investigations involving 89,000 victims whose losses totaled at least $176 million. In one case, the suspects used a Web site to sell more than $2 million worth of pharmaceutical drugs without any prescriptions or physician involvement with the purchasers. In another scam, about 400 men lost about $3,000 each when they sent money off in the hope of winning the hand a Russian bride. Other scams promoted fraudulent investment opportunities, Ponzi-type pyramid schemes and the illegal sale of copyright-protected software, games and movies. Officials say they've managed to recover about $17 million from alleged perpetrators. (AP/Siliconvalley.com 16 May 2003)

2003-10-27 **Brazil cybercrime lab identity data theft attack internet violent crime police officials Sao Paulo hacker commission vandalism**

NIPC/DHS

October 27, New York Times — Brazil becomes a cybercrime lab.

Brazil is becoming a laboratory for cybercrime, with hackers specializing in identity and data theft, credit card fraud and piracy, as well as online vandalism. So far this year, nearly 96,000 overt Internet attacks—ones that are reported, validated or witnessed —have been traced to Brazil. Already overburdened in their fight to contain violent crime, police officials are finding it difficult to keep pace with hacker syndicates. The 20 officers working for the electronic crime division of the São Paulo police catch about 40 cybercrooks a month. But those criminals account for but a fraction of the "notorious and ever increasing" number of cybercrimes in São Paulo, Brazil's economic capital, said Ronaldo Tossunian, the department's deputy commissioner. The São Paulo department's effort is not helped by vague legislation dating back to 1988. Under that law, police officers cannot arrest a hacker merely for breaking into a site, or even distributing a software virus, unless they can prove the action resulted in the commission of a crime.

2003-12-17 **cyber crimes task force Ohio federal violation network attack critical infrastructure**

NIPC/DHS

December 16, Cyber Crimes Task Force of Central Ohio — Cyber task force opens in Ohio. The Central Ohio Cyber Task Force (CCTF) officially opened on on Monday, December 15. The CCTF is a joint federal task force which investigates federal violations of cyber crime in central Ohio, and is the first of its kind in Ohio. The primary crime areas the CCTF investigates and is also willing to serve as a resource for local and state law enforcement agencies are those where a computer is the primary target or tool of a criminal subject to commit any of the following: computer network attacks and intrusions, particularly for all critical infrastructure, government and the Department of Defense servers/networks and for severe commercial losses; sexual exploitation of children; Internet fraud; and intellectual property rights. The CCTF is a cooperative effort of the FBI, U.S. Department of Defense, Defense Criminal Investigative Service, the Ohio State University Police Department, City Columbus Police Department, City of Grandview Police Department, and Ohio Attorney General's Office. It is also supported by the United States Attorney's Office and Southern District of Ohio Franklin County Prosecutor's Office.

2004-02-02 **Internet fraud scam e-mail Nigerian 4-1-9 419 caught Netherlands**

NewsScan

FINALLY! THE NIGERIAN E-MAIL SCAMMERS CAUGHT

Police in the Netherlands have arrested 52 people suspected of using the so-called "Nigerian e-mail scam" to defraud Internet users by sending them spam e-mails asking for their help in transferring a large sum of money out of Nigeria or some other troubled country in exchange for a generous percentage-fee. A task force of 80 officers raided 23 apartments, seizing computers, fake passports and 50,000 euros ($62,000) in cash. Most of those arrested were believed to be Nigerian. (Wired 2 Feb 2004)

2004-05-17 **Homeland Security DHS information sharing federal government**

DHS IAIP Daily; http://www.govexec.com/dailyfed/0504/051404tdpm1.htm

May 17, National Journal's Technology Daily — Officials announce plan to share terrorism intelligence.

Attorney General John Ashcroft on Friday, May 14, unveiled an initiative to foster greater information sharing among federal, state and local law enforcement agencies. "No single government agency, or government, can win the war on terrorism," Ashcroft said. FBI Director Robert Mueller and Homeland Security Department Undersecretary Frank Libutti attended the announcement. Details of the National Criminal Intelligence Sharing Plan were developed at a 2002 law-enforcement summit convened by the International Association of Chiefs of Police to examine the requirements necessary for a national network that would gather, analyze and share information and intelligence on criminal and terrorist activities. On Friday, Ashcroft said the greatest structural failure in thwarting the September 11, 2001, terrorist attacks involved the "impediments to communication and information sharing among the men and women charged with keeping America safe."

2004-06-22 **Gypsy group lawsuit IBM Nazi Holocaust assistance compensation**

NewsScan

GYPSY HOLOCAUST SURVIVORS SUING IBM IN SWISS COURT

Gypsies are suing IBM in Swiss court, alleging that IBM's expertise helped the Nazis commit mass murder more efficiently. A Gypsy group chose Geneva to file the lawsuit because IBM's wartime European headquarters were in that city. A Swiss appellate court has ruled: "IBM's complicity through material or intellectual assistance to the criminal acts of the Nazis during World War II via its Geneva office cannot be ruled out," and pointed to "a significant body of evidence indicating that the Geneva office could have been aware that it was assisting these acts." DHS IAIP Daily; http://sacramento.bizjournals.com/sacramento/stories/2004/10/18/daily15.html

October 19, Sacramento Business Journal (CA) — Justice Department to target hacking, intellectual property theft with five new units.

The United States Attorney's office in five cities will be home to new Computer Hacking and Intellectual Property units, federal officials announced Tuesday, October 19. The new units, all in areas where intellectual property is a significant contributor to the economy, will be in Sacramento, CA; Washington, D.C.; Pittsburgh, PA; Nashville, TN; and Orlando, FL. The program, known as CHIP, will target copyright and trademark violations, theft of trade secrets, unauthorized access to computers, Internet fraud and theft of computers and other high-tech items. It will also train local law enforcement officers on tech issues. The new CHIP offices join 14 existing offices around the country.

2004-11-16 **organized cybercrime Stephen Cobb Chey Cobb DHS federal**

NewsScan;

SAFE & SOUND IN THE CYBER AGE: FEDS TO THE RESCUE?
By Stephen Cobb and Chey Cobb

Feds to the Rescue? Don't Hold Your Breath. First the bad news. If you were hoping that the threat of organized cybercrime would turn out to be something that we information security experts invented to drum up business, the time has come to stop hoping. International gangs of cyber-criminals do exist, as evidenced by the arrests announced recently by the U.S. Secret Service, which hauled in 28 people for alleged involvement in a global organized cybercrime ring (see NewsScan, 29 October 2004). According to the financial institutions victimized by this criminal enterprise, it netted more than $4.3 million. The suspects, who come from six different countries in North America and Europe, are alleged to have trafficked "in at least 1.7 million stolen credit card numbers." According to Secret Service Director W. Ralph Basham, "These suspects targeted the personal and financial information of ordinary citizens, as well as the confidential and proprietary information of companies engaged in e-commerce." According to ComputerWorld, where Mr. Basham was quoted, the suspects operated Web sites that were used to buy and sell counterfeit credit cards and false identification documents, and also share information on how to commit fraud, trade in stolen information, and operate the tools needed to commit such crimes. We realize that the world today is full of big numbers, so if $4.3 million doesn't strike you as a lot of money, bear in mind that this is just one bust of a few dozen felons. There are strong indications that hundreds, if not thousands, of criminals are getting in on the cybercrime wave. And there is little doubt that banks in the U.S. and Europe have lost several billions of dollars over the last twelve months to just one form of cybercrime: phishing (see Newsscan, 1 May 2003). A few months ago Gartner put the direct losses from phishing, that is, money fraudulently removed from people's account, at over $2.4 billion, and sources in the UK cite losses of similar magnitude. So what's the good news? We don't think there is any, despite the admirable work of the Secret Service (assisted in this case by the U.K.'s National Hi-Tech Crimes Unit, the Vancouver Police Department's Financial Crimes Section, the Royal Canadian Mounted Police and Europol). Sadly, as hard as the fine officers of these agencies work, they are hardly making a dent in the problem (see the lead story in NewsScan Daily, 20 September 2004, for more on the scale of organized cybercrime). One reason for this lack of progress is undoubtedly the lack of government investment in basic cyber security research. Given the huge negative impact of cybercrimes on both U.S. citizens and U.S. financial institutions, you might expect the federal government to be pouring money into improving computer security. Sadly, according to experts in the field, the amount of federal funding for basic cyber security research is currently less than $50 million a year (by comparison, the government recently contributed $50 million to the building a rainforest in Iowa). Some say this disturbing situation was highlighted by the October resignation of Amit Yoran after just one year as director of the National Cyber Security Division of the Department of Homeland Security. This follows two previous high profile departures from the top cyber security post in less than two years (by Howard Schmidt and Richard Clarke respectively). Observers have cited a lack of funding as a major factor in all three resignations. One person who is very much in touch with this situation is Dr. Eugene Spafford, the executive director of the Center for Education and Research in Information Assurance and Security (CERIAS). Speaking at the Information Security Decisions conference in Chicago last month, Dr. Spafford surprised the audience of 500 information security practitioners with a multiple choice question: How much do you think the federal government is spending each year on basic computer security research? The responses, quickly tabulated by a very clever electronic audience feedback system, showed that most people assumed the government was spending a lot more than it really is. Always keen to give NewsScan readers the most accurate data, Stephen asked Dr. Spafford for clarification. After all, you might recall, as we did, the Cyber Security Research and Development Act of December, 2002, in which the President authorized up to $903 million in cyber security research funds and fellowship opportunities at NSF and the National Institute of Standards and Technology (NIST), from 2003 through 2007. So how could spending be less than $50 million per year? Sadly, replied Dr. Spafford, "Authorization is not appropriation... The authorization simply says that if the money is available to NSF, they can spend it. No additional money was actually appropriated." For readers interested in learning more, a report on cybersecurity research funding is due soon from PITAC, the President¹s Information Technology Advisory Committee,. It should show up here: http://www.itrd.gov/pitac/index.html. If that report does not bear good news, you might want to contact your congresspersons, whomever they now may be. [Chey Cobb, CISSP, the author of "Network Security for Dummies," is a former senior technical security advisor to the NRO. Her email address is chey at soteira dot org. Stephen Cobb, CISSP, is the author of "Privacy for Business" and the Chief Security Executive at STSN. He can be reached as scobb at cobb dot com.]

2004-11-17 **Europe EU IT security cybercrime agency formed**

DHS IAIP Daily; http://www.computerweekly.com/articles/article.asp?liArticle ID=135123&liArticleTypeID=1&liCategoryID=6&liChannelID=22&li FlavourID=1&sSearch=&nPage=1

November 17, ComputerWeekly — Europe's IT security agency set to fight cybercrime.

The European Union's international cybercrime squad is up and running, a year after it was given the go-ahead by the European Commission. The European Network and Information Security Agency (Enisa) has a five-year budget of $44.5M and a mandate to get member states working together to combat security threats. It aims to become a pan-European "center of excellence" on security matters, collecting and analyzing data on security incidents, advising the commission and member states on security issues, standardizing security approaches and pushing for more co-operation between the private and public sectors.

NewsScan; http://www.usatoday.com/tech/news/techpolicy/2005-01-27-child-abuse-site_x.htm

WEB SITE TO FIGHT CHILD ABUSE

A new Web site has been created by the U.K.'s National Crime Squad (NCS) in collaboration with the technology industry and with agencies in the U.S., Canada, and Australia, and Interpol, to provide information to help and support victims of abuse. Jim Gamble of the NCS explains: "Child abuse is one of the worst crimes to affect today's society and we in the UK must break away from thinking that we can tackle this issue within our own borders. Internet users access a worldwide service and we must tackle abuse from a worldwide perspective. That is why strategic partnerships with partners across the globe are so vital to the success of this initiative. Police across the world must work as one on this." (Federal Computer Week/USA Today 27 Jan 2005)

2005-07-01 **music movie TV software piracy international US raids FBI warez**

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4640439.stm

U.S. LEADS INTERNATIONAL PIRACY RAIDS

Authorities in 11 countries, led by the FBI, conducted raids on the operators of Internet operations suspected of pirating movies, software, and computer games. The raids, which were conducted in the United States, Canada, Israel, France, Belgium, Britain, Denmark, the Netherlands, Germany, Portugal, and Australia, led to the arrests of seven individuals, the seizure of $50 million worth of pirated material, and the shutting down of eight servers used to distribute the copyrighted works. According to U.S. Attorney General Alberto Gonzales, the raids also identified more than 120 other individuals allegedly involved in Internet piracy. Targeted in the raids were 14 so-called "warez" groups, which are the source for possibly as much as 95 percent of copyrighted material that is available online. Because operators of warez groups traditionally employ extensive measures to mask their identities and hide what they are doing, the groups have proven especially difficult for authorities to penetrate. Those arrested could face fines and jail terms, including up to 10 years in prison for distributing content prior to its commercial release. BBC, 1 July 2005

2000-02-04 **technology criminal hacker evidence encryption legal law judge ruling trial case**

New York Times
http://www.nytimes.com/library/tech/00/01/cyber/cyberlaw/28law.html

During the Mitnick trial, defense lawyers were given the contents of hard disk drives seized from laptop computers belonging to the defendant — save for the roughly 1 Gb of encrypted data for which Mitnick refused to reveal the encryption key(s), as he was fully entitled to do under the prerogatives of the Fifth Amendment of the US Constitution forbidding self-incrimination. On May 20, 1998, the federal judge, Mariana R. Pfaelzer of the Los Angeles district, agreed with prosecutors that they could keep the encrypted data from the defense team. Some legal experts disagreed with the ruling, saying that in the absence of evidence to the contrary, the encrypted data should not have been sequestered by the government side. The problem would recur, they said, as disk encryption became more widespread.

2000-04-30 **e-mail interception monitoring government law enforcement police Internet**

Sunday Times http://www.sunday-
times.co.uk/news/pages/sti/2000/04/30/stinwenws01034.html

Reports in Britain detailed government plans to build a monitoring center capable of scanning all inbound and outbound e-mail and mobile phone calls in the UK. Plans included requirements for permanent linkages between the center and ISPs. Although a warrant would be required for examination of communications to individuals, approval for interception of corporate e-mail would be easier to obtain. The proposal for the GTAC (Government Technical Assistance Centre) raised a storm of protest from civil liberties advocates.

2000-07-11 **Internet service provider ISP surveillance wiretap interception monitoring law enforcement privacy protests e-mail investigation sniffer**

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB963264584706292829.htm, Washington Post
http://www.washingtonpost.com/wp-dyn/articles/A15206-2000Jul20.html,
Washington Post

The Federal Bureau of Investigation is using a superfast e-mail-surveillance software system called Carnivore, so named because it can quickly ferret out "the meat" among a vast quantity of data in search of criminal or terrorist content. FBI investigators say the Internet wiretapping system has been used in fewer than 100 criminal cases since its launch last year, but privacy advocates say its deployment gives government, at least theoretically, the ability to eavesdrop on all customers' digital communications, from e-mail to online banking to Web surfing. The FBI defends Carnivore as more precise than the primitive Internet wiretap systems used in the past, and credits it with the ability to target the digital traffic of just one user amidst a stream of millions of other messages. "This is just a very specialized sniffer," says Marcus Thomas, head of the FBI's Cyber Technology Section, but Republican Congressman Bob Barr (R-Ga.) counters, "Once the software is applied to the ISP, there's no check on the system. If there's one word I would use to describe this, it would be 'frightening.'" (Wall Street Journal 11 Jul 2000)

The Republican Congressional leadership . . . [opposed] Clinton Administration plans to use its "Carnivore" software system to monitor a criminal suspect's e-mail messages as they pass through an Internet service provider. The FBI says this system is not intended to extend the government's surveillance capabilities, but merely to update their methods to cope with changing technology, but House Majority Leader Dick Armey (R-Tex.) says: "Nobody can dispute the fact that this is not legal within the context of any current wiretap law... We have a Congress that is anxious to work with [the Administration] ... but in effect they have said: 'We're going to go on our own and not wait for technology or the Congress to catch up with our desires for cyber-snooping.' That's a dangerous thing for us to allow to go along unchecked." (Washington Post 21 Jul 2000)

In testimony before a House Judiciary subcommittee, FBI official Donald M. Kerr strongly defended the agency's use of the "Carnivore" system, which effectively places a wiretap on the Internet and allows law enforcement officials to identify the origin and destination of all e-mail messages related to a person under suspicion of a crime. The reaction of Rep. Spencer Bachus (R-Ala.) was skeptical: "The potential for abuse here is tremendous. What you're saying is 'Trust us.'" But Kerr insisted that Carnivore was an essential tool for fighting crime: "Criminals use computers to send child pornography to each other using anonymous, encrypted communications. Hackers break into financial service companies' systems and steal customers' home addresses and credit-card numbers, criminals use the Internet's inexpensive and easy communications to commit large-scale fraud on victims all over the world, and terrorist bombers plan their strikes using the Internet." Civil liberties groups have been consistently critical of the FBI's support of Carnivore. (Washington Post 25 Jul 2000)

2000-08-03 **privacy surveillance wiretapping interception law enforcement investigation civil liberties e-mail**

NewsScan, Washington Post http://www.washingtonpost.com/wp-dyn/articles/A25897-2000Aug2.html, San Jose Mercury News
http://www.sjmercury.com/svtech/news/breaking/merc/docs/021106.htm

U.S. District Judge James Robertson . . . ordered the Justice Department to expedite its review of requests by the American Civil Liberties Union (ACLU) and the Electronic Privacy Information Center (EPIC) for background materials on "Carnivore," a software tool developed to help the FBI carry out court-approved monitoring of suspected criminal activity on the Internet. An attorney for EPIC says, "The fact that the court is going to supervise the processing of the material is very good news. If left to their own devices, it's likely the FBI would tend to drag its feet on this, and now I think that's less likely. . . . It's going to be very difficult to have a meaningful debate about the legal issues Carnivore raises if we don't really know what Carnivore is." (Washington Post 3 Aug 2000)

Attorney General Janet Reno . . . asked the Justice Department to select a U.S. university to do an objective review of the FBI's "Carnivore" e-mail surveillance system, which scans Internet data packets as they travel to and from a criminal suspect. Civil liberties groups have been demanding that they be given all the information needed to understand how the system operates. They are not happy with Reno's decision. ACLU executive Barry Steinhardt says a university-conducted review will not be "truly independent" and adds: "The fox doesn't get to choose who guards the henhouse." (AP/USA Today 10 Aug 2000)

2000-08-11 **surveillance law enforcement international jurisdiction wiretaps access foreign control national security**

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB965952625894025409.htm

[In July,] The Federal Bureau of Investigation . . . voiced national security concerns regarding Nippon Telegraph & Telephone's planned acquisition of U.S. Internet service provider Verio. The agency has complained in recent years that its ability to maintain surveillance over U.S. telecommunications networks could be compromised by foreign ownership deals, and this latest statement indicates those concerns are now moving into the Internet arena. FBI fears are focused on the possibility of foreign companies moving network operations offshore, which could constrict the agency's ability to physically access Internet gear to conduct wiretaps. Experts say the deal probably will be approved, but have expressed concern about the precedent it will set: "I'm confident it can be worked out, but the willingness of the government to take [its inquiry] this far and get assurances they probably don't need is not a good idea," says a lawyer specializing in telecommunications and Internet regulatory matters. (Wall Street Journal 6 Jul 2000)

[In August,] The Federal Bureau of Investigation has negotiated an agreement with Nippon Telegraph & Telephone that sets conditions for the Japanese firm's $5.5 billion purchase of U.S. Internet service provider Verio. The agreement provides a number of safeguards to protect U.S. law-enforcement investigations, including a ban on Japanese government involvement in Verio's day-to-day activities (the government still owns a sizeable stake in NTT). Critics contend that the FBI overstepped its authority in laying down conditions of the sale: "If there's a lesson learned, it's get the FBI out of these transactions, because they're extracting concessions that may be beyond what the law requires," says Albert Gidari, a Seattle lawyer who specializes in regulatory issues. (Wall Street Journal 11 Aug 2000)

Internet pioneer Vinton Cerf told a Senate committee . . . [on 6 Sep] that he is satisfied that the FBI's use of the Carnivore e-mail monitoring system won't violate the privacy of Internet users. Cerf added that the efforts by some civil liberties groups to force the FBI to reveal Carnivore's source code are misguided. "I don't want you to misunderstand that I think this is all great," he said, agreeing that the potential for abuse is there. "I don't believe what the FBI has done is abusive. Used in the fashion described, it is very constrained in its data capture." Cerf's reservations about disclosing the source code were echoed by Judiciary Committee chairman Orrin Hatch: "ISP geeks may be less familiar with the penalties and restraints than the gentlemen from the FBI." The Justice Department has agreed to an independent review of Carnivore by a panel of academic experts it will select, but some top security experts say the conditions set for the review are tyrannical: "Independent has a new meaning in DOJ parlance," said Peter G. Neumann, principal scientist at SRI International Computer Science Laboratory. "Independent means total censorship, total control over content." (Wall Street Journal 7 Sep 2000)

2000-10-05 **records justice judge deletion archives discard destroy invalid inadmissible evidence e-mail communications permanent**

NewsScan, New York Times
http://.nytimes.partners.com/2000/10/05/technology/06CYBERLAW.html

District Court Judge James Rosenbaum has published an article called "In Defense of the DELETE Key," in which he bemoans the eternal nature of computer communications and reminisces fondly about pre-computer days when people casually spoke "off the record": "At this earlier time, two people could easily say something — even, perhaps, something politically incorrect — simply between themselves. They might even have exchanged nasty notes between themselves. And when they had moved past this tacky, but probably innocent moment, it was truly gone." Today, however, "an idle thought jotted onto a calendar, a tasteless joke passed to a once-trusted friend, a suggestive invitation directed at an uninterested recipient, if done electronically, will last forever. Years later, it can subject its author to liability." Rosenbaum proposes a "cyber statute of limitations" — perhaps six months for an isolated e-mail message — after which "deleted" documents would be legally consigned to the electronic rubbish heap and become inadmissible as evidence of possible wrongdoing. He makes an exception for recovered "deleted" messages from someone who has exhibited a pattern of egregious behavior or communications. The article was published in the Summer issue of The Green Bag, a literary law journal. (New York Times 5 Oct 2000)

The Federal Trade Commission filed a complaint in federal court . . . [Oct 2] alleging that Verity International, which is registered in Dublin and is no relation to the California software company Verity Inc., improperly charged thousands of U.S. Internet users for long-distance phone calls. The porn customers were told they were being charged to view sex videos over a phone line to Madagascar at a rate of $3.99 a minute, but the FTC determined that the calls actually terminated in the U.K. and should have cost only eight cents a minute. Verity planned to pocket the difference. The scope of the scam was huge — in a single week in September, some 67,000 U.S. households received bills from Verity, with an average overcharge of $222 (although some overcharges topped $4,000). Interestingly, the agency used an off-the-shelf software program called NeoTrace to locate the alleged perpetrators. According to NeoTrace's manufacturer, NetWorx, the software is used by the FBI, the U.S. Customs Service, NATO, the Royal Canadian Mounted Police and Interpol to trace the geographic origin of Internet traffic. 2000-12-07 **law enforcement investigation wiretap e-mail address law ruling debate regulations**

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB976146889727650215.htm

Law enforcement officials have long held that a 1986 law allowing police to record phone numbers by someone tied to a criminal investigation permits them to secretly copy e-mail addresses in messages sent to people involved in criminal probes, but a newly disclosed e-mail message suggests there is internal dissension over the legality of such "pen traps": "We have agents that would like to use a pen for e-mail, but our [chief division counsel] thinks that we can only use a pen to get the telephone number dialed by the modem," one agent wrote in the Feb. 14 e-mail. "I don't think we in the field have a grasp of how the existing telecommunications laws apply to computer communications." Highlighting the depth of confusion over the issue within law-enforcement circles, the agent noted that this legal opinion came from the FBI's National Infrastructure Protection Center, which includes the bureau's top computer-crime experts in Washington. The uncertainty brings into question the legality of using Carnivore, the FBI's e-mail "sniffing" software, which has been justified under the 1986 law that covers any device that "records or decodes electronic or other impulses, which identify the numbers dialed or otherwise transmitted" and that is attached to a telephone line. "Carnivore is not attached to a telephone line and does not obtain a number dialed," says Philip L. Gordon, a lawyer with the Privacy Foundation, who notes that privacy protections for e-mail addresses should be greater than those for phone numbers. "They're clearly different." IT'S A SLOW WEEK: SHOULD YOU CLEAN OUT YOUR INBOX?
One person interviewed about his e-mail usage admitted to having 2,465 messages sitting in his inbox: "I know you can put these things in files and have them organized, but it never seems worth the trouble." Ned Kock of Temple University's e-collaboration center agrees that mailbox organization places an additional burden on busy people: "In using e-mail, you have six main tasks. You open the system. You download the messages. You read the messages. You reply. You file them. You shut off the system. We as a species are optimized for face- to-face communication, so only two of these the reading and replying are vaguely associated with that. The others are just overhead. They carry no social interest at all. There is an excitement to reading and replying, but filing takes cognitive effort without an immediate reward. So despite its being important in the long run to be organized, it is human nature to avoid it." Our conclusion? The choice is yours: follow your dream... or your nature. (New York Times 5 Jul 2001)

FBI's CATCH-22 (OR CATCH-374) NAME FOR CARNIVORE [8 Feb 2001]
The FBI's plans for its Carnivore system for "wiretapping" the Internet have been under continuous criticism from privacy advocates, and House majority leader Dick Armey of Texas has said the technology raises strong concerns that the government is "infringing on Americans' basic constitutional protection against unwarranted search and seizure." Some defenders of Carnivore, have suggested that the controversy is largely because of the catchy name chosen for the system, which was called Carnivore because it could get to the "meat" of a criminal investigation. One official said ruefully: "If they called it Device 374, nobody could remember what Device 374 was." (New York Times 8 Feb 2001)
http://partners.nytimes.com/2001/02/08/technology/08CARN.html

CARNIVORE TO GET NEW PRIVACY PROTECTIONS [19 Apr 2001]
Justice Department sources are saying that Attorney General John Ashcroft, a strong defender of individual privacy rights, will heed FBI Director Louis Freeh's advice to allow the government to continue using the Carnivore e-mail surveillance system but will require various new safeguards - such as tightening the "audit trail" to make sure the system is not being abused by law enforcement officials and developing a more precise definition of what e-mail may be inspected. (Los Angeles Times 19 Apr 2001)
http://www.latimes.com/business/cutting/todays.topstory.htm

FBI JUSTIFIES ITS INTERNET SURVEILLANCE METHODS [4 May 2001]
Documents obtained by the Associated Press under the Freedom of Information Act show that the FBI used the Carnivore or Etherpeek surveillance tools 24 times from October 1999 to August 2000 to monitor Internet e-mail and other communications traffic as part of criminal investigations of such activities as network vandalism, drug probes, extortion, and intellectual property theft. One agent wrote to a superior: "We got bank accounts, where money was hidden and other information. Some of the data sent was instrumental in tying several of the conspirators to the crime." The agent's superior told the agent that the kind of information he was providing would be "very helpful in fighting the idea that we are randomly looking at everyone's e-mail." (AP/USA Today 4 May 2001)
http://www.usatoday.com/life/cyber/tech/2001-05-04-carnivore.htm

DICK ARMEY CONTINUES OPPOSITION TO CARNIVORE
In a letter to Attorney General John Ashcroft, House majority leader Dick Armey (R-Texas) is urging the Justice Department and the FBI to consider abandoning its DCS-1000 system (popularly known as "Carnivore"), which monitors large amounts of Internet traffic in search of communications to or from the target of an investigation. Armey noted that the Supreme Court has just ruled that the police must discontinue use of thermal-imaging technology to look inside a suspect's house, and argued that the same privacy principles apply to Carnivore. (New York Times 14 Jun 2001)
http://partners.nytimes.com/2001/06/14/technology/14CARN.html

CONGRESS AGAINST CARNIVORE [25 Jul 2001]
The U.S. House of Representatives has passed a bill that would require federal law-enforcement officials to provide a detailed accounting each year of how they made use of the system known as Carnivore (renamed DCS 1000), which allows criminal investigators with a search warrant to monitor the e-mail traffic to and from a suspect's computer. The FBI would be called on to reveal which officials and which courts authorized its use, which specific laws were invoked to justify its use, and what benefits were gained from that use. (Reuters/USA Today 25 Jul 2001)

BITS OF EVIDENCE
A growing number of consultants now specialize in helping law firms prepare for trail by sorting through electronic documents and e-mail messages found either on a defendant's own computer or on file server systems. Computers can identify documents by date, authors, recipients and keywords, and can frequently yield information the author thought had been erased. Attorney Michael Epstein says: "You know for a paper document, it's either there or it isn't. With e-mail, it's a little different." He provides the example of a lawsuit bought by one company against its former employees, whose denials of working for themselves on company time were refuted by evidence of their personal activities obtained by restoring files erased from the computers they had used at work. 2001-12-05 **e-mail content filtering terrorism key word search law enforcement policy technology Carnivore denial-of-service attack false positives flooding saturation useless defeat**

RISKS 21 82

Fredric L. Rice contributed a depressing analysis to RISKS about why Carnivore and similar content-based e-mail scanning will inevitably be defeated. He pointed out that it would be trivially simple to flood the system with vast numbers of messages containing machine-generated gibberish fitting the profiles used by Carnivore to spot possible involvement in terrorism. In addition, any activist who actually did get picked up the by the FBI because ofa real e-mail could simply post the suspect e-mail on the Web, thus providing a template for yet more chaff. The author concluded, "I can't see anything coming out of the struggle besides a pile of useless software running on ISP's servers fingering innocent people and failing to point at a single bad guy."

2002-01-09 **biometric face recognition I&A identification authentication failure removal law enforcement police**

RISKS 21 87

Nick Brown wrote in RISKS, ". . . [A] highly-publicised facial recognition system has been quietly dropped by law enforcement officials in Tampa, Florida, following a large number of false positives (including males identified as females, and vice versa) and a total of zero matches against known criminals, leading to zero arrests. Aside from the already-discussed civil liberties RISKs of such systems, it seems we need to add the possibility that the taxpayers may not be getting value for money, with or without their knowledge (the withdrawal of this kind of thing tends to be done with rather less media coverage than its introduction). One wonders if this will have any effect on plans to introduce such systems into airports to 'detect' terrorists."

SOFTWARE UNCOVERS E-MAIL UNTRUTHS
SAS Institute has developed software that it says can sift through e-mails and other electronic text to discern falsehoods. "The patterns in people's language change when they are uncertain or lying," says Peter Dorrington, business solutions manager at SAS. "We can compare basic patterns in words and grammatical structures versus benchmarks to detect likely lies." For instance, over-use of the word "or" and too many adjectives can be giveaways, according to Aldert Vrij's book, "Detecting Lies and Deceit." SAS says its software can also be used to detect inaccuracies in resumes and job applications. (Financial Times 20 Jan 2002)

Security Wire Digest 4 5

ENRON SCANDAL PUTS FOCUS ON FORENSICS
Computer forensics will likely play a significant role in Congress' investigation into the financial collapse of Enron, since the bankrupt energy giant's accounting firm--Arthur Andersen--admitted destroying several potentially incriminating documents--including many e-mails and computer files. Authorities believe that at least some of the destroyed documents could help explain how Andersen could have approved several off-the-books partnerships--which hid billions in Enron debt--and are at the heart of the debacle. Enron has since fired Arthur Andersen. "Computer forensics is going to be very important in this investigation," says John Patzakis, president and general counsel for Guidance Software, maker of the EnCase forensics application. "There is so much that you can learn about a system, such as how it's been used. Even if these files are completely deleted, there's still a lot of information that can be gleaned, including when the deletions occurred."

NEW OFFICIAL SELF-SERVICE LITIGATION SYSTEM AVAILABLE IN ENGLAND/WALES

UK lawyer Tony Ford discusses a report in the Daily Telegraph about a new online litigation service, "Money Claim Online," in England and Wales. Through this service ordinary citizens can contest cases online, where the amount in dispute is less than 100,000 UK pounds. Legal proceedings are conducted and judgments are passed through a Web browser. Tony Ford worries about the lack of identity authentication of the parties using this service. He is also concerned about "other gross miscarriages of justice". In response, contributor Robin Crorie points out that "Money Claim Online" is service that has actually been offered for at least two years. He notes that in both "Money Claim Online" as well as its physical analogue, there are no identity checks of the parties in contest.

MICROSOFT TRACKS USERS' SONGS, MOVIES
The newest version of Microsoft's MediaPlayer software, which comes free with the Windows XP operating system, is designed to create a log of the songs and movies that users play. When a CD or DVD movie is played, the MediaPlayer 8 software stores that information in a file on the user's PC, in addition to transmitting an identifier number unique to each user on the computer. That function creates the possibility that information on user habits could be tracked and sold for marketing purposes. Privacy experts say the log file could be used by investigators, lawyers, snooping family members, or companies interested in finding out an individual's personal entertainment habits. Microsoft said the program creates the log so that a user does not have to repeatedly download the same track, CD or movie information, and that the ID number was created simply to enable MediaPlayer users to have a personal account on the Web site dealing with software. The company says it has no plans to share that information with others. (AP/Miami Herald 21 Feb 2002)

HIDING ON THE INTERNET
Terrorist groups are known to be heavy users of the Internet, so why isn't it easier to trace their whereabouts? David Lang, a computer forensics expert, explains: "The Internet presents two main challenges. One is it's ubiquitous -- you can access it from just about anywhere in the world. The other thing is you can be easily hidden." Terrorists capitalize on the first of those features by using Internet cafes and anonymous public kiosks to send mail, and exploit the second feature by making good use of encryption . One interesting fact is that terrorists don't seem to need the services of sites like Anonymizer.com that specialize in helping people send messages without revealing their identities. Lance Cottrell of Anonymizer points out the tension that exists between privacy and security: "That's kind of the irony in this. For the honest good citizen, privacy is extremely endangered and tracking is ubiquitous. But I don't see a sign that we've ever been able to build a system that criminals with serious intent haven't been able to circumvent." (New York Times 28 Mar 2002)

RISKS 22 05

Merlyn Kline contributed this Orwellian note to RISKS:

According to the UK broadsheet *The Independent*, Dr Sergio Velastin, of Kingston University's Digital Imaging Research Centre, has developed software to analyse CCTV images for the purpose of predicting crime:

http://news.independent.co.uk/uk/crime/story.jsp?story=287307

Quote from the article:

Scientists at Kingston University in London have developed software able to anticipate if someone is about to mug an old lady or plant a bomb at an airport. It works by examining images coming in from close circuit television cameras (CCTV) and comparing them to behaviour patterns that have already programmed into its memory. The software, called Cromatica, can then mathematically work out what is likely to happen next. And if it is likely to be a crime it can send a warning signal to a security guard or police officer.

2002-06-06 **Carnivor ISP Internet service provider e-mail traffic surveillance investigation technology wiretaps flaws court order bungled**

RISKS 22 11

The Electronic Privacy Information Center (EPIC) received information under a court order that revealed that the FBI's "Carnivore" software was misconfigured during an attempt to monitor traffic relating to Osama bin Laden. The resulting tide of unwanted information, including e-mail for unauthorized targets, so upset the FBI operative that he destroyed the entire run of data. A commentary by EPIC noted, "Since its existence became public in 2000, the Carnivore system has been criticized by EPIC and other privacy groups, as well as members of Congress, because it gives the FBI unprecedented, direct access to the data networks of Internet service providers. The FBI has publicly downplayed the system's potential for over-collection of private communications, although internal documents released earlier to EPIC confirmed such a risk. An independent review of Carnivore commissioned by the Justice Department also found that the system is capable of 'broad sweeps' and recommended technical changes to address the problem. Neither DOJ nor the FBI has indicated publicly whether those recommendations were ever implemented."

PEOPLE SAY THE DARNDEST THINGS IN E-MAIL
In recent investigations e-mail is playing an increasingly pivotal role in producing criminal evidence. In the kidnapping and murder case of Wall Street Journal reporter Daniel Pearl, investigators used e-mail from his abductors to track them down, and anti-American sentiments voiced in messages from Taliban convert John Walker Lindh and shoe bomb suspect Richard Reid to their mothers were gathered as evidence against them. Closer to home, Merrill Lynch analysts indiscreetly derided stocks as a "disaster" or a "dog" in e-mail while publicly touting them to investors. "It's like the gift that keeps on giving," says a California deputy attorney general. "People are so chatty in e-mail." And e-mail seems to linger forever -- or at least until the space occupied by deleted files is overwritten with new information. "The best way to get rid of computer data is to take the hard drive and pound it with a hammer and throw it in a furnace," says the head of a forensic software company. And even that might not work -- those messages may still be stored on a corporate or ISP server, or on the recipient's computer. "E-mail has become the place where everybody loves to look," says Irwin Schwartz, president of the National Association of Criminal Defense Lawyers. (AP 15 Aug 2002)

2003-01-13 **law enforcement databases name matching foreign spellings**

NewsScan

WHAT'S IN A NAME?
Everyone from the FBI to financial firms is struggling to keep track of an increasing number of individuals with foreign (non-European) names that may be spelled in several different ways in different databases. The issue of name-matching has become particularly acute now that the U.S. government is attempting to track visitors with a Middle Eastern background — as an example, a visit to Google produces some 50 different spellings of Mohmmar Qadaffi (or is it Muammar Gaddifi?). In response software firms are racing provide effective tools for foreign-name searches. "Last year was our best ever," says the CEO of Language Analysis Systems, which provides foreign-name searching and recognition products. While 75% of the company's business comes from the U.S. government, it's also seen increased interest from banks, airline reservation systems and data-mining companies. Language Analysis recently paired up with Basis Technology to offer the government a product called Cartouche — a name-matching system for searching and retrieving names across multiple languages. Basis CEO Carl Hoffman has urged the government to adopt Unicode-compliant systems, which would make it possible to display and process foreign names, not only as they appear in the English alphabet, but also as they appear in their native scripts. 2003-05-30 **log file virtual operating system replay attack digital forensics recovery computer crime**

NewsFactor Network
http://science.newsfactor.com/story.xhtml?story_title=Virtual_Time_Machine_May_Foil_Hackers&story_id=21642#story-start

Prof. Peter Chen of the University of Michigan has proposed using a virtual machine called ReVirt to log all significant events to disk, permitting not only reversion to any given point in time, but also replay of the events in a computer attack. Chen estimates that a 100GB hard disk could easily store several months worth of log files with minimal overhead. Chen and his colleagues published an article with the following abstract <
http://portal.acm.org/citation.cfm?id=844148&jmp=citings&coll=GUIDE&dl=ACM > :

Current system loggers have two problems: they depend on the integrity of the operating system being logged, and they do not save sufficient information to replay and analyze attacks that include any non-deterministic events. ReVirt removes the dependency on the target operating system by moving it into a virtual machine and logging below the virtual machine. This allows ReVirt to replay the system's execution before, during, and after an intruder compromises the system, even if the intruder replaces the target operating system. ReVirt logs enough information to replay a long-term execution of the virtual machine instruction-by-instruction. This enables it to provide arbitrarily detailed observations about what transpired on the system, even in the presence of non-deterministic attacks and executions. ReVirt adds reasonable time and space overhead. Overheads due to virtualization are imperceptible for interactive use and CPU-bound workloads, and 13—58% for kernel-intensive workloads. Logging adds 0—8% overhead, and logging traffic for our workloads can be stored on a single disk for several months.

For another summary of the system, see Kim Roth's article, "Virtual Replay" in the _Michigan Engineer_ [Fall/Winter 2003] at < http://www.engin.umich.edu/alumni/engineer/03FW/feature/ >.

2003-06-04 **research NSA National Security Agency supercomputing problems computational analyze intelligence data Perntagon aircraft ships nuclear**

NIPC/DHS

June 04, National Journal — Security officials urge more research into supercomputing.

The nation's investment in supercomputing research and development has played a crucial role in national security, but more investment is needed to resolve numerous computational problems, a key National Security Agency (NSA) official said on Wednesday. George Cotter, chief of NSA's Office of Corporate Assessments, told attendees of an Army High-Performance Computing Research Center luncheon that the conclusion of a congressionally mandated study on high-end computing R&D determined a need for faster computing to enable the military to create better weapons, aircraft and ships, as well as to improve the nation's ability to monitor its nuclear-weapons stockpile. Faster computers also are needed to analyze intelligence data and build better mapping capabilities for the military, he said. The center has received $4 million in research funding annually over the past two years from the Army as the Pentagon decided to increase its focus on using supercomputing for military purposes. The program was initiated in 1990.

2003-08-22 **crime fight computer database check fraud**

NewsScan

DATABASE TO FIGHT FINANCIAL CRIME

Banks throughout the Midwest U.S. can make use of a computer database called FinCrime that allows financial institutions and law enforcement to share information about crimes and provide warnings. Once check fraud or some other financial crime is committed, bankers and law enforcement personnel can enter information about the crime and the suspect into the database. FinCrime looks for matching information. "Obviously the more participants we have, the more data we can gather in this electronic database, the more valuable it's going to be for participants," said John Sorensen, president and chief executive of the Iowa Bankers Association. "We're trying to expand it widely and keep the cost of participation at either nothing or very small costs... One of the unique things about our network is that it's going to be owned by state banking associations and that it will be provided really as a service as members of these state banking associations," Sorensen said. UK: VITAL E-CRIME EVIDENCE OFTEN DESTROYED

Contributor Keith A. Rhodes presents an article from vnunet.com. The article states that some companies in the UK maybe destroying digital evidence on their systems while investigating cyber crimes before ringing for law enforcement help. The article reports that Len Hynds, the Detective Chief Superintendent of the National High Tech Crime Unit (NHTCU) said that there was a need to "…develop common standards in terms of dealing with high-tech crime between the private and public sectors." Michael Colao, a consultant, said: "What we see is well-meaning IT professionals going in and doing what you see on every bad crime film: they muddy the waters… You need a professional computer forensic team in there as soon as possible."

2004-03-01 **forensics police lab video separation manipulation**

NewsScan

FORENSIC VIDEO

In Allegheny County, Pennsylvania, a police forensics lab is able to separate individual feeds from dozens of cameras that record on the same tape or disc and can stabilize images from shaky cameras and adjust the brightness and contrast. The techniques are similar to ones used by authorities in Florida to examine videotape from a car wash in Sarasota and help track down a man accused of abducting and killing an 11-year-old girl. But one of the officers in the Allegheny County lab cautions: "This is not a magic wand. There's a lot we can do with video and digital images, but there are still limitations." For example, although a surveillance camera outside a Pittsburgh job center captured the perpetration of a murder, police were unable to enhance the images enough to get a clear picture of the killer, causing one of the police offers to complain: "Frustrating isn't the word. You can see some facial features, his shoes, his distinct clothing, but it's just not enough." (AP/USA Today 1 Mar 2004)

2004-04-01 **Massachusetts open-standards open-source IT contract**

DHS IAIP Daily; http://www.govtech.net/news/news.php?id=89839

April 01, Government Technology — Massachusetts awards first open-standards IT contract.

This week the state of Massachusetts acquired its first information technology (IT) services under its new open-standards policy. The Executive Department Legal Counsel's Virtual Law Office (VLO) will be developed using open-standards and open-source components. Similar to systems utilized by large private law firms, the VLO will deliver sophisticated content management, legal case management and new reporting tools. The contract award is expected to result in savings to the state both through more efficient management of legal services and outright ownership of the software code. Typically, state government would pay initial and ongoing licensing fees for new software. "The new open-standards policy is resulting in fair and open competition," said Administration and Finance Secretary Eric Kriss. "Out of the gate, this policy is having a positive impact on the state's bottom line."

DHS IAIP Daily; http://www.news−medical.net/view_article.asp?id=1185

May 03, inpharma.com — Database to help identify counterfeit pharmaceuticals.

The Food and Drug Administration (FDA) is planning to create a database of the major pharmaceutical brands on the U.S. market, to make it easier to establish the authenticity of suspect products and identify counterfeit versions that enter the supply chain. The agency's Cincinnati-based Forensic Chemistry Centre (FCC) will establish a Counterfeit Analysis Work Group that will compile and maintain the database, which will contain frequently-updated information on both authentic brands and counterfeit versions of drugs. The group will put together a checklist that will be sent to all pharmaceutical companies selling products in the U.S., requiring them to provide the FCC with certain information about their brands to help ensure their authenticity. It will also create a database of authentic dosage forms for drugs. According to World Health Organization estimates, counterfeit medicines comprise six percent of the world market.

DHS IAIP Daily; http://www.fcw.com/geb/articles/2004/0524/web−texwire−05 −24− 04.asp

May 24, Federal Computer Week — Wireless to help Garland police.

The Garland, TX, police department will be the first local users of a new wireless network for first responders that is able to transmit voice and data at least 20 times faster than the city's old network. The deployment of the network will start with the city's 290 police officers, including the mobile data terminals in 80 squad cars. City officials are starting with data on the new network, using it as part of the Computer Automated Dispatch system to transmit 911 calls, alarms, report management, graphics and mug shots to the mobile units, said Darrell McClanahan, Garland's telecommunications manager. "This is an important milestone in fulfilling our city's communications vision for a fully converged high-speed data, voice and video network over which police, fire, emergency medical personnel and, eventually, all city employees will be interconnected in real time," McClanahan said.

2004-10-18 **privacy identification printers**

NewsScan; http://news.bbc.co.uk/2/hi/technology/3753886.stm

EACH PRINTER CARRIES UNIQUE SIGNATURE

It turns out that every printer leaves a unique "intrinsic signature" on all the documents it produces, enabling law enforcement officials to track down printers used to make bogus bank notes, fake passports or other important documents. In a test, a research team from Purdue University was able to identify the correct printer more than 90% of the time. The signature derives from the way different printers lay down ink in distinct bands that can be spotted by image processing software. "We extract mathematical features, or measurements, from printed letters, then we use image analysis and pattern-recognition techniques to identify the printer," says Purdue professor Edward Delp. The research has been focused on identifying laserjet signatures, but the researchers are now turning their attention to inkjet printers as well.

NewsScan;
http://www.cbc.ca/story/arts/national/2004/11/23/Arts/artcomputer041123.html

COMPUTER AUTHENTICATION OF ARTWORKS

Computer scientists at Dartmouth College have developed a new mathematical process of authenticating art using high-resolution digital photos and complex computer analyses to map out the idiosyncrasies of an artist's unique pen and brush stokes for comparison with other artworks. The process replicated the work of human authenticators when it was used to analyze works by artists Pieter Bruegel the Elder and Perugino. Dartmouth professor Hany Farid, co-director of the project, says: "What we've tried to do is capture certain mathematical properties of an artist in terms of their underlying style, properties almost certainly not visible to human eyes." But he emphasizes that the process is meant to be an additional tool, and not a replacement for the traditional means of authenticating artworks: "It's simply another tool that is contributing to the dialogue of art authenticating." NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A30161-2004Dec2.html

THE SEARCH SOFTWARE USED BY THE IN-CROWD

Analysts working for U.S. intelligence and other federal agencies looking for documents and data stored on computers inside their own agencies they use software made by the Convera Corp. in Virginia, which offers specialized services and offer such features as the ability to automatically notify intelligence analysts when a new document matching a search query is added to the agency's database, and to search for patterns within data, identifying relationships buried in mountains of separate documents. Helen Mitchell, head of enterprise search for the FDA, says: "Before, people couldn't find everything if things were misfiled or they didn't have the time or resources. With the Convera software, and the technology for searching documents and patterns, they can find documents even with misspellings." Convera plans to make its Internet search engine available to regular computer users for free sometime next year. (Washington Post 4 Dec 2004)

2004-12-05 **cyber detectives DePaul University Chicago computer scientists pattern-recognition algorithm software crime detection neural network link CSSCP**

DHS IAIP Daily; http://www.newscientist.com/news/news.jsp?id=ns99996734

December 05, New Scientist — Cyber detective links up crimes.

Computer scientists Tom Muscarello and Kamal Dahbur at DePaul University in Chicago have developed an artificial intelligence system that uses pattern-recognition software to link related crimes that may have taken place in widely separated areas whose police forces may rarely be in close contact. Called the Classification System for Serial Criminal Patterns (CSSCP), the system sifts through all the case records available to it, assigning numerical values to different aspects of each crime, such as the kind of offense, the perpetrator's sex, height and age, and the type of weapon or getaway vehicle used. From these figures it builds a crime description profile. A neural network program then uses this to seek out crimes with similar profiles. If it finds a possible link between two crimes, CSSCP compares when and where they took place to find out whether the same criminals would have had enough time to travel from one crime scene to the other. In the UK an online version of a manually searchable crime database called Crimelink was launched this week.

NewsScan; http://www.latimes.com/technology/la-na-fbi13jan13

SECURITY IV: NEW FBI SOFTWARE NOT USABLE

A new FBI computer system called Virtual Case File, designed to help agents share information to ward off terrorist attacks, may have to be discarded because it doesn't work as designed. The agency will be soliciting proposals for new software from outside contractors for new software. Sen. Judd Gregg (R-N.H.), chairman of the Senate appropriations subcommittee, calls the development "a stunning reversal of progress" and adds: "If the software has failed, that sets us back a long way. This has been a fits-and-starts exercise, and a very expensive one for a very long time. There are very serious questions about whether the FBI is able to keep up with the expanding responsibility and the amount of new dollars that are flowing into it. We have fully funded it at its requested levels." Science Applications, the company that developed the system, says it "successfully completed" delivery of the initial version of the Virtual Case File software last month. 2005-01-18 **FBI Carnivore eavesdrop**

NewsScan; http://apnews.excite.com/article/20050119/D87MS3CO0.html

FBI AXES CARNIVORE, EATS INVESTMENT

The FBI has abandoned its custom-built Internet surveillance technology, dubbed Carnivore, and is now using commercial software to eavesdrop on computer network traffic during investigations of suspected criminals, terrorists and spies. In addition, it's asking Internet service providers to conducting wiretaps on targeted customers, when necessary. Carnivore initially was developed because commercial tools available in 2000 were inadequate, but FBI spokesman Paul Bresson says the Bureau moved a while ago to using popular commercial wiretap software because it's less expensive and has improved in its ability to copy e-mails to and from a specific Internet account without affecting other subscribers. "We see the value in the commercially available software; we're using it more now and we're asking the Internet service providers that have the capabilities to collect data in compliance with court orders," says Bresson. The FBI didn't disclose how much it had spent on Carnivore, but outside experts estimate expenditures at somewhere between $6 million and $15 million. (AP 18 Jan 2005)

DHS IAIP Daily; http://www.usatoday.com/tech/products/software/2005−01−20−ar abic−scans_x.htm

SOFTWARE WOULD SCAN ARABIC DOCUMENTS FOR INFORMATION

Computer scientists are at work on software to scan Arabic documents, even handwritten ones, for specific words or phrases, technology its developers say could aid in intelligence gathering. Researchers at the University of Buffalo have received $240,000 in funding from the federal Director of Central Intelligence Postdocotoral Research Fellowship Program. Optical character recognition (OCR) software trains the computer to interpret the images of an alphabet based on scanned images of characters or words recorded by humans who have examined the original images. Arabic presents challenges because characters may take different forms depending on where within a word they appear, and Arabic vowels are pronounced but often not written.

EDUPAGE; http://news.com.com/2100-1012_3-5730176.html

UNIVERSITY RESEARCHERS DEVELOPING BROWSER TO FIGHT TERRORISM

Researchers at the University of Buffalo (UB) are developing browser technology that endeavors to identify hidden connections in vast collections of documents. Rather than simply looking for matches to specified query terms, which is what typical search engines do, the UB technology seeks to uncover connections between ideas. According to John McCarthy, professor emeritus of computer science at Stanford University, a tool that successfully links concepts could be an important breakthrough. A number of federal agencies, including the Federal Aviation Administration (FAA), are investing in the research, which they hope can be used to find the sorts of connections that will aid efforts to fight terrorism. The project has been used to search the report from the 9/11 Commission as well as public Web pages, looking for connections regarding the hijackers. The tool searches for concepts such as names, dates, and places and maps the connections it finds, potentially resulting in trails of evidence useful to investigators or other authorities. DHS IAIP Daily; http://www.eetimes.com/news/latest/technology/showArticle.jhtml?articleID=165600118

U.S. AIR FORCE TAPS SECURE ULTRAWIDEBAND

Sandia National Laboratories has combined ultrawideband (UWB) radio signals with advanced encryption techniques to develop a secure sensor and communications network for the U.S. military. The ultrasecure UWB communication system promises to help the government protect its troops on the battlefield by detecting the position of enemies and by making it much harder for them eavesdrop or jam military communications. "By utilizing the immense spectrum of UWB to spread the energy of communications signals from sensors over a wide frequency spectrum, the signal power falls below the noise floor of normal receivers," said Sandia National Laboratories researcher Timothy Cooley. Also known as "impulse radio," ultrawideband radio transmissions smear a wide spectrum with short, 100-picosecond pulses that are below the noise floor of conventional radio receivers. Even if enemies were equipped with a special UWB receiver, they would be unlikely to know how to reassemble the disparate data packets of each impulse into a coherent whole. And even if they should manage to reassemble the packets, they would still have to crack the 256-bit AES encryption used by Sandia's special secure military communications version. The sensor and communications networks are being developed for the U.S. Air Force Electronic Systems Center.

DHS IAIP Daily; http://www.theregister.co.uk/2005/07/10/london_bomb_

UK POLICE REQUEST PICTURES, E-MAIL, PHONE RECORDS IN BOMBER HUNT

London police have asked the public to turn in pictures from mobile phones and video pictures as they hunt the terrorists behind the bomb attacks on the UK capital Thursday, July 7. The call came as Britain's authorities sought to secure email and mobile phone records as they continue their hunt for the bombers. Much of the media networks' coverage of the bombings came from stills and video captured on camera phones and other mobile devices. London's Metropolitan Police on Sunday asked people who captured images on Thursday, both before and after the bombings, and either in or close to the areas where the bombings happened, to forward them to images@met.police.uk. "These images may contain crucial information which could help detectives in what is a painstaking and complex inquiry," said the head of the Met's Anti-Terrorist Branch, Deputy Assistant Commissioner Peter Clarke.

EDUPAGE; http://news.zdnet.com/2100-1009_22-5798787.html

BRITAIN TO TRACK, CONTROL TERRORIST WEB SITES

Following recent terrorist attacks on London's public transit system, the British government announced plans to tighten oversight on people who run Web sites inciting terrorism. In speaking to Parliament on July 20, Home Secretary Charles Clarke acknowledged that the government would have to "tread carefully" around free speech in instituting changes to the national security policies. Clarke said he intends to draw up a list of unacceptable behaviors, such as preaching, running Web sites, or writing articles intended to provoke terrorism. The Foreign and Commonwealth Office and intelligence agencies will be instructed to build a database of people who provoke terrorism. Immigration officers will have access to the database, and the government is planning changes to the law to make it easier to deport religious extremists whose behaviors meet the revised policies. NEW GERMAN REGISTRATION SYSTEM CAUSES CHAOS

…[T]he [German federal] registration offices bought themselves some brand-spanking-new software. All people living in Germany must register their address and the names of people who live with them with this office (which is part of the police jurisdiction) inside of a week of moving into town. The police use the data for all sorts of purposes.

They cut over to the new system October 4, and the police suddenly discovered that they were offline - their systems did not work anymore, probably because the API was different. The police had to set up emergency computers directly linked to the official system and have police officers in the field *call in* their requests. Result: the line is always busy. But of course, there is no threat to the general public, just nasty waiting for the police….

The registration office was pointing the finger at the police, saying they had known for a year that this was coming. Then people called the papers complaining that waiting times at the office - which also issues passports and ID cards and the like - had gone from an hour to FOUR hours.

The official excuse is that clerks were not sufficiently trained in the use of the 23 million Euro software called "Meso". And they insist that the waiting time is "only" doubled, not more. They request the good taxpayers who paid for the software to just stay home and not bother them until they get the kinks worked out - really, one office gave out a press release to just leave them alone!

An added problem is that many people are trying to apply for new passports because from December on people have to pay more for them because they have to have RFID chips with biometric data stored in them so that the US government is appeased and will still let Germans in without visas…..

2005-11-30 **study wiretap telephone wiretapping interception evasion security flaw privacy government agencies FBI legal ramifications**

DHS IAIP Daily; http://www.nytimes.com/2005/11/30/national/30tap.html

SECURITY FLAW ALLOWS WIRETAPS TO BE EVADED, STUDY FINDS

The technology used for decades by law enforcement agents to wiretap telephones has a security flaw that allows the person being wiretapped to stop the recorder remotely, according to research by computer security experts who studied the system. It is also possible to falsify the numbers dialed, they said. Someone being wiretapped can easily employ these countermeasures with off-the-shelf equipment, said the lead researcher, Matt Blaze, an associate professor of computer and information science at the University of Pennsylvania. "This has implications not only for the accuracy of the intelligence that can be obtained from these taps, but also for the acceptability and weight of legal evidence derived from it," Blaze and his colleagues wrote in a paper that was published Wednesday, November 30, in Security & Privacy, a journal of the Institute of Electrical and Electronics Engineers. To defeat wiretapping systems, the target need only send the same "idle signal" that the tapping equipment sends to the recorder when the telephone is not in use. The target could continue to have a conversation while sending the forged signal. Despite this, the FBI says the vulnerability exists in only about 10 percent of state and federal wiretaps today. "Signaling Vulnerabilities in Wiretapping Systems" by Blaze, et al: http://www.crypto.com/papers/wiretapping/

COURT RULES AGAINST POLICE IN INTERNET "ENTRAPMENT" CASE
A majority of a three-judge U.S. appellate court panel . . . ruled against the use of the Internet to entrap an individual into committing sex offenses. After being divorced by his wife because he could not control his compulsion to cross-dress, the individual in question began to use the Internet to search for a woman who would accommodate his sexual tastes. He entered into correspondence with someone called Sharon, who tuned out to be an undercover police investigator, who suggested the idea of having sex acts with her children. The man was arrested when he showed up at a meeting place to carry out the plan. The court ruled: "Prior to his unfortunate encounter with Sharon, [the man charged for attempting to have sex with minors] was on a quest for an adult relationship with a woman who would understand and accept his proclivities, which did not include sex with children. There is surely enough real crime in our society that it is unnecessary for our law enforcement officials to spend months luring an obviously lonely and confused individual to cross the line between fantasy and criminality." ENCRYPTION AND ORGANIZED CRIME [30 Jul 2001]
When Phil Zimmerman created the encryption software known as PGP ("Pretty Good Privacy") he knew that his program would be used not only by honest citizens but also by criminals, and he says "I felt bad about that," but notes that "the fact that criminals use cars doesn't mean that the rest of us shouldn't have cars." Criminal use of PGP is now being examined in a federal case against Nicodemo S. Scarfo Jr., accused of running gambling and loan sharking operations for the Gambino crime family. The defendant's lawyers are arguing that federal law enforcement officials acted unconstitutionally when they evaded the privacy protections of PGP by surreptitiously installing on Scarfo's personal computer some technology that recorded every keystroke made, including his password. Their position is that this action amounted to a wiretap, for which they should have obtained a special court order, called a "Title III" order. But assistant U.S. attorney Ronald Wigler says that "letters do not become 'electronic communications' subject to Title III merely because they happen to have been typed on a computer." (New York Times 30 Jul 2001)
http://partners.nytimes.com/2001/07/30/technology/30TAP.html

PRIVACY ADVOCATES OBJECT TO "KEY LOGGING" TECHNOLOGY [14 Aug 2001]
Privacy advocates are strenuously criticizing the use by federal law enforcement officials of "key-logging" technology to monitor the communications of "Little Nicky" Scarfo, a reputed Philadelphia mob boss. Rather than obtain a court-approved wiretap order, the officials used a simple search warrant (much easier to obtain) in order to plant on Scarfo's computer a yet-to-be-explained technology that monitors every keystroke, including e-mail. Mark Rasch of the security consulting firm Predictive Systems says: "The logical consequence of the government's argument is that the government will never need to get a wiretap order for a computer. With the technology that's available today, the government can remotely install software on a computer to capture all keystrokes and transmit that report to its agents in real time." (Washington Post 14 Aug 2001)
http://washingtonpost.com/wp-dyn/articles/A55606-2001Aug9.html

FBI TARGETS SUSPECTS' PCs WITH SPY VIRUS [21 Nov 2001]
The FBI is working on software that could insert a computer virus into a suspect's computer capable of reading encrypted data. The software, known as "Magic Lantern," installs "keylogging" software that can capture keystrokes typed on a computer. The virus can be sent via e-mail and once on the targeted PC, it waits for a suspect to launch the Pretty Good Privacy encryption program and then logs the passphrase used to start the program, essentially giving agents access to the keys needed to decrypt files. The Magic Lantern software is part of the FBI's "Enhanced Carnivore Project Plan," which operates under the umbrella project name of Cyber Knight. Electronic Privacy Information Center attorney David Sobel says privacy issues arise when keylogging results in "overly broad" searches, since it would be possible to observe every keystroke typed by the suspect, even if a court order specified only encryption keys. The FBI has already used a less-sophisticated version of the software to build the high-profile racketeering case against Nicodemo Scarfo, but had to manually turn the system on and off in order to comply with the court order. (MSNBC/Wall Street Journal 21 Nov 2001) http://interactive.wsj.com/articles/SB10062942834030720.htm (sub req'd)

FBI CONFIRMS DEVELOPMENT OF KEYSTROKE-CAPTURING EAVESDROP TECHNOLOGY [12 Dec 2001]
The FBI has confirmed that it has under development a technology that could use the Internet to plant Trojan Horse software in a criminal or terrorist suspect's PC that would capture passwords to access the suspect's e-mail and other documents. An FBI official said, "Like all technology projects or tools deployed by the FBI it would be used pursuant to the appropriate legal process." (Reuters/Yahoo 12 Dec 2001)

DO THE POLICE NEED A COURT ORDER TO INSPECT A SUSPECT'S E-MAIL?
In a case involving the admissibility of Internet evidence used to convict he a man for solicitation of a 15-year-old girl he met in a chat room, the Pennsylvania Supreme Court will decide whether police authorities need a court order (as they would if they wanted to set up a telephone wiretap operation) before looking at a suspect's e-mail and instant messages. The lower court took the position that the wiretapping law did not apply because the police did not intercept the messages but looked at them after they had been received, and it suggested that the defendant had given implied consent to the inspection of his messages: "Any reasonably intelligent person, savvy enough to be using the Internet, would be aware that messages are received in a recorded format, by their very nature, and can be downloaded or printed." INTERNET GROUPS SAY THEY DON'T WANT POLICEMEN IN THEIR LOBBIES
Internet service providers and trade groups have gone to a federal appeals court to protest another court's requirement that police officers be physically present when search warrants are conducted to find electronic messages or files. The groups argue that the requirement creates a "chilling effect" on a company's subscribers without accomplishing anything good: "The police officer waiting in the lobby while the technician works away on the computer does not in any way safeguard anyone's Fourth Amendment rights." Besides, it would be burdensome and disruptive: "A large Internet service provider can receive literally hundreds of search warrants and other requests for information during the course of a year. It is entirely possible that at any given time a dozen or more law enforcement officers would be on the premises of given service provider." (Reuters/San Jose Mercury News 13 May 2002)

GOVERNMENT, INTERNET BIZ FIGHT TERROR
In the seven months since the passage of a sweeping law to combat terrorism, Internet and telecommunications companies have seen a surge in law enforcement requests to snoop on subscribers. Privacy advocates fear that expanded police power under the [U.S.A.P.A.T.R.I.O.T.] Act - combined with lax oversight and increased cooperation between the government and private sector phone network and Internet gatekeepers - may be stomping on civil liberties. The new laws do not apply just to terrorism but to other crimes as well.

IS BROADBAND A TELECOM SERVICE -- OR AN INFO SERVICE?
The answer to that question will make a lot of difference, especially to the FBI and the Justice Department, which rely on a law requiring "telecommunications" services to be designed in a way that would allow law enforcement officials, with a court order, to monitor activity of suspected criminals or terrorists; in contrast, there is no such requirement for "information services." So the Federal Communications Commission will be asked to determine that electronic-surveillance access rules also apply to the broadband information offerings of phone and cable companies. HOUSE APPROVES LIFE SENTENCES FOR CRACKERS
The U.S. House of Representatives has approved the Cyber Security Enhancement Act (CSEA) by a near-unanimous vote. Among the Act's provisions are an expansion of police ability to conduct Internet or telephone eavesdropping without first obtaining a court order, and the approval of life prison sentences for malicious computer hackers (crackers) whose acts "recklessly" put others' lives at risk. In the case of wiretaps, the Act would permit limited surveillance without a court order when there is an "ongoing attack" on an Internet-connected computer or "an immediate threat to a national security interest." The surveillance would be limited to collecting a suspect's telephone number, IP address, URLs or e-mail header information -- not the content of an e-mail message or phone conversation. In addition, the Act would permit ISPs to disclose the contents of e-mail messages and other electronic records to police in cases when "an emergency involving danger or death or serious physical injury to any person requires disclosure of the information without delay." The Act is not expected to meet any serious opposition in the Senate. (CNet News.com 15 Jul 2002)

TWO JUDGES REJECT FBI TESTIMONY IN INTERNET PORN CASES
Federal district judges Denny Chin in New York and Catherine D. Perry in St. Louis have rejected evidence obtained by FBI agents who claimed falsely that anyone signing up with the child porn site "Candyman" would automatically receive child porn images from other site members. Later, the agents admitted that people signing up for the group had the ability to opt out of the member mailing list and therefore did not necessarily receive pornography through that list. Judge Chin wrote: "If the government is correct in its position that membership in the Candyman group alone was sufficient to support a finding of probable cause, then probable cause existed to intrude into the homes" of thousands of people who had merely logged onto that Web site. "Here, the intrusion is potentially enormous. Thousands of individuals would be subject to search, their homes invaded and their property seized, in one fell swoop, even though their only activity consisted of entering an e-mail address into a Web site from a computer located in the confines of their homes." ONLINE WIRETAPPING POSES LEGAL, TECHNICAL OBSTACLES
As the Internet telephony market expands, law enforcement officials are facing both legal and technical hurdles as they seek to block the emerging services from becoming a haven for criminals and terrorists. The FBI wants regulators to affirm that tapping into Voice over Internet Protocol (VoIP) networks is covered under the 1994 Communications Assistance for Law Enforcement Act, and is also pushing the industry to create technical standards that would make such wiretaps easier and cheaper. Because VoIP is so new, standards don't yet exist for setting up networks, but several groups, including the Telecommunications Industry Association, are working on them. "We're seeing major changes in the network, and we are trying to be ahead of the curve," says the FBI's unit chief for electronic surveillance. Privacy advocates, on the other hand, fear that because of the nature of the technology, tapping into the data stream for voice would also possibly retrieve more than what the court ordered, including people's e-mail and other digital communications. BROUHAHA OVER ENCRYPTION AS EVIDENCE OF ILL-INTENT

An eruption of emotion resulted when a Minnesota judge ruled that the presence of encryption software on the computer of a man accused of child abuse (soliciting a minor for lewd photographs) was relevant to the prosecution's case. Although one can reasonably express skepticism about the wisdom of the court's ruling or question their understanding of the availability and acceptance of encryption software, some people responded with comically exaggerated emotion. One contributor to RISKS labeled his missive "Encryption Illegal in Minnesota" -- which was plainly nonsense. The summary from _The Register_ was as follows:

>The Minnesota State Court of Appeals has rejected an appeal from David Levie on charges of soliciting a nine-year-old girl to pose for naked pictures, ruling that the prosecution's introduction of an encryption program on his computer as evidence was admissible. During a search of his computer, police found the PGP (Pretty Good Privacy) encryption program. Levie's lawyers argued that forensic examination yielded no evidence of any encrypted files on his computer and so the presence of encryption software should not be used as evidence against Levie. One police officer testified that PGP may be included with every Apple computer on the market. The appeals court ruled that the presence of encryption software was relevant to the prosecution's case and refused to order a retrial, though the case will be sent back for re-sentencing. The case could establish a precedent in Minnesota of accepting the presence of encryption software as evidence of criminal intent.<

EDUPAGE; http://www.nytimes.com/2005/09/10/nyregion/10library.html

FBI LOSES ROUND ONE

A federal judge has handed the FBI a preliminary defeat in its efforts to continue to suppress information about an investigation of a Connecticut institution. The institution, whose identity has been kept confidential under the terms of the USA PATRIOT Act, and the American Civil Liberties Union (ACLU) sued the FBI for the right to disclose the institution's identity. Judge Janet C. Hall agreed with the plaintiffs, saying that under the FBI's position, "the very people who might have information regarding investigative abuses and overreaching are peremptorily prevented from sharing that information with the public." Hall did grant a stay of her ruling, however, giving federal authorities until September 20 to try to persuade the Court of Appeals to overturn the ruling. If the appeals court takes no action by then, the plaintiffs are free to disclose the institution's identity.
Watching the case closely are groups critical of the PATRIOT Act, who have long argued that the law grants federal authorities excessive investigative powers at the expense of civil liberties.

EDUPAGE; http://news.zdnet.com/2100-1035_22-5883032.html

FCC ISSUES VOIP DECISION; QUESTIONS REMAIN

The Federal Communications Commission issued a decision that any voice over Internet protocol (VoIP) provider linked to the public telephone network must comply with a set of rules making it easier for police to seek and obtain wiretaps. The affected companies must meet these requirements by spring 2007. Still undecided is what the Communications Assistance for Law Enforcement Act (CALEA) ruling means for universities, nonprofits, companies, and individuals offering wireless or other forms of Internet access. The regulation is based on the argument that CALEA's definition of "telecommunications carrier" applies to broadband and VoIP providers. The FCC plans to issue another decision on the subject by the end of the year.

UNIVERSITIES RESIST US GOVERNMENT DEMANDS FOR SURVEILLANCE HOOKS

The federal government, vastly extending the reach of an 11-year-old law, is requiring hundreds of universities, online communications companies and cities to overhaul their Internet computer networks to make it easier for law enforcement authorities to monitor e-mail and other online communications. The action, which the government says is intended to help catch terrorists and other criminals, has unleashed protests and the threat of lawsuits from universities, which argue that it will cost them at least $7 billion while doing little to apprehend lawbreakers. Because the government would have to win court orders before undertaking surveillance, the universities are not raising civil liberties issues.

The order, issued by the Federal Communications Commission in August and first published in the Federal Register last week, extends the provisions of a 1994 wiretap law not only to universities, but also to libraries, airports providing wireless service and commercial Internet access providers. It also applies to municipalities that provide Internet access to residents, be they rural towns or cities like Philadelphia and San Francisco, which have plans to build their own Net access networks. So far, however, universities have been most vocal in their opposition.

The 1994 law, the Communications Assistance for Law Enforcement Act, requires telephone carriers to engineer their switching systems at their own cost so that federal agents can obtain easy surveillance access.

2005-10-23 **FCC CALEA ISP higher education libraries expense**

EDUPAGE; http://www.nytimes.com/2005/10/23/technology/23college.html

HIGHER EDUCATION RESPONDS TO CALEA ORDER

The higher education community is preparing several responses to an order by the Federal Communications Commission to extend the provisions of the Communications Assistance for Law Enforcement Act (CALEA) to Internet service providers, including institutions of higher education, libraries, and municipalities that provide Internet access. The order would require covered entities to configure their networks to allow law enforcement officials--with the authority of a court order--to tap into data streams remotely. Currently, such taps typically require the assistance of network personnel. Making networks compliant with the new regulations would in most cases require significant investment in new switches and routers, and higher education officials contend that the expense would not be justified by the number of taps placed on their networks. By some accounts, U.S. colleges and universities would incur costs of at least $7 billion to redesign their networks. Those seeking an exception from CALEA for education noted that in 2003, just 12 of nearly 1,500 wiretap orders were issued for computer networks. Representatives of higher education are working on responses including appeals, possible lawsuits, and negotiations with federal officials. Higher education officials said that the objection is not with providing appropriate assistance to law enforcement but that lower-cost solutions would provide the needed capability without placing a large financial burden on colleges and universities and their students. DHS IAIP Daily; http://www.securityfocus.com/brief/129 23

THREE CHARGED WITH WIRETAPPING, RACKETEERING.

A federal grand jury indicted private investigator Anthony Pellicano and two associates for the alleged illegal use of law enforcement data and wiretapping using a custom software program, prosecutors announced on Monday, February 6. The 110-count indictment charges Pellicano and his associates with creating a criminal enterprise in which the private detective allegedly paid tens of thousands of dollars to police officers to provide him with confidential law enforcement information on numerous individuals. In addition, the indictment charges Pellicano and the two associates -- a software developer and a telecommunications engineer -- with creating a program known as Telesleuth in 1995 and using it as early as 1997 to wiretap such people as Herbalife co-founder Mark Hughes, actor Sylvester Stallone and journalist Anita Busch. Monday's indictment was originally issued under seal on Wednesday, February 1. Among the other charges are 31 counts of wire fraud and five counts of identity theft. Four other defendants were charged wiretapping and wire fraud.

2000-02-07 **budget proposal administration wiretapping law enforcement military telco telephone company**

Wired http://www.wired.com/news/politics/0,1283,34164,00.html, NewsScan, Washington Post http://www.washingtonpost.com/wp-dyn/articles/A32193-2000Aug15.html

In February, the Clinton administration proposed a $1.84T budget fiscal 2001 that would include major increases in spending on law enforcement capabilities such as wiretapping. The government would reimburse telcos to the tune of $240M (up from $15M) under the controversial CALEA (Communications Assistance to Law Enforcement Act) for rewiring their networks to make wiretapping easier.

[However, in August (wrote the NewsScan editors), A three-judge panel of the U.S. Court of Appeals for the District of Columbia . . . ruled that the Federal Communication Commission's attempts to implement a 1994 electronic wiretap law have been too accommodating to law enforcement agencies and not sufficiently protective of the right of citizens to individual privacy or of the financial requirements of companies. The wiretap law (the Communications Assistance for Law Enforcement, or CALEA) was passed by Congress because the FBI had insisted it was losing ground against criminals because wireless phone companies were not designing wiretapping capabilities into their networks. An executive of the Center for Democracy and Technology, which had opposed the FBI's request to Congress, . . . [said] the appellate court's decision means that "government cannot get its hands on what it's not authorized to get just by promising it won't read what it's not supposed to read." January 14, Federal Computer Week — Commerce to fund IT security.

A senior Commerce Department official said funding will be poured into information technology security this year. Michael Sade, director for acquisition management and procurement executive, said the real impact of IT security isn't going to be on the technology side, but on the personnel side — such as ensuring vendors have security clearances. Sade generally spoke about how Commerce officials will better partner on projects with vendors and other government agencies through dialogue. Significant projects underway include modernization of the Patent and Trademark Office and National Weather Service. Commerce has begun making significant IT investment in preparation for the 2010 Census — possibly including the capability of doing surveys through the Web, Sade said. Another growing trend will entail better review of satellite programs in which the department funds projects that are overseen by other departments and agencies.

2004-05-18 **cybercrime law enforcement importance of skills**

DHS IAIP Daily; http://news.zdnet.co.uk/internet/security/0,39020375,3915513 8,00.htm

May 18, ZDNet UK — Skills not money needed to fight cybercrime.

Law enforcement agencies require a bigger pool of skilled investigators and digital forensic experts, not more money or legislation, according to a study by The European Information Society Group (EURIM) that was presented at the House of Commons on Tuesday, May 18. According to the third phase of EURIM's e-crime study, around half the UK population and 10 percent of the world's population has access to the Internet. This means that a large number of criminals also connect to the Internet, which has led to the transfer of traditional crimes to the online world. The problem, said EURIM, is that although cybercrimes are becoming more common, members of the police force and specialist computer crime units lack many of the basic skills required to trace and analyze computer-based crimes. EURIM 's study makes a number of recommendations, one of which is to create specialist academic courses that focus on areas that are currently neglected by schools and colleges.

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1734035,00.asp?kc=ewnws120104dtx1k000 0599

November 30, eWeek — FBI's cyber-crime chief relates struggle for top talent.

The FBI's inability to recruit and keep the best available IT talent has proven to be one of the biggest challenges facing the government's Internet Crime Complaint Center (I3C), a senior official said Tuesday, November 30. Delivering the keynote address on the opening day of Ziff Davis Media's Security Virtual Tradeshow, I3C chief Daniel Larkin said the center's staffing problems underline the need for deeper cooperation between the FBI and the IT industry to win the battle against sophisticated cyber-criminals. "We can't recruit and keep the best available minds in the IT world. They come, stay a few years and move on because, ultimately, we can't pay what the industry pays for talent," Larkin said, adding that the bureau also has experienced difficulties with keeping pace with employees' training needs. Because of those shortcomings, Larkin said, the I3C spent the past four years forging partnerships with the biggest names in the tech industry to share expertise, coordinate on intelligence and develop best practices and protocols for fighting cyber-crime.

NEW JERSEY LAW ENFORCEMENT UNITS COMBINE TO FIGHT COMPUTER CRIME

Three state law enforcement units in New Jersey will combine to fight computer crime. The new Computer Crime Task Force, formed by New Jersey state Attorney General Peter C. Harvey, will include personnel from the Division of Criminal Justice's (DCJ) Computer Analysis and Technology Unit (CATU), the New Jersey State Police Digital Technology Investigations Unit, and the state police Cyber Crimes Unit. The new task force will include three investigative units staffed with state troopers, DCJ investigators, and FBI special agents and will focus on computer hacking and viruses, Internet fraud, and the creation and distribution of child pornography. The Incident Response Unit investigations will focus on computers, computer networks, telecommunication devices, and other devices used in the commission of crimes. It will also provide cyber crime awareness outreach services to the public and train law enforcement regarding network intrusion crimes. The Cyber Crime Unit will investigate the use of computers in fraud and identity theft. A training committee will coordinate community outreach programs. The task force will aim to increase the reporting of cyber crime and computer intrusions. A Computer Crimes Task Force hotline is available at 1-888-648-6007, in addition to an online incident reporting form at http://www.cctf.nj.gov.

21.1 General QA failures

Category 21.1 *General QA failures*

1997-01-08 **QA quality assurance**

PA News

A major stock brokerage in England faced million-pound claims for compensations after its new computer software generated a tide of errors. The errors sparked so many queries that the staff began falling behind in providing responses, leading to an avalanche of customer complaints. The company even had to stop taking on new business.

Category 21.1 *General QA failures*

1997-01-10 **QA**

RISKS 18 75

In Finland, a software error caused the automobile registration system to send out 11,000 erroneous letters threatening to de-register cars because they were supposedly out of use. The embarrassed agency had to send out 11,000 letters of apology.

Category 21.1 *General QA failures*

1997-01-13 **QA quality assurance ticket verification operator error**

RISKS 18 76

You might want to hang on to those "old-fashioned" paper tickets for a while. In a case posted to RISKS in January 1997, Robin Burke reports that his wife was informed that her electronic ticket had been used the week before her confirming phone call. It took several phone calls to prove that she was not trying to defraud the airline. It appears that a data entry operator had incorrectly brought up the wife's record and marked it "used" without noticing the mismatch.

Category 21.1 *General QA failures*

1998-01-06 **QA quality assurance Trojan unauthorized liability tort**

RISKS 19 53

Larry Werring wrote in RISKS FORUM DIGEST that major software manufacturers are permitting appalling lapses of quality assurance by letting their programmers insert unauthorized code into production versions of software. Microsoft EXCEL 97, for example has a flight simulator of sorts that pops up if you press a particular sequence of keys. How much memory and disk space are these Trojans taking up, he asks. [BTW, I tested the EXCEL Easter Egg; it worked but it crashed EXCEL when I pressed the ESC key.]

Category 21.1 *General QA failures*

1998-01-06 **authenticity quality assurance QA design identification**

RISKS 19 53

An anonymous correspondent reported to RISKS that a CVS pharmacy computer program keyed on first and last name as a (falsely) unique identifier. As a result, his prescription would have been assigned to a stranger's record — and in some circumstances (e.g., treatment for HIV infection) such prescriptions would damage insurability.

Category 21.1 *General QA failures*

1998-01-10 **confidentiality reliability personnel hiring background**

RISKS 19 54

ICL, the big high-tech UK company, proposed to hire prison inmates to work on the Y2K problem. Security experts politely pointed to security risks in having such people become intimately acquainted with and even modify internal details of production applications.

Category 21.1 *General QA failures*

1998-03-23 **QA**

Wired

Al Gore's staff used their computer system to send Sen. Daniel Moynihan birthday greetings on 16 March. However, what they actually sent was congratulations on the birth of twins.

Category 21.1 *General QA failures*

1998-03-26 **QA dimension capacity software failure**

EDUPAGE

As if the Y2K problem weren't enough, some analysts were concerned about the likely failure of some financial software incapable of handling a Dow-Jones Industrial Average of 10,000 or more. Seems many programmers limited that field to four digits.

Category 21.1 *General QA failures*

1998-04-09 **QA quality assurance pension fund underpayment blooper bug**

RISKS 19 66

Over the last 20 years, Los Angeles County in California underpaid its employee pension fund because of a programming error. The bill: $1.2B in missing capital.

Category 21.1 *General QA failures*

1998-04-14 **QA quality assurance nuclear facility fissionable uranium**

RISKS 19 67

At Los Alamos National Laboratory, a problem in the software linking a joy-stick to a stepper motor caused a servomechanism to almost slam together two masses of fissionable uranium-235 [these particular U-235 masses would have remained subcritical even if they had slammed together]. The report on the DoE Web site (see <http://tis.eh.doe.gov/web/oeaf/oe_weekly/oe_weekly_98/oe98-12.html>) said, "Engineers troubleshot the control circuitry and discovered problems with the software and flaws in the communication between the joystick controls and the central processing unit. They determined that when the joystick interface did not respond, a subroutine returned an ASCII (American Standard Code for Information Interchange) character "?" to the main program for the potentiometer settings that controlled the stepping motor speed. The main program was never developed to deal with a question mark and translated this value to the number equivalent of an ASCII "?" (the number 63). The number 63 corresponded to a large negative position (beyond closure of the stacks) that caused the stepping motor to drive in at full speed when it was selected for movement." [Moral: design your QA tests to prevent nuclear explosions wherever possible.]

Category 21.1 *General QA failures*

1998-04-21 **QA privacy phones**

EDUPAGE

Southern California customers of GTE who paid to have unlisted numbers were not pleased when 50,000 unlisted accounts were published in detail and sold to telemarketers. The company, facing fines of up to $30,000 per name, blamed the problem on the notorious "computer glitch" which is (judging from its curiously frequent occurrence in critical systems) presumed to be a cybercontruct, possibly extraterrestrial, completely independent of quality assurance procedures. X-files staff members should look into this, as should tort lawyers.

Category 21.1 *General QA failures*

1998-05-10 **QA data corruption quality assurance database codes publish**

RISKS 19 73

Pity Mr Cody Johnston, a commercial trucker in Bozeman, MT. He admittedly broke speeding laws and paid a fine. Unfortunately, the court computer system printed out a list of convictions using erroneous labels for the internal codes and the local newspaper reported his misdemeanor as a sexual deviation charge, which potentially includes homosexuality and bestiality. Mr Johnston sued the court and the newspaper for libel.

Category 21.1 *General QA failures*

1998-05-14 **QA quality assurance software engineering reliability**

EDUPAGE

Salon Magazine, the online source for intellectual discussions of social issues, published an interesting essay by Ellen Ullman, author of _Close to the Machine_ (City Lights Press), describing the poor quality of current software engineering. See <http://www.salonmagazine.com/21st/>.

Category 21.1 *General QA failures*

1998-06-18 **obscenity QA quality assurance program language cursing**

EDUPAGE

Matsushita Panasonic Interactive media sold a program for children called "Secret Writer's Society." The program helps kids by reading their writing back to them; it includes an extensive list of prohibited words — curses, obscenities and so on. Unfortunately, poor QA allowed the program to generate strings of the prohibited words instead of suppressing them. Children and parents were startled by the streams of foul language erupting from their computers. The company's response was to deny that it was a significant problem.

Category 21.1 *General QA failures*

1998-06-23 **QA quality assurance lottery random numbers**

RISKS 19 83

Nobody who chose the digit "9" ever won the Arizona Lottery's new Pick 3 game — because the algorithm never generated a 9 in the winning three-digit numbers. Great embarrassment, possible legal liability. . . .

Category 21.1 *General QA failures*

1998-06-28 **QA quality assurance chip bug problem**

EDUPAGE

The new Xeon microprocessor from Intel, a component of workstation computers, was admitted to be flawed. Intel lamely tried to make a virtue of necessity; a spokesperson said, "The good news is that this (chip) isn't in the market yet."

Category 21.1 *General QA failures*

1998-07-22 **e-mail Eudora bug file corruption QA quality assurance**

EDUPAGE

In July, reports surfaced of a peculiar and disruptive bug affecting the popular Eudora Pro versions 3.0 and 4.0 e-mail programs. Bruce Adelsman of New Brighton, MN discovered that when the outbox was heavily loaded with messages that had already been sent, the e-mail program behaved erratically in sending new e-mail. Some new messages were marked as sent even though they weren't and some old messages we re-sent.

A few weeks later, another problem in Eudora came to light when independent testers found that it would be possible to interpret a mouse click on a URL embedded in a mail message to execute programmatic instructions instead of linking to a Web site. This flaw would allow a user to execute a malicious Trojan Horse program that could do anything the programmer wanted on the target machine. Qualcomm, makers of Eudora, immediately issued a patch to fix the problem.

In mid-August Sendmail, Inc., the company that has taken over commercial distribution of the formerly free sendmail program, announced server-level patches that would apply filters to e-mail to prevent delivery of hostile attachments.

Category 21.1 *General QA failures*

1998-07-26 **software engineering quality assurance QA fraud corruption**

EDUPAGE

In Mexico City, the change of government has reduced the level of endemic corruption that permeates Mexican business and politics. As a result, IBM de Mexico has agreed to pay the city administration $37.5M in damages for a failed database system project that they won without competitive bidding in 1996.

Category 21.1 *General QA failures*

1998-08-13 **QA quality assurance software backup Web site support**

RISKS 19 91

McAfee's PC Medic 97 Deluxe package included QuickBackup v2.04 for Windows; it failed to perform a total backup because it could not backup files from directories whose names contain a blank space. Solution from Network Associates Technical Support: download version 2.05 from the Web site. Problem: impossible, as the file was not on their Web site. Result: I returned the product for refund. Moral: Quality Assurance really does matter.

Category 21.1 *General QA failures*

1998-09-23 **QA quality assurance testing operations management**

RISKS 19 97

After technicians finished testing new programs at the National Australia bank, a major Sydney (Australia) clearing center, they unfortunately forgot to restore the payroll program. The NAB then failed to authorize payments from more than 50 major companies. "Tens of thousands of people missed payday" as a result.

Category 21.1 *General QA failures*

1998-10-01 **QA quality assurance testing operations availability**

RISKS 20 1

The Department of Social Security in the UK lost its National Insurance Registry when errors in the installation of new software developed by Andersen Consulting destroyed the database. Payments were forcibly being made manually and without normal checks on eligibility. The outage was expected to last at least a month, with untold hardship for government staff and unknown losses due to fraud.

Category 21.1 *General QA failures*

1998-10-01 **QA quality assurance testing operations availability banking**

RISKS 20 1

The Bank of Montreal installed a new version of its electronic-card transaction-processing software and promptly crashed its system. All MasterCard and debit-card authorizations were denied and the Bank's ATMs shut down. The system came back up again 10 hours later.

Category 21.1 *General QA failures*

1998-10-03 **QA quality assurance operations oversight banking**

RISKS 20 2

The Royal Bank of Canada prepared a file of checks destined for direct deposit in the Toronto Dominion Bank accounts of 50,000 welfare recipients in Ontario. When a Royal Bank technician noticed an error in dates on the file they had transmitted, they warned the Toronto Dominion to expect a new file and that file was duly transmitted. Unfortunately, the Toronto Dominion operations crew forgot to set a parameter to read the new file — and so 50,000 poor people got no checks at all that day.

Category 21.1 *General QA failures*

1998-10-21 **quality assurance QA design constraints real-world**

RISKS 20 4

M. Ruth Milner of New Mexico ran into a textbook case of poor software design. Several departments of the state government implemented a new database structure that attempts to comply with federal regulations requiring data interchange among states. Some bonehead analyst decided that the only name formats allowed would be
1. Initial(s) and last name.
2. First name, last name.
3. First name, middle initial, last name.

Poor M. Ruth was labelled MRUTH by both the DMV and the taxation department. Officials told her that the new systems had been implemented without real-world testing.

Category 21.1 *General QA failures*

1998-11-06 **euro conversion Europe commerce interoperability**

Reuters

At Gartner Group's European IT Conference in Cannes, France, industry analysts worried that European organizations have failed to cope with the monetary conversion to the Euro. The date for implementation was 1 December 1999, but many companies have failed to prepare for the new currency. Another problem was that many firms had already assigned their IT staff to the millennium conversion and were therefore understaffed to deal with the additional requirements of the new money. The Euro conversion experience could be a dry-run for the Y2K problem.

Category 21.1 *General QA failures*

1998-11-11 **quality assurance QS pornography TV satellite channels**

Reuters

For a few hours, subscribers to European satellite TV services were startled to see pornography from the Eros Channel on the channels normally assigned to BBC News. The mixup was apparently an accidental technical error at the satellite distribution center in Switzerland.

Category 21.1 *General QA failures*

1999-01-03 **QA quality assurance bug spreadsheet data export import**

RISKS 20 14

A RISKS correspondent noted that exporting numbers with 12 significant figures from Excel to a comma-delimited CSV file and back causes loss of the last 5 significant digits — and it doesn't even roundoff, merely truncates.

Category 21.1 *General QA failures*

1999-01-15 **QA**

RISKS 20 15

Craig Raskin reported in RISKS that several Y2K testing tools missed obvious errors in test programs he devised for quality assurance of his own Y2K tools. He wondered how many errors such commercial tools are missing in the production environments where they are being used trustingly by Y2K-compliance teams.

Category 21.1 *General QA failures*

1999-01-15 **Y2K QA quality assurance**

RISKS 20 15

James S. Vera wrote in RISKS 20.16: Intuit's Quicken'99 fails with a "divide by zero" message when a transaction dated in January 1999 is recorded in the Auto category and its "Home and Car Center" is opened.

Category 21.1 *General QA failures*

1999-01-29 **QA Y2K quality assurance**

RISKS 20 18

In the southern Swedish city of Malmö, a new version of the municipal accounting package caused consternation by losing transactions every night when the system would crash. As a result, some bills were not being paid, causing embarrassment for the city and cash-flow problems for the unpaid vendors.

Category 21.1 *General QA failures*

1999-02-01 **QA quality assurance failure bug underpayment contract**

RISKS 20 19

In England, the government's expensive (£140M) new NIRS 2 social benefits computer system installed by the UK Government Department of Social Security (DSS) was more than a year late in delivery. As a result, thousands of widows were underpaid for up to two years; missing amounts ranged from £1 to £100 a week. The government was therefore sitting on (and earning interest on) a windfall of £1B in unpaid benefits.

Category 21.1 *General QA failures*

1999-02-03 **QA Internet Explorer Microsoft antitrust trial embarrassment**

Wired via PointCast

A huge gefuffle over a small error erupted in the marathon Microsoft antitrust trial. A videotape of how slowly Windows 98 would access the Web when modified as instructed by government attorneys and experts. Turns out the videotape was made correctly but installation and uninstallation of the software for access to the Prodigy value-added network damaged the system registry.

Category 21.1 *General QA failures*

1999-02-04 **programming error bug array dimension limit rollover**

Investor's Daily, USA Today

As the Dow Jones industrial average approached 10,000 there were warnings that older software might rollover their interpretation of the index to 1000, causing a wave of automated selling and a potential dip in the stock market. In the event, nothing bad happened.

Category 21.1 *General QA failures*

1999-02-10 **QA quality assurance misplaced faith technology records**

RISKS 20 20

At Carnegie Mellon University, Professor Philip Koopman lost his photocopier privileges for one of his graduate courses because the administrators reported, straight-faced, that he and his students had made 4,294,967,026 copies in two weeks. They knew this because a computer told them so. Prof. Koopman didn't even bother doing the page/minute calculations but commented that the number was "suspiciously close to 2**32 and that it [was] far more likely the number -272 printed with an unsigned print format, but that argument didn't do [him]any good." He should have stuck to the page per minute calculation ((it works out to ~3551 copies per _second_ continuously for the entire 14 days).

Category 21.1 *General QA failures*

1999-02-12 **quality assurance Web site correction privacy**

San Jose Mercury News

Hallmark Cards deserves kudos for fixing a security hole on its Web site within 5 minutes of the first alert. [Would that everyone were so responsive.]

Category 21.1 *General QA failures*

1999-03-01 **QA quality assurance automated phone**

RISKS 20 23

Keith Rhodes wrote in to RISKS, "A police computer in Fort Worth TX made 1,300 phone calls to invite residents to a police community forum — beginning at 3 a.m. Sunday morning, instead of during the day."

Category 21.1 *General QA failures*

1999-03-11 **availability crash rollover design quality assurance QA time**

RISKS, http://support.microsoft.com/support/kb/articles/q216/6/41.asp 20 24

Because of what appears to be a 32-bit millisecond counter in the Windows95 and Windows98 Vtdapi.vxd module, all Windows 9x computers hang after 49.7 days of continuous operation. [See <http://support.microsoft.com/support/kb/articles/q216/6/41.asp>]

Category 21.1 *General QA failures*

1999-03-11 **date quality assurance QA**

RISKS 20 24

Kenneth Dyke reported in RISKS that several improperly-dated e-mail messages caused confusion and disorder in his MS-Outlook in-basket. For example, a message dated "Sun, 4 Jan 2099 18:28:02 -0200" was listed by Outlook as being dated "Fri, Aug 1, 1919, 12:28 PM." This and other errors did not increase Mr Dyke's confidence in Microsoft's Y2K remediation programs.

Category 21.1 *General QA failures*

1999-03-11 **prison jail doors locks open**

RISKS 20 24

ICSA.net's Director of Research Services, David Kennedy, wrote in RISKS, ". . . cell doors on the ninth floor of the Kenton County Detention Center in Covington KY opened spuriously and remained open for 9.5 hours, although the convicts were still confined within a larger area.

Category 21.1 *General QA failures*

1999-04-15 **privacy confidentiality e-mail addresses prospects blunder error bug snafu QA quality assurance failure**

CNET News.com http://www.news.com/News/Item/0,4,35168,00.html

Strike another blow for better quality assurance: registrants on the Xterra Web site run by Nissan were surprised to receive e-mail containing the entire list of 24,000 e-mail addresses of all those who had registered — a gold mine for unscrupulous scumbag junk mailers — or to competitors engaged in competitive intelligence. A Nissan spokesperson lamely explained that a "technical error" had done the deed. Yeeeessss, we had already deduced that the e-mail was unlikely to have been sent deliberately. . . .

Category 21.1 *General QA failures*

1999-04-15 **privacy confidentiality e-mail addresses prospects blunder error bug snafu QA quality assurance failure**

CNET news.com http://www.news.com/News/Item/0,4,35225,00.html

In April 1999, AT&T sent 1,800 e-mail messages containing all 1,800 addressees in the visible TO: field. Some recipients expressed concern about having their e-mail address distributed to junk e-mailers. A company spokesperson blamed human error for the blunder. In a story for CNET news.com, Troy Wolverston reported that, "Online privacy activist Jason Catlett, president of Junkbusters, said the Nissan and AT&T incidents show that companies are still trying to figure out how to use the Internet to target customers. He said that companies are starting to consider email to be an important marketing tool, but they lack the expertise to use it properly."

Category 21.1 *General QA failures*

1999-04-21 **QA quality assurance browser bugs correction patches**

CNET News.com http://www.news.com/News/Item/0,4,35492,00.html

Microsoft responded quickly to serious vulnerabilities in its Internet Explorer browser versions 4 and 5 by issuing patches within a couple of weeks after revelations that malicious Web sites could bypass IE security mechanisms using misleading URLs. The weaknesses allowed access to user files and a simple mechanism for hijacking Web connections, putting up spoofs in place of authentic pages and thereby tricking users into revealing confidential information such as user IDs, passwords, credit-card numbers and so on. Another peculiar feature was corrected in IE 5, where it was possible for a Web page to force an executable ActiveX control into a user's clipboard.

Category 21.1 *General QA failures*

1999-07-19 **Y2K programming quality assurance embedded code rollover time limits dates UNIX**

New York Times

A New York Times article reported on many date-related problems that will persist beyond the Y2K transition. For example, a well-known counter in UNIX systems rolls over to zero in 2038. Microsoft programs have counters that will break at various times; for instance, MS-Visual C++ will break in 2036 unless there are significant changes to the compiler and existing programs are recompiled before the limit. [In addition, many programmers have decided to use arbitrary windows of time rather than fixing the fundamental problem; thus they have defined two-digit ranges that fall into the 20th century and others that fall into the 21st. Unfortunately, no one agrees on precisely where the windows should lie so it is quite possible that an old product (or one based on an old product) will have serious problems in, say, 2025 whereas another one will break in 2030.]

Category 21.1 *General QA failures*

1999-07-21 **liability tort Y2K protection law consumers**

Reuters

In July, the Clinton Administration approved a law to delay lawsuits against companies providing software or other products that are not Y2K compliant. The 90-day cooling-off period should allow repairs, according to supporters of the bill. However, opponents claimed that the delay would limit consumer rights. [Strike another blow for allowing companies to get away with making users serve as unpaid quality-assurance staff — and doing testing on production systems.]

Category 21.1 *General QA failures*

1999-07-21 **financial fraud Y2K quality assurance outside consultants foreign study report**

Journal of Commerce

GartnerGroup issued a report on _Year 2000 and the Expanded Risk of Financial Fraud_ and warned that the huge effort to pry into production software worldwide has greatly increased the possibility that dishonest programmers will try to take advantage of the systems they have learned about — and modified, sometimes with minimal supervision.

Category 21.1 *General QA failures*

1999-07-30 **Y2K quality assurance critical infrastructure protection government**

Reuters

The Y2K Information Coordination Center (ICC) was established by the US government with plans to go operational by 31 October 1999 and close down by June 2000. The Y2K-ICC would help coordinate government efforts in Y2K remediation and response and would also work with critical infrastructure to log and counter Y2K problems and possibly even cyberattacks. However, John Koskinen, chair of the President's Council on Year 2000 Conversion, told Newsbytes that the ICC would definitely not morph into the dreaded FIDNET (Federal Intrusion Detection Network).

Category 21.1 *General QA failures*

1999-08-21 **GPS global positioning system rollover**

New York Times

The GPS time counter rolled over at midnight GMT on Friday Aug 20, 1999, with Saturday the 21st expressed as 0 instead of 1024 weeks since Jan 6, 1980. Although some people in Japan were inconvenienced by failure of their automobile GPS receivers, the event caused little disruption.

Category 21.1 *General QA failures*

1999-09-09 **date problem glitch bug legacy code programs**

Philadelphia Inquirer

Some Y2K specialists were concerned about the possibility of legacy-code failures on 9-9-99 because that date used to be commonplace as a marker meaning "End of input data." However, almost no reports of trouble were publicized. Many observers hoped that this non-event presaged similarly mild problems over the Y2K transition.

Category 21.1 *General QA failures*

1999-10-01 **malware backdoor Trojan logic bomb Y2K consultants sabotage infowar**

Newsbytes

Michael Vatis of the FBI's computer crime section and head of the National Infrastructure Protection Center warned that he expects to see significant sabotage and fraud carried out by consultants who have worked on Y2K fixes. The pressure and lack of quality assurance on outsourced program fixes makes his prediction reasonable.

Category 21.1 *General QA failures*

1999-10-28 **quality assurance computer hardware bug flaw tort liability class action lawsuit settlement**

OTC

Toshiba announced in late October that it had settled a class-action lawsuit resulting from a bug in some of its laptops that allowed data corruption on diskettes when writing to the last byte on any sector. The company agreed to pay $2.1B in damages.

Category 21.1 *General QA failures*

1999-11-04 **Web e-commerce sales preparation quality assurance load errors volume availability**

Wired

Handspring announced its new Visor palm-top computers and went online to sell them. Unfortunately, the company failed to apply adequate quality assurance to its site and encountered so many problems that even its President couldn't get the units he ordered. Chris Oakes, writing for Wired magazine, described the debacle. Key points:
* The unexpected surge in Web and telephone orders caught the company unprepared.
* Few customers have received their handhelds.
* Some customers have received duplicate orders or been billed twice the right amount.
* The company has made errors in calculating the sales taxes.
* Their Web site crashed immediately upon opening for business because of the heavy demand.
* In response, the company hired 40 operators to deal with phone orders — and still had customers waiting two hours for service.
The author commented, ". . . Handspring has become a virtual case study in how not to conduct e-commerce."

Category 21.1 *General QA failures*

1999-11-29 **Y2K QA quality assurance software testing bug glitch date**

Computerworld Online
http://www.computerworld.com/home/news.nsf/CWFlash/9911291jury

Sami Lais, writing for Computerworld Online on 1999-11-29, described a Y2K glitch with wider import. In Philadelphia, Jury Commissioner Michael J. McAllister was surprised to find potential jurors reporting that they had received instructions to appear for jury duty on Jan 3, 1900. The Y2K-compliant jury-roster software had been cleared of date bugs during acceptance tests. Investigation showed that subsequent changes linked the program to a module in a non-compliant library.

Moral: all quality assurance tests must be repeated after any program modification before putting the new version into production.

2000-02-07 **design boundary conditions quality assurance QA stress testing overload denial of service**

NewsScan;St Petersburg Times (FL) http://www.sptimes.com/, MSNBC http://www.msnbc.com/news/365664.asp

A new Web site promising to give away $10,000 a day in scholarship money to the lucky visitor who wins the luck of the draw [was launched on 3 Feb]. The Cambridge, Mass.-based company FreeScholarships.com is financing its giveaways through marketing groups and advertisers eager to access the teenage and 20-something population. The money is available for college, graduate school, or private school for children, and winners need only be U.S. citizens over the age of 13. Applicants must divulge some amount of demographic data to qualify, and winners are chosen by computer-generated random drawing. The odds of winning depend on how many log on. And for those who don't win? FreeScholarships.com also offers tips on financial aid. (AP/St. Petersburg Times 3 Feb 2000)

FreeScholarships.com found out that handing out money can be harder than it looks sometimes. On [the first day of operation] the site was overwhelmed with visitors trying to register for the tuition giveaway, causing the servers to crash. Technicians were still working on the problem [the next day]. The site, described by its founder as "a low-energy path for people to get a shot at helping them pay for school," plans to give away $10,000 a day to students seeking funds for college, graduate programs, private or parochial school. Additional drawings will give away $25,000 every month and $50,000 each quarter. (MSNBC 4 Feb 2000)

[This case illustrates the critical importance of appropriate design and of stress testing as part of quality assurance.]

2000-02-21 **source code untrusted authors espionage**

RISKS 20 81

According to a 17 Feb 2000 AP item (18 Feb 2000 article in *The Washington Post* by David Ignatius, the US State Department has its shorts in a knot because they have just realized that a software package called the Mission Performance Plan that is running on embassy computers around the world was written by programmers from the former Soviet Union. On 2 Feb 2000, the Department of State sent an urgent cable to 170 embassies ordering them to remove the package by the 7th while security specialists examine the code for trap doors, logic bombs and other cybernasties.

[Comment by MK: this incident reinforces the view that the trustability of software writers is even more important than quality assurance where security is concerned. As many commentators have noted, it may be impossible in practice to apply adequate quality assurance to untrusted code. I have frequently urged QA specialists to ensure that they use code-coverage logging to ensure that every line of code is actually executed during the SQA process; however, even total coverage does not necessarily mean that a program is guaranteed safe, since variable sequence of execution could result in different outcomes for the same subroutines because of data dependencies.]

RISKS; http://cs.nyu.edu/rubin/passport.html 20 85

Avi Rubin and Dave Kormann published a paper about security holes in Microsoft's Passport protocol; their abstract follows verbatim: Passport is a protocol that enables users to sign onto many different merchants' web pages by authenticating themselves only once to a common server. This is important because users tend to pick poor (guessable) user names and passwords and to repeat them at different sites. Passport is notable as it is being very widely deployed by Microsoft. At the time of this writing [March 2000], Passport boasts 40 million consumers and more than 400 authentications per second on average. We examine the Passport single signon protocol, and identify several risks and attacks. We discuss a flaw that we discovered in the interaction of Passport and Netscape browsers that leaves a user logged in while informing him that he has successfully logged out. Finally, we suggest several areas of improvement.

2000-06-05 **software bloat QA quality assurance professionalism**

RISKS http://radsoft.net/bloatbusters/sw_dns.htm 20 91

R. A. Downes examined the source code for an old Microsoft registry cleaner called RegMaid. He trimmed the executable from 153,600 bytes down to 83,968 bytes in ten minutes. "Not to beat the dead horse but - just think about it. Ten minutes, 55% savings of 83,968 - and I had never seen this code before in my life." In another bloatware analysis, his team reduced a piece of commercial software from 3.5MB to 7KB (yes, that's seven _kilo_bytes) in a single hour. As Downes wrote, "Avoiding bloat has never been an effort, despite what the defenders of latter-day commercial software like to claim. Things can be done right from the beginning, or even if not, corrected in a negligible envelope of time. . . . It's professional pride on the one side — and `who cares?' on the other."

In a follow-on submission to RISKS, Martin Ward complained about the default handling of inserted images in MS-Word documents: there is no compression unless one takes special measures. As a result, the document ended up at 26 Mb — when simple compression converted it to a mere 180 Kb. Ward summarized two specific design flaws as follows:
* Their image file format doesn't compress images;
* MS Word doesn't compress files when it stores them.

2001-04-25 **QA quality assurance availability real-time process control failure bug design flaw testing**

RISKS 21 36

Peter G. Neumann, moderator of RISKS, reported on quality assurance failures in the Washington Metro: "Washington D.C. Metro's $20 million central computer system crashed at 5:15 p.m. during the evening rush hour on 24 Apr 2001. The central system provides real-time graphics to the downtown control center. Similar malfunctions occurred in 1998 and 1999 (e.g., RISKS-20.60). In the 15 months following its installation, this BDM system crashed 50 times, according to the Metro. Coincidentally, a six-car train that had broken down 8 minutes earlier was stuck in the tunnel between Friendship Heights and Bethesda, and had to be towed out."

Category 21.1 *General QA failures*

2001-08-12 **system failure crash availability communications network phone software error bug flaw QA quality assurance notification**

RISKS 21 60

Andre Oppermann reported from Switzerland on a massive mobile telephone network failure. Writing in RISKS, he summarized the events as follows:

On Friday, July 27th 2001, the whole Swisscom Mobile GSM network, serving 3.3 million customers (70% market share in Switzerland), broke down for 10 hours from approx. 12:30 until 22:30 GMT+0200.

Two independent software errors in the primary and backup network signaling processors (the SS7 network) caused a halt for the processing of all signaling in a GSM network. This includes call setup, call receiving, SMS (short message service), logging onto network and basically everything else. The central GSM systems (HLR, VLR, NMC and so on) stayed up but were unable to communicate with the base stations in the field.

The primary system suffered a complete failure (software error) and as designed the backup system took over. While it was working fine first the backup system got loaded more and more, judging from the description something like a missing free() call, and eventually broke down too half an hour later.

The newspaper "Le Monde" was reporting insider information last week saying that these signaling processors are made by Alcatel and that Alcatel found out about the software errors two weeks before (and probably also had a fix) but "forgot" to inform Swisscom Mobile about it. Alcatel is now facing a Swiss Franc 30 million liability case. This is the loss Swisscom Mobile has because of lost revenues, not including public image damages.

In one thing I have respect for Swisscom; They did a pretty good job with public relations and informed the media and public very openly about their technical problem(s). Now, two weeks later, Swisscom Mobile also issued a, thought written for the non technician but pretty detailed, press release of the cause and events of this network failure.

. . . .

Category 21.1 *General QA failures*

2001-11-06 **QA quality assurance installation format data destruction disk drive underlying assumptions**

RISKS 21 74

A minor programming bug (missing quotation marks) in the new version of the iTunes media player for Macintosh computers resulted in total deletion of all the data on the unfortunate victims' disk drives.

In a later issue of RISKS, a commentator made the point that actually, it wasn't a minor programming bug that caused the error, it was bad quality assurance. Another writer explained the underlying problem: on the Mac, spaces can be used within file names. However, writes the contributor, "With the new Unix-based OSX, long-time mac users are discovering the hard way that spaces are used as delimiters in scripts and in parsing, so filenames containing spaces can have unintended results. Most Unix code samples and docs assume that no one ever puts spaces in their file names, so the samples never show quotes being used, and some docs don't mention this need either. Just about every programmer making the Mac switch from OS 9 to 10 finds this out the hard way, just not as publicly and catastrophically. The risk-- changing the underlying behavior of familiar software, and not being aware of all the assumptions behind that underlying behavior."

Another followup explained that "According to a well-placed friend within Apple, the failure was a bit more complex than described. He says that the bug in the script was actually discovered prior to the software being posted, but that the corrected version somehow did not end up being posted (classic version management issue.) Furthermore, the fact that broken script had been posted was discovered in the middle of the night, but the folks responsible for the server did not pull it down until hours later, thus increasing the collateral damage (classic people management issue.)"

2001-12-04 **data entry keystroke error QA quality assurance bounds checking limits reasonableness check losses stock market trading share price fall**

RISKS 21 81

According to the _Wall Street Journal_, "Dentsu Inc., one of the world's biggest advertising companies, was making its trading debut Friday on the Tokyo Stock Exchange after completing one of the year's biggest initial public offerings -- a deal arranged by UBS Warburg, a unit of Switzerland's UBS AG. . . . Before the Tokyo market opened Friday, a UBS Warburg trader entered what was intended to be an order to sell 16 Dentsu shares at 610,000 yen ($4,924.53) each or above. Instead, the trader keyed in an order to sell 610,000 Dentsu shares at 16 yen apiece. . . . The order was canceled by 9:02 AM, but not before 64,915 shares, almost half of the 135,000 shares in the IPO, had been sold. The price of Dentsu shares, which had been bid up to 600,00 yen before the market opened, fell to 405,000 yen. Now, UBS Warburg is obligated to deliver the shares it sold, and will have to buy them on the open market."

George C. Kaplan, who contributed this item to RISKS, cogently pointed out, "The article doesn't say anything about sanity checks in UBS's trading software. These have their own risks, of course, but you'd think that an error of 4 orders of magnitude in the selling price would at least merit an "Are you sure?" before the order went through. Once again, we see how computers let people make really big mistakes quickly."

Category 21.1 *General QA failures*

2001-12-26 **QA quality assurance buffer overflow programming flaws language design compiler**

RISKS 21 84

Henry Baker and Peter G. Neumann began a discussion of buffer overflows as a root cause of quality assurance problems world wide. Some highlights from Baker's essay:

* I'm no fan of lawyers or litigation, but it's high time that someone defined "buffer overflow" as being equal to "gross criminal negligence".

* If buffer overflows are ever controlled, it won't be due to mere crashes, but due to their making systems vulnerable to hackers. Software crashes due to mere incompetence apparently don't raise any eyebrows, because no one wants to fault the incompetent programmer (and his incompetent boss). So we have to conjure up "bad guys" as "boogie men" in (hopefully) far-distant lands who "hack our systems", rather than noticing that in pointing one finger at the hacker, we still have three fingers pointed at ourselves.

Highlights from Dr Neumann's response:

* . . . [A]n expressive programming language that prevents you from doing bad things would with very high probability be misused even by very good programmers and especially by programmers who eschew discipline; and use of a badly designed programming language can result in excellent programs if done wisely and carefully.

* . . . [I]t would be very helpful if designers of modern programming languages, operating systems, and application software would more judiciously observe the principles that we have known and loved lo these many years (and that some of us have even practiced!). Take a look at my most recent report, on principles and their potential misapplication, for DARPA's Composable High-Assurance Trustworthy Systems (CHATS) program, now on my Web site:
http://www.csl.sri.com/neumann/chats2.html

[This discussion went on for weeks and can be followed in subsequent issues of RISKS.]

2002-01-04 **QA quality assurance automated teller machines ATM bank data corruption error bug**

RISKS 21 84, 87

Paul van Keep reported to RISKS on a drastic programming error in the Netherlands just as the currency switched to the Euro:

"About 51,000 customers who withdrew money from their ING Bank account on 1 & 2 Jan 2002 (through an ATM) have had the wrong amount debited from their account. The bank hasn't yet given an explanation for the error other than to suspect that it was related to the high stress their systems were under during the first few days of the new year. The amounts debited from customer accounts was a hundred times what they withdrew from the ATMs. This got some people into trouble when their balance went negative and they could no longer use their bank PIN card to pay with in shops. ING Bank corrected the error yesterday."

Category 21.1 *General QA failures*

2002-01-06 **QA quality assurance Euro conversion**

RISKS 21 86

Clive Page told RISKS readers of a serious quality assurance problem in England: "Although the UK is one of the three European Union countries not to have adopted the Euro, many large retailers in the UK announced that they would accept them, but would give change in pounds sterling. Among these was the Debenhams chain of department stores. . . . Robert Sheilds, a 15-year old Luton schoolboy, decided he would like experience of using Euro, so he changed 10 pounds to Euro at a bank, and went on to his local branch of Debenhams to spend them. He found that they had programmed their tills as if there were 1.6 pounds to the Euro rather than 1.6 Euro to the pound, but none of the sales assistants was experienced enough to notice the error. So after his initial purchase, he still had more than 10 pounds in change. He tried to tell the store staff of their mistake, but they said the rate was programmed into the computer, and nobody had the authority to change it. So he carried on spending, and after two hours, ended up with 130 pounds of goods, and 20 pounds in cash. At this point the store manager asked him to leave, saying «I think you've had your fun». Richard then took a train to Bedford (about 20 miles away) to try his luck at another branch, but by this time staff had been alerted, and refused all Euro transactions."

Category 21.1 *General QA failures*

2002-01-10 **QA quality assurance design support flaws features failures incompetence stupidity foolishness crash data corruption**

RISKS 21 86

Rex Black wrote in to RISKS with an off-the-top-of-his-head list of obvious quality assurance and design failures and bloopers from his recent experience. Some key points summarized (not literal quotes) from his list:

* Too many programs are written with no consideration of the possibility of data corruption in their data files. They ought to have recovery capabilities.

* Products are designed so that there are sometimes no error or diagnostic messages at all when they fail.

* Automatic updates of software can sometimes wipe out laboriously constructed configurations, making the updated version useless.

* Long-established problems that are known to technical support fail to make into even the electronic read-me files for their products.

* "The daily (or more often) crash that my Windows Me laptop computer subjects me to, generally without warning, usually losing a good fifteen minutes worth of work. I guess I should learn to save every thirty seconds?"

Mr Black ends with, "If experienced people like me have problems like this, imagine the average computer user who has no idea whatsoever about what is going on when her system screws up. And why should they have to understand a computer to use them? (Don Norman, in his book *The Invisible Computer*, discusses this situation at length.) Ultimately, a computer is a tool, nothing more, nothing less. I think we have a long way to go before we can claim levels of quality consistent with what the makers of almost any other tool could claim."

Category 21.1 *General QA failures*

2002-01-10 **bank interest calculations changes information warfare QA quality assurance design customer relations technical support failure incompetence stupidity obfuscation dolts publicity audit**

RISKS; http://www.mit.edu/people/jik/pfsb_problem/ 21 86

Jonathan Kamens noticed a discrepancy in the interest calculations on his bank account one month as a result of a software upgrade (he was slightly overpaid). It took five months for the bank to explain the difference. In the meantime, Kamens put up a Web site that provided a great deal of embarrassing publicity and even humiliation for the bank officials who had been unable to deal with his simple request. [Moral: in the age of the Web, horrible customer service can cost you much more than the loss of one client's business.]

Category 21.1 *General QA failures*

2002-01-16 **QA quality assurance data input bounds checking limits edits output verification**

RISKS 21 87

Carl Fink contributed this gem to RISKS: "A Georgetown, TX man who had arranged for his water bill to be automatically debited from his bank account alertly noticed that his monthly bill was for over $21,000. (If he hadn't noticed, the debit would have happened, causing him to bounce multiple checks before the error was corrected.) When he told the city of the problem, «They said there was absolutely nothing they could do to stop the automated debit, and it was out of their hands.» Their solution was to send a city employee with a check for $21,000 to reimburse their customer!
http://www.austin360.com/statesman/editions/tuesday/metro_state_1.html

Risks? Lack of sanity checking on a new billing system springs to mind. Lack of any way to correct errors is also quite prominent.

Category 21.1 *General QA failures*

2002-01-19 **QA quality assurance design human error**

RISKS 21 87

Arthur Goldstein reported, "The Chesterfield and North Derbyshire Royal Hospital admitted on 10 Jan that it had mistakenly sent computer generated letters to 30 patients, including six elderly men, telling them they were pregnant. The system operator was blamed for choosing the wrong option (instead of informing them that their operations had been postponed)."

[MK comments: Of course it isn't the operator's fault that there was a glitch; program designers are supposed to take input errors into account and to compensate for them. The designers should have included gender-specificity, age constraints, and so on in their design; e.g., {IF gender = male AND condition = female-specific THEN error}.

MORAL: Use table-driven checks to validate human inputs.]

Category 21.1 General QA failures

2002-02-01 **quality assurance security reliability development Microsoft oxymoron**

NewsScan

GATES REFLECTS ON FUTURE HOPES AND PAST SINS [12 Nov 2001]
Microsoft Chairman Bill Gates says his two top priorities now are improving the reliability of his company's software and conquering the market for "tablet" computers, the laptop-size computers that can be used like a clipboard. The tablets can be written on with a special stylus, and the writing is then treated by Microsoft software as though the words had been typed. Gates says tablet PCs will overtake laptops by 2005. As for software reliability, Gates is repentant: "We're doing a little bit of mea culpa on this. These are areas where Microsoft needs to improve. It affects the way we develop code." (USA Today 12 Nov 2001)
http://www.usatoday.com/life/cyber/tech/review/2001-11-12-comdex-gates.htm

MICROSOFT MAKES SECURITY A TOP PRIORITY [16 Jan 2002]
Microsoft Chairman Bill Gates says it's time to shift away from focusing on features to ensuring more security and privacy. Calling the new initiative "Trustworthy Computing," Gates wrote in an e-mail to employees, "When we face a choice between adding features and resolving security issues, we need to choose security. Our products should emphasize security right out of the box." Gates also emphasized that privacy should be a concern: "Users should be in control of how their data is used. It should be easy for users to specify appropriate use of their information, including controlling the use of e-mail they send." The new focus comes on the heels of a widely publicized security flaw in its flagship Windows XP program. (CNet News.com 16 Jan 2002)
http://news.cnet.com/news/0-1003-200-8509737.html?tag=mn_hd

MICROSOFT HIRES SECURITY SPECIALIST [1 Feb 2002]
Microsoft has hired a top security expert who will oversee the development of company strategies to enhance the security of Microsoft's products, services and infrastructure. Scott Charney, a principal for PricewaterhouseCoopers' Cybercrime Prevention and Response Practice, called his new job "in a word, irresistible." Microsoft CTO Craig Mundie said Charney would be a valuable addition to the company: "As one of the industry's top computer security experts, Scott has wide-ranging experience in cybercrime and computer forensics, which will make him an essential member of Microsoft's Trustworthy Computing leadership team." (AP 1 Feb 2002)

Category 21.1 General QA failures

2002-03-11 **real time control system version upgrade failsafe QA quality assurance management**

RISKS 21 94

RISKS moderator Peter G. Neumann summarized a case of inappropriate use of control software coupled with lack of management concern over safety issues in a railway accident in Michigan:

Operating with a less-than-a-year-old remote-controlled system, a runaway train plowed through NIPSCO's Michigan City Generating Station on the morning of 7 Mar 2002, hitting another locomotive before the second locomotive's engineer narrowly jumped to safety. The unmanned eastbound diesel-electric engine, known as Big Blue, was pushing six coal cars when it approached the coal drop-off area at about 30 m.p.h. at 7:15 a.m. However, the train (in excess of 1.5 million pounds, including the coal) did not respond to radio controls and smashed through the enclosed thaw shed and coal rotary dumper, before smashing into the other train, Old No. 12. (Big Blue should have been going only about 1 mph for the last 100 yards entering the dumper.) The impact sent the other train through a fence, uprooted a bumper post, and ripped up track. A spokesman blamed it on a switch malfunction. But the system was supposedly designed so that if the remote-controlled engine receives no signal, its brakes should automatically engage. Employees reportedly said that the system was not designed for the engines currently in use. Two other accidents occurred in the past month. Also noted was what sounds like a serious lack of receptivity from NIPSCO in responding to safety complaints from the workers' union over the past four or five years.

Category 21.1 General QA failures

2002-04-22 **Y2K QA quality assurance repayments accounting errors**

RISKS 22 04

In Brevard County, FL, several city administrations were reeling in shock when they were informed that due to problems during the run-up to the year 2000, they had been significantly overpaid by the County. Some small towns were facing repayments of up to 10% of their annual budget.

Category 21.1 *General QA failures*

2002-05-05 **automated inventory control model overshoot exception QA quality assurance statistical quality control**

RISKS 22 05

Paul Breed told a cute story in RISKS:

>I've been working on an old car, in the process of removing the spot welds I needed a specific sized bullet tipped drill bit. The bit would only last about 5 welds and I had hundreds to do. The only place I could find locally to buy the bits was in a pack of 15 various size bits at the local home center.

So, over the period of three months, I purchased all of their drill sets, every weekend (usually 3 sets). Now I have disassembled the old car and don't need more bits. The last time I was in the home center they had so many of these drill bit sets that they were overflowing on to the floor.

From my experience the computerized inventory system has a delay of about 3 months. It determined that this item sold out for 12 weeks straight, plugged this into it's inventory tracking prediction S/W and ordered hundreds and hundreds of sets.....<

[MK comments: The spike in demand was so unusual it should have triggered a request for a human being to check on whether the automated system really should order so many replacements. Designers of automated systems should program statistical quality-control features into their software.]

Category 21.1 *General QA failures*

2002-05-05 **QA quality assurance billing utility electricity meter computer court disaster response public relations failure**

RISKS 22 05

Some customers of Seattle City Light have been billed up to 10 times the correct amount for their electricity. Although the municipal administration claimed it would adopt the "Nordstrom way" by dealing with billing disputes quickly and in favor of the customers, a spokesperson also said that electric meters don't lie, and thus at least one customer who had protested his bill had to prove that he did not use the power. [MK notes: hellooo? Computers often lie when they are programmed wrong. Claiming that a computer-generated result must be true because the computer says it is reminds one of the touching faith some children have in the Tooth Fairy.]

Category 21.1 *General QA failures*

2002-05-22 **Web design QA quality assurance public relations breach contract fraud misrepresentation bait-and-switch class action lawsuit**

RISKS 22 08

Tudor Bosman reported in RISKS: >Despite its initial denials, Compaq Australia now admits that it did in fact process the payments of customers who bought Presario laptops for just one cent as a result of an online pricing hiccup. [...] Compaq is still adamant, however, that it is not obligated to honor the accidental one-cent pricing, despite mounting industry criticism and ongoing threats of a customer-initiated class action law suit. [...] "As this was a genuine error, Compaq canceled all orders from the system. In instances where 1 cent was debited from customers accounts it will be refunded." <

Category 21.1 *General QA failures*

2002-05-22 **program design QA quality assurance automated dispenser bounds checking violation array initialization price error**

RISKS 22 08ff

Several RISKS correspondents had a feast recounting stories of badly programmed vending machines. In one case, a user could lose money by punching in a choice too quickly after giving the no-armed bandit his dollar; slower-witted customers did fine [MK notes: this is an example of a "race condition" in programming, in which the programmer assumes that certain independ actions will necessarily occur in a strict sequence. The appropriate design is to serialize the components of the transaction; e.g., by using manually-coded semaphores or existing lock routines.] Another case involved unprogrammed values in the selection codes for chocolates; even though the machine typically had only 10 types of candies numbered from 1 to 10, nothing prevented entry of higher values (e.g, 80), and some of these numbers dispensed candybars with very low prices. [MK notes: any bets on the reasons for these bugs? Sure look like omission of bounds-checking (shouldn't accept position numbers higher than what's been filled) coupled with failure to initialize elements of an array (perhaps random values left over from quality assurance testing – if you can call it that in these circumstances).]

Category 21.1 *General QA failures*

2002-05-23 **user interface design failure confusion ergonomics**

RISKS 22 09

Chris Brady continued his analysis of the trouble at Swanwick airport in Britain:

Confusing screens at Swanwick's new air-traffic control centre near Heathrow have resulted in aircraft being directed towards the wrong airports. Controllers have also misread the altitude of aircraft because letters and numbers are difficult to distinguish on the screens, according to the *Daily Mail*, 23 May 2002. For example, the numbers 0, 8 and 6 are confused, leading to mistakes of thousands of feet in the height of flightpaths (noted in a report in *Computer Weekly* magazine).

Controllers and their supervisors at the privatised NATS (National Air Traffic Services) centre at Swanwick have detailed the errors in a health and safety report, which revealed that one controller has repeatedly misread requested flight levels, and mixed up FL360 (36,000 ft) with FL300 (30,000ft).

Others reported difficulties of seeing some letters clearly, particularly the Glasgow code EGPF and the Cardiff code EGFF.

NATS and the CAA (Civil Aviation Authority, U.K.) have said that difficulties in reading screens has been experienced only by a small number of controllers, and that it is not a safety matter. NATS also said that an improved display had been developed and a prototype was shortly to undergo testing.

The risks are many and unfortunately obvious. But what happened to the principles of good HCI design (human-computer interface) and user acceptance testing? Obviously no-one thought to ask the controllers if they could actually read the screens clearly as they play three-dimensional chess with the aircraft and passengers flying into, out of, and past one of the busiest airports in the world.

Category 21.1 *General QA failures*

2002-05-23 **air-traffic control system failure crash availability upgrade maintenance disruption real-time**

RISKS 22 09

Chris Brady reported in RISKS:

Yet again the new multi-million-pound air-traffic computer system at Swanwick near Heathrow crashed last Friday (May 17, 2002) shortly after 6.30 am.

This is a time of maximum inbound flights from the Middle and Far East -- with full 747's arriving at one a minute. Also too it is just when the morning rush hour for domestic and European departures and arrivals begins to build up.

The crash was the result of a 'routine upgrade' which made half the air traffic controllers' computer screens inoperable. This meant that only half the normal flights could be handled. This meant that airlines had to cancel most of their flights into and out of Heathrow - a situation which lasted for most of the day. Imagine one flight being canceled and all the disruption that can cause, then multiply that by many hundreds. And the knock on effect of the wrong planes and crews in the wrong places at the wrong times lasted for most of the following weekend. The consequent loss of revenue to the struggling airline industry is inestimable, to say nothing of the increased loss of confidence in the safety of flying amongst the traveling public.

The risks are obvious. The new computer system at Swanwick is a disaster waiting to happen. A 'routine upgrade' should not result in a major loss of service. The upgrade was obviously made to the primary system before testing on any back up system (is there one?), and if a routine upgrade can cause such a system loss then what would happen to a major upgrade?

Confidence in the safety of the ATC system at Heathrow is not increased with the U.K. Government's refusal to financially bale out - yet again - to the tune of millions of pounds - the owners of the new system, the privatised NATS (National Air Traffic Services).

Category 21.1 *General QA failures*

2002-06-27 **documentation assumption error training awareness error**

RISKS 22 13

Steve Bellovin summarized an unfortunate case of dependence on the wrong assumption when operating a computer-controlled military device:

According to a U.S. Army report, a software problem contributed to the deaths of two soldiers in a training accident at Fort Drum. They were firing artillery shells, and were relying on the output of the Advanced Field Artillery Tactical Data System. But if you forget to enter the target's altitude, the system assumes a default of 0. (A Web site I found indicates that (part of) Ft. Drum is at 679 feet above sea level.) The report goes on to warn that soldiers should not depend exclusively on this one system, and should use other computers or manual calculations.

Other factors in the incident include the state of training of some of the personnel doing the firing. [Source: AP]

2003-02-21 **Oracle server new vulnerabilities exploit software CERT CC advisory**

NIPC/DHS

February 19, CERT/CC — CERT Advisory CA-2003-05 Multiple Vulnerabilities in Oracle Servers.

Multiple vulnerabilities exist in Oracle software. Depending on the vulnerability being exploited, an attacker may be able to execute arbitrary code; read, modify, or delete information stored in underlying Oracle databases; or cause a denial of service. Systems running the following software are affected: Oracle9i Database (Release 1 and 2); Oracle8i Database v 8.1.7; Oracle8 Database v 8.0.6; and Oracle9i Application Server (Release 9.0.2 and 9.0.3). Solutions for specific vulnerabilities can be found in Oracle Security Alerts published here:
http://otn.oracle.com/deploy/security/alerts.htm. Systems administrators should review the Oracle Security Alerts and apply patches as appropriate. Until a patch can be applied, the CERT/CC recommends that vulnerable sites disable unnecessary Oracle services, run Oracle services with the least privilege, and restrict network access to Oracle services.

Category 21.1 *General QA failures*

2003-02-28 **QA quality assurance blooper**

NewsScan

WELCOME TO CORNELL. (NO, WAIT — NOT SO FAST THERE!)
Because of a "systems coding error," Cornell University sent welcoming e-mail letters to hundreds of high school students who'd already been rejected. A few hours after the university congratulated the students on their acceptance, it had to send them letters confessing its mistake and apologizing. One high school counselor said, "I know mistakes can happen, but this kind is devastating to the student and family. The apologies of the university don't quite cover the disappointment of my senior." (New York Times 28 Feb 2003)

Category 21.1 *General QA failures*

2003-03-12 **new vulnerability PeopleSoft business software flaw exploit Web server compromise**

NIPC/DHS

March 10, CNET News — Security alert posted for PeopleSoft.

A serious security flaw has been found in business management software from PeopleSoft. The flaw, known as a remote command execution vulnerability, gives outsiders the ability to install malicious computer code on PeopleSoft customers' Web servers, potentially leading to a "complete compromise" of their PeopleSoft business systems, according to Internet Security Systems (ISS), the Atlanta-based computer security company that issued the warning on Monday. PeopleSoft supplies software designed to streamline accounting, human resources, sales and manufacturing activities to more than 5,000 companies around the world. The flaw affects only certain releases of PeopleSoft version 8, which the company began shipping in 2000. Nearly 2,000 companies have installed version 8, according to PeopleSoft spokesman Steve Swasey. The patches and details about the vulnerability are available on the company's private Web site for PeopleSoft customers: www.peoplesoft.com. PeopleSoft has yet to hear of any problems related to the security flaw, Swasey added.

Category 21.1 *General QA failures*

2003-03-20 **new advisory CERT CC integer overflow Sun RPC XDR**

NIPC/DHS

March 19, CERT/CC — CERT Advisory CA-2003-10: Integer overflow in Sun RPC XDR library routines.

XDR (external data representation) libraries are used to provide platform-independent methods for sending data from one system process to another, typically over a network connection. The xdrmem_getbytes() function in the XDR library provided by Sun Microsystems contains an integer overflow that can lead to improperly sized dynamic memory allocation. Depending on how and where the vulnerable xdrmem_getbytes() function is used, subsequent problems like buffer overflows may result. Exploiting this vulnerability will lead to denial of service, execution of arbitrary code, or the disclosure of sensitive information. Specific impacts reported include the ability to crash the rpcbind service and possibly execute arbitrary code with root privileges. In addition, intruders may be able to crash the MIT KRB5 kadmind or cause it to leak sensitive information, such as secret keys. CERT recommends the application of a vendor specified patch or upgrade as specified by vendor.

Category 21.1 *General QA failures*

2003-03-24 **Yahoo security obscurity obfuscation Website open access**

NIPC/DHS

March 19, SecurityFocus — Point, click, get root on Yahoo.

A simple scan for unpublished websites within Yahoo's Internet address space gave an unemployed IT worker access to several of the portal company's internal systems, including root access inside the company firewall, the worker says. Yahoo URLs provided by the man routed to what appeared to be two unprotected Web-based remote administration consoles for company disk and file storage systems. In a written statement, Yahoo spokesperson Mary Osako acknowledged that the servers shouldn't have been exposed to the Internet, and said the company closed off access on Wednesday. "No user data was compromised," Osako wrote. The IT worker, who asked to remain anonymous, confirmed Yahoo's statement.

Category 21.1 *General QA failures*

2003-03-26 **CERT CC advisory vulnerabilities Lotus Notes Domino software servers**

NIPC/DHS

March 26, CERT/CC — CERT Advisory CA-2003-11: Multiple Vulnerabilities in Lotus Notes and Domino.

In February 2003, NGS Software released several advisories detailing vulnerabilities affecting Lotus Notes clients and Domino servers. Multiple reporters, the close timing, and some ambiguity caused confusion about what releases are vulnerable. The impact of these vulnerabilities range from denial of service to data corruption and the potential to execute arbitrary code. The CERT/CC has issued an advisory to help clarify the details of the vulnerabilities, the versions affected, and the patches that resolve these issues. Please refer to the CERT website for additional information.

Category 21.1 *General QA failures*

2003-04-17 **quality assurance failure flaw bug Microsoft MS Office 200 register software**

NIPC/DHS

April 17, CNET News.com — Flaw bugs Office 2000 customers.

A software slipup in Microsoft's latest update to Office 2000 results in the application repeatedly asking some customers to register the program. The glitch apparently affects only Office 2000 users who don't have administrative rights on their computer, a Microsoft representative said Thursday. "They are experiencing unexpected registration prompts, but it doesn't interfere with product functionality," he said. Administrative rights allow a PC user to exercise total control over the computer's data. Giving such rights to nontechnical employees is considered by many security experts to be an unacceptable risk for companies. Microsoft's representative didn't know if the cause of the problem had been determined but said that the software company is working on fixing the issue.

Category 21.1 *General QA failures*

2003-04-22 **bug patch flaw fix Microsoft MS Office 2000 quality assurance failure**

NIPC/DHS

April 22, The Register — Microsoft issues Office 2000 registration bug patch.

Microsoft has posted a patch to remedy the registration bug that has plagued Office 2000 users in some of the world's biggest organizations since April 15. The bug invokes Office's Registration Wizard, even if the user has already registered the product, typically through the purchase of a Select Customer volume license. In many cases, the bug is merely annoying, forcing the user to get rid of an unwanted window. In some cases, dismiss the window too often and Office ceases to function, or enters what Microsoft calls "Reduced Functionality Mode". The only way to get it back is to register the software with Microsoft. The patch may be found on the Microsoft Website:
http://support.microsoft.com/?id=818798

Category 21.1 *General QA failures*

2003-04-27 **quality assurance failure bug software flaw expenses software engineering SEI**

NIPC/DHS

April 27, The Associated Press — Spread of buggy software raises questions.

Last year, a study commissioned by the National Institute of Standards and Technology found that software errors cost the U.S. economy about $59.5 billion annually. Developers say defects stem from several sources: software complexity, commercial pressure to bring products out quickly, the industry's lack of liability for defects, and poor work methods. Programmers typically spend half their time writing code and the other half looking for errors and fixing them. That approach may have worked in the infancy of computers, when programs were small, says Watts Humphrey, of Carnegie Mellon University's Software Engineering Institute. Now, most programs in testing have five to 10 defects per 1,000 lines of code, or up to 10,000 bugs in a million-line program. It would take 50 people a year to find all those bugs, Humphrey says.

Category 21.1 *General QA failures*

2003-04-29 **Oracle9i vulnerability operating system compromise buffer overflow patch databases link**

NIPC/DHS

April 29, eWEEK — Vulnerability puts Oracle9i at risk.

A new vulnerability in Oracle Corp.'s database software puts not only the information in the database at risk, but in some cases, also can lead to a compromise of the operating system. The vulnerability is in the service that enables users to create links between two Oracle databases. In order to exploit the flaw, an attacker would need to send an overly long parameter with the connect string with a query to create a database link. This would trigger the stack buffer overflow, which would in turn overwrite the saved return address on the stack. This would give the attacker the ability to run any code he chose on the vulnerable server. The vulnerability affects Oracle 9i Release 1 and 2; all releases of 8i; all releases of 8; and 7.3.x. A patch is available at the Oracle website:
http://otn.oracle.com/deploy/security/pdf/2003alert54.pdf.

Category 21.1 *General QA failures*

2003-05-02 **Outlook 2003 microsoft beta version bug 21 steps offline folder Government Computer News**

NIPC/DHS

May 02, Government Computer News — Bug delays Outlook 2003's release.

A bug lives on in the latest beta version of Microsoft Outlook 2003 despite two widely publicized fixes. The Inbox bug systematically deletes e-mail messages throughout networked systems that still have Outlook 2002 installed. One workaround proposed by Microsoft involves 21 steps to redirect the location of the cache and change the location of the default profile's Offline Folder File. That didn't work in tests conducted by Government Computer News. Another workaround, which also didn't fix the Outlook bug, is to back up all user data on the server running Microsoft Exchange Server and then delete and recreate the Outlook Profiles. Backup is necessary because this procedure deletes calendar data, e-mails and so on. Microsoft has delayed final product release from early summer to late summer or early fall.

Category 21.1 *General QA failures*

2003-05-05 **Connectiva vulnerabilities Linux arbitrary code DoS denial of service Apache Web Server GNU C**

NIPC/DHS

May 05, Information Security — Multiple vulnerabilities in Conectiva implementations.

Conectiva, a vendor of Portuguese, Spanish and English versions of Linux, has released updates to correct several vulnerabilities in its implementations. These could allow an attacker to run arbitrary code, cause denial of service or crash applications. A vulnerability in glibc, a GNU C Library could be used by an attacker to create an overflow problem in the xdrmem family of functions to run arbitrary code or crash applications. Another pair of vulnerabilities involves the Apache Web server. A memory leak could allow an attacker to deplete memory and cause a denial of service. There are also file descriptor leaks that could give privileges to untrusted CGI scripts. Updated versions are available from the Conectiva website:
http://distro.conectiva.com.br/atualizacoes

Category 21.1 *General QA failures*

2003-06-25 **MS03-021 windows media player library access 9 ActiveX control script flaw**

NIPC/DHS

June 25, Microsoft — Microsoft Security Bulletin MS03-021: Flaw In Windows Media Player May Allow Media Library Access.

A flaw exists in the way in which the ActiveX control included with Windows Media Player 9 Series provides access to information on the user's computer. An attacker could invoke the ActiveX control from script code, which would allow the attacker to view and manipulate metadata contained in the media library on the user's computer. An attacker could also embed a link to a malicious site in an HTML e-mail and send it to the user. After opening the e-mail, the site could be visited automatically without further user interaction. The attacker might also be able to determine the user name of the logged-on user by examining the directory paths to media files. Microsoft has assigned a risk rating of "Moderate" to this issue and recommends that system administrators install the patch on a schedule consistent with their practices.

Category 21.1 *General QA failures*

2003-08-21 **Orcale9iM XDB flaw open door hackers XML Database denial service DoS vulnerability insider FTP HTTP server buffer overflow**

NIPC/DHS

August 21, eWEEK — Oracle XDB flaws open door for hackers.

The XDB (XML Database) in Oracle Corp.'s Oracle9i Database Release 2 has a set of potential buffer overflows that a smart attacker could exploit to cause a denial-of-service (DoS) attack or to capture an active user session on Oracle9iM. To exploit the weaknesses, an authenticated database user is required, or the FTP and HTTP servers must be enabled in the XML database. The vulnerabilities are "highly susceptible" to an insider attack that originates on a corporate intranet if users ignore best practices for secure database configuration. To minimize risk, Oracle recommends disabling the FTP and HTTP servers in the XML database. Those are both installed and enabled by default and can't be turned on or off individually. A patch is available on the Oracle Website:
http://metalink.oracle.com/

Category 21.1 *General QA failures*

2003-09-03 **MS03-037 flaw Visual Basic Applications Arbitrary Code Execution VBA documents e-mail attachemnt forward**

NIPC/DHS

September 03, Microsoft — Microsoft Security Bulletin MS03-037: Flaw in Visual Basic for Applications Could Allow Arbitrary Code Execution.

A flaw exists in the way Microsoft VBA checks document properties passed to it when a document is opened by the host application. A buffer overrun exists which if exploited successfully could allow an attacker to execute code of their choice in the context of the logged on user. In order for an attack to be successful, a user would have to open a specially crafted document sent to them by an attacker. This document could be any type of document that supports VBA, such as a Word document, Excel spreadsheet, PowerPoint presentation. In the case where Microsoft Word is being used as the HTML e-mail editor for Microsoft Outlook, this document could be an e-mail, however the user would need to reply to, or forward the mail message in order for the vulnerability to be exploited. Microsoft has assigned a rating of "Critical" to this vulnerability and recommends that system administrators install the patch at the earliest available opportunity.

Category 21.1 *General QA failures*

2003-09-03 **MS03-036 code execution execute wordperfect converter corel malicious code buffer overrun**

NIPC/DHS

September 03, Microsoft — Microsoft Security Bulletin MS03-036: Buffer Overrun in WordPerfect Converter Could Allow Code Execution.

There is a flaw in the way that the Microsoft WordPerfect converter handles Corel WordPerfect documents. A security vulnerability results because the converter does not correctly validate certain parameters when it opens a WordPerfect document, which results in an unchecked buffer. As a result, an attacker could craft a malicious WordPerfect document that could allow code of their choice to be executed if an application that used the WordPerfect converter opened the document. Microsoft Word and Microsoft PowerPoint, FrontPage, Publisher, and Microsoft Works Suite can all use the Microsoft Office WordPerfect converter. The vulnerability could only be exploited by an attacker who persuaded a user to open a malicious WordPerfect document-there is no way for an attacker to force a malicious document to be opened or to trigger an attack automatically by sending an e-mail message. Microsoft has assigned a risk rating of "Important" to this vulnerability and recommends that system administrators install the patch at their earliest opportunity.

Category 21.1 *General QA failures*

2003-09-03 **MS03-035 Microsoft Word Macros Automatically Run malicious document e-mail attachment**

NIPC/DHS

September 03, Microsoft — Microsoft Security Bulletin MS03-035: Flaw in Microsoft Word Could Enable Macros to Run Automatically.

A vulnerability exists because it is possible for an attacker to craft a malicious document that will bypass the macro security model. If the document was opened, this flaw could allow a malicious macro embedded in the document to be executed automatically, regardless of the level at which macro security is set. The malicious macro could take the same actions that the user had permissions to carry out, such as adding, changing or deleting data or files, communicating with a web site or formatting the hard drive. The vulnerability could only be exploited by an attacker who persuaded a user to open a malicious document -there is no way for an attacker to force a malicious document to be opened. The vulnerability cannot be exploited automatically through e-mail. A user must open an attachment sent in e-mail for an e-mail borne attack to be successful. The vulnerability only affects Microsoft Word—other members of the Office product family are not affected. Microsoft has assigned a risk rating of "Important" to this vulnerability and recommends that system administrators install the patch immediately.

Category 21.1 *General QA failures*

2003-09-03 **MS03-038 Microsoft Access Snapshot Viewer Code Execution Execute malicious website visit Office**

NIPC/DHS

September 03, Microsoft — Microsoft Security Bulletin MS03-038: Unchecked buffer in Microsoft Access Snapshot Viewer Could Allow Code Execution.

A vulnerability exists because of a flaw in the way that Microsoft Access Snapshot Viewer validates parameters. Because the parameters are not correctly checked, a buffer overrun can occur, which could allow an attacker to execute the code of their choice in the security context of the logged-on user. For an attack to be successful, an attacker would have to persuade a user to visit a malicious Web site that is under the attacker's control. The Microsoft Access Snapshot Viewer is not installed with Microsoft Office by default. Microsoft has assigned a rating of "Moderate" to this vulnerability and recommends that system administrators install the patch at the earliest available opportunity.

Category 21.1 *General QA failures*

2003-11-06 **critical fix patch update Microsoft MS Office 2003**

NIPC/DHS

November 05, eSecurity Planet — 'Critical' Office 2003 patch released.

Microsoft has issued a 'critical' update to fix problems in the Powerpoint, Word and Excel products in Microsoft Office 2003, which was released on October 21. Microsoft said the errors occur when a user tries to open or save files that includes an OfficeArt shape that was previously modified or saved in an earlier version of Microsoft Office. The errors mean that documents may not open completely or may be corrupted. In some cases, the documents may open but with missing content. There is no word on whether the 'critical' patch will be shipped with all new sales of the Office 2003 suite going forward. The update is available on the Microsoft Website:
http://support.microsoft.com/?kbid=828041

2003-11-07 **software error medical tests wrong treament computer always right**

RISKS 23 19

CANADIAN MEDICAL EQUIPMENT GIVES REVERSED DIAGNOSTIC RESULTS

[Peter Neumann summarized a report from Danny Burstein on a medical testing equipment failure that illustrates a common failing among computer users: not using common sense.]

About 3,000 people got opposite results when they were tested for gonorrhea and chlamydia over an 18-month period. Because of a faulty diagnostic machine in Cranbrook (southeastern British Columbia), positive and negative test results for the two sexually transmitted diseases were reversed.

About 3,000 people were tested. The 83 that were positive were incorrectly told they were clean. The 2,900 or so that were negative were told they were positive and were given the standard treatments. From a health standpoint the 83 sick folks come out the worst, because their treatment was delayed for months or years. But even the folk who were well went through the drug protocols and other exams and treatments -- which have their own secondary effects, plus, of course, the social/inter-personal problems which being (mis)diagnosed with an STD will cause, especially with regard to patient partner tracking.

One Would Have Thought that someone in the medical office or the lab or the insurance or the pharmacy or somewhere…, looking at 3,000 test results, would have quickly noticed that instead of finding a positive rate of 3% these tests were coming back at 97%. One would Also Have Thought that enough of these people would have gotten a second set of tests so as to raise eyebrows a lot earlier.

Category 21.1 *General QA failures*

2003-11-13 **new critical vulnerability Microsoft security bulletin buffer overflow overrun patch fix exploit**

NIPC/DHS

November 13, Microsoft — Microsoft Security Bulletin MS03-051: Buffer Overrun in Microsoft FrontPage Server Extensions Could Allow Code Execution.

There are two vulnerabilities in Microsoft FrontPage Server Extensions. The first vulnerability exists because of a buffer overrun in the remote debug functionality of FrontPage Server Extensions. This functionality enables users to remotely connect to a server running FrontPage Server Extensions and remotely debug content using, for example, Visual Interdev. An attacker who successfully exploited this vulnerability could be able to run code with Local System privileges on an affected system, or could cause FrontPage Server Extensions to fail. The attacker could then take any action on the system. The second vulnerability is a Denial of Service vulnerability that exists in the SmartHTML interpreter. This functionality is made up of a variety of dynamic link library files, and exists to support certain types of dynamic web content. An attacker who successfully exploited this vulnerability could cause a server running Front Page Server Extensions to temporarily stop responding to requests. Microsoft has assigned a risk rating of "Critical" to this issue and recommends that system administrators install the patch immediately.

Category 21.1 *General QA failures*

2003-11-13 **new critical vulnerability Microsoft security bulletin Word Excel arbitrary code execution patch fix exploit**

NIPC/DHS

November 11, Microsoft — Microsoft Security Bulletin MS03-050: Vulnerability in Microsoft Word and Microsoft Excel Could Allow Arbitrary Code to Run.

A vulnerability exists in Microsoft Excel that could allow malicious code execution. If successfully exploited, an attacker could craft a malicious file that could bypass the macro security model. If an affected spreadsheet was opened, this vulnerability could allow a malicious macro embedded in the file to be executed automatically, regardless of the level at which the macro security is set. The malicious macro could then take the same actions that the user had permissions to carry out. A vulnerability exists in Microsoft Word that could allow malicious code execution. If a specially crafted document were to be opened it could overflow a data value in Word and allow arbitrary code to be executed. If successfully exploited, an attacker could then take the same actions as the user had permissions to carry out. Microsoft has assigned a risk rating of "Important" to this issue and recommends that system administrators install this patch immediately.

2003-12-09 **Oracle new critical vulnerability warning OpenSSL denial-of-service**

NIPC/DHS

December 05, eWEEK — Oracle issues high-severity vulnerability warning.

Oracle issued a high severity security alert warning Thursday, December 4, confirming that a variety of its server products could be tampered with through vulnerabilities via the OpenSSL protocol. The flaws could potentially open the door for a remote hacker to cause a denial-of-service (DoS) attack, execute arbitrary code, and gain access privileges. The notification addresses SSL vulnerabilities detailed in CERT Advisory CA-2003-26 and SSL vulnerabilities detailed in several older Common Vulnerabilities and Exposures (CVE) Candidates. Products concerned with the vulnerability include certain releases of Oracle9i Database Server, Oracle8i Database Server, Oracle9i Application Server, and Oracle HTTP Server. Additional information is available on Oracle's Website:
http://otn.oracle.com/deploy/security/pdf/2003alert62.pdf

2003-12-24 **MySQL release bug fix patch open-source database software**

NIPC/DHS

December 22, eWEEK — MySQL Quashes Defects in Database Release. MySQL AB on Monday, December 22, released Version 4.0.17 of its MySQL open-source database software. The update features a number of cleaned up code defects. Available in source code and binary form, the MySQL 4.0.17 maintenance release for the current MySQL production version corrects all valid bugs discovered during an October poll conducted within the development community via an independent study. According to the study, 21 software defects in 235,667 lines of MySQL source code were found. The report's Defect Summary noted 15 defect instances of NULL Pointer Deference, three defect instances of an allocated memory leak, and three defect instances of an uninitialized variable prior to usage. Additional information is available on the MySQL Website:
http://www.mysql.com/downloads/mysql-4.0.html

2004-01-05 **time_t 32-bit time software programs computers**

RISKS 23 12

HAPPY 2**30'TH BIRTHDAY, TIME_T!

Contributor Paul Eggert writes about the POSIX time counter time_t reaching half its positive range on January 9, 2004. The 32-bit counter counts seconds elapsed since 1970. Some products by Parametric Technology Corp. which were using time_t for keeping time needed patching because of the time_t half-time milestone. Eggert wonders how many applications will break when time_t finally overflows in January 2038. Contributor Paul E. Black reports an overflow bug in Moscow ML, a higher order logic system, caused by time_t's birthday. The maintainers of Moscow ML issued patches within a few days of the bug being discovered. In another follow-up article, Ed Ravin reports failure of the Heimdal implementation of Kerberos because of the time_t birthday. Ravin's company was able to work around this failure by upgrading to a newer version of Heimdal, which had the bug fixed.

Category 21.1 *General QA failures*

2004-01-14 **Microsoft security bulletin patch flaw vulnerability fix buffer overflow overrun**

NIPC/DHS;
http://www.microsoft.com/technet/treeview/default.asp?url=/technet/security/bulletin/MS04−003.asp

January 13, Microsoft — Microsoft Security Bulletin MS04-003: Buffer Overrun in MDAC Function Could Allow Code Execution (832483).

Microsoft Data Access Components (MDAC) is a collection of components that provides the underlying functionality for a number of database operations. When a client system on a network tries to see a list of computers that are running SQL Server and that reside on the network, it sends a broadcast request to all the devices that are on the network. Because of a vulnerability in a specific MDAC component, an attacker could respond to this request with a specially-crafted packet that could cause a buffer overflow. An attacker who successfully exploited this vulnerability could gain the same level of privileges over the system as the program that initiated the broadcast request. For an attack to be successful an attacker would have to simulate a SQL server that is on the same IP subnet as the target system. A target system must initiate such a broadcast request to be vulnerable to an attack. An attacker would have no way of launching this first step but would have to wait for anyone to enumerate computers that are running SQL Server on the same subnet. Also, a system is not vulnerable by having these SQL management tools installed. Code executed on the client system would only run under the privileges of the client program that made the broadcast request. Microsoft has assigned a severity rating of "Important" to this issue.

2004-03-02 **security vulnerability flaw hole patch fix WinZip MIME**

DHS IAIP Daily; http://www.eweek.com/article2/0,4149,1540280,00.asp

February 27, eWEEK — Vulnerability in WinZip could compromise security.

Security analysts on Friday, February 27, reported that versions of the popular ZIP file management program WinZip have a serious security flaw. According to iDefense Inc., an error in the parameter parsing code in these versions "allows remote attackers to execute arbitrary code." The attacker would have to construct a specially designed MIME archive (with one of .mim, .uue, .uu, .b64, .bhx, .hqx and .xxe extensions) and distribute the file to users. Once opened, the attack would trick WinZip into executing code contained in the attacking file. iDefense said it had a functioning proof-of-concept attack demonstrating the problem. The malicious file could be distributed by e-mail, on a Web page, or through peer-to-peer networks. According to iDefense, versions 7 and 8, as well as the latest beta of WinZip 9 are vulnerable to this attack. However, the released Version 9 of WinZip is not vulnerable. In addition to upgrading, users can prevent an attack by turning off automatic handling of these file types by WinZip in Windows Explorer.

2004-03-31 **new security vulnerability flaw hole buffer overflow exploit patch fix RealNetworks**

DHS IAIP Daily; http://service.real.com/help/faq/security/security022604.html

March 26, eSecurity Planet — RealNetworks confirms buffer overflow problem.

Digital media delivery firm RealNetworks confirmed a buffer overflow vulnerability in its Helix Universal Server product, warning that a root exploit could give an attacker "inappropriate access" to compromised system. RealNetworks first warned of the flaw in January, describing it as a simple denial-of-service issue, but on Friday, March 26, the company released an updated advisory Friday to confirm the existence of a "potential root exploit." A root exploit could give an attacker complete control over a susceptible machine to execute malicious code. On Windows platforms where the Helix Server is run as an NT Service, the bug could allow arbitrary code execution under the context of the NT SYSTEM account. Vulnerable products includes Real's Helix Universal Mobile Server & Gateway 10, version 10.1.1.120 and prior and the Helix Universal Server and Gateway 9, version 9.0.2.881 and prior. RealNetworks has released an updated version of the Helix Universal Server or Gateway: http://service.real.com/help/faq/security/security022604.htm l

2004-05-19 **open source code repository flaw vulnerability**

DHS IAIP Daily; http://news.com.com/Flaws+found+in+manager+apps/2100−1002_3− 5216353.html?tag=nefd.lede

May 19, CNET News.com — Flaws drill holes in open-source repository.

Flaws in two popular source code repository applications could allow attackers to access and corrupt open-source software projects, a security researcher said Wednesday, May 19. One vulnerability affects the Concurrent Versions System (CVS), an application used by many developers to store program code. The other flaw affects a system known as Subversion, said Stefan Esser, the researcher who discovered the security holes. The flaw in CVS, which is used more widely than Subversion, affects all versions of the software released before May 19, according to Esser. The vulnerability, technically known as a "heap overflow," occurs because data from the system's users is not vetted carefully enough. The CVS Project and major Linux and BSD distributions have posted advisories on the issue. The hole in Subversion is caused by an error in the way the code parses dates. It could be exploited to allow "remote code execution on Subversion servers and therefore could lead to a repository compromise," according to Esser's advisory.

2004-05-26 **vulnerability CVS buffer overflow concurrent version system**

DHS IAIP Daily; http://www.us−cert.gov/cas/techalerts/TA04−147A.html

May 26, US-CERT — Technical Cyber Security Alert TA04-147A: CVS Heap Overflow Vulnerability.

There is a heap memory overflow vulnerability in the way CVS handles the insertion of modified and unchanged flags within entry lines. When processing an entry line, an additional byte of memory is allocated to flag the entry as modified or unchanged. There is a failure to check if a byte has been previously allocated for the flag, which creates an off-by-one buffer overflow. By calling a vulnerable function several times and inserting specific characters into the entry lines, a remote attacker could overwrite multiple blocks of memory. In some environments, the CVS server process is started by the Internet services daemon (inetd) and may run with root privileges. An authenticated client could exploit this vulnerability to execute arbitrary code, execute commands, modify sensitive information, or cause a denial of service. Note that if a CVS server is configured to permit anonymous read-only access, then this provides sufficient access to exploit a vulnerable server, as anonymous users are authenticated through the cvspserver process. Users should apply the appropriate patch or upgrade as specified by vendor. This issue has been resolved in Stable CVS Version 1.11.16 and CVS Feature Version 1.12.8.

2004-08-12 **Adobe Acrobat Reader 5.0 UNIX Linux vulnerability command execution backtick character patch issued**

DHS IAIP Daily; http://www.idefense.com/application/poi/display?id=124&type=vulnerabilities&flashstatus=true

August 12, iDEFENSE — Adobe Acrobat Reader (Unix) shell metacharacter code execution vulnerability.

Remote exploitation of an input validation error in the uudecoding feature of Adobe Acrobat Reader (Unix) 5.0 allows an attacker to execute arbitrary code. The Unix and Linux versions of Adobe Acrobat Reader 5.0 automatically attempt to convert uuencoded documents back into their original format. The vulnerability specifically exists in the failure of Acrobat Reader to check for the backtick shell metacharacter in the filename before executing a command with a shell. Successful exploitation allows attackers to execute arbitrary code under the privileges of the user who opened the malicious document with a vulnerable version of Adobe Acrobat Reader. PDF documents are frequently exchanged via e-mail and in combination with a social engineering attack allows attackers to remotely exploit this vulnerability. Adobe Acrobat Reader (UNIX) 5.0.9 appears to be patched against this vulnerability.

Category 21.1 *General QA failures*

2004-08-17 **concurrent versioning system CVS history comand information disclosure vulnerability**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/579225

August 17, US-CERT — Vulnerability Note VU#579225: CVS "history" command may disclose sensitive information.

Concurrent Versions System (CVS) is a source code maintenance system that is widely used by open-source software development projects. It provides a history command that displays reports on cvs commands that have been executed on files or directories in the source repository. When using the history command, it supports a -X command line switch, which is designed to allow a user to specify the name of the history file to be used. There is an information disclosure vulnerability in this command line switch. When specifying a directory or filename to the -X command line switch, the error message that is returned could allow an attacker to determine the existence and accessibility of arbitrary files or directories on an affected system. A remote, authenticated CVS user could determine if arbitrary files or directories exist on an affected system and whether the CVS daemon has 9 privileges to access them. This issue has been resolved in Stable CVS Version 1.11.17 and CVS Feature Version 1.12.9: https://www.cvshome.org/

2004-10-08 **SANS top 20 Internet security vulnerabilities list**

DHS IAIP Daily; http://security.itworld.com/4341/041008sanstop20/page_1.html

October 08, IDG News Service — SANS unveils top 20 security vulnerabilities.

IT security and research organization The SANS Institute released its annual Top 20 list of Internet security vulnerabilities on Friday, October 8, with the intention of offering organizations at least a starting point for addressing critical issues. The SANS list is compiled from recommendations by leading security researchers, companies, and government organizations around the world. The list is divided into the top 10 Windows and top 10 Unix vulnerabilities. Topping the Windows list is Web servers and services, while the Unix list leads with BIND domain name systems. Vulnerabilities in file sharing applications and instant messaging (IM), which ranked seven and 10 on the Windows list, respectively, represent fairly new categories of risk, said Ross Patel, director of the Top 20 list. Report: http://www.sans.org/top20/

Category 21.1 General QA failures

2004-10-13 **Adobe Acrobat Reader information disclosure vulnerability no update issued**

DHS IAIP Daily; http://secunia.com/advisories/12809/

October 13, Secunia — Adobe Acrobat / Adobe Reader disclosure of sensitive information.

A vulnerability has been discovered in Adobe Acrobat and Adobe Reader, which can be exploited by malicious people to disclose sensitive information. The problem is that embedded Macromedia flash files can be executed in a local context. There is no vendor solution at this time.

Category 21.1 General QA failures

2004-10-15 **Oracle database vulnerability exploits software patches available**

DHS IAIP Daily; http://www.nwfusion.com/news/2004/1015oraclwarns.html

October 15, IDG News Service — Oracle warns of exploits for latest database flaws.

Oracle is warning customers to apply software patches it released in August 2004, citing the availability of malicious code that can exploit unpatched vulnerabilities in its software. The security holes affect a number of Oracle products, including Versions of its 8i, 9i and 10g Database, Application Server and Enterprise Manager software. Oracle strongly recommends affected customers apply the software patches "without delay."

Category 21.1 General QA failures

2004-10-19 **Lotus Notes Domino cross site scripting attack vulnerability no update issued**

DHS IAIP Daily; http://securitytracker.com/alerts/2004/Oct/1011779.html

October 19, SecurityTracker — Lotus Notes/Domino square bracket encoding failure lets remote users conduct cross-site scripting attacks.

A remote user can access the target user's cookies (including authentication cookies), if any, associated with the site running the Notes/Domino software, access data recently submitted by the target user via web form to the site, or take actions on the site acting as the target user. It is reported that the Lotus Notes HTML encoding function fails to encode square brackets ('[' and ']'). No solution is currently available.

Category 21.1 General QA failures

2004-10-26 **Novell ZENworks privilege escalation vulnerability Remote Management Agent**

DHS IAIP Daily; http://secunia.com/advisories/12969/

October 26, Secunia — Novell ZENworks for Desktops privilege escalation vulnerability.

A vulnerability exists in Novell ZENworks for Desktops, which can be exploited by malicious, local users to gain escalated privileges. The vulnerability is caused due to the Remote Management Agent invoking the ZENworks Remote Control Help functionality with SYSTEM privileges. This can be exploited to execute arbitrary programs with escalated privileges. The vulnerability has been fixed in version 4 SP1b/4.0.1 Interim Release 5:
http://support.novell.com/servlet/filedownload/sec/pub/zfd40 1_ir5.exe

---

Category 21.1 General QA failures

2004-10-27 **RealPlayer skin buffer overflow vulnerability code execution attack**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2004/Oct/1011944.html

October 27, SecurityTracker — RealPlayer skin file buffer overflow may let remote users run arbitrary code.

RealNetworks reported that a remote user can create a malicious skin file that, when loaded by the target user, will trigger a buffer overflow in DUNZIP32.DLL and potentially execute arbitrary code. A fixed version (10.5 (6.0.12.1056)) is available: www.service.real.com/help/faq/security/041026_player/

Category 21.1 General QA failures

2004-10-28 **QuickTime software heap based buffer overflow vulnerabilities HTML BMP**

DHS IAIP Daily; http://secunia.com/advisories/13005/l

October 28, Secunia — Two Quicktime vulnerabilities.

An unspecified integer overflow can be exploited in Quicktime to cause a buffer overflow and execute arbitrary code on a user's system via a specially crafted HTML document. Also, a boundary error within the decoding of BMP images can be exploited to cause a heap-based buffer overflow and execute arbitrary code on a user's system. The integer overflow only effects Windows systems. Update to version 6.5.2: http://www.apple.com/support/downloads/quicktime.html

---

Category 21.1 *General QA failures*

2004-11-04 **Google local service cross site scripting vulnerability no update issued**

DHS IAIP Daily; http://www.zone−h.org/advisories/read/id=6180

November 04, Zone-H.org — Cross Site Scripting vulnerability in Google Local service.

An input validation vulnerability has been reported in Google Local service. A remote user can access the target user's cookies (including authentication cookies), if any, associated with the Google Local site, access data recently submitted by the target user via Web form to the site, or take actions on the site acting as the target user. There is no solution at this time.

Category 21.1 *General QA failures*

2004-11-23 **Winamp stack based buffer overflow vulnerability code execution**

DHS IAIP Daily; http://secunia.com/advisories/13269/

November 23, Secunia — Winamp "IN_CDDA.dll" buffer overflow vulnerability.

A vulnerability in Winamp 5.05 has been reported which can be exploited by malicious people to compromise a user's system. The vulnerability is caused due to a boundary error in the "IN_CDDA.dll" file. This can be exploited in various ways to cause a stack-based buffer overflow, e.g., by tricking a user into visiting a malicious web site containing a specially crafted ".m3u" playlist. Successful exploitation allows execution of arbitrary code. Update to version 5.0.6: http://www.winamp.com/player/

Category 21.1 *General QA failures*

2004-12-16 **Veritas backup software registration stack based buffer overflow vulnerability code execution attack update issued**

DHS IAIP Daily; http://secunia.com/advisories/13495/

December 16, Secunia — Veritas Backup Exec registration request buffer overflow.

A vulnerability has been reported in VERITAS Backup Exec, which can be exploited by malicious people to compromise a vulnerable system. The vulnerability is caused due to a boundary error in the Agent Browser service when processing received registration requests and can be exploited to cause a stack-based buffer overflow. Successful exploitation allows execution of arbitrary code. Original advisory and hotfixes available at: http://seer.support.veritas.com/docs/273419.htm

---

Category 21.1 *General QA failures*

2004-12-21 **libtiff TIFF integer overflow vulnerability code execution attack update issued**

DHS IAIP Daily;
http://www.idefense.com/application/poi/display?id=174&type= vulnerabilities

December 21, iDEFENSE — Libtiff directory entry count integer overflow vulnerability.

Remote attackers may be able to execute arbitrary code with permissions of the user opening the malformed TIFF file. The exposure to this vulnerability is mitigated by the fact that user interaction is required and that the user must view the malicious TIFF file in an application that is linked to a vulnerable version of libtiff. Update to version 3.7.1.
ftp://ftp.remotesensing.org/pub/libtiff/

Category 21.1 *General QA failures*

2004-12-22 **Xpdf buffer overflow vulnerability code execution attack update issued**

DHS IAIP Daily; http://secunia.com/advisories/13602/

December 22, Secunia — Xpdf "doImage()" Buffer Overflow Vulnerability.

A vulnerability has been reported in xpdf, which can be exploited by malicious people to compromise a user's system. The vulnerability is caused due to a boundary error in the "doImage()" function in "Gfx.cc". This can be exploited to cause a buffer overflow by tricking a user into opening a malicious PDF file.Successful exploitation may allow execution of arbitrary code. Apply patch for version 3.00: ftp://ftp.foolabs.com/pub/xpdf/xpdf-3.00pl2.patch Update to version 3.00pl2.
http://www.foolabs.com/xpdf/download.html

Category 21.1 *General QA failures*

2004-12-30 **WHM application software AutoPilot multiple vulnerabilities cross site scripting attack update issued**

DHS IAIP Daily; http://secunia.com/advisories/13673/

December 30, Secunia — WHM AutoPilot multiple vulnerabilities.

WHM AutoPilot has some vulnerabilities that can be exploited by malicious people to conduct cross-site scripting, this allows hackers to compromise a vulnerable system and disclose system information. Input passed to the "site_title" and "http_images" parameter in "header.php" isn't properly sanitized before being returned to the user. This can be exploited to execute arbitrary HTML and script code in a user's browser session in context of a vulnerable site. Update to version 2.5.0: http://www.whmautopilot.com/

Category 21.1 *General QA failures*

2005-01-01 **quality assurance QA failure credit card payments overcharge reimbursement drug store**

RISKS; http://www.latimes.com/business/la-fi-rup1.4jan01,1,4107985.story 23 65

SPECIAL DEAL AT WALGREEN -- DOUBLE YOUR CHARGES

Monty Solomon reported in RISKS on a software glitch:

Walgreen Co., the largest U.S. drugstore chain, accidentally overcharged as many as 4 million customers buying gifts and decorations the two days before Christmas because its payment-processing system malfunctioned from overuse. Walgreen discovered the error on Christmas Day and electronically reimbursed customers whose credit or debit cards had been incorrectly double- and triple-charged, said company spokesman Michael Polzin. Some credits may not post on customers' accounts until early next week, he said.

Category 21.1 *General QA failures*

2005-01-04 **quality assurance QA failure rate vehicle toll system satellite GPS**

RISKS; http://www.spiegel.de/wirtschaft/0,1518,335367,00.html 23 65

BUGGY GERMAN TOLL-COLLECTION SYSTEM FOR BUGGIES

On 1 Jan 2005, the German government introduced an automated toll-collection system for truckers. Dr Debora Weber-Wulff, Professor of Media and Computing at the Fachhochschule für Technik und Wirtschaft (University of Applied Sciences) in Berlin relayed a report to RISKS from Der Spiegel that there were significant errors: "10 % of all attempts to use the system ended in failure or in people just not paying the toll. The system started with just 320.000 'On-Board Units' (OBU) installed that calculate the tolls using a complicated, satellite-based scheme. If a trucker does not have an OBU they must either purchase a ticket by mobile phone (costly) or at a toll booth in a rest stop. The problems here are that many truckers do not know exactly what exit they will be getting off at. In addition, if there is a traffic jam or other problems and they have to take a detour, they must change their toll ticket."

Category 21.1 *General QA failures*

2005-01-04 **quality assurance QA design flaw automated welfare payment banking direct deposit**

RISKS; http://www.heise.de/newsticker/meldung/54690 23 65

GERMAN DIRECT DEPOSIT DOESN'T

On 1 Jan 2005, the German government introduced a new system for direct deposit of social welfare payments. Dr Debora Weber-Wulff, Professor of Media and Computing at the Fachhochschule für Technik und Wirtschaft (University of Applied Sciences) in Berlin reported in RISKS that about 5% of the recipients received no payments because their older account numbers had fewer than the expected 10 digits. Apparently "The program was of course supposed to put in *leading* zeros, for example <0012345678>. Instead, the zeros were added at the end (1234567800) causing the payments to be unassignable to the recipient." The search for the guilty began immediately, with the software company involved, T-Systems, immediately blaming the government for supplying bad data.

Category 21.1 General QA failures

2005-01-06 **quality assurance QA design flaw procedures employees fail-safe fall-back**

RISKS; http://www.boingboing.net/2005/01/05/a_kafka_day_at_the_l.html 23 66

YOU CAN'T GET THERE FROM HERE

Mark Frauenfelder reported on a Kafkaesque response to a software design flaw in Los Angeles, CA. When a police officer forgot to enter the date on a moving traffic violation ticket, the city computer system was unable to register the ticket. A bureaucrat at the ticket office informed the driver that she would have to call the office _every single workday_ to find out when the ticket finally did get registered, then drive down immediately to pay the fine -- which would include penalties for late payment. Paying the ticket before the computer system registered it was impossible. Paying the ticket "late" would result in an increase in car insurance premiums.

In a follow-up posting, Paul Robinson suggested contacting city attorneys to "ask them to agree to dismiss the charge and not prosecute this particular ticket because the case office is not posting the ticket and you can't be put in a position where you are 'twisting, turning in the wind,' waiting for an unknown and unknowable filing to be made which places you in jeopardy of even more serious criminal penalties when you can't get the current one resolved." Failing that, Mr Robinson advised suing the District Attorney's office "for a writ of mandamus prohibiting them from prosecuting the original ticket. You may even be able to sue for damages but I think all you're interested in is to get rid of the matter, either by converting it off of a moving violation or getting it dismissed. I don't think it would be that difficult to file for an order even without a lawyer since you're only trying to solve the problem and the government, by its incompetence or misconduct is placing you in a position in which you are being denied the right to a constitutionally guaranteed speedy trial and quite possibly to equal.protection and possibly other issues. Even if you don't get the order you've got grounds to have any potential penalty for not paying the ticket and not appearing canceled."

Category 21.1 General QA failures

2005-01-06 **WinAce GZIP ZIP vulnerability directory traversal attack**

DHS IAIP Daily; http://secunia.com/advisories/13734/

WINACE GZIP AND ZIP DIRECTORY TRAVERSAL VULNERABILITY.

A vulnerability has been reported in WinAce 2.5, which potentially can be exploited by malicious people to compromise a user's system. The vulnerability is caused due to an input validation error when extracting files compressed with GZIP (.gz) or ZIP (.zip). This makes it possible to have files extracted to arbitrary locations outside the specified directory using the "../" directory traversal sequence. There is no solution at this time.

Category 21.1 General QA failures

2005-01-15 **quality assurance QA software design flaws list**

RISKS; http://asktog.com/Bughouse/index.html 23 67

SOFTWARE ENGINEERING TIPS

Peter Ludemann contributed these pointers to bad software design in RISKS:

Bruce Tognazzini has started collected well-known bugs at http://asktog.com/Bughouse/index.html ... many of these have shown up before in Risks, such as "Harassing Confirmations & Missing Confirmations" and "'Smart' functions that aren't smart".

Readers might also enjoy (if that's the right word) Tognazzini's article on Security D'ohlts: http://asktog.com/columns/058SecurityD'ohlts.html and an older article on how inconvenience and security are confused: http://asktog.com/columns/051AirSecurity.html

Category 21.1 *General QA failures*

2005-01-15 **quality assurance QA map software Microsoft MapPoint directions long trip Norway**

RISKS 23 67

TAKE THE LONG WAY HOME

Two RISKS contributors pointed out a flaw in Microsoft's map software; Adam Shostack's report is as follows (and is entitled "MapPoint Explains Vikings?":

When going from Haugesund, Rogaland, Norway, to Trondheim, So-Trondelag, Norway, be aware that following Microsoft MapPoint's directions, will take you through England, France, Belgium, the Netherlands, Germany, Denmark, Sweden, and finally back into Norway. While this may be culturally sensitive and respectful of historic Viking routing, rooting, or looting, it is somewhat less efficient than other routes, as a quick glance at a map will show.

Start: Haugesund, Rogaland, Norway

End: Trondheim, So-Trondelag, Norway

Total Distance: 1685.9 Miles, Estimated Total Time: 47 hours, 31 minutes
(This is listed as the "quickest" route.)

Category 21.1 *General QA failures*

2005-01-24 **system configuration boot device printer USB drive documentation design denial of service DoS**

RISKS 23 68

BOOT THE PRINTER OFF THE SYSTEM TO BOOT

Lindsay Marshall had an interesting observation in RISKS about the unexpected consequenes of two configuration paramaters:

A neighbour of mine just bought a new Epson printer and were trying to install it on their laptop. They had a problem : they rebooted their system and it said "Not a system disk". They gave me a call and I wandered up to have a look. I hit a few keys and suddenly it booted again. Odd I thought (not having noticed a crucial event!). I got in as Administrator and installed the software for them and we connected up the printer and rebooted. "Not a system disk". I thought for a bit and looked in the BIOS and lo and behold, the first boot item was a USB disc, and the printer does indeed have a USB disc feature so that you can access camera memory cards via the printer. Unplug the printer and the system boots fine, plug it and no dice. (What I hadn't noticed above was that my neighbour had unplugged the printer from the USB as I was hitting keys.)

How could anyone expect everyday users with no experience of systems internals to deal with a situation like that? Why should a printer look like a disc anyway (at least by default), and why have the default BIOS setting to boot from USB first? A disaster waiting to happen and it happened.

Category 21.1 *General QA failures*

2005-01-24 **DatarDataRescue Interactive Disassembler Pro (IDA Pro) buffer overflow vulnerability privilege escalation attack**

DHS IAIP Daily; http://www.k−otik.com/english/advisories/2005/0059

DATARESCUE INTERACTIVE DISASSEMBLER PRO (IDA PRO) BUFFER OVERFLOW

A vulnerability has been identified in IDA Pro that could be exploited by attackers to execute arbitrary code with the privileges of the logged in user. The stack based overflow problem occurs when parsing long PE import library names. This flaw can be exploited by convincing a user to open a malicious Portable Executable file with a vulnerable version of IDA Pro, which may potentially lead to a system compromise.

Category 21.1 *General QA failures*

2005-01-26 **automobile operating system virus cell phone Bluetooth access control design flaw quality assurance QA**

RISKS; http://tinyurl.com/5p3jh 23 70

INFECTING CARS VIA CELL PHONES?

Karl Klashinsky noted a serious problem with software that has no security provisions:

The topic of software flaws in the embedded systems within modern automobiles has been discussed in RISKS several times. But here's a new twist (to me, at least), a case where the on-vehicle software is corrupted by a virus, inserted into the automobile's computing systems, via a blue-tooth enabled cell-phone.

Peter Neumann commented:

There's the obvious risk here… a vehicle can be infected by the cell-phone in the vehicle next to you while stopped in traffic or sitting in a parking lot. As this vulnerability becomes known in the cracker community, how long before someone tailors a virus specific to a vehicular target -- perhaps creating runaway-vehicle scenarios similar to the "faulty cruise control" incidents reported here in RISKS.

Category 21.1 *General QA failures*

2005-01-26 **ISC BIND 8.x / 9.x remote denial of service vulnerabilities denial of service DoS update issued**

DHS IAIP Daily; http://www.k−otik.com/english/advisories/2005/0064

ISC BIND 8.X / 9.X REMOTE DENIAL OF SERVICE VULNERABILITIES

Two vulnerabilities have been reported in ISC BIND 8.4.4, 8.4.5, and 9.3.0, which could be exploited by attackers to cause a Denial of Service. The first flaw affects BIND 8.x and results from a buffer overrun error when using a certain array to track nameservers/addresses, which may be exploited by a remote attacker to cause a Denial of Service. The second issue is present in the self-check function of BIND 9.x, and may be exploited to cause a Denial of Service. Upgrade to BIND version 8.4.6 or 9.3.1: http://www.isc.org/sw/bind/

Category 21.1 *General QA failures*

2005-01-27 **Openswan Pluto buffer overflow vulnerability code execution attack**

DHS IAIP Daily; http://securitytracker.com/alerts/2005/Jan/1013014.html

OPENSWAN PLUTO GET_INTERNAL_ADDRESSES() REMOTE BUFFER OVERFLOW LETS REMOTE AUTHENTICATED USERS EXECUTE ARBITRARY CODE

Openswan has a buffer overflow vulnerability; a remote authenticated user may be able to execute arbitrary code on the target system. A remote authenticated user can execute arbitrary code on the target system with the privileges of the 'pluto' process. The vendor has released fixed versions (1.0.9 and 2.3.0), available at: http://www.openswan.org/code/

Category 21.1 *General QA failures*

2005-02-01 **quality assurance QA bug glitch matching algorithm medical residents hospitals students mismatch**

RISKS; http://blogborygmi.blogspot.com/2005/01/selection-dysfunction.html 23 71

MEDICAL STUDENTS MISMATCHED TO HOSPITALS

In a serious problem for medical students, a program used to match student preferences with hospital preferences failed for urology residencies in January 2005. As a result of the error in the computer program, the match had to be re-run a few days after the first (wrong) run, causing disruption for residents who had already began to make their plans to move to distant cities.

RISKS correspondent Daniel Kahn Gillmor commented, "So, why wasn't a human reviewing the results of the match for reasonableness before publication? Why aren't the algorithms used in the match process freely available? What safeguards are there on the data-entry step (since GIGO continues to apply)? Why isn't there an audit process in place?"

Category 21.1 *General QA failures*

2005-02-02 **hardware failure CD scratch damage drive shatter break design control**

RISKS 23 71

HIGH-SPEED CD-DRIVES SHATTER DAMAGED DISKS

Henk Langeveld reported on a disturbing interaction of damaged CDs and new high-speed CD-drives:

I've had the nasty experience to have lost four CD's to newer high-speed CD and DVD-drives within a year.

The current state of technology will run CDs and DVDs at high speeds, and the centrifugal force of the drive increases the risk of any scratch on the media to result in one broken CD, and one ruined drive.

Peter G. Neumann added:
[Drew Dean commented to me on this: ``I believe programs such as Exact Audio Copy (EAC) do slow down the drive, and most CD/DVD burning software can write at slower speeds, but I'm not aware of any interface to tell an OS to always slow down reading." PGN]

In follow-up postings in RISKS 23.72, Eben King and Jonathan King and others provided helpful suggestions and links for utilities that can slow down fast CD-ROM drives.

Category 21.1 *General QA failures*

2005-02-11 **Avaya vendor product multiple vulnerabilities privilege escalation cross site scripting phishing information disclosure system compromise attacks**

DHS IAIP Daily; http://secunia.com/advisories/14210/

AVAYA VARIOUS PRODUCTS MULTIPLE VULNERABILITIES.

Avaya has acknowledged some vulnerabilities in various products, which can be exploited by malicious, local and remote users. Exploitation of these vulnerabilities can be used to bypass certain security restrictions and gain escalated privileges, conduct cross-site scripting and phishing attacks, disclose sensitive information, and compromise a vulnerable system. Solution available at: http://support.avaya.com/elmodocs2/security/ASA-2005-037_MS0 5-004-MS05-015.pdf

---

Category 21.1 *General QA failures*

2005-02-16 **DCP-Portal SQL injection vulnerability command execution no update issued**

DHS IAIP Daily; http://securitytracker.com/alerts/2005/Feb/1013216.html

DCP-PORTAL SQL INJECTION VULNERABILITY

Several input validation vulnerabilities were reported in DCP-Portal that could permit a remote user to inject SQL commands. The 'index.php' and 'forums.php' scripts do not properly validate user-supplied input in several parameters. If magic_quotes_gpc is set to off in the 'php.ini' configuration file, then a remote user can submit a specially crafted HTTP request to execute SQL commands on the underlying database. No solution is currently available.

Category 21.1 *General QA failures*

2005-02-16 **K Desktop Environment KDE open source X-Windows buffer overflow vulnerability root privileges code execution attack update issued**

DHS IAIP Daily; http://securitytracker.com/alerts/2005/Feb/1013217.html

KDE BUFFER OVERFLOW REMOTE ACCESS VULNERABILITY.

A buffer overflow vulnerability was reported in KDE in the 'fliccd' component of KDE-Edu, KStars, and INDI. A local user can obtain root privileges and a remote user may be able to gain access to the system. A local user can trigger several buffer overflow vulnerabilities in fliccd to execute arbitrary code on the target system. The Instrument Neutral Distributed Interface (INDI) support installs fliccd with set user id (setuid) root user privileges. As a result, a local user can gain root privileges. If the fliccd daemon is running (which is not the default configuration), then a remote user can gain access to the target system, potentially with root privileges. The vendor has issued a patch for 3.3.2, available at: ftp://ftp.kde.org/pub/kde/security_patches

2005-03-03 **CA Unicenter Asset Management software input validation vulnerabilities password disclosure code execution attack updates issued**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2005/Mar/1013360.html

CA UNICENTER ASSET MANAGEMENT INPUT VALIDATION VULNERABILITIES

A remote authenticated user with access to the administrative console can obtain the SQL administrator password, displayed (in masked form) on the 'Change Credentials for Database' window. A remote authenticated user can create a specially crafted URL that, when loaded by a target user, will cause arbitrary scripting code to be executed by the target user's browser. The code will originate from the site running the Unicenter Asset Management software and will run in the security context of that site. As a result, the code will be able to access the target user's cookies (including authentication cookies), if any, associated with the site, access data recently submitted by the target user via web form to the site, or take actions on the site acting as the target user. Vendor advisory and updates available at: http://supportconnect.ca.com/sc/solcenter/solresults.jsp?apa rno=QO64323

2005-03-07 **X11 libXpm XPM image buffer overflow vulnerability system compromise code execution attack update issued**

DHS IAIP Daily; http://secunia.com/advisories/14460/

X11 LIBXPM XPM IMAGE BUFFER OVERFLOW VULNERABILITY

A vulnerability has been reported in libXpm, which potentially can be exploited by malicious people to compromise a vulnerable system. The vulnerability is caused due to boundary errors in "GetImagePixels()" and "PutImagePixels()". This may be exploited to cause a buffer overflow when a specially crafted XPM image file is processed. Successful exploitation may potentially allow execution of arbitrary code. The vulnerability has been fixed in the CVS repository.

OYSTER CARD FAULT CAUSES PROBLEMS ON LONDON UNDERGROUND

"Automatic updates cause journey renewal problems"
by Daniel Thomas, *Computing*, 10 Mar 2005

Londoners were faced with travel problems this morning after an IT error meant hundreds of commuters could not renew journeys on their Oyster card.

The error, which affected the whole of the London Underground (LU) and Docklands Light Railway (DLR), was caused when an overnight electronic updating process went wrong.

Transport for London (TfL) and TranSys - the consortium that operates the Oyster card scheme - automatically updates the system each night to add new records and block stolen and canceled cards.

But a glitch in the system early this morning means commuters are unable to use machines at Underground or DLR station this morning to add new journeys onto the smart cards.

'Every morning information goes out about stopped cards and it was an error in the data that caused the problem,' said a spokeswoman for TranSys.

Passengers that have already paid for their journey or using prepay can still use the system as normal.

TfL and TranSys identified the error at 4am this morning and starting issuing a fix to the problem by 8.30am.

'We hope everything to be up and running again by the end of the morning,' said the TranSys spokeswoman. 'We are now looking into what actually caused the error and ways of ensuring this doesn't happen again.'

2005-03-11 **MySQL multiple remote vulnerabilities remote authenticated attacker privilege escalation updates issued**

DHS IAIP Daily; http://www.securityfocus.com/bid/12781/info/

MYSQL AB MYSQL MULTIPLE REMOTE VULNERABILITIES

MySQL is reported prone to multiple vulnerabilities that can be exploited by a remote authenticated attacker. MySQL is reported prone to an insecure temporary file creation vulnerability. It is also prone to an input validation vulnerability that can be exploited by remote users that have INSERT and DELETE privileges on the 'mysql' administrative database and may be leveraged to load and execute a malicious library in the context of the MySQL process. It is reported that the vendor has addressed these vulnerabilities in MySQL versions 4.0.24 and 4.1.10a. Users should consult http://dev.mysql.com/downloads/ for availability of these downloads.

2005-03-23 **radio frequency identification devices RFID exploits vulnerabilities compromise privacy hole reverse engineering fraud theft**

RISKS; http://www.interesting-people.org/archives/interesting-people/ 23 81

RSA FINDS MORE FLAWS IN RFID

Jacqueline Emigh of eweek.com wrote:

After uncovering a security weakness in a radio-frequency identification tag from Texas Instruments Inc., researchers from RSA Security Inc.'s RSA Laboratories and The Johns Hopkins University are now eyeing future exploits against other RFID products in the interests of better security, one of the researchers said this week. Meanwhile, TI will keep making the compromised RFID tag in order to meet the needs of applications more sensitive to speed and pricing than to privacy, according to a TI official.

The Johns Hopkins University Information Security Institute and RSA first publicized their findings about the RFID security hole in January. In a paper posted at www.rfidanalysis.org, the researchers claim that by cracking a proprietary cipher, or encryption algorithm in one of TI's DST (digital signature transponder) RFID tags, they were able to circumvent the tags' built-in security enough to buy gasoline and turn on a car's ignition. The researchers from Johns Hopkins and RSA reverse-engineered and emulated the 40-bit encryption over two months.

2005-03-23 **automobile car cruise control autopilot failure accident crash bug lockup freeze brakes ignition engine control**

RISKS 23 81

CRUISE-CONTROL TAKES BITS IN ITS TEETH?

Robert Scheidt reported on a serious problem and asked for clarification:

Recently in France a number of failures of "cruise control" systems especially on recent models of Renault made cars have been reported, some creating serious accidents (including a deadly one). In general it is reported that the car stays at his set speed and no matter what the driver does, including cutting the ignition and breaking, the car continues at that speed.

What's more surprising is that it is also reported that brakes become ineffective (the brake pedal resists pressure).

I could imagine that the cruise control being probably under control of some microprocessor, this microprocessor could "hang" due to some software problem and therefore that everything it controls just stays as it is. Especially in newer cars where fuel injection is completely electronically controlled (no mechanical link between the gas pedal and the fuel injection controls).

However, I have difficulties believing that the same microprocessor would control the brakes and make them ineffective. I wonder if somebody on this board has some insight on how the electronic controls of modern cars are designed and especially if a single component's failure (such as a common microprocessor) could affect multiple functions (e.g., acceleration and brakes).

There was a flurry of discussion in RISKS 23.82. Several correspondents confirmed that some automotive systems do in fact control brakes as well as speed.

2005-03-24 **bank account redit card transfer third party registration vulnerability fraud theft design flaw**

RISKS 23 81

RISKY US BANK VISA PRODUCT

John Meissen analyzed the security flaws in a new Visa service:

US Bank has a Visa product targeted at teens (or rather, their parents), called VisaBuxx. It looks and acts like a standard Visa-logo debit card, but is more like a prepaid phone card - you pre-load it with value, and it's not directly tied to any bank account.

Their web site and marketing literature talk about being able to easily add value to the card by transferring money online from an existing US Bank checking account. Unfortunately, the system leaves a lot to be desired.

The usbank.com website has a link for the VisaBuxx program. When you click on it you're redirected to another site, called visabuxx.com. This site is apparently run by someone called "WildCard Systems". In order to transfer money from your US Bank checking account to the card you have to provide WildCard Systems with your checking account number and routing information and authorization to pull funds from the account, or give them your own debit card number. While WildCard Systems may be honorable and trustworthy, the risks in this are so obvious that it's painful. Meanwhile, the Terms Of Service published on the site go to great lengths to explicitly disavow any responsibility for anything bad that might result from the use of the site.

The correct way for the bank to have implemented this would have been to provide the ability to associate the card with your existing Internet banking identity, and then let you log in through the bank's website and tell the them to send money from an account to the card rather than allowing the card operators to pull money from your account. Having the ability to provide account data to the VisaBuxx website is useful for non-US Bank customers, but a legitimate US Bank customer I shouldn't be forced to do it.

I find it mind-boggling that financial corporations still can't see the obvious when it comes to protecting customer account data. When dealing with an official bank product I should NEVER have to tell the application anything about my accounts.

2005-03-25 **Sybase lawsuit threat flaw vulnerability open disclosure Next Generation Security**

EDUPAGE; http://www.computerworld.com/

SYBASE BLOCKS FLAW DISCLOSURE WITH THREAT TO SUE

California-based Sybase Inc. has threatened to sue U.K.-based Next Generation Security (NGS) Software Ltd. If that company discloses the details of eight security flaws it discovered in 2004 in Sybase database software, Adaptive Server Enterprise Version 12.5.3. NGS notified Sybase of the flaws, and Sybase released a patched and updated version of the software in February 2005. NGS policy mandates that it wait for vendors to issue patches before publicly releasing information on software flaws. The company chose not to make a public disclosure of the database holes after receiving the Sybase letter threatening to sue. According to an e-mail statement from a Sybase spokeswoman, the company was motivated to prevent the disclosure out of concern for its users' security. ComputerWorld, 25 March 2005

2005-03-28 **denial of service human error clock time data entry bank customers automated teller online services**

RISKS; http://tinyurl.com/djrmz 23 82

HUMAN ERROR SHUTS DOWN BARCLAY'S AUTOMATED TELLER SYSTEM

Michael "Streaky" Bacon [no, really] reported on a service interruption for customers of the British Barclay's Bank. The following reorganizes parts of his report to RISKs.

On 27 Mar 2005, the UK put its clocks forward one hour. This apparently caused problems for Barclays Bank - one of the UK's leading banks - with ATMs and other online services unavailable to customers in the South of the country. The text of the Daily Telegraph's report on the failure is reproduced below.

> Summer Time slip-up forces Barclays' cashpoints to close
> *The Daily Telegraph*, 28 March 2005
>
> Millions of Barclays customers were unable to withdraw money yesterday after the bank's cashpoint network crashed amid claims that a duty manager had accidentally put the clocks back instead of forward. More than 1,400 auto-tellers in the south of England and some on-line services were out of order. Barclays customers were unable to withdraw money from any bank, while cardholders with other banks were unable to use Barclays cash machines.
>
> The error came to light at 4am on 27 Mar 2005 when technicians noticed that customers' personal details were not being forwarded to the computers that control much of the bank's infrastructure. The problem was eventually resolved at 5pm. Executives trying to determine the cause of the problem admitted that a mistake during the switch to British Summer Time could have been to blame. Customer services staff were less ambiguous. One admitted: "A manager put the clocks back instead of forward and that has caused enormous problems."
>
> The bank's British network uses two servers based in Gloucestershire: one for operations north of the Wash and the other to control operations in the South. The Gloucester South server is understood to have been set one hour back instead of forward. The bank conceded that an error over the time change was to blame but denied that an individual manager made the mistake. Alistair Smith, a spokesman for the bank, said: "It seems that this problem may somehow be related to the time change, although I am told it was not to do with someone making a mistake while manually changing the time."

Mr Bacon then analyzes the situation as follows:

I would be surprised if the bank relied upon the actions of a human to change the time on its servers. For example, if the servers are not time synchronised through an atomic clock receiver or from an NTP Time Server, it begs serious questions regarding the time-standing of transactions.

Bi-annual time changes have been a part of computing at least since the first commercial systems began processing. Surely 54 years is not too short a time to have worked out the risks and put in place procedures to deal with them.

If it was indeed a human error, perhaps the heading on the relevant page should read: "Spring forward, fall back".

Another puzzling factor is that it apparently took 11 hours (4 am to 5 pm) to determine and correct the problem. In my experience, the first thing to be blamed is the last thing that was changed.

DHS IAIP Daily; http://secunia.com/advisories/14756/

SYLPHEED MIME-ENCODED ATTACHMENT FILENAME BUFFER OVERFLOW.

A vulnerability has been reported in Sylpheed, which potentially can be exploited by malicious people to compromise a user's system. The vulnerability is caused due to a boundary error when displaying messages containing attachments with MIME-encoded filenames. This can be exploited to cause a buffer overflow via a specially crafted message. Update to version 1.0.4: http://sylpheed.good-day.net/

Category 21.1 General QA failures

2005-04-01 **NetVault buffer overflow vulnerability code execution attack no update issued**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2005/Apr/1013625.html

NETVAULT BUFFER OVERFLOWS LET LOCAL AND REMOTE USERS EXECUTE ARBITRARY CODE

A vulnerability exists in the processing of the 'configure.cfg' file. A local user with access to the file can create a computername 'Name=' entry that is longer than 111 bytes. When the NetVault Process Manager service starts (or restarts), a buffer overflow will be triggered and arbitrary code executed with System privileges. A remote user can connect to the target system on port 20031 and supply a specially crafted 'clientname' entry in the 'Available NetVault Machines' list to trigger a heap overflow and execute arbitrary code on the target server. A local user with write access to the 'configure.cfg' file can execute arbitrary code with System level privileges. No solution is currently available.

Category 21.1 General QA failures

2005-04-05 **BakBone NetVault heap based buffer overflow vulnerabilities system compromise no update issued**

DHS IAIP Daily; http://secunia.com/advisories/14814/

BAKBONE NETVAULT BUFFER OVERFLOW VULNERABILITIES

Some vulnerabilities in BakBone NetVault, which can be exploited by malicious people to compromise a vulnerable system. The vulnerabilities are caused due to some boundary errors in the communication handling. This can be exploited to cause a heap-based buffer overflow by sending some specially crafted traffic to port 20031. There is no vendor solution at this time.

Category 21.1 *General QA failures*

2005-05-30 **vulnerability hole Microsoft Windows operating system OS Remote Desktop protocol server private key disclosure DLL public key hardcoding design error no solution**

DHS IAIP Daily; http://www.securityfocus.com/bid/13818/info/

MICROSOFT WINDOWS REMOTE DESKTOP PROTOCOL SERVER PRIVATE KEY DISCLOSURE VULNERABILITY

The vulnerability presents itself because a private key that is used to sign the Terminal Server public key is hardcoded in a DLL. This allows the attacker to disclose the key and calculate a valid signature to carry out man in the middle attacks. An attacker could therefore cause the client to connect to a server under their control and send the client a public key to which they possess the private key. There is no solution at this time.

Category 21.1 *General QA failures*

2005-05-31 **vulnerability hole MyBB bulletin board cross-site scripting SQL injection user input checking database exploitation**

DHS IAIP Daily; http://www.securityfocus.com/bid/13827

MYBB MULTIPLE CROSS-SITE SCRIPTING AND SQL INJECTION VULNERABILITIES

MyBB is prone to multiple cross-site scripting and SQL injection vulnerabilities. These issues are due to a failure in the application to properly sanitize user supplied input. The application is prone to multiple SQL injection vulnerabilities. Successful exploitation could result in a compromise of the application, disclosure or modification of data, or may permit an attacker to exploit vulnerabilities in the underlying database implementation. Updates available at: http://mybboard.com/community/attachment.php?aid=862

Category 21.1 *General QA failures*

2005-05-31 **vulnerability hole Microsoft Windows operating system OS Hyperlink Object Library buffer overflow arbitrary code execution privilege execution**

DHS IAIP Daily; http://www.securityfocus.com/bid/12479

MICROSOFT WINDOWS HYPERLINK OBJECT LIBRARY BUFFER OVERFLOW VULNERABILITY

The Microsoft Windows Hyperlink Object Library is reported prone to a buffer overflow vulnerability. An attacker may exploit this condition to execute arbitrary code on a vulnerable computer, which may grant unauthorized access to the computer or lead to privilege escalation. It is reported that issue presents itself when a user follows a malformed link specially crafted by an attacker, however, other attack vectors also exist to exploit this vulnerability. Specifically, an application that employs the affected library by accepting and supplying parameters to the library may allow an attacker to exploit this vulnerability remotely and without user interaction. Updates available through Source link below.

Category 21.1 *General QA failures*

2005-05-31 **vulnerability hole PHP4 PHP5 SSI local remote arbitrary code execution vendor solutions**

DHS IAIP Daily; http://www.securityfocus.com/bid/11964

PHP MULTIPLE LOCAL AND REMOTE VULNERABILITIES

PHP4 and PHP5 are reported prone to multiple local and remote vulnerabilities that may lead to code execution within the context of the vulnerable process. PHP safe_mode_exec_dir is reported prone to an access control bypass vulnerability. A local attacker that can manipulate the directory name from which the PHP script is called, may bypass 'safe_mode_exec_dir' restrictions by placing shell metacharacters and restricted commands into the directory name of the current directory. This may allow them to gain access to potentially sensitive information, such as database credentials. Refer to Source link below for vendor solutions.

Category 21.1 *General QA failures*

2005-06-01 **vulnerability hole PeerCast URL remote format string arbitrary command execution denial-of-service DoS solution upgrade**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/0651

PEERCAST MALFORMED URL REMOTE FORMAT STRING VULNERABILITY

A vulnerability was identified in PeerCast, which may be exploited by remote attackers to execute 10 arbitrary commands or cause a denial of service. This flaw is due to a format string error when handling specially crafted HTTP requests (port 7144), which may be exploited by remote attackers to crash or compromise a vulnerable server. Upgrade to PeerCast version 0.1212: http://www.peercast.org/download.php

Category 21.1 *General QA failures*

2005-06-01 **vulnerability hole Symantec Brightmail AntiSpam information disclosure remote database access**

DHS IAIP Daily; http://www.securityfocus.com/bid/13828

SYMANTEC BRIGHTMAIL ANTISPAM REMOTE INFORMATION DISCLOSURE VULNERABILITY

Symantec Brightmail AntiSpam is susceptible to a remote information disclosure vulnerability. This issue is due to a failure of the application to properly ensure that remote database access is properly disabled. Original advisory and updates: http://securityresponse.symantec.com/avcenter/security/Conte nt/2005.05.31a.html

---

Category 21.1 *General QA failures*

2005-06-01 **vulnerability hole NASM IEEE_PUTASCII buffer overflow unauthorized access**

DHS IAIP Daily; http://www.securityfocus.com/bid/13506

NASM IEEE_PUTASCII REMOTE BUFFER OVERFLOW VULNERABILITY

NASM is prone to a remote buffer overflow vulnerability. An attacker exploits this issue by crafting a malicious source file to be assembled by the application. This file is sent to an affected user and if the user loads the file in NASM, the attack may result in arbitrary code execution. The attacker may then gain unauthorized access in the context of the user running NASM. Refer to Source link below for vendor solutions.

Category 21.1 *General QA failures*

2005-06-01 **vulnerability Microsoft Outlook Express file processing extension obfuscation**

DHS IAIP Daily; http://www.securityfocus.com/bid/13837/info

MICROSOFT OUTLOOK EXPRESS ATTACHMENT PROCESSING FILE EXTENSION OBFUSCATION VULNERABILITY

Microsoft Outlook Express is prone to an attachment file extension obfuscation vulnerability that may present a risk under certain configurations. Reports indicate that this may be leveraged to make the attached email message executable. It is possible to cause a default file handler to be invoked to process the attached email message and potentially allowing for code execution. This issue may lure a victim into a false sense of security and may result in inadvertent or unintentional execution of attacker supplied code. There is no solution at this time.

Category 21.1 *General QA failures*

2005-06-04 **remote vulnerability hole Bluetooth Protocol device pairing PIN no solution**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/0689

BLUETOOTH PROTOCOL DEVICE PAIRING PROCESS REMOTE VULNERABILITY

A vulnerability was identified in the Bluetooth Protocol, which may be exploited by remote attackers to bypass certain security measures. This flaw is due to a design error in the pairing process initialized by two Bluetooth devices in order to create a shared secret value, which may be exploited by an attacker to force the repairing process, determine a valid link key, crack the PIN (Personal Identification Number) and potentially hijack all the messages transferred between two Bluetooth devices. There is no solution at this time.

Category 21.1 *General QA failures*

2005-06-06 **vulnerability hole Sun Solaris privilege escalation**

DHS IAIP Daily; http://securitytracker.com/alerts/2005/Jun/1014108.html

SUN SOLARIS LIBC __INIT_SUID_PRIV() LETS LOCAL USERS GAIN ELEVATED PRIVILEGES

A vulnerability was reported in libc and libproject on Sun Solaris. A local user may be able to gain elevated privileges. A local user can invoke libproject(3LIB) to trigger a flaw in the libc(3LIB) __init_suid_priv() function and gain elevated privileges. Original advisory and update: http://sunsolve.sun.com/search/document.do?assetkey=1-26-101 740-1

Category 21.1 *General QA failures*

2005-06-06 **vulnerability hole PortailPHP SQL injection exploit database implementation**

DHS IAIP Daily; http://www.securityfocus.com/bid/13708/exploit

PORTAILPHP ID PARAMETER SQL INJECTION VULNERABILITY

PortailPHP is prone to an SQL injection vulnerability. Successful exploitation could result in a compromise of the application, disclosure or modification of data, or may permit an attacker to exploit vulnerabilities in the underlying database implementation. No solution is currently available.

Category 21.1 *General QA failures*

2005-06-07 **vulnerability hole input validation user input sanitization failure arbitrary code execution PHP cross-site scripting information access solution upgrade**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/0697

FLATNUKE MULTIPLE INPUT VALIDATION VULNERABILITIES

Multiple input validation vulnerabilities reportedly affect FlatNuke. These issues are due to a failure of the application to properly sanitize user supplied input prior to using it in application critical actions such as generating Web content or loading scripts. An attacker may leverage these issues to execute arbitrary PHP code, execute client side script code in the browsers of unsuspecting users through cross site scripting attacks, and gain access to sensitive information. Other attacks are also possible. Upgrade to FlatNuke version 2.5.4: http://sourceforge.net/project/showfiles.php?group_id=93076& package_id=98622

Category 21.1 *General QA failures*

2005-06-08 **vulnerability hole IBM AIX operating system buffer overflow arbitrary code execution no solution**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2005/Jun/1014132.html

IBM AIX BUFFER OVERFLOWS LET LOCAL USERS EXECUTE ARBITRARY CODE

Several vulnerabilities were reported in IBM's AIX operating system, affecting the vscout, paginit, diagTasksWebSM, getlvname, and swcons commands and multiple "p" commands. A local user can supply specially crafted command line parameters to trigger a buffer overflow in the invscout, paginit, diagTasksWebSM, getlvname, and swcons commands and execute arbitrary code, potentially with root privileges. No solution is currently available.

Category 21.1 *General QA failures*

2005-06-09 **software vulnerability tcpdump BGP decoding infinite loop denial-of-service DoS ISIS packets**

DHS IAIP Daily; http://www.securityfocus.com/advisories/8671

TCPDUMP BGP DECODING ROUTINES DENIAL OF SERVICE VULNERABILITY

TCPDUMP is prone to a vulnerability that may allow a remote attacker to cause a denial of service condition in the software. The issue occurs due to the way tcpdump decodes Border Gateway Protocol (BGP) packets. A remote attacker may cause the software to enter an infinite loop by sending malformed ISIS packets resulting in the software hanging. Updates are available from vendors.

Category 21.1 *General QA failures*

2005-06-09 **vulnerability hole IBM AIX operating system buffer overflow arbitrary code execution no solution**

DHS IAIP Daily; http://www.securityfocus.com/bid/13914/discuss

IBM AIX GETLVNAME COMMAND LINE ARGUMENT LOCAL BUFFER OVERFLOW VULNERABILITY

IBM AIX getlvname is prone to a local buffer overflow vulnerability. A buffer overflow exists in the handling of the commandline arguments to getlvname. When parsing and concatenating the supplied arguments a length parameter is not checked and a typical overflow occurs. A successful attack allows arbitrary machine code execution with super user privileges, facilitating privilege escalation. Vendor solution is pending.

Category 21.1 General QA failures

2005-06-09 **vulnerability Cisco Voice VLAN 802.1x authentication bypass CDP packet spoofing**

DHS IAIP Daily; http://www.securityfocus.com/bid/13902/discuss

CISCO VOICE VLAN 802.1X AUTHENTICATION BYPASS VULNERABILITY

Cisco switches are susceptible to an authentication bypass vulnerability, allowing attackers to gain anonymous access to the voice VLAN. Attackers may spoof CDP packets, and impersonate a Cisco IP phone, in order to anonymously join the voice VLAN. This allows attackers to gain access to network resources without the expected 802.1x authentication sequence. As network administrators expect that switch port access is restricted to only authenticated users, a false sense of security may pervade. Vendor advisory and workarounds: http://www.cisco.com/warp/public/707/cisco-sn-20050608-8021x .shtml

---

Category 21.1 General QA failures

2005-06-13 **vulnerability eTrace plugin shell command no solution**

DHS IAIP Daily; http://secunia.com/advisories/15678/

E107 ETRACE PLUGIN SHELL COMMAND INJECTION VULNERABILITY

A vulnerability in the eTrace plugin for e107, which can be exploited by malicious people to compromise a vulnerable system. Input passed to the "etrace_cmd" and "etrace_host" parameters in "dotrace.php" isn't properly sanitized before being used in a "system()" call. This can be exploited to inject arbitrary shell commands. There is no solution at this time.

Category 21.1 General QA failures

2005-06-14 **Microsoft June 2005 security bulletin ten updates**

DHS IAIP Daily; http://www.microsoft.com/technet/security/bulletin/ms05−jun.
mspx

MICROSOFT ISSUES JUNE SECURITY BULLETIN

Microsoft issued its security update for June on Tuesday, June 14. Of the ten updates (MS05-025 – MS05-034) issued for June, three are critical, four are important, and three are moderate. Affected products and components are Internet Explorer, Windows HTML Help, Windows Server Message Block, Web Client Server, Outlook Web Access for Exchange Server, Outlook Express, Step-by-Step Interactive Training, Microsoft Agent, Telnet Client, and ISA Server 2000. Impacts include remote code execution, information disclosure, and escalation of privilege. See Source link and individual bulletins for updates.

Category 21.1 General QA failures

2005-06-15 **vulnerability hole Bitrix Site Manager exploit Web server arbitrary code execution no solution**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/0779

BITRIX SITE MANAGER REMOTE PHP FILE INCLUSION VULNERABILITY

A vulnerability was identified in Bitrix Site Manager, which may be exploited by attackers to compromise a vulnerable web server. This flaw is due to an input validation error in the "index.php" script when processing a specially crafted "SERVER[DOCUMENT_ROOT]" variable, which may be exploited by attackers to include arbitrary files and execute remote commands with the privileges of the web server. There is no solution at this time.

Category 21.1 General QA failures

2005-06-16 **vulnerability hole ultimate PHP Board weak password encryption no solution**

DHS IAIP Daily; http://www.securityfocus.com/bid/13975

ULTIMATE PHP BOARD WEAK PASSWORD ENCRYPTION VULNERABILITY

Ultimate PHP Board is prone to a weak password encryption vulnerability. This issue is due to a failure of the application to protect passwords with a sufficiently effective encryption scheme. This issue may allow a malicious user to gain access to user and administrator passwords for the affected application. There is no solution at this time.

Category 21.1 General QA failures

2005-06-16 **vulnerability gedit filename format string arbitrary code execution**

DHS IAIP Daily; http://www.securityfocus.com/bid/13699/solution

GEDIT FILENAME FORMAT STRING VULNERABILITY

gEdit is prone to a format string vulnerability. Exploitation may occur when the program is invoked with a filename that includes malicious format specifiers. This issue could be exploited to corrupt arbitrary regions of memory with attacker supplied data, potentially resulting in execution of arbitrary code in the context of the user running the program. See Source link below for vendor updates.

Category 21.1 General QA failures

2005-06-17 **vulnerability Sun Messaging server HTML injection attack no solution**

DHS IAIP Daily; http://sunsolve.sun.com/search/document.do?assetkey=1−26−101 770−1

SUN ONE/IPLANET MESSAGING SERVER WEBMAIL MSIE HTML INJECTION VULNERABILITY

Sun ONE/iPlanet Messaging Server Webmail is prone to an HTML injection vulnerability. This issue may allow a remote attacker to inject hostile HTML and script code into the session of a Webmail user. Sun has stated that this issue only affects users who access Webmail with Internet Explorer. There is no solution at this time.

Category 21.1 General QA failures

2005-06-17 **vulnerability hole Adobe Reader 7 XML Eternal Entity XXE JavaScript PDF update issued**

DHS IAIP Daily; http://www.zone−h.org/advisories/read/id=7674

ADOBE READER 7 VULNERABLE TO XML EXTERNAL ENTITY (XXE) ATTACK

Recent versions of Adobe Reader are vulnerable to XML External Entity (XXE) attacks. By including a JavaScript in a PDF file, and having this JavaScript parse an embedded XML document with a reference to an external entity, it is possible to read certain types of text files on the local computer, and have them sent to a remote attacker. Original advisory and updates available: http://www.adobe.com/support/techdocs/331710.html

Category 21.1 General QA failures

2005-06-20 **vulnerability hole Cisco VPN 3000 remote user valid groupnames updated version issued**

DHS IAIP Daily; http://securitytracker.com/alerts/2005/Jun/1014246.html

CISCO VPN 3000 LETS REMOTE USERS DETERMINE VALID GROUPNAMES

A vulnerability was reported in the Cisco VPN 3000 concentrators. A remote user can determine valid groupnames. When groupname authentication is used, the system provides a different response to a connection request with a valid groupname than it does with an invalid groupname. A remote user can connect to the target system repeatedly and send an IKE Aggressive Mode packet using different groupnames to attempt to determine valid groupnames. The system will respond only to packets with a valid groupname. The vendor has released a fixed version (4.1.7.F).

Category 21.1 General QA failures

2005-06-21 **vulnerability SpamAssassin remote denial-of-service DoS**

DHS IAIP Daily; http://www.securityfocus.com/bid/13978/solution

SPAMASSASSIN MALFORMED EMAIL HEADER REMOTE DENIAL OF SERVICE VULNERABILITY

SpamAssassin is prone to a remote denial of service vulnerability. This issue is due to a failure of the application to properly handle overly long email headers. An attacker may cause SpamAssassin to take inordinate amounts of time to check a specially crafted email message. By sending many malicious messages, it may be possible for attackers to cause extremely large delays in email delivery, denying service to legitimate users. See Source link for solution.

Category 21.1 *General QA failures*

2005-06-22 **vulnerability hole Veritas Backup remote heap overflow privilege escalation update issued**

DHS IAIP Daily; http://www.securityfocus.com/bid/14023/solution

VERITAS BACKUP EXEC ADMIN PLUS PACK OPTION REMOTE HEAP OVERFLOW VULNERABILITY

Veritas Backup Exec is affected by a remote heap overflow vulnerability. A remote attacker can exploit this issue by crafting and sending malicious data to the service and executing arbitrary code. Successful exploitation may result in a super user compromise. Original advisory and updates: http://seer.support.veritas.com/docs/276607.htm

Category 21.1 *General QA failures*

2005-06-22 **vulnerability hole Ipswitch WhatsUp Professional SQL injection data modification update issued**

DHS IAIP Daily; http://www.securityfocus.com/bid/14039/discuss

IPSWITCH WHATSUP PROFESSIONAL LOGIN.ASP SQL INJECTION VULNERABILITY

WhatsUp Professional is prone to an SQL injection vulnerability affecting its Web based front end. Successful exploitation could result in a compromise of the application, disclosure or modification of data, or may permit an attacker to exploit vulnerabilities in the underlying database implementation. The vendor has released WhatsUp Professional 2005 SP1a to address this issue.

Category 21.1 *General QA failures*

2005-06-22 **vulnerability hole Sun Java Web Start unauthorized access**

DHS IAIP Daily; http://www.securityfocus.com/bid/12847/solution

SUN JAVA WEB START SYSTEM PROPERTY TAGS REMOTE UNAUTHORIZED ACCESS VULNERABILITY

A remote unauthorized access vulnerability affects Java Web Start. This issue is due to a failure of the application to properly validate user supplied input prior to considering it as trusted. An attacker may leverage this issue to gain unauthorized read and write access to affected computers. Other attacks may also be possible. It should be noted that unauthorized access granted in this way will be with the privileges of the unsuspecting user that visits a malicious Website. See Source link for solutions.

Category 21.1 *General QA failures*

2005-06-24 **vulnerability hole Sun Solaris operating system local buffer overflow**

DHS IAIP Daily; http://www.securityfocus.com/bid/14049/info

SUN SOLARIS TRACEROUTE MULTIPLE LOCAL BUFFER OVERFLOW VULNERABILITIES

Sun Solaris traceroute is affected by multiple local buffer overflow vulnerabilities. These vulnerabilities present themselves when the application handles excessive data supplied through command line arguments. These issue are reported to affect /usr/sbin/traceroute running on Sun Solaris 10. Some reports indicate that this issue cannot be reproduced. It is also reported that this issue is only exploitable on the Solaris x86 platform.

Category 21.1 *General QA failures*

2005-06-24 **vulnerability hole IBM DB2 Universal Database authorization bypass fixes issued**

DHS IAIP Daily; http://www.securityfocus.com/bid/14057/info

IBM DB2 UNIVERSAL DATABASE UNSPECIFIED AUTHORIZATION BYPASS VULNERABILITY

IBM DB2 Universal Database is susceptible to an authorization bypass vulnerability. This issue is due to a failure of the application to properly enforce authorization restrictions for database users. Users with SELECT privileges on in a database may bypass authorization checks to execute INSERT, UPDATE, or DELETE statements. Further details are not available at this time. This BID will be updated as more information is disclosed. This vulnerability allows attackers to modify or destroy data without having proper authorization to do so. IBM has released an advisory, along with fixes to address this issue.

2005-06-28 **vulnerability hole CSV DB arbitrary command execution**

DHS IAIP Daily; http://secunia.com/advisories/15842/

CSV_DB / I_DB ARBITRARY COMMAND EXECUTION VULNERABILITY

A vulnerability has been reported in CSV_DB 1.0, which can be exploited by malicious people to execute arbitrary commands. Input passed to the "file" parameter in csv_db.cgi is not properly sanitized before being used. This can be exploited to execute arbitrary commands on the server by appending the commands to the end of the "file" parameter using the pipe character. The vendor has confirmed that the vulnerability also affects i_DB version 1.0.

Category 21.1 *General QA failures*

2005-07-14 **software quality assurance QA design flaw bounds checking impossible values data integrity nonsense sanity**

RISKS; http://www.cnn.com/2005/US/07/14/hot.summer.ap/index.html 23 94

TORRENTIAL METER ERROR

The utility department in Mascoutah (Illinois) sent Rose Mary Cook a bill for the use of 10 million gallons of water in a month, totalling $29,787 for the water and $43,581 for the ensuing sewer usage. The cause was not surprisingly the result of a broken meter.

[Abstract by Peter G. Neumann, who ask, "Why doesn't meter reading use sanity checking?"]

[MK adds that teachers of systems design and programming should drill their students in the principle that all inputs should be checked for reasonableness. For example, 10M gallons in, say, 30 days implies a continuous flow of almost 4 gallons _per second_ throughout the month. A well written program would have flagged the data error before sending the monstrous bill.]

Category 21.1 *General QA failures*

2005-07-17 **data corruption database medical records admissions consults disaster plan backups continuity planning failure catastrophe acquisition**

RISKS 23 94

LISBON HOSPITAL RECORDS SYSTEM DOWN 10 DAYS DUE TO DATABASE CRASH

Lisbon newspaper "O Público" reports today that the main information system for the Lisbon Hospital Center, which supports three large Lisbon hospitals, has not worked since July 8. It appears that the master patient index has become inaccessible, and may be lost. If a patient shows up without a hospital-issued card, which includes a patient id number, the patient's records cannot be accessed. Out- patient consultations and admissions are being processed manually, causing "great confusion." Emergency room admissions are much slower than usual. The waiting list for surgery also appears lost, although that has not been confirmed. A doctor at one of the hospitals and board member for a doctors union said that "No one knows for certain what will happen or when the problem will be solved." The assistant to the director of the hospital group explains that "The system failed totally eight days ago, and technicians tried to restore it immediately, but without success. At the beginning of last week, the US firm who supplied the system was brought in, and it is expected that the situation will be resolved by Monday." He also said that the failure was unexpected, that the hospital group did not the ability to fix it on their own, and that the breakdown "has had no impact on the normal functioning of the hospitals, except for the slowdown in patient registration."

So, it takes much longer to admit patients, their medical records are inaccessible unless they have registered before and bring with them their registration card (something that anyone dealing with a medical emergency will for sure remember to do), and doctors report confusion, but there's really no impact, according to the hospital group administration. A mission-critical system has no backup or immediate access to repair expertise.

For readers not familiar with Portugal, Lisbon public hospitals are notorious for poor financing, inefficiency, bureaucracy, and long waiting lists. They cater mostly to those who cannot afford private care, especially many pensioners in an aging city. Another common problem with public institutions in Portugal are poor procurement controls, especially for technology and informations services. Many purchases are made without much attention to cost of ownership, service guarantees, or access to parts and service. Some administrators are too easily seduced by fancy presentations by local representatives of foreign suppliers who have no local expertise or staying power.

2005-07-24 **hacker vulnerability disclosure reward discovery TippingPoint**

EDUPAGE; http://news.com.com/2100-7350_3-5802411.html

PAYING HACKERS FOR BUGS

Computer-security firm TippingPoint has begun a program to pay rewards to individuals who report computer vulnerabilities. Not unlike similar programs from other companies, the TippingPoint deal offers a variable amount of money if a reported bug proves valid. The company will use the information to update its own protection software and will notify the maker of the vulnerable product about the problem. David Endler, director of security research at TippingPoint, said the reward program is intended to "reward and encourage independent security research" and to "ensure responsible disclosure of vulnerabilities." Not all security companies believe in bounties. Internet Security Systems, for one, said that paying for such bug reports amounts to having hackers do a company's research for it. An official from Internet Security Systems also noted that the bugs reported in such programs are typically very low-level problems, saying that the more extreme vulnerabilities are worth much more when used for hacking than if turned in to security companies. CNET, 24 July 2005

2005-07-29 **open vulnerability disclosure Cisco router software Michael Lynn litigation**

EDUPAGE; http://www.siliconvalley.com/mld/siliconvalley/12255870.htm

CISCO AND SECURITY RESEARCHER AGREE TO DISAGREE

Security researcher Michael Lynn and Cisco Systems have reached an agreement that should put an end to Cisco's legal action against Lynn for speaking publicly about a flaw in the company's router software. Lynn, who until Wednesday was employed by Internet Security Systems (ISS), gave a presentation at the Black Hat Conference discussing the vulnerability. Cisco and ISS had discouraged Lynn from giving the presentation, saying that a patch had been issued for the flaw. Lynn believed Cisco had not been open with consumers about the severity of the problem, and he resigned from ISS to protest the company's position that he should not give the presentation. After he left ISS, however, Lynn faced legal action from Cisco, which argued that he had no right to make the presentation since he was no longer employed by ISS. Under the agreement, Lynn will stop disclosing information about the flaw, and the legal action will be canceled. Computer security expert Bruce Schneier applauded Lynn for his conviction in exposing what he thought was a serious flaw despite the risks of going public. Matt Bishop, professor of computer science at the University of California-Davis, said he sees the practice of exposing flaws publicly as a dangerous practice and that working with the affected vendor is preferable. San Jose Mercury News, 29 July 2005

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1316

ORACLE FOR OPENVIEW (OFO) MULTIPLE SECURITY VULNERABILITIES

Multiple vulnerabilities were identified in Oracle for Openview (OfO), which could be exploited by remote or local attackers to execute arbitrary commands or conduct SQL injection attacks. These flaws, initially reported in Oracle Critical Patch Update (July 2005), could be exploited by remote or local attackers to cause a denial of service, execute arbitrary commands or conduct SQL injection attacks. OfO customers who have support contracts directly from Oracle should obtain the Critical Patch Update (July 2005) from Oracle: http://www.oracle.com/technology/deploy/security/pdf/cpujul2 005.html OfO customers who have support from Hewlett-Packard should contact the normal support channel to obtain the Critical Patch Update (July 2005): http://www.hp.com/managementsoftware/contract_maint

Category 21.1 General QA failures

2005-08-06 **vulnerability hole PHP-Fusion SQL injection exploit database implementation**

DHS IAIP Daily; http://www.securityfocus.com/bid/14489/info

PHP-FUSION MESSAGES.PHP SQL INJECTION VULNERABILITY

PHP-Fusion is prone to an SQL injection vulnerability. This issue is due to a failure in the application to properly sanitize user-supplied input to the 'messages.php' script before using it in an SQL query. Successful exploitation could result in a compromise of the application, disclosure or modification of data, or may permit an attacker to exploit vulnerabilities in the underlying database implementation. Security Focus is not currently aware of any vendor-supplied patches for this issue.

Category 21.1 General QA failures

2005-08-08 **vulnerability MySQL buffer overflow user defined functions**

DHS IAIP Daily; http://www.appsecinc.com/resources/alerts/mysql/2005−002.html

BUFFER OVERFLOW IN MYSQL USER DEFINED FUNCTIONS

User-defined functions in MySQL allow a user in the database to call binary libraries on the operating system. Creating a user-defined function requires insert privileges on the mysql.func table. The init_syms() function uses an unsafe string function to copy a user specified string into a stack based buffer. Due to improper sanitation this buffer is able to be overflowed, overwriting portions of the stack. This allows an attacker to write 14 bytes of arbitrary data and eight bytes of hard coded data beyond the end of the buffer. Exploiting this vulnerability would require the ability to create user-defined functions. This is not typically granted to untrusted users. MySQL versions 4.0.25, 4.1.13, or 5.0.7-beta have been patched: http://dev.mysql.com/downloads/

Category 21.1 General QA failures

2005-08-08 **vulnerability Comdev eCommerce file inclusion system compromise**

DHS IAIP Daily; http://secunia.com/advisories/16346/

COMDEV ECOMMERCE FILE INCLUSION VULNERABILITY

A vulnerability has been discovered in Comdev eCommerce, which can be exploited by malicious people to compromise a vulnerable system. Input passed to the "path[docroot]" parameter is not properly verified, before it is used to include files. This can be exploited to include arbitrary files from external and local resources. Example: http://[host]/oneadmin/config.php?path[docroot]=[file] Successful exploitation requires that "magic_quotes_gpc" is disabled. The vulnerability has been confirmed in version 3.1. Other versions may also be affected. Solution: Edit the source code to ensure that input is properly verified.

Category 21.1 General QA failures

2005-08-08 **vulnerability PHPSiteStats authentication bypass access violation**

DHS IAIP Daily; http://www.securityfocus.com/bid/14493/solution

PHPSITESTATS UNSPECIFIED AUTHENTICATION BYPASS VULNERABILITY

PHPSiteStats is prone to an unspecified authentication bypass vulnerability. A successful attack can allow unauthorized attackers to bypass the authentication routines and gain access to the application. An attacker may then carry out other attacks against the vulnerable computer. PHPSiteStats 1.0 is prone to this issue. Other versions may be vulnerable as well. The vendor has released PHPSiteStats 1.1 to address this issue: http://prdownloads.sourceforge.net/phpsitestats/phpsitestats 1.1.zip?download

---

Category 21.1 General QA failures

2005-08-08 **vulnerability hole SysCP system compromise update issued**

DHS IAIP Daily; http://secunia.com/advisories/16347/

TWO VULNERABILITIES REPORTED IN SYSCP

Two vulnerabilities have been reported in SysCP, which can be exploited by malicious people to compromise a vulnerable system. 1) Input passed to a certain parameter is not properly verified before being used to include a language file. This can be exploited to include arbitrary files from external resources. 2) Input passed to the internal template engine is insufficiently sanitized, which can be exploited to inject arbitrary PHP code. Successful exploitation requires that register_globals is enabled. The vulnerabilities have been reported in versions 1.2.10 and prior. Users should update to version 1.2.11. http://www.syscp.de/wiki/EnDownloads

---

Category 21.1 *General QA failures*

2005-08-09 **patch fix update Red Hat critical Gaim update heap buffer overflow denial-of-service DoS**

DHS IAIP Daily; http://rhn.redhat.com/errata/RHSA−2005−627.html

RED HAT RELEASES CRITICAL GAIM SECURITY UPDATE

An updated gaim package that fixes multiple security issues is now available. A heap based buffer overflow issue was discovered in the way Gaim processes away messages. A remote attacker could send a specially crafted away message to a Gaim user logged into AIM or ICQ that could result in arbitrary code execution. A denial of service issue was also discovered in Gaim. A remote attacker could attempt to upload a file with a specially crafted name to a user logged into AIM or ICQ, causing Gaim to crash. A denial of service bug was found in Gaim's Gadu Gadu protocol handler. A remote attacker could send a specially crafted message to a Gaim user logged into Gadu Gadu, causing Gaim to crash. Please note that this issue only affects PPC and IBM S/390 systems running Gaim. Users of gaim are advised to upgrade to an updated package, which contains backported patches and is not vulnerable to these issues. Before applying this update, make sure all previously released errata relevant to your system have been applied.

Category 21.1 *General QA failures*

2005-08-09 **vulnerability Gravity Board X SQL injection file inclusion no patch**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1349

GRAVITY BOARD X SQL INJECTION AND FILE INCLUSION VULNERABILITIES

Two vulnerabilities have been identified in Gravity Board X, which could be exploited by attackers to include arbitrary files and/or conduct SQL injection and cross site scripting attacks. The first issue is due to an input validation error in the "deletethread.php" script when processing a specially crafted "board_id" parameter, which may be exploited by attackers to cause arbitrary scripting code to be executed by the user's browser. The second vulnerability is due to an input validation error in the "index.php" script that does not properly filter a specially crafted "email" variable, which may be exploited by remote users to conduct SQL injection attacks. The third flaw is due to an input validation error in the "editcss.php" script when processing a specially crafted "csscontent" variable, which could be exploited by attackers to execute arbitrary PHP commands. Gravity Board X version 1.1 and prior are affected. The FrSIRT is not aware of any official supplied patch for this issue.

Category 21.1 *General QA failures*

2005-08-09 **vulnerability AOL client software privilege escalation no patches**

DHS IAIP Daily; http://www.securityfocus.com/bid/14530/discuss

AOL CLIENT SOFTWARE LOCAL PRIVILEGE ESCALATION VULNERABILITY

AOL client software is susceptible to a local privilege escalation vulnerability. This issue is due to a failure of the software to properly secure its installation path against local modifications. This issue allows local users to replace the affected binary with an executable of their choice, allowing them to execute arbitrary code with SYSTEM privileges. This facilitates the complete compromise of the local computer. AOL version 9.0 Security Edition is reported susceptible to this vulnerability; other versions may also be affected. Security Focus is not currently aware of any vendor-supplied patches for this issue.

Category 21.1 *General QA failures*

2005-08-09 **Microsoft patches security vulnerability critical**

DHS IAIP Daily;
http://www.redmondmag.com/news/article.asp?EditorialsID=6852

MICROSOFT PATCHES NINE SECURITY VULNERABILITIES

Microsoft released six security bulletins Tuesday, August 9, including three bulletins rated "critical." All six bulletins involved Windows, and one of the bulletins also involved Internet Explorer. The most serious of the bulletins is a cumulative security update for Internet Explorer (MS05-038). The bulletin, which also applies to some versions of Windows, addresses three security flaws. Two of those are critical flaws that allow an attacker to take complete control of a computer over the Internet. The other flaw allows information disclosure. As a cumulative update for IE, the patch sets a kill bit for older versions of certain objects that have known security vulnerabilities. Those objects include the Microsoft HTML Help ActiveX control, the Microsoft MSAgent ActiveX control and a SharePoint Portal Services logging ActiveX control. The patch also changes the way IE Favorites behaves to close off a class of vulnerabilities. Another bulletin patches a critical vulnerability found in Windows Plug and Play that can allow remote code execution and elevation of privilege (MS05-039). The other bulletin involving a critical flaw is MS05-043 for a vulnerability in the Windows Print Spooler Service that could allow remote code execution. Microsoft Security Bulletin Summary for August 2005: http://www.microsoft.com/technet/security/bulletin/ms05-aug. mspx

Category 21.1 General QA failures

2005-08-10 **vulnerability Lasso Professional Server authentication bypass information disclosure**

DHS IAIP Daily; http://www.securityfocus.com/bid/14543/info

LASSO PROFESSIONAL SERVER REMOTE AUTHENTICATION BYPASS VULNERABILITY

Lasso Professional Server is susceptible to a remote authentication bypass vulnerability. This issue is due to a failure of the application to properly enforce defined security constraints. This vulnerability allows remote attackers to gain access to potentially sensitive information contained in Web pages they would normally be unable to see, potentially aiding them in further attacks. Depending on the contents and design of the targeted Web pages, attackers may possibly interact with the Website to cause data alterations or destruction. This issue is present in versions 8.0.4 and 8.0.5 of Lasso Professional Server. Fix for OmniPilot Software Lasso Professional Server 8.0.4: http://support.omnipilot.com/article_files/Security%20Fix%20 804-805.zi p Fix for OmniPilot Software Lasso Professional Server 8.0.5: http://support.omnipilot.com/article_files/Security%20Fix%20 804-805.zip

Category 21.1 General QA failures

2005-08-10 **vulnerability Nortel Contivity VPN Client local privilege escalation launch arbitrary files**

DHS IAIP Daily; http://www.securityfocus.com/bid/14542/info

NORTEL CONTIVITY VPN CLIENT LOCAL PRIVILEGE ESCALATION VULNERABILITY

Nortel Contivity VPN Client is susceptible to a local privilege escalation vulnerability. This issue is due to a failure of the application to properly lower the privileges of the running process when required. Due to the nature of the affected application, it executes with SYSTEM privileges. When a local user opens a dialog box to select digital certificates, they may use it to launch arbitrary files. Due to the failure of the application to properly revert to the users correct privileges, the executed file will be run with SYSTEM privileges. This vulnerability allows local attackers to access and execute arbitrary files with SYSTEM privileges, facilitating the compromise of the local computer. Security Focus is not aware of any vendor-supplied patches for this issue.

Category 21.1 General QA failures

2005-08-10 **vulnerability multiple MySQL UDF denial-of-service load arbitrary library**

DHS IAIP Daily;
http://www.securiteam.com/windowsntfocus/5VP0A00GLU.html

MYSQL UDF MULTIPLE VULNERABILITIES

User-defined functions in MySQL allow a user in the database to call binary libraries on the operating system. Creating a user-defined function requires insert privileges on the mysql.func table. The lack of proper length validation allow attackers to execute arbitrary code using MySQL UDL. Improper directory separator checking, allow attacker to perform directory traversal using MySQL UDL. The lack of proper checking allow attackers to cause a denial of service or load arbitrary library with MySQL UDL. The vendor has released patches for MySQL versions 4.0.25, 4.1.13 and 5.0.7-beta: http://dev.mysql.com/downloads/

Category 21.1 General QA failures

2005-08-10 **vulnerability WordPress remote code execution no patch**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1366

WORDPRESS "CACHE_LASTPOSTDATE" REMOTE CODE EXECUTION ISSUE

A vulnerability was identified in WordPress, which may be exploited by remote attackers to execute arbitrary commands. This flaw is due to an input validation error when processing a specially crafted "cache_lastpostdate" variable sent via cookies, which may be exploited by remote attackers to execute arbitrary PHP commands. WordPress version 1.5.1.3 and prior are affected. The FrSIRT is not aware of any official supplied patch for this issue.

Category 21.1 General QA failures

2005-08-11 **vulnerability McAfee ePolicy Orchestrator Local Information Disclosure**

DHS IAIP Daily; http://www.securityfocus.com/bid/14549/references

MCAFEE EPOLICY ORCHESTRATOR LOCAL INFORMATION DISCLOSURE VULNERABILITY

Network Associates McAfee ePolicy Orchestrator is susceptible to a local information disclosure vulnerability. This issue is due to incorrectly configured directory permissions in the default installation process of the application. This vulnerability allows local attackers to access arbitrary files located in the same partition as the affected directory with SYSTEM privileges. This will aid them in further attacks. Security Focus is not currently aware of any vendor-supplied patches for this issue.

Category 21.1 General QA failures

2005-08-11 **vulnerability multiple format string GNOME**

DHS IAIP Daily; http://secunia.com/advisories/16394/

GNOME EVOLUTION MULTIPLE FORMAT STRING VULNERABILITIES

Vulnerabilities have been reported in Evolution which can be exploited by malicious people to compromise a vulnerable system. 1) A format string error when displaying full vCard information attached to an e-mail message can be exploited to execute arbitrary code. Successful exploitation requires that the user clicks on "Show Full vCard" or saves the vCard to an address book and then views it under the "Contacts" tab. 2) A format string error exists when displaying specially crafted contact data retrieved from an LDAP server. 3) A format string error exists when displaying specially crafted task list data retrieved from remote servers and when the user saves the task list data under the "Calendars" tab. The vulnerabilities have been reported in versions 1.5 through 2.3.6.1 and have reportedly been fixed in 2.3.7 (unstable).

Category 21.1 General QA failures

2005-08-11 **vulnerability Adobe Version Cue 1.x Mac OS X privilege escalation update issued**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2005/Aug/1014776.html

ADOBE VERSION CUE 1.X FOR MAC OS X SYSTEM PRIVILEGE ESCALATION

A security vulnerability has been identified in a previous release of Adobe Version Cue, a feature of Adobe Creative Suite, that effects only computers on which Mac OS X and Version Cue Workspace are installed. If the vulnerability is exploited, a user with a local Mac OS X account could obtain system administrator access to local files and applications on that computer. The identified vulnerability is caused by special file permissions on internal Version Cue application files. This vulnerability cannot be exploited by users who do not have local login accounts on that computer. Users of Version Cue 1.x should download and install the security update: www.adobe.com/support/downloads/detail.jsp?ftpID=2985

Category 21.1 General QA failures

2005-08-12 **cyber security alert US-CERT NDMP exploit recommendations**

DHS IAIP Daily; http://www.us−cert.gov/cas/techalerts/TA05−224A.html

VERITAS BACKUP EXEC USES HARD-CODED AUTHENTICATION CREDENTIALS

VERITAS Backup Exec Remote Agent for Windows Servers is a data backup and recovery solution that supports the Network Data Management Protocol (NDMP). NDMP "...is an open standard protocol for enterprise-wide backup of heterogeneous network-attached storage." By default, the Remote Agent listens for NDMP traffic on port 10000/tcp. The VERITAS Backup Exec Remote agent uses hard-coded administrative authentication credentials. An attacker with knowledge of these credentials and access to the Remote Agent may be able to retrieve arbitrary files from a vulnerable system. The Remote Agent runs with SYSTEM privileges. Exploit code, including the credentials, is publicly available. US-CERT has also seen reports of increased scanning activity on port 10000/tcp. This increase may be caused by attempts to locate vulnerable systems. US-CERT recommends taking the following actions to reduce the chances of exploitation: * Use firewalls to limit connectivity so that only authorized backup server(s) can connect to the Remote Agent. The default port for this service is port 10000/tcp. * At a minimum, implement some basic protection at the network perimeter. When developing rules for network traffic filters, realize that individual installations may operate on non-standard ports. * In addition, changing the Remote Agent's default port from 10000/tcp may reduce the chances of exploitation. Please refer to VERITAS support document 255174 for instructions on how to change the default port.

Category 21.1 *General QA failures*

2005-08-12 **vulnerability exploit Microsoft Plug and Play US-CERT execute arbitrary code patches issued**

DHS IAIP Daily; http://www.us−cert.gov/current/current_activity.html#VU998653

EXPLOIT FOR VULNERABILITY IN MICROSOFT PLUG AND PLAY

US-CERT is aware of a public exploit for a vulnerability in Microsoft Plug and Play that could allow an attacker to locally or remotely execute arbitrary code or cause a denial-of-service condition on a vulnerable system. The exploit code targets Windows systems by connecting to NetBIOS ports 139/tcp or 445/tcp on a vulnerable system. A remote, unauthenticated attacker may be able to execute arbitrary code or cause a denial-of-service condition on Windows 2000. With Windows XP SP1, the remote user must be authenticated to exploit the vulnerability. A local, authenticated attacker may be able to execute arbitrary code or to create a denial-of-service condition on Windows XP SP2 and Server 2003 systems. Microsoft has released a patch to address this vulnerability in Microsoft Security Bulletin MS05-039. Administrators are encouraged to apply the appropriate fixes as soon as possible. VU#998653 - Microsoft Plug and Play contains a buffer overflow vulnerability: http://www.kb.cert.org/vuls/id/998653 Patches from Microsoft: http://www.microsoft.com/technet/security/bulletin/ms05-aug. mspx

Category 21.1 *General QA failures*

2005-08-15 **NIST cybersecurity flaw vulnerability database NVD encyclopedia**

EDUPAGE; http://www.fcw.com/article89911-08-15-05

NIST COMPILES CYBERSECURITY FLAWS DATABASE

Scientists at the National Institute of Standards and Technology (NIST) have created a vast database designed to collect information on virtually all known cybersecurity vulnerabilities, updated daily with new information. The National Vulnerability Database (NVD), which combines information held in all federal databases, currently has about 12,000 listings and includes links to industry resources. According to Peter Mell, senior computer scientist at NIST and creator of NVD, about 10 new vulnerabilities are added each day. Nell, who characterized the NVD as "an encyclopedia of everything," said it can be useful both for the public at large and for computer developers seeking current information about security weaknesses in a wide range of commercial products. Federal Computer Week, 15 August 2005

Category 21.1 *General QA failures*

2005-08-16 **vulnerability Adobe Acrobat remote buffer overflow PDF arbitrary code execution**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/896220

ADOBE ACROBAT CONTAINS A REMOTELY EXPLOITABLE BUFFER OVERFLOW

Adobe Acrobat is a suite of applications that allow users to manipulate PDF (Portable Document Format) files. A buffer within a core plug-in for Adobe Acrobat and Acrobat Reader can be overwritten using a specially-crafted PDF document. If a remote attacker can persuade a user to access a specially crafted PDF file, that attacker may be able to execute arbitrary code or crash the Adobe Acrobat/Acrobat Reader process. Users should upgrade to unaffected versions of Adobe Acrobat and Acrobat Reader. For a list of unaffected versions please see Adobe Security Advisory 321644: http://www.adobe.com/support/techdocs/321644.html

---

Category 21.1 *General QA failures*

2005-08-16 **vulnerability Kismet multiple integer underflow execute arbitrary commands denial-of-service DoS**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1422

KISMET MULTIPLE INTEGER UNDERFLOW AND UNSPECIFIED VULNERABILITIES

Multiple vulnerabilities were identified in Kismet, which could be explited by remote attackers to execute arbitrary commands or cause a denial of service. The first flaw is due to an error in the handling of unprintable characters in the SSID (the impact of this issue is currently unknown). The second issue is due to integer underflow errors in the pcap handling, which could be exploited to cause heap corruption. The third vulnerability is due to an integer underflow in CDP protocol dissector, which could be exploited by remote attackers to execute arbitrary commands. Products affected are Kismet versions prior to 2005-08-R1. Upgrade to Kismet version 2005-08-R1: http://www.kismetwireless.net/download.shtml

---

Category 21.1 General QA failures

2005-08-16 **vulnerability SafeHTML cross-site scripting**

DHS IAIP Daily; http://www.securityfocus.com/bid/14574/info

SAFEHTML UTF-7 AND CSS COMMENT TAG CROSS SITE SCRIPTING VULNERABILITIES

SafeHTML is prone to cross-site scripting vulnerabilities, specifically in dealing with UTF-7 encoding of characters and with CSS comment tags. Failure to filter HTML content can result in the exploitation of various latent vulnerabilities in Web based applications. A successful attack may facilitate HTML injection or cross-site scripting type issues. The vendor has released version 1.3.5 to resolve this issue. SafeHTML SafeHTML 1.3.2: http://pixel-apes.com/download/safehtml-1.3.5.zip

---

Category 21.1 General QA failures

2005-08-16 **vulnerability BlueZ arbitrary command execution update issued**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1431

BLUEZ "SECURITY.C" ARBITRARY COMMAND EXECUTION VULNERABILITY

A vulnerability was identified in BlueZ, which could be exploited by remote attackers to execute arbitrary commands. This flaw is due to an input validation error in "hcid/security.c" when processing and executing specially crafted bluetooth device names as command line arguments, which could be exploited by attackers to execute arbitrary commands or create pairings without the user's approval. Products affected are bluez-libs versions prior to 2.19 and bluez-utils versions prior to 2.19 Users should upgrade to bluez-libs-2.19 and bluez-utils-2.19: http://www.bluez.org/download.html

---

Category 21.1 General QA failures

2005-08-17 **vulnerability Microsoft Internet Explorer remote code execution no patch issued**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1450

MICROSOFT INTERNET EXPLORER "MSDDS.DLL" REMOTE CODE EXECUTION

A critical vulnerability was identified in Microsoft Internet Explorer, which could be exploited by remote attackers to execute arbitrary commands. This issue is due to a memory corruption error when instantiating the "Msdds.dll" (Microsoft Design Tools Diagram Surface) object as an ActiveX control, which could be exploited by an attacker to take complete control of an affected system via a specially crafted Web page. This vulnerability has been confirmed with Microsoft Internet Explorer 6 SP2 on Windows XP SP2 (fully patched). Note: It is currently unclear whether the "Msdds.dll" library is installed with Microsoft Office, Microsoft Visual Studio, or with other applications. More information will be provided when further details are available. Products affected are: Microsoft Internet Explorer 6 for Microsoft Windows XP SP2; Microsoft Internet Explorer 6 for Microsoft Windows XP SP1; Microsoft Visual Studio .NET 2003; and Microsoft Visual Studio .NET 2002. The FrSIRT is not aware of any official supplied patch for this issue.

Category 21.1 General QA failures

2005-08-17 **vulnerability phpPgAds SQL injection command execution upgrade**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1447

PHPPGADS SQL INJECTION AND COMMAND EXECUTION VULNERABILITIES

Multiple vulnerabilities were identified in phpPgAds, which could be exploited by remote attackers to execute arbitrary commands. The first issue is due to an input validation error in the XML-RPC library when processing, via an "eval()" call, certain XML tags nested in parsed documents, which could be exploited by remote attackers to execute arbitrary PHP commands. For additional information, see : FrSIRT/ADV-2005-1413 The second vulnerability is due to an input validation error in "lib-view-direct.inc.php" when processing a specially crafted "clientid" variable, which could be exploited by malicious users to conduct SQL injection attacks. The third flaw is due to an input validation error when processing specially crafted parameters, which may be exploited by remote attackers to include malicious files and execute arbitrary commands with the privileges of the web server. Products affected are phpPgAds versions prior to 2.0.6. Users should upgrade to phpPgAds version 2.0.6 : http://prdownloads.sourceforge.net/phpadsnew/

2005-08-18 **vulnerability MailWatch MailScanner XML RPC upgrade**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1457

MAILWATCH FOR MAILSCANNER XML-RPC REMOTE CODE EXECUTION ISSUE

A vulnerability was identified in MailWatch for MailScanner, which could be exploited by remote attackers to execute arbitrary code. This flaw is due to an input validation error in the XML-RPC library when processing, via an "eval()" call, certain XML tags nested in parsed documents, which could be exploited by remote attackers to execute arbitrary PHP commands. For additional information, see : FrSIRT/ADV-2005-1413 Products affected are MailWatch for MailScanner versions prior to 1.0.2. Users should upgrade to MailWatch for MailScanner version 1.0.2: http://mailwatch.sourceforge.net/

Category 21.1 General QA failures

2005-08-18 **vulnerability Juniper Netscreen VPN username enumeration information disclosure**

DHS IAIP Daily; http://www.zone−h.org/advisories/read/id=7977

JUNIPER NETSCREEN VPN: USERNAME ENUMERATION VULNERABILITY

NTA Monitor has discovered a VPN username enumeration vulnerability in the Juniper Netscreen integrated Firewall/VPN products while performing a VPN security test for a customer. The vulnerability affects remote access VPNs (known as "Dialup VPNs" in ScreenOS) using IKE with pre-shared key authentication. Certificate authentication is not affected, nor is manual key authentication. In practice, we find that most Netscreen systems are configured for remote access with pre-shared key authentication (called "AutoKey IKE with Preshared keys" in ScreenOS), so this bug will affect the majority of users. The vulnerability allows an attacker to use a dictionary attack to determine valid VPN usernames on the Netscreen. Once a valid username is discovered, the attacker can then use this to obtain a hash from the Netscreen, which can then be cracked offline to determine the associated password. Once an attacker has a valid username and password, they can potentially gain access to the resources protected by the VPN. The issue is believed to affect all models of Juniper Netscreen running all ScreenOS software versions up to 5.2.0. Users should use certificate authentication rather than pre-shared key authentication.

Category 21.1 General QA failures

2005-08-19 **vulnerability Computer Associates Message Queuing denial-of-service DoS patches issued**

DHS IAIP Daily;
http://supportconnectw.ca.com/public/ca_common_docs/camsecur ity_notice.asp

COMPUTER ASSOCIATES MESSAGE QUEUING VULNERABILITIES

There are several vulnerability issues in the Computer Associates Message Queuing (CAM / CAFT) software. The CAM TCP port is potentially vulnerable to a Denial of Service (DoS) attack; buffer overflow conditions can potentially allow arbitrary code to be executed remotely with elevated privileges; and there is potential to launch a spoof CAFT and allow arbitrary commands to be executed with elevated privileges. This affects all versions of the CA Message Queuing software prior to v1.07 Build 220_13 and v1.11 Build 29_13 on the specified platforms. Patches are available for all affected users.

Category 21.1 General QA failures

2005-08-20 **vulnerability PCRE Regular Expression heap overflow no solution**

DHS IAIP Daily; http://www.securityfocus.com/bid/14620/references

PCRE REGULAR EXPRESSION HEAP OVERFLOW VULNERABILITY

PCRE is prone to a heap overflow vulnerability. This issue is due to a failure of the library to properly bounds check user-supplied input prior to copying data to an internal memory buffer. The impact of successful exploitation of this vulnerability depends on the application and the user credentials utilizing the vulnerable library. Successful attack may ultimately permit an attacker to control the contents of critical memory control structures and write arbitrary data to arbitrary memory locations. A solution is not currently known.

Category 21.1 General QA failures

2005-08-21 **vulnerability Land Down Under input validation bug SQL injection cross-site scripting attack no solution**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2005/Aug/1014747.html

LAND DOWN UNDER INPUT VALIDATION BUGS PERMIT SQL INJECTION AND CROSS-SITE SCRIPTING ATTACKS

Some input validation vulnerabilities were reported in Land Down Under. A remote user can conduct cross-site scripting attacks. A remote user can also inject SQL commands. A remote user can access the target user's cookies (including authentication cookies), if any, associated with the site running the Land Down Under software, access data recently submitted by the target user via web form to the site, or take actions on the site acting as the target user. A remote user can execute SQL commands on the underlying database. No solution is currently known.

Category 21.1 General QA failures

2005-08-22 **vulnerability BEA WebLogic Portal unauthorized remote access patch issued**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1495

BEA WEBLOGIC PORTAL UNAUTHORIZED REMOTE ACCESS VULNERABILITY

A vulnerability was identified in BEA WebLogic Portal, which may be exploited by attackers to gain unauthorized access. This flaw occurs on Websites that use entitlements placed directly on desktop books, pages, or portlets, which could be exploited by remote attackers to access all the pages of the Book via specially crafted HTTP GET requests. No further details have been disclosed. Entitlements that are placed on Portals built from library books, pages, and portlets are not affected by this issue. Products affected are BEA Systems WebLogic Portal 8.1 SP1-SP4. Patch for BEA WebLogic Portal 8.1 SP4: ftp://ftpna.beasys.com/pub/releases/security/patch_CR238578_81SP4.zip

Category 21.1 General QA failures

2005-08-22 **vulnerability ELM header parsing buffer overflow system compromise update issued**

DHS IAIP Daily; http://secunia.com/advisories/16508/

ELM "EXPIRES" HEADER PARSING BUFFER OVERFLOW VULNERABILITY

A vulnerability has been reported in ELM, which can be exploited by malicious people to compromise a user's system. The vulnerability is caused due to a boundary error when parsing the "Expires" header and can be exploited to cause a stack-based buffer overflow by sending a specially crafted e-mail to a user. Successful exploitation allows execution of arbitrary code. The vulnerability has been reported in versions 2.5 PL7, 2.5 PL6, and 2.5 PL5. Prior versions may also be affected. Users should update to version 2.5 PL8.

Category 21.1 General QA failures

2005-08-23 **vulnerability hole PCRE regular expressions Perl library buffer overflow execute arbitrary code restart update server processes**

DHS IAIP Daily; http://www.ubuntu.com/usn/usn−173−1

PCRE VULNERABILITY

A buffer overflow has been discovered in the PCRE, a library that provides Perl compatible regular expressions. Specially crafted regular expressions triggered a buffer overflow. On systems that accept arbitrary regular expressions from untrusted users, this could be exploited to execute arbitrary code with the privileges of the application using the library. The libpcre3 package is affected. The problem can be corrected by upgrading the affected package to version 4.5-1.1ubuntu0.4.10 (for Ubuntu 4.10), or 4.5-1.1ubuntu0.5.04 (for Ubuntu 5.04). However, a standard system upgrade is not sufficient to effect the necessary changes. Users should reboot their machines to ensure that all services using this library are restarted correctly. If not, please manually restart all server processes (exim, Apache, PHP, etc.). Users should also restart their desktop session.

Category 21.1 General QA failures

2005-08-24 **vulnerability HAURI anti-virus remote buffer overflow access violation patch issued**

DHS IAIP Daily; http://www.securityfocus.com/bid/14647/solution

HAURI ANTI-VIRUS ACE ARCHIVE HANDLING REMOTE BUFFER OVERFLOW VULNERABILITY

HAURI Anti-Virus is affected by a remote buffer overflow vulnerability when handling ACE archives. An attacker can exploit this issue by crafting a malicious ACE archive containing a specially crafted file name and sending this archive to a vulnerable computer. The attacker may exploit this vulnerability to gain unauthorized remote access in the context of the superuser. The vendor has released patches to address this issue in ViRobot Linux Server 2.0. Users running ViRobot Expert 4.0 and ViRobot Advanced Server can upgrade to vrazmain.dll version 5.8.22.137 through the online update functionality of the application. HAURI LiveCall users can upgrade to vrazmain.dll version 5.8.22.137 through the LiveCall Website. Hauri Patch ViRobot Unix/Linux Server Security Vulnerability Patch http://www.globalhauri.com/html/download/down_unixpatch.html

Category 21.1 General QA failures

2005-08-29 **vulnerability Looking Glass cross-site scripting shell command injection no solution**

DHS IAIP Daily; http://secunia.com/advisories/16607/

LOOKING GLASS CROSS-SITE SCRIPTING AND SHELL COMMAND INJECTION

Vulnerabilities in Looking Glass, which can be exploited by malicious people to conduct cross-site scripting attacks and compromise a vulnerable system. Input passed to the "version" array parameter in footer.php and header.php is not properly sanitised before being returned to users. This can be exploited to execute arbitrary HTML and script code in a user's browser session in context of an affected site. Input passed to the "target" parameter in lg.php is not properly sanitised before being used in a "system()" call. This can be exploited to inject arbitrary shell commands via e.g. the "|" pipe character. The vulnerabilities have been confirmed in the latest available version. Other versions may also be affected. No official fix is currently known.

Category 21.1 General QA failures

2005-08-29 **vulnerability SqWebMail bug arbitrary scripting code attack update issued**

DHS IAIP Daily; http://securitytracker.com/alerts/2005/Aug/1014810.html

SQWEBMAIL BUG IN FILTERING IMG TAGS LETS REMOTE USERS INJECT ARBITRARY SCRIPTING CODE

A vulnerability was reported in SqWebMail. The software does not properly filter HTML code in e-mail messages. A remote user can send an HTML-based e-mail message containing arbitrary scripting code. When the target user views the message, the scripting code will be executed by the target user's browser. The code will originate from the site running the SqWebMail software and will run in the security context of that site. As a result, the code will be able to access the target user's cookies (including authentication cookies), if any, associated with the site, access data recently submitted by the target user via web form to the site, or take actions on the site acting as the target user. A remote user can access the target user's cookies (including authentication cookies), if any, associated with the site running the SqWebMail software, access data recently submitted by the target user via web form to the site, or take actions on the site acting as the target user. The vendor has issued a fixed development snapshot version (5.0.4.20050826): http://www.courier-mta.org/?download.php

2005-08-30 **vulnerability multiple PHPLDAPAdmin user input sanitization arbitrary code execution no patch issued**

DHS IAIP Daily; http://www.securityfocus.com/archive/1/409529/30/0/threaded

PHPLDAPADMIN WELCOME.PHP MULTIPLE VULNERABILITIES

phpldapadmin is prone to multiple input validation vulnerabilities. These issues are due to a failure in the application to properly sanitize user-supplied input. phpldapadmin is prone to a directory traversal vulnerability. An attacker can exploit this vulnerability to retrieve arbitrary files on the vulnerable system in the security context of the Web server process. Information obtained may aid in further attacks against the underlying system; other attacks are also possible. phpldapadmin is prone to a remote file include vulnerability. An attacker can exploit this vulnerability to execute arbitrary PHP script code in the security context of the Web server process. phpldapadmin is also prone to a cross-site scripting vulnerability. An attacker may leverage this issue to have arbitrary script code executed in the browser of an unsuspecting user. This may facilitate the theft of cookie-based authentication credentials as well as other attacks. Security Focus is not currently aware of any vendor-supplied patches for this issue.

Category 21.1 General QA failures

2005-08-31 **vulnerability hole BNBT EasyTracker remote denial-of-service DoS HTTP parser code no patch issued**

DHS IAIP Daily; http://www.securityfocus.com/bid/14700/discuss

BNBT EASYTRACKER REMOTE DENIAL OF SERVICE VULNERABILITY

BNBT EasyTracker contains a denial of service vulnerability in its HTTP parser code. This issue is due to a failure of the application to properly handle malformed HTTP requests. If an attacker sends a malformed HTTP request to the application, reports indicate that the affected application will terminate unexpectedly. A remote attacker is able to terminate the application, denying service to legitimate users. Currently we are not aware of any vendor-supplied patches for this issue.

2005-09-06 **software quality assurance QA design software engineering project management maintainability catastrophe mess disaster insurance calculations refunds errors**

RISKS; http://tinyurl.com/8qhuz (in German) 24 03

GERMAN GOVERNMENT SOFTWARE OVERPAYS PREMIUMS BY $25M PER MONTH

In the never-ending tale of woe surrounding the German social services and unemployment software A2LL (produced by T-Systems, the software arm of the former German state Telecom company), the Spiegel has just reported that the software miscalculates the health insurance premiums that the government pays every month - to the tune of 25 million Euros too much, every month. The bill is footed by the taxpayers, of course, since T-Systems wisely put a cap in to contract for reparations - a maximum of 5 million Euros is all T-Systems needs to pay.

….

According to *Der Spiegel*, an expert commission is already discussing what to do with the software, which was taken into service just in January of 2005. It has been declared to be in such a state of non-maintainability and non-adaptability ("nicht mehr wartungs- und entwicklungsfähig") that they are speaking about an entirely new software - to be written, of course, by T-Systems, who brought on this mess in the first place. They just are trying to decide whether to start a new central "solution" or a decentralized one for each unemployment office, as there are many local rules and insurance providers that seem to be causing difficulty.

The problem is with the insurance premiums for the unemployed, which was lowered retrospectively to save money for the government in March. A health insurance umbrella organization, VdAK, says it has difficulty in determining how much to pay back, if anything, because they do not know for exactly which people and months the wrong premium was calculated. A previous large error reported completely wrong data on who exactly was insured when to the insurance companies. The VdAK has said that when the German Social Services BA (Bundesagentur für Arbeit) gets their software straightened out, they will be glad - for a fee, of course - to see if they can repay the premiums payed in error.

2005-10-13 **sustainability databases NSF data integrity accessibility**

EDUPAGE; http://www.insidehighered.com/news/2005/10/13/digital

REPORT ADDRESSES SUSTAINABILITY OF DATABASES

A new report from a National Science Board task force calls on the federal government to implement a clear and focused strategy to ensure that growing collections of information in databases remain accessible and easy to use in the coming years. The report argues that the National Science Foundation (NSF), which has financed many technological developments in recent years, has not crafted policies and strategies that consider and address the range of technologies for storing data. The report praises the improvements that have been made to systems that collect various types of material in digital form and make those materials widely available online, but it says the need is "urgent" for a strategy to guarantee the viability of those materials. The concern, according to the report, is that as technology platforms continue to evolve, some digital content could be left in the lurch, unable to be accessed by newer systems. The report makes a number of recommendations for the NSF, including coordinating efforts between data storage and users of those data, promoting effective training, and supporting efforts to educate "a sufficient number of high-quality data scientists" to manage such systems. Inside Higher Ed, 13 October 2005

2005-10-17 **software quality assurance QA testing failure errors data corruption fraud incompetence**

RISKS; http://tinyurl.com/create.php; 24 08

DOESN'T *ANYONE* CHECK THEIR RESULTS ANY MORE?

MassHighway admitted that the state had found 19 legends on the new signs with significant errors in mileage. That's 12 percent of the 164 new signs in the $1.05 million contract.

According to the contractor, some of the distances were calculated using Microsoft's Streets & Trips software. According to Microsoft, the software without a GPS hookup costs $39.95. This contractor was paid $130,000 by the state.

Apparently the contractor had tried to use Mapquest, but found it unreliable.

One sign on Interstate 93 north, near Exit 45 in Andover, reported that Manchester, N.H. Was 42 miles away, although the actual distance is just a bit more than 28 miles. Another sign on Route 128/95 in Needham reported that Wellesley is 7 miles away. The actual distance is slightly less than 3 miles. A sign on Route 3 north in Braintree listed the distance to I-93 as 5 miles when the distance by odometer was 3 miles.

2005-10-20 **smart card reader failure accusation fraud court case reliability**

RISKS; http://news.bbc.co.uk/1/hi/england/london/4361286.stm 24 08

SYSTEM FAILURE = COURT APPEARANCE

Nick Rothwell reports on an alarming consequence of a system failure:

>A woman is being summoned to court, and faces a 1000-pound fine if found guilty, over non-payment of a 1.20-pound London bus fare.

Most of London's transport system is moving over to the Oyster card system, where quasi-smartcards are touched against readers at tube station barriers or doors to buses. A card can contain season tickets, top-up funds for pay-as-you-go travel, or both.

According to the television news coverage today, Jo Cahill believed that she had paid on entering the bus, but the reader did not register her card in order to deduct the fare from the top-up funds. An inspector has treated her as a fare-dodger, even though she explained the situation and offered to pay.

This seems to set the precedent that users are required to confirm that the reader has indeed registered their card, even though the visual and audible signals are not always clear. Transport for London claims that its Oyster card readers rarely fail, although they do not specify whether or not users will always be taken to court when they do fail. (I frequently get onto buses where the reader has a post-it note saying "reader broken" stuck to it.)<

2005-10-27 **vulnerability Oracle password system weak protection warning**

DHS IAIP Daily;
http://news.com.com/Oracle+password+system+comes+under+fire/ 2100−1002_3−5918305.html?tag=nefd.top

ORACLE PASSWORD SYSTEM COMES UNDER FIRE

Experts warn that attackers could easily uncover Oracle database users' passwords because of a weak protection mechanism, putting corporate data at risk of exposure. Joshua Wright of the SANS Institute and Carlos Sid of Royal Holloway College, University of London, say they have found a way to recover the plain text password from even very strong, well-written Oracle database passwords within minutes. In a presentation given at the SANS Network Security conference in Los Angeles, on Wednesday, October 26, they said that the technique that Oracle uses to store and encrypt user passwords doesn't provide sufficient security. The researchers shared how passwords are encrypted before being stored in Oracle databases. Wright and Cid identified several vulnerabilities, including a weak hashing mechanism and a lack of case preservation (all passwords are converted to uppercase characters before calculating the hash). Wright and Cid wrote "By exploiting these weaknesses, an adversary with limited resources can mount an attack that would reveal the plain text password from the hash for a known user." The researchers said that Oracle users can protect their systems by requiring strong passwords and assigning limited user rights. Presentation at SANS: http://www.sans.org/rr/special/index.php?id=oracle_pass

2005-11-02 **vulnerability Cisco airspace wireless LAN unencrypted access**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/2278

CISCO AIRESPACE WIRELESS LAN CONTROLLERS UNENCRYPTED NETWORK ACCESS

A vulnerability has been identified in Cisco Airespace Wireless LAN (WLAN) Controllers. This may be exploited by attackers to bypass security policies. This vulnerability is due to an error in the Lightweight Access Point Protocol (LWAPP) mode that accepts unencrypted traffic from end hosts even when configured to encrypt traffic, which could be exploited by attackers to send malicious traffic into a secure network.

2005-11-02 **vulnerability multiple Simple PHP blog input validation arbitrary code execution no solution**

DHS IAIP Daily; http://www.securityfocus.com/bid/15283/discuss

SIMPLE PHP BLOG MULTIPLE INPUT VALIDATION VULNERABILITIES

The Simple PHP Blog is prone to multiple input validation vulnerabilities. These issues are due to a failure in the application to properly sanitize user-supplied input. An attacker may leverage these issues to have arbitrary script code executed in the browser of an unsuspecting user in the context of the affected site. These may facilitate the theft of cookie-based authentication credentials as well as other attacks. Security Focus did not report a solution to this vulnerability.

SOFTWARE BUG CRASHES JAPANESE STOCK EXCHANGE

"The Tokyo Stock Exchange suffered its worst ever outage yesterday when trading was suspended for four and a half hours due to a software problem. A spokesman said that the glitch appeared to be connected to the decision to expand the trading system's capacity last month in response to high trading volumes. The modified system had worked well, but crashed when the automatic monthly clean-up of the software was implemented. A back-up system also failed because it uses the same software."

2005-11-04 **vulnerability hole CuteNews template local file inclusion arbitrary code execution update issued**

DHS IAIP Daily; http://secunia.com/advisories/17435/

CUTENEWS "TEMPLATE" LOCAL FILE INCLUSION VULNERABILITY

A vulnerability has been found in CuteNews which could be exploited by attackers to disclose sensitive information and compromise a vulnerable system. The vulnerability is caused when input passed to the "template" parameter in "show_archives.php" and "show_news.php" is not properly verified before it is used to include files. This can be exploited to include arbitrary files from local resources. This can further be exploited to execute arbitrary PHP code by including the "inc/ipban.mdu" script where PHP code can be injected via the "add_ip" parameter. Successful exploitation requires disabling of "magic_quotes_gpc." The vulnerability has been fixed in an updated 1.4.1 version (build 178).

2005-11-05 **vulnerability hole Macromedia Flash Player SWF arbitrary code execution update issued**

DHS IAIP Daily; http://secunia.com/advisories/17430/

MACROMEDIA FLASH PLAYER SWF FILE HANDLING ARBITRARY CODE EXECUTION VULNERABILITY

A vulnerability has been reported in Macromedia Flash Player which could be exploited to compromise a user's system. The vulnerability is caused due to missing validation of the frame-type identifier that is read from a SWF file. This value is used as an index in Flash.ocx to reference an array of function pointers. This can be exploited via a specially crafted SWF file to cause the index to reference memory that is under the attacker's control, which causes Flash Player to use attacker-supplied values as function pointers. Secunia recommends updating to Flash Player 8 (8.0.22.0) or apply Flash Player 7 update (7.0.61.0 or 7.0.60.0).

2005-11-06 **vulnerability Cisco IOS heap overflow system reload remote code execution**

DHS IAIP Daily; http://www.securiteam.com/securitynews/6E0011PEKA.html

CISCO IOS HEAP-BASED OVERFLOW VULNERABILITY

The Cisco Internetwork Operating System (IOS) may permit arbitrary code execution after exploitation of a heap-based buffer overflow vulnerability. In many cases, a heap-based overflow in Cisco IOS will simply corrupt system memory and trigger a system reload when detected by the "Check Heaps" process, which monitors for such memory corruption. In a successful attack against an appropriate heap-based overflow, it is possible to achieve code execution without the device crashing immediately. Successful exploitations of heap-based buffer overflow vulnerabilities in Cisco IOS software often result in a Denial of Service. In some cases it is possible to overwrite areas of system memory and execute arbitrary code from those locations. In the event of successful remote code execution, device integrity will have been completely compromised. Cisco has included additional integrity checks in its software that are intended to reduce the likelihood of arbitrary code execution. The advisory is posted on Cisco's website. 2005-11-08 **critical vulnerability update fix US-CERT Microsoft Windows Image Processing arbitrary code execution denial-of-service DoS**

DHS IAIP Daily; http://www.us−cert.gov/cas/techalerts/TA05−312A.html

MICROSOFT WINDOWS IMAGE PROCESSING VULNERABILITIES

Microsoft has released updates that address critical vulnerabilities in Windows graphics rendering services. A remote, unauthenticated attacker exploiting these vulnerabilities could execute arbitrary code or cause a denial of service on an affected system. The Microsoft Security Bulletin for November 2005 addresses multiple buffer overflows in Windows image processing routines. Viewing a specially crafted image from an application that uses a vulnerable routine may trigger these vulnerabilities. If this application can access images from remote sources, such as Websites or e-mail, then remote exploitation is possible. Microsoft has provided the updates to correct these vulnerabilities in Microsoft Security Bulletin MS05-053. MS05-053: http://www.microsoft.com/technet/security/bulletin/MS05-053. mspx

DHS IAIP Daily; http://www.securityfocus.com/bid/15352/references

MICROSOFT WINDOWS GRAPHICS RENDERING ENGINE WMF/EMF FORMAT CODE EXECUTION VULNERABILITY

Multiple vulnerabilities were identified in Microsoft Windows, which could be exploited by remote attackers to execute arbitrary commands or cause a denial of service. The first issue is due to heap overflow errors in "GDI32.DLL" when processing malformed Windows Metafile (WMF) and Enhanced Metafile (EMF) images, which could be exploited by convincing a user to visit a malicious Website using Internet Explorer, read a malicious email using Outlook, or open a specially crafted Office document containing a malicious image. The second flaw is due to an integer overflow error in the "PlayMetaFileRecord()" function of "GDI32.DLL" that does not properly handle malformed Windows Metafile (WMF) images, which could be exploited by convincing a user to visit a malicious Website using Internet Explorer, read a malicious email using Outlook, or open a specially crafted Office document containing a malicious image. The third vulnerability is due to an error in the "GetEnhMetaFilePaletteEntries()" function of "GDI32.DLL" when processing malformed Enhanced Metafile (EMF) images, which could be exploited to cause a denial of service via a malicious image. Security Focus reports that Microsoft has released a bulletin that includes fixes for supported versions of the operating system. Bulletin: http://www.microsoft.com/technet/security/bulletin/ms05-nov. mspx

2005-11-17 **quality assurance issues design flaw AAA Website registration identity theft risk**

RISKS 24 11

AAA WEB INTERFACE SECURITY ISSUES

Marty Lyons writes about the quality assurance issues with the new Website of the American Automobile Association (AAA). His story:

To sign up for an account, I needed to supply a membership number (printed on your plastic member card), and my name (also printed on the card), along with an email address, and a chosen account name. A few seconds later, I was logged in, and was able to check my account info, including mailing address, and type of credit card used for membership.

There was no verification of identity at all during account establishment. At a minimum, mandating that a user-entered postal code match the AAA database prior to creating the account would have afforded some protection.

So with a AAA member number and name, someone is well on their way to identity theft -- the rest of your wallet not required. Since many places take AAA cards to provide discounted services (hotels, car repair, restaurants, movie theatres, etc.) you can imagine the RISK. I've sent a letter to the organization letting them know their web registration needs to be redesigned.

RISKS 24 09

AND WE THOUGHT DATE PROBLEMS WERE OVER WITH Y2K

In a Q&A session about our airline's new staff travel online booking system, the following was asked:

Q. I am unable to book [a flight] online because my date of joining is February 29. What should I do?

A. Because you joined in a leap year the system is unable to identify your date of joining. You will need to ask Employee Services to change your date to February 28 for staff travel purposes.

The risk: if the booking system doesn't recognise February 29 then there are going to be a lot of empty flights on that date!! In this post-Y2K age, it is astonishing that we are still suffering from such date issues and this is not even with legacy systems, but brand new ones.

A software glitch has interrupted the sweeping overhaul of city emergency communications, which could delay the upgrade of police car computer systems by up to two years, officials said Monday. News about the glitch in the city's $15 million contract with Northrop Grumman Information Technology drew a strong reaction from the City Council's Public Safety Committee.

[Abstract by Peter G. Neumann]

Category 21.1 *General QA failures*

2005-11-30 **quality assurance issues design flaw Y2K++ bad year data McGraw-Hill TruSource programming errors**

RISKS 24 11

ERRONEOUS YEARS IN RETIREMENT DATA

Contributor Jim Horning's employer had outsourced its 401(k) plan administration to TruSource, a division of Union Bank of California, N.A.

When Mr. Horning looked through some retirement-plan data, he noticed a chart containing dates from the 31st and 41st centuries. The chart for the Pioneer High Yield Fund "(SINCE 03/31/98)" was labeled, "4098 3099 2000 1001 4001 4002 2003 1004 4004 3005". Mr. Horning concludes, "[A]pparently the dates escaped the notice of the humans (if any) at McGraw-Hill and TruSource who were in the loop in the preparation of these documents. It is interesting to speculate what combination of programming errors would yield this precise sequence of dates."

[Abstract by Karthik Raman]

RISKS Contributor Paul E. Ford conjectures that the dates are poorly formatted but correct:

Given the rising sequence in the last 2 digits and selective set in the first digit, I would surmise that these represent some sort of quarter data. So, 98Q4 through 05Q3. Any possibility the second position 0s are actually Qs?

Mr. Horning responds, "Paul, What sharp eyes you have! You could see those Qs even when I transcribed the data by hand. I can barely see them as Qs on the original, even given your helpful suggestion, but I do believe that you are correct."

Peter Neumann concludes:

Also noted by Amos Shapir, who observed that the date labels are placed three quarters apart. But that still does not explain the "4002", which looks as if it should have been "3002". Before running Jim's item in RISKS-24.11, I explicitly asked him to check whether the "4002" was accurately represented by him, and he did verify that. So, I suspect that the "4002" may have been a recording error in the original, or else a lapse in the reporting schedule.

2005-11-30 **vulnerability Perl format string arbitrary code execution user input sanitization**

DHS IAIP Daily; http://www.securityfocus.com/bid/15629/references

PERL PERL_SV_VCATPVFN FORMAT STRING VULNERABILITY

Perl is susceptible to a format string vulnerability. This issue is due to a failure of the programming language to properly handle format specifiers in formatted printing functions. An attacker may leverage this issue to write to arbitrary process memory, facilitating code execution in the context of the Perl interpreter process. This can result in unauthorized remote access. Developers should treat the formatted printing functions in Perl as equivalently vulnerable to exploitation as the C library versions, and properly sanitize all data passed in the format specifier argument. Solution: http://www.securityfocus.com/bid/15629/solution

Category 21.1 General QA failures

2005-12-01 **Japan Tokyo Stock Exchange human data-input error multimillion dollar loss Mizuho Securities Co. software quality assurance design flaw**

RISKS; http://business.timesonline.co.uk/article/0,,13133-1948579,00.html 24 12

HUMAN ERROR RESULTS IN $MULTIMILLION LOSS

Japanese financial-services firm Mizuho Securities Co. Said Thursday it erroneously placed sell orders because of a simple human data-input mistake that apparently ignored an error warning. This cost Mizuho at least 27 billion yen ($225 million). The company mistakenly sold 610,000 shares of J-Com Co. At 1 yen (less than 1 cent) per share, instead of the request to sell just one share at 610,000 yen ($5,080). The mishap sent the benchmark Nikkei 225 index down 1.95 percent on the Tokyo Stock Exchange. Mizuho Financial Group dropped 3.4 percent to 890,000 yen ($7,416.67).

[Abstract by Peter G. Neumann]

RISKS contributor Tomas Uribe follows-up:

One would think that "money-critical" systems would have more stringent safeguards against this type of thing. Also, someone must have made $225 million as well--who might have been the lucky ones who bought the discounted shares?

Jeremy Epstein dug through the RISKS archive to find a similar mishap at the Tokyo Stock Exchange (RISKS-21.81):

Before the Tokyo market opened Friday, a UBS Warburg trader entered what was intended to be an order to sell 16 Dentsu shares at 610,000 yen ($4,924.53) each or above. Instead, the trader keyed in an order to sell 610,000 Dentsu shares at 16 yen apiece.

Peter Neumann remarks, "I knew the new case sounded familiar! Perhaps the 610,000 is a default number for an erroneous field? That's quite a coincidence."

In another follow-up, "RsH" writes:

As per the information in the Reuters item http://asia.news.yahoo.com/051211/3/2c7vk.html the actual loss may be lower or more than the $225 million as the amount of the premium that will need to be paid to by back shares is still to be determined. The sale order was for about 41 times the actual number of shares actually outstanding, incidentally.

It turns out that the Tokyo Stock Exchange's own software was responsible for part of the problem, as it prevented the cancellation of the order from being processed!

RsH echoes Jeremy Epstein's comment: Also note that this is NOT the first time this has happened at the TSE, and they have yet to fix their system!

The Times, a UK newspaper had the following story about how this episode at the TSE concluded:

The president of the Tokyo Stock Exchange resigned yesterday to take responsibility for the "fat-finger" trading error that sparked a day of mayhem on Tokyo markets earlier this month. Takuo Tsurushima resigned along with Sadao Yoshino, the bourse's managing director, and Yasuo Tobiyama, its head of computer systems. The incident has left considerable turmoil in its wake: Mizuho Securities lost 40 billion yen (Â£195 million) on the botched trade and two Japanese day traders made Y2.5 billion in a few minutes.

Western investment houses who made money from the error have been publicly criticized by the Japanese Government and agreed to pay the profits they made into an investors' protection fund.

Losses from the trade were sufficient to force Mizuho to cancel all end-of-year bonuses from the securities arm. The trader, believed to be a 24-year-old woman relatively inexperienced on the dealing floor, had wanted to sell one share in J Com, a new telecoms firm, for Y600,000. She mistyped the order and sold 600,000 shares at Y1 each.

IE DESIGN FLAW LETS HACKER CRACK GOOGLE

An unpatched design flaw in Microsoft Corp.'s Internet Explorer browser could give malicious hackers an easy way to use the Google Desktop application to covertly hijack user information. The vulnerability was discovered in the cross-domain protections in Internet Explorer and a proof-of-concept exploit has been published. A spokesperson for Microsoft acknowledged the flaw in a statement and said the company was unaware of active attacks against IE users. The hacker who discovered the vulnerability used the Google Desktop utility to prove his findings, but in theory, any domain or application that depends on the IE cross-domain security model is vulnerable. Google spokesperson Sonya Boralv said initial investigations show that the problem resides in IE and not as a result of any vulnerabilities in Google Desktop, the downloadable utility that lets PC users merge desktop and search results on the well-known browser interface.

2005-12-04 **GPS speed restriction design flaw Transport Canada device safety-critical systems**

RISKS; http://www.cnn.com/2005/AUTOS/12/01/canada_gps_speed/index.html 24 11

RISKS OF GPS-BASED AUTOMATIC SPEED RESTRICTION ON VEHICLES

Jeremy Epstein complains about a device Transport Canada is testing which, if you have GPS increases the resistance in the gas pedal if you try to exceed the speed limit. Mr. Epstein remarks, "Bad idea." He writes:

I'm not an expert in GPS systems, but I've seen them get confused, especially when there are nearby parallel roads. I wouldn't want it to hold my speed to 25 MPH because it thinks I'm on the dirt road that runs parallel to a highway. And if the device changes its mind suddenly, the results could be catastrophic - I'm pushing hard on the accelerator because (for whatever reason) I decide to exceed the speed limit, and suddenly it decides the speed limit has increased - now I'm flooring the car because it reduces its resistance factor. Conversely, if I have a normal pressure on the accelerator, and the speed limit drops, the device might cause my speed to drop precipitously. I'm sure there are lots of other GPS-based risks - what does the device do if it can't find a GPS signal?

2005-12-05 **vulnerability flaw Microsoft SQL Server 2000 2K profiler database**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1896302,00.asp

FLAW FOUND IN MICROSOFT'S SQL SERVER 2000 PROFILER

A recently discovered vulnerability in Microsoft Corp.'s SQL Server 2000 database allows users to mask their login names. The vulnerability was discovered by Imperva, a researcher and vendor of data-center security products. The flaw shows up in the use of SQL Profiler in Microsoft SQL Server 2000 to audit connections to SQL Server 2000 by using the Audit Login event class. When login names contain leading zero characters, those names are not visible in the contexts of the SQL Profiler graphical user interface, a trace file that is saved by SQL Profiler, and in a trace table that is saved by SQL Profiler. Microsoft put out an advisory that stated that the problem only applies to the Profiler in SQL Server 2000. The problem is fixed in the Profiler in SQL Server 2005 when users use the Profiler to audit connections to SQL Server 2005. Microsoft recommends that users audit connections to SQL Server 2000 by using server-side tracing and by loading the resulting data from a server-side trace file into a database table by using the fn_trace_gettable function. Microsoft Advisory: http://support.microsoft.com/default.aspx?scid=kb;en-us;910741

2005-12-05 **Microsoft Internet Explorer IE design flaw crack Google Desktop Search fortified**

DHS IAIP Daily; http://www.pcpro.co.uk/news/81024/google−fortifies−desktop −s earch−against−ie−flaw.html

GOOGLE FORTIFIES DESKTOP SEARCH AGAINST IE FLAW

Google has altered its Desktop Search so that it can no longer be used in digital attacks in conjunction with a flaw in Microsoft's Internet Explorer (IE). On Friday, December 2, an Israeli hacker reported having discovered a means of remotely using Google desktop search to remotely search the computers logged on to a specially built website using Microsoft's IE. Problems in the way the browser handles Cascading Style Sheets (CSS) led to a short cut round the restrictions the browser places on interaction between different domains. Hacker Matan Gillon posted proof-of-concept code last week, but now says that it now "no longer works because Google slightly changed their site's code." However, Google told reporters that the flaw is a problem with IE, rather than the search giant's software, so the CSS problem remains at large.

2005-12-05 **Microsoft unpatched Internet Explorer IE Trojan horse vulnerability flaw exploit**

DHS IAIP Daily; http://news.zdnet.co.uk/0,39020330,39240189,00.htm

TROJANS TARGET UNPATCHED IE FLAW

Computer users have been warned that several Trojan horses that exploit an unpatched flaw in Internet Explorer (IE) have been discovered. Two exploits that use the recently disclosed vulnerability were reported by antivirus company Sophos on Friday, December 2. Called Clunky-B and Delf-LT, the exploits could allow malicious code to be executed remotely on a user's PC. These Trojans could "download anything, including a 'banker Trojan' that gives up your bank details," according to a Sophos spokesperson. Systems running Microsoft IE on Windows XP Service Packs 1 and 2 are vulnerable to attack. Machines running Windows 98, Windows 98 SE, Windows Me and Windows 2000 Service Pack 4 are also vulnerable to the exploits. Microsoft is not due to issue another round of security patches until Tuesday, December 13. Some security experts have suggested the company should roll out an unscheduled patch before this time to address this flaw. However, it's not clear whether the flaw will even be addressed in the next Microsoft security bulletin. Sophos advised users to turn off the Active Scripting facility in IE, as a stop-gap measure.

2005-12-08 **design flaw malicious anti-piracy approach MacInTouch Printer Setup Mac OS X Tiger**

RISKS 24 12

MALCIOUS ANTI-PIRACY MEASURE IN MACINTOUCH

Veteran RISKS contributor Monty Solomon reports of a dangerous design flaw in MacInTouch printer set up software for Mac OS X Tiger:

[MacInTouch Reader]
Printer Setup Repair, the widely-used utility for Mac OS X printers, has taken a malicious approach to combating software piracy. With version 5.0.3 for Mac OS X Tiger, if the user enters a pirated serial number known to the program, the program will immediately and without any warning remove all user preferences and the user keychain, and possibly do other unknown damage to the user's system.

The response of John Goodchild, President of Fixamac Software, Inc to this was:

Thank you for bringing this to our attention. We have examined our code and discovered an error in the area that rejects pirated registration codes. The original objective was to delete the Printer Setup Repair preferences but a misplaced space in the code allowed the entire user preferences folder to be erased. This would only occur if a pirated code was used. The error was probably overlooked since there was a need to block a new batch of pirated codes quickly. There was no such error in the area that handles legitimate registration codes and in no way can occur if a legitimate registration code is entered incorrectly since the user name is also a part of our internal tests. We have fixed the problem and posted an update. This was not a malicious act on our part, rather an effort to protect our product from software pirates, and we regret any damage that may have been caused by the use of pirated registration codes. Anyone who downloaded Printer Setup Repair 5.0.3 between 11-05-05 and 12-06-05 should download the current release from our web site.

2005-12-08 **Microsoft Internet Explorer IE7 security improvements blog entry developers**

DHS IAIP Daily;
http://www.techweb.com/wire/security/174906971;jsessionid=WRE35TOIAV2AUQSNDBECKH0CJUMEKJVN

MICROSOFT TO BEEF UP INTERNET EXPLORER 7 SECURITY

Microsoft is changing Internet Explorer (IE) 7's security zones in a bid to create a more attack-resistant browser, according to a public blog entry written by three developers at the software giant. Like its predecessors, IE 7 enforces security policies by clumping sites into four security categories, or zones, dubbed Internet, Intranet, Trusted Sites, and Restricted Sites. Typically, the Intranet zone comes with fewer restrictions than the Internet zone. In the past, however, attackers have sometimes managed to fool IE into treating an outside site as in one of the less-secure zones, known as a "zone-spoofing attack." To prevent some of these attacks, IE 7 will instead treat all sites as being in the more-secure Internet zone, unless the PC is really part of a managed network (such as is often the case in a corporate environment). "This change effectively removes the attack surface of the intranet zone for home PC users," wrote Vishu Gupta, Rob Franco and Venkat Kudulur, on the trio's "IEblog".

2005-12-09 **eBay auction Microsoft Excel zero-day exploit code**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1899697,00.asp

EBAY PULLS BIDDING FOR MICROSOFT EXCEL VULNERABILITY

An unknown security researcher chose a novel way to issue a warning for a code execution flaw in Excel -- posting it for sale on eBay. But the auction was pulled late Thursday, December 8, after discussions between Microsoft and eBay Inc. When the auction was squashed, the bidding had reached $53 and had attracted 19 offers. A spokesperson for Microsoft confirmed that the eBay listing was indeed a legitimate security flaw in Excel. In the listing, posted by a seller named "fearwall," the issue is described as a zero-day vulnerability that was discovered on Tuesday, December 6, 2005, and reported to Microsoft. The seller openly taunts the software giant, poking fun at the company's delays in providing fixes for known security bugs. "It can be assumed that no patch addressing this vulnerability will be available within the next few months. So, since I was unable to find any use for this by-product of Microsoft developers, it is now available for you at the low starting price of $0.01 (a fair value estimation for any Microsoft product)," the listing read.

2005-12-12 **vulnerability attack Web Internet Mozilla Firefox bug arbitrary code execution**

DHS IAIP Daily;
http://www.infoworld.com/article/05/12/12/Hnmozillabug_1.html

NEW ATTACK TARGETS KNOWN MOZILLA BUG

Computer users who have not upgraded to the latest version of Mozilla Corp.'s Firefox browser may now have an extra incentive to do so, thanks to a hacker going by the name of Aviv Raff. On Sunday, December 11, Raff published a sample code (http://aviv.raffon.net/2005/12/11/MozillaUnderestimateVulnerabilityYetAgainPlusOldVulnerabilityNewExploit.aspx) that could be used to take over the computers of Firefox users running version 1.0.4 or earlier of the browser. The exploit takes advantage of a known bug (http://www.mozilla.org/security/announce/mfsa2005-50.html) in the way that Firefox processes the popular Javascript Web programming language. "I think it's been enough time for people to upgrade from v1.0.4. of Firefox. So, here is the PoC [proof of concept] exploit for the…vulnerability," he wrote on his blog. The bug was fixed in Mozilla version 1.0.5, which was released last July, and has also been fixed in version 1.7.9 of the Mozilla Suite, said Mike Schroepfer, vice president of engineering with Mozilla Corp. In some ways, this latest exploit is similar to the attack code that has been circulating for Microsoft's Internet Explorer browser, said Russ Cooper, scientist with security vendor Cybertrust Inc. "It can install and run code of the attacker's choice if a victim visits a malicious Website," he said.

2005-12-12 **vulnerability hole Nortel SSL VPN Web interface remote command execution upgrade issued**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/2845

NORTEL SSL VPN WEB INTERFACE REMOTE COMMAND EXECUTION VULNERABILITY

A vulnerability has been identified in Milliscripts, which may be exploited by attackers to execute arbitrary commands. This is due to an input validation error in the "tunnelform.yaws" script when processing a specially crafted "a" parameter, which may be exploited by attackers to inject arbitrary commands via the embedded Java Applet and cause malicious scripting code to be executed by the user's browser in the security context of an affected Website. Solution: Upgrade to version 5.1.5.

Category 21.1 General QA failures

2005-12-13 **vulnerability Microsoft DirectX DirectShow AVI processing buffer overflow solution issued**

DHS IAIP Daily; http://www.securityfocus.com/bid/15063/references

MICROSOFT DIRECTX DIRECTSHOW AVI PROCESSING BUFFER OVERFLOW VULNERABILITY

A buffer overflow vulnerability exists in the Microsoft Windows DirectX component. This issue is related to processing of .AVI (Audio Visual Interleave) media files. The specific vulnerability exists in DirectShow and could be exposed through applications that employ DirectShow to process .AVI files. Successful exploitation will permit execution of arbitrary code in the context of the user who opens a malicious .AVI file. This issue could be exploited through any means that will allow the attacker to deliver a malicious .AVI file to a victim user. In Web-based attack scenarios, exploitation could occur automatically if the malicious Webpage can cause the .AVI file to be loaded automatically by Windows Media Player. Other attack vectors such as email or instant messaging may require the victim user to manually open the malicious .AVI. Solution:

2005-12-14 **Microsoft Software Update Services SUS glitch security patches**

DHS IAIP Daily;
http://www.infoworld.com/article/05/12/14/HNmspatches_1.html

MICROSOFT'S SECURITY PATCHES HIT SNAG

Some users of Microsoft Corp.'s Software Update Services (SUS) may be experiencing a minor annoyance, thanks to a glitch in the company's latest security patches, released Tuesday, December 13. The latest update may be changing the status of software updates that had been previously approved by administrators who use the service, according to Microsoft. "If you synchronize your server after December 12, 2005, all previously approved updates may be unapproved and the status may appear as 'updated,'" Microsoft said in a note published Wednesday, December 14. SUS is used by Microsoft administrators to gain more control over which Microsoft software patches get installed on their network. When a patch has been tested and determined to be appropriate for installation, it can be marked as "approved" and then automatically installed on the PCs being managed by the service. Tuesday's glitch disrupts that process. The problem is that the latest updates appear to have overwritten a file that is used to keep track of approved updates, said Russ Cooper, a scientist at security vendor Cybertrust Inc. The simplest solution is to simply restore this file, called Approveditems.txt, from a backup copy, Cooper said.

2005-12-16 **compiler trust trusted computing base Trojan horse insertion code software engineering quality assurance design flaws subversion**

RISKS; http://www.acsa-admin.org/2005/abstracts/47.html 24 13

COUNTERING TRUSTING TRUST THROUGH DIVERSE DOUBLE-COMPILING

David A. Wheeler published a paper about trusting compilers.

>Everyone here should be familiar with Ken Thompson's famous "Reflections on Trusting Trust." If not, see: < http://www.acm.org/classics/sep95/>. The "trusting trust" attack subverts the compiler binary; if attacker succeeds, you're doomed. Well, till now.

I've written a paper on an approach to counter this attack. See: "Countering Trusting Trust through Diverse Double-Compiling."

Here's the abstract:

An Air Force evaluation of Multics, and Ken Thompson's famous Turing award lecture "Reflections on Trusting Trust," showed that compilers can be subverted to insert malicious Trojan horses into critical software, including themselves. If this attack goes undetected, even complete analysis of a system's source code will not find the malicious code that is running, and methods for detecting this particular attack are not widely known. This paper describes a practical technique, termed diverse double-compiling (DDC), that detects this attack and some unintended compiler defects as well. Simply recompile the purported source code twice: once with a second (trusted) compiler, and again using the result of the first compilation. If the result is bit-for-bit identical with the untrusted binary, then the source code accurately represents the binary. This technique has been mentioned informally, but its issues and ramifications have not been identified or discussed in a peer-reviewed work, nor has a public demonstration been made. This paper describes the technique, justifies it, describes how to overcome practical challenges, and demonstrates it.<

2005-12-16 **vulnerability quality assurance Q&A Microsoft Internet Explorer IE7 critical fix**

DHS IAIP Daily; http://news.com.com/Microsoft+patch+jams+up+IE/2100−1002_3−5 999193.html

MICROSOFT PATCH JAMS UP IE

The "critical" security fix for Internet Explorer (IE) available last Tuesday, December 13, is causing trouble for users who have been testing the new IE 7 browser. Microsoft has received "scattered reports of users experiencing odd browser behavior" after installing the latest security update, Jeremy Dallman, project manager for IE security at the company, wrote in a Friday, December 16, posting to a corporate blog. Three different problems have been reported: The browser could crash right after starting up; links may come up blank; or multiple windows may open when the browser is initiated, according to the posting. "After investigating several of these reports, we have traced these issues to a common source," Dallman wrote. The culprit is IE 7, the next version of Microsoft's Web browser, which is in beta testing. The problems occur only if IE 7 is installed on a machine alongside IE 6. That double-IE configuration is not supported by the fix, according to Dallman's note. When installed next to IE 6, the first beta of IE 7 will add an incorrectly configured key to the Windows Registry the first time it is run, he wrote. This can be resolved by deleting the key from the Windows Registry.

2005-12-31 **denial of service DoS vulnerability Enterprise Server Attachment Service TIFF attachment Blackberry heap buffer overflow no update software**

DHS IAIP Daily; http://www.securityfocus.com/bid/16098/solution 23

BLACKBERRY ENTERPRISE SERVER ATTACHMENT SERVICE TIFF ATTACHMENT DENIAL OF SERVICE VULNERABILITY

Research In Motion Blackberry Enterprise Server is prone to denial of service attacks. This issue affects the Attachment Service and may be triggered by a malformed TIFF attachment. The issue is reportedly caused by a heap-based buffer overflow. Security Focus reports that the vendor has stated that this issue will result in a denial of service, and it is therefore not believed that the issue is exploitable beyond a denial of service at the time of writing. This BID will be updated if further information is made available that contradicts this assumption. Security Focus is unaware of any vendor-supplied patches for this issue.

Category 21.1 *General QA failures*

2005-12-31 **denial of service DoS vulnerability Enterprise Server Router SRP Pack Blackberry no update software**

DHS IAIP Daily; http://www.securityfocus.com/bid/16100/solution 23

BLACKBERRY ENTERPRISE SERVER ROUTER SRP PACKET DENIAL OF SERVICE VULNERABILITY

The Blackberry Enterprise Server Router component is prone to a denial of service vulnerability. This vulnerability may be triggered by sending malformed SRP (Server Routing Protocol) packets to the router. This could only be exploited by an attacker who can communicate with the router. Security Focus reports that the vendor has acknowledged the issue and stated that it will be corrected in future releases. Security Focus is unaware of any vendor-supplied patches for this issue.

Category 21.1 *General QA failures*

2006-01-03 **denial of service DoS Intel Graphics Accelerator driver Microsoft Windows XP 2000 2K crash**

DHS IAIP Daily; http://www.securityfocus.com/bid/16127/references 23

INTEL GRAPHICS ACCELERATOR DRIVER REMOTE DENIAL OF SERVICE VULNERABILITY

The Intel Graphics Accelerator driver is susceptible to a remote denial of service vulnerability. This issue is demonstrated to occur when the affected driver attempts to display an overly long text in a text area. This allows attackers to crash the display manager on Microsoft Windows XP, or cause a complete system crash on computers running Microsoft Windows 2000. Other operating systems where the affected display driver is available are also likely affected.

Category 21.1 *General QA failures*

2006-01-03 **denial of service vulnerability DoS BlackBerry Enterprise Server Phenoelit German hacker group Research in Motion software fixes**

DHS IAIP Daily; http://www.informationweek.com/showArticle.jhtml;jsessionid= HCQOZBHQGSYK0QSNDBCSKHSCJUMEKJVN?articleID=175800729 23

HACKERS FIND SECURITY HOLE IN BLACKBERRY ENTERPRISE SERVER

Research In Motion's (RIM) BlackBerry Enterprise Server product may be vulnerable to denial of service attacks, according to a group of German hackers, called Phenoelit, that identifies security flaws. Phenoelit found a problem in the way the server's BlackBerry Router handles Server Routing Protocol packets. An attacker could cause denial of service by sending "specially crafted" packets to the router, according to the U.S. Computer Emergency Readiness Team. The result could be disrupted communications between the BlackBerry Enterprise Server and BlackBerry devices. In a prepared statement, Research In Motion said it "has already developed software fixes for the issues identified by [the group] and although there have been no customer reports of any actual problems, RIM has also provided temporary precautionary measures that can be taken in the mean time until customers are able to implement the software updates." RIM asks companies to make sure their BlackBerry Enterprise Server and BlackBerry Router are located behind the corporate firewall. RIM calls it an "internal-only vulnerability" that can be caused by an inside attacker.

2006-01-18 **vulnerability Oracle products critical patch update**

DHS IAIP Daily; http://www.us−cert.gov/cas/techalerts/TA06−018A.html 23

TECHNICAL CYBER SECURITY ALERT TA06-018A:
ORACLE PRODUCTS CONTAIN MULTIPLE VULNERABILITIES

Oracle has released a critical patch update that addresses more than eighty vulnerabilities in different Oracle products and components. The impact of these vulnerabilities varies depending on the product, component, and configuration of the system. Potential consequences include the execution of arbitrary code or commands, information disclosure, and denial of service. Vulnerable components are likely to be available to attackers via remote networks and with limited or no prior authorization. An attacker who compromises an Oracle database may be able to gain access to sensitive information. According to Oracle, three of the vulnerabilities corrected un the Oracle Critical Patch Update for January 2006 affect Oracle Database Client-only installations. US-CERT recommends that sites running Oracle review the Critical Patch Update, apply patches, and take other mitigating action as appropriate. US-CERT is tracking all of these issues under VU#545804:
http://www.kb.cert.org/vuls/id/545804 Oracle Critical Patch Update - January 2006:
http://www.oracle.com/technology/deploy/security/pdf/cpujan2 006.html

2006-01-18 **Oracle database server vulnerability flaws update release**

DHS IAIP Daily; 23
http://www.techweb.com/wire/security/177101585;jsessionid=VA
JPECC3JG220QSNDBGCKHSCJUMEKJVN

ORACLE FIXES 82 DATABASE, SERVER FLAWS

Oracle on Tuesday, January 17, patched 82 different vulnerabilities in its flagship database and other server products, leading security company Symantec to raise the overall Internet threat status and others puzzling over the exact extent of the risk. The Critical Patch Update fixes 37 flaws in Oracle's Database, 17 in its Application Server, 20 in the Collaboration Suite, 27 in E-Business Suite, and one each in the PeopleSoft Enterprise Portal and JD Edwards HTML Server. While the number may seem staggering to those not used to Oracle's quarterly security updates -- Windows users, for instance, go into shock when Microsoft releases more than a dozen fixes in a given month -- January's batch is actually smaller than the October 2005 bunch. Then, Oracle patched 106 different bugs. Many of this quarter's fixed vulnerabilities were tagged by Oracle with its highest risk ratings -- unlike other vendors such as Microsoft, Oracle breaks out risk rankings into numerous sub-categories -- with notes that they're easy to exploit and have a potentially wide range of impact. Among the bugs are many which can be exploited remotely, and 61 which can be used by anonymous (non-authenticated) users.

2006-01-25 **Gartner Oracle security vulnerability exploit**

DHS IAIP Daily; http://www.techweb.com/wire/security/177103864;jsessionid=O40E1UZM0ACXCQSNDBGCKH0CJUMEKJVN 23

Gartner bashes Oracle over security.

Oracle security practices are raising red flags, a Gartner analyst recently warned, and administrators should hunker down in protecting their database systems. Just five days after Oracle released a critical security update that patched 82 vulnerabilities, a Gartner researcher said in an online advisory that "Oracle can no longer be considered a bastion of security." Rich Mogull wrote, "The range and seriousness of the vulnerabilities patched in this update cause us great concern.... The database products alone include 37 vulnerabilities, many rated as easily exploitable and some potentially allowing remote database access. Oracle has not yet experienced a mass security exploit, but this does not mean that one will never occur." Mogull noted that Oracle administrators had avoided patching by relying on the database's strong security and the fact that the software was deployed deep within an enterprise's defenses. That no-patching procedure won't cut it now. To keep databases secure, Mogull recommended that companies shield all Oracle systems, patch known bugs -- "because incomplete information from Oracle will make shielding incomplete," he said in an aside -- and pressure Oracle to get on the security stick.

2006-01-26 **Oracle advisory vulnerability patch immediately**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1915359,00.asp 23

ORACLE ADVISES USERS: PATCH CRITICAL HOLE -- NOW.

Oracle is advising its customers to quickly apply a database patch for a flaw security experts are calling "very severe." Security experts warn the hole could allow even unsophisticated users to take control of Oracle databases. The patch, known as DB18, fixes a hole that affects most supported versions of the Oracle database software, including Oracle versions 8, 9 and 10. The hole is "very severe" and allows users to bypass the Oracle database's authentication and become administrative "super users," according to Shlomo Kramer, CEO of Imperva, which discovered the hole. However, Kramer and others say Oracle may be downplaying the seriousness of the threat out of concern that malicious hackers could be tipped off to the severity of the issue. Oracle Corp. said that it patches security holes in the order of their severity and categorized DB18 as a serious vulnerability with the potential for wide impact in the January Critical Patch Update [CPU], according to an e-mail statement. Researchers in Imperva's Application Defense Center discovered the security hole "a few months ago," though it has existed for years, Kramer said. "It goes all the way back to Version 8, but it wasn't patched until now."

2006-01-31 **Perl programming scripting language vulnerability printing functions write arbitrary process memory code execution solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/15629/discuss 23

PERL PERL_SV_VCATPVFN FORMAT STRING INTEGER WRAP VULNERABILITY.

Perl is susceptible to a format-string vulnerability. This issue is due to the programming language's failure to properly handle format specifiers in formatted printing functions. An attacker may leverage this issue to write to arbitrary process memory, facilitating code execution in the context of the Perl interpreter process. This can result in unauthorized remote access. Developers should treat the formatted printing functions in Perl as equivalently vulnerable to exploitation as the C library versions, and should properly sanitize all data passed in the format specifier argument. Solution: Webmin has released updated versions of Webmin and Usermin to fix the insecure usage of the formatted printing functions. See the following Website for more solution details: http://www.securityfocus.com/bid/15629/solution

2006-01-31 **Winamp music player quality assurance QA buffer overflow vulnerability flaw**

DHS IAIP Daily; http://secunia.com/advisories/18649/ 23

WINAMP COMPUTER-NAME-HANDLING BUFFER-OVERFLOW VULNERABILITY.

ATmaCA has discovered a vulnerability in Winamp, which can be exploited by malicious people to compromise a user's system. The vulnerability is caused due to a boundary error during the handling of filenames including a computer name. This can be exploited to cause a buffer overflow via a specially crafted playlist containing a filename starting with an overly long computer name (about 1040 bytes). Solution: Update to version 5.13.

2006-02-11 **quality assurance design municipal property tax human user error quality assurance QA plausibility**

RISKS; http://tinyurl.com/rq8p8 24 15

TRUSTING THE COMPUTER CAUSES TAX REVENUE SHORTFALL FOR TOWN

In Valparaiso, Indiana, someone pressed the wrong key in the municipal-tax program and accidentally altered the property value for a house originally evaluated at $121,900 so that it was appraised at $400M. No one noticed. The tax bill went from $1,500 to $8M, causing a significant increase in the anticipated municipal tax revenues. Although the faulty tax bill was corrected, the town planners had already lowered the property tax rate to take into account the imaginary $8M windfall and therefore faced a budget deficit for municipal services and schools.

DHS IAIP Daily; http://news.com.com/Oracle+patches+11i+security+flaws/2100 −1 002_3−6044020.html?tag=cd.lede 23

ORACLE PATCHES 11I SECURITY FLAWS.

Oracle has issued an upgrade to its E-Business Suite 11i diagnostics module containing a number of the security fixes, according to applications security firm Integrigy. Oracle made an unusual move by alerting its users about the security patches, according to Integrigy's advisory. Historically, Oracle has released product upgrades but not disclosed whether they included security fixes, Integrigy noted. The "Diagnostics Support Pack February 2006 with Oracle Diagnostics 2.3 RUP A" aims to address security flaws in Oracle diagnostics Web pages and Java classes, according to Integrigy. "The significant (security) issue is (that) some diagnostics can be executed without any authentication, and it is possible to configure the diagnostics to be unrestricted," according to the Integrigy report. Although the company releases quarterly security updates, "Oracle has not previously provided customers a notification that security fixes were included (in an upgrade)," Integrigy noted in its report.

2006-03-08 **Symantec Ghost software multiple vulnerabilities data modification privilege escalation arbitrary code execution**

DHS IAIP Daily; http://www.hackerscenter.com/archive/view.asp?id=23418 23

SYMANTEC GHOST MULTIPLE VULNERABILITIES.

Three vulnerabilities have been reported in Symantec Ghost, which can be exploited by malicious, local users to gain knowledge of potentially sensitive information, modify certain data, and potentially gain escalated privileges. Analysis: Default administrator login ID and password left behind during installation can be used by local users to modify or delete stored administrative tasks. This can be exploited to modify tasks to run arbitrary code on the local system. Insecure permissions in the shared memory sections within the Sybase SQLAnywhere database used by Symantec Ghost can potentially be exploited to gain access to, and to modify information stored in the database. A boundary error in the login dialog box of dbisqlc.exe, which is installed as a part of the SQLAnywhere package, can cause a buffer overflow. This can potentially be exploited to gain access to information stored in the database that is not normally accessible. Vulnerable: Symantec Ghost 8.x; Symantec Ghost Solution Suite 1.x. Solution: Update to Symantec Ghost 8.3 that is shipped as a part of Symantec Ghost Solutions Suite 1.1.

Category 21.1 *General QA failures*

2006-03-08 **quality assurance QA error failure Scholastic Aptitude Test (SAT) scores students admissions**

RISKS; College Board http://tinyurl.com/zj8wh 24 19

DAMP PAPERS CAUSE ERRORS IN SAT TEST SCORES

On the order of 4000 [4,400] students taking the October 2005 Scholastic Aptitude Tests (SATs) received scores lower than they should have been [and 600 got higher scores than they achieved], due to [initially] unexplained "technical problems" [later described as dampness that expanded the paper sheets]. Some scores on the reasoning section were as much as 100 [actually as bad as 450] points too low (out of 800 [or 2400]). This may be unfortunate for those students, considering that the final acceptances and rejections are being decided before the affected universities have been notified. Similar scanning problems were noted in an earlier SAT chemistry test, although on a smaller scale.

[An NPR "All Things Considered" story by Claudio Sanchez on April 25 reported that "Angry parents -- and their lawyers -- are demanding answers." The College Board announced new quality assurance measures to prevent a repetition of the scanning errors including scanning the sheets twice (once on each of two days) and comparing the results to spot mechanical problems.]

2006-03-09 **quality assurance QA automatic word processor spell checker conversion correction errors**

Language Log http://itre.cis.upenn.edu/~myl/languagelog/archives/002911.html

THE CUPERTINO EFFECT

Benjamin Zimmer posted an amusing analysis of a peculiar automatic correction in some word processing software: the misspelling "cooperatino" (for "cooperation") is corrected to "Cupertino." Apparently some European translators have dubbed this problem "The Cupertino Effect." Zimmer writes,

>Here's a brief sampling of the hundreds of Cupertinos one can find on the ".int" domain used by international groups like the UN, the EU and NATO:

* Within the GEIT BG the Cupertino with our Italian comrades proved to be very fruitful. (NATO Stabilisation Force, "Atlas raises the world," 14 May 2003)

* The fact that Secretary General Robertson is going to join this session this afternoon in the European Union headquarters gives you already an idea of how close and co-ordinated this Cupertino is and this action will be. (NATO Press Point, 19 Mar. 2001)

* Safe blood transfusion services are being addressed in Freetown and Lungi, using WHO RB funds in Cupertino with the Red Cross Society of Sierra Leone and in Bo by MSF/Belgium. (WHO/EHA report on Sierra Leone, 1 May 2000)

* Could you tell us how far such policy can go under the euro zone, and specifically where the limits of this Cupertino would be? (European Central Bank press conference, 3 Nov. 1998)

* Co-ordination with the World Bank Transport and Trade Facilitation Programme for South East Europe will be particularly important in the area of trade facilitation and shall be conducted through regular review mechanisms and direct Cupertino. (European Agency for Reconstruction, "Focal area: Justice and home affairs") . . . .<

Apparently another automatic correction changes "coperation" to "copulation" as in the following examples:

* "Albania was very interested in concluding a customs copulation agreement."

* "The Heads of State and Government congratulated SATCC for the crucial role it plays in strengthening copulation and accelerating the implementation of regional programmes in this strategic sector. (Southern African Development Community, Communique from the 1982 SADC Summit)"

* "The Western Balkan countries confirmed their intention to further liberalise trade amongst each other. They requested that they be included in the pan-european system of diagonal copulation, which would benefit trade and economic development. (International Organization for Migration, Foreign Ministers Meeting, 22 Nov. 2004)"

2006-03-10 **quality assurance QA automatic spreadsheet format conversion correction errors**

RISKS 24 19

MS-EXCEL DAMAGES EXPERIMENTAL DATA

Biomedical researchers reported that MS-Excel converted some gene names into dates, damaging data sets and causing rejection of the damaged data. The authors listed 30 gene names such as DEC1 that got converted to dates (e.g., to 1-Dec). A worse problem occurred when data identifiers contained the letter E in a string of digits; these identifiers were irreversibly converted to floating point numbers in scientific notation. The authors wrote,

>There is another default conversion problem for RIKEN clone identifiers identifiers of the form nnnnnnnEnn, where n denotes a digit. These identifiers are comprised of the serial number of the plate that contains the library, information on plate status, and the address of the clone. A search … identified more than 2,000 such identifiers out of a total set of 60,770. For example, the RIKEN identifier "2310009E13" was converted irreversibly to the floating-point number "2.31E+13." A non-expert user might well fail to notice that approximately 3% of the identifiers on a microarray with tens of thousands of genes had been converted to an incorrect form, yet the potential for 2,000 identifiers to be transmogrified without notice is a considerable concern. Most important, these conversions to an internal date representation or floating-point number format are irreversible; the original gene name cannot be recovered.<

Peter G. Neumann commented, "If some computer virus or trojan did this sort of damage to the results of thousands of high-cost biomedical experiments, I imagine that we'd see a serious effort to put some people in jail. I'm not suggesting that any similar sort of retribution is appropriate here, but perhaps some rehabilitation would be in order. . . ."

DEBIT CARD TYPO RENDERS COUPLE PENNILESS

An AP item datelined Palmdale, California notes that George Beane was charged $4,334.33 for four burgers at Burger King. To make a long story short, the cashier entered $4.33 and then forgetfully reentered the same amount again, resulting in a debit-card charge that instantly was paid out of his Bank of America account, wiping out their balance. After this was discovered, the bank insisted the funds were on a three-day hold and the debit could not be be reversed. [The AP article said, "Burger King did not charge the Beanes for their meal, and the couple got their $4,334.33 back on Friday."] "For those three days, those were the most expensive value burgers in history," Pat Beane said.

[Abstract by Peter G. Neumann; additions by MK]

Mark Feit added in RISKS 24.23:

>[Debit-card] Transactions at countertop terminals do have a bounds check, but it happens at the wrong point in the transaction. The customer receipt and store copy are printed *after* the charge has been committed to the clearing house, leaving the cardholder with no way to approve the amount. (Even restaurants, which have an extra step where you add a gratuity, have this problem, because the final figure is still un-verified by the customer.) Even if the customer refuses to consummate the transaction by signing, it's still a done deal and the only recourse for correcting it is to take it up with the bank.

I suspect that's what happened in this case, and it's a very good reason to use a real credit card instead of a debit card.<

2006-05-02 **MySQL remote information disclosure buffer overflow vulnerabilities execute arbitrary code solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/17780/discuss 23

MYSQL REMOTE INFORMATION DISCLOSURE AND BUFFER OVERFLOW VULNERABILITIES.

MySQL is susceptible to multiple remote vulnerabilities. Analysis: A buffer overflow vulnerability due to insufficient bounds checking of user supplied data before copying it to an insufficiently sized memory buffer. This issue allows remote attackers to execute arbitrary machine code in the context of affected database servers. Failed exploit attempts will likely crash the server, denying further service to legitimate users. Two information disclosure vulnerabilities due to insufficient input sanitization and bounds checking of user supplied data. These issues allow remote users to gain access to potentially sensitive information that may aid them in further attacks. For a complete list of vulnerable products: http://www.securityfocus.com/bid/17780/info Solution: The vendor has released version 5.0.21 of MySQL to address these issues. Versions 4.0.27, 4.1.19, and 5.1.10 are also scheduled to be released in the future. For more information: http://www.securityfocus.com/bid/17780/references

PARKING METER CHARGES $8M FOR 63-YEAR PARKING STAY

A humor column in today's _LA Times_ featured a photograph of a self-pay parking kiosk with a mis-set date of 16 May 1943, showing an amount due of $8,082,022.84.

Sanity checking, you ask? Not bloody likely. An auxiliary display shows the fee in larger characters; it reads 8.1E+6. When you have an programmer so clueless as to calculate money values in floating point, there is little hope for subtleties like sanity checking.

As a side point, I'm fascinated that things like parking kiosks now use chips powerful enough to have floating-point support, at least as a library. A 4-bitter would be adequate for the task, though it's not clear to me that this particular programmer could have written the code needed to compute the fee on a 4-bit machine.

1997-05-09 **privacy database QA**

RISKS 19 14

The Kansas Sex-Offender Database that was published on the Web in May is full of egregious and irresponsible errors. In one county, 14 of the 16 addresses listed as residences of convicted sex offenders were wrong. The sex offenders had moved. No one bothered to check the correctness of the addresses listed, with the result that innocent people were already being harassed for being on the list. Makes you wish one of the bureaucrats responsible for the list had rented a dwelling where a pervert used to live. . . .

Category 21.2 *Security product QA failures*

1997-05-09 **QA crypto**

RISKS 19 13

A bank decided to make mutual fund information available to its customers on a Web site. To secure access to a member's portfolio, the SSL code generated a unique 40-bit session key for each session. Unfortunately, the session key was foolishly constructed using the IP address as part of the value. When many employees from a single Internet site visited their portfolio, they ended up forcing the session keys to recycle within 40 minutes, resulting in access to an earlier inquirer's portfolio when an innocent later inquirer visited the site. Moral: don't make assumptions about sources of randomness and uniqueness. Birthdays are not unique. IP addresses are not unique. People's full names are not unique. Cartesian products of variables that don't have mutually exclusive values are not unique.

1997-06-26 **QA interface**

RISKS 19 23

Michael Passer reported that Ctrl-Enter, which normally introduces a page break in MS-Word 97 and other word-processing packages, is redefined without warning when using Word as the e-mail editor in MS-Outlook: it sends the e-mail message at once. Bad form: changing the meaning of common keystrokes _in the same program_ as a function of context is not cool, even when the keystroke redefinition is quietly noted on the File pull-down menu.

Category 21.2 *Security product QA failures*

1997-07-16 **QA hardware calculation**

RISKS 19 24

A RISKS correspondent found that the newest revision of the DEC ALPHA motherboard has a defective pow() function. "Try 'pow(1.234567, 7.654321)'. If you don't get 5.017something, you have the same problem."

Category 21.2 *Security product QA failures*

1997-07-16 **QA spreadsheets**

RISKS 19 24

Research on production spreadsheets reveals that in 300 files tested and in experiments with more than 1000 users, many spreadsheets contained serious errors. See <http://panko.cba.hawaii.edu/ssr/Mypapers/whatknow.htm> for a summary of findings of many independent studies showing cell-wise and sheet-wise error rates. For example, a study by ". . .Coopers and Lybrand in London. . . reported . . . that over 90% of all spreadsheets with more than 150 rows contained at least one significant formula mistake."

Category 21.2 *Security product QA failures*

1997-07-18 **DSN QA**

RISKS 19 25

On 97.07.17, reported Daniel Pouzzner, the .com and .net domains disappeared from the DNS due to propagation of corrupt namerserver databases. Peter G. Neumann added, "[The problem apparently began around 11:30pm 16 Jul EDT, during the autogeneration of the NSI top-level domain zone files, and resulted from the failure of a program converting Ingres data into the DNS tables, corrupting the .COM and .NET files. Quality-assurance alarms were evidently ignored and the corrupted files were released at 2:30am EDT — with widespread effects. Other servers copied the corrupted files from the NSI version. Corrected files were issued four hours later, although there were still some lingering problems. . . .]

Category 21.2 *Security product QA failures*

1997-07-18 **Internet availability disaster backhoe fiber**

AP, Newsbytes, Reuter, Independent

On 1997.07.17 at 02:45 EDT, an operator at Network Solutions Inc. ignored alarms and released corrupted DNS table updates to the Net; as a result of the corruption, the entire .com and .net domains disappeared for half a day, disrupting worldwide access to e-mail and Web access in those sectors (mostly located in the United States and Canada). A few hours later, a backhoe operator sliced through a fiber-optic cable in Laurel, MD, near Washington, DC and shut down several phone trunks and elements of the Internet backbone, causing massive rerouting of Internet traffic and considerable congestion on the backup routes. The Net was back to normal by around 15:00 the same day. Members of the London Internet Exchange (LINKS) complained about what they described as inadequate accountability at Network Solutions.

2000-05-19 **antivirus false positives QA quality assurance**

RISKS 20 89

The Norton AntiVirus signature file dated 2000-05-18 caused many false positive identifications of the VBS.NewLove.A e-mail enabled worm.

Category 21.2 *Security product QA failures*

2000-05-25 **antivirus QA quality assurance confidentiality**

RISKS 20 89

A home-grown anti-virus scanner at a company accidentally converted all e-mail file access attributes to world-readable while it scanned in-boxes for suspect files. The breach of control was discovered only after about 10 days of vulnerability.

Category 21.2 *Security product QA failures*

2000-05-30 **antivirus quarantine QA quality assurance technical support**

RISKS 20 90

Richard Thieme, a regular contributor to the RISKS Forum, reported that Symantec's Systemworks 2000 Anti-Virus program reacted to the source code for the network.vbs worm by quarantining an entire Eudora Pro e-mail box where filters automatically stored incoming e-mail from a security list. That entire folder remained permanently inaccessible. When he finally reached a human being in technical support after hours of trying to get a meaningful response on how to recover the quarantined e-mail messages, he was told that no one had ever requested that particular function before. Given that the messages were not, in fact, infected, the anti-virus product actually caused harm instead of preventing it.

Category 21.2 *Security product QA failures*

2000-07-06 **QA quality assurance**

RISKS 20 94

CTS, the company that supplies automated barriers for access control to trains in Surrey, England, upgraded the software in June. Instead of improving the response speed, the newly programmed barriers erased the information on valid tickets, causing immense tie-ups for manual restitution to furious customers as well as for manual verification of unerased tickets. [Comment: how could any software firm test so poorly that such a drastic error could slip through quality assurance?]

Category 21.2 *Security product QA failures*

2000-07-18 **access control QA quality assurance design flaw danger emergency**

RISKS 20 95

The designers of subway access-control systems have justifiably introduced antipassback timers so that a magnetic ticket cannot be used immediately after someone has entered the restricted area of a station. However, Boyd Roberts reported to RISKS that the London Underground engineers foolishly introduced a timer for egress as well as ingress. Roberts wrote, "This is atrocious design" and pointed out that in an unmanned station, such restrictions on egress could be catastrophic in an emergency.

In a follow-up posting, Clive D. W. Feather explained that the barrier system is controllable by staff, who can analyze the situation and override any blockage. In addition, all Tube stations must be manned all the time, and if staff leave they are required by policy and procedure to disable the barriers.

Category 21.2 *Security product QA failures*

2000-08-25 **QA quality assurance encryption bug key escrow**

RISKS. PoliTech http://www.politechbot.com/p-00067.html, Wired http://www.wired.com/news/print/0,1294,16219,00.html 21 03

The popular PGP encryption and digital-signature software was shown to include a bug in the key escrow functions that allowed unauthorized access to improperly-encrypted ciphertext.

Category 21.2 *Security product QA failures*

2000-10-16 **access control software canonical passwords hard-coded cleartext crack**

RISKS 21 09

WinU software from Bardon was claimed to lock down computers using Windows; the company's Web site included a list of large customers using the software. Someone posted a list of hard-coded, cleartext canonical backdoor passwords ("emergency passwords") obtained from the executable files, thus at once rendering the product useless and indirectly helping to supply a list of companies ripe for attack.

Category 21.2 *Security product QA failures*

2000-12-03 **antivirus signature files QA quality assurance operating system crash**

RISKS 21 13

Peter G. Neumann wrote, "Windows 95, 98, and NT all seem to have crashed under McAfee virus definition file version 4.0.4102. It includes a driver that actually imitates the virus. Network Associates recommended starting in Safe Mode and disabling VirusScan's startup scan."

Category 21.2 *Security product QA failures*

2001-04-23 **hacker challenge firewall QA quality assurance promotion gimmick backfire failure penetration**

RISKS 21 36

Jay Anantharaman reported in RISKS on a hacker challenge gone wrong: "A team of computer hackers has gained 35,000 pounds for hacking into a computer system just twenty-four hours after the competition began. Argus Systems organised the competition -- to break into a Web server locked down using its security product called PitBull -- to promote its products and to coincide with the start of Infosec, the UK's premier computer security event. Undeniably, the stunt backfired and is an embarrassment for Argus Systems Group, as well for as security consultant firm Integralis and hardware vendor Fujitsu Siemens, which helped organise the stunt and have coordinated three similar competitions in the US and Germany without suffering setbacks."

Category 21.2 *Security product QA failures*

2001-04-29 **virus operations security production software infection QA quality assurance embarrassment**

RISKS 21 37

Dave Stringer-Calvert reported in RISKS that Microsoft security fixes were infected with FunLove virus upon release. "A virus infection of security fix files on Microsoft's partner and premier support Web sites has forced the software giant to suspend certain downloads for more than a fortnight. Microsoft issued an alert on Monday, which states that various Hotfix files on its Premier Support and Microsoft Gold Certified Partners Web sites are infected with the FunLove virus. A copy of the notice said Microsoft has stopped access 'in order to protect customers' to an unspecified number of files, and expects to be able to restore access later today [29 Apr 2001]. Customers were advised to contact their technical account manager in the interim."

Category 21.2 *Security product QA failures*

2001-06-13 **bug tracking database error QA quality assurance incorrect data corruption transcription dissemination validation validity integrity**

RISKS 21 49

Uwe Ohse was able to compare his original bug posting about a particular problem with the version of his report in the SecurityFocus Vulnerability Database; to his distaste, he "found a number of errors in the database entry. The vulnerability in question is a local one, not a remotely exploitable bug. The bug database got it exactly the other way round. The database entry states the bug exists in version 1.0, but not in 1.0.1 to .3. This is wrong - the bug exists in version 1.1.0 (i don't know about older versions). There are other minor incorrect information."

Category 21.2 *Security product QA failures*

2001-07-20 **password change programming design error rejection false negative logic**

RISKS 21 53

A RISKS correspondent reported on a flaw with general applicability for all security systems: don't change the rules on password composition when _receiving_ existing passwords.

Philip Bragg explained that the original password for a digital certificate allowed non-alphanumeric characters; however, after a software change, the Web site form that asks users to log on with their old (or new) passwords explicitly forbids non-alphanumeric characters in the input field. Interestingingly, entering a bad password leads to an error message, whereas entering the correct password leads to "a mostly blank and useless page." Mr Bragg notes, "If the system knows I am using the correct passphrase why won't it let me renew my certificate?"

Web designers take note.

Category 21.2 *Security product QA failures*

2002-01-04 **QA quality assurance bug date javascript display**

RISKS 21 85

William Colburn, writing in RISKS, noted an embarrassing date problem on the Web page showing McAfee virus alerts: the date was missing in the sentence, "This page current as of." With javascript enabled, the date shown was January 4, 1971. Worse still, it turned out that the 1971 date was pulled from his own computer, which had the wrong date set. Finally, he pointed out that the current date was inserted by javascript into a cached copy of the page, producing the risk that an old page with inaccurate information could mislead someone into thinking it was up to date.

2002-03-10 **buffer overflows vulnerabilities ICAT CVE**

ICAT Metabase

The ICAT Metabase < http://icat.nist.gov/icat.cfm > for the Common Vulnerabilities and Exposures (CVE) database reported 240 vulnerabilities involving buffer overflows out of a total of 1241 for the period from 1 Jan 2001 to 10 Mar 2002. This represents about 19% of all vulnerabilities logged for that period. Overall, for the entire period since the CVE began recording vulnerabilities in 1995, buffer overflows are named in 737 of the 3677 vulnerabilities or about 20% of the total.

Category 21.2 *Security product QA failures*

2002-04-22 **privacy confidentiality design disclosure flaw QA quality assurance identity theft SSN**

RISKS 22 04

Ted Lee reported this astounding blunder in RISKS:

>I had reason to question the denial of a claim on our dental insurance. I called the appropriate 800 number and ended up choosing the menu item for their "automated services." The first thing they asked for was my subscriber identification number, which the voice then said "is usually your social security number." I punched it in. The voice repeated it back to me -- and then went on to spell out my name (yes, they had it correct; OK, no middle initials, but first and last name were fine) *and* give my birthdate. Need I say more?<

[MK adds: For those puzzled by the implications, this system allows anyone who has picked up a potential identity-theft victim's SSN and knows they do business with this insurance company to determine the victim's birthdate -- very helpful in developing the stolen identity.

MORAL: don't program automated systems to divulge confidential information unnecessarily.]

Category 21.2 *Security product QA failures*

2003-02-07 **Microsoft problematic patch pulled Windows NT XP uninstall**

NIPC/DHS

February 05, eSecurity Planet — Problematic Windows NT patch pulled.

Microsoft has pulled the security patch for Microsoft Security Bulletin MS02-071: Flaw in Windows WM_TIMER Message Handling Could Enable Privilege Elevation. The patch, which was first issued on December 11, actually introduces an error that may cause systems to fail. While the Slammer worm inflicted its damage on copies of Microsoft SQL Server 2000, the latest problem revolves around a security patch for Windows NT 4.0 systems. But it comes at a time when sysadmins are being scolded for not updating systems with the necessary patches in the first place. (The patch for Slammer has been around since July.) The security vulnerability was found in the WM_TIMER Message Handling in NT 4.0 and could enable privilege elevation. Patches for Windows 2000 and Windows XP were unaffected by the latest withdrawal, Microsoft said. In the updated advisory, Microsoft said it was investigating the cause of the problematic patch and promised to release an updated fix soon. The company urged Windows NT 4.0 administrators to uninstall the patch until a new fix is issued. This vulnerability has a severity rating of "Important". The updated advisory may be found on the Microsoft website:

2003-03-04 **new vulnerablility snort buffer overflow NIPC advisory execute arbitrary code**

NIPC/DHS

March 03, Department of Homeland Security, National Infrastructure Protection Center — NIPC Advisory 03-003: "Snort buffer overflow Vulnerability".

There is a buffer overflow in the Snort Remote Procedure Call normalization routines which can cause Snort to execute arbitrary code embedded within sniffed network packets. Depending upon the particular implementation of Snort this may give local and remote users almost complete control of a vulnerable machine. The vulnerability is enabled by default. Snort is a widely used Intrusion Detection System from Sourcefire. The affected Snort versions include all version of Snort from version 1.8 through current. Snort 1.9.1 has been released to resolve this issue. More information can be found on the Sourcefire website:
http://www.sourcefire.com/services/advisories/sa022503.html.

2003-03-20 **new vulnerability Microsoft security bulletin ISA DNS Intruction Detection Filter denial-of-service**

NIPC/DHS

March 19, Microsoft — Microsoft Security Bulletin MS03-009: Flaw In ISA Server DNS Intrusion Detection Filter Can Cause Denial Of Service.

Microsoft Internet Security and Acceleration (ISA) Server 2000 contains the ability to apply application filters to incoming traffic. A flaw exists in the ISA Server DNS intrusion detection application filter, and results because the filter does not properly handle a specific type of request when scanning incoming DNS requests. An attacker could exploit the vulnerability by sending a specially formed request to an ISA Server computer that is publishing a DNS server, which could then result in a denial of service to the published DNS server. DNS requests arriving at the ISA Server would be stopped at the firewall, and not passed through to the internal DNS server. All other ISA Server functionality would be unaffected. By default, no DNS servers are published. DNS server publishing must be manually enabled. The vulnerability would not enable an attacker to gain any privileges on an affected ISA Server or the published DNS server or to compromise any cached content on the server. It is strictly a denial of service vulnerability. Microsoft has assigned a risk rating of "Moderate" to this vulnerability. A patch is available at the Microsoft website.

Category 21.2 *Security product QA failures*

2003-04-10 **new vulnerability Microsoft security bulletin Winsock ISA firewall flaw patch exploit fix**

NIPC/DHS

April 09, Microsoft — Microsoft Security Bulletin MS03-012: Flaw In Winsock Proxy Service And ISA Firewall.

There is a flaw in the Winsock Proxy service in Microsoft Proxy Server 2.0, and the Microsoft Firewall service in ISA Server 2000, that would allow an attacker on the internal network to send a specially crafted packet that would cause the server to stop responding to internal and external requests. Receipt of such a packet would cause CPU utilization on the server to reach 100%, and thus make the server unresponsive. The Winsock Proxy service and Microsoft Firewall service work with FTP, telnet, mail, news, Internet Relay Chat (IRC), or other client applications that are compatible with Windows Sockets (Winsock). These services allow these applications to perform as if they were directly connected to the Internet. They redirect the necessary communications functions to a Proxy Server 2.0 or ISA Server computer, thus establishing a communication path from the internal application to the Internet through it. Microsoft has assigned a risk rating of "Important" to this vulnerability. A patch is available at the Microsoft website.

2003-04-18 **CERT CC advisory Snort IDS intrusion detection system new vulnerability exploit patch fix**

NIPC/DHS

April 17, CERT/CC — CERT Advisory CA-2003-13: Multiple Vulnerabilities in Snort Preprocessors.

The Snort intrusion detection system ships with a variety of preprocessor modules that allow the user to selectively include additional functionality. There are vulnerabilities in two of these modules. CORE Security Technologies has discovered a remotely exploitable heap overflow in the Snort "stream4" preprocessor module. To exploit this vulnerability, an attacker must disrupt the state tracking mechanism of the preprocessor module by sending a series of packets with crafted sequence numbers. This causes the module to bypass a check for buffer overflow attempts and allows the attacker to insert arbitrary code into the heap. This vulnerability affects Snort versions 1.8.x, 1.9.x, and 2.0 prior to RC1. Internet Security Systems has discovered a remotely exploitable buffer overflow in the Snort RPC preprocessor module. When the RPC decoder normalizes fragmented RPC records, it incorrectly checks the lengths of what is being normalized against the current packet size, leading to an overflow condition. The RPC preprocessor is enabled by default. This vulnerability affects Snort versions 1.8.x through 1.9.1 and version 2.0 Beta. Both issues are addressed in Snort version 2.0, which is available at the Snort website: http://www.snort.org/.

2003-04-24 **patch fix slow Microsoft Windows XP security bulletin**

NIPC/DHS

April 24, IDG News Service — Microsoft fixing patch that can slow Windows XP.

Microsoft is revising a security patch for Windows XP systems with Service Pack 1 installed after customers complained that installing the patch slowed their systems down to a crawl. Removing the patch brings system speed back to normal. Originally released on April 16, Security Bulletin MS03-013 addressed a buffer overrun vulnerability in the Windows kernel, which manages core services for the operating system such as allocating processor time and memory, as well as error handling. Microsoft is working on a revised patch which will be re-issued when it has been completed and fully tested. Microsoft said that customers running Windows XP Service Pack 1 should still consider applying the flawed patch as protection until a new version is released. The revised bulletin is available at the Microsoft Website: http://www.microsoft.com/technet/treeview/default.asp?url=/t echnet/security/bulletin/MS03-013.asp.

2003-05-08 **VPN vulnerabilities Cisco 3002 hardware client DoS Attack ICMP packets performance degradation**

NIPC/DHS

May 08, IDG News Service — Cisco reports VPN vulnerabilities.

Cisco on Wednesday warned customers of three vulnerabilities in its Cisco 3005, 3015, 3030, 3060 and 3080 VPN (virtual private network) Concentrators and the Cisco VPN 3002 Hardware Client. In one of the vulnerabilities, an interloper could access systems on a private network from a workstation on the public network without any form of authentication. Another vulnerability can be exploited to carry out a DOS attack on the VPN concentrator. In the third vulnerability a flood of malformed ICMP (Internet Control Message Protocol) packets could cause a performance degradation on the concentrator or cause it to restart. Workarounds and an upgrade are available on the Cisco Website: http://www.cisco.com/warp/public/707/cisco-sa-20030507-vpn3k.shtml

2003-05-08 **microsoft security flaw intenret passport hackers consumer accounts vulnerability**

NewsScan; NIPC/DHS

MICROSOFT SCRAMBLES TO FIX SECURITY FLAW

Microsoft says it has fixed a security glitch in its Internet Passport service that left 200 million consumer accounts vulnerable to hackers. Product manager Adam Sohn said the flaw apparently had existed since at least September 2002, but investigators found no evidence that anyone had tried to exploit it before last month. The flaw was discovered by Pakistani researcher Muhammed Faisal Rauf Danka after hackers repeatedly hijacked Passport accounts belonging to him and a friend. Danka says it took him only about four minutes to find the problem. The embarrassing security lapse could leave Microsoft open to sanctions by the Federal Trade Commission, as well as a possible hefty fine. Under a settlement last summer, the government had accused Microsoft of deceptive claims about Passport's security, and in response the company had pledged to beef up its safeguards and submit to audits every two years for the next 20 years, or risk fines of up to $11,000 per violation. "If we were to find that they didn't take reasonable safeguards to protect the information, that could be an order violation," says an FTC official. Meanwhile, Microsoft is currently touting its "trustworthy computing initiative," which is intended to improve security for all its software products and services. (AP 8 May 2003)

May 08, Associated Press — Microsoft admits Passport was vulnerable.

Computer researcher Muhammad Faisal Rauf Danka of Pakistan discovered how to breach Microsoft Corp.'s security procedures for its Internet Passport service. The service is designed to protect customers visiting some retail Web sites, sending e-mails and in some cases making credit-card purchases. Microsoft acknowledged the flaw affected all its 200 million Passport accounts but said it fixed the problem early Thursday, after details were published on the Internet Wednesday night. Under a settlement with the Federal Trade Commission (FTC) last year over lapsed Passport security, Microsoft pledged to take reasonable safeguards to protect personal consumer information during the next two decades or risk fines up to $11,000 per violation. The FTC's Jessica Rich said Thursday that each vulnerable account could constitute a separate violation - raising the maximum fine that could be assessed against Microsoft to $2.2 trillion.

2003-05-13 **security flaws virtual machines random bit change cosmic rays IEEE physical access**

NewsScan

May 13, CNET News — Security flaws exposed in virtual machines. Princeton University student Sudhakar Govindavajhala has found security flaws in Java and .Net virtual machines. The technique relies on the ability of energy to "flip bits" in memory. While cosmic rays can very occasionally cause a random bit in memory to change value, from 0 to 1 or from 1 to 0, Govindavajhala decided not to wait. He used a lamp to heat up the chips inside a computer and cause one or more bits of memory to change. By doing so, the researcher broke the security model that virtual machine's rely on—that the computer faithfully executes its instruction set. An attack requires physical access to the computer, so the technique poses little threat to virtual machines running on PCs and servers. But it could be used to steal data from smart cards, Govindavajhala said Tuesday at the Institute of Electrical and Electronic Engineers (IEEE) Symposium on Security and Privacy in Berkeley, CA. He also pointed out that as processors and memory get faster, the energy needed to induce bit flips becomes smaller, suggesting that his technique will only become more effective.

2003-06-25 **Symantec Security Check activeX control holes buggy code attack operating system**

NIPC/DHS

June 25, IDG News Service — Serious security holes, buggy code found in Symantec products.

On Monday, anti-virus software company Symantec acknowledged a report about a serious security flaw in Symantec Security Check, an online service that enables users to scan their computer's vulnerability to a number of security threats. An ActiveX control installed by the Security Check service contains a buffer overflow vulnerability that could enable a remote attacker to crash or run malicious code on systems that had the control installed. Symantec updated the ActiveX control in the Security Check service, but security researchers monitoring the issue noted attackers who have a copy of the flawed ActiveX code with a valid Symantec digital signature could trick a Microsoft Windows system into accepting the control, opening that system to attack. Also on Monday customers using Symantec AntiVirus Corporate Edition reported that an automated anti-virus definition update from the company caused the anti-virus software to fail. Symantec subsequently provided instructions on how to repair systems that had downloaded the faulty update.

2003-10-20 **Windows security problems fix Microsoft operating systems vulnerabilities**

NewsScan

MICROSOFT VOWS TO FIX WINDOWS SECURITY PROBLEMS

Microsoft CEO Steve Ballmer has admitted the inadequacy the company's current collection of security software patches for the Windows operating system and says the company will modify them in the coming year. Customers have complained that the company's system of frequently issuing new patches is too time-consuming and difficult, so Microsoft is now designing technology to shield Windows from malicious e-mail messages, viruses and worms. The changes will include shipping Windows with an Internet firewall turned on by default, which would have blocked the recent "Blaster" virus, and will prevent attachments from executing commands — a common method network vandals use to hijack computers. (San Jose Mercury News 10 Oct 2003)

2003-10-23 **revisions Microsoft Security Bulletin MS03-047 045 Outlook Web Access OWA language versions patches exchange third-party software**

NIPC/DHS

October 23, Computerworld — Microsoft posts 'revisions' to security bulletins.

Microsoft issued "major revisions" to two patches last week, MS03-045 and MS03-047, after they caused problems on foreign language versions of the Windows operating system and Exchange e-mail server. Security bulletin MS03-045, rated "Important," concerns a buffer overrun vulnerability in a component of most supported versions of Windows. Microsoft discovered compatibility problems between the patch and third-party software on systems running foreign language editions of Windows 2000 with Service Pack 4. Russian, Spanish and Italian versions of Windows 2000 were affected, in addition to versions in a number of other languages, including Czech, Finnish and Turkish. Security bulletin MS03-047, rated "Moderate," described a cross-site scripting vulnerability in Exchange Server 5.5, Service Pack 4. The patch did not work for some customers who installed foreign language versions of Outlook Web Access (OWA), an Exchange service that enables e-mail users to access their Exchange mailboxes using a Web browser instead of the Outlook mail client. While customers running English, German, French and Japanese versions of OWA were covered by the original patch, those running OWA in other languages need to apply the rereleased version, Microsoft said. The patches are available on the Microsoft Website: http://www.microsoft.com/technet/treeview/default.asp?url=/t echnet/security/current.asp

2003-11-03 **security patch fix exploit vulnerability Microsoft buffer overflow Messenger Service**

NIPC/DHS

October 30, eSecurity Planet — Microsoft revises critical patches.

Microsoft has issued major revisions to several 'critical' security patches because of problems associated with Debug Programs. The "major revisions" issued on October 30 have been released to correct problems in the MS03-042, MS03-043, and MS03-045 patches. The MS03-042 patch, which plugs a 'critical' buffer overflow issue in the Windows Troubleshooter ActiveX Control, has been re-issued because of problems related to CPU resource usage. The Debug Problems afflict all three faulty patches—MS03-043, which is a buffer overrun in Messenger Service that could lead to code execution and MS03-044, which could allow PC takeover because of buffer overflows in the ListBox and ComboBox Control. Additional information is available on the Microsoft Website:
http://www.microsoft.com/technet/treeview/default.asp?url=/t echnet/security/bulletin/winoct03.asp

2003-12-23 **fix patch vulnerability flaw buffer overflow Internet Explorer browser software third-party Microsoft**

NIPC/DHS

December 22, CNET News.com — New open-source patch released for IE. A Website that published a third-party patch to fix a security hole in Microsoft's Internet Explorer (IE) has had to re-issue the patch Saturday, December 20, after the original was found to contain a buffer overflow exploit. This exploit, which allowed an attacker to take control of the patched PC, might have been far more damaging than the flaw that the patch was trying to fix. According to Openwares, only about 6,500 people downloaded the original patch. Security experts warned people against installing it last week, saying that aside from trust issues, the patch author would not have had access to IE source code and so the patch could interfere with future updates from Microsoft. The IE vulnerability, which was first reported in late November, allows a browser to display one URL in the address bar while the page being viewed is actually hosted elsewhere, making the user more susceptible to ruses like "phishing." However, Openwares' first fix, which worked by filtering out any URLs containing suspicious characters, would work only with addresses that had less than 256 bytes. Larger addresses produced a buffer overflow. Microsoft has still not released a fix for the IE problem or given any indication as to when one might be available.

2004-01-14 **Microsoft security bulletin patch flaw vulnerability fix**

NIPC/DHS;
http://www.microsoft.com/technet/treeview/default.asp?url=/technet/security/bulletin/MS04−001.asp

January 13, Microsoft — Microsoft Security Bulletin MS04-001: Vulnerability in Microsoft Internet Security and Acceleration Server 2000 H.323 Filter Can Allow Remote Code Execution.

A security vulnerability exists in the H.323 filter for Microsoft Internet Security and Acceleration Server 2000 that could allow an attacker to overflow a buffer in the Microsoft Firewall Service in Microsoft Internet Security and Acceleration Server 2000. An attacker who successfully exploited this vulnerability could try to run code of their choice in the security context of the Microsoft Firewall Service. This would give the attacker complete control over the system. The H.323 filter is enabled by default on servers running ISA Server 2000 computers that are installed in integrated or firewall mode. ISA Servers running in cache mode are not vulnerable because the Microsoft Firewall Service is disabled by default. Users can prevent the risk of attack by disabling the H.323 filter. Microsoft has assigned a severity rating of "Critical" to this issue.

2004-02-05 **firewalls proxy HTTP request check point Application Intelligence AI update issued**

DHS IAIP Daily; http://www.us−cert.gov/cas/techalerts/TA04−036A.html

February 05, US-CERT — Technical Cyber Security Alert TA04-036A: HTTP Parsing Vulnerabilities in Check Point Firewall-1.

The Application Intelligence (AI) component of Check Point Firewall-1 is an application proxy that scans traffic for application layer attacks once it has passed through the firewall at the network level. Both the AI and HTTP Security Server features contain an HTTP parsing vulnerability that is triggered by sending an invalid HTTP request through the firewall. When Firewall-1 generates an error message in response to the invalid request, a portion of the input supplied by the attacker is included in the format string for a call to sprintf(). It is possible to exploit this format string vulnerability to execute commands on the firewall. This vulnerability can be exploited as a heap overflow, which would allow an attacker to execute arbitrary code. In either case, the commands or code executed by the attacker would run with administrative privileges, typically "SYSTEM" or "root". Additional information and a patch are available on the Check Point Website: http://www.checkpoint.com/techsupport/alerts/security_server .html

2004-02-05 **VPN ISS firewalls proxy HTTP request check point Application Intelligence AI update issued**

DHS IAIP Daily;
http://www.crn.com/sections/BreakingNews/dailyarchives.asp?A rticleID=47735

February 05, TechWeb — Security flaws found in popular firewall software.

Flaws found late Wednesday in Check Point Software's popular firewall and VPN software could allow an attacker to gain entrance to enterprise networks, Internet Security Systems (ISS) said in a critical alert. The disclosure of the vulnerabilities is yet another sign of a move by hackers to hammer at security software, firewalls, and intrusion detection systems, the very devices and applications enterprises rely on to defend themselves against intruders, said Dan Ingevaldson, the director of ISS's X-Force research team. The first vulnerability is within Check Point Firewall-1, and stems from the HTTP Application Intelligence that's designed to prevent potential attacks or detect protocol anomalies aimed at servers behind the firewall. The flaw also exists in the HTTP Security Server applications proxy that ships with all versions of Firewall-1, including the most recent. On Wednesday, Check Point posted a patch for this vulnerability that it recommended be installed immediately. The second vulnerability lies within Check Point VPN-1 Server and its virtual private networking (VPN) clients, Securemote and SecureClient. The vulnerability exists in the ISAKMP processing in both the server and clients, and if exploited, could result in an attacker gaining access to any client-enabled remote computer, including those in employees' homes.

2004-03-02 **security vulnerability flaw hole fix patch Dell OpenManage server HTTP POST**

DHS IAIP Daily;
http://www.techworld.com/news/index.cfm?fuseaction=displaynews&NewsID=1115

February 27, Techworld — Critical security hole in Dell OpenManage.

A security hole in Dell OpenManage server could leave the product open to attack by an unauthorized user. The problem has been identified as high risk by security consultancy Secunia. The vulnerability is caused due to a boundary error in the Web server when handling certain HTTP POST requests. POST is an extremely common HTML method of processing forms but can be exploited by sending a message with a hidden but extremely long variable to cause a heap overflow. The vulnerability can be side-stepped by restricting access to Port 1311/TCP and only allowing trusted IP addresses to connect. However, without that in place, a denial of service or system access are readily achievable. Additional information is available on the Secunia Website: http://secunia.com/advisories/10994/

2004-03-22 **security vulnerability flaw hole patch fix Norton Internet software**

DHS IAIP Daily;

March 19, CNET News.com — Flaw stymies Norton Internet Security.

A software component of Norton Internet Security could allow hackers to use the application as a backdoor into a person's computer system, security researchers warned Friday, March 19. The flaw occurs in an ActiveX component used by security firm Symantec's desktop security program, Norton Internet Security, according to research firm NGSSoftware. The security hole could be used to run an attack program that would then take control of the computer that the software was trying to protect. "The attack can be achieved either by encouraging the victim to visit a malicious Web page or placing a script within...an HTML e-mail," the advisory stated. Symantec's Antispam software has a similar issue caused by a different ActiveX component. Fixes for the flaws can be downloaded using Symantec's LiveUpdate.

2004-05-12 **vulnerability Symantec DNS NetBIOS**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1591455,00.asp

May 12, eWEEK — Multiple vulnerabilities found in Symantec client products.

Symantec has acknowledged several serious bugs in several of its client security products in both corporate and consumer editions. The problems involve several functions of the products but one specific file, SYMDNS.SYS. Fixes for all of the problems are available through Symantec's LiveUpdate and technical-support channels. Products affected include Symantec Client Firewall versions 5.0.0 through 5.1.1; Symantec Client Security 1.0.0, 1.1.0 and 2.0.0; Norton AntiSpam 2004; Norton Internet Security 2002 through 2004; and Norton Internet Security Professional Edition 2002 through 2004. DNS response is one of the functions listed as having such an error. A malicious response to a DNS request could cause the program to fail or alter the flow of the program. There are also errors in the processing of NetBIOS Name Service responses that could allow remote code execution or denial of service. Since NetBIOS is not a routable protocol, such attacks would have to come from within a network segment. Additional information is available on the Symantec Website: http://securityresponse.symantec.com/avcenter/security/Conte nt/2004.05.12.html

2004-10-18 **software anti-virus detection evasion vulnerability**

DHS IAIP Daily; http://www.idefense.com/application/poi/display?id=153&type=vulnerabilities&flashstatus=true

October 18, iDEFENSE — Multiple vendor anti-virus software detection evasion vulnerability.

Remote exploitation of an exceptional condition error in multiple vendors' anti-virus software allows attackers to bypass security protections by evading virus detection. The problem specifically exists in the parsing of .zip archive headers. This vulnerability affects multiple anti-virus vendors including McAfee, Computer Associates, Kaspersky, Sophos, Eset and RAV. See iDEFENSE Advisory in Source link for vendor fixes.

2004-11-03 **F-secure antivirus Microsoft Exchange mail server ZIP archive malicious code update issued**

DHS IAIP Daily; http://securitytracker.com/alerts/2004/Nov/1012057.html

November 03, SecurityTracker — F-Secure Anti-Virus for Microsoft Exchange vulnerability.

A vulnerability was reported in F-Secure Anti-Virus for Microsoft Exchange which could allow a remote user to can send malicious code within a ZIP archive that will pass through the anti-virus function without detection. The vendor reported that some password protected files are not detected inside a ZIP archive. The vendor has released F-Secure Anti-Virus for Microsoft Exchange 6.3x Hotfix 2, available at: ftp://ftp.f-secure.com/support/hotfix/fsav-mse/fsavmse63x-02.zip

2004-12-15 **Adobe Acrobat Reader buffer overflow vulnerability code execution attack update issued**

DHS IAIP Daily; http://secunia.com/advisories/13474/

December 15, Secunia — Adobe Acrobat Reader "mailListIsPdf()" function buffer overflow.

A vulnerability has been reported in Adobe Acrobat Reader 5.0.9 for Unix, which can be exploited by malicious people to compromise a user's system. The vulnerability is caused due to a boundary error in the "mailListIsPdf()" function when checking input files. This can be exploited to cause a buffer overflow by sending an e-mail with a malicious PDF document attached or a link to one. Successful exploitation allows execution of arbitrary code. Update to version 5.0.10 for Unix: http://www.adobe.com/products/acrobat/readstep2.html

---

Category 21.2 *Security product QA failures*

2004-12-15 **Ethereal network sniffer software vulnerabilities denial of service DoS**

DHS IAIP Daily; http://secunia.com/advisories/13471/

December 15, Secunia — Ethereal multiple vulnerabilities.

Multiple vulnerabilities exist which can be exploited by malicious people to cause a DoS (Denial of Service) and potentially compromise a vulnerable system including execution of arbitrary code. Vulnerabilities include errors within the DICOM dissector, the handling of RTP timestamps, the HTTP dissector, and the SMB dissector. Update to version 0.10.8: http://www.ethereal.com/download.html

---

Category 21.2 *Security product QA failures*

2004-12-21 **Kerberos V5 authentication software open source buffer overflow vulnerability update issued**

DHS IAIP Daily; http://secunia.com/advisories/13592

December 21, Secunia — Kerberos V5 "libkadm5srv" buffer overflow vulnerability.

A vulnerability has been reported in Kerberos V5, which potentially can be exploited by malicious users to compromise a vulnerable system. The vulnerability is caused due to a boundary error in the libkadm5srv administration library within the "add_to_history()" function during the password history handling. This can be exploited to cause a heap-based buffer overflow when a principal changes the password and has a certain password history state. The vulnerability is fixed in version 1.4-beta3. The vulnerability will reportedly be fixed in the upcoming krb5-1.4 release and krb5-1.3.6 patch release. Apply patch for version 1.3.5: http://web.mit.edu/kerberos/advisories/2004-004-patch_1.3.5. txt

---

Category 21.2 *Security product QA failures*

2005-01-11 **mpg123 Motion Pictures Experts Group MPEG layer-2 buffer overflow vulnerability code execution attack no update issued**

DHS IAIP Daily; http://secunia.com/advisories/13779/

MPG123 MPEG LAYER-2 BUFFER OVERFLOW VULNERABILITY

A vulnerability has been reported in mpg123, which potentially can be exploited by malicious people to compromise a user's system. The vulnerability is caused due to an error in the parsing of frame headers for layer-2 streams. This may be exploited to cause a heap-based buffer overflow via a specially crafted MP2 or MP3 file. Successful exploitation may allow execution of arbitrary code with the privileges of the user executing mpg123. There is no solution at this time.

Category 21.2 *Security product QA failures*

2005-01-12 **Apple iTunes playlist handling buffer overflow vulnerability code execution attack**

DHS IAIP Daily; http://secunia.com/advisories/13804/

SECUNIA ADVISORY SA13804: APPLE ITUNES PLAYLIST HANDLING BUFFER OVERFLOW VULNERABILITY

A vulnerability in iTunes can be exploited by malicious people to compromise a user's system. The vulnerability is caused due to a boundary error within the handling of .m3u and .pls playlists. This can be exploited to cause a buffer overflow via a specially crafted playlist. Successful exploitation may allow execution of arbitrary code.

Category 21.2 *Security product QA failures*

2005-01-17 **VMWare operating system emulator ESX server sensitive information disclosure vulnerability update issued**

DHS IAIP Daily; http://secunia.com/advisories/13871/

VMWARE ESX SERVER THREE VULNERABILITIES

VMware has acknowledged some vulnerabilities in ESX Server, which can be exploited to disclose sensitive information in kernel memory, bypass certain security restrictions, and potentially compromise a vulnerable system. Update to version 2.5 or apply security update available at: http://www.vmware.com/download/esx/

Category 21.2 *Security product QA failures*

2005-01-17 **MySQL script vulnerability privilege escalation attack update issued**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2005/Jan/1012914.html

MYSQL 'MYSQLACCESS.SH' UNSAFE TEMPORARY FILES MAY LET LOCAL USERS GAIN ELEVATED PRIVILEGES

A vulnerability was reported in MySQL in the 'mysqlaccess.sh' script. A local user may be able to obtain elevated privileges. Mmysqlaccess.sh, creates temporary files in an unsafe manner. A local user can create a symbolic link (symlink) from a critical file on the system to a temporary file to be used by the script. Then, when the script is executed, the sym-linked file may be modified with the privileges of the script. A fix is available via Bitkeeper at: http://lists.mysql.com/internals/20600

Category 21.2 *Security product QA failures*

2005-01-17 **BlackBerry Enterprise Server denial of service DoS vulnerability Wireless Markup Language WML update issued**

DHS IAIP Daily; http://secunia.com/advisories/13861/

BLACKBERRY ENTERPRISE SERVER MOBILE DATA SERVICE DENIAL OF SERVICE.

A vulnerability has been reported in BlackBerry Enterprise Server, which can be exploited by malicious people to cause a DoS (Denial of Service). The vulnerability is caused due to an error in the Mobile Data Service when processing WML (Wireless Markup Language) pages and can be exploited by tricking a user into viewing a malicious WML page containing an URL without space characters in the comment block. The vulnerability has been fixed in the following versions: BlackBerry Enterprise Server for Domino 2.2 Service Pack 4 Hot Fix 2 and BlackBerry Enterprise Server for Microsoft Exchange 3.6 Service Pack 4 Hot Fix 2.

Category 21.2 *Security product QA failures*

2005-01-18 **Unix Linux Xpdf stack based buffer overflow vulnerability code execution attack update issued**

DHS IAIP Daily; http://www.securityfocus.com/archive/1/387583/2005−01−16/200 5−01−22/2

MULTIPLE UNIX/LINUX VENDOR XPDF MAKEFILEKEY2 STACK OVERFLOW

Remote exploitation of a buffer overflow vulnerability in the xpdf PDF viewer included in multiple Unix and Linux distributions could allow for arbitrary code execution as the user viewing a PDF file. Successful exploitation of this vulnerability leads to arbitrary code execution as the user who opened the malicious file. An attacker would have to convince a target to open the provided file in order to exploit this vulnerability. A patch to address this issue is available at: ftp://ftp.foolabs.com/pub/xpdf/xpdf-3.00pl3.patch. Updated binaries (ver. 3.00pl3) to address this issue are available at: http://www.foolabs.com/xpdf/download.html

---

Category 21.2 *Security product QA failures*

2005-01-19 **Oracle products multiple vulnerabilities injection denial of service DoS attack update issued**

DHS IAIP Daily; http://secunia.com/advisories/13862/

ORACLE PRODUCTS HAVE TWENTY-THREE VULNERABILITIES.

Twenty-three vulnerabilities have been reported in various Oracle products. Some have an unknown impact and others can be exploited to disclose sensitive information, gain escalated privileges, conduct PL/SQL injection attacks, manipulate information, or cause a DoS (Denial of Service). Patches are available through the vendor.

Category 21.2 *Security product QA failures*

2005-01-21 **Ethereal network sniffer packet dissector vulnerabilities denial of service DoS update issued**

DHS IAIP Daily; http://secunia.com/advisories/13946/

ETHEREAL MULTIPLE UNSPECIFIED PACKET DISSECTOR VULNERABILITIES

Multiple vulnerabilities have been reported in Ethereal, which can be exploited by malicious people to cause a DoS (Denial of Service) or potentially compromise a vulnerable system. These vulnerabilities include errors in the COPS dissector, the DLSw dissector, the DNP dissector, the Gnutella dissector, the MMSE dissector, and the X11 dissector. Update to version 0.10.9: http://www.ethereal.com/download.html

---

Category 21.2 *Security product QA failures*

2005-01-26 **Avaya products multiple vulnerabilities denial of service DoS privilege escalation attack**

DHS IAIP Daily; http://secunia.com/advisories/14011/

AVAYA PRODUCTS MULTIPLE VULNERABILITIES

Multiple vulnerabilities have been reported in Avaya products, which can be exploited by malicious people to cause a Denial of Service or compromise a vulnerable system. Avaya has multiple vulnerabilities in: libitff / zip / vim / unarj /openmotif / postgresql / lesstif / pine / xpdf ; which potentially can be exploited to cause a DoS (Denial of Service), a user can gain escalated privileges, or compromise a vulnerable system. The vendor recommends the following: restrict local access to the server; do not open or view PDF files, and XPM and TIFF images; do not compress or decompress files from untrusted sources; do not enable modeline or filetype plugins in VIM; do not run the "make_oidjoins_check" script.

Category 21.2 *Security product QA failures*

2005-01-27 **Juniper JUNOS remote denial of service vulnerability DoS**

DHS IAIP Daily; http://secunia.com/advisories/14049/

JUNIPER JUNOS UNSPECIFIED REMOTE DENIAL OF SERVICE VULNERABILITY

A new vulnerability has been identified in Juniper Networks routers running JUNOS software, which can be exploited by attackers to cause a Denial of Service. The vulnerability is caused due to an unspecified error within the processing of certain network packets. This can be exploited to disrupt the operation of a vulnerable device via some specially crafted network packets. According to Juniper, it is not possible to use firewall filters to protect vulnerable routers. The vulnerability affects all releases of JUNOS built prior to 2005-01-07. Users registered at Juniper's support site can view patch information at: https://www.juniper.net/alerts/viewalert.jsp?txtAlertNumber= PSN-2005-01-009&actionBtn=Search

DHS IAIP Daily; http://secunia.com/advisories/14082/

HP VIRTUALVAULT TRUSTED GATEWAY AGENT DENIAL OF SERVICE VULNERABILITY

A vulnerability has been reported in HP Virtualvault, which can be exploited by malicious people to cause a Denial of Service. The vulnerability is caused due to an unspecified error in the TGA (Trusted Gateway Agent) daemon and can be exploited via specially crafted network traffic. Apply patch available through the vendor.

Category 21.2 *Security product QA failures*

2005-02-02 **Cisco Internet Protocol videoconferencing IP/VC product vulnerability remote user access device hijacking workaround issued**

DHS IAIP Daily; http://securitytracker.com/alerts/2005/Feb/1013067.html

CISCO IP/VC HARD-CODED SNMP COMMUNITY STRINGS LET REMOTE USERS ACCESS THE DEVICE

A vulnerability was reported in Cisco's IP/VC videoconferencing products. A remote user can gain access to the system using common default SNMP community strings. A user with knowledge of the community strings can gain full control of the device. Such users can, among other things, create new services, terminate or affect existing sessions, and redirect traffic to a different destination. Cisco has described a workaround in their advisory, available at: http://www.cisco.com/public/technotes/cisco-sa-20050202-ipvc .shtml

DHS IAIP Daily; http://news.com.com/Windows+glitches+to+get+fixes/2100−1002_ 3−5562678.html

MICROSOFT TO RELEASE 13 UPDATES - AT LEAST ONE CRITICAL

Thirteen Microsoft patches will be released next Tuesday, February 8, including nine fixes for Windows flaws. At least one of the updates for the Windows operating system is rated "critical," its highest rating, Microsoft said Thursday, February 3, in a posting to its TechNet site. The forewarning is part of the company's program to give regular computer users notice of monthly security bulletins before the patches themselves are released. These updates will patch a critical flaw affecting Office and Visual Studio, and another critical flaw involving Windows, Windows Media Player and MSN Messenger. Also on the way are a patch for an "important" vulnerability in .Net Framework and a fix for "moderate" problems with SharePoint Services and Office. Bulletin: http://www.microsoft.com/technet/security/bulletin/advance.m spx

2005-03-16 **OpenPGP partial plaintext retrieval vulnerability encrypted message recovery design flaw consult vendor**

DHS IAIP Daily; http://www.securityfocus.com/bid/12529/discussion/

OPENPGP PARTIAL PLAINTEXT RETRIEVAL VULNERABILITY

OpenPGP may theoretically allow attackers to retrieve partial plaintexts from encrypted OpenPGP messages. A cipher text attack method has been developed that exploits a flaw in OpenPGP to retrieve partial plaintexts from OpenPGP messages encrypted with symmetric encryption. Apparently when messages are encrypted with the CFB mode, a design flaw in an integrity check feature can be exploited. Consult your vendor for patch information.

Category 21.2 *Security product QA failures*

2005-03-28 **Symantec security product vulnerabilities denial of service DoS system crash update issued**

DHS IAIP Daily; http://securityresponse.symantec.com/avcenter/security/Content/2005.03.28.html

MULTIPLE SYMANTEC PRODUCTS HAVE DENIAL OF SERVICE VULNERABILITIES

Two vulnerabilities were reported in Symantec's Norton AntiVirus, Internet Security, and System Works in the AutoProtect feature. A user can create a file or modify a filename to cause the target system to crash. When Auto-Protect was invoked to scan a particular file type, e.g., introduced on a CD, copied and pasted into the system, etc., the resultant scan caused the system to hang and generate a general protection fault error, or BSOD requiring a system reboot to clear. When SmartScan enabled, renaming a file stored on a network share can induce a system crash when the modification kicks off SmartScan. Based on the file write for the name change, SmartScan will be invoked to scan the file, which can result in excess CPU consumption and ultimately a system crash. Updates are available via Symantec LiveUpdate.

2005-04-25 **Trend Micro antivirus software update problem Windows XP SP2**

DHS IAIP Daily; http://news.zdnet.co.uk/0,39020330,39196220,00.htm

TREND MICRO CUSTOMERS SUFFER WEEKEND PROBLEMS

Trend Micro apologized on Monday, April 25, for distributing a faulty software update that caused IT workers around the world to spend the weekend fixing their systems. The Japan-based antivirus company has promised to compensate customers whose computers running Windows XP SP2 were disabled by the update. The company said the update was only available for ninety minutes and caused "certain performance issues" with CPUs. Trend Micro, which denied rumors that the update included a virus, said it didn't know what had caused the incident but that it had now issued a fix and was working with channel partners to solve the problem. Trend Micro said that most of the businesses affected were located in Japan, and that few complaints had been received from customers in the U.S. and Europe. The update affected versions 7.5 and above of Trend Micro's Scan Engine.

2005-05-11 **Cisco Catalyst switches 6500 7600 firewall services module ACL bypass vulnerability update issued**

DHS IAIP Daily; http://www.cisco.com/warp/public/707/cisco−sa−20050511−url.s html

CISCO — CISCO CATALYST 6500/7600 SERIES FIREWALL SERVICES MODULE ACL BYPASS VULNERABILITY.

A new vulnerability was identified in Cisco products, which may be exploited by attackers to bypass the security restrictions. A vulnerability exists in the Cisco Firewall Services Module when URL, FTP, or HTTPS filtering is enabled in which inbound TCP packets can bypass access-list entries intended to explicitly filter them. updates available through Source link below.

Category 21.2 *Security product QA failures*

2005-05-11 **Ethereal network sniffer stack buffer overflow vulnerability update issued**

DHS IAIP Daily; http://www.securityfocus.com/bid/13567/info/

ETHEREAL DISTCC DISSECTION STACK BUFFER OVERFLOW VULNERABILITY

A remote buffer overflow vulnerability exists in Ethereal due to a failure of the application to securely copy network-derived data into sensitive process buffers. The specific issue exists in the DISTCC protocol dissector. An attacker may exploit this issue to execute arbitrary code with the privileges of the user that activated the vulnerable application. This may facilitate unauthorized access or privilege escalation. The vendor has released Ethereal version 0.10.11 to address this and other vulnerabilities.

Category 21.2 *Security product QA failures*

2005-05-19 **ZENworks remote management authentication validation failure no update issued**

DHS IAIP Daily; http://www.zone−h.org/en/advisories/read/id=7524/

ZENWORKS REMOTE MANAGEMENT FAILS TO PROPERLY VALIDATE AUTHENTICATION

This authentication protocol contains several stack and heap overflows that can be triggered by an unauthenticated remote attacker to obtain control of the system that requires authentication. Successful exploitation of ZENworks allows attackers unauthorized control of related data and privileges on the machine and network. It also provides attackers leverage for further network compromise. There is no solution at this time.

2005-06-30 **government surveillance counter-terrorism identification authentication I&A travellers visitors Department Homeland Security DHS errors data integrity correctness Freedom of Information Act FOIA**

EPIC Alert; http://www.epic.org/alert/EPIC_Alert_12.13.html 12 13

US-VISIT PROBLEMS CAUSE VISITOR DELAYS AT PORTS OF ENTRY

The Electronic Privacy Information Center (EPIC) obtained information throught the Freedom of Information Act (FOIA) showing that the United States Visitor and Immigrant Status Indicator Technology (US-VISIT) has significant errors in its database, causing "many cases of mistaken identity. Commercial aircrew members, vacationers, and businesspersons have all been delayed by the gaffes. The problems caused unnecessary delays in the visitors' travels and resulted in the improper flagging of crewmembers by government watch lists."

The EPIC summary continues:

>US-VISIT was launched at 115 airports and 14 seaports in January 2004. By the end of 2005, the program will be operational at all of the nations more than 400 ports of entry. US-VISIT requires foreign nationals entering or exiting the country to submit biometric and biographical information. This data collection often begins before a visitor buys her plane ticket, as U.S. Consular offices abroad may, before issuing a U.S. Visa, collect fingerscans from potential visitors and compare them against those in a criminal database. Fingerscans are again collected upon the visitor's arrival in the U.S. For verification and then stored in a government database, as are travelers' arrival and departure records. Failure to be processed through this departure confirmation system could jeopardize a visitor's re-admittance to the U.S., as the government compares the manifest information provided by air and cruise lines to ascertain that visitors have not overstayed their visas.

Last September, US-VISIT expanded to include visitors from the 27 nations who are members of the Visa Waiver Program, thus requiring the screening of an additional 33,000 persons per day. Except for visiting diplomats and officials and persons under 14 or over 79 years old, US-VISIT now applies to virtually all foreign nationals holding nonimmigrant visas, regardless of country of origin.

The documents obtained by EPIC show that some travelers are aware that the US-VISIT database contains erroneous information well before DHS realizes its own mistake and fear that their next visit to the U.S. Will result in misidentification. Visitors reported missing their connecting flights due to errors in the database system, and airline crewmembers reported being delayed up to ninety minutes after a long international flight. Some travelers reported that the operator collecting fingerscans at a port had erroneously reversed their left and right index fingerprints, labeled a husband's fingerprints as his wife's, failed to collect the data required under US-VISIT, or collected data from travelers exempt from the program, such as holders of a G-4 visa.<

RISKS; http://www.wired.com/news/technology/0,1282,68363,00.html 23 96

EMERGENCY ALERT SYSTEM ERRORS IN FLORIDA & NEVADA

Kevin Poulson reported in _Wired_ on two errors in the Emergency Alert System (EAS) at the end of July that luckily failed to cause panic.

"The Florida gaffe occurred when an operator at the National Weather Service's Tallahassee forecast office inadvertently entered the code 'RHW' instead of 'RWT,' keying a radiological hazard warning instead of a required weekly test…. Fortunately, it failed to cause panic, in part because the audio accompanying the message still identified it as 'only a test,' and the office moved rapidly to quash the false alarm."

In Las Vegas, radio station "KXTE-FM tried to send out a message canceling an earlier Amber Alert, and instead transmitted an EAN, or emergency action notification -- a special code reserved for the president of the United States to use in the event of a nuclear war or similar extreme national emergency…. The error apparently resulted from a hardware problem in the station's EAS encoder-decoder. 'We think that the internal battery had failed, the programming had scrambled itself,' said [a spokesperson for KXTE]."

2005-08-03 **lightning damage lightning-detection system recursion**

RISKS; http://tinyurl.com/7jf8h 24 01

RECURSIVE LIGHTNING PROBLEMS

A bit of light-hearted fun at the expense of the lightning-detection folks:

Klaus Johannes Rusch noted this recursive case of vulnerability to what's being monitored:

>Fortunately there were only a few minor injuries when a plane overshot a runway at Pearson International Airport. According to a CBC report … most operations on the airport had been suspended due to bad weather: "… a spokesperson with the Greater Toronto Airports Authority said lightning was causing technical problems with the airport's lightning-detection system." Why would one expect that lightning-detection systems could cope with lightning?<

Peter G. Neumann chimed in with an amusing recollection of a similar case:

>My favorite meta-lightning event occurred was when I was giving a lecture in my Survivable Systems course at Maryland, and I was talking about the time at Wallops Island where they had several missiles ready to launch because they wanted to study the effects of lightning on the missile controls. As some of you may remember, lightning hit the launch platform and triggered the launching of one of the missiles (which I mentioned most recently in RISKS-20.42). Just at that point in the lecture, lightning hit the lecture room and took down the computer controlling the outfeeds to remote classrooms and our own video monitors. Some of the students wondered how I had managed such a theatrical effect.<

DHS IAIP Daily; http://www.securityfocus.com/bid/14488/info

ACUNETIX WEB VULNERABILITY SCANNER REMOTE DENIAL OF SERVICE VULNERABILITY

Acunetix Web Vulnerability Scanner is affected by a remote denial of service vulnerability. This issue affects the Web sniffer component of the application. An attacker can exploit this issue by gaining control of a server through some means or by sending spoofed traffic to the network. A successful attack can result in a denial of service condition due to resource exhaustion. Acunetix Web Vulnerability Scanner version 2.0 is affected. Other versions may be vulnerable as well. Security Focus is not currently.

RISKS; http://archiv.tagesspiegel.de/archiv/31.08.2005/2022942.asp#art (in German) 24 03

GERMAN INSIDER-THEFT CASE ILLUSTRATES AWFUL SECURITY

Social services have a money machine set up in which, when a client is given money, instead of having it transferred to their account, a chip card is selected, and the number of the card typed into a computer program that controls payouts. The client takes the card to an ATM-like money machine, puts the card in, key is the secret password which is [I hope you are sitting down … --dww] the *birthday* of the client, and takes out the money. A camera films the transaction, but erases the tapes about 6 weeks later.

The program records the payout in the files of the client, and only people with proper passwords have access to the payout system. This is called security.

About 27.000 Euros (about the same in dollars these days) disappeared about 2 years ago. The revision department nailed down 22 transactions that had been conducted without an entry in the files of a client, and the clients knew nothing of the windfalls.

The accused kept his mouth shut during the process, and it was uncovered that the cards were not kept track of and "flew around the offices", people would log onto their payout computers and remain logged in all day, sometimes leaving the office without locking the door. It would have been trivial for a colleague to quickly use a computer to load up a card, then slip it to an accomplice and have them pick up the cash. In addition, everyone seemed to know everyone else's passwords…

The defence lawyer also noted that the social workers were all mad about the extra work they had to do about the new German dole system, so it really could have been anyone.

Berlin remains out the 27.000 Euros and has to pay court costs, the accused keeps his job (but was transferred, probably to the filing room), and the judge recommends they re-think the security of the payout system. I'm with the judge on this one!

2005-12-22 **Symantec vulnerability impacts products detection exploits patches code programs bug security RAR compressed files utility titles products Library Norton Internet Security SystemWorks Firewall Symantec**

DHS IAIP Daily; http://www.securitypipeline.com/news/175007890;jsessionid=2AK0KWQB2SDV0QSNDBCSKH0CJUMEKJVN

Symantec says vulnerability impacts 63 products.

Symantec on Wednesday, December 21, named more than 60 of its products as affected by the critical vulnerability disclosed earlier this week, and said it was pushing out a "heuristic" detection that would spot potential exploits. However, no patches have yet been released. The number of impacted products was among the largest ever for a single vulnerability, and demonstrated the risk of reusing code in a large group of programs. The bug, which was made public Tuesday, December 20, by researcher Alex Wheeler, is in how Symantec's AntiVirus Library, part of virtually all the Cupertino, CA,-based security giant's programs, handles RAR compressed files. RAR files are created by the WinRAR compression utility, developed and sold by RarLab. In an advisory released Wednesday, Symantec listed 48 enterprise titles and 15 consumer products that used the flawed Library. On the consumer side, the 2006 versions of Norton AntiVirus, Internet Security, SystemWorks, and Personal Firewall are open to attack. Corporate titles such as Norton AntiVirus for Microsoft Exchange, BrightMail Antispam, and AntiVirus for Handhelds are also on the list. The only protection for the moment is a special detection capability that Symantec is downloading to users' systems.

2005-12-27 **Bugzilla unsafe temporary files gain privileges script temporary files symbolic link critical created overwritten bug tracking vulnerability Security Tracker pending**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2005/Dec/1015411.html

Bugzilla 'syncshadowdb' unsafe temporary files may let local users gain elevated privileges.

A vulnerability was reported in Bugzilla in the 'syncshadowdb' script wherein a local user can obtain elevated privileges. The 'syncshadowdb' script uses temporary files in an unsafe manner. A local user can create a symbolic link (symlink) from a critical file on the system to a temporary file to be used by the script. Then, when the script is executed by the bug tracking system, the symlinked file will be created or overwritten with the privileges of the bug tracking system. The vulnerability can enable a local user to obtain the privileges of the bug tracking system. The vulnerability affects Version(s): 2.6.10 and prior versions. Versions 2.18.* and 2.20.* are not affected. Security Tracker reports that the fix will be included in the pending 2.16.11 version but a solution is currently available. Solution: https://bugzilla.mozilla.org/show_bug.cgi?id=305353

2006-01-11 **Symantec Norton System Works rootkit feature malware quality assurance failure**

DHS IAIP Daily; http://www.betanews.com/article/Symantec_Found_Using_Rootkit_Feature/1137029426 23

SYMANTEC FOUND USING ROOTKIT FEATURE [NO, IT'S NOT A ROOTKIT]

Symantec is cleaning up a feature in Norton SystemWorks that uses a rootkit-like technique to hide a system folder from Windows. The technology works similar to Sony BMG's controversial rootkit DRM in the way it masks files and makes them invisible to the operating system. The Norton Protected Recycle Bin feature adds a directory called Nprotect, which stores temporary copies of files that users delete. The idea was to supplement the standard Windows Recycle Bin and enable users to recover files they removed accidentally. However, hiding a directory from Windows can open the door to vulnerabilities, as the Sony DRM rootkit debacle exposed. Malware authors were able to write viruses and worms that hid in the cloaked directory, effectively preventing scanning software from discovering their existence on a PC. Users of Norton SystemWorks can download the patch now through LiveUpdate. The rootkit-like activity was discovered by Mark Russinovich of Sysinternals, who first released details on the Sony XCP software.

[MK notes: this article illustrates an improper use of the word "rootkit." It has never meant "stealth" alone. It is specifically used to denote software that allows an attacker to return to a compromised system and regain root privileges.]

2006-01-12 **canonical password Joe account access control vulnerability root backdoor**

RISKS; http://tinyurl.com/atvlo 24 15

CISCO/CISCO = SILLY/SILLY

Gadi Evron analyzed a Cisco advisory entitled "Default Administrative Password in Cisco Security Monitoring, Analysis and Response System" which revealed a back door to root:

"The security issue is basically a user account on the system that will give you root when accessed.

The account is:
1. Hidden.
2. Default.
3. With a pre-set password."

Evron also noted that many Cisco routers still use a canonical "Joe" account (same string for account and password):

"On the other hand, the most common practice to hack routers today, is still to try and access the devices with the notoriously famous default login/password for Cisco devices: cisco/cisco.

Cisco/cisco is the single most used default password of our time. It got more routers pwned than any exploit in history, and it still does. One would think that a company such as Cisco, especially with this history, would stay away from such 'default' accounts? But the fact that this account is hidden makes it something different."

MICROSOFT'S SECURITY DISCLOSURES COME UNDER FIRE.

Is Microsoft silently fixing security vulnerabilities and deliberately obfuscating details about patches in its monthly security bulletins? Matthew Murphy, a security researcher who has worked closely with the Microsoft Security Response Center in the past, is accusing the software maker of "misleading" customers by not clearly spelling out exactly what is being patched in the MS06-015 bulletin released on April 11. That bulletin, rated "critical," contained patches for a remote code execution hole in Windows Explorer, the embedded file manager that lets Windows users view and manage drives, folders and files. However, as Murphy found out when scouring through the fine print in the bulletin, the update also addressed what Microsoft described as a "publicly disclosed variation" of a flaw that was reported in May 2004. In an entry posted to the SecuriTeam blog, Murphy noted that the vulnerability that is documented was privately reported, but the "variation" that was also patched has been publicly known for 700+ days. "[The] information as published is extremely misleading and Microsoft's choice not to document a publicly reported vulnerability is not one that will be for the benefit of its customers' security," Murphy said.

2005-07-20 **embedded control systems automobile safety shutoff flaw error damage emergency design override**

RISKS 23 95

DOES THE PROGRAMMER ALWAYS KNOW BEST?

Bob Paddock reported in RISKS that his Chrysler Voyager van seems to have been damaged by lightning recently and illustrated a design flaw that affects many other software and firmware systems: the assumption that users are complete idiots who cannot be trusted to override an automated decision no matter what the circumstances.

>Got the van out Friday night. I pulled out of the garage and as soon as I hit the road the Check Engine Light came on and the speedometer dropped to zero, as I continued to gain speed, going up the hill. The automatic transmission was now stuck in 1st-gear. I turned around a few driveways up the street and went back to the house. Made appointment to take it in for servicing the next morning.

Dealer is about four miles down the street. Limped along in 1st-gear to the dealer the next morning until we reached the only major four way intersection in this four mile gauntlet.

Right in the middle of the intersection the engine died like I turned the key off. A good Samaritan pushed the van off the road. The dealer came and towed the van for the last mile of the trip.

The dealer said that a tachometer feedback sensor had gone bad "and the van didn't know what speed it was going so it shut down to be safe".

Now for the Us vs Embedded part of the story: Isn't it sufficient that *I* knew stopping in the middle of a busy four way intersections was a Really Bad Thing to do? *It* thought it knew better than I did.

I'm really glad I did not have to cross any railroad tracks when *it* decided to stop on the crossing because it thought it was safe, rather than listen to my commands.<

* * *

In followup comments in RISKS 23.96, Michael Kohne warned that the dealer's hypothesis might be unfounded -- the reasons for the engine shutdown could have been something else entirely. Or perhaps "Another alternative is that he doesn't mean 'safe' the way you mean safe. He means 'it shut the engine down as an alternative to revving up until it explodes'. Because I guarantee that if the van's CPU let a bad sensor destroy the engine you'd be plenty po'd, and you'd probably be screaming even louder."

RISKS 24 03

SINGLE-STATE AUTOMATON*

Last week I watched the chauffeur of a Mercedes car. There was a parking spot left just in front of another Mercedes. Both different types, though fairly new. As I watched by the chauffeur got out of her car and pushed the button on the remote control to close the doors.

The system worked. The doors of the Mercedes closed. The already parked Mercedes responded with a happy 'click' and opened its doors. The chauffeur, confident the click was her car telling everything was fine, didn't pay attention, until I pointed her to the fact that she opened the other Mercedes.

She tried several times. When her car opened the other one closed. And vice versa. But she didn't see it as a problem, she could close the doors of her car and walk away. Until I pointed out the system probably worked the other way round as well ….

[Abstract (lightly edited by MK) from Leon Kunders]

* MK explains: a "single-state automaton" is a device that can be either on or off and cycles between the states without memory. For example, an elevator call-button is a single-state automaton: pressing it multiple times once it is on does nothing to increase the speed of the elevator.

2006-04-07 **major Intel architecture x86 vulnerability Pentium design issue**

DHS IAIP Daily; http://www.fcw.com/article94004−04−07−06−Web&RSS=yes 23

CYBER ATTACKERS CAN EXPLOIT PENTIUM SELF-DEFENSE.

Your computer could hand itself over to cyber attackers when it's trying to cool off. That warning was issued this week at the CanSecWest/Core06 Conference in Vancouver, British Columbia. Computers with Intel Pentium processors can be hijacked through a built-in mode designed to protect the processor's motherboard, said Loïc Duflot, a security engineer and researcher for the scientific division of France's Central Directorate for Information Systems Security. The vulnerability affects every computer that runs on x86 architecture, including the millions that the U.S. government and industry use, said Dragos Ruiu, the conference's organizer.

NewsScan; http://news.com.com/A+virus+may+be+in+your+cars+future/2100-7349_3-5568633.html

NEW STUDY WARNS OF CAR VIRUSES

A report by IBM Security Intelligence Services predicts that viruses spreading to mobile phones, PDAs and wireless networks could infect the embedded computers that increasingly are used to run basic automobile functions. The average new car runs 20 computer processors and about 60 megabytes of software code, raising more opportunities for malfunctions. In addition to the threat facing vehicles, the report noted the fastest growing threat last year was phishing -- a method of deceiving computer users into revealing personal information -- and predicted that activity would grow more serious in 2005. (Reuters/CNet.com 8 Feb 2005)

RISKS 23 72

INFECTING CARS VIA CELL PHONES -- CONT'D

Peter Ladkin reported on a mild brouhaha about the possibility that Bluetooth-enabled car-control systems might be susceptible to damage from viruses infecting or transmitted via cell-phones. He determined that the original reports (including one in RISKS 23.70) may have been stimulated by a discussion with anti-virus expert Eugene Kaspersky, who discussed _theoretical_ possibilities of infecting car systems in response to specific questions from a reporter.

Ladkin mentioned a cute cartoon he saw in which "A passenger is sitting in an airliner using his laptop, and on the screen appears: Bluetooth: new device found: Airbus A310." He then analyzed the economics of critical failures in automobiles and pointed out how unreliable software tends to be. Given how safety-critical car-control systems are, and given the massive costs of customer damage claims, he commented, "So there is plenty of motivation to make auto critical electronics the most dependable SW-based systems the world has ever seen. We are a long way from it, but I don't think we are going to be seeing critical systems upgraded through gratuitously insecure channels. Except for the exceptions, of course."

He concluded, "If I were to bet today, I'd bet on the cartoon staying a cartoon."

2005-02-14 **quality assurance QA response error tolerance missile interceptor communications failure**

RISKS; http://www.cnn.com/2005/TECH/01/12/missile.defense.ap/index.htm 23 66

MISSILE FAILS TEST? CHANGE THE RULES.

Jeremy Epstein commented on the DoD's response to errors in the missile interceptor system:

As has been widely reported, the DoD's missile interceptor test failed miserably in December [2004], building on a rather impressive history of failures. According to Pentagon brass, the problem was "with an automated pre-launch check of the communications flow between the interceptor and the main flight control computer. Detecting too many missed messages, the system shut down automatically, as designed. [so] the Pentagon will increase the pre-launch tolerance for missed messages. [General] Obering said the tolerance level was set too low; increasing it will not risk a flight guidance failure".

Well, that makes me feel better. The system ran into problems, so it generated errors. Rather than figuring out what the problem was, let's ignore the errors. Not unlike turning up the radio in your car so you can't hear it falling apart.

The general went on to say "Statistically, it's a very rare occurrence and most likely would not happen again."

Gee, I feel safer every minute.

* * *

In RISKS 23.72 he reported on yet another failure:

MISSILE INTERCEPTOR DOESN'T EVEN LEAVE ITS SILO -- AGAIN

As reported in RISKS 23.65 and 23.66, the Dec 15 test of the missile interceptor system failed when it didn't lift off from the launchpad due to a timing problem.

The 14 Feb test didn't do any better. CNN reports that "a spokesman for the [Missile Defense] agency, Rick Lehner, said the early indications was that there was a malfunction with the ground support equipment at the test range on Kwajalein Island in the Marshall Islands, not with the missile interceptor itself. If verified, that would be a relief for program officials because it would mean no new problems had been discovered with the missile."

That's good news?

In case you're keeping score, that's 6 failures out of 9 attempts since the program started. And the three "successes" have been highly scripted.

Your tax dollars at work (at least for Americans).

SOME PRIUS CARS SHUT DOWN AT SPEED

Peter G. Neumann summarized an article about an upsetting software error:

The U.S. National Highway Transportation Safety Administration has 13 reports of Toyota's Prius gas-electric hybrid cars (2004 and early 2005) stalling or shutting down at highway-driving speeds, which Toyota attributes to software problems.

The original article by Sholnn Freeman from the Wall Stree Journal included this text:

>Toyota spokesman Sam Butto said the auto maker identified a "programming error" in the computer systems of 23,900 Prius cars last year. He said that last May Toyota sent owners of those cars service warnings telling them to go to their dealerships for a software upgrade. But he said he wasn't sure how many people went in to receive the hour-long fix.

He and another Toyota spokesman said the auto maker isn't sure if the latest problems associated with 2004 Prius models involve buyers who never got the upgrade or if an altogether different glitch is shutting the car down.<

Edwin Slonim commented in RISKS:

I have always feared losing power, brakes and steering at high speed - with a helpful dashboard indication of "internal error 687, please reset". Looks like it is starting to happen. Of course we need to put this into proportion - how many cars stall at high speed with a fuel blockage, or swerve with a blowout.

SINGLE POINT OF FAILURE PARALYZES SWISS RAILSYSTEM FOR 3 HOURS

On 22 Jun 2005 at 5.08pm, a power short occurred between Amsted (Canton Uri) and Rotkreuz (Canton Zug, which in German means "train") on the Swiss train line. The SBB (Schweizerischen Bundesbahnen) operated their own power lines, and this short circuit caused a sharp drop in voltage, which quickly spread throughout the ENTIRE country of Switzerland.

Trains were stalled in the middle of nowhere, with no air conditioning in the heat of the summer. Some train doors could not be opened. More than 200,000 passengers were affected. It took about two hours to get everyone out of the trains. SBB used busses to transport stranded passengers and diesel locomotives to drag trains to the nearest station.

It took two more hours before enough power was restored in order for the trains to begin moving. But the efficient Swiss worked all night moving trains so that everything moved rather smoothly the next day.

There were allegedly no computers involved, but the single point of failure was a vivid illustration of many RISKS concepts, not the least of which is: don't throw out those diesel locomotives yet!

[Report from Debora Weber-Wulff]

Anthony Thorn added:

>My concern --and arguably the risk-- is the impact of such an incident on passenger trains in the new Gotthard "base"-tunnel which will open in 2011. This will be 57 Km (35 miles) long and run at depths up to 2000 meters (7000 feet) which means that the tunnel temperature will exceed 45 C. (113 F). If a train is stopped in the tunnel a very rapid response would be required to avoid a catastrophe.<

SCADA SYSTEM FAILURE CAUSES AIR POLLUTION

Bill Hopkins relays a report from Pennsylvania:

>Our local newspaper reports in print (but not on line) that Exelon Power's Cromby generator in Phoenixville, PA exceeded pollution limits for seven months in 2004 after an unidentified "vendor" programmed an emissions monitor for the wrong standards, and that the company will pay 600 grand. Websites for the company and the PA Dept of Environmental Protection confirm the story. Exelon is the parent company of PECO Energy, formerly Philadelphia Electric Co., which supplies power to the area.

Cromby has two generators, one coal-fired and one switchable between oil and natural gas. The vendor ("a big company" says Exelon) set the monitor for the coal-fired unit to standards for the other unit. (I would guess that the SO2 limits for oil might be higher.) Exelon discovered the problem while aggregating data "for a large use," stopped it and turned itself in. DEP assesses a fine for each day of violation.

Risks for a company: trusting the dials and trusting the vendor when you're on the hook.

Risks for the rest of us: breathing in.<

SOFTWARE FAILURE HIJACKS MALAYSIAN AIRLINES BOEING 777

The Australian (17 Sep 2005) has a chilling story about the pilots of a Malaysian Airlines 777 flying from Perth to Kuala Lumpur last month battling to regain control after an "unknown computer error" caused the aircraft to pitch violently, and brought it close to stalling.

An Australian Transport Safety Bureau report … released yesterday reveals the pilot in command disconnected the autopilot and lowered the plane's nose to prevent a stall, after incorrect data from a supposedly fail-safe device caused the plane to pitch up and climb 3000ft, cutting its indicated air speed from 500kmh to 292kmh, activating a stall warning and a "stickshaker". [A stickshaker vibrates the aircraft's controls to warn the piot when he is approaching stall speed … which, you know, means the plane is about to fall out of the air.]

The system refused to give up control, however. It increased the power on the automatic throttle, forcing the pilot to counter by pushing the thrust levers to the idle position. The aircraft immediately pitched up again, and climbed 2000ft.

The pilot turned back to Perth under manual control. When he kicked in the two autopilot systems, the plane banked to the right, and the nose pitched down.

On its landing approach, at 3000ft, the flight display gave a low airspeed warning and the auto-throttle increased thrust. The warning system also indicated a dangerous windshear, but the crew landed the jet safely.

According to the report, "investigations are focusing on faulty acceleration figures supplied by a device called the Air Data Inertial Reference Unit". The ADIRU collates aircraft navigation and performance data from other systems and passes the information to the primary flight computer.

What's potentially more disturbing, however -- and neither the Transport Safety Bureau nor The Australian appear to have picked this up -- is that a US FAA directive … in June this year highlighted other problems with the Boeing 777's ADIRU.

Boeing has told operators of the jet -- which by the way has the best safety record of any aircraft … -- to load a previous software version.

FAIL-SAFE DIDN'T: BERLIN TUNNEL TESTS SNARL TRAFFIC

After a night of repairs to one of the autobahn tunnels in Berlin the crew wanted to test the fire alarm system. They tried starting some of the fire alarms, and were worried that the automatic gates that are to keep cars from entering a tunnel with a possible fire weren't closing right. They punched more and more alarms, and the gates on both tunnel tubes (work was going on in only one tube) suddenly banged closed - and the computer regulating them crashed.

The gates failed safe -- but they couldn't be opened again. Not by hand, and not by computer, which just refused to start again. They worked feverishly from 5am to 10am, trying to get the gates open again so that traffic (which is normally very heavy at that time of the morning), could move. [I'm glad I took the train yesterday! -dww]

Police were able to evacuate cars trapped in the tunnel by way of an exit from the tunnel, which was not gated.

A special complication was that the gates on the north end of the tunnel were made by a different company than the gates on the south end of the tunnel, this caused "additional problems". Which ones, are left to the comp.risks readers as an exercise.

It is still not clear how the error happened or why the computer would not re-start, speculation has it that the computer couldn't handle so many fire alarms at the same time.

Moral of the story:

* It was good that the system failed safe.
* It was bad that it did not seem able to handle the number of fire alarms that are installed in the tubes.
* If you have different suppliers for parts, you want to make sure they are still delivering the same stuff.

2006-04-15 **automobile real-time control systems failures problems glitches crashes drive-by-wire**

RISKS; Daily Telegraph http://tinyurl.com/e6668 24 25

RISKS OF DRIVE-BY-WIRE SYSTEMS FOR AUTOMOBILES

In March 2006, British motorist was trapped in his BMW at speeds of 130 mph for 26 minutes when his electronic accelarator linkage jammed at maximum throttle. He called police on his mobile phone and miraculously avoided crashing into any other cars on the heavily-travelled motorway during his terrifying trip up the A1 highway. He flipped the car at a roundabout but walked away uninjured.

Don Norman commented in RISKS,

>Seems that stuck throttles were a continual event with old, mechanical throttles. The electronic throttles have received numerous complaints, but all of the ones I could find were about "unintended acceleration". Doing a web search for "electronic throttle accident" (without the quotes) is quite revealing.

I still don't know enough about this class of potential accidents to offer definitive comment. But from what I can tell, automobile incidents will replace aircraft ones for the RISKS community. The more things change, …

Example:

The National Highway Transportation Safety Administration is investigating complaints that some Toyota Motor Corp. cars may suddenly accelerate or surge, causing one car to strike a pedestrian. The 2002 and 2003 Toyota Camry, Camry Solara and Lexus ES300 vehicles all come equipped with an electronic throttle control system, which the NHTSA said uses sensors to determine how much throttle is being applied.

The NHTSA said 30 crashes have been attributed to the problem, with four accidents resulting in five injuries. The crashes "varied from minor to significant and may have involved other vehicles and/or building structures." The preliminary investigation is the first step in the investigative process. The NHTSA will contact Toyota to ask for documents pertaining to the issue, and could upgrade the investigation to an engineering analysis. More than 1 million Toyotas are covered by this investigation, according to the agency.

Toyota officials could not immediately be reached for comment.<

DHS IAIP Daily; http://fcw.com/article94273−05−08−06−Print 23

INDUSTRIAL CONTROL SYSTEMS POSE LITTLE-NOTICE SECURITY THREAT.

The electronic control systems that act as the nervous system for all critical infrastructures are insecure and pose disastrous risks to national security, cybersecurity experts warn. Supervisory control and data acquisition and process control systems are two common types of industrial control systems that oversee the operations of everything from nuclear power plants to traffic lights. Their need for a combination of physical security and cybersecurity has largely been ignored, said Scott Borg, director and chief economist at the U.S. Cyber Consequences Unit, an independent research group funded by the Department of Homeland Security. Control systems security is one of six areas of critical vulnerabilities Borg included in a new cybersecurity checklist released in April by the research group. The private-sector owners of critical infrastructure refuse to release data and deny that their aging, inherently insecure systems pose any security risk, said Dragos Ruiu, an information technology security consultant to the U.S. government who runs several hacker conferences. Average hackers can break into the systems, said Robert Graham, chief scientist at Internet Security Systems. He, Borg and other experts fear that major cyberattacks on control systems could have socio-economic effects as severe and far-reaching as Hurricane Katrina.

WALDO GOES WILD

The Register published this tongue-in-cheek report on a robot gone off its nut:

* Robot runs riot at California hospital *

Staff and patients at San Francisco's UCSF Medical Center were left fearful and shaken last week, when a robotic nurse threw off its shackles and went on the rampage.

"Waldo", a robot used to dispense pills and potions to medical stations at the top notch medical facility, refused to return to the pharmacy to pick up a fresh stash at the end of his rounds, according to the San Francisco Chronicle. Instead, the crazed automaton – reportedly the size of a good-sized TV, which in California means it must be at least the size of the average British garden shed -- careened past the drug depository before barging into a room in the hospital's radiation oncology department where an examination was in progress. The psychotic pill pusher reportedly refused to leave, sending both doctor and patient fleeing for their lives.

"This is the first time anything like this has happened," a hospital spokesman told the paper. "Our technology folks are going to have to take a look." Yeah, if they can find him. The 'bot's clearly gone bad, and is probably even as we speak cruising the city's Tenderloin district pushing purloined prescription pain killers, paying off dirty cops and menacing lost tourists.

Even more worryingly, the spokesman said nothing about shutting down Waldo's two colleagues, dubbed Elvis and Lisa Marie. A terrible accident waiting to happen? We think so.

DHS IAIP Daily; 23
http://www.techworld.com/security/news/index.cfm?NewsID=5205
&Page=1&pagePos=4&inkc=0

HACKER COMPUTER NETWORKS GETTING HARDER TO FIND.

Hacked computer networks, or botnets, are becoming increasingly difficult to trace as hackers develop new means to hide them, says security experts. Botnets are used to send spam, propagate viruses, and carry out denial of service attacks. Extortion schemes are frequently backed by botnets, and hackers are also renting the use of armadas of computers for illegal purposes through Web advertisements, said Kevin Hogan, senior manager for Symantec Security Response. Three or four years ago, it was easier to connect to botnets and estimate the size of one by noting the number of IP addresses on the network, he said. As legislation emerged cracking down on spammers, those who ran botnets started pursuing more clandestine ways to continue their operations. Rather than deter hardcore spammers, it drove them further underground, said Mark Sunner of MessageLabs. Botnets have an ebb and flow similar to biological behavior, Sunner said. Viruses on an infected computer may download new variants in an attempt to evade anti-virus sweeps. Law enforcement authorities have become more adept at tracking down botnet admins. However, the admins have countered by sticking to smaller groups of around 20,000 machines that are less likely to be detected as quickly, Sunner said.

BOTNET HACKER PLEADS GUILTY.

A 20-year-old hacker admitted Monday, January 23, to surreptitiously seizing control of thousands of Internet-connected computers, using the zombie network to serve pop-up ads and renting it to people who mounted attacks on Websites and sent out spam. Jeanson James Ancheta, of Downey, CA, pleaded guilty in Los Angeles federal court to four felony charges for crimes, including infecting machines at two U.S. military sites, that earned him more than $61,000, said federal prosecutor James Aquilina. Prosecutors called the case the first to target profits derived from use of "botnets," large numbers of computers that hackers commandeer and marshal for various nefarious deeds. The "zombie" machines' owners are unaware that parasitic programs have been installed on them and are being controlled remotely. Ancheta one-upped his hacking peers by advertising his network of "bots," short for robots, on Internet chat channels. A Website Ancheta maintained included a schedule of prices he charged people who wanted to rent the machines, along with guidelines on how many bots were required to bring down a particular type of Website. Acheta's sentencing is scheduled for May 1.

2006-02-08 **McAfee tool anti-bot zombie computer networks Advance Botnet Protection DDoS attacks**

EDUPAGE; 23
http://www.techworld.com/security/news/index.cfm?NewsID=5326&inkc=0

MCAFEE TACKLES BOTS

McAfee has introduced a new tool designed to defend against bots. Most distributed denial-of-service (DDoS) attacks are carried out by networks of computers running automated programs, or bots, that are controlled centrally. So-called botnets typically consist of thousands of computers hijacked by a hacker who can use them to launch DDoS attacks. Most attacks involve bots sending thousands of incomplete packets to the targeted server, which may be overwhelmed by the traffic. Defending against such attacks is difficult because it is not easy to distinguish legitimate traffic from DDoS traffic, and system administrators do not want to inadvertently block legitimate server requests. McAfee said that its new system, called Advanced Botnet Protection, is able to identify traffic that consists of incomplete packets, allowing network operators to separate malicious botnet traffic and avoid DDoS attacks.

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1933210,00.asp 23

HUNT INTENSIFIES FOR BOTNET COMMAND AND CONTROLS.

A group of high-profile security researchers, which includes international representatives from anti-virus vendors, ISPs, educational institutions and dynamic DNS providers, is ramping up efforts to find and disable the command and control infrastructure that powers millions of zombie drone machines, or bots, hijacked by malicious hackers. The idea is to open up a new reporting mechanism for ISPs and IT administrators to report botnet activity, especially the command and control system that remotely sends instructions to botnets. "If that command-and-control is disabled, all the machines in that botnet become useless to the botmaster. It's an important part of dealing with this problem," said Gadi Evron, a botnet hunter who serves in Israel's Ministry of Finance. Over the last year, the group has done its work quietly on closed, invite-only mailing lists. Now, Evron has launched a public, open mailing list to enlist the general public to help report botnet command and control servers. The new mailing list will serve as a place to discuss detection techniques, report botnets, pass information to the relevant private groups and automatically notify the relevant ISPs of command and control sightings.

2000-12-10 **spam unsolicited commercial bulk e-mail UCE denial-of-service attack DoS delay availability bandwidth saturation**

RISKS, InformationWeek http://www.informationweek.com/817/verizon.htm 21 15

In December, 70,000 Verizon ISP customers were significantly slowed (up to several hours) in their access to the Net because of three denial-of-service attacks within two weeks involving millions of unsolicited commercial e-mail ("spam"). Or at least, that's what Verizon _claimed_; however, Steve Wildstrom wrote to RISKS expressing skepticism: "Interestingly, Verizon has failed to come up, at least in public, with any evidence that this was in fact an attack. Given the company's dubious service record, a lot of folks suspect this may be a pretty lame attempt to blame a popular bogeyman for an inability to handle traffic. . . . An attack would almost certainly have involved a large number of messages from a small number of sources and at least the mail relays that the messages were sent through would have been identifiable, if not the ultimate source."

NETWORK VANDAL ATTACKS MICROSOFT SITES
Just a day after Microsoft's Web sites were down for an extended period of time because of the "human error" of a technician, they were victimized by the "human malice" of a network vandal who subjected them to a "denial of service" attack that flooded them with bogus communications, causing them to gridlock and reject legitimate communications from their customers. The company has called in the FBI for assistance. Computer security expert Abe Singer of the San Diego Supercomputer Center said that part of Microsoft's vulnerability to attack was due to the fact that its four domain-name servers are linked in a single network. "They had all their eggs in one basket and basically someone knocked down the basket." (Washington Post 26 Jan 2001)

2001-02-16 **denial of service bandwidth saturation SMS short message service mobile phone Thailand**

Reuters; http://www.joeha.com/wbnfeb162001.htm

Thailand's biggest mobile phone network crashed on Valentine's Day [2001] as thousands of young lovers sent romantic messages to their sweethearts. . . . Advanced Info Service (AIS) said the company's GSM network was flooded with more than 100,000 text messages sent within an hour via mobile phones Wednesday. The deluge of messages paralyzed the short message service (SMS) network, blocking all voice calls. AIS has a capacity for just 72,000 SMS messages per hour.

"The volume of messages sent from mobile phones this Valentine's Day was the highest volume ever -- twice as big as the message traffic sent on New Year's Eve," Wichian Mektrakarn, vice president of AIS's engineering operation, told Reuters. Wichian said many young Thais preferred to send Valentines by SMS because they were too shy to voice their feelings. "Clicking out sweet nothings on the phone is much easier than uttering words, which some still find it difficult to do," he said.

PORT 445 ATTACK COULD CAUSE DoS
By Shawna McAlearney

Security researchers are warning users to change default registry settings on Windows 2000 boxes to prevent denial-of-service (DoS) attacks through TCP port 445.

Researcher Peter Grundl of KPMG Denmark says that sending malformed packets to the Microsoft-ds port (TCP 445) can result in kernel resources being allocated by the LAN Manager service, which manages domain access. The consequences of such an attack could vary, from the Windows 2000 host ignoring the attack to users finding the dreaded blue screen of death. Experts say the impact of the attack would likely depend upon which services were running.

Targeting the Windows 2000 Server/Advanced Server/Professional, Grundl says: "An attack could be something as simple as sending a continuous stream of 10K null characters to TCP port 445." According to the advisory, this attack will cause the system service to enter a state where it constantly uses 100 percent of CPU resources.

"Port 445 attacks are a recurring problem for users of Windows 2000," says Steve Gibson, president of Gibson Research Corp. "Luckily, any NAT or firewall will protect against the whole class of port 445 vulnerabilities."

Microsoft says it has confirmed this is a problem. The software giant recommends concerned users follow the Registry Editor instructions provided on its Web site, but warns that using the Editor incorrectly can cause serious problems that may not be fixable.

2002-05-05 **DoS denial of service government information warfare**

NIPC Daily Report

The White House Web site reportedly suffered a brief but crippling denial of service attack that rendered the site inaccessible to users on 4 May. White House spokesperson Jimmy Orr confirmed that the White House site was rendered inaccessible due to a "denial of service" in the morning hours between 9 a.m. and 11:15 a.m. EDT. [Spokespersons could not attribute the denial of] service to an orchestrated attack, but did confirm that the White House was "looking into" the possible causes of the of the shutdown. Technicians were able to "unclog the clog" between Whitehouse.gov and its Internet service provider, making the site accessible to the general public. At no point did any malicious data reach White House servers. Security experts believe the Whitehouse.gov shutdown to be linked to the spate of Web site hacks and defacements launched by Chinese and pro-Chinese Internet vandals over the past few days. FAILED ATTACKS ON INTERNET
Attacks on U.S. Internet providers Tuesday morning [Aug 6] turned out to be just a blip on the screen. Bush Administration cybersecurity chief Richard Clarke described the attacks -- which were thought to have come from someplace in Western Europe -- as amounting to not much more than an "unusual" event: "There was a real spike in Internet traffic at odd hours. It was clearly unusual because it was five times and seven times normal, but it didn't take anything down." Internet monitoring group Matrix NetSystems detected a 1% decrease in Internet accessibility within the hours of the attacks, but most U.S. systems managers say the attacks were barely noticeable and caused no damage. NewsScan

HACKER ATTACK TARGETS ROOT SERVERS
A powerful denial-of-service attack briefly crippled nine of the 13 Internet "root" servers, but traffic routing was able to continue unimpeded, said ICANN VP Louis Touton: "As best we can tell, no user noticed and the attack was dealt with and life goes on." One government official described Monday's attack as the most sophisticated and large-scale assault on these root servers to date. The attack, which began around 4:45 p.m. EDT on Monday, blasted the servers with 30 to 40 times the normal amount of messages, rendering seven computers unable to respond to legitimate Internet traffic. Two others failed intermittently during the attack. The Internet theoretically can run with just one operational root server, but response times would be very slow. (AP 23 Oct 2002)

NIPC/DHS

March 25, Associated Press — Al-Jazeera site experiences hack attack.

Hackers attacked the Web site of Arab satellite television network Al-Jazeera on Tuesday, rendering it intermittently unavailable, the site's host said. The newly launched English-language page, which went live Monday, was hardest hit in a bombardment of data packets known as a denial-of-service attack. Ayman Arrashid, Internet system administrator at the Horizons Media and Information Services, the site's Web host, said the attack began Tuesday morning local time. The Web host is based in the Persian Gulf state of Qatar. The servers that host the Al-Jazeera site are in France and the United States. Only the U.S. servers were under attack, said Arrashid, so the attackers were likely in the United States. He said technicians were working to thwart the attack, but could not estimate when the site would be fully available again.

2003-05-15 **denial service attack hole kernel Linux DoS Secunia Red Hat hash collisions spoofed source address 400 packets per sencond**

NIPC/DHS

May 15, internetnews.com — DOS hole found in Linux Kernel.

Security experts Thursday warned of a vulnerability in the Linux Kernel 2.4 branch, which can be exploited to cause denial-of-service (DOS) attacks. "By flooding a Linux system with packets with spoofed source addresses, the handling of the cache will consume large amounts of CPU power. This could potentially bring a Linux system offline with a rate of only 400 packets per second by using carefully chosen source addresses that causes hash collisions in the table," according to a security advisory from computer security firm Secunia. Secunia rated the flaw as "moderately critical" and cautioned that it could be exploited to bring a Linux system offline with a rate of only 400 packets per second by using carefully chosen source addresses that causes hash collisions in the table. Red Hat has issued updated kernel packages to patch Red Hat Linux versions 7.1 through 9: http://rhn.redhat.com/errata/RHSA-2003-172.html.

2003-06-02 **net attack computers Dan Wallach Scott Crosby internet hash functions offline packets process power Rice University Houston Texas**

NIPC/DHS

June 02, New Scientist — Net attack overwhelms computers with complexity.

Dan Wallach and Scott Crosby, researchers at Rice University in Houston, TX, have found an Internet attack that can knock a web-connected computer offline using specially crafted packets of data. Many programs perform small calculations - called hash functions - on substantial amounts of data to make it easier to sort through. Tables of hashed information can then be referred to, to check that information has not been corrupted or lost en route. Wallach and Crosby calculated that some data would force a program to perform the most intensive hash calculations possible. They tested a number of commercial computer programs and found that sending these types of packets could use up nearly all of a computer's processing power, preventing it from carrying out normal tasks. Wallach and Crosby were able to disrupt target computer program using just a dial-up modem connection. The only way to defend against the attack is to use more efficient, better designed hashing algorithms. A paper outlining the attack will be presented in August at the Usenix Security Symposium in Washington D.C.

DHS/IAIP Update

BUFFER OVERFLOW PLUGGED IN SUN ONE WEB SERVER.

Sun Microsystems on Monday, January 12, warned of a buffer overflow vulnerability in its Sun ONE/iPlanet Web Server product. The firm said the flaw could be exploited by a remote user to crash the Web server, which is a type of denial-of-service attack. Independent research firm Secunia has rated the security hole as "moderately critical." The vulnerability affects the Sun ONE/iPlanet Web Server 6.0 Service Pack 5 and earlier versions on the HP-UX platform. Sun has issued a new service pack to fix the flaw, noting that there are no workarounds. The susceptible products are a crucial part of Sun's Web services initiative which falls under Sun Open Net Environment (Sun ONE) brand. The Sun ONE brand includes the Sun ONE Web Server, Sun ONE Portal Server, Sun ONE Application Server, Sun ONE Directory Server, Sun ONE Identity Server, Sun ONE Messaging Server and the Sun ONE Integration Server (all formerly iPlanet products). A service pack is available online: http://wwws.sun.com/software/download/products/3f186391.html

2004-01-26 **computer network vulnerability Internet security**

NIPC/DHS; http://news.com.com/2100−7355_3−5145863.html?tag=nefd_top

January 22, CNET News.com — Security pros question flaw find.

Two Internet software developers who said they have uncovered a way to cause entire networks of computers to freeze or shut down may have simply rediscovered an old network issue. The network performance issues are described in a series of Web site forum postings recently publicized within the security community. The poster, who uses the alias NT Canuck, said he created a tool, with the help of another developer, that can shut down entire networks. However, security researchers at the Computer Emergency Response Team (CERT) Coordination Center downplayed the issue, saying that the program simply inundates a network with so much data that computers have problems functioning correctly. "We don't see any specific vulnerability being discovered here," said Jason Rafail, an Internet security analyst at the center. According to the Web posts, the programmers found that certain circumstances could be created that would cause a network of computers to freeze, and in some cases fail. The developers contacted Microsoft and the CERT Coordination Center; both organizations confirmed that they were contacted in November. However, Microsoft's Security Response Center (MSRC) has not been able to replicate the discoverers' exact findings, said Stephen Toulouse, senior program manager for the MSRC.

2004-04-19 **ColdFusion MX Macromedia denial-of-service DoS vulnerability patch**

DHS IAIP Daily; http://www.esecurityplanet.com/trends/article.php/3342061

April 19, eSecurity Planet — ColdFusion MX DoS vulnerability patched.

Graphics design software specialist Macromedia has rolled out a fix for a denial-of-service vulnerability found in its ColdFusion MX 6.1 product suite. The firm said the flaw affected all editions of ColdFusion MX 6.1 and all versions of ColdFusion MX 6.1 J2EE. Macromedia tagged the issue as "important" and recommended that users apply the accompanying patch immediately. ColdFusion MX, formerly known as "Neo," is a key part of Macromedia MX, an integrated collection of tool, server and client technologies developed to function as a single environment. But, security bugs have followed the product around with the latest centering around the way ColdFusion MX handles file uploads. "When file uploads to ColdFusion MX via an HTML form are started, but are interrupted before they complete - disk space on the server may not be reclaimed when the ColdFusion MX template finishes processing," the company explained.

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/content/article/2006/01 /13/AR2006011300210.html 23

MILLION DOLLAR HOMEPAGE TARGETED IN HUGE DENIAL OF SERVICE ATTACK

The Million Dollar Homepage, an ad gimmick created by British college student Alex Tew that brought more than $1 million to its 21-year-old creator, was under a massive denial of service attack Friday, January 13, the Website's hosting company said. Tens of thousands of computers controlled by an unknown group or person overwhelmed the site's servers with requests. The site was up Friday due to the voluntary efforts of the hosting company, InfoRelay Online Systems Inc. Tew drew international attention when his September idea to sell a million pixels on his homepage for a $1 each to advertisers took off. The attack stemmed from a network of computers, called a botnet, that were infected with Trojans or other malicious software distributed over the Internet, Russell Weiss, vice president of technical services for InfoRelay, said. The attack started Wednesday night, January 11, growing by early Thursday, January 12, into a zombie army of possibly as many as 100,000 computers from all over the world, Weiss said. Weiss did not know where the attack originated, or whether it was part of an extortion scheme.

2006-03-08 **Xerox WorkCenter Pro PostScript processing error denial-of-service DoS vulnerabilities solution update**

DHS IAIP Daily; http://securitytracker.com/alerts/2006/Mar/1015738.html 23

XEROX WORKCENTER PRO MULTIPLE POSTSCRIPT PROCESSING ERRORS LET REMOTE USERS DENY SERVICE.

Several vulnerabilities were reported in Xerox WorkCenter Pro and Xerox CopyCenter. A remote user can cause denial-of-service conditions. Analysis: A remote user can send a specially crafted PostScript file to the target printer to trigger a buffer overflow in the PostScript file interpreter code and cause denial-of-service conditions on the target system. In addition, a remote user can send a specially crafted PostScript file to traverse the directory and cause denial-of-service conditions on the target system. A remote user can also send a specially crafted PostScript file designed to expose TCP/IP ports to cause denial-of-service conditions on the target system. Additionally, a remote user can trigger a memory error in the Web server code to cause denial-of-service conditions. An unspecified vulnerability exists in the ESS/Network Controller. A user may be able to disconnect power to cause Immediate Image Overwrite to fail without indication. Vulnerable products: The WorkCenter Pro 65, 75, and 90 models and the CopyCenter C65, C75, and C90 models are affected. Solution: The vendor has issued a fixed version (1.001.02.074). This security bulletin supersedes Security Bulletin XRX04-008. The vendor's advisory is available at: http://www.xerox.com/downloads/usa/en/c/cert_XRX06_002.pdf

2006-04-19 **Cisco IOS MPLS denial-of-service DoS vulnerability solution advisory**

DHS IAIP Daily; http://www.securityfocus.com/bid/17607/discuss 23

CISCO IOS XR MPLS DENIAL-OF-SERVICE VULNERABILITY.

Multiple Multi Protocol Label Switching (MPLS) related vulnerabilities exist on Cisco IOS XR. Only systems that are running Cisco IOS XR and configured for MPLS are affected by these vulnerabilities. Analysis: Upon successful exploitation a Modular Services Card (MSC) on a Cisco Carrier Routing System 1 or a Line Card on a Cisco 12000 series router may reload affecting switched traffic. A successful attack results in a denial-of-service condition for traffic that is being switched on an affected MSC or line card. Vulnerable: Cisco IOS XR for PRP 3.2.3; Cisco IOS XR for CRS-1 3.2.3; Cisco IOS XR 3.2.50; Cisco IOS XR 3.2.4; Cisco IOS XR 3.2.4; Cisco IOS XR 3.2.2; Cisco IOS XR 3.2.1; Cisco IOS XR 3.2. Cisco IOS XR 3.3.0 is not vulnerable to this issue. Solution: Cisco has released an advisory to address this issue: http://www.securityfocus.com/archive/1/431359

Category 22.2 DDoS attacks

1999-01-15 **denial of service attack smurf e-mail saturation ISP Internet Service Provider**

RISKS 20 16

According to an article by Tim Barlass in the Daily Telegraph of Australia (12 Jan 1999, p. 9), someone launched a sustained Smurf denial-of-service attack on Ozemail, an important Australian Internet service provider. E-mail service has been disrupted for users in Sydney. A company spokesperson said they were trying to track down the perpetrator and were considering installing filtering software to prevent future attacks.

[Note from MK: a "Smurf" attack uses widely-available software written by criminal hackers to send ping packets with forged origination in the headers to a (usually major) corporate network's broadcast address. Every device — perhaps hundreds or thousands — sends a reply packet to the forged originator address. That system thus receives a flood of packets, often overloading its TCP/IP stacks and resulting in denial of service. See the article by Michael Dillon in ASK THE INFRA EXPERT (Internet World: Apr 20, 1998) for a more detailed explanation.]

Category 22.2 DDoS attacks

1999-12-07 **criminal hackers distributed denial-of-service attacks tools DDoS master slave**

Newsbytes

In August 1999, a new breed of automated attack tools surfaced in the computer underground. Trin00 and TFN were used to install slave programs on unprotected computers using Trojans to insert the unauthorized code. These slave programs, once loaded, wait passively for encrypted instructions from a master program. The slaves can then bombard a specific victim with a flood of spurious communications, causing a denial of service. Because many slaves respond to a single command from the master, the effects on a selected target can be devastating. This is a parallel processor for criminal hackers. Unfortunately, there is no simple fix for the problem; the ideal solution is to prevent the slaves from ever being installed by improving security on all sites on the Net — but don't hold your breath.

2000-02-08 **distributed denial-of-service attack tools Internet Web download law enforcement investigation**

CNET news.com http://news.cnet.com/category/0-1005-200-1545456.html

Evan Hansen and John Borland of CNET news.com summarized the key issues in the distributed denial-of-service (DDoS) attacks affecting the Web in early February 2000. Trinoo, Tribe Flood Network and Stacheldraht programs use client software illegally installed on poorly-secured systems to amplify commands for coordinated, high-volume bombardment of specific victim sites. Paul Tharp wrote a clear summary of the problem for the New York Post pointing out that the roots of the DDoS lie far back in the development of the Internet — an environment where trust was the norm and a ping (request for information) was never perceived as a threat.

2000-02-17 **law enforcement investigation criminal vandal denial of service**

NewsScan, Washington Post http://www.washingtonpost.com/wp-dyn/business/A59099-2000Feb16.html

Federal Bureau of Investigation director Louis J. Freeh [said] his agency is pursuing "fast-developing leads" to hunt down the vandals who recently made a number of denial-of-service attacks on leading Web sites, and Attorney General Janet Reno is asking Congress for an additional $38 million to fight computer crime by training local police and prosecutors, hiring 100 new FBI computer analysts, and adding 68 lawyers to prosecute computer crimes. Freeh believes that the FBI has gotten excellent cooperation from businesses targeted by the attacks, but security expert Mark Rasch of Global Integrity Corp. says that companies have expressed fear that FBI inquiries will disrupt their business operations: "One of the problems you have is fundamental mistrust between the private sector and the law enforcement community. They're afraid of losing control of the investigation. They are concerned the FBI will ask what computer was hit . . . and walk away with your main server." (Washington Post 17 Feb 2000)

Category 22.2 DDoS attacks

2000-02-17 **denial-of-service attacks investigation law enforcement police ISP**

OTC Newsbytes

The RCMP was investigating the identity of a teenaged criminal hacker calling himself "mafiaboy" who was thought to be one of the perpetrators of the massive distributed denial-of-service (DDoS) attacks on major Web sites in early February. The Canadian federal police were cooperating with the FBI after theLook Communication ISP in Montreal turned over records to help track down the suspect. Security experts warned, however, that copycats were using the same pseudonym as a result of publicity following the DDoS attacks.

Category 22.2 DDoS attacks

2000-02-22 **distributed denial-of-service attacks DDoS vigilantes corporations information secrets sharing government policy**

New Thinking

Gerry McGovern, President of the Irish I.T. consulting company NUA, wrote in his weekly _New Thinking_ column that he was worried about news that US banks were warned about impending distributed denial-of-service (DDoS) attacks but kept the information to a tightly-knit group of financial institutions rather than sharing it with the public and security organizations. He argued that this behavior, as well as being counter-productive in the long run, was anti-social. He accused big business of usurping some of the rights and responsibilities of governments and ended, "Government has flaws; we all know that. But government is our best attempt to create institutions that allow society to be managed in a civilised manner. Without government the choice is chaos or vigilantism. The current search for the hackers behind the major spate of website attacks is a mix of both. Scores of security firms are out looking for the culprits. Their driving objective has nothing to do with law and justice and everything to do with the hoped for PR announcement that their firm caught the nasty hacker. Members of these firms are posing as suspects and friends of suspects in online chat rooms and other areas, to the extent that 'suspects' are turning up all over the place at the same time confusing everybody. . . . Law enforcement on the Internet is becoming a farce, and that's not good for anybody. Internet business will suffer if consumer confidence in the medium declines. As much as we would all like to clean up politics and make government more accountable, today right now - it is still all we've got. I have no problem with big business per se, but I don't want it 'protecting' my privacy and I don't ever want it out 'policing' my streets".

2000-02-22 **DDoS distributed denial-of-service attacks analysis sociology fundamentals community**

Red Rock Eater News

Prof. Phil Agre, owner of the Red Rock Eater News, published a cogent analysis of the distributed denial-of-service (DDoS) attacks that shook the world of e-commerce in early February 2000. Agre said that the fundamental structure of the Internet combined with widespread ignorance by normal users of unsecured computers contributed to the vulnerability of the systems. He predicted that there would be enormous pressure against unsecured sites being used as platforms for the DDoS attacks.

Category 22.2 DDoS attacks

2000-05-01 **criminal hacker tools software denial of service**

NewsScan

Like legitimate software developers, who issue progressively improved versions of their applications, crackers seem to have released an early version of a powerful new tool that attacks and brings down Web sites. The new tool, "Mstream," which is made to launch "distributed denial of service" attacks, is similar to the ones that hosed up Yahoo and other Web sites earlier this year. In a denial of service attack, programmers embed software into hundreds or thousands of computers. Later, on cue, those computers send messages to a targeted server. The volume of Internet messages knocks out the target, rendering it inaccessible to other users. Mstream's core attack engine appears to be more potent than earlier versions and it may be able to carry out its nefarious task with only a handful of computers. Further, it can also damage the network of attacking host computers by overburdening those systems with a protective technique called "egress filtering," in which the hosts try to discard the packets they send. (New York Times 1 May 2000)

2000-06-09 **Trojan denial-of-service attacks zombie slave platform**

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB960516256118849978.htm

Network Security Technologies Inc. has warned the FBI that a new "attack" . . . [Trojan] has already been implanted on as many as 2,000 computers worldwide, and could be used to cripple e-commerce and other Web sites. The company discovered the virus, which is hidden in a small video file received in e-mail or found on the Net, when an employee inadvertently downloaded and launched the program. The software can turn a victim's computer into a platform for remote-controlled "denial-of-service" attacks on Web sites. The program is disguised as a video file in the so-called avi format, but actually includes an "exe" extension, which launches the virus. Network Security officials say they've identified two computers and their owners — one in Maine and one in Canada — who appear to be implicated in the plot. (Wall Street Journal 9 Jun 2000)

2001-02-02 **DDoS distributed denial-of-service attack e-mail list**

NewsScan

SECURITY EXPERTS TRICKED INTO HELPING LAUNCH ATTACK
Bugtraq -- an Internet mailing list comprising about 37,000 security industry technicians -- was used as the instrument for launching a denial-of-service attack against Network Associates, one of the world's largest Internet security companies. The bizarre incident began when a hacker sent a disguised string of code to Securityfocus.com, which manages the Bugtraq list. The hacker's message claimed the code was an example of a program that could exploit a recently discovered security hole in corporate security systems, but when Bugtraq members opened the code, it caused their computers to flood Network Associates' Web site with tens of thousands of messages, disabling the Web site for about 90 minutes. In another strange twist, Securityfocus admitted that it had forwarded the infected message to its members -- after getting the code checked and okayed by Network Associates. Industry watchers say the attack could be motivated by revenge against Network Associates, which was the company that first publicized the corporate network vulnerability. DHS IAIP Daily; http://www.techweb.com/wire/security/159402730

WEEKEND ATTACK INFECTS HOSTING SERVERS

The Internet Storm Center (ISC) tracked a large-scale hack over the weekend that infected site-hosting servers, which in turn transformed all the hosted sites into distributors of malicious code. "We have received reports and evidence that a number of companies that provide shared hosting Web servers have had their servers exploited and all of the customer homepages modified so that visitors are attacked," said the Storm Center's Daniel Wesemann Sunday, March 13, in an online posting. It seems that the attack used both direct and indirect means to infect users, said the ISC. But ICS also found some evidence that a DNS cache poisoning attack was part of the program. "We are not quite sure yet how this is being done, as the files that we've received so far do not seem to contain DNS/DHCP poisoning code." This latest incident of DNS cache poisoning is unrelated to an earlier event this month, which was created by exploiting vulnerabilities in Symantec's gateway products.

2005-05-07 **distributed denial-of-service DDoS spam unsolicited commercial e-mail flooding zombies restrictions SMTP servers**

RISKS 23 88

RUMPELSTILTSKIN ATTACK FLOODS NETWORKS

Brett Glass reported on a wave of fraudulent traffic from zombies testing for real e-mail addresses by generating likely candidates. "As described in a paper I wrote several years ago (where I coined the term for lack of a better existing one), it is an e-mail address harvesting attack in which a machine attempts to send e-mail messages to randomly guessed addresses at a domain. It might try common first names -- for example, 'john@domain.com,' 'joe@domain.com,' and 'mike@domain.com' -- and then proceed to common last names and combinations of names and initials. (In some cases, we've seen some very unusual guesses that appear to have been extracted from lists of AOL screen names.) If mail for a guessed address is accepted, the "zombie" machine records the address and sends it back to its 'master' -- a controlling machine which adds it to a database of addresses which will become targets for spam."

Glass concludes with recommendations:

>Because the "zombies" are generally not mail servers, the most effective way to mitigate these attacks -- though it might offend the sensibilities of the "Orthodox End-to-Endians" -- is for ISPs and enterprised to block outgoing port 25 traffic from client computers that are not designated as, or intended to be, mail servers. These computers should send outgoing mail only through a designated mail server, which in turn monitors them for excessive outgoing traffic.

ISPs' firewalls should monitor and log attempts to send such traffic, so that infected machines can be spotted and cleansed of their infections.

As I've mentioned above, there will be some people who are philosophically opposed to the notion of restricting Internet traffic so as to limit abuse. Alas, such idealism is inappropriate for the real world, where spam is now consuming so many resources that it threatens not only to choke off not only legitimate e-mail but to consume the lion's share of ISPs' bandwidth.<

2005-05-24 **Federal Trade Commission FTC Internet Service Providers ISP zombies service cutoff hijacked computers China spam**

EDUPAGE; http://www.reuters.com/newsArticle.jhtml?storyID=8592338

FTC FIGHTING ZOMBIES

The Federal Trade Commission (FTC) will appeal to 3,000 Internet service providers (ISPs) worldwide to help identify and cut off service to hijacked computers. Such "zombies," as they are commonly called, are used by spammers to send millions of unsolicited e-mails. By some accounts, zombie machines send 50 to 80 percent of all spam. Though not requirements, the FTC's recommendations include monitoring subscriber accounts for large amounts of e-mail coming from a particular machine and helping those customers with hijacked computers clean their systems. The FTC said that 25 other countries are participating in the effort, though China--the country believed to be the source of a large percentage of the world's spam--is not one of them. Dave McClure, president of the U.S. Internet Industry Association, said that most U.S. ISPs already do most or all of the things recommended by the FTC. He noted that ISPs are forbidden by law from reading subscriber e-mails, saying that it can be difficult to distinguish between "spam coming across your network and your local charitable organization sending out its monthly newsletter." 2006-02-13 **botnet scheme charge indictment zombie computer networks DDoS attacks monetary damages**

EDUPAGE; http://news.com.com/2100-7350_3-6038478.html 23

MEN CHARGED IN BOTNET SCHEME

Three men have been charged by federal authorities in a botnet scheme that reportedly netted the three $100,000 and caused $150,000 in damage. According to the indictment, Christopher Maxwell and two unnamed conspirators created a network of computers by illegally accessing networks at California State University at Northridge, the University of Michigan, and the University of California at Los Angeles. Using the network of zombie machines, the men installed adware on users' computers and also launched a denial-of-service attack on the network of Seattle's Northwest Hospital. The attack on the hospital resulted in the monetary damages cited in the indictment and also shut down the facility's intensive care unit. U.S. Attorney John McKay noted that although botnets are often seen as mere nuisances, this case shows that the repercussions from them can be deadly. If convicted, Maxwell could serve 10 years in prison and be fined $250,000.

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/hacking/story/0,10801,109631,00.html 23

VERISIGN DETAILS MASSIVE DENIAL-OF-SERVICE ATTACKS.

A sudden increase in a particularly dangerous type of distributed denial-of-service (DDoS) attack could portend big trouble for companies, according to VeriSign Inc. The attacks, which started on January 3 and ended in mid-February, were notable because they employed an especially devastating kind of DDoS attack, said Ken Silva, VeriSign's chief security officer. Such an attack typically involves thousands of compromised zombie systems sending torrents of useless data or requests for data to targeted servers or networks -- rendering them inaccessible for legitimate use. In this case, attackers sent spoofed domain-name requests from botnets to Domain Name System servers, which processed the requests and then sent replies to the spoofed victims, according to Silva.

2000-02-19 **DDoS distributed denial-of-service attacks White House meeting government policy President**

Prof. Gene Spafford / CERIAS — Purdue University

Prof. Gene Spafford attended an emergency meeting at the White House on Friday 2000-02-11 to discuss the distributed denial-of-service (DDoS) attacks on major Internet sites that occurred at the beginning of February. He summarized the main points from the discussion as follows (quoting directly):

1) The Internet is international in scope, and most of the companies present have international operations. Thus, we must continue to think globally. US laws and policies won't be enough to address all our problems.

2) Privacy is a big concern for individuals and companies alike. Security concerns should not result in new rules or mechanisms that result in significant losses of privacy.

3) Good administration and security hygiene are critical. The problems of the previous week were caused by many sites (including, allegedly, some government sites) being compromised because they were not maintained and monitored. This, more than any perceived weakness in the Internet, led to the denial of service.

4) There is a great deal of research that yet needs to be done.

5) There are not enough trained personnel to deal with all our security needs.

6) Government needs to set a good example for everyone else, by using good security, employing standard security tools, installing patches, and otherwise practicing good INFOSEC.

7) Rather than new structure or regulation, broadly-based cooperation and information sharing is the near-term approach best suited to solving these kinds of problems.

2000-02-25 **criminal hacker distributed denial-of-service attacks**

CNN

At the end of February, FBI investigators and private security firms continued their search for the perpetrators of the extensive distributed denial-of-service attacks on major Web sites at the start of the month. The investigators were using log files from the affected systems and some of the slave-program-infested sites that were remote-controlled to send the flood of spurious requests to the victims. Some of the router logs show they were swamped with ore than 1 Gb/second of data during the attacks — and it was very important that the routers were the specific targets, since it made defensive measures all but impossible in real time. Some of those slave-infested computers included systems at Stanford University, UCLA, the University of California at Santa Barbara, and home business computers in Oregon. Logs from the #Goonies channel on IRC show someone calling itself "Coolio" (of which there are many, including one in the GlobalHell criminal hacker gang and one that claimed credit for defacing Web sites of DARE (the anti-drug program) and the US Commerce Department's Chemical Weapons Convention site in November 1999. Coolio boasted on IRC about hacking Amazon, the Russian Trek Travel site; it appears the boasting identified the precise time of the attack, something that had not yet been published by the news media. The number of tips, including some from the computer underground, was very high and every field office in the US had agents hunting down the leads.

2003-08-16 **Blaster worm Sean Sundwall Microsoft spokesman msblaster exploit windows server software redirection disabling**

NIPC/DHS

August 16, Associated Press — Microsoft says no major problems from 'Blaster' worm.

Microsoft spokesman Sean Sundwall said the company had not noticed any extraordinary network congestion Saturday, August 16, from attempts by the "blaster" worm to force thousands of infected computers to target the software company's Website and network. The virus-like infection exploits a flaw in most current versions of Microsoft's Windows operating system for personal computers, laptops and server computers. Although Microsoft posted a software patch on July 16, many users failed to download it, leaving them vulnerable. The exploiters of the Microsoft flaw made a mistake. The worm instructed computers to call up an incorrect address for reaching the actual Microsoft Website that houses the software patch. Although Microsoft has long redirected those who visited that incorrect address to the real site, the company disabled the automatic redirection Thursday. That has helped Microsoft's real Web site stay accessible to users, Sundwall said.

Category 22.4 *Accidental availability disruptions*

1997-01-09 **QA quality assurance loop positive feedback**

Reuters; RISKS 18 75

When an operator keyed in a special code into the SkyTel control system, it caused a half-hour beeping chorus that rang 100,000 beepers with up to 25 erroneous calls. Seems the technician assigned a PIN to a new customer that was actually a secret code used to broadcast news headlines to those 100,000 beepers. So when the customer used the new PIN, it appeared on all the beepers in question — and many of their users promptly called back SkyTel and entered the PIN, causing ever-increasing waves of beeping. The problem was particularly irritating for West coast residents, since the beeping chorus started at 8:16 am Eastern time, which translated to 5:16 am on the Pacific coast.

1997-01-10 **availability ISP**

AP

Flat-rate charges for Internet access will eventually be a eliminated, said industry watchers in January. ISPs begin to lose money once their $20/month users reach about 11 hours a month online. As major ISPs such as AOL struggle with the consequences of decoupling usage from cost of usage, niche markets have opened for ISPs charging premium rates but guaranteeing more than busy signals.

Category 22.4 *Accidental availability disruptions*

1997-01-12 **QA quality assurance availability loop positive feedback**

EDUPAGE

A technical glitch on Thursday the 9th of January 1997 caused the SkyTel paging network to send erroneous call-me-back messages to more than 100,000 customers. The problem was exacerbated when some diligent subscribers returned the call and left their phone numbers so that whoever had beeped them could call back. The result was a 26-minute major phone traffic jam as thousands of other SkyTel customers then called those numbers. Apparently, the whole mess started when a customer desiring a new PIN (personal identification number) was mistakenly assigned one linked to a secret code that the company uses to beam Dow Jones News Service information out to 100,000 customers. The PIN, a seven-digit number that looked like a phone number, was zapped to the Dow Jones subscribers, many of whom then tried to dial it as a local call. Others recognized it as a PIN, and called SkyTel to retrieve the "caller's" number, jamming the lines there. "One frequency of our one-way nationwide network experienced an anomaly in the database that caused customers to be paged erroneously," says a spokesman for SkyTel's parent company, MTel, which has apologized for the snafu. (Wall Street Journal 10 Jan 97 A1)

Category 22.4 *Accidental availability disruptions*

1997-01-17 **availability AOL**

AP

By January, AOL's incredibly stupid decision to offer unlimited access for a flat fee of $19.95 had resulted in endless waits because selfish people stayed online for hours — even running special programs to prevent the network from logging them off for inactivity. Furious customers faced endless busy signals; people depending on the network for important e-mail and other services were cut off from the resources they had come to depend on. Many customers launched lawsuits; several state attorneys general launched investigations of possible commercial fraud and misrepresentation. This is an example of the Tragedy of the Commons described by Garrett Hardin twenty years ago; in that case, he described the destruction of English village commons where people could graze their sheep at no cost. Population growth resulted in a perceived economic advantage in the short term by putting as many sheep as possible on the commons even though the animals destroyed the resource. Similarly, AOL violated a prime principle of the market by providing unlimited access to a limited resource without a feedback mechanism to ensure that users would act responsibly. By the last week in January, AOL had agreed in principle to refund fees to anyone affected by the snafu — potentially millions of people.

1997-03-28 **denial of service ISP Internet DNS domain names DoS**

RISKS 19 1

Michael Miora, NCSA's Director of Consulting, discovered that he no longer had access to the Net. His ISP, Sprynet, suddenly and without notification cut off service to anyone not using an e-mail address ending in "@sprynet.com." This measure was supposed to cut down on fraud. It presumably cut down on clients.

Category 22.4 *Accidental availability disruptions*

1997-03-28 **SSL browser vulnerability Web**

RISKS 18 95 ff

Daniel Klein, a Pittsburgh security consultant, discovered a major hole in both Netscape Navigator and Microsoft Internet Explorer. Servers using the GET command instead of the POST command in Web pages, even those using SSL to encrypt communications. The problem is that improperly written pages allow confidential information resident on the client side to be read by the server for the _next_ Web page loaded: "The information that Web user typed in securely suddenly gets transferred to the logs of the next machine, credit card numbers and all." This bug was confirmed independently by Eric Rescorla and explained in more detail by Anup K. Ghosh, PhD in RISKS 19.02 (97.04.02).

Category 22.4 *Accidental availability disruptions*

1997-05-19 **air traffic electrical power outage backup disaster denial**

AP

A short circuit in backup MCI communications systems at the Air Route Traffic Control Center in Oberlin, OH wiped out most communications among air-traffic control towers and 180 airplanes in Indiana, Michigan, Pennsylvania, New York, Ohio and West Virginia for 67 minutes. A few low-power channels remained functional and ATC relied in part on cellular phones and some non-MCI phone lines. Flights leaving Cleveland, Pittsburgh and Detroit were delayed by an hour; other planes were rerouted around Ohio air space for the duration of the outage.

Category 22.4 *Accidental availability disruptions*

1997-05-23 **denial of service saturation bandwidth ISP**

Newsbytes

On Wednesday 97.05.21, an e-mail server at the Reston, VA facility of the BellAtlantic.net ISP shut down e-mail delivery to its customers. The system was unable to deliver the mail until Friday the 23rd, when all accumulated messages were on their way to their destinations. No messages were lost.

Category 22.4 *Accidental availability disruptions*

1997-05-29 **Internet availability**

EDUPAGE

A study by Inverse Network Technology suggested that most of the delays in e-mail delivery originate in problems on gateways. The study suggested that 88% of all e-mail takes no more than five minutes to deliver; however, some ISPs allow 10% of their deliveries to take longer than an hour.

Category 22.4 *Accidental availability disruptions*

1997-07-17 **Internet power failure outage availability disaster**

Newsbytes

On 08:17 PDT on 1997.07.16, a rectifier failure in a battery room shut down power to the MAE-West switching center, terminating Internet access for major ISPs and their customers. At 11:00 PDT, someone in Los Angeles cut a fiber-optic cable and shut down ATM (asynchronous transfer mode) links carrying 473 T-3 lines (45 Mbps each). The outages affected Internet traffic throughout the United States, with major congestion and outright outages lasting until 13:40 PDT.

Category 22.4 *Accidental availability disruptions*

1997-07-25 **Internet congestion bandwidth availability**

AP

Elizabeth Weise of AP published a fascinating story in late July that reported on research by communications engineers and physicists explaining why the Internet seems to have unpredictable periods of heavy congestion. Some analysts see a "tragedy of the commons" in which users, unaware of the effects of their largely free use of Internet bandwidth, blithely increase their surfing without regard to equitable sharing with the unknown millions of other users. The Net responds acceptably until key "pipes" are saturated with data — and then response can slow to a crawl. In an interesting effect of mass-action, at some point large numbers of users get disgusted and log off, releasing the gridlock suddenly. Some analysts suggest that charging people for their time online will solve the problem; others argue that defining classes of service will help (e.g., charging for high-priority usage and not for low-priority applications). Critics of these proposals deny the validity of the "commons" model, arguing that increased demand can make increased capacity cost-effective.

Category 22.4 *Accidental availability disruptions*

1997-09-10 **telecommunications denial of service QA disaster**

RISKS 19 39

Peter G. Neumann, abstracting a report forwarded by Steve Bellovin, wrote "Around 7pm on the evening of 8 Sep 1997, the main MFS Communications switch (MFS Switch One) failed, downing UK telecommunications links provided by MFS, Worldcom, and First Telecom. The outage also affected most of CompuServe's UK customers, whose access is typically via an MFS phone number."

Category 22.4 *Accidental availability disruptions*

1997-10-09 **denial of service backhoe attack**

AP

In Kansas City in October, an unidentified dump-truck driver forgot to lower his truck's bed before speeding through a street and snagging overhead telephone cables. His carelessness interrupted phone and Net access for 119,000 Sprint users for four hours. Victims included people in Oklahoma, Missouri, and all the way into Florida. This is a new variant of the time-honored "backhoe attack" for causing denial of service.

Category 22.4 *Accidental availability disruptions*

1997-11-11 **QA denial of service power outage e-mail denial of service**

RISKS 19 45

Another glitch hit AOL on Nov 3, 1997, when users lost e-mail service for an hour or so . Worse still, a bug generated a repeating message apologizing for the loss of service and required forcible termination of the AOL client software to stop the automated grovelling. On Nov 18, the e-mail system was unavailable for up to six hours.

Category 22.4 *Accidental availability disruptions*

1997-12-24 **backup disaster recovery**

RISKS 19 53

Sun Valley, ID uses a computerized ticketing system involving a database of authorized skiiers and scanners. After a disk crash in December 1997, the company had to order several thousand skiiers to reregister — including new ID cards and photographs.

Category 22.4 *Accidental availability disruptions*

1998-02-26 **denial of service backhoe telephone cable outage**

EDUPAGE

Another backhoe attack: Illuminet cables were severed in Illinois, causing widespread phone-service outage for customers of AT&T, Teleport, and Bell Atlantic's cellular-phone customers.

Category 22.4 *Accidental availability disruptions*

1998-03-09 **mailstorm positive feedback mailing list server unsubscribe**

RISKS 19 62

In a routine e-mail announcement to about a thousand members, the National Association of Broadcasters included instructions on how to unsubscribe from the list. Unfortunately, the address they gave actually broadcast — how appropriate — the unsubscribe messages to the entire list, causing a growing mailstorm as people replied to the bizarre messages and amplified their responses by a thousand.

Category 22.4 *Accidental availability disruptions*

1998-03-17 **availability capacity Internet bandwidth**

EDUPAGE

If Internet traffic continues doubling every three to six months, the Net will run out of bandwidth, warned ISPs and vendors. Key problems include the rising use of streaming video and other high-volume communications. In April, reported EDUPAGE, "A study by the U.S. Commerce Department <http://ecommerce.gov/> [said] that traffic on the Internet is doubling every hundred days and predicts that electronic commerce will grow to $300 billion a year by 2002. (USA Today 16 Apr 96)"

Category 22.4 *Accidental availability disruptions*

1998-04-14 **availability QA transmission networks fiber optic**

EDUPAGE

In April, software errors at AT&T caused several hours of downtime for customers of the communication giant's fiber optic data network. Later reports indicated that the network failure severely disrupted electronic commerce networks relying on computer communications for financial transactions such as approvals of credit cards.

Category 22.4 *Accidental availability disruptions*

1998-04-14 **availability downtime disaster closing business retail**

RISKS 19 67

Starbucks in Boston, and possibly elsehwere were closed on Tuesday 14 Apr because a central computer crashed and prevented them from opening their cash registers. [Hmm: backup systems? Manual procedures? Free coffee?]

Category 22.4 *Accidental availability disruptions*

1998-04-14 **availability network crash down frame relay telecomm**

RISKS 19 67

On Monday, 13 Apr, the AT&T frame relay network crashed for about a day, depriving an estimated 2500 companies US-wide of computer telecommunications for credit-card validation, inter-bank and inter-branch transactions. Financial losses from lost business were expected to be astronomical. In May, AT&T published an explanation of the events that led to the failure: "AT&T said the problem began when a computer command was issued to upgrade software code in one of the network switch's circuit cards. This created a faulty communications path that generated a large volume of administrative messages to other network switches. As a result, the other switches quickly became overloaded and stopped routing data from customers' applications for periods ranging from six to 26 hours before the network was fully restored."

Category 22.4 *Accidental availability disruptions*

1998-05-07 **single point failure availability disaster backup telecomm**

RISKS 19 72

A single communications tower was taken out of service in Newark, Ohio. RISKS correspondent Matt Curtin reported on the results: "[A Newark friend's] entire network was unreachable, and even his ISP's connection between Columbus and Newark was down. He then told me that since 10:30 a.m., no one in Newark had any telephone service whatsoever. No one could take credit cards. Some stores' POS terminals would not work. No ATMs were working. Even the digital cellular network in Newark became unusable — probably due to overload, as a result of picking up some of the slack."
Complete service was restored only at 18:45. Mr Curtin made the point that single points of failure ought by now to be avoided but they are still widespread.

Category 22.4 *Accidental availability disruptions*

1998-05-16 **mail storm denial of service saturation autoreply**

RISKS 19 74

Yet another mailstorm erupted when an Australian official set autoreply on his e-mail package while he was away. Unfortunately, he inadvertently set his destination for these largely-useless messages to be all 2,000 users on his network — and requested autoconfirmation of delivery of each autoreply — which generated yet another autoreply — and so on ad infinitum and ad nauseam. Within four hours, his endless positive-feedback loop generated 150,000 messages before his autoreply was shut down. The ripples lasted for days, with the perpetrator saddled with 48,000 messages in his in-basket and a stream of 1,500 a day pouring in. [Personally, I detest autoreplies, feeling that a correspondent's lack of reply is self-descriptive. However, if one must use this facility, it's appropriate to regard it as a potential Sorceror's Apprentice, so pay attention to details. In particular, anyone subscribing to e-mail lists (such as RISKS) should never enable autoreply. The danger is exacerbated if the mailing list address is also the address for automatic posting to the list — a guaranteed mailstorm-generator.]

Category 22.4 *Accidental availability disruptions*

1998-05-21 **beeper satellite television TV interruption denial service**

EDUPAGE, RISKS

Over ten million pagers were silenced across the US when the Panamsat Galaxy 4 satellite malfunctioned and began spinning out of control. Other service interruptions affected public radio networks that were unable to transmit some syndicated programs. Carriers switched to other satellites and operations were back to normal within a couple of days.

Category 22.4 *Accidental availability disruptions*

1998-07-07 **availability QA quality assurance software air traffic**

RISKS 19 84

When the American Airlines SABRE computers failed twice in a week at the start of July, hundreds of AA flights were delayed from 8 minutes to several hours.

Category 22.4 *Accidental availability disruptions*

1998-07-14 **QA quality assurance airport baggage traffic control**

RISKS 19 85

In July, both Hong Kong's new airport and Amsterdam's airport were saddled with the consequences of computer problems. The HK airport bagage handling system went haywire, with tons of baggage having to be sent to the old Kai Tak airport when the cargo-handling system lost all its records. In Amsterdam, a malfunction in the air-traffic control software blanked out all screens and caused an emergency hold on all inbound and outbound flights at Schiphol. Although the software was restarted in half an hour, the resulting chaos lasted for the rest of the day. Finally, in Copenhagen, similar baggage-handling software problems were reported in September.

Category 22.4 *Accidental availability disruptions*

1998-08-07 **availability power surges phones fax data**

RISKS 19 90

In Sydney, Australia, a sudden power surge at 12:20 pm on 4 Aug hit Telstra, the main communications service. The sudden outage crashed bank computers, automated banking machines, and phone and fax lines. The power outage lasted one hour but repercussions continued into the night as customers tried to get place phone calls and saturating the bandwidth.

Category 22.4 *Accidental availability disruptions*

1998-08-18 **water supply disaster availability monitoring emergency**

RISKS 19 92

In Lewiston, ME, a computer problem shut down public water-supply chlorination, meaning that 40,000 people had to boil water before drinking it. The water-quality problem lasted 30 hours in part because no one noticed the lack of chlorination until a routine check that occurred 14 hours after the failure. MORAL: frequency of monitoring must reflect the importance of spotting problems.

Category 22.4 *Accidental availability disruptions*

1998-08-19 **air traffic control availability QA quality assurance crash**

RISKS 19 93

Nashua, NH airport experienced over 100 Air Traffic Control system failures in the first eight months of 1998. In the incident on 19 Aug, the system went down for 37 minutes with 350 airplanes having to be managed using verbal commands and slips of paper. Peter Neumann commented, "Do you think the Y2K impact on the ATC system will last only 37 minutes?"

Category 22.4 *Accidental availability disruptions*

1998-09-17 **penetration appropriate diversion resources denial service**

EDUPAGE

Aaron Blosser , a 28-year-old consultant, was accused of misappropriating resources on 2585 computers at his client, U.S. West (a major telephone company). In his attempt to find ever-greater prime numbers, he commandeered over 10 years of processing cycles; as a result of the extra work, directory-assistance operators found the time for retrieval of telephone numbers stretching from the usual 3-5 seconds on into the 5 minute range. Associated Press reported, "The computers were so slow in mid-May that customer calls had to be rerouted to other states, and at one point the delays threatened to close down the Phoenix Service Delivery Center."

Category 22.4 *Accidental availability disruptions*

1998-09-27 **archives data retention media instability incompatibility**

EDUPAGE

The head of the US National Archives failed to meet a deadline for clear policies on government record retention. John W. Carlin explained that all the information technology resources at his disposal were focused on the Y2K problem. He emphasized the complexity of the problem: "How do we identify, manage, preserve and provide ongoing access to e-mail, word processing documents and other kinds of electronic records that are proliferating in formats, mushrooming in quantity and vulnerable to quick deletion, media instability and system obsolescence?"

1999-02-01 **emergency phone 911 system crash outage availability**

RISKS 20 19

On 1 Feb 1999, the New York City emergency phone system (911) crashed during a routine backup generator test. It seems the generator did not work and the backup system went down for an hour as technicians worked on getting the power generator running. The main system was down for six hours in all.

Category 22.4 *Accidental availability disruptions*

1999-02-01 **air traffic control critical infrastructure failure backup**

RISKS 20 19

Air traffic controller Paul Cox wrote in RISKS, "On 15 Jan 1999, at 2 PM, the power failed at Seattle Center, an en-route ATC facility that covers nearly 300,000 square miles of the NW United States." He described how the brief interruption in power during some routine tests set in motion catastrophic failure of the ATC in this area. Computers had to be rebooted, radar screens went dead for periods up to an hour and more, and the human controllers were frantic as they tried to shift planes from their normal 5 mile separation to the reequired 20 mile distances prescribed by the FAA. Luckily, the controllers had succeeded after much lobbying in having a backup radio system that did not require computers at all and that therefore worked at once after the power glitch. Mr Cox wrote, "This failure simply drives home yet again that backup systems are only as good as the main systems IF those backups are equally dependent upon a power supply. In fact, our backup communications system and backup radar display systems were essentially worthless to us, because they failed at the same instant as the main system did when the power died. As long as you have a single point of failure in any system, it doesn't matter how many backups you have downstream if they are dependent on that point."

1999-02-12 **security e-mail public access free**

USA Today

USA Today reported that HotMail and Yahoo, providers of free e-mail, were improving security by shutting down any account subject to several unsuccessful attempt to login. [MK comments: This is one of the oldest mistakes in system management, since it immediately opens each account to a trivially easy denial of service: simply try to logon several times to a victim's account without the right password and VOILA — no further legitimate access until the account is reset.]

Category 22.4 *Accidental availability disruptions*

1999-02-18 **import availability down-time failure crash**

Wall Street Journal

John R. Emshwiller reported in the Wall Street Journal (" Customs Service's Old Computer System Triggers Worry," 1999.02.18) that the U.S. Customs Service's antiquated computers (antiquated in this era of Moore's Law means 14 years old in this case) are causing increasingly frequent failures of availability. Customs Service Commissioner Raymond Kelly said succinctly, "The system is collapsing." Random downtime causes backups in processing the flow of imports ($900B per year involving 19.4 million entry requests) with resulting delays in getting imported products to their destinations on time.

The most serious breakdown to date occurred on 1998.10.01, when hard disk failures caused a chain of system failures resulting in a six-hour downtime. The consequences were dramatic: a backlog of 80,000 requests. In a misguided attempt to stave off further electronic requests, system administrators shut down their modem lines; however, "many importers have automatic dialing systems that just kept resubmitting the requests, each of which was marked as a new entry." The Customs Service decided unilaterally to delete 45,000 of the accumulated requests, forcing resubmission for those shipments.

Currently, the Customs Service has requested financial support for new computer hardware and software, but the Clinton Administration has proposed paying for the $1B expense by levying an import fee — a measure strenuously objected to by the business community, which would prefer funding from general tax revenues.

The article ends on a curious note: "One relative bright spot: Customs Service officials say they don't expect any major Year 2000 computer problems. On the other hand, said Woody Hall, an agency assistant commissioner, `the joke around here is that a lot of good it's going to do you to be Y2K-compliant if the system crashes around you.' "

2000-06-19 **availability bandwidth music trafficking network congestion satellite alternative**

Edupage, NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB953765627187819503.htm

In January, Oregon State University administrators banned the Napster program from its networks, saying that the enormous volume of stolen songs was exceeding its bandwidth budget. Calculations showed a doubling time of only three months if the growth in song traffic were to continue unabated.

[In March,] Napster . . . adapted its software to use more "intelligent" search techniques and thus streamline the bandwidth needed to download requested files. The software change, which is the result of an unusual collaboration between the fledgling company and Indiana University, one of the first colleges to block the program, takes advantage of the fact that many colleges are now connected to the high-speed, next-generation Internet2. Now, when a Napster user asks for a file, the software first looks for the file on the user's campus network, then on the high-speed network. Those downloads take much less time than ones from the public network, thus reducing the load on the university networks. As a result, Indiana University . . . [said it was] ready to allow Napster back on campus . . . although network operators . . . [would] continue to monitor its use. (Wall Street Journal 23 Mar 2000)

Ever since MP3 music files took college campuses by storm, the problem of traffic congestion on campus networks has been growing. A typical case is Bucknell University, where 40% of the school's total Internet traffic is attributable to MP3 download services such as Napster. In an effort to resolve the gridlock, Bucknell officials called on alum Jeff Boulter, now a senior director of product development at Launch Media, to come up with a solution. The result is Launch College Direct, a service that uses iBeam Broadcasting's proprietary system to stream Internet content via satellite and put it on a local network that bypasses the school's Internet connection. The new service, which is free, will be deployed first at Bucknell and Georgia Tech. Launch plans to use it to deliver its own collection of music and music videos. (Los Angeles Times 19 Jun 2000)

2000-09-07 **electric power availability infrastructure protection**

NewsScan

Technology experts Peter Huber and Mark Mills charge that politicians have been ignoring a growing crisis caused by an energy-guzzling computer industry: "A personal computer and its peripherals typically boost power consumption in your home by about 5% per year — more if you run with the Wired crowd. But most of digital infrastructure's burgeoning demand for power occurs out of sight. Almost all the power it takes to deliver a conventional TV picture is used in the den where you watch it. The Web's invisible infrastructure, by contrast, consumes at least twice as much power as the hardware on your desktop. A Palm Pilot sips tiny amounts of power — but connect it to the Web and it can add as much new electric load as a refrigerator, in the servers, routers, and digital transmission systems used to feed it... A year ago we estimated that some 13% of U.S. power output was being used to manufacture and run computers and the sprawling infrastructure. It's more than that today. The country is 'siliconizing' everything — and behind every digital bit stands a bucket of electrons, behind every chip a power supply." Huber and Mills are coauthors of the Digital Power Report, a newsletter. (Wall Street Journal 7 Sep 2000)

2000-12-03 **availability crash mainframe banking financial transactions stoppage outage**

RISKS 21 15

Peter G. Neumann summarized a report by Sam Zuckerman in the _San Francisco Chronicle_ of the 2nd of December: "On 1 Dec 2000, the nationwide Wells Fargo computer network crashed for a few hours, three days after WF had finished merging their computer networks with those of Norwest (which bought WF in 1998). One of four Hitachi Tritium 400 mainframes in the Minneapolis data center shut itself down, apparently after detecting some sort of anomaly. The result stopped all banking operations that depend on real-time interaction."

Category 22.4 *Accidental availability disruptions*

2000-12-28 **availability outage infrastructure**

RISKS 21 18

Glenn C. Lasher Jr. reported in RISKS' "On Thursday, 28 November 2000, 17 of the 21 telephone exchanges in the City of Schenectady NY were taken out of service by a water-main break (for those not familiar with the North American phone system, exchanges uniformly contain a range of 10,000 phone numbers). The Central Office serving downtown Schenectady is located on the block between Franklin and State Streets and Jay and Clinton Streets. The water main break was on Clinton St, and caused the closure of Clinton and State Streets. The break occurred at 3 AM, and the phones went out around 9 AM.

The cellular telephone networks appear to be unable to cope with the additional traffic. I received a frantic call from my wife, who called me at work from her cell phone to tell me the house phone was out. The signal quality was extraordinarily bad, as is the nature of CDMA digital when the cell is overloaded. One is left to assume that users of FDMA and TDMA-based phones may have been cut off completely, especially analog phone users, where the cells have a hard limit of 20 simultaneous calls."

The report continues with more details and an analysis of the situation that includes the following excellent points: "So, where do we begin on this one? Well, here are the RISKS:

1. Placement of mission-critical equipment below ground level leaves it susceptible to flooding. One might assume that an unusually heavy downpour might also have caused problems here.

2. This is a good example of network stress, looking at the behaviour of the cellular networks.

3. This is also a classic demonstration of a single point of failure. A problem in one location has cut off a critical service to an entire (although small) city. It does not matter if your service is through the IBOC (Verizon, in this area) or a CLEC (Sprint, AT&T, Met Tel, to name a few), all fo the equipment is owned and maintained by the IBOC and housed at the corner of Franklin and Clinton.

4. It is also a classic demonstration of diverse paths, as my Internet service continues to run. It does not pass through that same building, but is rather located a mile away on Eastern Parkway (or at least I believe that is the location). "

2001-04-01 **wireless communications spectrum shortage availability regulation**

NewsScan

U.S. AGENCIES WARN OF SPECTRUM SHORTAGE
The U.S. Commerce Department, Defense Department and the Federal Communications Commission issued reports last week warning that there isn't enough radio spectrum to readily accommodate companies seeking to develop new wireless Internet services. The reports came in response to a request by the Clinton administration last year to review options for relocating some traditional government and industry uses of the radio spectrum to make way for so-called third generation (3G) wireless services. Officials at the Commerce Department and the Pentagon said they could identify only about 45 megahertz out of the 140 MHz studied, and that it would cost about $2 billion in engineering and other changes to free it up. Meanwhile, the FCC examined 190 MHz now used by schools and fixed wireless providers, but said any change would disrupt those services. Commerce Secretary Donald Evans said he was committed to finding a solution to the spectrum impasse, but a Pentagon official said the wireless industry has yet to prove that it really needs more spectrum. COMCAST: 'NOT 100% READY' TO DEAL WITH CUSTOMER PROBLEMS [4 Jan 2002]
Internet service problems were experienced by about 10% of 71,000 Comcast Cable customers in North Jersey who had been transferred to Comcast's own network after the failure of one offered by Excite@Home. "These kinds of problems are very typical when you're launching something new... Our folks were dealing with a large amount of calls at a single point in time. There were some early folks we brought on that were not 100% ready for everything customers were asking," says a company spokesperson. (New York Times 4 Jan 2002)
http://partners.nytimes.com/2002/01/04/technology/04COMC.html

COMCAST PROBLEMS AFFECT DELIVERY OF 300,000 MESSAGES [15 Feb 2002]
Comcast, the cable company and Internet service provider, said yesterday it would "work around the clock" to fix a technical problem that slowed delivery of 300,000 subscriber messages. Industry observers remember that when Excite@Home was on the way to declaring bankruptcy last year it had tried forcefully to make the point that cable companies Comcast and AT&T did not understand the complexity and costs of operating an Internet business. 2002-02-20 **documentation DNS Domain Name System reserved addresses DoS denial-of-service**

RISKS 21 92ff

Gene Spafford wrote about an interesting problem that occurred in late 2001 when e-mail to one of his friends starting timing out. Investigation revealed that some forbidden origination addresses taken from the IANA list of reserved IP ranges were now being used legitimately. Spafford warned fellow system administrators to keep track of such changes regularly to avoid similar inadvertent self-inflicted denial of service.

James Graves chimed in with a thoughtful comment on the importance of keeping an up-to-date central database of operations knowledge so that problems can be solved once and then later occurrences can be solved immediately simply by looking up the solutions.

2003-01-08 **MSN Messenger instant messaging denial-of-service DoS outage**

NIPC/DHS

January 07, InfoWorld — MSN Messenger outage affects millions.

Microsoft Corporation's MSN Messenger service went down yesterday. According to a Microsoft spokesman, the service went down at approximately 9 a.m. EST, and the root cause of the outage is still unknown. The outage affected all 75 million worldwide users of Microsoft's .Net Messenger Service, including Windows Messenger and MSN Messenger subscribers, according to a statement from Larry Grothaus, lead product manager for MSN. The .Net Messenger Service is the back-end service that powers both the Windows Messenger and the MSN Messenger clients. MSN Hotmail e-mail service and other MSN services weren't affected, he said. Although service was restored for some users by about 2 p.m. EST, some users were still unable to log onto the messaging software later in the afternoon. Microsoft didn't have any more difficulties with the service late yesterday, but some users may still be shut out as the service scales back up, according to Grothaus.

NIPC/DHS

March 20, InternetWeek — War information demand slows U.S. military, Arab, alternative news sites.

The Arab news site Al Jazeera, U.S. military sites, and a U.S. alternative press site were among those suffering massive slowdowns and outages in the first day of the war in Iraq, according to Web performance measurement firm Keynote Systems. The slowdowns and outages were presumed to be due to overwhelming demand for access to information, rather than hacker attacks, said Eric Siegel, principle Internet consultant for Keynote. Likewise, British government sites are seeing significant slowdowns and outages. Siegel speculated that the entire online Arab world is turning to Al Jazeera for news, whereas the West has a diversity of sources online.

2003-04-22 **Global Positioning System GPS satellite failure denial-of-service risk**

NIPC/DHS

May 01, Wired — What if GPS fails?

Eighteen of the 28 satellites in the GPS constellation are operating past their intended lifespan or suffering from equipment failure. There have been three launch incidents in the past five years, and the Air Force, which maintains the 20-year-old network, is overburdened with competing space priorities. According to John Petersen, director of the Arlington Institute, a scenario-planning outfit in Virginia, "If GPS were to fail completely...civil aviation, trucking, shipping, and telecommunications would be worst hit." Internet activity would slow to a crawl, because many backbone operators rely on precise GPS time stamps to route data. The $12 billion market for GPS devices would be sent reeling, and the arrival of location-based wireless services would be set back years. However, Owen Wormser of the Office of the Assistant Secretary of Defense says GPS can withstand the loss of several satellites before becoming completely dysfunctional. "The system would degrade slightly, rather than seize up," he says.

2003-11-28 **cable failure UK Internet traffic affect denial-of-service**

NIPC/DHS

November 26, CNET News.com — Cable failure hits UK Net traffic.

A major failure in one of the key communications links between the United States and Europe appears to have caused widespread disruption to Internet services in the UK. The fault occurred Tuesday, November 25, in the TAT-14 fiber-optic cable system that connects the United States, Denmark, Germany, the Netherlands, France and the UK, and is understood to have left the system unusable for traffic. TAT-14 is a dual, bidirectional ring of cable, so a single serious fault should not be enough to break it, since traffic would still be able to flow between the countries on the ring. But a part of the cable near the U.S. coast had already suffered a technical fault earlier this month, which meant there was no built-in redundancy to cope with Tuesday's failure. According to BT, a member of the consortium of telephone companies that owns TAT-14, the U.S.-side fault should be fixed by the end of this week, which will bring the cable network online again. Tuesday's failure affected BT's voice calls, rather than its data services, but it is understood that a number of Internet service providers experienced faults.

2004-03-15 **denial-of-service DoS outage Microsoft Hotmail MSN Messenger**

NIPC/DHS

March 14, PC World — Outage hits Hotmail, MSN Messenger.

Internal technical problems at Microsoft closed down access for many MSN Messenger and Hotmail users, as well as some MSN Internet Access customers, for about eight hours Friday, March 12. Microsoft started receiving reports or problems with its instant messaging, Web based e-mail and dial-up Internet services at about 8:30 a.m. Pacific Time Friday, a company spokesperson says. The issue was identified at around 3 p.m. and solved an hour and a half later, she adds. "The outage was pretty significant in terms of the number of customers it affected, but by now the services should be up and running for everybody," the Microsoft spokesperson confirmed late on Friday afternoon. "It was a completely internal issue," the spokesperson says. The problem had nothing to do with hackers or the security patch for MSN Messenger that Microsoft released earlier this week, she adds. Microsoft did not disclose how many customers were unable to connect to those services in the interim. Service complaints came mostly from the U.S. and Canada, but users outside of North America may also have been affected, the spokesperson says. Users who were already connected to the services were for the most part able to continue using them, the issue primarily affected new log-ons, she says.

2004-03-22 **denial-of-service DoS outage Microsoft Hotmail MSN Messenger**

NIPC/DHS

March 19, IDG News Service — Hotmail, MSN Messenger hit with another outage.

Technical problems at Microsoft Corp. for the second time within a week caused trouble for users trying to connect to Hotmail and MSN Messenger, the company said Thursday, March 19. Users around the globe reported that they had problems signing on to the Hotmail and MSN Messenger services during about a three-hour period from 5:00 p.m. GMT until 8:00 p.m. GMT Thursday. Microsoft in a statement said it identified an issue that caused log-on and connectivity issues on some MSN services for a portion of its customers and has since solved it. The company did not specify the scope of the problem. The outage also affected connectivity for MSN Internet Access customers, Microsoft said. The company blames the problems on an unspecified internal problem and said it has no indication of any external causes such as cyberattacks. Although to users the problem was essentially the same, Microsoft said that Thursday's problems are different from those that caused an approximately eight-hour outage last Friday.

DHS IAIP Daily;
http://www.cnn.com/2004/TRAVEL/05/01/delta.delays/index.html

May 01, CNN — Computer glitch grounds Delta flights.

A glitch in a Delta Air Lines computer system grounded flights out of Atlanta on Saturday afternoon, May 1, because data needed for takeoffs was not available, an FAA spokesperson said. Flights in some other cities were affected by the delays. Initially all flights east of Salt Lake City, Utah, were grounded, but within a couple of hours, flights were beginning to take off from airports other than Atlanta, Delta spokesperson Liza Caceres said. By early evening, the delays and cancellations were mostly confined to the Central and Eastern United States, Delta spokesperson Andy McDill said. The Atlanta-based airline uses the computer data in question to calculate weight and balance, and process passenger-related information, said Kathleen Bergen of the FAA. "It's not a safety-related issue," Bergen said.

DHS IAIP Daily;
http://www.pcadvisor.co.uk/index.cfm?go=news.view&news=4331

November 26, IDG News Service — UK government hit with another large computer failure.

IT system failures continued to plague the UK government last week, when as many as 80,000 civil servants working for the Department of Work and Pensions (DWP) had to deal with what is being described as the biggest computer crash in government history. The DWP was carrying out a "routine software upgrade" on Monday, November 22, when the system crashed, leaving around 80 percent of the department's 100,000 desk machines disrupted or completely shut down, a DWP spokesperson said Friday, November 26. The problems lasted through most of Thursday, November 25. Microsoft and EDS (Electronic Data Systems) run the DWP's network. The DWP is responsible for providing a variety of state benefits to about 24 million people. It is believed that the crash was caused when an incompatible system was downloaded on to the entire network. The IT failure was only the latest in a string of serious computer system problems experienced by the department.

2004-12-08 **interactive games Halo Microsoft Xbox Internet traffic saturation bandwidth**

NewsScan; http://news.bbc.co.uk/1/hi/technology/4079397.stm

THE HALO EFFECT: NETWORK GRIDLOCK

The November 9 launch of Microsoft's Halo 2 Xbox game sparked an Internet traffic explosion that has continued into December and could herald chronic network congestion problems for Internet service providers, warns network monitoring firm Sandvine. "The explosion in Xbox Live traffic attributed to Halo 2 should be seen as a clarion call. ISPs need to enhance the broadband experience for these high-end users by prioritizing or reserving bandwidth for games," says Sandvine CTO Marc Morin. One of the main factors that can disrupt online gaming is "lag," in which there is a noticeable delay between the player's action and the game's response time. Installing software that makes networks more "intelligent" will be key to ISPs' ability to accommodate bandwidth-hungry gamers, says a Yankee Group analyst: "In the competitive broadband environment, operators need to differentiate the way they offer access to services like live-play gaming." NEW ZEALAND OUTAGE SHUT DOWN STOCK EXCHANGE

A major outage in New Zealand Telecom Corp.'s cable network Monday disrupted data services, electronic cash transactions, mobile phone, and Internet services, as well as shutting down the nation's stock exchange for hours (the third time in the past nine months that data link failures have halted trading). Widespread disruption to business and private services was caused by two cable breaks on its North Island network. They were repaired by mid-afternoon Monday--at least five hours after they occurred. [Internet service and mobile phones were also out of commission due to two cable breaks. MHS]

The outage was caused by two separate incidents, including a fiber cable break north of the capital, Wellington, and a second cable being cut in Taranaki province on the west coast of North Island, more than 300 kilometers (188 miles) north of Wellington.

2005-06-21 **Blackberry nationwide cellular network outage blackout denial-of-service DoS**

DHS IAIP Daily; http://www.nytimes.com/aponline/technology/AP−Blackberry−
Out age.html

BLACKBERRY NETWORK DOWN FOR HOURS

The BlackBerry e-mailservice suffered a nationwide outage Friday morning, June 17, but the nearly four-hour disruption only appeared to affect devices connected to certain types of cellular networks. Although Research in Motion Ltd. (RIM), which makes the popular mobile devices and provides a service connecting them to corporate networks, did not respond to phone calls seeking comment, Cingular Wireless, T-Mobile USA, and Nextel Communications Incorporated confirmed the outage. Cingular Wireless said RIM's outage lasted for three hours and 49 minutes, while T-Mobile USA said service was restored by noon EDT. Nextel Communication Incorporated reported that only some customers experienced trouble, and in those cases it was a delay in e-mails rather than a full-fledged service disruption. Both Verizon Wireless and Sprint Corporation said there were no complaints from their customers at all, possibly due to their reliance on cellular networks based on a technology called Code Division Multiple Access (CDMA); the three cellular carriers who experienced the service disruption rely on alternate technology-based cellular networks other than CDMA.

DHS IAIP Daily;
http://www.cnn.com/2005/WORLD/asiapcf/06/28/pakistan.internet.reut/index.html

INTERNET CRASHES IN PAKISTAN

An undersea cable carrying data between Pakistan and the outside world has developed a serious fault, virtually crippling data feeds, including the Internet, telecommunications officials said. The system crashed late on Monday, June 27, and was still down on Tuesday evening. Many offices across the country ground to a halt as people realized it was not one of Pakistan's regular, but usually brief, technical hitches. An official at the Karachi stock exchange said Pakistan's main bourse was unaffected as it had its own internal trading system. Fixing it would entail an interruption for other countries using the link, including India, Dubai and Oman, one company official said. But the impact on neighboring countries would be limited and the repairs would begin at 4 a.m. on Wednesday (2300 GMT on Tuesday) to minimize any disruption, he said. Airlines and credit card companies were among the businesses hit by the crash. "It's a total disaster," said Nasir Ali, commercial director of the private Air Blue airline. "We have a Web-based booking system which has totally collapsed."

RESTORING 260,000 LINES TO TAKE DAYS, WEEKS

Telephone and wireless communication could take weeks to restore in areas that took the brunt of Hurricane Katrina's blow. In less severe locations, it will likely only be days. Those time frames parallel how long it will likely take power companies to repair downed lines. Cellular companies report much of their loss of service has resulted from power outages that affected roughly 80 percent of the state. At a minimum, 260,000 telephones lines are down, resulting from uprooted trees that pulled cables as they fell, and water from flooding that seeped into equipment, said Mike Walker, a BellSouth spokesperson. Cingular Wireless said most network disruptions in Mississippi are in Jackson, Biloxi, Pascagoula, Bay St. Louis, Hattiesburg, Gulfport and Brookhaven. Alltel Corp., which has 190,000 Mississippi subscribers, reported 50 percent of its cell sites out of service. "We're moving more than 50 portable generators from Panama City, Florida" said the Arkansas-based company spokesperson Larry White. About 3,500 Alltel landline customers in Florence and Prentiss are also out of service, White said.

TELECOMS STRUGGLING TO RESTORE SERVICE IN GULF COAST REGION

Cellular and other communication services have gradually improved in the Gulf Coast region, but service providers said Thursday, September 1, they still can't reach equipment in the flooded city of New Orleans to make needed repairs. Officials at Cingular Wireless LLC, Verizon Wireless, Sprint Corp. and BellSouth Corp. reported that with flooding and power outages in New Orleans, crews can't access cellular sites and switching stations for repairs. Of about 1 million landline phones in Lousiana that were out of service after the storm hit Monday, only 130,000 have been restored so far, said Bill Oliver, BellSouth's president of Lousiana operations Telecommunications have improved, however, in places such as Baton Rouge, Mobile, AL, and Pensacola, FL, company spokespersons said. The carriers are all relying on backup generators and in some cases portable generators and cellular transceivers carried on panel trucks. When possible, the carriers are also increasing power to rooftop cell sites in New Orleans to boost signals, the spokespeople said. "This is much worse than the 9/11 emergency. It is not just a part of a city like New York," said Jeff Kagan, an independent telecommunications analyst in Atlanta, GA. Wireless providers urged callers to use text messaging as an alternative to voice calls, partly because it requires less bandwidth.

2005-09-05 **hurricane Katrina disaster communications cut down satellite phone links**

DHS IAIP Daily; http://www.usatoday.com/tech/wireless/2005−09−05−satellite−phones_x.htm

SATELLITE PHONES PROVIDE CRITICAL LINK TO OUTSIDE WORLD

Satellite phones are serving as critical lifelines in Gulf Coast areas that lack other phone services. The National Guard, the American Red Cross, utility workers, reporters and people in search of relatives are among those using satellite phones to communicate. More than a million customers in Louisiana, Mississippi and Alabama are still without landline phone service, BellSouth says. And cell phone service has been spotty at best along the Gulf Coast. Typically, poles or wires were downed and power outages knocked out service to the digital gear and cell phone towers that are the lynchpins of landline and wireless networks. Satellite phones communicate directly with satellites that hover more than 500 miles high and work virtually everywhere around the globe. U.S. satellite phone providers Globalstar and Iridium note the phone generally must be used outdoors, and its antenna should be pointed skyward and have a clear line of sight to the satellite. Batteries supply about eight hours of talk time but can be recharged using a wall unit or a car's power adaptor.

2005-09-06 **hurricane Katrina disaster communications cut down wireless carriers restore service**

DHS IAIP Daily; http://rcrnews.com/news.cms?newsId=24016

WIRELESS CARRIERS BEGIN TO RESTORE SERVICE

Wireless carriers continued to make progress in re-establishing wireless communications to the Gulf Coast region following Hurricane Katrina. Cingular Wireless L.L.C. reported that as of Monday, September 5, it had fully restored service in Mobile, AL, and Jackson, MS, and that most coverage capacity has been re-established in and around Biloxi, MS. Customers in Meridian, Hattiesburg, and Gulfport, MS, were able to send and receive calls at reduced levels. Cingular also noted that some calls are going through in New Orleans and surrounding areas, but at reduced levels. BellSouth Corp. estimated that 810,000 lines remain impacted in the hardest-hit areas of the Gulf Coast. BellSouth released initial financial estimates of between $400 million and $600 million for both capital and expenses for network restoration. Verizon Wireless said it was providing improved service in areas southwest of New Orleans and was making progress in areas north of Lake Pontchartrain as well as in Baton Rouge and Mississippi. Central New Orleans continues to have widespread outages with limited coverage. Sprint Nextel Corp. reported similar progress in Mississippi, Alabama and Florida. T-Mobile USA Inc. said it had restored wireless service to a "significant level" in New Orleans. Alltel Corp. has restored service in portions of Jackson, MS, and much of Baton Rouge.

GETTING THE GULF COAST BACK ON THE COMMUNICATIONS GRID

Hurricane Katrina wiped out communications systems throughout the Gulf States, and much of the impacted region remains cut off from voice and data service. On Friday, September 2, the Federal Communications Commission (FCC) held a conference call with wireless Internet service providers and infrastructure experts to coordinate volunteer efforts for storm-ravaged areas. FCC staff asked organizers to help gather data from those offering to donate resources -- from satellites to power generators to spare parts -- to help reconnect the effected areas. These improvised networks will initially target the needs of first responders tasked with rescue, relief and security services. FCC chief of staff Daniel Gonzalez says the commission is waiving some red tape to speed things up. Those waivers include permission for volunteers to launch a low-power FM radio station in Louisiana -- an LPFM, which would usually be called "pirate radio."

2005-09-19 **hurricane Katrina disaster denial-of-service accidental overwhelmed Red Cross Website online transactions donations**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1860051,00.asp

DONATIONS OVERWHELM RED CROSS STAFF, SITE

In the wake of Hurricane Katrina the Red Cross was faced with an overwhelmed IT infrastructure that was unable to handle the numerous online donations. After the tsunami in Southeast Asia last December, the Red Cross faced a huge number of online donations in which the IT staff worked long hours and offloaded some of the transaction processing to technology partners. However the donation system still wasn't ready for Hurricane Katrina. Dave Clarke, chief technology officer at the Red Cross stated, "As soon as we understood the magnitude of the tragedy, we knew the money would be coming in. When we began to see the initial transaction volume, we determined that if it continued on that growth curve, we would run out of capacity. And we knew we had to get ready."

2005-10-19 **Glitch outages California phone Internet Long Beach Hermose Beach Newport Beach Whittier Garden Grove Verizon software error**

DHS IAIP Daily; http://www.latimes.com/news/printedition/la−me−
phones19oct19
,1,4316471.story?ctrack=1&cset=true

GLITCH RESULTS IN PHONE OUTAGES FOR THOUSANDS

At least 150,000 customers in Southern California lost their phone and Internet service for up to 12 hours Tuesday, October 18, because of a computer glitch at a Long Beach central switching plant. The outage struck communities from Hermosa Beach to Newport Beach along the coast and as far inland as Whittier and Garden Grove. According to Verizon, the problem was caused by a software error in a downtown Long Beach office of Verizon Communications Inc. The malfunction corrupted the main software that connects calls and operates the local network.

MAJOR DISRUPTION IN LEVEL 3 NETWORK SLOWS INTERNET TRAFFIC

The Internet has been slower due to a major disruption of service from tier one carrier Level 3 Communications on October 21. The disruption caused increases in Internet response times and drops in availability. In addition, Websites were unreachable and service was shut off for some users. According to George Roettger, Internet security specialist for NetLink Services Inc, "I don't think I've ever seen an entire backbone network go down like that before."

2005-10-26 **Power outages phone FL batteries cellular Wilma Verizon Wireless**

DHS IAIP Daily;
http://www.palmbeachpost.com/search/content/business/epaper/2005/10/26/a2d_phones_1026.html

POWER OUTAGES DRAG DOWN PHONE SERVICE

Palm Beach County, FL, experienced widespread power outages Tuesday, October 25, after a day without electricity drained backup batteries for cellular and land-line systems in the aftermath of Hurricane Wilma. Most phones were operating Monday morning, October 24, while Hurricane Wilma crossed Palm Beach County and the Treasure Coast. After the power failed, those systems ran on batteries that generally last from four to 10 hours, depending on usage. Phone service was sporadic on Tuesday, as batteries began to fail. Chuck Hamby, spokesperson for Verizon Wireless, said "It worked very well through the storm, but then with the power outages, more and more cell sites dropped out of the network." Many cellular towers have built-in generators that can power the towers for five to seven days. Most providers said Hurricane Wilma did not cause much structural damage to phone lines and towers.

DHS IAIP Daily; http://news.com.com/Net+outage+hits+Brits/2100−1037_3−597837 4.html?tag=nefd.top

NET OUTAGE HITS UNITED KINGDOM

Internet service providers America Online, Virgin.net, Wanadoo and Zen Internet all confirmed that they had been hit by outages in the United Kingdom (UK) for several hours Wednesday, November 30. BT Group, the UK's telecommunications giant, said the glitches were due to a software problem linked to user authentication. Three servers were the cause of the problem, which affected customers randomly around the UK, according to BT. A BT representative said the outages resulted from increased congestion on the network, preventing fresh users from logging on, although those already connected via BT's broadband network experienced no service interruption. Although none of the ISPs could immediately provide precise information on how many end-users experienced problems, a Zen representative described the outages as "short term but significant," and a representative for Wanadoo said most ISPs had been touched by the problems at BT. AOL estimated that the number of its subscribers who experienced Internet connectivity problems could have reached 100,000. BT's representative said the company has launched an investigation into the problem.

2006-01-04 **availability airline reservation system business continuity disaster recovery failure**

RISKS 24 14

UNITED AIRLINES RESERVATION COMPUTER SYSTEM OUTAGE

According to a RISKS correspondent, the AP and Reuters newswire report describing the United Airlines reservation system outage on the 3rd of January 2006 was wrong. Peter Neumann summarized the reports as follows: "Computer Glitch Delays United Air Flights In US, 3 Jan 2006 United Airlines' domestic flights were delayed up to 90 minutes Tuesday night because of an outage in the computer system controlling United's check-ins and reservations, which went down for about five hours around 5 p.m. CST Wednesday. Passengers were checked manually, and flights were delayed up to 90 minutes." However, the corresepondent personally saw delays of far more than 90 minutes at Los Angeles International Airport (LAX). He described the debacle as follows (quoting directly):

* No self-check-in kiosks working, reservationists answering the phone with "our computers are still down", which meant every queue had more than 500 people in it, spilling out on the sidewalk outside the terminal, and they were using "the manual procedure". The people close to the head of the queue had been waiting for more than two hours, they said, and they dispensed with the special queues for premier or 1k, just to spread the pain equally.

* They weren't calling out specific flights to try to fill them.

* They had most of the check-in desks empty. Obviously they don't have enough people trained in the manual procedure to alleviate the bottleneck.

* The woman working the lines (with a megaphone) was apologetic, but wouldn't answer questions, not even frequently asked questions which did not have to with individual problems, such as "if I miss my last flight will you provide a hotel? Or is my ticket now refundable if I fly another carrier?

* some reports are they were flying planes half-empty because people couldn't get to the gates. Of course, they weren't announcing how long they were holding flights to try to board them.

* TSA, not known for their flexibility, was not allowing people to go to the gates directly with a boarding pass. Even an e-ticket receipt with a seat assignment wouldn't get you there.

United stock is down 2% today, trading at around a buck a share. Their earnings are -$43 per share at the moment. I'll bet this was an expensive failure."

2006-03-15 **BlackBerry user denial-of-service DoS software upgrade RIM**

DHS IAIP Daily; 23
http://news.com.com/Some+BlackBerry+users+frustrated+by+outa ges/2100−1041_3−6050225.html?tag=nefd.top

SOME BLACKBERRY USERS FRUSTRATED BY OUTAGES.

Research In Motion (RIM) confirmed Wednesday, March 15, that several BlackBerry customers' service experienced outages this week due to a software upgrade, which was the feared outcome if RIM had been forced to implement its workaround technology. Several customers with Cingular, T-Mobile, Verizon Wireless and Sprint's Nextel service reported delays, outages and problems with their BlackBerry Internet Service starting early this week and continuing through Wednesday. RIM confirmed that it was responsible for the problems: "Some BlackBerry Internet Service customers experienced intermittent service earlier this week due to an issue that appears to have stemmed from a software upgrade in RIM's infrastructure. Service appears to be operating at normal levels at this time. RIM continues to monitor the infrastructure closely."

Category 22.4 *Accidental availability disruptions*

2006-03-29 **vulnerability spider bot search engine Javascript cookies bypass design flaw data integrity deletion erasure**

RISKS 24 22

THE SPIDER OF DOOM

Alex Papadimoulis had a fascinating tale of a disappearing Web site. In brief, a government Web site was converted to a content-management system that would allow employees to manage their own Web pages without having to go through a Web designer. It worked fine for five days, but on the sixth day all the content was gone! The entire Website had been erased by an external user that turned out to be the GOOGLE web crawling spider.

>After quite a bit of research (and scrambling around to find a non-corrupt backup), Josh found the problem. A user copied and pasted some content from one page to another, including an "edit" hyperlink to edit the content on the page. Normally, this wouldn't be an issue, since an outside user would need to enter a name and password. But, the CMS authentication subsystem didn't take into account the sophisticated hacking techniques of Google's spider. Whoops.

As it turns out, Google's spider doesn't use cookies, which means that it can easily bypass a check for the "isLoggedOn" cookie to be "false". It also doesn't pay attention to Javascript, which would normally prompt and redirect users who are not logged on. It does, however, follow every hyperlink on every page it finds, including those with "Delete Page" in the title. Whoops.

After all was said and done, Josh was able to restore a fairly older version of the site from backups. He brought up the root cause -- that security could be beaten by disabling cookies and javascript -- but management didn't quite see what was wrong with that. Instead, they told the client to NEVER copy paste content from other pages.<

Steve Summit added in RISKS 24.23

>I can see Joe Loughry's tongue in his cheek pretty clearly from here, but it might not be obvious to a casual reader that this was manifestly *not* a "hacking" attempt by Google. That a simple and naïve traversal of some hyperlinks could cause content to be deleted makes it pretty obvious that something was badly wrong with the site's editing and access-control model.

Needless to say (or, it *ought* to be needless, but is actually pretty needful), security that assumes that visitors *will* have cookies and JavaScript enabled, that can be compromised if these features are disabled, is no security at all. That content could have been inadvertently deleted by any visitor to the vulnerable website; google's spider just happened to get to it all first.<

1997-01-29 **ActiveX diddling**

RISKS 18 80 ff

The CHAOS Computer Club of Germany demonstrated how a rogue ActiveX applet can insert a fraudulent transaction in a victim's stack of pending QUICKEN transfer orders.

Category 23 *Internet tools*

1997-02-21 **ActiveX**

RISKS 18 83

Microsoft responded to the CHAOS Computer Club demonstration of a data diddling attack via ActiveX by saying that the same problem could have occurred using Java and Netscape.

Category 23 *Internet tools*

1997-03-04 **digital signatures Authenticode ActiveX**

RISKS 18 85 ff

Bob Atkinson, chief architect of Microsoft's Authenticode system for signing ActiveX controls, responded to criticism of his company's approach to security of third-party executables. Among the key points: Microsoft has never claimed that it would certify the safety of other people's code; authentication is designed solely to permit identification of the culprits _after_ malicious code is detected; Explorer-based distribution of software is no more risky than conventional purchases through software retailers. Subsequent correspondence chastised Mr Atkinson for omitting several other key points; e.g., interactions among ActiveX controls can violate system security even though individual controls are apparently harmless; there is no precedent in fact for laying liability at the feet of software developers even when you _can_ find them; under attack, evidence of digital signature is likely to evaporate from the system being damaged; latency of execution of harmful payloads will complicate identification of the source of damage; malice is not as important a threat from code as incompetence; Microsoft has a history of including security-threatening options such as automatic execution of macros in Word without offering any way of turning off the feature; a Web site can invoke an ActiveX control that is located on a different site or that has already been downloaded from another site and can pass that control unexpected arguments that could cause harm.

Category 23 *Internet tools*

1997-03-06 **Java ActiveX**

RISKS 18 87

Dr Gary McGraw of Reliable Software Technologies in Sterling, VA reported on some new examples of known security problems in JAVA and ActiveX. A minor JAVA problem concerned the ability to determine a client's IP address without permission. A more serious ActiveX problem allows a server to connect to any arbitrary TCP/IP port on a client system even if a firewall is configured to prevent such connections.

Category 23 *Internet tools*

1997-03-28 **JavaScript denial of service MIME attachment**

RISKS 18 95

A user posted a warning to a USENET group about a Web page that spawns endless windows from within a Web page. The original Web site was designed as a demonstration of a possible denial of service attack. Unfortunately the USENET poster included the actual HTML code for the offending Web page in his USENET posting. Since Netscape Navigator automatically formats such attachments and executes the script, the USENET message had the same effect as the demonstration Web page. Denial of service by remote control. . . .

Category 23 *Internet tools*

1997-04-03 **ActiveX flaw**

Reuters

CEO Scott McNealy of Sun Microsystems, in his keynote address at the JavaOne Conference, showed how when a specially written program containing ActiveX could be downloaded by a remote user and then took over the user's computer and rifled its files for personal financial information. The ActiveX control had been signed but was still malicious.

Category 23 *Internet tools*

1997-04-28 **YAJF Java flaw authentication**

RISKS 19 11

Professor Ed Felten's team at Princeton discovered yet another Java security flaw. This one applies to version 1.1.1 of the Java Development Kit (JDK) and version 1.0 of the HotJava browser from Sun Microsystems. Seems that there are two problems: (1) "If an applet's signer is labeled as trusted by the local system, then the applet is not subject to the normal security restrictions." (2) The current flaw is that an applet can redefine the Java interpreter's perception of who signed it. By searching for the signers trusted by the client system, a hostile applet could bypass all normal security restrictions. The bug was fixed in release 1.1.2 of the JDK.

Category 23 *Internet tools*

1997-05-22 **JAVA ActiveX**

EDUPAGE

Pushing executable files out from servers to client systems is outstripping security provisions in JAVA and ActiveX. JAVA is supposed to integrate some security measures into its code (the "sandbox"), but in contrast, Microsoft's ActiveX relies only on certification of origin to reduce risks of Trojans and just plain programming errors. Prof. Ed Felten of Princeton University's Safe Internet Programming project said, "Once an Active X control is running on your machine, you have no way to constrain what it does."

Category 23 *Internet tools*

1997-08-08 **JAVA applet Microsoft Internet Explorer**

C|Net news.com http://www.news.com/News/Item/0,4,13226,00.html?latest

Ben Mesander, a Java developer with CreativeConcepts in Boulder, Colorado, discovered that Internet Explorer 3.x and 4.0 allows Java applets to open a network connection to a server other than the one from which they were downloaded. Such a bug would permit a Trojan applet to redirect interactions from a legitimate site to a rogue site without notifying the user of the change. For example, a modified applet on a bank site might redirect a user to a pirate site where confidential information could be seized. Because Java normally does not permit such connections, and because Netscape Navigator did not show the same problem, analysts concluded that the bug was in Microsoft Internet Explorer.

Category 23 *Internet tools*

1997-10-01 **JAVA vulnerability**

RISKS 19 40

The Reliable Software Group at University of California Santa Barbara published a new attack on JAVA applications using the CLASSPATH feature. The vulnerability allows a malicious server to spoof an innocent target site, making it look as if the client is communicating with the desired site (e.g., a bank) while actually the data are flowing, unencrypted, to the malicious hijacker site. Check <http://www.cs.ucsb.edu/TRs/> to see if the report makes it to the UCSB Dept of Computer Science compilation of technical reports.

Category 23 *Internet tools*

1997-10-17 **JAVA**

RISKS 19 41

Another JAVA problem surfaced in October when researcher Andre L. Dos Santos at the Reliable Software Group of the University of California Santa Barbara found a new exploit of the CLASSPATH feature. The demonstration program sends confidential data to a rogue site instead of to the bank that requested it.

Category 23 *Internet tools*

1997-11-28 **data diddling e-mail Java HTML Explorer browser**

RISKS 19 49

A RISKS correspondent reported that HTML-enabled e-mail was immediately interpreted by MS Internet Explorer 4.0 because its autopreview mode was active. The e-mail downloaded and executed a Java applet that opened a connection to a foreign Web site and would have gone on to many other sites had the user not interrupted it.

Category 23 *Internet tools*

1998-01-11 **ActiveX security flaw hole registry authentication signature**

BUGTRAQ, http://www.network-security.com/activex/DLLMainAttack.html

A hacker discovered a major security flaw in Internet Explorer and reported it to Microsoft before publishing it on the Net: "Controls that are registered in the Windows registry file become `trusted' and are not subjected to the HIGH / NONE safety level security service. It is possible to use a signed control to introduce an unsigned control onto the desktop. The unsigned control is registered in the Windows registry and can then be activated AT ANY TIME IN THE FUTURE by any HTML page." In other words, a Trojan horse control could allow further controls to be executed regardless of security level. As an aside, the hacker evidently could not wait for a patch before publishing the hole to the world.

1998-12-18 **mobile code Java applet ActiveX control Javascript proxy**

InternetWeek
http://www4.zdnet.com/intweek/stories/news/0,4164,2177494,00.html

Trend Micro Inc. launched its InterScan AppletTrap in January 1999 to identify and block malicious applets and controls written in Java, Javascript and ActiveX.

Category 23 *Internet tools*

1999-01-04 **Java virtual machine applet corrupt crash Windows JVM**

Newsbytes

Fabio Ciucci and the Anfy Java Collective of Italy <http://www.anfyjava.com> warned in 1998 that weaknesses in Microsoft's "corrupt" version of the Java Virtual Machine made it vulnerable to applets that could crash client systems. Although Microsoft published a patch to correct the security hole, it did not publicize the patch. In January, Ciucci and his colleagues warned that the recent revision of the MS JVM [available from <http://www.microsoft.com/java/vm/dl — vm31.htm> or from <http://www.microsoft.com/windows/ie/download/jvm.htm>] were still vulnerable — the company had failed to integrate the former patch in the new system. As a result, malicious applets — increasingly available on the Net — could cause incomprehensible JVM hangs and even outright crashes of the Windows operating system for users unaware of the need for a patch.

Category 23 *Internet tools*

1999-01-06 **flaw spreadsheet Excel weakness HTML Web browser flaw**

InternetWeek
http://www.zdnet.com/intweek/stories/prtfriendly/0,4557,2182861,00.html

A flaw in MS-Excel would allow malicious code written in HTML and downloaded from a Web site to execute arbitrary code secretly downloaded to the user system. The security hole would theoretically allow powerful violations of security such as sending confidential files to the hostile site. MS immediately provided a patch to disable the CALL function within Excel. Padgett Peterson, writing in RISKS 20.15, warned, "What is not well understood is that this exploit is actually multifaceted - there are a number of HTML constructs and a number of applications that can be used. The choke point seems to be in the (Windows) Registry which decides which applications (mostly Microsoft's) are considered "safe", that no warning screen is generated on network download/launch sequences for these applications. EXCEL is just one of these."

Category 23 *Internet tools*

1999-01-15 **Java active content book publication Web mobile code**

RISKS 20 16

Drs Edward Felten and Gary McGraw published a new book about mobile code security. _Securing Java: Getting down to business with mobile code_ was published by John Wiley & Sons in January 1999. In addition to the physical book, these experts put the entire text online at <http://www.securingjava.com>. The hope was that the free edition will not harm sales of the paper book.

Category 23 *Internet tools*

1999-05-01 **mobile active code ActiveX Java malware**

InternetWeek

Several companies announced products for identifying hostile or otherwise dangerous active content pulled from Web pages and executed on client systems. Finjan Software released a new version of its SurfinShield program; Security-7 announced a quarantine server for pre-emptive execution and validation of applets and controls. Experts warned that it is increasingly difficult to justify interdicting all Java, JavaScript and ActiveX execution because so many trading partners are depending on these tools for production Web applications. Rutrell Yasin, writing in InternetWeek, classified mobile code threats as follows:
* System modification: applets can exploit holes in Java, allowing hackers to alter database information;
* Privacy invasion: applets can be used to crack passwords or impersonate e-mail identities;
* Denial of service: applets can shut down a machine;
* Nuisance: applets can launch annoying attacks such as opening multiple windows.

Category 23 *Internet tools*

1999-05-10 **mobile malicious code**

NATIONAL POST (Canada)

Edmonton computer expert Tom Cervenka, member of the vulnerability-tracking "Because We Can" group <http://www.because-we-can.com> identified a vulnerability in the Web site of e-Bay, a major on-line auction site. The vulnerability would allow a criminal hacker to insert harmful JavaScript code on an eBay Web page; the code could then do anything JavaScript allows, including password stealing. Unfortunately, eBay officials dismissed the vulnerability as unimportant.

Category 23 *Internet tools*

1999-08-03 **Internet Explorer browser flaw weakness vulnerability bug macro execution Word Excel Powerpoint load alert patch**

New York Times via EDUPAGE

Because Microsoft believes that word processing, spreadsheet and presentation software should allow automatic execution of macros — thus turning these products into programming languages — they also allowed their Internet Explorer browser to load these programs without alerting users. In August, Microsoft scrambled to issue patches to correct this design flaw so that unwary users would not be subjected to hostile code merely by downloading documents from a hostile Web site or by reading e-mail attachments. The principle still stands: don't double-click attachments of uncertain origin or unvalidated safety.

Category 23 *Internet tools*

1999-09-29 **MS-IE5 Microsoft Internet Explorer browser bug vulnerability ActiveX control download Web firewall**

InfoWorld Electronic, IS/Recon, NTBUGTRAQ

Georgi Guninski, browser-bug discoverer extraordinaire, notified Microsoft of yet more security vulnerabilities in Internet Explorer 5. In August, he found that a malicious ActiveX control could install arbitrary code in the Windows Startup folder. See Guninski's Web site <http://www.nat.bg/~joro> for details but be aware that his demonstration code actually does subvert your security unless you set Internet Zone security setting to "High", or disable the setting "Script ActiveX controls marked safe for scripting." In September, he showed that a malicious JavaScript could download executable code from a Web site (typically allowed by firewalls) and the hostile code could then send itself to any IP address back out through the firewall. Microsoft recommended disabling IE5's active scripting.

2002-03-10 **Java vulnerabilities ICAT CVE CGI**

ICAT Metabase

The ICAT Metabase < http://icat.nist.gov/icat.cfm > for the Common Vulnerabilities and Exposures (CVE) database reported the following vulnerabilities involving Java for the period from 1 Jan 2001 to 10 Mar 2002:

CAN-2000-1117: The Extended Control List (ECL) feature of the Java Virtual Machine (JVM) in Lotus Notes Client R5 allows malicious web site operators to determine the existence of files on the client by measuring delays in the execution of the getSystemResource method. Published Before: 1/9/2001 Severity: Low

CAN-2001-0068: Mac OS Runtime for Java (MRJ) 2.2.3 allows remote attackers to use malicious applets to read files outside of the CODEBASE context via the ARCHIVE applet parameter. Published Before: 2/12/2001 Severity: Medium

CAN-2001-0186: Directory traversal vulnerability in Free Java Web Server 1.0 allows remote attackers to read arbitrary files via a .. (dot dot) attack. Published Before: 5/3/2001 Severity: High

CAN-2001-0297: Directory traversal vulnerability in Simple Server HTTPd 1.0 (originally Free Java Server) allows remote attackers to read arbitrary files via a .. (dot dot) in the URL. Published Before: 5/3/2001 Severity: Low

CAN-2001-0307 Summary: Bajie HTTP JServer 0.78 allows remote attackers to execute arbitrary commands via shell metacharacters in an HTTP request for a CGI program that does not exist. Published Before: 5/3/2001 Severity: Medium

CAN-2001-0308: UploadServlet in Bajie HTTP JServer 0.78 allows remote attackers to execute arbitrary commands by calling the servlet to upload a program, then using a ... (modified ..) to access the file that was created for the program. Published Before: 5/3/2001 Severity: Medium

CAN-2001-0324: Windows 98 and Windows 2000 Java clients allow remote attackers to cause a denial of service via a Java applet that opens a large number of UDP sockets, which prevents the host from establishing any additional UDP connections, and possibly causes a crash. Published Before: 5/3/2001 Severity: High

CAN-2001-0926: SSIFilter in Allaire JRun 3.1, 3.0 and 2.3.3 allows remote attackers to obtain source code for Java server pages (.jsp) and other files in the web root via an HTTP request for a non-existent SSI page, in which the request's body has an #include statement. Published Before: 11/28/2001 Severity: Medium

CAN-2001-1008: Java Plugin 1.4 for JRE 1.3 executes signed applets even if the certificate is expired, which could allow remote attackers to conduct unauthorized activities via an applet that has been signed by an expired certificate. Published Before: 8/31/2001 Severity: High

CVE-2000-1099 : Java Runtime Environment in Java Development Kit (JDK) 1.2.2_05 and earlier can allow an untrusted Java class to call into a disallowed class, which could allow an attacker to escape the Java sandbox and conduct unauthorized activities. Published Before: 1/9/2001 Severity: Medium

CVE-2001-0126: Oracle XSQL servlet 1.0.3.0 and earlier allows remote attackers to execute arbitrary Java code by redirecting the XSQL server to another source via the xml-stylesheet parameter in the xslt stylesheet. Published Before: 3/12/2001 Severity: High

CVE-2001-0137: Windows Media Player 7 allows remote attackers to execute malicious Java applets in Internet Explorer clients by enclosing the applet in a skin file named skin.wmz, then referencing that skin in the codebase parameter to an applet tag. Published Before: 3/12/2001 Severity: High

SUN SUES MICROSOFT FOR DAMAGES OVER JAVA
Sun Microsystems has filed a new lawsuit against Microsoft, alleging that Microsoft's business practices damaged the market for Sun's Java programming language. It also alleges that Microsoft kept more than 20 technologies secret, preventing Sun and other server makers from incorporating the features needed to maker their servers work with Microsoft's software. Sun's suit follows an earlier filing in 1997, which focused on a contractual dispute over Microsoft's licensing of Java. The two companies eventually settled out of court. This time around, however, Sun is seeking, potentially, billions of dollars in damages in addition to an injunction that would require Microsoft to distribute the latest version of Java, to disclose technical information so that other companies can write compatible software, and to cease bundling some Microsoft products. The Sun suit follows similar suits recently filed by AOL Time Warner and Be Inc. (Wall Street Journal 11 Mar 2002)
http://online.wsj.com/article/0,,SB1015608994249257320.djm,00.html (sub req'd)

SUN'S CHRISTMAS COMES EARLY IN VICTORY OVER MICROSOFT
A U.S. district court judge ruled Monday that Microsoft had violated Sun Microsystems' copyright for its Java software and ordered the software giant to include Sun's version of Java with its Windows operating system, handing Sun a double-barreled victory over its high-tech rival. The case stems from Sun's claims that Microsoft dropped Sun's Java software in favor of its own variation, which Sun alleges is incompatible with its technology. "Unless Sun is given a fair opportunity to compete in a market untainted by the effects of Microsoft's past antitrust violations, there is a serious risk that in the near future the market will tip in favor of .Net, that it is impossible to ascertain when such tipping might occur in time to prevent it from happening, and that if the market does tip in favor of .Net, Sun could not be adequately compensated in damages," wrote Judge J. Frederick Motz in his decision. Microsoft says it plans to appeal the decision. (CNet News.com 23 Dec 2002)
http://news.com.com/2100-1001-978786.html

SUN AND MICROSOFT GET SET FOR JAVA LEGAL BATTLE
Sun and Microsoft are appearing in federal court to argue their positions before U.S. District Judge J. Frederick Motz, who will be ruling on Sun's request for an injunction requiring Windows to include Sun's latest Java software immediately, pending resolution of the larger Sun lawsuit against Microsoft. Sun claims Microsoft has gained an unfair advantage by shipping Windows with a version of Java that is both outdated and strongly biased toward Windows, even though Java is meant to make it possible for programs to run on all computers, regardless of the operating system. (AP/San Jose Mercury News 15 Jan 2003)

NewsScan

HP AND DELL PCs TO INCLUDE JAVA
Hewlett-Packard and Dell will be including Java as a standard component on their personal computers. (Java, a creation of Sun Microsystems, makes it easy to run a program on many different kinds of computers.) Sun, of course, is happy that, as a result of the 1998 Microsoft antitrust trial, computer manufacturers can no longer be pressured by Microsoft to run only that company's products. Sun executive Richard Green says, "The back and forth with Microsoft has limited the success of Java on the personal computer desktop. It is remarkable that the two largest computer makers have committed to Java for their customers." (New York Times 12 Jun 2003)

2004-02-23 **JAVA virtual machine support vulnerability MS Microsoft**

RISKS 23 20

MICROSOFT DUMPS JAVA VM

Consultant Ferdinand John Reinke wrote in RISKS: "Are you familiar with the MS Java Virtual Machine (MSJVM) issue? After September 30th 2004, Microsoft will no longer be able to support this technology. As a result, customers who have the MSJVM installed after this date will be vulnerable to potential attacks that will attempt to exploit this technology. This problem is compounded by the fact that Microsoft will no longer be able to provide software updates or patches to the MSJVM. This issue is not just a concern for organizations that use Java, but will also impact anyone who has the MSJVM installed. More alarming, many organizations aren't even aware that they have MSJVM installed."

Later, in RISKS 23.23, Jonathan de Boyne Pollard suggested that the change of support would have no immediate effects: "The software is not, after all, magically changing somehow on that date to become more vulnerable." He also denied that the security implications of awareness of what software one has on one's system is in any way related to whether the software is supported or not.

[MK comments: The issue is whether anyone is going to provide patches, and if so, how quickly. As for knowing what one has on one's system, it's very unlikely that a system manager will patch what (s)he doesn't know is being used on the system.]

2004-10-08 **Java Sun Eastman Kodak patent**

NewsScan; http://australianit.news.com.au/articles/0

SUN SETTLES JAVA SUIT FOR $92 MILLION

Eastman Kodak has accepted a $92-million offer by Sun Microsystems to settle a billion-dollar patent-infringement lawsuit over the Java programming language. A U.S. federal jury decided last Friday, after a three-week trial, that Java infringed on patents Kodak acquired when it bought Wang Laboratories' imaging software business for $260 million in 1997. The night before the trial's damages phase, which was to begin Thursday, the companies ended their two-year-old battle in an out-of-court settlement. Without admitting or denying the allegations, Sun Microsystems said it will pay Kodak $92 million to settle all claims in the dispute. In exchange, Sun received a license for Java under all Kodak patents. (The Australian, 8 Oct 2004)

2004-12-20 **Google Desktop Search local search integration result disclosure remote Java applet exploit update issued**

DHS IAIP Daily; http://securitytracker.com/alerts/2004/Dec/1012624.html

December 20, SecurityTracker — Google Desktop Search discloses local search integration results to remote users.

A remote user can create a Java applet that, when loaded by the target user, will execute queries to the remote server that served the Java applet that appear to the Google Desktop Search application to be valid Google queries, causing the search application to integrate the local search results with the information returned by the remote server that served the Java applet. The applet running on the target user's system will then have access to the integrated local search results and can forward those results to the remote server. The vendor has released a fixed version (121004) as of December 10, 2004.

2005-01-20 **Sun Java plug-in two vulnerabilities security restrictions bypass malicious applet JDK JRE 5.0 not affected**

DHS IAIP Daily; http://secunia.com/advisories/13918/

TWO VULNERABILITIES IN SUN JAVA PLUG-IN

Two vulnerabilities have been discovered in Sun Java Plug-in, which can be exploited by malicious people to bypass certain security restrictions or compromise a user's system. The first vulnerability involves an error in the Java Plug-in within the handling of JavaScript calling into Java code can be exploited by a malicious applet hosted on a Website to access and modify local files or execute local applications. This vulnerability has been fixed in SDK / JRE 1.4.2_01 and later, and SDK / JRE 1.3.1_13 and later. The second vulnerability involves an error in the way applets on the same Web page can interfere with each other can be exploited to load files and Web pages in another applet. This vulnerability has been fixed in SDK / JRE 1.4.2_06 and later, and SDK / JRE 1.3.1_13 and later. For both vulnerabilities, JDK and JRE 5.0 are not affected.

23.2 Javascript

Category 23.2 Javascript

2001-02-13 **e-mail address capture spyware Web privacy JavaScript**

RISKS 21 24

Stewart C. Russell reported to RISKS on unauthorized e-mail address capture while browsing:
>I was looking at an estate agent's (realtor's) website when I noticed the status line on my browser saying "Contacting <mailserver>" then "Message Sent". I looked through the site's HTML code and there was a little piece of JavaScript which appeared to send an e-mail message to the site's owner with no intervention from me. This service is provided by http://www.siteguest.com/, who describe it as "Caller ID for your web site".

Sure enough, in the next few days I started to get a number of e-mails from this realtor promising the best deals on houses. I'd prefer to choose who gets my e-mail address, and the behaviour of this particular individual has pretty much guaranteed no business from me.

The risk? The usual JavaScript and security warnings should be on, and that combining web and mail functions in one program is not always a good idea.<

Category 23.2 Javascript

2002-03-10 **JavaScript vulnerabilities ICAT CVE CGI**

ICAT Metabase

The ICAT Metabase < http://icat.nist.gov/icat.cfm > for the Common Vulnerabilities and Exposures (CVE) database reported the following vulnerabilities involving JavaScript for the period from 1 Jan 2001 to 10 Mar 2002:

CAN-2001-0365: Eudora before 5.1 allows a remote attacker to execute arbitrary code, when the 'Use Microsoft Viewer' and 'allow executables in HTML content' options are enabled, via an HTML email message containing Javascript, with ActiveX controls and malicious code within IMG tags. Published Before: 6/27/2001 Severity: High

CAN-2001-0596: Netscape Communicator prior to 4.77 allows a remote attacker to execute arbitrary javascript via specially crafted GIF images. The javascript is embedded in the GIF file as a comment. Published Before: 8/2/2001 Severity: High

CAN-2001-0722: Internet Explorer 5.5 and 6.0 allows remote attackers to read and modify user cookies via Javascript in an about: URL. Published Before: 12/6/2001 Severity: Medium

CAN-2001-0723: Internet Explorer 5.5 and 6.0 allows remote attackers to read and modify user cookies via Javascript, aka the "Second Cookie Handling Vulnerability." Published Before: 11/14/2001 Severity: Medium

CAN-2001-0743: Paging function in O'Reilly WebBoard Pager 4.10 allows remote attackers to cause a denial of service via a message with an escaped ' character followed by JavaScript commands. Published Before: 10/18/2001 Severity: Medium

CAN-2001-0745: Netscape 4.7x allows remote attackers to obtain sensitive information such as the user's login, mailbox location and installation path via Javascript that accesses the mailbox: URL in the document.referrer property. Published Before: 10/18/2001 Severity: Medium

CAN-2001-0824: Cross-site scripting vulnerability in IBM WebSphere 3.02 and 3.5 FP2 allows remote attackers to execute Javascript by inserting the Javascript into (1) a request for a .JSP file, or (2) a request to the webapp/examples/ directory, which inserts the Javascript into an error page. Published Before: 12/6/2001 Severity: High

CAN-2001-0828: A cross-site scripting vulnerability in Caucho Technology Resin before 1.2.4 allows a malicious webmaster to embed Javascript in a hyperlink that ends in a .jsp extension, which causes an error message that does not properly quote the Javascript. Published Before: 12/6/2001 Severity: High

CAN-2001-0829: A cross-site scripting vulnerability in Apache Tomcat 3.2.1 allows a malicious webmaster to embed Javascript in a request for a .JSP file, which causes the Javascript to be inserted into an error message. Published Before: 12/6/2001 Severity: High

CAN-2001-0898: Opera 6.0 and earlier allows remote attackers to access sensitive information such as cookies and links for other domains via Javascript. Published Before: 11/15/2001 Severity: Medium

CAN-2001-0919: Internet Explorer 5.50.4134.0100 on Windows ME with "Prompt to allow cookies to be stored on your machine" enabled does not warn a user when a cookie is set using Javascript, Published Before: 11/26/2001 Severity: High

CAN-2001-0987: Cross-site scripting vulnerability in CGIWrap before 3.7 allows remote attackers to execute arbitrary Javascript on other web clients by causing the Javascript to be inserted into error messages that are generated by CGIWrap. Published Before: 7/22/2001 Severity: High

CVE-2001-0148: The WMP ActiveX Control in Windows Media Player 7 allows remote attackers to execute commands in Internet Explorer via javascript URLs, a variant of the "Frame Domain Verification" vulnerability. Published Before: 6/2/2001 Severity: High

CVE-2001-0149: Windows Scripting Host in Internet Explorer 5.5 and earlier allows remote attackers to read arbitrary files via the GetObject Javascript function and the htmlfile ActiveX object. Published Before: 6/2/2001 Severity: High

Category 23.2 Javascript

2004-08-03 **Mozilla Netscape browser critical flaw vulnerability Javascript Webpages**

DHS IAIP Daily; http://www.internetnews.com/security/article.php/3389941

August 03, internetnews.com — PC takeover flaw in Mozilla, Netscape.

Security researchers have discovered a "highly critical" security hole in the Netscape and Mozilla browsers that puts users at risk of computer takeover. According to an advisory from iDefense, the vulnerability is caused by an integer overflow within the SOAPParameter object's constructor. SOAPParameter objects handle support for SOAP , the XML-based messaging protocol that defines rules for structuring messages. "Successful exploitation allows the remote attacker to execute arbitrary code in the context of the user running the browser," iDefense warned. The flaw can be exploited via specially created Web pages containing malicious Javascript. Browser products affected include Mozilla 1.6; and Netscape versions 7.0 and 7.1. The research firm recommends that Netscape users disable Javascript in the browser as a workaround. The open-source Mozilla Foundation has released an update to fix the flaw: http://www.mozilla.org/products/mozilla1.x/

Category 23.2 Javascript

2004-12-08 **multiple browser injection vulnerability JavaScript exploit no update issued**

DHS IAIP Daily; http://www.securitytracker.com/archives/summary/9000.html

December 08, SecurityTracker — Multiple browsers window injection vulnerability.

A remote user can inject arbitrary content into an open window in certain cases to spoof Website contents. It is reported that if the target name of an open window is known, a remote user can create Javascript that, when loaded by the target user, will display arbitrary content in the opened window. A remote user can exploit this to spoof the content of potentially trusted Websites. Specific browsers affected are Apple Safari, KDE Konqueror, Microsoft Internet Explorer, Mozilla Firefox, Netscape, and Opera. There is no solution at this time.

Category 23.2 Javascript

2005-09-16 **java exploit audio file automatic execution e-mail GMAIL spam script**

RISKS 24 04

GMAIL SECURITY FLAW: ACTS ON JAVASCRIPT IN UNOPENED E-MAIL

Suw Charman reported on a new vulnerability and exploit:

* * *

I received a spam this morning that opened audio files without me even opening the e-mail. The spam was from 'news@capitalex.com' and had the subject 'news'.

A closer looks reveals this code:

<Script Language='Javascript'>

<!--

document.write(unescape('%3C%49%46%52%41%4D%45%20%77%69%64%74%68%3D%22%31%22%20%68%65%69%67%68%74%3D%22%31%22%20%53%52%43%3D%22%68%74%74%70%3A%2F%2F%77%77%77%2E%70%72%6F%66%6F%72%65%78%74%72%61%64%65%2E%63%6F%6D%2F%69%6D%61%67%65%73%2F%6E%65%77%65%78%2E%68%74%6D%6C%22%20%66%72%61%6D%65%42%6F%72%64%65%72%3D%22%31%22%20%0D%0A%0D%0A%73%63%72%6F%6C%6C%69%6E%67%3D%22%6E%6F%22%3E%3C%2F%49%46%52%41%4D%45%3E'));

//-->

</Script>

This decodes to

<IFRAME width="1" height="1" SRC="
http://www.proforextrade.com/images/newex.html" frameBorder="1" scrolling="no"></IFRAME>

That page loads automatically, *without me having opened the e-mail*, then runs a shed load of rubbish including two audio files.

2005-10-20 **Hackers scammers javascript Websites Internet JS Wonka Unicode JavaScript Internet Explorer Firefox Websense**

DHS IAIP Daily; http://informationweek.com/story/showArticle.jhtml?articleID =172302840

HACKERS, SCAMMERS HID MALICIOUS JAVASCRIPT ON WEBSITES

Internet thieves are using a new, fast spreading technique called "JS/Wonka" to conceal their code. The JS/Wonka technique converts characters to and from their respective Unicode values. JavaScript completes those conversions automatically, so it doesn't require much expertise on the part of the code writer. Dan Hubbard, senior director of security and research at Websense, said, "For whatever reason, the number has just skyrocketed since the last of September…There are 10,000 unique sites using this exact same method. The strange thing is, they're completely different types of sites." Internet Explorer and Firefox, among other browsers, are vulnerable. According to Websense, three out of four of the sites found using JS/Wonka are hosted in the U.S. which is another indication that either a group of scammers is working together, or that a obfuscation toolkit has just been made available, and hasn't had time to spread overseas. Websense's JS/Wonka Alert: http://www.websensesecuritylabs.com/resource/pdf/wslabs_wonk a_analysis_oct05.pdf

23.3 ActiveX

Category 23.3 ActiveX

2000-05-24 **mobile code ActiveX vulnerability certificate**

CERT-CC Advisory http://www.cert.org/advisories/CA-2000-07.html 2000 07

CERT-CC reported, "The Microsoft Office 2000 UA ActiveX control is incorrectly marked as "safe for scripting". This vulnerability may allow an intruder to disable macro warnings in Office products and, subsequently, execute arbitrary code. This vulnerability may be exploited by viewing an HTML document via a web page, newsgroup posting, or e-mail message." The vulnerability applied to all systems with Internet Explorer and any Microsoft Office 2000 products. One interesting aspect of the case is that the vulnerability was first reported to CERT-CC by L0pht Research Labs and @Stake, supporting the view that the pseudonym-using staff of those organizations are genuinely committed to professionalism. More important, however, is that the vulnerability exposes the fundamental weakness of the entire security model for ActiveX: knowing where a control originates in no way guarantees the safety of that code.

Category 23.3 ActiveX

2000-12-22 **activeX security workshop paper publication report**

RISKS, CERT-CC http://www.cert.org/reports/activeX_report.pdf 21 17

Richard M. Smith wrote, "This past summer, CERT sponsored a two-day workshop on security issues with ActiveX controls. The final report was just released today and is available as a PDF file at the CERT Web site: < http://www.cert.org/reports/activeX_report.pdf >. There is a lot of good information in the report about how individuals and organizations can reduce security risks in Internet Explorer when using ActiveX controls. In addition, there is a section aimed at software developers on how to create safer controls.

A good bit of the technical information in the report has not been made public before."

Category 23.3 *ActiveX*

2002-03-10 **ActiveX vulnerabilities ICAT CVE**

ICAT Metabase

The ICAT Metabase < http://icat.nist.gov/icat.cfm > for the Common Vulnerabilities and Exposures (CVE) database reported the following vulnerabilities involving ActiveX for the period from 1 Jan 2001 to 10 Mar 2002:

CAN-2000-1105: The ixsso.query ActiveX Object is marked as safe for scripting, which allows malicious web site operators to embed a script that remotely determines the existence of files on visiting Windows 2000 systems that have Indexing Services enabled. Published Before: 1/9/2001 Severity: Medium

CAN-2001-0365: Eudora before 5.1 allows a remote attacker to execute arbitrary code, when the 'Use Microsoft Viewer' and 'allow executables in HTML content' options are enabled, via an HTML email message containing Javascript, with ActiveX controls and malicious code within IMG tags. Published Before: 6/27/2001 Severity: High

CAN-2001-0538: Microsoft Outlook View ActiveX Control in Microsoft Outlook 2002 and earlier allows remote attackers to execute arbitrary commands via a malicious HTML e-mail message or web page. Published Before: 8/14/2001 Severity: High

CAN-2002-0022: Buffer overflow in the implementation of an HTML directive in mshtml.dll in Internet Explorer 5.5 and 6.0 allows remote attackers to execute arbitrary code via a web page that specifies embedded ActiveX controls in a way that causes 2 Unicode strings to be concatenated. Published Before: 3/8/2002 Severity: High

CVE-2001-0090: The Print Templates feature in Internet Explorer 5.5 executes arbitrary custom print templates without prompting the user, which could allow an attacker to execute arbitrary ActiveX controls, aka the "Browser Print Template" vulnerability. Published Before: 2/16/2001 Severity: High

CVE-2001-0091: The ActiveX control for invoking a scriptlet in Internet Explorer 5.0 through 5.5 renders arbitrary file types instead of HTML, which allows an attacker to read arbitrary files, aka a variant of the "Scriptlet Rendering" vulnerability. Published Before: 2/16/2001 Severity: Medium

CVE-2001-0148: The WMP ActiveX Control in Windows Media Player 7 allows remote attackers to execute commands in Internet Explorer via javascript URLs, a variant of the "Frame Domain Verification" vulnerability. Published Before: 6/2/2001 Severity: High

CVE-2001-0149: Windows Scripting Host in Internet Explorer 5.5 and earlier allows remote attackers to read arbitrary files via the GetObject Javascript function and the htmlfile ActiveX object. Published Before: 6/2/2001 Severity: High

CVE-2001-0434: The LogDataListToFile ActiveX function used in (1) Knowledge Center and (2) Back web components of Compaq Presario computers allows remote attackers to modify arbitrary files and cause a denial of service. Published Before: 7/2/2001 Severity: High

2005-11-10 **Web application active content disable security incompatibility non-standard operating system restrictions design**

RISKS 24 10

LAW SCHOOL FORCES APPLICANTS TO DISABLE SECURITY MEASURES

Tony Lima reports on an annoying case of bad Web design he discovered when a Macintosh-using young friend of his tried to apply to a law school. It took over an hour to disable security sufficiently to allow a required ActiveX control to run on a Windows machine:

>I finally got the control to install after doing the following:

- Disabling my anti-spyware software (ewido security suite). I then tried to install the control with no luck.

- Setting the privacy permission for lsac.org to "allow." Again no luck installing the control.

- Eliminating all security by making the security settings (Tools/Internet Options/Security/Custom Level) completely open. I enabled each and every ActiveX and other control including unsigned controls and controls marked as not safe. The control then installed successfully.

Now perhaps I didn't have to go quite that far but a deadline was approaching and I really didn't want to take the time to perform the trial and error that would apparently be required to determine exactly how much security to give up.<

Prof Lima adds humorously:

"It occurs to me that this is truly THE law school admission test. If you're dumb enough to let this control install you're probably good law school material. OTOH if you don't let the control through then you're too smart to be a lawyer. (That's about all the humor I can manage after 1.5 hours fighting with this stuff. I've disconnected from the net and am running my usual four scanning programs right now.)"

2006-05-10 **VeriSign i-Nav ActiveX control remote buffer overflow vulnerability execute arbitrary code solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/17939/discuss 23

VERISIGN I-NAV ACTIVEX CONTROL REMOTE BUFFER OVERFLOW VULNERABILITY.

Verisign i-Nav ActiveX control is prone to a buffer overflow vulnerability. The software fails to perform sufficient bounds checking of user supplied input before copying it to an insufficiently sized memory buffer. Analysis: This vulnerability allows remote attackers to execute arbitrary code on vulnerable installations of the Verisign i-Nav ActiveX control. User interaction is required to exploit this vulnerability in that the target must visit a malicious Webpage. The specific flaw exists within the "VUpdater.Install" ActiveX control which is used to provide native support for Internationalized Domain Names in Microsoft Internet Explorer, Microsoft Outlook and Microsoft Outlook Express. Solution: Reportedly, the vendor has released updated versions of the affected software to address this issue. Users of affected packages should contact the vendor for further information. For more information: http://www.securityfocus.com/bid/17939/references

1997-01-09 **web spoofing diddling**

EDUPAGE

Ed Felten's Java-security team at Princeton University published an analysis of many ways that attackers can hijack information being sent to legitimate Web sites by users; one example is to insert unauthorized hot links in a poorly-secured Web site. EDUPAGE reported, "The researchers suggest that Web surfers take the following precautions: disabling JavaScript in their Web browsing software; keeping an eye on the software's location line, to ensure they know where they are; and paying close attention to the addresses they visit. (Chronicle of Higher Education 10 Jan 97 A25) < http://www.cs.princeton.edu/sip/pub/spoofing.html >"

1998-11-11 **virus HTML hypertext markup language**

Wired http://www.wired.com/news/print_version/technology/story/16206.html

There was a brief burst of alarm in November 1998 when the "Virus Information Center" posted a demonstration of how HTML could be used to write a virus. Skeptics noted that the "html.internal" virus would not, in fact, infect HTML documents unless the infected site had access to MS-Visual Basic. For VB users, however, such a virus could replicate extensively in any HTML documents on disk. For the time being, however, the virus class posed a theoretical, not a practical, threat.

2000-02-03 **alert CERT-CC FBI DOD Web cross-site scripting vulnerability**

NewsScanhttp://www.msnbc.com/news/365542.asp

Carnegie Mellon U.'s CERT Coordination Center, together with the FBI and the Defense Department, has issued a warning citing a security flaw in most complex Web sites that could allow hackers to launch malicious programs on a person's computer or capture information disclosed by a Web site user, such as credit card numbers. The flaw involves "cross-site scripting," which enables dangerous computer code to be embedded in innocuous-looking links to popular Web sites. The vulnerability is not limited to any particular kind of software, and occurs when complex Web sites fail to verify that hidden software code sent from a consumer's browser is safe. "Any information that I type into a form, what pages I visit on that site, anything that happens in that session can be sent to a third party, and it can be done transparently," says top Microsoft security manager Scott Culp. CERT says only a massive effort by Web site designers can remedy the problem, but in the interim, users should avoid clicking on Web links from untrusted sources, such as unsolicited e-mail messages or discussion forum messages. (AP/MSNBC 2 Feb 2000)

Peter Neumann, moderator of the RISKS Forum, added that the alert would be available at < http://www.cert.org/advisories/CA-2000-02.html > and that readers might also want to read the FAQ at < http://www.cert.org/tech_tips/malicious_code_FAQ.html >.

Category 23.4 *HTML, XML, browsers*

2000-03-29 **privacy covert channel monitoring identifier continuity Web browser behavior HTTP programming spyware**

RISKS 20 86

Martin Pool explained a newly-discovered exploit for surreptitiously monitoring the behavior of Web-site visitors. Much like cookies, the headers of cached objects are returned to a Web server when the browser checks to see if there have been any changes to specific objects (if there are, the browser downloads a new copy; if not, the browser uses the cached copy of the object). If an unscrupulous Web-site programmer stores unique information in the Last-Modified field of stored objects, the behavior of tagged users (or at least, of users of a specific browser on a particular computer) can be monitored. Because the Last-Modified field is returned only if the browser client requests exactly the same URL (and all associated parameters), the snooping HTML programmer has to provide an object that will not change and that is common to all pages on the site; an example would be a (near-invisible) single pixel. Using the full extent of the Last-Modified field, snoopers would be able to generate approximately 1B unique identifiers per object — and each new object would offer the opportunity for another billion identifiers.

2000-07-31 **QA quality assurance Web site source testing tool editor concealment distortion trickery compensation bad design standards interoperability**

RISKS 20

Lloyd Wood reported on a dangerous feature of Internet Explorer 5.5: it alters the appearance of HTML source code by suppressing the visibility of embedded backslashes. He discovered this extraordinary deception when he tried to figure out why the non-standard (invalid) HTML code one of his colleagues generated using MS-Word was failing with other browsers but working in IE. As he wrote in RISKS, "If you view source, you expect to see the actual source, and not a prefiltered version. This filtering is clearly a risk in that it allows behaviour that would previously have been clearly exposed as bugs in the composing products to stay, unnoticed and uncorrected, because it means you can't trust the tool you're using, and because it screws up interoperability testing. (Which, because IE comes from Microsoft, is hardly a surprise.)"

Category 23.4 *HTML, XML, browsers*

2000-09-20 **denial of service filtering censorship HTML-enabled e-mail attack vulnerability**

RISKS 21 05

Dan Birchall noted in RISKS that HTML-enabled e-mail could be used to cause trouble for anyone behind a proxy server equipped with anti-porn (or other) censorware. By embedding invisible pixels addressing banned sites in such e-mail, an attacker could generate an arbitrary number of entries in the censorware log files, thus initiating investigations of specific victims. The poor souls under investigation would have no idea that the e-mail they had received was surreptitiously harming their reputations.

2000-11-22 **e-mail monitoring spyware covert channel privacy hostile code HTML Web bugs**

NewsScan, New York Times
http://partners.nytimes.com/2000/11/22/technology/22NET.html

Privacy advocates are concerned about the fact that the new e-mail software system called HTML mail makes it possible for people sending you messages to monitor when and what time of day you open them, how often you reopen them, and whether you forward them to other people. The marketing companies that use HTML mail say it helps them develop more personalized promotions; individuals who use it claim they have a right to monitor their own correspondence. Richard M. Smith, the chief technology officer for the Privacy Foundations, argues: "You can buy 50,000 addresses of people who subscribe to The New Yorker. But you don't know what articles they're reading in it, or what books they've bought or what medical problems they've been researching lately. That's very much a possibility within this technology." (New York Times 22 Nov 2000)

Category 23.4 *HTML, XML, browsers*

2001-01-23 **cross-site scripting vulnerability Web**

RISKS 21 22

Michael Sims reported cross-site scripting vulnerabilities on the News.com (CNET) Web site. Users were able to insert arbitrary headlines on the Web site; e.g., Sims wrote, "http://news.cnet.com/news/topic/0-1003-249-0.html?title=CNET%20Editors%20Agree:%20Slashdot%20is%20a%20better%20news%20site%20than%20News.com&topic=slashdot"

Sims wrote, "CNET was notified six hours before this e-mail was sent to RISKS; they have not replied at this time or taken any corrective action."

2001-10-02 **html malicious code programming Web site hijacking misspellings cybersquatting fraud court case injunction diversion advertising pornography**

NewsScan

COURT SHUTS DOWN THOUSANDS OF WEB SITES
A U.S. court shut down more than 5,500 Web sites operated by John Zuccarini of Andalusia, Penn., after it determined that the sites illegally diverted Web surfers from their intended destinations and forced them to download pop-up ads for pornography and gambling. Zuccarini had registered many misspellings of popular sites, including 41 variations on "Britney Spears," in a strategy to corral sloppy typists and bombard them with the unwanted ads. Visitors to Zuccarini's sites often could not leave without shutting down their systems, because the "back" button on their Web browsers was rigged to trigger more ads. Category 23.4 *HTML, XML, browsers*

2002-01-10 **SSL https padlock icon misleading interpretation programming**

RISKS 21 86ff

A discussion in RISKS led to some interesting analysis of the disconnect between the state of the padlock icon on Web browsers and the use of SSL. The problem began with a visit to the Kaiser Permanent Web site for members at < http://www.kponline.org/ >. All attempts to initiate https connections appeared to fail. However, in a followup, Geoff Kuenning summarized the situation neatly as follows:

>. . . [I]n viewing the source of the referenced Web page, it appears that the "sign on" button makes an https (SSL) connection. Thus, although the "padlock" icon in the browser is unlocked, anything sent from that page is in fact sent using SSL.

I have recommended that Kaiser change their main page so that it forwards the browser to an SSL equivalent, solely so that the padlock icon will appear locked.

I think that the true RISK is not in Kaiser's Web page, but rather in the browser. The "padlock" icon reflects not whether the page SENDS information securely, but rather the fact that the page was FETCHED securely. This disconnect between what is shown and what is expected has been raised recently by Jeff Mogul in the converse direction: a page that had the padlock proceeded to send information insecurely.

The first problem (apparently insecure page is actually secure) can be patched around with the forwarding kludge I mentioned above. The second can be handled by the user to some extent (certain browser settings can warn you when you transition from a secure page to an insecure one). However, the true problem is in browser design. The "padlock" icon should be associated with a LINK, not a page. Regardless of how it was fetched, if a page contains both secure and insecure links, the lock should be shown as unlocked and should lock only when you mouse over a secure link. Only if all outgoing links from a page are secure should the padlock be permanently displayed in its locked form.
<

MORAL: It is not enough to be secure; you must be SEEN to be secure.

Category 23.4 *HTML, XML, browsers*

2002-01-28 **Web page hijacking URL user ID misleading trickery dissimulation spoofing browser**

RISKS 21 89

Rob Graham spotted a dangerous application of syntax in a URL that looked like this:

< http://www.microsoft.com&item=3Dq209354@hardware.no/nyheter/feb01/Q209354 %20%20HOWTO.htm >

The naïve users would assume that the URL is part of the microsoft.com domain; in fact, this syntax means that a user ID and password (the part in front of the @ sign) is being passed to the URL _following_ the @ sign.

[MK notes: In testing this in March 2002 using MS IE6, I was taken directly to the "hardware.no" site, where a message read "This page has been removed after request from Microsoft. . . ." In contrast, using my preferred browser, Opera 6.01, I received a pop-up warning from the browser alerting me to the fact that the string "www.microsoft.com&item=3Dq209354" was in fact a user ID and password and asking if it was OK to proceed. Bravo Opera!]

2002-03-10 **HTML vulnerabilities ICAT CVE CGI**

ICAT Metabase

The ICAT Metabase < http://icat.nist.gov/icat.cfm > for the Common Vulnerabilities and Exposures (CVE) database reported the following vulnerabilities involving ActiveX for the period from 1 Jan 2001 to 10 Mar 2002:

CAN-2000-0898: Small HTTP Server 2.01 does not properly process Server Side Includes (SSI) tags that contain null values, which allows local users, and possibly remote attackers, to cause the server to crash by inserting the SSI into an HTML file. Published Before: 1/9/2001 Severity: Medium

CAN-2000-1172: Buffer overflow in Gaim 0.10.3 and earlier using the OSCAR protocol allows remote attackers to conduct a denial of service and possibly execute arbitrary commands via a long HTML tag. Published Before: 1/9/2001 Severity: High

CAN-2001-0322: MSHTML.DLL HTML parser in Internet Explorer 4.0, and other versions, allows remote attackers to cause a denial of service (application crash) via a script that creates and deletes an object that is associated with the browser window object. Published Before: 6/2/2001 Severity: Medium

CAN-2001-0365: Eudora before 5.1 allows a remote attacker to execute arbitrary code, when the 'Use Microsoft Viewer' and 'allow executables in HTML content' options are enabled, via an HTML email message containing Javascript, with ActiveX controls and malicious code within IMG tags. Published Before: 6/27/2001 Severity: High

CAN-2001-0389: IBM Websphere/NetCommerce3 3.1.2 allows remote attackers to determine the real path of the server by directly calling the macro.d2w macro with a NOEXISTINGHTMLBLOCK argument. Published Before: 7/2/2001 Severity: Medium

CAN-2001-0484: Tektronix PhaserLink 850 does not require authentication for access to configuration pages such as _ncl_subjects.shtml and _ncl_items.shtml, which allows remote attackers to modify configuration information and cause a denial of service by accessing the pages. Published Before: 6/27/2001 Severity: Medium

CAN-2001-0519: Aladdin eSafe Gateway versions 2.x allows a remote attacker to circumvent HTML SCRIPT filtering via a special arrangement of HTML tags which includes SCRIPT tags embedded within other SCRIPT tags. Published Before: 8/14/2001 Severity: Medium

CAN-2001-0520: Aladdin eSafe Gateway versions 3.0 and earlier allows a remote attacker to circumvent filtering of SCRIPT tags by embedding the scripts within certain HTML tags including (1) onload in the BODY tag, (2) href in the A tag, (3) the BUTTON tag, (4) the INPUT tag, or (5) any other tag in which scripts can be defined. Published Before: 8/14/2001 Severity: Medium

CAN-2001-0521: Aladdin eSafe Gateway versions 3.0 and earlier allows a remote attacker to circumvent HTML SCRIPT filtering via the UNICODE encoding of SCRIPT tags within the HTML document. Published Before: 8/14/2001 Severity: Medium

CAN-2001-0523: eEye SecureIIS versions 1.0.3 and earlier allows a remote attacker to bypass filtering of requests made to SecureIIS via the escaping of HTML characters within the request, which could allow a remote attacker to use restricted variables and perform directory traversal attacks on vulnerable programs that would otherwise be protected by SecureIIS. Published Before: 8/14/2001 Severity: Medium

CAN-2001-0538: Microsoft Outlook View ActiveX Control in Microsoft Outlook 2002 and earlier allows remote attackers to execute arbitrary commands via a malicious HTML e-mail message or web page. Published Before: 8/14/2001 Severity: High

CAN-2001-0726: Outlook Web Access (OWA) in Microsoft Exchange 5.5 Server, when used with Internet Explorer, does not properly detect certain inline script, which can allow remote attackers to perform arbitrary actions on a user's Exchange mailbox via an HTML e-mail message. Published Before: 12/6/2001 Severity: High

CAN-2001-0835: Cross-site scripting vulnerability in Webalizer 2.01-06, and possibly other versions, allows remote attackers to inject arbitrary HTML tags by specifying them in (1) search keywords embedded in HTTP referrer information, or (2) host names that are retrieved via a reverse DNS lookup. Published Before: 12/6/2001 Severity: High

CAN-2001-0837: DeltaThree Pc-To-Phone 3.0.3 places sensitive data in world-readable locations in the installation directory, which allows local users to read the information in (1) temp.html, (2) the log folder, and (3) the PhoneBook folder. Published Before: 12/6/2001 Severity: Medium

CAN-2001-0874: Internet Explorer 5.5 and 6.0 allow remote attackers to read certain files via HTML that passes information from a frame in the client's domain to a frame in the web site's domain, a variant of the "Frame Domain Verification"

vulnerability. Published Before: 12/13/2001 Severity: Medium

CAN-2001-0901: Hypermail allows remote attackers to execute arbitrary commands on a server supporting SSI via an attachment with a .shtml extension, which is archived on the server and can then be executed by requesting the URL for the attachment. Published Before: 11/19/2001 Severity: High

CAN-2001-0925: The default installation of Apache before 1.3.19 allows remote attackers to list directories instead of the multiview index.html file via an HTTP request for a path that contains many / (slash) characters, which causes the path to be mishandled by (1) mod_negotiation, (2) mod_dir, or (3) mod_autoindex. Published Before: 3/12/2001 Severity: Medium

CAN-2001-0948: Cross-site scripting (CSS) vulnerability in ValiCert Enterprise Validation Authority (EVA) 3.3 through 4.2.1 allows remote attackers to execute arbitrary code or display false information by including HTML or script in the certificate's description, which is executed when the certificate is viewed. Published Before: 12/4/2001 Severity: High

CAN-2001-1013: Apache on Red Hat Linux with with the UserDir directive enabled generates different error codes when a username exists and there is no public_html directory and when the username does not exist, which could allow remote attackers to determine valid usernames on the server. Published Before: 9/12/2001 Severity: Medium

CAN-2001-1019: Directory traversal vulnerability in view_item CGI program in sglMerchant 1.0 allows remote attackers to read arbitrary files via a .. (dot dot) in the HTML_FILE parameter. Published Before: 9/8/2001 Severity: Medium

CAN-2002-0022: Buffer overflow in the implementation of an HTML directive in mshtml.dll in Internet Explorer 5.5 and 6.0 allows remote attackers to execute arbitrary code via a web page that specifies embedded ActiveX controls in a way that causes 2 Unicode strings to be concatenated. Published Before: 3/8/2002 Severity: High

CAN-2002-0024: File Download box in Internet Explorer 5.01, 5.5 and 6.0 allows an attacker to use the Content-Disposition and Content-Type HTML header fields to modify how the name of the file is displayed, which could trick a user into believing that a file is safe to download. Published Before: 3/8/2002 Severity: High

CAN-2002-0025: Internet Explorer 5.01, 5.5 and 6.0 does not properly handle the Content- Type HTML header field, which allows remote attackers to modify which application is used to process a document. Published Before: 3/8/2002 Severity: Medium

CVE-2000-0897: Small HTTP Server 2.01 allows remote attackers to cause a denial of service by repeatedly requesting a URL that references a directory that does not contain an index.html file, which consumes memory that is not released after the request is completed. Published Before: 1/9/2001 Severity: Medium

CVE-2000-1187: Buffer overflow in the HTML parser for Netscape 4.75 and earlier allows remote attackers to execute arbitrary commands via a long password value in a form field. Published Before: 1/9/2001 Severity: High

CVE-2001-0002: Internet Explorer 5.5 and earlier allows remote attackers to obtain the physical location of cached content and open the content in the Local Computer Zone, then use compiled HTML help (.chm) files to execute arbitrary programs. Published Before: 7/21/2001 Severity: High

CVE-2001-0028: Buffer overflow in the HTML parsing code in oops WWW proxy server 1.5.2 and earlier allows remote attackers to execute arbitrary commands via a large number of " (quotation) characters. Published Before: 2/12/2001 Severity: High

CVE-2001-0089: Internet Explorer 5.0 through 5.5 allows remote attackers to read arbitrary files from the client via the INPUT TYPE element in an HTML form, aka the "File Upload via Form" vulnerability. Published Before: 2/16/2001 Severity: Medium

CVE-2001-0091: The ActiveX control for invoking a scriptlet in Internet Explorer 5.0 through 5.5 renders arbitrary file types instead of HTML, which allows an attacker to read arbitrary files, aka a variant of the "Scriptlet Rendering" vulnerability. Published Before: 2/16/2001 Severity: Medium

CVE-2001-0130: Buffer overflow in HTML parser of the Lotus R5 Domino Server before 5.06, and Domino Client before 5.05, allows remote attackers to cause a denial of service and possibly execute arbitrary commands via a malformed font size specifier. Published Before: 3/12/2001 Severity: High

CVE-2001-0149: Windows Scripting Host in Internet Explorer 5.5 and earlier allows remote attackers to read arbitrary files via the GetObject Javascript function and the htmlfile ActiveX object. Published Before: 6/2/2001 Severity: High

CVE-2001-0154: HTML e-mail feature in Internet Explorer 5.5 and earlier allows attackers to execute attachments by setting an unusual MIME type for the attachment, which Internet Explorer does not process correctly. Published Before: 5/3/2001 Severity: Medium

CVE-2001-0243: Windows Media Player 7 and earlier stores Internet shortcuts in a user's Temporary Files folder with a fixed filename instead of in the Internet Explorer cache, which causes the HTML in those shortcuts to run in the Local Computer Zone instead of the Internet Zone, which allows remote attackers to read certain files. Published Before: 6/27/2001 Severity: Medium

CVE-2001-0340: An interaction between the Outlook Web Access (OWA) service in Microsoft Exchange 2000 Server and Internet Explorer allows attackers to execute malicious script code against a user's mailbox via a message attachment that contains HTML code, which is executed automatically. Published Before: 7/21/2001 Severity: High

CVE-2001-0457: man2html before 1.5-22 allows remote attackers to cause a denial of service (memory exhaustion). Published Before: 6/27/2001 Severity: Medium

2002-07-16 **content filter substitution replacement Web site corruption criminal hackers cross-site scripting HTML**

NewsScan

THE NEW LANGUAGE OF THE WEB
An e-mail security filter used by Yahoo has spawned a bizarre revision of the text in hundreds of Web sites by deleting letter combinations that could be used by hackers and replacing them with innocuous words. For example, "eval" has been converted to "review", so that the word "medieval" now appears as "medireview" on many sites. A recent search conducted by British Internet site NTK found that 640 different Web sites now contain the word "medireview" in place of "medieval." The offending words, which also include "mocha" (changed to "espresso") and "expression" (replaced by "statement"), are blacklisted because they could be used for cross-site scripting -- embedding potentially dangerous code into a Web page or an e-mail message written in HTML. (New Scientist 15 Jul 2002)

2003-07-09 **MS03-023 Buffer Overrun HTML converter allow code execution vulnearbility microsoft security bulletin Internet Explorer Enhanced Security Configuration**

NIPC/DHS

July 09, Microsoft — Microsoft Security Bulletin MS03-023: Buffer Overrun In HTML Converter Could Allow Code Execution.

There is a flaw in the way the HTML converter for Microsoft Windows handles a conversion request during a cut-and-paste operation which results in a vulnerability. A specially crafted request to the HTML converter could cause the converter to fail in such a way that it could execute code. An attacker could craft a specially formed Web page or HTML e-mail that would cause the HTML converter to run arbitrary code on a user's system. If Internet Explorer Enhanced Security Configuration has been disabled, the protections put in place that prevent this vulnerability from being automatically exploited would be removed. Exploiting the vulnerability would allow the attacker only the same privileges as the user. Microsoft has assigned a risk rating of "Critical" to this issue and recommends that system administrators install the patch immediately.

Category 23.4 *HTML, XML, browsers*

2003-12-16 **denial-of-service SOAD document type definition DTD parameter vulnerability XML parser error**

NIPC/DHS

December 15, eSecurity Planet — DoS Flaw in SOAP DTD Parameter. IBM and Microsoft have released fixes for a potentially serious vulnerability that could be exploited to trigger denial-of-service attacks. The companies said the vulnerability was caused by an error in the XML parser when parsing the DTD (Document Type Definition) part of XML documents. Affected software include the IBM WebSphere 5.0.0 and Microsoft ASP.NET Web Services (.NET framework 1.0, .NET framework 1.1). According to IBM, the security patch fixes a flaw that could be exploited by sending a specially crafted SOAP request. "This can cause the WebSphere XML Parser to consume an excessive amount of CPU resources," the company warned. IBM's security patch is available here:
http://www-1.ibm.com/support/docview.wss?rs=180&context=SSEQ TP&q=PQ709%2021&uid=swg24005582. Microsoft confirmed the DTD error parsing vulnerability. In some cases, Microsoft recommended the rejection of XML messages that contain DTS, because of its limitations. The company said the SOAP 1.1 specification states that a SOAP message must not contain a DTD. Microsoft's security patch is available here:
http://support.microsoft.com/default.aspx?kbid=826231.

2004-02-18 **W3C Web DARPA standards adoption Defense Research Projects Agency**

DHS IAIP Daily; http://fcw.com/fcw/articles/2004/0216/web−daml−02−19−04.asp

February 18, Federal Computer Week — W3C adopts DARPA language.

The Defense Advanced Research Projects Agency (DARPA) this month announced that the World Wide Web Consortium (W3C) approved a computer language based on DARPA Agent Markup Language (DAML) as an international standard. Web Ontology Language, known as OWL, was designated an official Web standard, joining such better-known languages as HTML and Extensible Markup Language (XML). The DARPA markup language project last year evolved into OWL and is continuing development under W3C's watch. OWL builds on XML and is designed to allow a higher level of interoperability among devices, Web sites and databases. It uses XML as to transport data, but OWL is designed to link disparate data from different sources and determine relationships between them. OWL's proponents say it can refine searches and Web services, giving users more accurate and precise information based on queries. And the language could potentially let computers recognize how disparate forms of information are linked and draw conclusions based on those links.

2004-03-20 **XML Extensible Markup Language security concern**

NIPC/DHS

March 29, CNET News.com — Extra headaches of securing XML.

Extensible Markup Language and XML-based protocols are rapidly becoming a common way for businesses to format and exchange corporate information. Businesses typically have used Web services to connect internal applications and share information with a well-known network of business partners. However, once companies start using Web services and XML more extensively, they need to reconsider how they are exposing their data--and to what, Gartner analyst Benoit Lheureux said. Infiltrating a corporate network by tapping into Web services interfaces is potentially more damaging than simply knocking out a Website, because business-to-business applications expose valuable corporate information, he noted. Typical security products are designed to keep unwanted intruders from entering corporate networks or to prevent attacks that can disable a machine. Applications that send information via XML documents use the same Internet network protocols that traditional security products monitor. But because XML messages are wrapped in the IP "envelope" that most firewalls are designed to track, corporate networks inspect the envelope but not the contents. Fraudulent XML messages could therefore enter corporate networks undetected.

2004-07-30 **Microsoft security bulletin patch update privilege US-CERT**

DHS IAIP Daily; http://www.microsoft.com/technet/security/bulletin/ms04−
025. mspx

July 30, Microsoft — Microsoft Security Bulletin MS04-025: Cumulative Security Update for Internet Explorer.

This update resolves several newly discovered public vulnerabilities. If a user is logged on with administrative privileges, an attacker who successfully exploited the most severe of these vulnerabilities could take complete control of an affected system, including installing programs; viewing, changing, or deleting data; or creating new accounts with full privileges. Users whose accounts are configured to have fewer privileges on the system would be at less risk than users who operate with administrative privileges. Microsoft has assigned a risk rating of "Critical" to this issue and recommends that users install the patch immediately. US-CERT released Technical Cyber Security Alert TA04-212A: Critical Vulnerabilities in Microsoft Windows for this issue: http://www.us-cert.gov/cas/techalerts/TA04-212A.html

2004-10-04 **XML RSS Really Simple Syndication broadcasting**

NewsScan; http://online.wsj.com/article/0

RSS GIVES XML A NEW LEASE ON LIFE

A year ago, blogs were widely regarded as the private diaries of tech-savvy eccentrics, and pundits were still waiting for the highly touted XML (extensible markup language) to make its mark on the Net, says Wall Street Journal columnist Lee Gomes. "Fast forward now to something called RSS, or Really Simple Syndication, which is a technology that bloggers use to, in a manner of speaking, broadcast their writing throughout the Internet. RSS, it turns out, is actually a kind of XML… In other words, thanks to blogs, XML -- in the form of RSS -- has finally arrived. This real XML revolution, though, is nothing like the stolid, corporate, rather dull affair that was first predicted. (If you liked database algorithms, you'd have loved XML.) Instead, it has a grassroots, quirky, somewhat antiauthoritarian cast to it." Gomes warns that while some major Internet giants, such as Yahoo and Microsoft, have signed on to support RSS feeds, blogs may ultimately change the traditional Web economics, because readers can skip frequent visits to their sites to check for new content. And while most RSS boosters describe the technology as an antidote for information overload, it could make things worse: "As e-mail proves, if it's easy for people to use computers to say something, they will. Do they have something to say? Who cares!" says Gomes.

2005-01-18 **Google links search engine blogs no follow tag priority cheat fraud fake false**

NewsScan;
http://news.com.com/Google+aims+to+outsmart+search+tricksters/2100-1024_3-5540740.html

GOOGLE MOVES TO OUTSMART SEARCH MANIPULATORS

Google is implementing a new tactic for blocking "link spammers" -- people who use the comment form on Web forums or blogs to place a link pointing back to their own Web site. The strategy is used to trick Google's PageRank technology into boosting a Web site's ranking in its results. The problem has become particularly rampant in the age of blogging, when publishers have little recourse to stop outsiders from littering their comment forms with bogus links. Google's answer, says search expert Danny Sullivan, is to give publishers a "no follow" tag that they can insert on a Web page to indicate that comments or links are not their own and signal Google as it indexes the Web that the pages are to be overlooked. "The tag provides you a way to flag links that are basically not yours," says Sullivan. "The reason why that's helpful is because they won't count those links. It makes the idea of spamming less attractive." Blog publisher Six Apart says it will adopt the tagging standard for its roughly 6.5 million blogs. "We're interested in deploying this tool so that all the search engines, whether it's Google, Yahoo or MSN, can properly distinguish content published by the author from content from commentors," says Six Apart VP Anil Dash. (CNet News.com 18 Jan 2005)

2005-02-07 **Mozilla Firefox Camino Internet Web browser International Domain Names IDN spoofing security vulnerability no update issued**

DHS IAIP Daily; http://secunia.com/advisories/14163/

MOZILLA / FIREFOX / CAMINO WEB BROWSERS IDN SPOOFING SECURITY ISSUE

A security issue has been reported which can be exploited by a malicious Website to spoof the URL displayed in the address bar, SSL certificate, and status bar. The problem is caused due to an unintended result of the IDN (International Domain Name) implementation, which allows using international characters in domain names. This can be exploited by registering domain names with certain international characters that resemble other commonly used characters, thereby causing the user to believe they are on a trusted site. No solution is currently available.

Category 23.4 *HTML, XML, browsers*

2005-02-08 **Mozilla Firefox Internet Web browser multiple vulnerabilities command execution attack JavaScript hybrid image**

DHS IAIP Daily; http://securitytracker.com/alerts/2005/Feb/1013108.html

MOZILLA FIREFOX MULTIPLE VULNERABILITIES

There are several vulnerabilities in Mozilla Firefox. A remote user may be able to cause a target user to execute arbitrary operating system commands in certain situations or access access content from other windows, including the 'about:config' settings. This is due to a hybrid image vulnerability that allows batch statements to be dragged to the desktop and because tabbed javascript vulnerabilities let remote users access other windows. These vulnerabilities have been fixed in the CVS repository.

2005-02-08 **e-mail browser client vulnerabilities arbitrary code execution patch**

RISKS; http://www.ngssoftware.com/advisories/eudora-01.txt 23 72

HIGH RISK VULNERABILITIES IN EUDORA FOR WINDOWS

The Windows e-mail client Eudora v6.2.0 and earlier versions were reported by John Heasman of NGSSoftware to have serious vulnerabilities. Monty Solomon summarized them in RISKS:

The flaws permit execution of arbitrary code via:

1) previewing or opening a specially crafted e-mail 2) opening specially crafted stationary or mailbox files

These issues have been resolved in Eudora 6.2.1 as detailed at
http://www.eudora.com/security.html

It can be downloaded from:
http://www.eudora.com/products/

NGSSoftware are going to withhold details of this flaw for three months. Full details will be published on the 2nd of May 2005. This three month window will allow users of Eudora the time needed to apply the patch before the details are released to the general public. This reflects NGSSoftware's approach to responsible disclosure.

2005-04-29 **Red Hat Linux Mozilla Internet Web browser vulnerabilities patch issued code execution**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/0428

REDHAT SECURITY UPDATE FIXES MULTIPLE MOZILLA VULNERABILITIES

Redhat has released a security patch to correct various vulnerabilities in Mozilla. The vulnerabilities can be exploited by malicious people to gain knowledge of potentially sensitive information. This could allow cross-site scripting attacks, bypass certain security restrictions, and compromise a user's system. The flaws could be exploited by malicious websites to execute arbitrary commands and cause a denial of service. Use Red Hat Network to download and update your packages: http://rhn.redhat.com/

Category 23.4 *HTML, XML, browsers*

2005-05-09 **Mozilla Firefox Internet Web browser JavaScript URL vulnerability**

DHS IAIP Daily; http://secunia.com/advisories/15292/

TWO VULNERABILITIES IN MOZILLA FIREFOX

Two vulnerabilities have been discovered in Firefox, which can be exploited by malicious people to conduct cross-site scripting attacks and compromise a user's system. "IFRAME" JavaScript URLs are not properly protected from being executed in context of another URL in the history list. This can be exploited to execute arbitrary HTML and script code in a user's browser session in context of an arbitrary site. Input passed to the "IconURL" parameter in "InstallTrigger.install()" is not properly verified before being used. This can be exploited to execute arbitrary JavaScript code with escalated privileges via a specially crafted JavaScript URL. A temporary solution has been added to the sites "update.mozilla.org" and "addons.mozilla.org" where requests are redirected to "do-not-add.mozilla.org". This will stop the publicly available exploit code using the two vulnerabilities to execute arbitrary code in the default settings of Firefox.

Category 23.4 *HTML, XML, browsers*

2005-05-10 **Mozilla Firefox Internet Web browser authentication dialog vulnerability HTTP**

DHS IAIP Daily; http://www.securityfocus.com/bid/12728/solution/

MOZILLA SUITE/FIREFOX HTTP AUTHENTICATION DIALOGS TAB FOCUS VULNERABILITY

Mozilla Suite prior to 1.7.6 and Mozilla Firefox prior to 1.0.1 are reported prone to a vulnerability that may result in the loss of authentication credentials. It is reported that HTTP authentication dialogs do not remain focused for the tab that invoked the dialog, rather the dialog focuses over the active tab. A remote attacker may potentially exploit this condition to aid in phishing attacks. Netscape 7.2 is reportedly vulnerable to this issue as well. It is also 8 possible that other versions of Netscape are affected. The vendor has released upgrades for Firefox dealing with this issue. Mozilla has reported that a pending release of Mozilla Suite 1.7.6 will be released dealing with this issue in the near future.

Category 23.4 *HTML, XML, browsers*

2005-05-11 **operating system Macintosh Apple Tiger OS X vulnerability data loss mobile code malware widgets proof-of-concept exploits browser Safari**

http://www.vnunet.com/news/1162958

APPLE OS X & SAFARI EXPLOITS APPEAR QUICKLY

Apple's OS X v10.4 and Safari browser v2.0 turned out to have vulnerabilities that were quickly exploited by proof-of-concept tools available on the Web. Safari automatically downloads mobile code (widgets) written in Java. Unfortunately, malicious widgets would be difficult to remove, requiring manual deletion of files.

Category 23.4 *HTML, XML, browsers*

2005-05-11 **Gecko browser HTTP authentication prompt vulnerability no update issued**

DHS IAIP Daily; http://www.securiteam.com/securitynews/5RP0C0AFPA.html

GECKO BASED BROWSERS HTTP AUTHENTICATION PROMPT VULNERABILITY

The HTTP authentication prompt appears above the currently open tab regardless of which tab triggered it. A spoofer who could get a user to open a high value target in another tab might be able to capture the user's ID and password. There is no solution at this time.

Category 23.4 *HTML, XML, browsers*

2005-05-12 **Mozilla Suite Firefox Internet Web browser vulnerability code execution attack**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/0530

MOZILLA SUITE AND FIREFOX MULTIPLE CODE EXECUTION VULNERABILITIES

Mozilla has released new versions of Mozilla Suite and Firefox, to correct vulnerabilities that could be exploited by attackers to compromise a vulnerable system or perform Cross Site Scripting. The first flaw is due to an input validation error when handling a "javascript:" url in the "view-source:" or "jar:" pseudo-protocols, which may be exploited via a malicious Website to perform Cross Site Scripting and execute arbitrary code. This issue is a variant of the "favicon" vulnerability. The second vulnerability occurs when executing Javascript eval and Script objects without dropping the privileges of the context calling them, which may be exploited by remote attackers to compromise a vulnerable system. This flaw is a variant of the "DOM" issue. Upgrade to Firefox 1.0.4 or Mozilla Suite 1.7.8: http://www.mozilla.org/download.html

Category 23.4 *HTML, XML, browsers*

2005-05-16 **Mozilla Suite Firefox Internet Web browser script manager cross site scripting vulnerability**

DHS IAIP Daily; http://www.securityfocus.com/bid/13641/discussion/

MOZILLA SUITE AND FIREFOX MULTIPLE SCRIPT MANAGER SECURITY BYPASS VULNERABILITIES

Multiple issues exist in Mozilla Suite and Firefox. These issues allow attackers to bypass security checks in the script security manager. These vulnerabilities allow remote attackers to execute script code with elevated privileges, leading to the installation and execution of malicious applications on an affected computer. Cross-site scripting, and other attacks are also likely possible. Original advisory and updates: http://www.mozilla.org/projects/security/known-vulnerabilities.html

2005-06-14 **survey study security hackers Web Internet browser attacks phishing personal information theft viruses worms**

EDUPAGE; http://news.com.com/2100-7349_3-5747050.html

SURVEY SHOWS MORE BAD GUYS TURNING TO BROWSER ATTACKS

According to a new survey by the Computing Technology Industry Association (CompTIA), the incidence of browser-based attacks rose sharply last year, while that of viruses and worms fell slightly. Browser-based attacks exploit the naivety of computer users, as in the case of phishing attacks, or technical vulnerabilities in browser or operating system software. Phishing scams work by fooling users into disclosing private information; other attacks attempt to download malicious code to the computers of visitors to a Web site to steal information or take control of the computer. According to CompTIA's survey of nearly 500 organizations, 56.6 percent have been targets of browser-based attacks, up from 36.8 percent one year ago. Viruses and worms continue to head the list of computer security threats, at 66 percent, which is just down from last year's number of 68.6 percent. CNET, 14 June 2005

Category 23.4 *HTML, XML, browsers*

2005-06-16 **vulnerability cross-site scripting security bypass Opera Web browser**

DHS IAIP Daily; http://www.securityfocus.com/bid/6962/solution

OPERA CROSS SITE SCRIPTING AND SECURITY BYPASS VULNERABILITIES

Multiple vulnerabilities were identified in Opera, which may be exploited by malicious Websites to conduct cross-site scripting attacks. The first flaw is due to insufficient validation of server side redirects when handling "XMLHttpRequest" objects, which could be exploited to access resources from outside the domain of which the object was opened. The second vulnerability is caused due to Opera not properly restricting the privileges of "javascript:" URLs when opened in e.g. new windows or frames which could be exploited to conduct cross site scripting attacks and to read local files. The third issue exists in the way the Opera browser generates a temporary page for displaying a redirection when "Automatic redirection" is disabled (not default setting), which could be exploited to conduct cross site scripting attacks. Update to Opera 8.01: http://www.opera.com

2005-06-24 **Web Internet browser vulnerability flaw Secunia Dialog Origin Spoofing**

DHS IAIP Daily; http://www.vnunet.com/vnunet/news/2138716/spoofing−flaw−swee ps−browsers

SPOOFING FLAW HITS MAJOR BROWSERS

Security company Secunia has warned of a flaw in a number of browsers that could expose users to phishing attacks. The company claims that most major browsers, including Internet Explorer, Firefox and Safari, suffer from a so-called Dialog Origin Spoofing Vulnerability. Opera 8.01 is not affected by the flaw. A hacker could use a JavaScript dialog box to request a web visitor to enter confidential information. The flaw centers around the fact that users have no way of verifying the origin of the dialog box. Hackers could exploit the flaw by offering a link to a trusted Website that simultaneously provides a malicious pop up that asks for confidential information. Microsoft has acknowledged the threat, but said that it will not release a patch because it uses a "current standard web browser functionality." Instead the software vendor urged users to use common sense before entering confidential information through a Web browser. "If a particular window or dialog box does not have an address bar and does not have a lock icon that can be used to verify the site's certificate, the user is not provided with enough information on which to base a valid trust decision about the window or dialog box," said Microsoft.

2005-12-09 **Web Internet browser Firefox exploit proof-of-concept code published threat**

DHS IAIP Daily; http://www.vnunet.com/vnunet/news/2147377/firefox−expoit−made−public

FIRST FIREFOX 1.5 EXPLOIT MADE PUBLIC

Security experts at Packet Storm have published proof-of-concept code that exploits an unpatched flaw in the Firefox 1.5 browser, making the application vulnerable to a denial of service attack. The code marks the first publicly disclosed security vulnerability in Firefox 1.5 since the version became available in late November. The published code will add a large entry to the 'history.dat' file of the browser, causing the application to freeze or crash the next time it is launched. Users can fix the problem by manually erasing the file. Another option is to change the browser setting to disable the saving of history data by setting the days of saved history to zero or increasing the privacy control. While the proof-of-concept code is relatively harmless, the flaw could be exploited to install malware, according to John Bambenek, a researcher with the University of Illinois at Urbana-Champaign and a volunteer at the SANS Internet Storm Center. "Presumably, if the topic was more tightly crafted than in the proof-of-concept code, a more malicious attack could be crafted that would install malware on the machine with the extra step of being reinstalled after each restart of Firefox," Bambenek wrote.

2005-12-31 **denial of service DoS vulnerability browser Blackberry Handheld JAD update software**

DHS IAIP Daily; http://www.securityfocus.com/bid/16099/solution 23

BLACKBERRY HANDHELD JAD FILE BROWSER DENIAL OF SERVICE VULNERABILITY

Blackberry Handheld devices are prone to a denial of service attack. The embedded Web browser will stop responding due to a dialog box that has not been properly dismissed when handling a malformed JAD (Java Application Description) file. Security Focus reports that the vendor has addressed this issue in version 4.0.2 of the Blackberry Device Software. The vendor encourages affected users to contact their service providers to obtain updated software.

2006-01-26 **Microsoft Internet Explorer IE ActiveX arbitrary code execution quality assurance failure**

DHS IAIP Daily; http://www.hackerscenter.com/archive/view.asp?id=22251 23

MICROSOFT INTERNET EXPLORER DOES NOT HONOR ACTIVEX.

Internet Explorer (IE) fails to properly check the kill bit for ActiveX controls, which may allow a remote attacker to execute arbitrary code on a vulnerable system. By convincing a user to view a specially crafted HTML document an attacker could execute arbitrary code with the privileges of the user. Depending on the ActiveX control being used, an attacker may be able to take other actions. There are a number of significant vulnerabilities in technologies involving the IE domain/zone security model, local file system (Local Machine Zone) trust, the Dynamic HTML (DHTML) document object model in particular, proprietary DHTML features; the HTML Help system, MIME type determination, the graphical user interface (GUI), and ActiveX. These technologies are implemented in operating system libraries that are used by IE and many other programs to provide Web browser functionality. IE is integrated into Windows to such an extent that vulnerabilities in IE frequently provide an attacker significant access to the operating system.

Category 23.4 *HTML, XML, browsers*

2006-01-30 **Mozilla Firefox Internet browser cross domain scripting vulnerability attack execute arbitrary script code**

DHS IAIP Daily; http://www.securityfocus.com/bid/16427/references 23

MOZILLA FIREFOX XBL -MOZ-BINDING PROPERTY CROSS DOMAIN SCRIPTING VULNERABILITY.

The Mozilla and Mozilla Firefox browsers are vulnerable to a cross domain scripting attack by which a malicious Webpage could access trusted sites' properties and execute arbitrary script code in the context of an arbitrary domain. The issue affects the "-moz-binding" property supported by the Mozilla Extensible Binding Language. XBL is a markup language for describing bindings that can be attached to elements in other documents. Bindings can be attached to elements using either cascading stylesheets [CSS] or the document object model [DOM]. A malicious site could access the properties of a trusted site and facilitate various attacks including disclosure of sensitive information.

2006-01-31 **new Internet browser cross site cooking threat Michael Zalewski Mozilla**

DHS IAIP Daily; 23
http://www.techworld.com/security/news/index.cfm?NewsID=5276
&Page=1&pagePos=6&inkc=0

BROWSERS FACE TRIPLE THREAT.

Polish security researcher Michael Zalewski has highlighted three bugs in the handling of cookies that he says could be used to carry out attacks on commercial Websites. The bugs, for which Zalewski has coined the term "cross site cooking," are fundamental to the design and implementation of cookies. The first problem involves the way browsers handle the domain specified in a cookie. Browsers should theoretically reject cookies where the domain is specified too broadly, but the mechanism doesn't work in Mozilla-based browsers, though Internet Explorer doesn't seem to be affected, Zalewski said. A variant on this bug is that browsers don't check to see if anything is between the periods in a domain name specified by a cookie. The third problem Zalewski outlined is a trick that he said could be easily used to force random visitors to a site to accept and relay malicious cookies to third-party sites. "Using this trick, a brand new identity may be temporarily bestowed upon the user, and used to perform certain undesirable or malicious tasks on the target site," he said.

2006-02-01 **Symantec Sygate Management server SMS authentication servlet SQL injection vulnerability quality assurance solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/16452/references 23

SYMANTEC SYGATE MANAGEMENT SERVER SMS AUTHENTICATION SERVLET SQL INJECTION VULNERABILITY.

Symantec Sygate Management Server is prone to an SQL injection vulnerability. The vulnerability specifically affects the SMS Authentication Servlet component of the server. A remote attacker can pass malicious input to database queries through HTTP GET requests, resulting in modification of query logic or other attacks. This allows attackers to overwrite the password of any account on the server. This can facilitate a complete compromise if the attacker can overwrite the administrator password. Solution: Symantec has released SYM06-002 to address this issue.

Category 23.4 *HTML, XML, browsers*

2006-02-02 **Netscape property validation vulnerability flaw cross-domain scripting attack**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2006/Feb/1015563.html 23

NETSCAPE '-MOZ-BINDING' PROPERTY VALIDATION FLAW LETS REMOTE USERS CONDUCT CROSS-DOMAIN SCRIPTING ATTACKS.

A vulnerability was reported in Netscape. A remote user can conduct cross-domain scripting attacks. The Netscape browser '-moz-binding' CSS property does not properly restrict HTML code from other domains before displaying the input. A remote user can create specially crafted HTML that, when loaded by a target user, will cause arbitrary scripting code to be executed by the target user's browser. The code can originate from an arbitrary domain but will run in the security context of the domain serving the HTML. As a result, the code will be able to access the target user's cookies (including authentication cookies), if any, associated with the domain, access data recently submitted by the target user via Web form to the domain, or take actions on the domain acting as the target user. Solution: No solution was available at the time of this entry.

Category 23.4 *HTML, XML, browsers*

2006-02-02 **Mozilla Internet browser Firefox Thunderbird multiple vulnerabilities remote attacker bypass security memory corruption**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2006/0413 23

MOZILLA PRODUCTS HAVE MULTIPLE MEMORY CORRUPTION AND SECURITY BYPASS ISSUES.

Multiple vulnerabilities were identified in Mozilla Suite, Mozilla Firefox and Thunderbird, which may be exploited by remote attackers to take complete control of an affected system or bypass security restrictions. The first issue is due to errors in the JavaScript engine that fails to properly protect certain temporary variables during garbage collection. The second flaw is due to a memory corruption error when dynamically changing the style of an element from "position:relative" to "position:static." The third vulnerability is due to an error when handling large history information passed in the "history.dat" file. The fourth issue is due to a memory corruption error when calling the "QueryInterface" method of the built-in Location and Navigator objects. The fifth flaw is due to an error in the "XULDocument.persist()" function that does not properly validate the attribute name. The sixth vulnerability is due to integer overflow errors in the E4X, SVG, and Canvas features. The seventh issue is due to an error in the XML parser. And the eighth flaw is due to an error in the E4X implementation that exposes the internal "AnyName" object to Web content. Solution: Upgrade to Firefox 1.5.0.1 or SeaMonkey 1.0: http://www.mozilla.org/products/ Disable JavaScript in Thunderbird and Mozilla Suite.

2006-02-07 **Mozilla Firefox Internet browser vulnerability exploit source code published Metasploit project**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/holes/story/0,10801,108469,00.html?SKC=security−108469 23

ATTACK CODE PUBLISHED FOR FIREFOX FLAW.

A hacker Tuesday, February 7, published code that exploits a vulnerability found in the latest version of Mozilla Corp.'s Firefox browser. The code, which targets the Firefox 1.5 browser, was posted Tuesday on The Metasploit Project site by a hacker known as H D Moore. Metasploit is a widely used hacking tool. Moore said that a hacker by the name of Georgi Guninski reported the flaw to the Mozilla Foundation on December 6, and that he had simply implemented and posted the technique described by Guninski. Mozilla published an advisory about the exploit last Wednesday as it released the Firefox 1.5.0.1 browser, which included a patch for the flaw. According to the advisory, the vulnerability, which had been rated as moderate, causes a corruption in the browser's memory that could be exploitable to run arbitrary code. Hacker Aviv Raff on Tuesday criticized Mozilla in his blog for under-rating the flaw. He has blasted the open-source group in the past for downplaying the seriousness of vulnerabilities that have been found in its software.

2006-02-08 **domain hijacking Web domain Internet browsers proxy servers**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1923546,00.asp 23

EFFECTS OF DOMAIN HIJACKING CAN LINGER.

Malicious hackers who are able to hijack an organization's Web domain may be able to steal traffic from the legitimate Website long after the domain has been restored to its owner, according to a recent report. Design flaws in the way Web browsers and proxy servers store data about Websites allow malicious hackers to continue directing Web surfers to malicious Webpages for days or even months after the initial domain hijacking. The persistent attack could lead to information or identity theft, according to Amit Klein, a Web application security researcher with the Web Application Security Consortium. The problem, which Klein termed "domain contamination" exists because of features in Web proxy servers, which store versions of Webpages, and Web "clients," or browsers, including Microsoft's Internet Explorer, the Mozilla Foundation's Firefox and the Opera browser. Proxy servers and browsers both establish trust relationships with Web servers that are identified as the authoritative host for a Webpage in the DNS (domain name system), Klein said. "Once a client believes it is communicating with the legitimate server for some domain, there's an implicit trust that's placed in that server that is not revoked," said Klein. Report: Domain Contamination: http://www.webappsec.org/projects/articles/020606.shtml

2006-02-14 **Microsoft IE zero-day exploit no patch advisory**

DHS IAIP Daily; http://www.crn.com/sections/breakingnews/dailyarchives.jhtml?articleId=180201596 23

MICROSOFT: IE ZERO-DAY BUG NOT WORTH PATCHING.

A new zero-day vulnerability in Internet Explorer (IE) is such a small deal, Microsoft said Tuesday, February 14, that it will not patch the bug, but instead will wait to fix it until it releases Windows XP SP3 in late 2007. The drag-and-drop flaw in IE 5.01, 5.5, and 6.0 was first reported to Microsoft in August 2005, and is somewhat similar to one addressed in a February 2005 security bulletin. "If an attacker can persuade a user to drag any object within the top-level window that his/her site is contained in, malicious script can redirect these inputs to other top-level windows, potentially resulting in an unintended consequence such as file installation," read an advisory published by SecuriTeam. Microsoft IE Advisory issued by SecuriTeam: http://www.securiteam.com/windowsntfocus/5MP0B0UHPA.html

2006-02-22 **US CERT Alert Apple Mac OS X Safari command execution vulnerability**

DHS IAIP Daily; http://www.uscert.gov/cas/techalerts/TA06−053A.html 23

US-CERT TECHNICAL CYBER SECURITY ALERT TA06-053A:
APPLE MAC OS X SAFARI COMMAND EXECUTION VULNERABILITY.

A file type determination vulnerability in Apple Safari could allow a remote attacker to execute arbitrary commands on a vulnerable system. Apple Safari is a Web browser that comes with Apple Mac OS X. The default configuration of Safari allows it to automatically "Open 'safe' files after downloading." Due to this default configuration and inconsistencies in how Safari and OS X determine which files are "safe," Safari may execute arbitrary shell commands as the result of viewing a specially crafted Webpage. Systems affected: Apple Safari running on Mac OS X. Impact: A remote, unauthenticated attacker could execute arbitrary commands with the privileges of the user running Safari. If the user is logged on with administrative privileges, the attacker could take complete control of an affected system. Solution: Since there is no known patch for this issue at this time, US-CERT is recommending a workaround. Workaround: Disable "Open 'safe' files after downloading". Disable the option to "Open 'safe' files after downloading," as specified in the document "Securing Your Web Browser": http://www.us-cert.gov/reading_room/securing_browser/#sgeneral.

2006-02-28 **Internet Explorer Microsoft IE vulnerability flaw folder deletion iframe solution**

DHS IAIP Daily; http://www.hackerscenter.com/archive/view.asp?id=23176 23

INTERNET EXPLORER IFRAME FOLDER DELETION WEAKNESS.

Cyber flash has discovered a weakness in Internet Explorer, which can be exploited by malicious people to trick users into deleting local folders. Affected software: Microsoft Internet Explorer 6.x. Analysis: The problem is that network shares can be included in an iframe where only certain parts of the content is visible to the user. This can be exploited to trick users into deleting local folders via an iframe referencing "\127.0.0.1c$." Successful exploitation requires that the user selects a folder icon, presses the delete key, and accepts a "Folder Delete" dialog. Solution: Do not accept suspicious "Folder Delete" dialogs when visiting untrusted Websites.

2006-03-23 **Microsoft IE Internet Explorer dangerous zero-day exploit security advisory**

DHS IAIP Daily; http://www.techweb.com/wire/security/183702421 23

MICROSOFT WARNS OF DANGEROUS INTERNET EXPLORER EXPLOIT.

An exploit for a new zero-day bug in Internet Explorer appeared Thursday, March 23, causing security companies to ring alarms and Microsoft to issue a security advisory that promised it would patch the problem. Just a day after anti-virus vendors warned of a new zero-day vulnerability in Internet Explorer -- the second such alert since Friday, March 17 -- companies including Symantec and Secunia boosted security levels as news of a public exploit spread. Although the publicly-posted exploit only launches a copy of the Windows calculator, "replacing the shellcode in this exploit would be trivial even for an unskilled attacker," Symantec continued. Microsoft confirmed the severity of the bug and the success of the exploit in its own advisory, issued late Thursday. Microsoft advisory: http://www.microsoft.com/technet/security/advisory/917077.mspx

2006-03-28 **Microsoft IE Internet Explorer browser zero-day exploit temporary patch release Eeye Digital Security**

DHS IAIP Daily; 23
http://www.securitypipeline.com/news/184400787;jsessionid=PDRAQICTESZRYQSNDBECKICCJUMEKJVN

SECURITY FIRM RELEASES PATCH FOR ZERO-DAY INTERNET EXPLORER FLAW.

Eeye Digital Security has released a temporary patch for a zero-day vulnerability in Internet Explorer (IE) that is being used by malicious Websites to install spyware on users' computers, officials said Tuesday, March 28. The eEye patch is meant as a placeholder until Microsoft Corp. releases a permanent fix, which is expected by Tuesday, April 11, said Marc Maiffret, co-founder and chief hacking officer of eEye. At that time, users of the eEye patch are advised to use the add/remove program in Windows to delete the fix before installing the Microsoft patch. The vulnerability, called the CreateTextRange bug, enables hackers to exploit active scripting in IE to install keystroke loggers and other malicious software.

2006-03-31 **Microsoft Internet Explorer IE malware malicious software exploit vulnerability class**

DHS IAIP Daily; 23
http://www.infoworld.com/article/06/03/31/77027_HNiemalware_ 1.html

NEW GENERATION OF IE MALWARE NOW CIRCULATING.

Hackers have posted a new version of malicious software that will make it easier for them to exploit an unpatched vulnerability in the Internet Explorer (IE) browser. The software was posted by hackers Friday, March 31, to the Milw0rm.com Website. The code exploits a flaw in the way IE processes Webpages using the createTextRange() method. Hackers have been using malware that takes advantage of this vulnerability to install unauthorized software on victims' computers over the past week, but this new generation is considered to be more dangerous. The new software works more quickly, meaning it will be particularly effective on older machines with limited memory and processing capabilities.

2006-04-06 **Microsoft Internet Explorer IE risky vulnerability patch issue**

DHS IAIP Daily; http://news.zdnet.com/2100−1009_22−6058548.html 23

MICROSOFT TO SLAP PATCH ON RISKY IE HOLE.

As part of its monthly patching cycle, Microsoft plans to release five security bulletins (at least one of which is classified “critical”) with fixes for flaws in Windows and Office on Tuesday, April 11. One of Tuesday's bulletins will be for its Internet Explorer (IE) Web browser. It will include a comprehensive update with multiple fixes, including one for the publicly known "CreateTextRange" vulnerability. In addition, Microsoft will be releasing an updated version of the Windows Malicious Software Removal Tool and a patch to change the way IE handles Web programs called ActiveX controls.

Category 23.4 HTML, XML, browsers

2006-04-12 **packet data fuzzing crash Internet browser crash methods HD Moore**

DHS IAIP Daily; http://www.securityfocus.com/news/11387 23

BROWSER CRASHERS WARM TO DATA FUZZING.

Last month, security researcher HD Moore decided to write a simple program that would mangle the code found in Webpages and gauge the effect such data would have on the major browsers. The result: hundreds of crashes and the discovery of several dozen flaws. The technique -- called packet, or data, fuzzing -- is frequently used to find flaws in network applications. Moore and others are now turning the tool on browsers to startling results. In a few weeks, the researcher had found hundreds of ways to crash Internet Explorer and, to a lesser extent, other browsers. In another example, it took less than an hour at the CanSecWest Conference last week for Moore and information-systems student Matthew Murphy to hack together a simple program to test a browser's handling of cascading style sheets, finding another dozen or so ways to crash browsers. "Fuzzing is probably the easiest way to find flaws, because you don't have to figure out how the application is dealing with input," said Moore, a well-known hacker and the co-founder of the Metasploit Project.

2006-04-12 **Microsoft backlash IE patch lawsuit patent lawsuit Eolas ActiveX changes**

DHS IAIP Daily; http://www.securitypipeline.com/news/185300871 23

MICROSOFT SPARKS BACKLASH BY TYING IE CHANGES TO PATCH.

By packaging a functionality change for Internet Explorer (IE) with a needed security update, Microsoft has alienated some IT professionals, security vendors complained Wednesday, April 12. Along with the 10 patches within the Tuesday, April 11, MS06-013 Security Bulletin, Microsoft bundled changes to IE's handling of ActiveX controls. Those changes, which were prompted by a 2003 $521 million judgment against Microsoft in a patent lawsuit brought by Eolas Technologies Inc. and the University of California, will require users to manually activate controls on some sites. The inclusion of the ActiveX changes "makes everything a mess" for companies deploying and testing Microsoft's monthly patches, said Mike Murray, director of research at vulnerability management vendor, nCircleMurray. Instead, Microsoft should have separated the IE ActiveX changes from the security fixes. "They easily could have deployed it as a separate patch or rolled it into a service pack," said Murray.

2006-04-14 **company IE patch warning Microsoft Internet Explorer IE interference applications**

DHS IAIP Daily; http://news.com.com/2100−1002_3−6061597.html 23

COMPANY WARNS ON IE PATCH.

An Internet Explorer update released earlier last week can interfere with some applications, including Google's Toolbar, according to PatchLink, a maker of patch management software. Other applications affected by the Web browser patch include business software from Oracle's Siebel customer relationship management unit and certain Web applications that use specific versions of Java, PatchLink said Friday, April 14. The problems arise because of changes Microsoft made to how the Web browser handles Web programs called ActiveX controls. The modifications are designed to shield Microsoft from liability in a high-profile patent dispute with Eolas Technologies and the University of California.

Category 23.4 *HTML, XML, browsers*

2006-04-15 **Microsoft Internet Explorer MS IE patent infringement software upgrade patch user interface**

RISKS 24 25

MS IE PATCH ALTERS USER INTERACTIONS WITH EMBEDDED OBJECTS

OK, let's be fair about this, the underlying purpose of the Microsoft patch isn't to break Web pages, though this result was understood and expected.

I haven't seen a detailed discussion of the implications of this situation in RISKS (some venues are calling the issue a "mini-Y2K" -- which is a bit overdramatic), but it *is* important. As of a few days ago, vast numbers of Internet Explorer (IE) users are experiencing Web pages all over the Net which simply don't work as expected any more.

Simplified backstory first. A couple of years ago, Microsoft lost a patent fight over commonly used techniques to embed "active" content into Web pages. While "ActiveX" operations are usually cited in this regard, in reality all manner of embedded active player objects are apparently involved, including Flash, QuickTime, RealPlayer, Java, etc. . . .

In any case, MS decided that they didn't want to pay the associated license fees for the patented techniques (so far, the holders of the patent have seemingly not gone after open source browsers in non-commercial contexts -- such as Firefox -- which is why Firefox is not currently affected by this issue).

Several months ago, MS issued a patch to change IE behavior to what they believe is a non-infringing operation. This requires that users explicitly click embedded objects first (theoretically guided by a small hint message that appears if they happen to mouse over the objects, which will supposedly be visually boxed as a cue), before the objects will become active. In the case of active objects that already require a click to start, this means that *two* clicks will now be needed.

There are variations on this theme. For example, in some cases, playback of video may commence automatically, but the video control buttons reportedly won't be active unless the user clicks them first. Confusing? Yep.

There are ways to redesign Web pages to restore the original behaviors, more or less. But these typically require the use of embedded javascript, which introduces its own complexity and security issues, especially on large sites. . . .

2006-04-17 **US CERT Technical Cyber Security Alert Mozilla product vulnerabilities**

DHS IAIP Daily; http://www.uscert.gov/cas/techalerts/TA06−107A.html 23

US-CERT TECHNICAL CYBER SECURITY ALERT TA06-107A: MOZILLA PRODUCTS CONTAIN MULTIPLE VULNERABILITIES.

The Mozilla Web browser and derived products contain several vulnerabilities; the most serious of which could allow a remote attacker to execute arbitrary code on an affected system. More detailed information is available in the individual vulnerability notes. See source for more details. Systems affected: Mozilla Web browser, e-mail and newsgroup client; Mozilla SeaMonkey; Firefox Web browser; Thunderbird e-mail client; Mozilla Suite. Note: Any products based on Mozilla components, particularly Gecko may also be affected. Solution: Upgrade to Mozilla Firefox 1.5.0.2, Mozilla Thunderbird 1.5.0.2, or SeaMonkey 1.0.1. According to Mozilla.org, Thunderbird 1.5.0.2 is to be released on April 18, 2006. Users are strongly encouraged to apply the workarounds described in the individual vulnerability notes listed within the source until updates can be applied. Firefox 1.5.0.2: http://www.mozilla.com/firefox/ Thunderbird 1.5.0.2: http://www.mozilla.com/thunderbird/releases/1.5.0.2.html SeaMonkey 1.0.1: http://www.mozilla.org/projects/seamonkey/

2006-04-18 **hacker sneak penetration browser vulnerability exploit Microsoft Internet Explorer IE**

DHS IAIP Daily; http://www.it− observer.com/news/6119/hackers_sneak_through_b rowser_vulnerability/ 23

HACKERS SNEAK THROUGH BROWSER VULNERABILITY.

Security experts from MicroWorld Technologies claim that a new exploit, named "Exploit.JS.CVE-2006-1359.c," is used by hackers to sneak into computers through a vulnerability in Internet Explorer (IE). Exploit.JS works by pushing an unexpected and unrecognizable HTML element that crashes IE. Then the Exploit forces IE to execute a malicious program to infiltrate into the computer. The vulnerability stems out from the way in which IE displays Webpages that use unexpected methods to call some HTML objects. Microsoft has already identified this loophole and has released a patch.

2006-04-26 **Mozilla Suite Firefox browser Javascript validation vulnerability solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/13232/discuss 23

MOZILLA SUITE AND FIREFOX XPINSTALL JAVASCRIPT OBJECT INSTANCE VALIDATION VULNERABILITY.

Mozilla Suite and Mozilla Firefox are affected by an input validation vulnerability. This issue is due to a failure in the application to verify input passed to installation objects. Analysis: Firefox and the Mozilla Suite support custom "favicons" through the tag. If a link tag is added to the page programmatically and a javascript URL is used, then script will run with elevated privileges and could run or install malicious software. For a complete list of vulnerable products: http://www.securityfocus.com/bid/13232/info Solution: Mozilla has released and advisory along with upgrades dealing with this issue. For further information: http://www.securityfocus.com/bid/13232/references

2006-04-26 **Microsoft Internet Explorer IE patch response Web browser**

DHS IAIP Daily; http://www.washingtonpost.com/wp− dyn/content/article/2006/04 /25/AR2006042501910.html 23

IE REVISED IN RESPONSE TO SECURITY CONCERNS, LOSS OF USERS.

Internet users were given a peek Tuesday, April 25, at a revamped version of Microsoft Corp.'s Internet Explorer (IE), a response to criticism that the most popular tool for Web surfing and hacking made users vulnerable to the Internet's dangers and caused them to defect to alternative browsers. A test version of IE 7 is available for download from Microsoft's Website, with tighter security protection and more advanced tools to give the user greater control in navigating the Web, said Dean Hachamovitch, general manager of IE. The company has improved its ability to write secure code, but it's unclear if the latest tools will address other dangers on the Internet, which require users to be more savvy, said Bruce Schneier, chief technical officer at Counterpane Internet Security Inc.

2006-04-27 **Microsoft Internet Explorer IE bug vulnerability denial-of-service DoS**

DHS IAIP Daily; http://securitytracker.com/alerts/2006/Apr/1016001.html 23

MICROSOFT INTERNET EXPLORER BUG IN PROCESSING NESTED OBJECT TAGS LETS REMOTE USERS DENY SERVICE.

A vulnerability was reported in Microsoft Internet Explorer. A remote user can cause denial-of-service conditions and may be able to cause arbitrary code to be executed on the target user's system. Analysis: The browser does not properly process certain combinations of nested OBJECT tags. A remote user can create specially crafted HTML that, when loaded by the target user, will trigger a NULL pointer dereference and cause the target user's browser crash. It may also be possible to execute arbitrary code, but code execution was not confirmed in the report. Affected version: 6. No solution was available at the time of this entry.

2006-04-27 **Mozilla products software memory corruption code injection access restriction bypass vulnerability solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/16476/discuss 23

MULTIPLE MOZILLA PRODUCTS MEMORY CORRUPTION/CODE INJECTION/ACCESS RESTRICTION BYPASS VULNERABILITIES.

Multiple Mozilla products are prone to multiple vulnerabilities. These issues include various memory corruption, code injection, and access restriction bypass vulnerabilities. Analysis: Garbage collection hazards have been found in the JavaScript engine where some routines used temporary variables that were not properly protected (rooted). Dynamically changing the style of an element from position: relative to position: static can cause Gecko to operate on freed memory. Calling the QueryInterface method of the built in Location and Navigator objects causes memory corruption that might be exploitable to run arbitrary code. XULDocument.persist() did not validate the attribute name, allowing an attacker to inject XML into localstore.rdf that would be read and acted upon at startup. An upgrade in the XML parser introduced a bug that could read beyond the end of the buffer, often causing a crash. The implementation of E4X introduced an internal "AnyName" object which was unintentionally exposed to Web content. Successful exploitation of these issues may permit an attacker to execute arbitrary code in the context of the affected application. This may facilitate a compromise of the affected computer. For a complete list of vulnerable products: http://www.securityfocus.com/bid/16476/info Solution: Please see the referenced vendor advisories for details on obtaining and applying fixes: http://www.securityfocus.com/bid/16476/references

2006-04-28 **Microsoft Internet Explorer IE bug second in a week proof-of-concept exploit code**

DHS IAIP Daily; 23
http://www.infoworld.com/article/06/04/28/77853_HNsecondbug_ 1.html

DESPITE DISCOVERY OF SECOND IE BUG, MICROSOFT WILL NOT ISSUE A FIX.

For the second time in a week, hackers have discovered a previously unknown bug in Microsoft Corp.'s Internet Explorer (IE). Although "proof-of-concept" code showing how this vulnerability could be exploited has been published, there are some mitigating factors. Attackers would first need to trick users into visiting a specially coded Webpage and then somehow get them to perform certain actions, such as writing "specific text in a text field," before they could run their malicious software, FrSIRT said. Furthermore, the bug reportedly does not affect the latest versions of Microsoft's Windows and Windows Server 2003 operating systems, FrSIRT said. Because of these factors, Microsoft has decided not to fix the bug in a security update to IE.

2006-05-03 **Mozilla Firefox iframe content window vulnerability JavaScript content arbitrary code execution attack solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/17671/discuss 23

MOZILLA FIREFOX IFRAME.CONTENT WINDOW.FOCUS DELETED OBJECT REFERENCE VULNERABILITY.

Mozilla Firefox is prone to a vulnerability when rendering malformed JavaScript content. An attacker could exploit this issue to cause the browser to fail or potentially execute arbitrary code. Analysis: The memory corruption error when processing a specially crafted HTML script that contains references to deleted objects and the "designMode" property is enabled, which could be exploited by attackers to crash a vulnerable browser or remotely take complete control of an affected system by tricking a user into visiting a malicious Webpage. Vulnerable: Mozilla Firefox 1.5.2; Mozilla Firefox 1.5.1; Mozilla Firefox 1.5 beta 2; Mozilla Firefox 1.5 beta 1; Mozilla Firefox 1.5; Mozilla Firefox 1.5.0.2. Not vulnerable: Mozilla Firefox 1.5.3. Solution: The vendor has released an advisory, along with fixes to address this issue. Please see the referenced advisory for further information: http://www.mozilla.org/security/announce/2006/mfsa2006-30.html

2006-05-04 **Mozilla Thunderbird e-mail client multiple remote information disclosure vulnerabilities no solution**

DHS IAIP Daily; http://www.securityfocus.com/bid/16881/references 23

MOZILLA THUNDERBIRD MULTIPLE REMOTE INFORMATION DISCLOSURE VULNERABILITIES.

Mozilla Thunderbird is susceptible to multiple remote information disclosure vulnerabilities. These issues are due to the application's failure to properly enforce the restriction for downloading remote content in e-mail messages. Analysis: Thunderbird's HTML rendering engine insufficiently filters the loading of external resources from inline HTML attachments. External files are downloaded even if the "Block loading of remote images in mail messages" option is enabled. These issues allow remote attackers to gain access to potentially sensitive information, aiding them in further attacks. Attackers may also exploit these issues to know whether and when users read e-mail messages. For a complete list of vulnerable products: http://www.securityfocus.com/bid/16881/info Solution: Currently, Security Focus is not aware of any vendor-supplied patches for this issue.

Category 23.4 *HTML, XML, browsers*

2006-05-04 **Mozilla Firefox Thunderbird debug mode insecure temporary file creation vulnerability solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/14443/discuss 23

MOZILLA SUITE, FIREFOX AND THUNDERBIRD DEBUG MODE INSECURE TEMPORARY FILE CREATION VULNERABILITY.

Mozilla Suite, Firefox, and Thunderbird create temporary files in an insecure manner. Analysis: A local attacker would most likely take advantage of this vulnerability by creating a malicious symbolic link in a directory where the temporary files will be created. When the program tries to perform an operation on a temporary file, it will instead perform the operation on the file pointed to by the malicious symbolic link. For a complete list of vulnerable products: http://www.securityfocus.com/bid/14443/info Solution: The vendor has addressed these issues in subsequent versions of the affected applications. For more information: http://www.securityfocus.com/bid/14443/references

23.5 E-mail & instant messaging or chat

Category 23.5 *E-mail & instant messaging or chat*

2000-04-27 **e-mail execution arbitrary code e-mail URL link vulnerability hole**

RISKS; Peacefire http://www.peacefire.org/security/stealthattach/ 20 88

Peacefire reported a new class of exploits using e-mail to force execution of arbitrary code by the Eudora e-mail client when a user clicks on an embedded URL in an HTML-enabled e-mail message. Bennett Haselton, writing in RISKS, said, "Security holes that allow you to run code on a remote user's machine just by sending them e-mail, are extremely dangerous — a hacker could use this to steal or erase any classified data on a remote user's hard drive, even if that user were behind a corporate firewall and had anti-virus software running. A virus writer could use the exploit to write a virus that could spread to almost all Eudora users — numbering in the millions — and potentially do hundreds of millions of dollars' worth of damage. (Unlike most such tricks, this exploit does not require the user to do anything "naive", like run an .exe that is sent to them as an attachment.) USA Today reported last year on the "BubbleBoy" virus, which similarly used a security hole in Microsoft Outlook to cause code to run on a user's machine, simply by reading an e-mail message"

Category 23.5 *E-mail & instant messaging or chat*

2000-05-05 **QA quality assurance design flaw programming language functionality**

RISKS, BBC 20 88
http://news.bbc.co.uk/low/english/sci/tech/newsid_737000/737396.stm

Russ Cage noted a rare burst of insight in the non-technical press about the fundamental reason there are e-mail enabled worms floating around cyberspace: the decision by Microsoft to include programming functionality as part of its office products. Writing in RISKS, he quoted from a BBC news article as follows: "Peter Sommer... told BBC News Online that Microsoft created these by building in to their software the tools needed to customize applications. Microsoft customers are going to have to ask the company to review very carefully the level of functionality that they are putting into their systems. [...] One has got to ask why products are put out which contain these programming languages, which may be of use to perhaps only 3 to 4% of the customers but for everyone else presents a considerable threat. [...] These features are also very difficult to turn off. The lesson from Love Bug is that people must be able to kill off this programming functionality within applications programs."

Category 23.5 *E-mail & instant messaging or chat*

2000-06-14 **antivirus security sandbox restriction script limitations e-mail worms patch fix improvement**

RISKS, Reliable Software Technologies http://www.rstcorp.com/news/jbf.html 20 92

Gary McGraw announced, "Reliable Software Technologies has just released a new program (JustBeFriends) designed to prevent e-mail macro viruses from spreading. It can be used along with or instead of the Microsoft supplied e-mail protection patch. JustBeFriends works will all versions of Outlook and Outlook Express, and is substantially simpler than the Microsoft patch." The program prevents all automated, script-based access to Outlook programs, thus blocking the mechanism used by e-mail enabled worms.

2001-07-23 **e-mail bounce management ISP SMTP header**

RISKS 21 56

Robert J. Woodhead suggested a useful improvement in list server software. Writing in RISKS, he explained that AOL bounce messages fail to include the _original_ destination address, making it impossible to fix mailing lists when someone redirects messages to another e-mail address. He wrote, "If mail servers added an "Original-Recipient:" header if they have to forward the e-mail (and there isn't already one in the headers), life would be immeasurably easier for bounce management. A standard for bounce reporting that made life easy for nonhumans would also seem to be an obvious idea."

2002-03-10 **e-mail chat vulnerabilities ICAT CVE**

ICAT Metabase

The ICAT Metabase < http://icat.nist.gov/icat.cfm > for the Common Vulnerabilities and Exposures (CVE) database reported the following vulnerabilities involving e-mail or chat for the period from 1 Jan 2001 to 10 Mar 2002:

CAN-2001-0581: Spytech Spynet Chat Server 6.5 allows a remote attacker to create a denial of service (crash) via a large amount (> 100) of connections to port 6387. Published Before: 8/22/2001 Severity: Medium

CAN-2001-0615: Directory traversal vulnerability in Faust Informatics Freestyle Chat server prior to 4.1 SR3 allows a remote attacker to read arbitrary files via a specially crafted URL which includes variations of a '..' (dot dot) attack such as '...' or '....'. Published Before: 8/14/2001 Severity: Medium

CAN-2001-0616: Faust Informatics Freestyle Chat server prior to 4.1 SR3 allows a remote attacker to create a denial of service via a URL request which includes a MS-DOS device name (e.g., GET /aux HTTP/1.0). Published Before: 8/14/2001 Severity: Medium

CAN-2001-0726: Outlook Web Access (OWA) in Microsoft Exchange 5.5 Server, when used with Internet Explorer, does not properly detect certain inline script, which can allow remote attackers to perform arbitrary actions on a user's Exchange mailbox via an HTML e-mail message. Published Before: 12/6/2001 Severity: High

CAN-2001-0792: Format string vulnerability in XChat 1.2.x allows remote attackers to execute arbitrary code via a malformed nickname. Published Before: 10/18/2001 Severity: High

CAN-2001-0857: Cross-site scripting vulnerability in status.php3 in Imp Webmail 2.2.6 and earlier allows remote attackers to gain access to the e-mail of other users by hijacking session cookies via the message parameter. Published Before: 12/6/2001 Severity: Medium

CAN-2001-0945: Buffer overflow in Outlook Express 5.0 through 5.02 for Macintosh allows remote attackers to cause a denial of service via an e-mail message that contains a long line. Published Before: 12/3/2001 Severity: Medium

CVE-2000-1148: The installation of VolanoChatPro chat server sets world-readable permissions for its configuration file and stores the server administrator passwords in plaintext, which allows local users to gain privileges on the server. Published Before: 1/9/2001 Severity: Medium

CVE-2001-0154: HTML e-mail feature in Internet Explorer 5.5 and earlier allows attackers to execute attachments by setting an unusual MIME type for the attachment, which Internet Explorer does not process correctly. Published Before: 5/3/2001 Severity: Medium

Category 23.5 *E-mail & instant messaging or chat*

2002-03-11 **cellular phones wireless virus worm malware palmtop**

NewsScan

FOR VANDALS, SMART PHONES NEW AND INVITING TARGETS
Stephen Trilling, research at Symantec, which makes antivirus software, warns: "We should think of smart phones as just another set of computers on the Internet. If they're connected to the Internet they can be used to transmit threats and attack targets, just as any computer can. It's technically possible right now." Recently, several software companies have begun selling antivirus and encryption software for smartphone operating systems made by Palm, Microsoft and the Symbian platform common in Europe. Ari Hypponen enumerates some of the dangers: "If a malicious piece of code gets control of your phone, it can do everything you can do. It can call toll numbers. It can get your messages and send them elsewhere. It can record your passwords." And he adds that it's not that hard to do: "It's possible for anyone to make custom software for this platform. Teens can download development tools and write their own software." (San Jose Mercury News 10 Mar 2002)
http://www.siliconvalley.com/mld/siliconvalley/2833740.htm

Category 23.5 *E-mail & instant messaging or chat*

2002-05-08 **anti-malware e-mail worm virus moderated mailing list design standards**

RISKS 22 06

Mailing list management software often uses a coded REPLY-TO address so that the moderator can simply REPLY to a proposed posting and send it to the entire list. Unfortunately, an anti-virus running on the moderator's workstation does the same when it encounters a virus-infested submission, thus sending the infection out to the entire list without letting the moderator stop it.

In a followup piece, a RISKS contributor noted that the design error is the anti-virus package's use of the REPLY-TO field rather than the RETURN-PATH address. In other words, the sender of the message should be informed that it is virus infected; the recipient of replies may be very different from the sender, as in this case.

Category 23.5 *E-mail & instant messaging or chat*

2002-05-27 **HTML control command language e-mail**

RISKS 22 10

In a newsletter sent to 40,000 recipients, I included a block of HTML code showing a forged header.

The e-mail list software spotted what it thought was the end of the document and inserted the e-mail address of each recipient in that person's copy of the newsletter, making many readers believe that their e-mail address had been distributed to the entire list. Result: hundreds of letters (some nice, some not).

LESSONS:

(1) When designing macros that scan for search strings associated with a particular condition (in this case, the end of a message), it would be wise to test the presumption that the condition is in fact true. In this example, perhaps a second check might verify that there is in fact no further text in the message before inserting the valediction.

(2) When quoting control language (in this case, HTML), and in the absence of some sort of escape character (meaning "the following is literal text, not command language"), we may avoid accidents by using symbol substitution to prevent accidental misreading of the quoted strings as if they were actually to be interpreted.

INSTANT MESSAGING CAN OPEN CORPORATE NETS TO VANDALISM
AOL and Microsoft freely admit that their popular instant messaging systems were designed for chat and not for transmission of sensitive corporate messages, but they are now building secure IM services for use by large customer groups. Why? Because, according to research firm IDC, 54 million employees this year will be using consumer IM systems for work-related purposes. Until they're using more secure instant messaging systems, companies need to be careful of what they do. Security expert Dan Ingevaldson of Internet Security Systems says that free IM systems represent a "huge gaping security risk for companies." (USA Today 28 May 2002)
http://www.usatoday.com/life/cyber/tech/2002/05/29/im-security.htm

2002-09-04 **instant messaging surveillance workplace communication standards policies telecommuting**

NewsScan

INSTANT MESSAGING A HIT IN CORPORATE WORLD
Businesses with multiple office locations increasingly are finding that instant messaging can provide the real-time connectivity missing in e-mail and voice-mail exchanges. The beauty of IM, as it's called, is not only that it catches the recipient's attention immediately by popping up on his or her screen, but it also tells the sender which recipients are available to communicate at that moment. IM is "absolutely useful in trying to figure out, 'Can I get to this person?'" says a Lehman Brothers managing director. Fans say it's reversing a 20-year trend toward employee insulation, with voice-mail systems that make it difficult to tell whether workers are in the office or out on the golf course. Advocates also note that IM has influenced managers to be more receptive to telecommuting arrangements, because it can verify who is really working from home, or at least is logged onto the computer there. And because failing to answer an IM quickly is considered rude, most workers use the "away from my desk" or "busy" sign when they're absent. "There's a sensation you can't hide," says one long-distance manager. IDC estimates that by the end of last year, 20 million people worldwide were using IM in businesses, and it predicts that number will soar to 300 million by the end of 2005. (Wall Street Journal 4 Sep 2002)

2002-10-21 **spam penetration pop-up Windows operating systems warnings**

NewsScan

POP-UP SPAM — A DIABOLICAL INVENTION
As if e-mail spam weren't annoying enough — now there's pop-up spam. A Romanian-based company has developed software that can blast computers with pop-up messages through the Messenger function on many Windows operating systems that was originally designed to allow computer network technicians to warn network users of a planned shutdown (not to be confused with Instant Messenger). Gary Flynn, a security engineer at James Madison University, deplores this latest technological development: "It's almost like somebody barging into your office and interrupting you." Zoltan Kovacs, founder of the company that makes the software, responds, "If some people use it for bad things, they should take their own responsibility, but it's their own problem." The new spam technique represents the latest attempt by advertisers to bypass the increasingly sophisticated e-mail filters used by ISPs and individuals, and also circumvents state and other laws designed to curb junk e-mail. 2003-03-04 **new vulnerablility Sendmail NIPC advisory server root access CERT CC**

NIPC/DHS

March 03, Department of Homeland Security, National Infrastructure Protection Center — NIPC Advisory 03-004: "Remote Sendmail Header Processing Vulnerability".

The Remote Sendmail Header Processing Vulnerability allows local and remote users to gain almost complete control of a vulnerable Sendmail server. Attackers gain the ability to execute privileged commands using super-user (root) access/control. This vulnerability can be exploited through a simple e-mail message containing malicious code. Sendmail is the most commonly used Mail Transfer Agent and processes an estimated 50 to 75 percent of all Internet e-mail traffic. System administrators should be aware that many Sendmail servers are not typically shielded by perimeter defense applications. A successful attacker could install malicious code, run destructive programs and modify or delete files. Additionally, attackers may gain access to other systems thru a compromised Sendmail server, depending on local configurations. Sendmail versions 5.2 up to 8.12.8 are known to be vulnerable at this time. Due to the seriousness of this vulnerability, the NIPC is strongly recommending that system administrators who employ Sendmail take this opportunity to review the security of their Sendmail software and to either upgrade to Sendmail 8.12.8 or apply the appropriate patch for older versions as soon as possible. Patches for the vulnerability are available from Sendmail at
http://www.sendmail.org. Additional information is available from CERT/CC at
http://www.kb.cert.org/vuls/id/398025.

Category 23.5 *E-mail & instant messaging or chat*

2003-04-24 **new vulnerability Microsoft security bulletin Outlook Express e-mail client patch exploit fix**

NIPC/DHS

April 23, Microsoft — Microsoft Security Bulletin MS03-014: Cumulative Patch for Outlook Express .

A vulnerability exists in the MHTML URL Handler that allows any file that can be rendered as text to be opened and rendered as part of a page in Internet Explorer. As a result, it would be possible to construct a URL that referred to a text file that was stored on the local computer and have that file render as HTML. If the text file contained script, that script would execute when the file was accessed. Since the file would reside on the local computer, it would be rendered in the Local Computer Security Zone. Using this method, an attacker could attempt to construct a URL and either host it on a website or send it via email. If the cumulative patch for Internet Explorer MS03-004 has been installed, known means by which an attacker may place a file onto a user's computer will be blocked. Microsoft has assigned a risk rating of "Critical" to this vulnerability and a patch is available at the Microsoft website.

2003-05-06 **AOL ICQ America Online Core Security e-mail execute arbitrary code updating hostile flaw**

NIPC/DHS

May 06, CNET News.com — Security group: AOL's ICQ is flawed.

There are six flaws, two of them critical, in America Online's (AOL) ICQ software, security firm Core Security Technologies warned in an advisory Monday. Three of the vulnerabilities, including one of the critical flaws, occurred in the software's e-mail feature. A bug in the component could allow an attacker to use the way the software handles e-mail to cause it to execute code, if the attacker can impersonate the user's e-mail server. The other critical vulnerability appeared in a feature of ICQ that allows automated updating. Because that component doesn't have adequate security, an attacker could pretend to be sending a legitimate update when in reality the upgrade is hostile code. No one from AOL's ICQ subsidiary was available Monday to comment on the alleged flaws. The advisory is available on the Core Security Technologies website: http://www.coresecurity.com/common/showdoc.php?idx=315ccion=10.

2003-05-09 **instant messaging software ICQ America Online Inc. Mirabilis IM client holes firewalls elnterprise**

NIPC/DHS

May 09, Computerworld — Security problems persist with instant messaging.

Security problems relating to the unfettered use of consumer chat software on corporate networks are fueling the adoption of tougher security measures and more commercial-grade products, users and analysts said. Ongoing concerns about instant messaging (IM) security were heightened this week by the disclosure of six vulnerabilities in America Online Inc.'s Mirabilis ICQ IM client software. Security analysts for some time have been warning that unchecked use of such software could cause dangerous holes in enterprise firewalls, leading to sensitive corporate data being exposed on public networks and files being transferred in an unprotected fashion.

2003-05-30 **Yahoo IM buffer overflow delete files executable code malicious programmer chat updates**

NIPC/DHS

May 30, CNET News.com — Yahoo issues IM, chat security patches.

Yahoo issued on Friday security patches for its Yahoo Instant Messenger and Yahoo Chat clients in an effort to fix a buffer overflow vulnerability discovered in the software. When users of the software log on to the IM network or enter a chat room, Yahoo is prompting them to install the patches. In addition, the company posted the patches on its Web site. Buffer overflow attacks in Yahoo IM and Yahoo Chat could lead to a number of problems. Users could be involuntarily logged out of an application, or it could allow the introduction of executable code, allowing a malicious programmer to take control of a user's machine, delete files and otherwise wreak havoc with a victim's computer system.

2003-08-25 **e-mail attachments scanning virus worm policy**

NewsScan

ISPs TO START SCANNING ATTACHMENTS
Several large U.S. Internet service providers, including Cox Communications, EarthLink and BellSouth, say they are preparing to scan all e-mail attachments for computer viruses before they forward them on to subscribers' accounts. The policy change comes on the heels of a month of e-mail problems caused by the Sobig and Blaster worms, resulting in consumer demand for better security measures on ISP servers. "Virus filtering is quickly becoming one of the check marks for the big ISPs," says Todd Dean, director of data operations and support for Cox. However, the cost of filtering e-mail can be daunting, says Forrester Research analyst Michael Rasmussen. "With ISPs of those sizes, you're easily looking at ongoing costs of several million dollars — not just the cost of purchasing the technology, but making it work with your existing systems, administrative costs and increased support costs associated with customers who are confused about what to do when their ISP tells them they have an e-mail with a virus inside." Several leading ISPs already scan mail, including AOL, Microsoft Network, Comcast, Covad and AOL Time Warner's RoadRunner network, forestalling the possibility of unwary subscribers becoming conduits for further viral infection. "Users should not be asked to protect themselves any more than they should be asked to go buy seat belts and airbags and install them in their own cars," says Alan Paller, research director for the SANS Institute, a security training facility. "That's got to come with their service, even if it comes with an added price." (Washington Post 28 Aug 2003)

2003-08-27 **sendmail vulnerability DoS denial service open source remote DNS Linux Unix free() fucntion attacks**

NIPC/DHS

August 27, SearchEnterpriseLinux.com — Sendmail vulnerable to DoS attacks.

Versions 8.12.0 through 8.12.8 of the open-source mail transfer agent Sendmail are vulnerable to remote denial-of-service attacks, according to an alert issued by the FreeBSD Project. The vulnerability is in the code that implements DNS (domain name system) maps. An attacker sending a malformed DNS reply packet could cause Sendmail to call "free ()" on an uninitialized pointer. Such a call could cause a Sendmail child process to crash. Sendmail is widely implemented in enterprises as part of several Linux and Unix distributions. A patch is available on the Sendmail Website: http://Sendmail.org/dnsmap1.html

NewsScan

INSTANT MESSAGE: YOU'RE UNDER ARREST
The investigation of a Wall Street trading scandal (in which a former Bank of America broker has been charged with grand larceny and securities fraud) is the first case that has used a chain of evidence derived from the instant messaging records of licensed brokers and dealers. Instant messaging (IM) systems are now widely used on Wall Street and to a large extent have replaced traditional e-mail. One attorney who consults on electronic communications said a New York Stock Exchange executive's question about instant messaging was: "Wait a minute, is that what my 13-year-old daughter uses at home?" The answer: "I said yes — and your traders." (USA Today 18 Sep 2003)

NewsScan

MICROSOFT LAUDED FOR CRACKING DOWN ON CHAT ROOMS
Child advocates are applauding a decision by Microsoft's MSN online service to crack down on its free chat rooms. Ernie Allen of the National Center for Missing & Exploited Children says: "There is no question but that chat rooms generally tend to be very dangerous places for children." MSN's move is intended to force users to identify themselves, so that they can be held accountable for their actions, and so that MSN can contact them when it gets complaints. Of course, ending support for free foreign chat rooms will also help Microsoft reduce MSN's financial loss. Technology analyst Rob Helm explains: "Maintaining any kind of online service is expensive. Putting chat on paid status in the U.S, and turning it off elsewhere is a step toward making MSN profitable." However, Microsoft spokesman Lisa Gurry says that cost savings were "not a factor" in the Microsoft chat-room decision. "This really is all about looking at delivering the safest online experience for folks using our services." (USA Today 24 Sep 2003)

2003-10-25 **Windows Messenger exploit code Service MS03-043 Linux Unix crashes machines**

NIPC/DHS

October 25, TechWeb News — Attackers gearing up to exploit Windows Messenger security hole.

An exploit code that takes advantage of a critical vulnerability in Microsoft's Windows Messenger Service is out in the wild and could prove as dangerous as this summer's MSBlaster worm if attackers decide to focus their efforts, security analysts said Friday, October 24. Released early last week, the exploit code — which has been crafted to run not only on attackers' Windows machines, but also on Linux and Unix boxes — crashes Windows systems not patched against the vulnerability released October 15 in Microsoft Security Bulletin MS03-043. What concerns security analysts is the speed with which this exploit was produced. The span between the disclosure of the vulnerability by Microsoft and proof of exploit code was just three days. Users can disable Windows Messenger Service by following the instructions in Microsoft's security bulletin: http://www.microsoft.com/technet/treeview/?url=/technet/secu rity/bulletin/MS03-043.asp

2003-11-14 **new vulnerability Eudora buffer overflow e-mail client spam**

NIPC/DHS

November 11, The Register — Eudora users warned over 'reply to all' trick.

A buffer overflow vulnerability in Eudora version 5.x, the popular email client, creates a mechanism for hackers to compromise targeted PCs. The problem stems from a failure to properly verify the "
From:" and "Reply-To:" when users of vulnerable versions of Eudora select "Reply-To-All". This shortcoming creates a means for hackers to spam users with a maliciously constructed email designed to trigger this buffer overflow condition. Users should update to Eudora 5.1-Jr3 (Japanese) or Eudora 6.0 (English) in order to shore up their security defenses: http://www.eudora.com/

2003-11-19 **e-mail server flaw exploit spam relay Microsoft Exchange**

NIPC/DHS

November 14, CNET News.com — Mail server flaw opens Exchange to spam.

Administrators of e-mail systems based on Microsoft's Exchange might have spammers using their servers to send unsolicited bulk e-mail, a consultant warned this week. Aaron Greenspan, a Harvard University junior published a white paper Thursday, November 13, detailing the problem. Greenspan's research concluded that Exchange 5.5 and 2000 can be used by spammers to send anonymous e-mail. He says even though software Microsoft provides on its site certifies that the server is secure, it's not. "If the guest account is enabled (on Exchange 5.5 and 2000), even if your login fails, you can send mail, because the guest account is there as a catchall," he said. "Even if you think you've done everything (to secure the server), you are still open to spammers." The guest account is a way for administrators to let visitors use a mail server anonymously, but because of security issues, the feature is generally not enabled. Exchange servers that had been infected by the Code Red worm and subsequently cleaned will still have the guest account enabled, Greenspan said.

2003-11-25 **flaw vulnerability Microsoft Exchange Server 2003 kerberos authentication**

NIPC/DHS

November 24, ZDNet UK — Exchange flaw could open up user accounts.

Microsoft is investigating what may be a serious flaw in Exchange Server 2003, only a month after the software's launch as part of Office System 2003. The bug appears to affect an Exchange component called Outlook Web Access (OWA), which allows users to access their in-boxes and folders via a Web browser. Consumers logging into their Web-based mailbox sometimes find themselves accessing another user's account, with full privileges, according to Matthew Johnson, a network administrator who reported the bug earlier this month on the NTBugtraq security mailing list. Microsoft has said it is investigating the issue and that the flaw appears to occur only when Kerberos authentication is disabled. Kerberos is the method that Microsoft uses for authenticating requests for services. For the moment, the company is advising customers to keep Kerberos authentication enabled, as it is by default, and may issue a patch or more information when its investigation is complete.

2003-12-10 **Yahoo instant messaging flaw vulnerability executable code**

NIPC/DHS

December 08, CNET News.com — Yahoo answers IM security flaw.

Yahoo has issued an update to its instant-messaging software, in order to address a security flaw found in the application. The company said the security issue was related to a buffer overflow, which is a common security vulnerability in computer programs written in C and C++ that allows more information to be added to a chunk of memory than it was designed to hold. Typical problems involved in an instant-messaging-related buffer overflow might include an involuntarily log-out of an IM session, a crash of browsing software applications, and a possible introduction of executable code. According to Yahoo, only a small percentage of the company's IM software users might be vulnerable as a result of the flaw. Yahoo said customers who changed their Explorer security settings from "medium" to "low" could be affected. The company said that even in that case, an attacker would have to lure a user of Yahoo IM to view malicious HTML code. Most often this would entail clicking a link sent through IM that leads back to a Web page hosting the code. Before changing an IE security setting to low, individuals are warned by the browser that the setting is considered "highly unsafe." Yahoo said it has not yet heard of any successful attacks based on the buffer flaw. The update is available on the Yahoo Website:
http://messenger.yahoo.com/messenger/security/

2004-01-14 **Microsoft security bulletin patch flaw vulnerability fix Exchange Server**

NIPC/DHS;
http://www.microsoft.com/technet/treeview/default.asp?url=/technet/security/bulletin/MS04−002.asp

January 13, Microsoft — Microsoft Security Bulletin MS04-002: Vulnerability in Exchange Server 2003 Could Lead to Privilege Escalation.

A vulnerability exists in the way that Hypertext Transfer Protocol (HTTP) connections are reused when NTLM authentication is used between front-end Exchange 2003 servers providing Outlook Web Access (OWA) and, OWA on Windows 2000 and Windows Server 2003, and when using back-end Exchange 2003 servers that are running Windows Server 2003. Users who access their mailboxes through an Exchange 2003 front-end server and OWA might get connected to another user's mailbox if that other mailbox is (1) hosted on the same back-end mailbox server and (2) if that mailbox has been recently accessed by its owner. Attackers seeking to exploit this vulnerability could not predict which mailbox they might become connected to. The vulnerability causes random and unreliable access to mailboxes and is specifically limited to mailboxes that have recently been accessed through OWA. This vulnerability is exposed if the Website that is running the Exchange Server 2003 programs on the Exchange back-end server has been configured not to negotiate Kerberos authentication, causing OWA to fall back to using NTLM authentication. The only known way that this vulnerability can be exposed is by a change in the default configuration of Internet Information Services 6.0 on the Exchange back-end server. Microsoft has assigned a severity rating of "Moderate" to this issue.

2004-01-28 **virus scanners attachment creation update macros conspiracy theory**

RISKS 23 15ff

RISKS OF VIRUS SCANNERS AND MACRO-ENABLED DOCUMENTS

Steve Bellovin writes about his experience upgrading AV software. This AV software product dealt with an e-mail with a viral attachment "in an appropriate permanent fashion." However, Bellovin says, the AV software notified the user of its disinfection with a text file attachment to the previously-infected e-mail. Bellovin thinks it won't be long before a virus mimics this AV software's action, to fool a user into opening a "notification" file. He asks, "Why are the good guys trying to teach people to click on attachments?" In a follow-up article, contributor Paul Tomblin answers this question--Tomblin thinks anti-virus companies need people to click on attachments and get infected in order stay in business. In another follow-up article, Alan J Rosenthal argues that "opening "attachments" is a fact of ms-win life." He says that users have become used to sending each other plain text messages as Word document attachments--which may often be infected--and transmitting malicious code through Word macros. Rosenthal thinks this problem could be solved if Microsoft created an Office suite without macros. This way, he says, users won't be able to transmit malicious code so easily, and "everyone else will be impressed by Microsoft's technical mastery…"

2004-03-10 **Microsoft security bulletin vulnerability hole flaw patch fix MSN Messenger privacy**

DHS IAIP Daily; http://www.microsoft.com/technet/security/bulletin/ms04-010.mspx

March 09, Microsoft — Microsoft Security Bulletin MS04-010:

Vulnerability in MSN Messenger Could Allow Information Disclosure. A security vulnerability exists in Microsoft MSN Messenger. The vulnerability exists because of the method used by MSN Messenger to handle a file request. An attacker could exploit this vulnerability by sending a specially crafted request to a user running MSN Messenger. If exploited successfully, the attacker could view the contents of a file on the hard drive without the user's knowledge as long as the attacker knew the location of the file and the user had read access to the file. To exploit this vulnerability, an attacker would have to know the sign-on name of the MSN Messenger user in order to send the request. Microsoft has assigned a risk rating of "Moderate" to this issue and recommends that system administrators consider installing the security update.

2004-03-10 **Microsoft security bulletin vulnerability hole flaw patch fix Outlook HTML e-mail**

DHS IAIP Daily; http://www.microsoft.com/technet/security/bulletin/ms04−009. mspx

March 09, Microsoft — Microsoft Security Bulletin MS04-009: Vulnerability in Microsoft Outlook Could Allow Code Execution.

A vulnerability in Outlook 2002 caused by the parsing of specially crafted mailto URLs exists could allow Internet Explorer to execute script code in the Local Machine zone on an affected system. To exploit this vulnerability, an attacker would have to host a malicious Website that contained a Web page designed to exploit the vulnerability and then persuade a user to view the Web page. The attacker could also create an HTML e-mail message designed to exploit the vulnerability and persuade the user to view the HTML e-mail message. After the user has visited the malicious Website or viewed the malicious HTML e-mail message an attacker who successfully exploited this vulnerability could access files on a user's system or run arbitrary code on a user's system. This code would run in the security context of the currently logged-on user. Microsoft has assigned a risk rating of "Important" to this issue and recommends that system administrators install the patch immediately.

2004-03-12 **Microsoft security vulnerability hole flaw patch fix Outlook e-mail**

DHS IAIP Daily;
http://www.computerworld.com/securitytopics/security/story/0,10801,90992,00.html

March 10, IDG News Service — Microsoft upgrades fix for Outlook from 'important' to 'critical'.

One day after releasing a trio of security patches, Microsoft is upgrading the seriousness of one of those fixes to from "important" to "critical." The update released in security bulletin MS04-009 fixes a problem with the way the Outlook e-mail software treats URLs that use the "mailto" tag, which allows Website authors to insert links on Web pages that launch Outlook or other e-mail clients. A problem with the way Outlook interprets mailto URLs could allow an attacker to use a specially formatted mailto URL to gain access to files on an affected system or insert and run malicious computer code. Microsoft initially claimed that only computers with the Outlook Today home page were vulnerable to attack. Outlook Today is the home page only until an e-mail account is created, Microsoft said. However, following release of the bulletin, Finnish security researcher Jouko Pynnonen, who discovered the vulnerability, informed the company that malicious hackers could attack vulnerable Outlook installations even if Outlook Today isn't the default home page, the company said. In a revised version of its security bulletin, Microsoft noted the discrepancy. Additional information is available on the Microsoft Website: http://www.microsoft.com/technet/security/bulletin/offmar04. mspx

2004-03-24 **security vulnerability flaw hole patch fix Web-based electronic e-mail service Hotmail Yahoo**

DHS IAIP Daily; http://www.esecurityplanet.com/trends/article.php/3329821

March 23, eSecurity Planet — Hotmail, Yahoo users at risk of PC takeover.

A potentially serious security flaw found in Web-based e-mail services offered by Microsoft and Yahoo could put millions of PCs at risk of takeover, an Internet security consultant GreyMagic warned Tuesday, March 23. The advisory warned that attackers could inject malicious code by simply sending an e-mail to an unsuspecting Hotmail or Yahoo user. The vulnerability only affects Hotmail and Yahoo running on Microsoft's Internet Explorer (IE) browser. Successful exploit could lead to theft of a user's login and password, disclosure of the content of any e-mail in the mailbox and disclosure of all contacts within the address book. Additionally, the attacker could manipulate the system to automatically send e-mails from the mailbox and to exploit vulnerabilities in IE to access the user's file system and eventually take over his or her machine. Microsoft has fixed the vulnerability and Hotmail is no longer vulnerable.

2004-03-26 **intant messenging IM threat CERT CC social engineering spam virus back door**

NIPC/DHS

March 25, New York Times — When instant messages come bearing malice.

Perpetrators are using Instant Messenging (IM) to deliver spam , unleash viruses, and create back doors into the systems of unsuspecting users. The CERT Coordination Center says IM users are especially susceptible to "social engineering," meaning attacks that prey on human foibles by enticing people with promises of free products, pornography and interesting-sounding links. When two people communicate through instant messaging, the messages are relayed as plain text through an IM service's central servers before they reach the recipient. An unscrupulous systems administrator could easily train a program to search for words, passwords or combinations of numbers to harvest critical personal information. The lack of privacy is compounded when IM messages travel over public wireless networks like those at cafes, airports and hotels where security levels are kept low to give users easy access to the network. IM users can transfer files to each other and give others access to their shared-files folder. These folders sometimes contain family photographs and documents with names, addresses and telltale financial information, "all the little pieces of information that actually might help someone assume a person's identity," said Fred Felman of Zone Labs.

2004-04-27 **new e-mail attack denial-of-service servers NDN flooding spoofed addresses**

DHS IAIP Daily; http://searchsecurity.techtarget.com/originalContent/0,28914
2,sid14_gci961512,00.html

April 27, SearchSecurity.com — E-mail attack could swamp e-mail servers.

Several researchers have identified a new e-mail attack that can be used to swamp enterprise e-mail servers, as well as some secondary systems. Experiments revealed that nearly 60% of general and 30% of Fortune 500 systems and domains could be leveraged for an attack. Security consultant Stefan Frei, who operates a Swiss e-mail portal, discovered a way that malicious users could swamp e-mail servers and accounts. In early April he reported it in a paper coauthored with software architect Ivo Silvestri and professional services director Gunter Ollmann. In the report, the trio explained how an attack could happen, beginning with a spoofed e-mail originator at the target. A message is sent to multiple invalid recipients. The system sends NDNs flooding back to the spoofed address. The assault can be further multiplied by adding an attachment to the initial message. The researchers recommend mail server changes to lessen the problem--such as not accepting mail for invalid recipients, limiting the maximum number of recipients, generating few and small error messages and validating input data. All of these fixes don't help a target ward off an attack. As Ollmann pointed out, about the only option is to block systems at the ISP level by, perhaps, blacklisting offending mail servers.

2004-05-07 **buffer overflow vulnerability Eudora e-mail email**

DHS IAIP Daily; http://www.esecurityplanet.com/prevention/article.php/335117
1

May 07, eSecurity Planet — 'Critical' buffer overflow found in Eudora.

Security researchers have discovered a "highly critical" security flaw in QUALCOMM's Eudora e-mail client that could lead to the execution of malicious code on vulnerable systems. Paul Szabo, a computer systems officer at the University of Sydney, reported the flaws in versions 6.1, 6.0.3 and 5.2.1 of Eudora and warned that Windows users were at risk of complete system takeover. According to Szabo's advisory, the vulnerability is due to a boundary error within the URL-handling functionality. A malicious hacker could exploit the hole with an e-mail containing a specially crafted link. Research firm Secunia has tagged a "highly critical" rating on the flaw and recommends that Eudora users be wary of other serious vulnerabilities in the mail client.

2004-05-18 **vulnerability Microsoft Outlook e-mail client illegal actions update issued**

DHS IAIP Daily; http://news.earthweb.com/ent−news/article.php/3355411

May 18, earthwebnews.com — Outlook 2003 bypass flaw reported.

Security researchers have discovered a vulnerability in the Microsoft Outlook 2003 software that could allow malicious hackers to perform illegal actions through e-mails. According to an alert from Secunia, the flaw could let attackers sneak past the security settings in the Outlook 2003 e-mail program and attempt to load harmful code to vulnerable PCs. Outlook 2003 is designed to protect the user by opening mails in a restricted security zone to prevent the use of active scripting or download of harmful files. This can be exploited to start a download sequence of arbitrary files, which in turn causes Internet Explorer to prompt the user whether to download the file," according to the alert, which carries a "moderately critical" rating. Combined with another flaw that deals with "Predictable File Location Weakness," Secunia said it was possible to launch the malicious file without any warning. Affected software include Outlook 2003, Office 2003 Student and Teacher Edition, Office 2003 Standard Edition, Office 2003 Small Business Edition and Office 2003 Professional Edition. The company recommends that users filter HTML and Rich Text Format messages until a fix is issued by the software giant. Alert found at http://secunia.com/advisories/11629/

2004-06-03 **e-mail makeover instant messaging IM RSS features**

NewsScan

E-MAIL NEEDS A MAKEOVER

Forget about spam -- even your "wanted" e-mail is clogging your in-box now, right? E-mail is "broken," says Eric Hahn, former CTO of Netscape and current CEO of antispam firm Proofpoint. "We need to make metaphoric changes. The [file-folder] metaphor was designed back when we were talking about getting five messages a day." Today, many folks receive 10 to 20 times that number and filing each one just takes too much time. "People hate filing. They hate it in paper. They hate it in e-mail. Could you imagine what it would be like to have to file Web pages just to get back to them?" Hahn suggests that in addition to overhauling the filing function, software developers should find a way to combine instant-messaging software with e-mail software. "Doesn't it seem odd that IM is separate from e-mail? Why are those conversations so fundamentally different?" he asks. Ben Gross, a researcher at the University of Illinois-Urbana-Champaign, says that in addition to incorporating IM, e-mail software developers need to integrate RSS readers into their products, so that users can view updates to a Web page without having to download the whole Web page into a browser. Some e-mail software developers are already experimenting with new approaches: Microsoft's Outlook 2003 and Google's Gmail service include a "group by conversation" feature that enables users to view related e-mails sent to and from a single person.

2004-06-14 **e-mail security threat early warning Internet traffic virus worm**

NewsScan

E-MAIL SECURITY FIRMS FOCUS ON EARLY WARNING

E-mail security companies are using a new technique to monitor Internet traffic that will allow them to identify virus outbreaks earlier and take a more proactive role in preventing hacker damage. The technology surveys traffic across a large number of organizations and searches for anomalies that might indicate malicious code activity. It then takes immediate action to slow down or block delivery, providing a head-start over conventional methods that analyze viruses and then rely on antivirus firms to identify and stop them. "We've seen we can gain four or five hours on the virus," says Scott Weiss, CEO of IronPort, which uses the early-warning technology. "Four to five hours is life for the network administrator." Suspicious traffic patterns that might signal viral outbreak include an increased volume in messages from specific senders and messages with similar subject lines or containing a particular type of attachment file. The computers can then tip off e-mail software to destroy or quarantine the suspect messages. "It's the start of a big trend," predicts Matt Cain, an analyst with Meta Group. E-MAIL PRIVACY: DON'T COUNT ON IT

A recent federal appeals court ruling giving e-mail less protection than other types of communication has inspired privacy advocates to reemphasize the need for caution in the use and management of e-mail. Kevin Bankston of the Electronic Frontier Foundation warns: "Under this decision, any node on the Internet that passes e-mails could flip a switch and start looking at any e-mail that passed through it," and Marc Rotenberg of the Electronic Privacy Information Center says that until Congress or the courts change the law "the best practice is not to put into e-mail something that you are concerned might be disclosed to a third party." And privacy expert J.J. Luna gives this piece of good advice: "Never sell a computer with a hard drive to anyone, for any reason." (Wall Street Journal 14 Jul 2004)

2004-08-09 **AOL Instant Messenger IM critical vulnerability buffer overflow attack**

DHS IAIP Daily; http://searchsecurity.techtarget.com/originalContent/0,28914
2,sid14_gci999090,00.html

August 09, SearchSecurity.com — 'Highly critical' flaw in AOL Instant Messenger.

AOL Instant Messenger (AIM) has a vulnerability attackers could use to compromise computers and launch arbitrary code, IT security firm Secunia said Monday, August 9. AIM 5.x contains a boundary error within the handling of "Away" messages that can be exploited to cause a stack-based buffer overflow. "A malicious Website can exploit this via the AIM URI handler by passing an overly long argument to the 'goaway?message' parameter," the advisory said. "Successful exploitation may allow execution of arbitrary code on a user's system when...a malicious Website is visited with certain browsers." Secunia said the vulnerability has been confirmed in version 5.5.3595 and that other versions may also be affected. The firm also noted that "various other issues were also reported, where a large amount of resources can be consumed on a user's system." The advisory said the vendor was contacted but has not responded, and recommends users switch to an alternative product.

2004-08-13 **Yahoo Messenger Portable Network Graphics PNG libpng vulnerability plug**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1635855,00.asp

August 13, eWEEK — Yahoo plugs PNG security hole.

Yahoo Inc. has posted a security update for its Windows version of Yahoo Messenger to fix a series of vulnerabilities in the PNG (portable network graphics) library, or libpng. The library provides a set of graphics routines for PNG files; PNG is an alternative graphics format to GIF. The PNG library holes, as previously reported, could allow an attacker to crash programs or execute attack code. Yahoo released the fix for users of Yahoo Messenger 6.0 for Windows because it uses the open-source PNG format in limited areas of its IM client to display images, said Yahoo spokesperson Terrell Karlsten. According to a security note on the Yahoo Messenger Website, there have been no known exploits of the vulnerabilities. Yahoo learned of the PNG library vulnerabilities from a U.S. Computer Emergency Readiness Team security bulletin issued last week. Additional information is available on the Yahoo Website: http://messenger.yahoo.com/security/update5.html

2004-08-19 **Mutt e-mail client PGP GnuPG vulnerability spoof messages social engineering attacks**

DHS IAIP Daily; http://www.securityfocus.com/bid/10929

August 19, SecurityFocus — Mutt PGP/GnuPG verified e-mail signature spoofing vulnerability.

Mutt PGP/GnuPG versions 1.3.28 and 1.5.6 contain a vulnerability that allows malicious users to send e-mail that spoofs a successfully verified PGP/GnuPG e-mail message. If a user employs Mutt with a specific configuration, this vulnerability could allow a malicious user to spoof e-mail from trusted sources. This will likely increase the effectiveness of social engineering attacks. Altering the configuration of Mutt to use colors may assist in determining if e-mail messages are spoofed.

2004-09-29 **instant messaging IM worm JPEG flaw**

DHS IAIP Daily; http://security.itworld.com/4340/040929imworm/page_1.html

September 29, IDG News Service — Instant messaging worm exploits JPEG flaw.

Security experts have spotted the first attempts to create an Internet worm that propagates using instant messages. Researchers at The SANS Institute's Internet Storm Center (ISC) have had two reports of users receiving messages on America Online Inc.'s Instant Messenger service that lured them to Websites containing malicious code, said Johannes Ullrich, chief technology officer at ISC, on Wednesday, September 29. The malicious code attempts to install "backdoor" software on the user's PC that gives remote attackers control over the machine and the victim's instant messenger contacts list, Ullrich said.

2004-11-20 **Google Gmail zx variable remote user cross site scripting attack vulnerability**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2004/Nov/1012289.html

November 20, SecurityTracker — Gmail 'zx' variable input validation bug lets remote users conduct cross-site scripting attacks.

A remote user can access the target user's cookies (including authentication cookies), if any, associated with the Gmail site, access data recently submitted by the target user via Web form to the site, or take actions on the site acting as the target user. It is reported that the zx variable is not properly validated. A remote user can create a specially crafted URL that, when loaded by a target user, will cause arbitrary scripting code to be executed by the target user's browser. From SecurityTracker's testing, it appears that this flaw has been corrected, but that was not confirmed in the report.

2004-11-29 **instant messaging IM logging storage retrieval archiving**

NewsScan; http://www.siliconvalley.com/mld/siliconvalley/10293868.htm

SMARTER IM-ING

Now there's a new service called IM Smarter that stores copies of conversations for later retrieval, a feature that could become quite handy as instant messaging makes inroads into the corporate world. Inventor David Weekly characterizes IM Smarter as an electronic "secretary" that takes notes and alerts you to important events. "The logging will appeal to people who passed notes in school and would keep them in a shoe box. And there are people who use IM for business purposes and want to keep those conversations." IM Smarter's storage capabilities lend fuel to an emerging debate over how ephemeral instant message conversations should be. Many IM-ers assume their conversations disappear when they (and their correspondents) log off. The IM Smarter service is currently free, but Weekly hopes to add advertising to support it, and eventually launch an ad-free premium service that allows users to set up IM alerts for tracking changes to Web sites or eBay auctions. (San Jose Mercury News 29 Nov 2004)

2004-12-08 **Internet security instant messaging IM peer-to-peer virus worm threat tracking**

DHS IAIP Daily; http://www.computerweekly.com/articles/article.asp?liArticle ID=135694&liArticleTypeID=1&liCategoryID=6&liChannelID=22&li FlavourID=1&sSearch=&nPage=1

December 08, ComputerWeekly — Group formed to track IM threats.

A group of Internet security and instant messaging (IM) providers have teamed up to detect and thwart the growing threat of IM and P2P (peer-to-peer) viruses and worms. The consortium, led by corporate IM software suppliers, is setting up a threat center to analyze and warn against the vulnerabilities. It is offering free alerts and e-mail notifications of risk assessments and threat management for subscribers. The group's formation follows evidence that security threats against IM and P2P networks are growing. The group includes Imlogic, McAfee, Sybari Software, Yahoo, America Online and Microsoft. The effort is being co-ordinated at the IMlogic Threat Center at http://www.imlogic.com/im_threat_center/index.asp

2005-01-13 **Google mail Gmail flaw accident hack Unix community source code boundaries no update issued**

DHS IAIP Daily; http://www.vnunet.com/news/1160489

ACCIDENTAL HACK REVEALS GMAIL FLAW

A Unix community group has reported a flaw in Google's free Gmail email service which it warns could compromise user information. Two members of HBX Networks, going by the monikers 'Hairball' and 'MrYowler,' were testing a Perl script that would send out a newsletter. When they tried to reply to the test email the page displayed HTML code which included the names and passwords of other users. The problem appears to come from poorly defined code boundaries on Google's mail server. The community group members do not propose a workaround beyond informing Google of the problem.

2005-03-10 **secure instant messaging IM companies businesses meet privacy concern unauthorized use detection**

DHS IAIP Daily;
http://www.computerworld.com/softwaretopics/software/groupwa
re/story/0,10801,100298,00.html

COMPANIES TURN TO SECURE INSTANT MESSAGING TO MEET PRIVACY CONCERNS

With the use of instant messaging (IM) on an upswing, companies concerned about security, regulatory and privacy issues are sometimes turning to secure IM solutions that allow only authorized users access to IM – while stopping others from sending instant messages. Available software provides businesses with control and administration of all IM activity by their workers, including dynamic detection and routing of IM use on the network, and prevention of unauthorized IM usage. Lawrence Orans, an analyst at Gartner Inc., said IM technology tools can now increase security because they allow businesses to set policies on permitted IM usage. While some companies do little to monitor their employees' IM use, the potential for viruses and network attacks will make it more important that they pay attention to potential problems, he said. "It will increasingly become risky to look the other way," Orans said. Another analyst, Robert Mahowald at IDC Inc., warned that there are still pitfalls to instant messaging, even with the use of secure applications. "You've significantly increased your chances of blocking [viruses and other problems] by having a secure IM solution in place," Mahowald said. "But it doesn't completely solve the problem."

2005-03-22 **instant messaging IM threat hacker spread malicious code research**

DHS IAIP Daily; http://www.vnunet.com/news/1162084

HACKERS INCREASINGLY SPREADING MALICIOUS CODE VIA INSTANT MESSAGING.

Attacks using instant messaging (IM) as an unprotected backdoor in enterprises are reaching epidemic proportions, industry experts have warned. Analyst firm IDC Research said that the problem is leading to a sharp hike in highly sophisticated IM attacks that spread malicious code and worms directly into organizations without any end-user intervention. "Hackers and virus writers have realized that the next vulnerable area for attack within an organization is to spread malicious code via IM," said Brian Burke, research manager for security products at IDC. Hackers are increasingly using IM as a vector for phishing scams and for so-called 'pharming' attacks, malicious redirects where thousands of IM users are persuaded to click on a link to a bogus, malware-infected Website. According to security firm Websense, incidents involving hackers using IM soared by 300 percent during the first quarter of 2005, compared with the fourth quarter of 2004. "Social engineering and vulnerabilities within IM client technologies are being used to gain access to hosts," said Dan Hubbard, senior director of security and technology research at Websense.

2005-04-05 **instant messaging IM chat security threat rise IMLogic industry consortium virus worm spam phishing attacks**

DHS IAIP Daily;
http://news.com.com/IM+threats+rise+sharply%2C+report+confir ms/2100−7349_3−5655267.html

INSTANT MESSAGING THREATS RISING SHARPLY, REPORTS CONFIRM

According to a report issued Tuesday, April 5, by the IMlogic Threat Center – an industry consortium led by security software maker IMlogic – the quantity of instant messaging (IM) threats increased 250 percent in the first quarter of 2005, compared with the same period last year. The research, which tracks viruses, worms, spam and phishing attacks sent over public IM networks, also contends that reported incidents of newly discovered IM threats have grown by 271 percent this year. In addition, the study found that more than 50 percent of the incidents reported to the Threat Center during the first quarter of 2005 involved attacks at workplaces where freely available IM software such as AOL Instant Messenger, MSN Messenger, Windows Messenger, and Yahoo Messenger is used. Based on that data, the consortium advises that companies take a closer look at managing IM security issues. Report: http://imlogic.com/news/press_107.asp

2005-04-19 **virus writing focus e-mail instant messaging IM shift automatic spread MSN Messenger Visual Basic VB programming language**

DHS IAIP Daily; http://www.vnunet.com/news/1162557

REPORT SAYS VIRUS WRITERS TURNING FROM E-MAIL TO IM

Email worms are falling out of favor with the hacking community, according to a report investigating malicious Internet activity. Instead malware authors are increasingly subverting vulnerable instant messenger (IM) systems and using network viruses that do not require user interaction to spread. Other threats identified include botnets and increasingly intrusive adware. The report, " Malware Evolution. January-March 2005," from security firm Kaspersky Labs notes that viruses for IM systems started to appear late last year but are only now appearing in volume. Seven out of every eight IM worms attack Microsoft's MSN Messenger service. "Improved antivirus technologies, and increased user awareness of security issues are clearly forcing virus writers and hackers to use new approaches to access users' information and systems," said Alexander Gostev, senior virus analyst at Kaspersky Labs. The study identifies 40 individual IM worms in the first quarter of the year, the majority written in one of the simplest computer languages, Visual Basic (VB). It noted that use of this language indicates the authors are relatively unsophisticated coders, since VB is not widely used by experts because it is so slow to run. Report: http://www.viruslist.com/en/analysis?pubid=162454316

2005-08-04 **instant messaging IM threat trend multiple network attack**

DHS IAIP Daily; http://www.techweb.com/wire/security/167101004

NEW TREND FOUND IN IM ENTERPRISE THREATS

Nearly a quarter more new viruses threatening corporate computers through employee use of public instant-messaging networks were discovered last month, including one that reflected a new trend of attacking multiple IM systems, a security firm said. A total of 42 new threats were tracked in July, a 24 percent increase over the previous month, San Diego-based Akonix Systems said. July had the second highest number of new threats seen by Akonix since the beginning of the year. The highest was in April, when 48 were found. Five new viruses were discovered in July, including Rants, Prex, Kirvo, Hagbard and Lamar. The Akonix Security Center also found new variants of previous malware, including Kelvir, Bropia, Opanki and Oscabot. Of particular concern was the Rants virus, which was found on two different IM networks, David Jaros, director of product marketing for Akonix, said. In April, Akonix started seeing the same virus written for separate networks, such as AIM from America Online and Yahoo Messenger. Since then, the security firm has seen several multi-network viruses. "The virus writers are no longer focusing on one network," Jaros said. "They're broadening the number of users as potential targets."

2005-11-02 **instant messaging IM secure productive AOL MSN Yahoo merger**

DHS IAIP Daily; ttp://www.esecurityplanet.com/best_practices/article.php/3561171

SECURE AND PRODUCTIVE WORKPLACE INSTANT MESSENGING

With the possible merger of AOL's AIM, MSN Messenger and Yahoos Messenger there will approximately 275 million users communicating over the internet. This has led to a vital part of the workday for many individuals. One of the advantages is that instant messaging allows for inexpensive communication between individuals. In addition, more recently there is now have video conferencing or voice-chats with minimal fuss and no extra charges. There are some perceived disadvantages to using IM, which includes lost productivity. However, one way to deal with this is to provide appropriate training to employees about proper usage of IM and that it should be treated much like e-mail.

2005-11-30 **instant messaging IM threats November 2005 skyrocket**

DHS IAIP Daily; http://www.messagingpipeline.com/news/174402978;jsessionid=XKU0HNGVXMREEQSNDBCCKH0CJUMEKJVN

INSTANT MESSAGING THREATS SKYROCKET IN NOVEMBER

Akonix Systems, the San Diego, CA, provider of instant messaging (IM) security systems, said that its Security Center team tracked 62 IM-based attacks in November, a 226-percent increase over last month. The most significant new finding was that viruses no longer discriminate against specific IM systems, and can have a far costlier impact in terms of potential damage. Akonix reported that 36 percent of the IM attacks hit more than one public network and 13 percent of the attacks had the capability to spread through all four major IM networks. The Akonix Security Center noted that 58 of the worms detected were variants of previous worms, while four new worms were introduced during November. "November marked the highest number of IM threats that we have ever seen to date, proving that hackers see this real-time communications medium as a wide-open security hole in corporate networks," said Don Montgomery, vice president of marketing at Akonix Systems, in a prepared statement.

2006-01-04 **instant messaging IM exploit WMF vulnerability study**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/holes/story/0,10801,107455,00.html 23

ATTEMPTS TO EXPLOIT WMF VULNERABILITY BY INSTANT MESSAGING MULTIPLY

Security researchers have logged more than 70 variations of instant messages (IM) attempting to exploit the Windows Metafile (WMF) vulnerability since the first were reported on Saturday, December 31. Malicious WMF files can be distributed via a number of channels, including e-mail, Websites, peer-to-peer file sharing services and IM systems. An attacker may be able to gain control of an IM user's computer by sending such a file, or a link to a Website where one is hosted, through an IM system and then tricking the recipient into clicking on the file or link. The first attempts to do this were logged on Saturday morning, when security researchers at Kaspersky Labs Ltd. Received reports of a wave of attacks on Dutch users of the MSN Messenger service. They had received messages inviting them to click on a link to a Website containing an image with the name "xmas-2006 FUNNY.jpg." Anyone following the link would set in motion a chain of events, beginning with the download of a Trojan horse identified by Kaspersky as Trojan-Downloader.VBS.Psyme.br. This in turn would try to install a bot named Backdoor.Win32.SdBot.gen, which would then receive instructions over an Internet Relay Chat (IRC) channel to download IM-Worm.Win32.Kelvir.

2006-01-18 **vulnerability Mozilla Thunderbird e-mail client execute arbitrary programs**

DHS IAIP Daily; http://www.securiteam.com/windowsntfocus/5CP0J2KHFO.html 23

MOZILLA THUNDERBIRD ATTACHMENT SPOOFING VULNERABILITY

Mozilla Thunderbird displays attachments in a wrongful manner which allows attackers to spoof attachments and convince users to execute arbitrary programs. The vulnerability is caused due to attachments not being displayed correctly in mails. This can be exploited to spoof the file extension and the associated file type icon via a combination of overly long filenames containing white spaces and "Content-Type" headers not matching the file extension. Successful exploitation may lead to malware being saved to the desktop. Vulnerable systems include Mozilla Thunderbird versions 1.0.2, 1.0.6, and 1.0.7; Mozilla Thunderbird version 1.5 is immune.

2006-02-10 **IBM Lotus Domino iNotes Client script insertion vulnerabilities exploit**

DHS IAIP Daily; http://secunia.com/advisories/16340/ 23

IBM LOTUS DOMINO INOTES CLIENT SCRIPT INSERTION VULNERABILITIES.

Some vulnerabilities have been reported in Lotus Domino iNotes Client, which can be exploited by malicious people to conduct script insertion attacks. Analysis: 1) Attached files (e.g. ".html" files) are opened in the context of the site if the user clicks on it. This can be exploited to execute arbitrary JavaScript code in the context of the user's session. 2) The e-mail subject is not properly sanitized before being displayed to the user as the browser title. This can be exploited to execute arbitrary JavaScript in the context of the user's session when the user views a received e-mail. 3) It is possible to bypass certain security checks related to "javascript:" URLs by inserting "
" in the middle of the URL. This can be exploited to execute arbitrary JavaScript code in the context of the user's session. 4) The attachment filename is not properly sanitized before being displayed to the user. This can be exploited to execute arbitrary JavaScript in context of the user's session when the user views a received e-mail. Solution: Update to version 6.5.5 or 7.0.1.

2006-02-21 **Microsoft Kaspersky Lab error e-mail trouble Antigen security software**

DHS IAIP Daily; http://news.com.com/Kaspersky+update+zaps+Microsoft+antiviru s/2100−1002_3−6041792.html?tag=cd.top 23

MICROSOFT AND KASPERSKY LAB HAVE RECOVERED FROM ERROR CAUSING SIGNIFICANT E-MAIL TROUBLES.

Microsoft and Kaspersky Lab have recovered from an error that caused significant e-mail troubles for some users of Microsoft's Antigen e-mail security software. Antigen users started receiving updates for their Kaspersky Lab antivirus engine again on Tuesday, February 21. Microsoft and Kaspersky had put those on hold after a flawed update caused trouble last week, representatives for Microsoft and Kaspersky said Tuesday. "As far as both parties are concerned, the problems have been addressed and its business as usual," said Steve Orenberg, president of Kaspersky's North American operations. The problems left some people without fully functional e-mail systems for as long as 10 hours. The culprit was a routine update to the Kaspersky antivirus engine, which was distributed early Thursday morning, February 16. Microsoft in the afternoon offered the previous version of the engine for download to solve the problem. While halting the updates for the Kaspersky engine for several days meant that one engine wasn't updated, users were still protected by the other engines and updates.

2006-03-22 **US CERT Cyber Security alert Sendmail vulnerability race condition solution upgrade**

DHS IAIP Daily; http://www.uscert.gov/cas/techalerts/TA06−081A.html 23

US-CERT TECHNICAL CYBER SECURITY ALERT TA06-081A: SENDMAIL RACE CONDITION VULNERABILITY.

A race condition in Sendmail may allow a remote attacker to execute arbitrary code. Sendmail contains a race condition caused by the improper handling of asynchronous signals. In particular, by forcing the SMTP server to have an I/O timeout at exactly the correct instant, an attacker may be able to execute arbitrary code with the privileges of the Sendmail process. Systems affected: Sendmail versions prior to 8.13.6. Solution: Upgrade Sendmail: Sendmail version 8.13.6 has been released to correct this issue: http://www.sendmail.org/8.13.6.html Patches to correct this issue in Sendmail versions 8.12.11 and 8.13.5 are also available. Version 8.12.11: ftp://ftp.sendmail.org/pub/sendmail/8.12.11.p0 Version 8.13.5: ftp://ftp.sendmail.org/pub/sendmail/8.13.5.p0

2006-03-28 **F-Secure Messaging Security Gateway Sendmail code execution vulnerability solution update**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2006/1139 23

F-SECURE MESSAGING SECURITY GATEWAY SENDMAIL CODE EXECUTION VULNERABILITY.

A vulnerability in Sendmail may permit a specially crafted attack to take over the Sendmail MTA process, allowing a remote user to execute commands and run arbitrary programs on the system. Analysis: F-Secure Messaging Security Gateway Appliances use Sendmail. The vulnerability may permit a specially crafted attack to take over the Sendmail MTA process, allowing a remote user to execute commands and run arbitrary programs on the system. Affected products: F-Secure Messaging Security Gateway X200 version 3.1.0 and prior; F-Secure Messaging Security Gateway X200 version 3.2.4 and prior; F-Secure Messaging Security Gateway P600 version 3.1.0 and prior; F-Secure Messaging Security Gateway P600 version 3.2.4 and prior; F-Secure Messaging Security Gateway P800 version 3.1.0 and prior; F-Secure Messaging Security Gateway P800 version 3.2.4 and prior. Solution: Hotfixes are automatically distributed through the delivery system.

2006-04-04 **McAfee WebShield SMTP remote format string vulnerability arbitrary code execution solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/16742/references 23

MCAFEE WEBSHIELD SMTP REMOTE FORMAT STRING VULNERABILITY.

McAfee WebShield SMTP 4.5 MR1a is susceptible to a remote format string vulnerability. There exists a format string vulnerability within the McAfee WebShield SMTP server which allows an attacker to execute arbitrary code on the host computer via an unauthenticated connection. With successful exploitation, an unauthenticated attacker is able to obtain SYSTEM access. Solution: The vendor has released a patch (P0803), along with version 4.5 MR2 to address this issue. Users of affected packages should contact the vendor for further information on obtaining fixes.

Category 23.5 *E-mail & instant messaging or chat*

2006-04-05 **sendmail asynchronous signal handling remote code execution vulnerability privilege grant solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/17192/references 23

SENDMAIL ASYNCHRONOUS SIGNAL HANDLING REMOTE CODE EXECUTION VULNERABILITY.

Sendmail is prone to a remote code execution vulnerability. Analysis: Compromise of networks and machines using affected versions of Sendmail may lead to exposure of confidential information, loss of productivity, and further network compromising. An attacker does not need to entice any kind of user interaction to trigger this vulnerability. Successful exploitation would grant an attacker the privileges that the Sendmail server daemon is running with. For a complete list of vulnerable products: http://www.securityfocus.com/bid/17192/info Solution: The vendor has released version 8.13.6 to address this issue. For further solution details: http://www.securityfocus.com/bid/17192/solution

2006-04-20 **Microsoft Outlook Express patch erases addresses quality assurance flaw**

DHS IAIP Daily; http://www.informationweek.com/news/showArticle.jhtml;jsessionid=SSYKRYB5EYMMKQSNDBGCKHSCJUMEKJVN?articleID=186500318 23

MICROSOFT PATCH 'ERASES' OUTLOOK EXPRESS ADDRESSES.

Another Microsoft patch from the batch released last week is apparently causing problems, at least according to numerous Windows users on the Redmond, WA, developer's official message boards. After applying the patch from security bulletin MS06-016, say dozens of users, their Outlook Express e-mail client's address book disappeared and form-style messages can't be sent. The problem said users, including several Microsoft MVPs, was the MS06-016 patch (also tagged as KB911567). Uninstalling the patch returned the address book to its prior state and allowed template-based messages to be e-mailed normally.

1997-01-05 **Netscape**

RISKS 18 74

A new bug in Netscape 3.0, 3.01 and 4.01 beta 1 allows a Web site to obtain a browser's e-mail address.

Category 23.6 *Web-site infrastructure, general Web security issues*

1997-01-13 **security Web e-commerce**

Computerworld Web site

O'Reilly & Associates published a survey of 648,613 Web sites in which they found that only 10% of the sites use SSL and only 0.5% offer third-party authentication (necessary for customers to be sure that they are dealing with the business they think they are connected to and not an imposter-site).

Category 23.6 *Web-site infrastructure, general Web security issues*

1997-03-27 **electronic commerce Web browser hole SSL**

Inter@ctive Week, RISKS

A newly-discovered hole in Web security allows information from a secure transaction to be captured by subsequent Web sites. Eugene Spafford and Steve Bellovin concur that the problem is a serious issue that will require major re-engineering to surmount. Patches are expected to take weeks.

Category 23.6 *Web-site infrastructure, general Web security issues*

1999-02-10 **e-commerce credit card personal information password privacy**

RISKS 20 20

Prof. Ross Anderson of Cambridge University analyzed requirements on the AMAZON.COM online bookstore for credit card number, password, and personal details such as phone number. He identified several risks: (1) merchant retention of credit card numbers poses a far higher risk of capture than of capture in transit; (2) adding a password increases the likelihood of compromise because so many naïve users choose bad passwords and then write them down; (3) even the British site for Amazon contravenes European rules on protecting consumer privacy; (3) such practices make it easier for banks to reject their clients' claims of fraudulent use of their credit-card numbers.

Category 23.6 *Web-site infrastructure, general Web security issues*

2000-05-15 **Web programming QA quality assurance vulnerability fix**

RISKS, Zope (http://www.zope.org/Members/jim/ZopeSecurity/ClientSideTrojan 20 89

Chris Adams summarized a widespread vulnerability in Web-site administration tools: "Basically, an attacker could create a page that redirected to site's admin interface or a form that submitted to it (possibly using JavaScript for automatic submission); in any case, the effect was that any use who was logged in as a site administrator could have an attacker execute arbitrary commands in their security context merely by following a link. If this was carefully set up using JavaScript and frames, it's more than possible that the admin would never notice what had happened. This attack would be particularly effective against online news sites and anyone else for whom it is common to receive many URLs every day as submissions." Adams pointed out that an easy fix was to make it more difficult to guess the form parameters for generating the URLs: "given that you need to have a random identifier that is not leaked to third parties for meaningful session management, an obvious step is to put in a parameter in the form that must match the user's session ID (e.g. Confirm=346593045 instead of Confirm=true)."

Category 23.6 *Web-site infrastructure, general Web security issues*

2000-05-26 **cache certificate user interface error QA quality assurance design flaw vulnerability exploit**

RISKS, CERT-CC http://www.cert.org/advisories/CA-2000-08.html 20 89

Kevin Fu reported in RISKS that Netscape Navigator has a flaw in the user interface for dealing with invalid certificates: "Within one Netscape session, if a user clicks on "continue" in response to a "hostname does not match name in certificate," then that certificate is incorrectly validated for future use in the Netscape session, REGARDLESS of the hostname or IP address of other servers that use the certificate. It seems that the "Certificate Name Check" warning will cache a certificate as valid for any hostname or IP address in the future. In this way, if an adversary tricks a user into accepting an invalid certificate at a seemingly benign site, then the user can then be tricked if he/she ever visits a malicious site using the same certificate. A `continue' click on a seemingly benign SSL web server might end up taking away server authentication from visiting https://www.a-site-that-you-give-private-info.com/ that has poisoned DNS." Fu concludes that this case raises serious questions:
(1) A user interface should be explicit; "Continue" is an insufficient indicator of function.
(2) Implementing security is hard, and the failure of Netscape should raise warning flags about implementation by other companies who invent their own security solutions.

Category 23.6 *Web-site infrastructure, general Web security issues*

2000-06-01 **malicious code executable compression stupidity risk management sneakernet air gap copyright UCITA license dissemination control**

RISKS 20 90

Avi Rubin complained in RISKS about how Microsoft distributed a white paper — by offering a self-extracting executable file. "Of all companies, Microsoft should be the last one to encourage users to get into the habit of downloading .exe programs and running them. . . . The problem is that it is very difficult to know that a program is harmless, just because it does something that you expect it to do. I could not believe that this is how Microsoft distributes its white papers. It is beyond comprehension."

In the next issue of the RISKS Forum Digest, Paul Wallich suggested that putting a document into an executable file might be a way of restricting distribution: "Bundling the file into an executable, however, arguably meets the requirements of the Digital Millennium Copyright Act for a technological copy-protection mechanism, which makes unauthorized redistribution of the text a serious crime (where `serious' means `you could go to jail for more than a year'). . . . If you view control, rather than dissemination, as the goal of putting documents on a web site, it's easy to comprehend."

Category 23.6 *Web-site infrastructure, general Web security issues*

2000-06-29 **confidentiality Web security failure**

RISKS 20 94

Keith Rhodes reported in RISKS, "In Australia, someone claimed to have accessed a Treasury Department Web site www.gstassist.gov.au that had essentially no security. By indexing from 1 to 17,000, he was able to obtain the bank records of that many registered GST Startup certificate suppliers. (There were apparently 27,000 records in all, but access stopped when the site was disabled.) He then sent e-mail to each these companies (which can honour a $200 GST-related rebate on computers, software, services and other items required for small and medium companies to prepare for Australia's new taxation system) with its own relevant details."

Category 23.6 *Web-site infrastructure, general Web security issues*

2000-07-18 **QA quality assurance Web design encryption false information cleartext transmission**

RISKS 20

The Royal Mail Web site claimed that it was using encrypted traffic to capture credit-card information when in fact it was not. An alert RISKS contributor, Gary Barnes noticed that his browser was in HTTP mode rather than HTTPS mode. Two weeks after he reported the problem, the incorrect protocol and the incorrect assurance of security were still in place. He wrote, "The RISK here is that customers will believe a web site that says `all orders sent from your computer to our servers [...] will be secured through the use of encryption technology', especially when the organisation responsible is as `trustworthy' as Royal Mail, and then trustingly send their unencrypted card details over the Internet. There's also the RISK that once alerted to such mistakes companies won't or can't act to fix the problem in a timely fashion, or at least remove their incorrect boasts of being `secure'."

Category 23.6 *Web-site infrastructure, general Web security issues*

2000-08-03 **confidentiality passwords e-mail access design Web security flaw vulnerability management process operations**

RISKS 21 03

During the month of July, an internal search page allowing access to user IDs and passwords was made world-readable on Switzerland's second-largest ISP. Over 700 accounts were compromised on the Sunrise ISP due to at least 20 different searches. Such a lapse is a violation of the European Directive on Data Privacy. Peter Kaiser, writing in RISKS, pointed out that storing unencrypted passwords is a terrible idea, let alone when the only protection was security by obscurity. He also pointed out to the ISP that their practice of soliciting user passwords in unsecured HTTP (instead of HTTPS) was a bad idea, but his warnings were ignored.

Category 23.6 *Web-site infrastructure, general Web security issues*

2000-08-16 **Web site URL ID strings data diddling modification access public relations privacy**

RISKS 21

The dangerous practice of encoding identifiers in URLs was exposed once again by Paul van Keep in RISKS, who reported that the < annapa.com > Web site allows anyone to alter the identifier in the URL for an account to access other accounts. Unfortunately, the company belittled the exploit, claiming that it was somehow restricted to "IT-specialists" only and therefore not a significant vulnerability.

Category 23.6 *Web-site infrastructure, general Web security issues*

2000-08-17 **Web site security log files accessibility access controls attributes**

RISKS 21 02

The Canadian _Globe and Mail _ (sometimes referred to as the _Groan and Wail_) Web site has world-readable log files that record, among other things, the exact IP address and search string of every request.

Category 23.6 *Web-site infrastructure, general Web security issues*

2000-08-25 **user identification policy problem vulnerability error flaw design stupidity confidentiality**

RISKS 21

Hotmail makes buddy lists available to anyone who registers an e-mail account using the name of an expired account. However, as Jay Ashworth noted in RISKS, more important is that allowing reuse of an identifier opens up enormous potential for impersonation and fraud.

Category 23.6 *Web-site infrastructure, general Web security issues*

2000-08-27 **Web design flaw inconsistency**

RISKS 21 04

Daniel P. B. Smith noted in RISKS that the eBay online auction Web site shows a time counter on each auction's Web page. Unfortunately, although the counter is updated in real time, the rest of the status information — including how many bids there are — does not get updated as frequently. He goes on to describe an embarrassing situation where he accepted an early, lower bid because he never received updates from eBay about a later, higher bid.

Category 23.6 *Web-site infrastructure, general Web security issues*

2000-10-03 **Web design glitch bug unknown access typo search confidentiality world readable medical information**

RISKS 21 09

Mistyping a search keyword on the Florida Department of Health's Web site caused the mystified user to access sensitive files including names, addresses and medical information. The state CIO apologized for the glitch and said the Health Department would continue investigating the glitch to find the cause and stop recurrence of such errors.

Category 23.6 *Web-site infrastructure, general Web security issues*

2000-10-24 **Web design flaw URL confidentiality**

RISKS 21 09

The New Jersey EZPASS Web site was shut down after it became clear that anyone could access the billing information for other users by altering a URL to transform it into someone else's URL. [MORAL: don't design Web sites so that identification information is encoded in URLs.]

Category 23.6 *Web-site infrastructure, general Web security issues*

2001-03-16 **e-commerce electronic data interchange EDI vulnerabilities weakness audit government tax confidentiality integrity penetration**

RISKS 21 28

Dave Stringer-Calvert, writing in RISKS, reported a finding by the GAO of lax security in IRS electronic filing systems:

"Even as the IRS was assuring taxpayers last year that electronic filing of tax returns was secure, serious shortcomings existed that could have allowed hackers to view and even change information on returns, a government watchdog agency said. The General Accounting Office found no evidence that hacking had occurred, but it said its investigators were able to gain unauthorized access to the tax agency's electronic filing system, which will handle a third of all federal returns this year. The GAO cited the IRS for lax security controls and for not requiring encryption of electronic returns. The report also said the IRS sent out $2.1 billion in refunds to taxpayers whose returns were not properly authorized."

Category 23.6 *Web-site infrastructure, general Web security issues*

2001-05-01 **buffer overflow QA quality assurance Web server**

NIPC Daily Report

Microsoft has released security bulletin MS01-023 regarding a security flaw that could allow a hacker to gain complete control of a Web site running IIS 5.0 server software for Windows 2000. The security vulnerability results because the ISAPI extension contains an unchecked buffer in a section of code that handles input parameters. This could enable a remote attacker to conduct a buffer overrun attack and cause code of their choice to run on the server. Such code would run in the Local System security context. This would give the attacker complete control of the server. Additional information regarding this vulnerability can be found at
http://www.microsoft.com/technet/security/bulletin/MS01-023.asp. (Source: Microsoft Corporation, 1 May)

Category 23.6 *Web-site infrastructure, general Web security issues*

2001-05-02 **criminal hacker tool exploit Web servers vulnerabilities rootkit patch**

NIPC Daily Report

A hacker, using the name "Dark Spyrit," released a program on 2 May designed to exploit the security hole in Windows 2000 Web servers. The program will give anyone with limited technical knowledge the ability to completely control a Windows 2000 server running version 5 of Microsoft's Internet Information Server (IIS) Web software. The creation of the exploit code for the flaw came as no surprise to Microsoft. "Customers who have applied the patch don't have to worry," the company said in a statement. "Customers who haven't applied the patch should take this as a reminder to do so immediately." (Source: ZDNet News, 3 May) (NIPC Comment: The NIPC issued Advisory 01-011 on 2 May, reporting the vulnerability in Microsoft s Internet Information Services (IIS) 5.0. www.nipc.gov/warnings/advisories/2001/01-011.htm.)

Category 23.6 *Web-site infrastructure, general Web security issues*

2001-06-12 **distributed computing Web design denial of service availability saturation**

RISKS 21 48

Steve Loughran noted in RISKS that the SETI@home screensaver that does computations for the Search for Extraterrestrial Intelligence project inadvertently caused a problem when Internet access to the SETI@home site became inaccessible. Seems the screensaver repeatedly attempted to "phone home" and saturated the Network Address Translation (NAT) pool of addresses. Mr Loughran noted, "The article closes by saying the problem was "solved" by increasing the number of available NAT addresses, although of course that didn't fix the problem, merely caused it to 'go away'. A real solution would be to have the screen-saver software implement incremental backoff and other mechanisms designed to gracefully handle a complete loss of remote server access. One would hope that the authors of the next generation of distributed computation applications take heed of the lessons of the current batch."

However, a staff member from SETI@home noted later, "One of the risks of developing any software is that problems experienced by users will be associated with the design of the software, not the failure of other components. The GUI version of SETI@home, upon connection failure, retries the connection twice at 45 second intervals. After the third failure the program waits 60 minutes before retrying. The UNIX version waits 60 minutes between connection failures. Apart from this report, I am unaware of any TCP/IP implementation that is unable to support 3 connection attempts per hour."

Category 23.6 *Web-site infrastructure, general Web security issues*

2001-08-31 **cross-site scripting vulnerability Web hack e-commerce digital cash e-wallet e-mail patch**

NewsScan

HOTMAIL HACKABLE WITH ONE LINE OF CODE [31 Aug 2001]
Security consultant Jeremiah Grossman was able to break through Microsoft's Hotmail and Passport protection schemes with just one line of code. Microsoft has patched the code, but Grossman says he could do it again in eight hours of work. His hacking experiment used a "cross-site scripting" technique that attaches invasive code onto programs used to make Web pages more interactive. Grossman calls them "a breeding ground for new types of Web security vulnerabilities," and Shawn Hernan of the Computer Emergency Response Team at Carnegie Mellon University says that "it's easy to dream up very, very bad scenarios." (USA Today 31 Aug 2001)

Category 23.6 *Web-site infrastructure, general Web security issues*

2001-12-06 **Internet security architecture implementation failure penetration vulnerability hacking intrusion**

RISKS 21 81

Peter G. Neumann summarized an article entitled, "Security hole at WorldCom left internal computer networks at risk" from the Associated Press:

"A security hole at WorldCom Inc. left internal networks at several of the nation's top companies (e.g., AOL Time Warner, Bank of America, CitiCorp, News Corp., JP Morgan, McDonald's Corp., Sun Microsystems) open to hackers. Adrian Lamo, a consultant in San Francisco, worked with WorldCom to fix the months-old problem over the weekend. There is no evidence that the security hole had been exploited, although it was possible to reconfigure or shut down corporate networks. Lamo: ``These networks were never designed to be connected to the Internet, They were private circuits running between locations." [Source: eponymous AP item, 05 Dec 2001, PGN-ed] "
http://www.siliconvalley.com/docs/news/tech/080991.htm

Category 23.6 *Web-site infrastructure, general Web security issues*

2002-01-07 **Web site design ActiveX operating system compatibility standards security**

RISKS 21 86

Koos van den Hout noted in RISKS that the mcafee.com Web site "shows a pop-up asking me to enable an ActiveX plug-in. . . . The fact that I am using a different operating system for which an ActiveX plug-in isn't available at all has never crossed the mind of whoever designed that." As he continued his browsing, he found that when he used the text-based Lynx 2.8.2 browser for Unix, he was told to lower the security setting for his browser -- in terms clearly indicating that the designer was taking MS Internet Explorer for granted.

Category 23.6 *Web-site infrastructure, general Web security issues*

2002-01-10 **confidentiality SSL https implementation failure URL QA quality assurance**

RISKS 21 86

Skip La Fetra pointed out in RISKS that some Web sites boasting of SSL and HTTPS connections construct URLs that contain sensitive details of a transaction. In his example, one page constructed a URL "https://securesite.com/verification.htm?name=3Dyyyyyy,CardNumber=3D12345=6789,ExpirationDate=3D12/31/2001" which Being part of the URL "address", this information included his name, address, credit card number, and expiration date. Such URLs _can_ be intercepted and the information abused despite the encryption of the page contents.

Category 23.6 *Web-site infrastructure, general Web security issues*

2002-01-10 **SSL https e-mail insecure transmission privacy design**

RISKS 21 86

J. Debert noted an inconsistency in attempts to protect consumer privacy:
>ATT allows customers to send form mail using SSL on their Web site. This is to keep their customer's info and the message private.

But their people include the entire message in plaintext e-mail messages sent in response defeating the purpose of the secure form.<

2002-03-11 **quality assurance QA Web design I&A identification authentication password failure flaw goofball idiots fools stupidity absurd**

RISKS 21 94

Grant Bayley reported that in Australia, an error in the programming for the Web-based registration system for names in the .org.au, .gov.au, and .edu.au domains allowed anyone to change ownership details of any domain instantly without even knowing the right password. Such a hole would have allowed complete hijacking of every non-commercial domain in Australia, including police forces and state governments.

Category 23.6 *Web-site infrastructure, general Web security issues*

2002-03-14 **design QA quality assurance Web URL discounts confidentiality**

RISKS 22 01

Saab USA sent out a promotion offering discounts to people who used a Web site with unique URLs for each recipient. Unfortunately, the URLs used sequential ID numbers. Entering a randomly-generated URL resulted in access to the name and address of some other recipient of the offer. In addition, there was nothing to stop users from printing more than one of the supposedly mutual discount offers available on the Web site, thus resulting in more discounts than the company apparently intended to offer. When Ron Gut, who reported on this case to RISKS, tried to use Saab's contact form to suggest improvements, he discovered that the form did not work with Netscape v4.7.

Category 23.6 *Web-site infrastructure, general Web security issues*

2002-03-27 **identity theft confidentiality online auction I&A identification authentication denial of service Web design passwords timeout inactivation lock penetration brute force dictionary attack password cracking**

RISKS, http://zdnet.com.com/2100-1106-868306.html 21 98

E-bay acounts are not protected by any limitation on the number of incorect logons; far from including a lockout, the service does not even impose a timeout. The system is ripe for brute-force, automated password-cracking. According to Scott Nicol, writing in RISKS, e-Bay chose this strategy to preclude denial-of-service attacks that become too easy when an account is locked simply because of repeated bad passwords. [MK notes: This is a classic example of the tradeoffs that different security measures impose: add a delay and you have made the attacker's job easier if their goals is DoS – they just have to send the same wrong password often enough to initiate another timeout. A reasonable approach would be to leave the zero-knowledge approach and look for patterns of attack so that the system can selectively respond to _attacks_ and not to _mistakes_.]

Category 23.6 *Web-site infrastructure, general Web security issues*

2002-04-22 **vulnerabilities buffer overflow database server arbitrary code**

Security Wire Digest 4 31

Shawna McAlearney wrote in Security Wire Digest about an important patch:

>Microsoft last week [mid-April 2002] urged SQL Server users to immediately patch a vulnerability that could allow an attacker to run code of choice on a target machine.

Ranked as a "moderate" threat by Microsoft, the "SQL Extended Procedure Functions Contain Unchecked Buffers" flaw affects SQL Server 7.0/2000. Those versions provide extended stored procedures that fail to validate input correctly, making them susceptible to buffer overflows.

An attacker exploiting the flaw could cause the SQL Server service to fail, or run code in the security context in which SQL Server is running--by default set to domain user. Microsoft says the precise privileges the attacker could gain depend upon the specific security context that the service runs in.

2002-05-05 **privacy browser QA quality assurance bugs flaws weaknesses vulnerabilities exploits demonstrations**

RISKS, http://www.newsbytes.com/news/02/176077.html 22 05

Brian McWilliams wrote in Newsbytes:

Security flaws in privacy features added to Microsoft's Web browser could enable attackers to perform several privacy-robbing attacks, including hijacking victims' MSN Messenger accounts, a security researcher warned. According to Thor Larholm, a developer with Denmark-based Internet portal Jubii.dk, "severe" bugs in the "Privacy Report" feature in Internet Explorer version 6 can be exploited "in effect removing all privacy." Last week, Larholm posted an advisory and harmless demonstrations of the flaws at his personal Web site. One example showed how the browser bugs enable a Web site to launch programs that exist on the user's hard disk. Another demo page silently sends a message to users in the target's MSN Messenger contact list….

2002-05-20 **cumulatative patch weakness flaws QA quality assurance**

Security Wire Digest 4 39

Advisory MS-02-023 caused a fuss because GreyMagic Software complained that the cumulative patch contained major flaws. Shawna McAlearney summarized the situation as follows in Security Wire Digest:

>
GreyMagic says Microsoft misunderstood what it called a cross-site scripting problem. "They only patched a symptom of this vulnerability, not its root cause," says GreyMagic. "The problem is not plain cross-site scripting, the problem is that dialogArguments' security restrictions are bypassed and it is passed to the dialog even though it shouldn't be."

GreyMagic now also contends that Microsoft failed to provide a sufficient patch for an earlier flaw.

"MS02-023 also allegedly patches the cssText issue we found back in February, but the patch is weak and can be easily circumvented," says GreyMagic. "So far we have a bulletin full of errors, which was partly fixed by Microsoft; an incomplete patch to the dialogArguments critical vulnerability, leaving IE 5.0 and IE 5.5 exposed; and a useless patch to the cssText vulnerability, leaving all users exposed to (a) critical vulnerability."

Causing further confusion is the "content-disposition: inline" IE flaw discovered by the LAC Corp. that "allows for downloading of a file and its automatic execution under several circumstances without the knowledge of the user."

Microsoft earlier dismissed LAC's advisory as "inaccurate" and having "nothing to do with either Internet Explorer or the security patch" released last year to fix a similar vulnerability, according to a Newsbytes report. MS02-023 acknowledges that IE 5.01/6 are vulnerable to the attack reported by LAC.

2002-05-23 **fraud loop lockout availability Web design priority I&A identification authentication child protection credit card**

RISKS 22 09

Daniel P. B. Smith presented an interesting case of bad design in his submission to RISKS. He needed to change the privacy settings on his Microsoft Passport account and, while he was at it, he had the idea of altering his name and age on the Web form presented for editing his profile. Unfortunately, he changed his name to Mickey Mouse and claimed he was born on 2001-04-01. This false entry then immediately locked him out of the profile editor because "he" was under 13! The only way to change the record was to create a new account that would allow him to alter the records for his "child." [MK comments: Personally, I don't like the idea of supplying false information to _anyone_. If you don't agree to the terms of a contract, don't accept the contract. The other message I glean from this case is that when you design a fail-safe mechanism, don't convert a process or account from a higher priority to a lower priority without confirming that the change is correct. In this case, a message informing the user, "If you change the birthday to indicate that you are less than 13 years old, you will lose the ability to update your profile" could have prevented the problem.]

FindLaw Download This 90

SECURITY FLAW IN WEB SOFTWARE
A security bug was found in software used by millions of Web sites. Private experts alerted users and the FBI's computer security division. Problem is, they didn't tell the maker of the software. Then they issued the wrong prescription for fixing the problem. The incident Monday involving Apache's Web software shows that the system to insulate the Internet from attack - a joint effort of the government and private companies - is still a long way from perfect.

2002-06-18 **MS IIS alert vulnerability Web server flaw bug weakness patch**

FindLaw Download This 90

MICROSOFT DISCLOSES SOFTWARE FLAW
Microsoft Corp. acknowledged a serious flaw Wednesday in its Internet server software that could allow sophisticated hackers to seize control of Web sites, steal information and use vulnerable computers to attack others online. The software, which runs about one-third of the world's Web sites, is used by millions of businesses and organizations but less commonly by home users. Microsoft made available a free patch for customers using versions of its Internet Information Server software with its Windows NT or Windows 2000 operating systems. The server software included within Microsoft's newer Windows XP operating system was not affected by the security flaw.

2003-01-15 **list top ten Web security vulnerabilities common HTTP exploits**

NIPC/DHS

January 13, Government Computer News — Open-source group names top 10 Web vulnerabilities.

The Open Web Application Security Project has released a list of the top 10 vulnerabilities in Web applications and services. The group said it wants to focus government and private-sector attention on common weaknesses that require immediate remediation. In the longer term, this list is intended to be used by development teams and their managers during project planning," the report noted. "Ultimately, Web application developers must achieve a culture shift that integrates security into every aspect of their projects." OWASP is a volunteer open-source community project created to bring attention to security for online apps. The OWASP vulnerabilities are well known, but continue to represent significant risk because they are widespread. They can be exploited by code in HTTP requests that are not noted by intrusion detection systems and are passed through firewalls and into servers despite hardening. The complete report and list of vulnerabilities is available on the organization's Web site, www.owasp.org.

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-02-06 **Microsoft security bullentin Internet Explorer vulnerability patch**

NIPC/DHS

February 05, Microsoft — Microsoft Security Bulletin MS03-004: Cumulative patch for two vulnerabilities involving Internet Explorer's cross-domain security model.

A flaw in Internet Explorer could allow a malicious web site operator to access information in another internet domain, or on the user's local system by injecting specially crafted code when certain dialog boxes were presented to the user. In the worst case, this vulnerability could allow an attacker to load a malicious executable onto the system and execute it. The attacker would have no way to force a user to a malicious web site. The vulnerability results because it is possible when using dialog boxes to bypass the cross-domain security model that Internet Explorer implements. A related cross-domain vulnerability allows Internet Explorer's showHelp() functionality to execute without proper security checking. In this scenario, the attacker could open a showHelp window to a known local file on the visiting user's local system and gain access to information from that file by sending a specially crafted URL to a second showHelp window. The attacker could also potentially access user information or run code of attacker's choice. Microsoft has assigned a risk rating of "Critical" to these vulnerabilities. A patch is available at the Microsoft website:
http://www.microsoft.com/windows/ie/downloads/critical/81084 7/default.asp. Applying the patch, however, will disable the HTML Help functionality because HTML Help was one of the attack vectors. Users who apply this patch are also encouraged to download the HTML Help update after applying this cumulative patch in order to restore HTML Help functionality.

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-02-19 **list top ten Web security vulnerabilities common HTTP exploits**

NIPC/DHS

February 18, Government Computer News — Open Source group releases list of top 10 Web vulnerabilities.

The Open Web Application Security Project released a list of the top ten vulnerabilities in Web applications and services on Tuesday. The group said it wants the list to focus government and private-sector attention on common vulnerabilities "that require immediate remediation." "Also, in the longer term, this list is intended to be used by development teams and their managers during project planning," the report reads. OWASP is a volunteer Open Source community project created to bring attention to Web application security. It patterned its list on the SANS Institute's and FBI's top 20 list of network vulnerabilities. Like the SANS-FBI list, the OWASP vulnerabilities are well known and have been recognized for years, but continue to represent significant risks because they remain common. They can be exploited by code in http requests that are passed through firewalls and into servers despite hardening and are not noted by intrusion detection systems. The complete report is available from the OWASP Website at www.owasp.org.

2003-03-06 **new vulnerability critical Macromedia Flash player Internet media software patch fix**

NIPC/DHS

March 04, IDG News Service — Macromedia reports critical hole in Flash player.

Macromedia Inc. warned Monday of a "critical" security flaw in the latest version of its Flash animation player and advised users to install an updated to fix the problem. The security flaw affects Version 6 of the Macromedia Flash Player, which was released a year ago this month and has been installed on an estimated 75% of PCs worldwide, according to the company. The vulnerability affects the integrity of the player's "sandbox," which is supposed to act as a cordoned-off area where Flash code retrieved from the Web can be run safely, without access to a user's files. The flaw could allow a malicious hacker to run native code on a user's computer, outside the sandbox, possibly without the user's knowledge, according to information on the company's Web site. No users had reported having been affected by the problem as of Monday evening, a Macromedia representative said. Nevertheless, the company advised users to download a new version of the player — Version 6.0.79.0 — from its Web site immediately. The bulletin, with a link to the download site, is at www.macromedia.com/v1/handlers/index.cfm?ID=23821.

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-03-10 **BIND domain name server vulnerability fix Internet Software Consortium**

NIPC/DHS

March 05, CNET News — Net consortium ties flaws to BIND.

Domain name servers are used to match domain names to numerical Internet Protocol addresses. As the vast majority of these run BIND (Berkeley Internet Name Domain), the software essentially runs the Internet. The Internet Software Consortium (ISC), the group responsible for maintaining the software, released a new version of BIND on Monday, with their Web site billing it as a maintenance release. However, on Wednesday the site had been updated, saying that the ISC had been made aware of vulnerabilities in BIND, adding that upgrading was "strongly recommended." BIND 9.2.1 is vulnerable to a remote buffer overflow bug when installed with the "libbind" nondefault option. Previous versions may also be vulnerable to problems associated with the commonly used OpenSSL library, but again this is a nondefault installation option and has more to do with the SSL library than BIND itself. An updated version of BIND is available at the ISC website: http://www.isc.org/products/BIND/.

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-03-14 **new vulnerability buffer overflow Opera software browser fix**

NIPC/DHS

March 13, eSecurity Planet — Opera rushes out another security fix.

Norway-based Opera Software has pushed out a new version of its Opera 7 browser because of issues surrounding security. The bug, which affects both versions 6.x and 7.x, was detected in the browser's handling of filenames when showing the "Download Dialog" box. "The problem is that very long filenames are handled incorrectly. This allows a malicious website to create a filename that causes a buffer overflow which can be exploited to execute arbitrary code," according to an alert from IT security services firm Secunia. In releasing the new Opera 7.03 version, the company confirmed the Secunia findings. Secunia warned that exploits for the vulnerability are in the wild for Windows, noting that "exploitation does not require user interaction as Web sites can spawn the "Download Dialog" automatically."

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-03-18 **new vulnerability Internet Information Server IIS Microsoft buffer overflow advisory**

NIPC/DHS

March 17, Department of Homeland Security — Unchecked buffer in Microsoft Internet Information Server (IIS), Advisory 03-005.

A security vulnerability is present in a Windows component used by WebDAV. A buffer overflow vulnerability exists in Microsoft IIS 5.0 running on Microsoft Windows 2000. Microsoft Windows 2000 and IIS Version 5.0 support the World Wide Web Distributed Authoring and Versioning (WebDAV) protocol. IIS 5.0 is installed and running by default on Microsoft Windows 2000 server products. An attacker could exploit the vulnerability by sending a specially formed HTTP request to a machine running Windows 2000 server and IIS Version 5.0. The request could cause the server to fail or to execute code of the attacker's choice. The code would run in the security context of the IIS service which, by default, runs in the LocalSystem context. Although Microsoft has supplied a patch for this vulnerability and recommends customers install the patch immediately, additional tools and preventive measures have been provided that customers can use to block the exploitation of this vulnerability while they are assessing the impact and compatibility of the patch. As an initial workaround Administrators can implement Microsoft's URL Scan tool to limit the lengths of URLs passed to the IIS system. Administrators are urged to update IDS signature files as relevant signatures become available; monitor FW, IDS, and other perimeter security devices for probes against port 80 and/or attempts to exploit this vulnerability; monitor information sources for additional alerts regarding possible attack activity; and report any relevant activity (increased port 80 probing or activity, web server crashes, etc.) to your agency Incident Response Capability and FedCIRC. The patch and additional information about this vulnerability are available on the Microsoft Website in Microsoft Security Bulletin MS03-007: Unchecked Buffer In Windows Component Could Cause Web Server Compromise:
http://www.microsoft.com/technet/treeview/default.asp?url=/t echnet/security/bulletin/MS03-007.asp See also CERT Advisory CA-2003-09: Buffer Overflow in Microsoft IIS 5.0 available at
http://www.cert.org/advisories/CA-2003-09.html

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-03-26 **new exploit Microsoft Windows 200 flaw Internet Information Server IIS patch fix**

NIPC/DHS

March 24, CNET News.com — Program exploits Windows 2000 flaw.

A Venezuelan security consultant has released a small program designed to compromise Microsoft Internet Information Service servers that haven't had a recent security hole patched. Monday's public release of the program's source code—known in security parlance as an exploit—will allow less technically knowledgeable system administrators to test for the existence of the vulnerability or allow less skillful miscreants to attack servers. "I released (the code) to enlighten the public and to promote system security for administrators unfamiliar with these exploits," said Rafael Nunez, information security consultant for Scientech de Venezuela and a former hacker. The flaw, which Microsoft said could be exploited through the World Wide Web Distributed Authoring and Versioning (WebDAV) component of Internet Information Service (IIS) 5.0, allows an attacker to take control of the server. Microsoft declined to comment on the issue, except to say that customers should patch their systems. Nunez stressed that system administrators need to patch their systems before a virus writer uses the vulnerability as a vector for a computer worm.

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-04-04 **new vulnerabilities software Real RealPlayer Apple Quicktime heap corruption**

NIPC/DHS

April 02, CNET News.com — Holes found in RealPlayer, QuickTime.

There are serious security holes in two popular digital media players: RealNetworks' RealPlayer and Apple Computer's QuickTime. In both cases, updates are available to remedy the problem. RealNetworks is warning that by creating a specifically corrupted Portable Network Graphics file, an attacker could cause "heap corruption." Doing so would allow the attacker to execute code on the victim's machine. The vulnerable software uses an older data-compression library within the RealPix component of the player, leaving the system vulnerable. The vulnerability affected the following versions of the software: RealOne Player, RealOne Player v2 for Windows, RealPlayer 8 for Windows, RealPlayer 8 for Mac OS 9, RealOne Player for Mac OS X, RealOne Enterprise Desktop Manager and RealOne Enterprise Desktop. Meanwhile, security firm iDefense warned this week of an exploitable buffer overflow vulnerability in versions 5.x and 6.0 of Apple's QuickTime Player that could affect computers with Microsoft's Windows. A URL containing 400 characters will overrun the allocated space on the system, allowing the attacker to assume control of the system, iDefense said.

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-04-07 **new vulnerability exploit patch fix Apache Web server denial-of-service**

NIPC/DHS

April 03, — Latest Apache release fixes DOS vulnerability.

The latest release of Apache 2.0, version 2.0.45, fixes a number of security vulnerabilities including an as-yet-undisclosed flaw that could be used to launch a denial of service attack against machines running the Apache Web server, according to information released by the Apache Software Foundation (ASF). Apache 2.0 users are encouraged to upgrade. Other, lower priority security leaks and bug fixes were also included in the 2.0.45 release. However, a known DOS vulnerability that affects those systems running Apache on the OS/2 platform remains open. The latest Apache version was "too important" to delay release until the OS/2 fix could be included, the ASF said. OS/2 users will have to wait for the release of 2.0.46 to get a fix for that problem, the ASF said.

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-04-15 **XML security standard show intergration interoperability**

NIPC/DHS

April 11, IDG News Service — XML security standard touted at show.

A group of application security vendors affiliated with the Organization for the Advancement of Structured Information Standards (OASIS) will next week announce a proposal for an XML standard for application vulnerabilities at the RSA Conference hosted by RSA Security in San Francisco. The group, made up of Citadel Security Software, GuardedNet, NetContinuum, SPI Dynamics and Teros, is promoting the development of the Application Vulnerability Description Language (AVDL), which is intended to standardize information about application vulnerabilities, enabling different products to share vulnerability information in a heterogeneous network environment, according to a statement released by the five companies. If widely adopted, the AVDL standards will enable customers to deploy diverse security technology to protect their network without having to sacrifice integration and interoperability, according to Wes Wasson, chief security strategy officer at NetContinuum.

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-04-24 **new patch exploit fix vulnerability Microsoft security bulletin Internet Explorer browser sofware**

NIPC/DHS

April 23, Microsoft — Microsoft Security Bulletin MS03-015: Cumulative Patch for Internet Explorer.

This cumulative patch eliminates the following four vulnerabilities: 1) A buffer overrun vulnerability in URLMON.DLL; 2) A vulnerability in the Internet Explorer file upload control; 3) A flaw in the way Internet Explorer handles the rendering of third party files; 4) A flaw in the way modal dialogs are treated by Internet Explorer. In addition, this patch includes a fix for Internet Explorer 6.0 SP1 that corrects the method by which Internet Explorer displays help information in the local computer zone. This patch also sets the Kill Bit on the Plugin.ocx ActiveX control in order to ensure that the vulnerable control cannot be reintroduced onto users' systems and to ensure that users who already have the vulnerable control on their system are protected. Like the previous Internet Explorer cumulative patch released with bulletin MS03-004, this cumulative patch will cause window.showHelp( ) to cease to function if you have not applied the HTML Help update. Microsoft has assigned a risk rating of "Critical" to this vulnerability and a patch is available at the Microsoft website.

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-05-01 **crackers wreak havoc physica world ACM conference privacy electronic society web-based order forms google attack**

NewsScan

MALICIOUS CRACKERS COULD WREAK HAVOC IN PHYSICAL WORLD
Researchers participating in a recent ACM conference on privacy in an electronic society have described how automated order forms on the Web could be exploited to send tens of thousands of unwanted catalogs to a business or an individual. The resulting deluge not only would pose an inconvenience to the victim, but likely would swamp the local post office charged with delivery, said Avi Rubin, technical director of the Information Security Institute at Johns Hopkins University. "People have not considered how easily someone could leverage the scale and automation of the Internet to inflict damage on real-world processes." Using Google to locate online order forms and simple software to fill in fields such as "name" and "address," "it could be set up to send 30,000 different catalogs to one person or 30,000 copies of one catalog to 30,000 different recipients," said Rubin. The technique could also be used to exploit the increasingly common Web-based forms used to request repair service, deliveries or parcel pickups. Rubin and his fellow researchers suggested Web sites could take steps to prevent such attacks, including setting up online forms so that they cannot easily be picked up by a search engine, or using HTML coding to create an online form so it no longer contains easily recognized field names, such as "name." Another strategy could be to include a Reverse Turing Test — a step in each form that requires human input. (Science Daily 1 May 2003)

2003-05-29 **MS03-018 Microsoft Security Bulletin patches CSS Cross Site Scripting redirection buffer overrun IIS 4.0 5.0 5.1**

NIPC/DHS

May 29, Microsoft — Microsoft Security Bulletin MS03-018: Cumulative Patch for Internet Information Service.

This patch supercedes all previous patches released for IIS 4.0 and IIS 5.0. It also fixes the following vulnerabilities affecting IIS 4.0, 5.0 and 5.1: a Cross-Site Scripting (CSS) vulnerability affecting IIS 4.0, 5.0 and 5.1 involving the error message that's returned to advise that a requested URL has been redirected; a buffer overrun that results because IIS 5.0 does not correctly validate requests for server side includes; a denial of service vulnerability that results because of a flaw in the way IIS 4.0 and 5.0 allocate memory requests when constructing headers to be returned to a web client; a denial of service vulnerability that results because IIS 5.0 and 5.1 do not correctly handle an error condition when an overly long WebDAV request is passed to them. This patch, rated "Important," requires the patch from Microsoft Security Bulletin MS02-050 to be installed.

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-06-04 **MS03-020 cumulative patch internet explorer buffer overflow arbitrary code malicious functionality window.showHelp() update Microsoft Security Bulletin**

NIPC/DHS

June 04, Microsoft — Microsoft Security Bulletin MS03-020: Cumulative Patch for Internet Explorer.

This cumulative patch includes the functionality of all previously released patches for Internet Explorer 5.01, 5.5 and 6.0, and eliminates two vulnerabilities: a buffer overrun vulnerability that occurs because Internet Explorer does not properly determine an object type returned from a web server, and a flaw that results because Internet Explorer does not implement an appropriate block on a file download dialog box. It could be possible for an attacker to exploit this vulnerability to run arbitrary code on a user's system. This cumulative patch will cause window.showHelp( ) to cease to function if you have not applied the HTML Help update. Microsoft has assigned a risk rating of "Critical" to this patch.

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-06-25 **Internet Explorer IE flaw unearth worm microsoft buffer overflow vulnerability BugTraq**

NIPC/DHS

June 25, CNET News.com — IE flaw could unearth worm.

A vulnerability in Microsoft's Internet Explorer could result in the creation of a serious Internet worm, security experts have warned. However, there is no proof that the vulnerability foretells the execution of arbitrary code. The buffer overflow vulnerability is triggered by a malicious Java script that can be embedded in an HTML document. When a Web page or HTML file containing the malicious script is viewed by Internet Explorer, versions 5 and 6, the buffer is overrun and the browser crashes. The code was posted to the BugTraq security mailing list early Sunday morning. Microsoft wasn't pleased with the premature revelation of the vulnerability before its security teams got a chance to look into the matter. There is currently no patch unavailable.

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-07-09 **Apache http server denial service DoS open-source bug fix**

NIPC/DHS

July 09, internetnews.com — DoS holes plugged in Apache HTTP Server.

The Apache Software Foundation on Monday released a new version of its open-source Web server project to plug four potentially serious security holes. The latest update to the Apache 2.0 HTTP Server (version 2.0.47) is described as a security and bug fix release to plug holes that could lead to denial-of-service attacks. The Foundation warned that the SSLCipherSuite directive being used to upgrade from a weak ciphersuite to a strong one could result in the weak ciphersuite being used in place of the strong one. The previous Apache HTTP Server version also contains a bug in the prefork MPM where certain errors returned by accept() on rarely accessed ports could cause temporal DoS. Another DoS security vulnerability, caused when target host is IPv6, was also patched. Apache explained that ftp proxy server can't create IPv6 socket. The Apache Foundation also warned older versions of the server would crash when going into an infinite loop because of too many subsequent internal redirects and nested subrequests.

2003-10-20 **Microsoft Internet Explorer buy music online complaint Justice Department**

NewsScan

CHALLENGE TO THE WEB WEAVED BY MICROSOFT
The U.S. Justice Department and 19 states have complained to U.S. District Judge Colleen Kollar-Kotelly about a design feature of Windows that compels consumers who buy music online to use only Microsoft's Internet Explorer browser and guides them to a Microsoft Web site. The dispute may become the first test of the Microsoft antitrust settlement approved by a federal court in October 2002. In response, a Microsoft executive said, "We believe that the use of Internet Explorer by the Shop-for-Music-Online link in Windows is consistent with the design rules established by the consent decree, and we will continue to work with the government to address any concerns. At issue is a design feature in Windows XP called "Shop for Music Online," which lets consumers purchase compact discs from retailers over the Internet, but when consumers click the link to buy music, Windows opens Microsoft's browser software even if consumers have indicated that they prefer using rival browser software. (AP/San Jose Mercury News 20 Oct 2003)

2003-11-02 **website abandoned sites weblogs y2k out-of-date content dissapear**

NewsScan

WEB LITTERED WITH ABANDONED SITES
The Web is cluttered with pages and whole sites long ago forgotten by their creators — political campaigns from yesteryear, personal projects that lost their pizzazz, and even Y2K sites that commemorate a catastrophe that never happened. And while it's easy to imagine losing interest in the effort required to update and maintain a Web site, the same phenomenon is evident among the Web's latest obsession — blogging. One study of 3,634 weblogs found that two-thirds had not been updated for at least two months and about 25% hadn't changed since the day they were launched. "Some would say, 'I'm going to be too busy but I'll get back to it,' but never did," says Jeffrey Henning, chief technology officer with Perseus Development Corp., which conducted the study. But while some users resent slogging through out-of-date content, others complain that sites disappear too quickly. "I do hear pretty frequently not so much that there's deadwood, but that sites go away without a trace," says Steve Jones, a communications professor at the University of Illinois at Chicago. (AP/Tampa Bay Online 2 Nov 2003)

2003-11-13 **France Telecom insecure Website Internet security**

RISKS 23 3

A heavily used RISKY website: France Telecom

Contributor Peter Kaiser complains about the insecure French Telecom website, francetelecom.com. Kaiser found that this Website requested sensitive personal and financial information despite "no outward indication of security -- that is, no "locked/unlocked" symbol." When he approached a France Telecom service rep Kaiser was told: "Thousands of orders are placed on francetelecom.com every day, we have…not been informed of problems encountered as a result of orders made on our site." Kaiser fears that such insecure e-commerce is a risk to both France Telecom and its customers. But he is consoled that identity theft cases as a result of France Telecom's practice will not be taken lightly by European courts.

Category 23.6 *Web-site infrastructure, general Web security issues*

2003-11-13 **new critical vulnerability Microsoft security bulletin Internet Explorer browser software patch fix exploit**

NIPC/DHS

November 11, Microsoft — Microsoft Security Bulletin MS03-048: Cumulative Security Update for Internet Explorer.

There are three vulnerabilities that involve the cross-domain security model of Internet Explorer, which keeps windows of different domains from sharing information. These vulnerabilities could result in the execution of script in the My Computer zone. After the user has visited a malicious Website or viewed a malicious HTML e-mail message an attacker who exploited one of these vulnerabilities could access files on a user's system, and run arbitrary code on a user's system in the security context of the user. Another vulnerability involves the way zone information is passed to an XML object within Internet Explorer. This vulnerability could allow an attacker to read local files on a user's system. Finally, there is a vulnerability that involves performing a drag-and-drop operation during dynamic HTML (DHTML) events in Internet Explorer. This vulnerability could allow a file to be saved in a target location on the user's system if the user clicks a link. No dialog box would request that the user approve this download. Microsoft has assigned a risk rating of "Critical" to this issue and recommends that system administrators install this patch immediately.

2003-11-25 **Web browser software Opera security flaw vulnerability exploit**

NIPC/DHS

November 24, CNET News.com — Opera update seals security holes.

A new version of Opera, released Friday, November 21, fixes two vulnerabilities in the Web browser. The vulnerabilities, disclosed to the BugTraq security mailing list, allow rogue Web sites to take control of a victim's computer by exploiting weaknesses in the way the browser handles "skin" files, or configuration files that can change the look of a program. An advisory, written by Jouko Pynnonen of Finland, describes scenarios that would allow an attacker to seize control of systems running Opera, all of which require some degree of user interaction to be successfully exploited. "In order to be exploited, these vulnerabilities require the victim to visit a Web page created by a malicious user," he wrote. Though Pynnonen says one vulnerability affects Windows systems only, the second vulnerability, a buffer overflow, will allow an attacker to take control of Linux-based systems. "The directory traversal problem doesn't exist on Linux...Other versions weren't tested," the advisory read, noting also that "the buffer overflow can be produced on Linux, too."

2003-11-28 **vulnerability scripting Internet Explorer browser software hacker**

NIPC/DHS

November 25, The Register — Scripting flaws pose severe risk for IE users.

A set of five unpatched scripting vulnerabilities in Internet Explorer creates a mechanism for hackers to compromise targeted PCs. The vulnerabilities, unearthed by Chinese security researcher Liu Die Yu along with Proof of Concept exploits, enable malicious Websites and viruses to bypass the security zone settings in IE6. Used in combination, the flaws might be exploited to seize control of vulnerable PCs. Microsoft has yet to patch the flaws. But users can protect themselves against the flaws by disabling active scripting or by using an alternative browser. Thomas Kristensen of Secunia said the five distinct vulns could used in combination to install executables. Secunia advises all IE users to disable active scripting. The drawback of this workaround is that with some Websites certain functions won't work unless scripting is enabled. IE users should define any sites they need to use as trusted so that they can continue to use scripting on those sites alone, Kristensen said. The original advisory is available here:
http://www.secunia.com/advisories/10289/

2003-12-12 **new vulnerability flaw exploit Internet Explorer browser software**

NIPC/DHS

December 12, eWEEK — Internet Explorer spoofing vulnerability found.

Security researchers confirmed a vulnerability in Internet Explorer 6 Tuesday, December 9, that could let an attacker display a fake URL in the browser's address bar in an attempt to disguise the real domain, an advisory from security company Secunia Ltd said. Using the security hole, an attacker could trick users into providing sensitive information or download malicious software by leading them to think that they are visiting a trusted site, the advisory said. A Microsoft spokesperson on Wednesday said that the company knows of no exploits of the reported hole or of any users being affected but said in a statement that it is "aggressively investigating the public reports." Microsoft may provide a fix through its monthly patch release cycle or a separate patch, depending on the outcome of the investigation, the spokesperson said. The Secunia advisory is available here:
http://www.secunia.com/advisories/10395

2004-01-14 **patch flaw vulnerability fix Sun ONE buffer overflow**

NIPC/DHS; http://www.esecurityplanet.com/prodser/article.php/3298031

January 12, esecurityplanet.com — Buffer overflow plugged in Sun ONE web server.

Sun Microsystems on Monday, January 12, warned of a buffer overflow vulnerability in its Sun ONE/iPlanet Web Server product. The firm said the flaw could be exploited by a remote user to crash the Web server, which is a type of denial-of-service attack. Independent research firm Secunia has rated the security hole as "moderately critical." The vulnerability affects the Sun ONE/iPlanet Web Server 6.0 Service Pack 5 and earlier versions on the HP-UX platform. Sun has issued a new service pack to fix the flaw, noting that there are no workarounds. The susceptible products are a crucial part of Sun's Web services initiative which falls under Sun Open Net Environment (Sun ONE) brand. The Sun ONE brand includes the Sun ONE Web Server, Sun ONE Portal Server, Sun ONE Application Server, Sun ONE Directory Server, Sun ONE Identity Server, Sun ONE Messaging Server and the Sun ONE Integration Server (all formerly iPlanet products). A service pack is available online: http://wwws.sun.com/software/download/products/3f186391.html

2004-01-23 **new flaw vulnerability patch fix OpenSSL protocol SSL Sun**

NIPC/DHS; http://www.esecurityplanet.com/prodser/article.php/3301661

January 21, eSecurityPlanet — Sun Cluster vulnerable to OpenSSL flaw.

Sun Microsystems on Wednesday, January 21, warned that systems running Sun Cluster 3.x with SunPlex Manager configured were at risk of takeover because of known flaws in the OpenSSL protocol. In a security advisory, Sun recommended that the SunPlex Manager be disabled until a comprehensive patch is ready, warning that exploitation of the vulnerability could lead to arbitrary code execution and denial-of-service (DoS) scenarios. Independent research firm Secunia is rating the vulnerability as "moderately critical." The confirmation of the system access and DoS vulnerabilities comes more than three months after the OpenSSL flaw was made public. Last October, the OpenSSL Project released new versions of its implementation of the Secure Sockets Layer (SSL) and Transport Layer Security (TLS) protocols to plug multiple vulnerabilities. All versions of OpenSSL up to and including 0.9.6j and 0.9.7b and all versions of SSLeay were updated. The OpenSSL project said any application that makes use of OpenSSL's ASN1 library to parse untrusted data was also susceptible. The OpenSSL holes carry a "highly critical" rating. More information can be found at http:/sunsolve.sun.com/pub-cgi/retrieve.pl?doc=fsalert/57475

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-02-04 **Microsoft Internet Explorer software patch inconsistent user complaint**

DHS IAIP Daily; http://news.zdnet.co.uk/internet/security/0,39020375,3914548
7,00.htm

February 04, ZDNet — Users report inconsistent results from latest IE patch.

Microsoft's latest security patch for its Internet Explorer (IE) browser doesn't always work, users report. The fix was supposed to disable a commonly used feature that allows usernames and passwords to be transferred within a URL. However, some users have found that even after the patch is deployed, the "feature" is still active. Microsoft said it has not as yet received any complaints from users experiencing the problems, but tests by ZDNet UK confirm that even after the latest patch is applied, IE still allows URLs containing password and user information to access Internet resources. However, at this stage it is still unclear why some users find the patch works, while others are still left vulnerable.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-05-18 **WS-I SOAP Web services security**

DHS IAIP Daily; http://www.esecurityplanet.com/trends/article.php/3355231

May 18, eSecurity Planet — WS-I clears basic security hurdle.

Web services security, a bugbear in the adoption of distributed computing architectures, is one step closer to being finalized. The Web Services Interoperability Organization (WS-I) said it has finished its Basic Security Profile Working Group Draft and is making it available in order to solicit feedback from the Web services community. The Basic Security Profile addresses transport security, SOAP messaging security and other security considerations as well as the interoperability characteristics of two main technologies: HTTP over Transport Layer Security and Web Services Security: SOAP Message Security. Naturally, the Basic Security Profile is expected to synch with other WS-I profiles and work with some existing specifications used to provide security, including the OASIS Web Services Security 1.0 specification, which passed muster last month. When the document is cleaned up and finalized, possibly later this year, it is expected to usher in a raft of new customers to Web services, and by extension service-oriented architectures (SOA).

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-07-29 **phpMyAdmin PHP MySQL administration Web development vulnerability**

DHS IAIP Daily; http://www.securityfocus.com/bid/10629/info/

July 29, SecurityFocus — phpMyAdmin multiple input validation vulnerabilities.

phpMyAdmin is prone to multiple vulnerabilities. The issues result from insufficient sanitization of user-supplied data. By constructing a URI request for the phpMyAdmin 'left.php' script an attacker may specify and add an arbitrary SQL server. A remote attacker may exploit this vulnerability to replace server configurations and as a result introduce a malicious SQL server into the phpMyAdmin controlled server list. It is also reported that a malicious database table name beginning with """ will escape the quotes in a PHP eval() statement and will thereby permit an attacker to execute arbitrary PHP code. The vendor has released version 2.5.7, patch level 1 addressing this vulnerability: http://sourceforge.net/index.php

2004-08-02 **IBM directory server Tivoli vulnerability ldap user exploit fix published**

DHS IAIP Daily; http://www.securityfocus.com/bid/10841

August 02, SecurityFocus — IBM Tivoli Directory Server LDACGI Directory Traversal Vulnerability.

IBM Tivoli Directory Server is reported to contain a directory traversal vulnerability in its Web front-end application. This issue presents itself due to insufficient sanitization of user-supplied data. This issue allows remote attackers to view potentially sensitive files on the server that are accessible to the 'ldap' user. This may aid an attacker in conducting further attacks against the vulnerable computer. A fix for Versions 3.2.2 is available here: http://www-1.ibm.com/support/docview.wss?uid=swg24006917 A fix for Version 4.1 is available here: http://www-1.ibm.com/support/docview.wss?uid=swg24006209

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-03 **Web server vulnerability note US-CERT BlackJumboDog**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/714584

August 03, US-CERT — Vulnerability Note VU#714584: BlackJumboDog contains a boundary error in the handling of FTP commands.

BlackJumboDog is a multi-function server for Microsoft Windows, providing FTP, Email, Web, and Proxy services. It is reported that version 3.6.1 contains a buffer overflow vulnerability. BlackJumboDog fails to check the length of FTP commands passed to it. Using specially crafted FTP commands, a remote user can trigger a buffer overflow condition possibly leading to code execution on the server. This issue has been resolved in version 3.6.2 of BlackJumboDog: http://homepage2.nifty.com/spw/software/bjd/download.html

---

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-04 **Mozilla Firefox Thunderbird vulnerabilities**

DHS IAIP Daily; http://secunia.com/advisories/10856/

August 04, Secunia — Mozilla multiple vulnerabilities.

The vendor has released details about some older vulnerabilities in Mozilla, Mozilla Firefox, and Thunderbird. These can potentially be exploited by malicious people to conduct spoofing attacks, compromise a vulnerable system, or cause a DoS (Denial of Service). The vulnerabilities have reportedly been fixed in: Mozilla 1.7 and higher, Firefox 0.9 and higher, and Thunderbird 0.7 and higher.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-04 **portable network graphics PNG library vulnerability open source US-CERT**

DHS IAIP Daily; http://www.us−cert.gov/cas/techalerts/TA04−217A.html

August 04, US-CERT — Technical Cyber Security Alert TA04-217A: Multiple Vulnerabilities in libpng.

The Portable Network Graphics (PNG) image format is used as an alternative to other image formats such as the Graphics Interchange Format (GIF). The libpng is a popular reference library available for application developers to support the PNG image format. Several vulnerabilities exist in the libpng library, the most serious of which could allow a remote attacker to execute arbitrary code on an affected system. Users should apply the appropriate patch or upgrade as specified by vendor. More detailed information about these vulnerabilities is available in individual vulnerability notes on the US-CERT Website.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-04 **PHP Bulletin Board phpBB SQL injection vulnerability query patch**

DHS IAIP Daily; http://www.securityfocus.com/bid/10868/info/

August 04, SecurityFocus — phpBB Fetch All SQL injection vulnerability .

It is reported that phpBB Fetch All is susceptible to an SQL injection vulnerability. This issue is due to a failure of the application to properly sanitize user-supplied input before using it in an SQL query. The successful exploitation of this vulnerability depends on the implementation of the web application that includes phpBB Fetch All as a component. It may or may not be possible to effectively pass malicious SQL statements to the underlying function. Successful exploitation could result in compromise of the application, disclosure or modification of data or may permit an attacker to exploit vulnerabilities in the underlying database implementation. The vendor has released version 2.0.12 to address this issue: http://prdownloads.sourceforge.net/phpbbfetchall/phpbb_fetch _all-2.0.12.zip?downloa

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-04 **PuTTY telnet SSH software vulnerability malicious server connection**

DHS IAIP Daily; http://secunia.com/advisories/12212/

August 04, Secunia — PuTTY unspecified system compromise vulnerability.

A vulnerability in PuTTY can be exploited by malicious people to compromise a user's system. The vulnerability is caused due to an unspecified error and may allow execution of arbitrary code on a user's system. Successful exploitation requires that a user has been tricked into connecting to a malicious server. Users should upgrade to version 0.55.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-05 **Opera Internet browser flaw computer hijack e-mail exposure**

DHS IAIP Daily; http://www.esecurityplanet.com/patches/article.php/3391281

August 05, internetnews.com — Critical flaws spoil Opera tune.

Alternative Web browser firm Opera Software has issued a fix for its Opera browser after a security research firm reported a potentially dangerous security bug. Opera rolled out a new version (7.54) and confirmed that users of previous versions were at risk of computer hijack. GreyMagic, the research outfit that discovered the vulnerabilities, said a successful attack would allow read-access to files on the victim's file system and read access to lists of files and folders on the victim's computer. Malicious hackers could also gain access to read incoming and outgoing e-mails on Opera's M2 mail program, which is built into the browser. The flaws also could result in cookie theft, URL-spoofing for phishing attacks and the spillage of a user's browsing history. GreyMagic also released a proof-of-concept demonstration that presents the user's files and directories in an Explorer-like manner, allowing the user to browse his/her own file system using the vulnerability.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-05 **Board Power Internet forum technology vulnerability cross-site scripting attack**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/744590

August 05, US-CERT — Vulnerability Note VU#744590: Board Power forum contains cross-site scripting vulnerability in the 'action' parameter of 'icq.cgi'.

Board Power is a forum application available for multiple operating systems. It is reported that Board Power v2.04 PF contains a cross-site scripting vulnerability. Board Power fails to filter malicious content passed into the "action" parameter of icq.cgi. Other versions may be affected. It appears that Board Power is no longer supported and has not been updated since 2000 by the developers (The Webmaster Guide, Inc.). The victim will be presented with information which the compromised site did not wish their visitors to be subjected. This could be used to "sniff" sensitive data from within the web page, including passwords, credit card numbers, and any arbitrary information the user inputs. Likewise, information stored in cookies can be stolen or corrupted. US-CERT is currently unaware of a practical solution to this problem.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-10 **Apache Webserver vulnerabilities HP VirtualVault HP11 Webproxy patch issued**

DHS IAIP Daily; http://secunia.com/advisories/12246

August 10, Secunia — HP VirtualVault / Webproxy multiple vulnerabilities in Apache.

HP has confirmed some vulnerabilities in Apache affecting HP VirtualVault and HP 11 Webproxy, which can be exploited by malicious people to cause a DoS (Denial of Service), bypass security restrictions, or compromise a vulnerable system. The vulnerabilities affect servers running HP-UX release B.11.04 with VirtualVault A.04.50 - A.04.70 or Webproxy A.02.00 - A.02.10 installed. Install patches available at: http://itrc.hp.com

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-10 **Microsoft security bulletin Exchange Server vulnerability cross site scripting spoofing**

DHS IAIP Daily; http://www.microsoft.com/security/bulletins/200408_exchange.
mspx

August 10, Microsoft — Microsoft Security Bulletin MS04-026: Vulnerability in Exchange Server 5.5 Outlook Web Access Could Allow Cross-Site Scripting and Spoofing Attacks.

A cross-site scripting and spoofing vulnerability exists in Outlook Web Access for Exchange Server 5.5 that could allow an attacker to convince a user to run a malicious script. An attacker who successfully exploited the vulnerability could manipulate Web browser caches and intermediate proxy server caches, and put spoofed content in those caches. They may also be able to exploit the vulnerability to perform cross-site scripting attacks. Microsoft has assigned a risk rating of "Moderate" to this issue and recommends that customers consider applying the security update. Customers who have customized any of the ASP pages that are listed in the File Information section in this document should back up those files before they apply the update because those ASPs will be overwritten when the update is applied. Any customizations would then have to be reapplied to the new ASP pages.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-13 **content management system JetboxOne vulnerability database information disclosure vulnerability US-CERT**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/586720

August 13, US-CERT — Vulnerability Note VU#586720: JetboxOne leaves account database unencrypted.

JetboxOne is an open-source content management system that is written in PHP. An information disclosure vulnerability exists because JetboxOne does not encrypt account information stored in the admin (user) and webuser (standard user) tables of a MySQL database. Any user with the ability to query the database may be able to view confidential account information. This may lead to unauthorized access to other accounts. US-CERT is currently unaware of a practical solution to this problem.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-13 **content management system JetboxOne vulnerability code execution vulnerability US-CERT**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/417408

August 13, US-CERT — Vulnerability Note VU#417408: JetboxOne may allow unauthorized users to execute arbitrary code.

JetboxOne, an open-source content management system, could allow an attacker with "AUTHOR" privileges to upload arbitrary files to the image folder via the upload image control. The vulnerability exists because the type of file being uploaded is not verified as a valid image file e.g. GIF, JPEG. Once uploaded, the attacker is then able to request the file, which will be interrpreted by the JetboxOne application. Based on the file type this may permit a malicious user to execute the arbitrary code on the compromised system. Currently, the vulnerability has been demonstrated on version 2.0.8. However, it may also exist in previous versions, but they are as of yet untested. US-CERT is currently unaware of a practical solution to this problem.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-16 **Website services security problems XML code authentication hacking**

DHS IAIP Daily;
http://www.computerworld.com/developmenttopics/development/s
tory/0,10801,95197,00.html

August 16, Computerworld — Web services security: trouble in transit.

The shareable design of Web services, which gives companies the benefit of easily exchanging data and applications with business partners, also makes them vulnerable to security breaches. Hackers have found ways to tweak the XML code used to tag the data so activity that's actually an attack appears to be valid. According to experts, hackers have three methods for breaching Web services and XML security: identity-based attacks, in which a hacker poses as an authorized user to gain access to Web services; malicious-content attacks, in which an intruder forces a Web server to perform an unauthorized activity; and operational attacks, in which a hacker manipulates an XML message to tie up server resources. But although the methods are known, safeguarding Web services is difficult because multiple elements must be locked down--the servers, the messages and the applications. Companies must first secure their Web servers and then decide which business partners and employees will have access to them, how they'll connect to them and which authentication method to use.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-20 **MySQL buffer overflow vulnerability DNS lookup**

DHS IAIP Daily; http://www.zone−h.org/advisories/read/id=5365

August 20, zone-h — MySQL "mysql_real_connect" buffer overflow vulnerability.

A vulnerability in MySQL could potentially allow malicious people to compromise a vulnerable system. The "mysql_real_connect()" function doesn't properly verify the length of IP addresses returned by a reverse DNS lookup of a hostname. This could potentially be exploited to cause a buffer overflow and execute arbitrary code. Successful exploitation requires that the attacker is able to return a malicious DNS reply when a MySQL user connects to a server. This has been reported in MySQL 4.0.20 and prior. It has been reported that this can't be exploited on the Linux and OpenBSD platforms. This issue will be fixed in the upcoming 4.0.21. Original Advisory: http://bugs.mysql.com/bug.php?id=4017

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-20 **Mozilla buffer overflow vulnerability POP3 protocol**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/561022

August 20, US-CERT — Vulnerability Note VU#561022: Mozilla contains a buffer overflow in the SendUidl() function.

Post Office Protocol Version 3 (POP3) is a mail protocol that provides a means for retrieving email from a remote server. This protocol is supported by Mozilla, Firefox, and Thunderbird. These clients contain a vulnerability that allows malformed POP3 responses to trigger a buffer overflow condition in the SendUidl() function. Such responses can be sent by a remote POP3 server and could result in arbitrary code execution. Exploitation of this vulnerability would require a user to connect to a malicious POP3 server. This issue has been resolved in Mozilla 1.7, Firefox 0.9, and Thunderbird 0.7.2:
http://www.mozilla.org/projects/security/known-vulnerabiliti es.html

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-23 **buffer overflow Netscape Network Security Services NSS suite Secure Sockets Layer SSL**

DHS IAIP Daily; http://xforce.iss.net/xforce/alerts/id/180

August 23, Internet Security Systems — Netscape NSS Library remote compromise.

A vulnerability exists in the Netscape Network Security Services (NSS) library suite which may result in remote compromise of products making use of this library for Secure Sockets Layer (SSL) communication. If the SSLv2 protocol is enabled on vulnerable servers, a remote unauthenticated attacker may trigger a buffer overflow condition and execute arbitrary code. This has the potential to result in complete compromise of the target server, and exposure of any information held therein. SSL is often used to secure sensitive or valuable communications, making this a high-value target for attackers. A vendor-supplied update for the NSS library is available: ftp.mozilla.org/pub/mozilla.org/security/nss/releases/NSS_3_9_2_RTM

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-08-23 **Mozilla Firefox Thunderbird vulnerability X.509 certificate verification failure**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/784278

August 23, US-CERT — Vulnerability Note VU#784278: Mozilla allows certificate to be imported even when the DN is the same as that of a built-in CA root certificate.

Mozilla version 1.7.7 fails to verify that the Distinguished Name (DN) of an X.509 certificate is unique when importing it. A denial of service occurs when Mozilla imports a specially crafted self-signed certificate that has the same DN as an existing Certificate Authority (CA) root certificate. Exploitation of this vulnerability can be automated causing the certificate to be imported without any user intervention. A remote attacker could cause a denial of service against the certificate store, preventing the user from accessing SSL websites. This issue has been resolved in Mozilla 1.7.2, Firefox 0.9.3, and Thunderbird 0.7.3: http://www.mozilla.org/projects/security/known-vulnerabilities.html

2004-10-19 **Microsoft Internet Explorer vulnerabilities code execution privilege escalation update Windows XP SP2**

DHS IAIP Daily; http://www.us−cert.gov/cas/techalerts/TA04−293A.html

October 19, US-CERT — Technical Cyber Security Alert TA04-293A: Multiple Vulnerabilities in Microsoft Internet Explorer.

Microsoft Internet Explorer (IE) contains multiple vulnerabilities, the most severe of which could allow a remote attacker to execute arbitrary code with the privileges of the user running IE. Microsoft Security Bulletin MS04-038 describes a number of IE vulnerabilities, including buffer overflows, cross-domain scripting, spoofing, and "drag and drop." The impacts of these vulnerabilities vary, but an attacker may be able to execute arbitrary code with the privileges of the user running IE. Solutions: Apply the appropriate patch as specified by Microsoft Security Bulletin MS04-038; disable Active scripting and ActiveX controls; upgrade to Windows XP Service Pack 2. Microsoft Security Bulletin MS04-038: http://www.microsoft.com/technet/security/bulletin/ms04-038. mspx

2004-10-27 **website blocking Bush foreign access controls**

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A2668-2004Oct27.html

BUSH WEB SITE BLOCKS FOREIGN VISITORS

The Bush-Cheney campaign has cut off access to its Web site by anyone outside the U.S. or Canada. Instead, those visitors will see the message: "Access denied. You don't have permission to access www.georgewbush.com on this server." The move comes a week after a crippling hacker attack that took down the Web site for six hours. Security experts say that while it's not usual for Web sites to block traffic from specific Internet addresses or from certain countries notorious for churning out spam, the Bush-Cheney campaign's move is probably unprecedented. "I've never heard of a site wholesale blocking access from the rest of the world," says Johannes Ulrich, CTO for the SANS Internet Storm Center. "I guess they decided it just wasn't worth the trouble to leave it open to foreign visitors." Jonah Sieger, a founding partner for Connections Media, which does consulting work with Democratic candidates, says it doesn't make sense for the Bush-Cheney folks to "consciously block access to anybody. Maybe the next thing they'll try is to block Democrats and people in blue states from coming to the site." (Washington Post 27 Oct 2004)

2004-11-01 **browsers Internet Explorer Firefox Safari Mozilla Opera study**

NewsScan; http://news.com.com/Study+Firefox+still+gaining+on+Internet+Explorer/2100-1032_3-5435176.html

IE LOSING GROUND TO OPEN SOURCE BROWSERS

Microsoft's Internet Explorer browser is still the overwhelming market leader, but the percentage of Americans using open-source alternatives Mozilla and Firefox inched up to 6% in October from 3.5% in June. Apple's Safari and the Opera browsers combined were employed by just a little over 1% of users, according to online research firm WebSideStory. The results were gleaned by sensors embedded on major Web sites that identified which browsers visitors were using to access the sites. And although Mozilla and Firefox constitute a miniscule portion of the browser market, some analysts say their steady rise may signal a trend. "What we're seeing is (Mozilla and Firefox) looking more like a vanguard than a flash in the pan," says WebSideStory analyst Geoff Johnston. (CNet News.com 1 Nov 2004)

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-11-04 **Apache Web server software Space Headers denial of service DoS vulnerability update issued**

DHS IAIP Daily; http://secunia.com/advisories/13045/

November 04, Secunia — Apache "Space Headers" denial of service vulnerability.

A vulnerability has been discovered in Apache, which can be exploited by malicious people to cause a DoS (Denial of Service). The vulnerability is caused due to an error in the parsing routine for headers with a large amount of spaces. This can be exploited by sending some specially crafted requests with a large amount of overly long headers containing only spaces. The vulnerability has been fixed in version 2.0.53-dev.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-11-09 **Microsoft Internet Explorer URL Handler vulnerability Windows XP SP2 update**

DHS IAIP Daily; http://secunia.com/advisories/13124/

November 09, Secunia — Microsoft Internet Explorer "res:" URI Handler file identification vulnerability.
A vulnerability has been discovered in Internet Explorer, which can be exploited by malicious sites to detect the presence of local files. An "Access is Denied" error will be returned if a site in the "Internet" zone tries to open an existing local file in the search window using the "res:" URI handler. This can be exploited to determine the presence of specific programs or files in the system directories and on the desktop. The vulnerability has been confirmed on a fully patched system with Internet Explorer 6.0 and Microsoft Windows XP SP1. The vulnerability does not affect systems running Windows XP with SP2 installed.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-11-10 **spoofing vulnerability Microsoft Internet Security and Acceleration ISA server 200 Proxy 2.0 update issued**

DHS IAIP Daily; http://www.microsoft.com/technet/security/bulletin/ms04−039. mspx

November 10, Microsoft — Spoofing vulnerability in Microsoft Servers.

A spoofing vulnerablity exists in Microsoft Internet Security and Acceleration (ISA) Server 2000 and Microsoft Proxy Server 2.0 that could enable an attacker to spoof trusted Internet content. Users could believe they are accessing trusted Internet content when in reality they are accessing malicious Internet content, for example a malicious Website. Microsoft rates this vulnerability as Important and recommends users install updates described in Microsoft Security Bulletin MS04-039 available through the Source link below.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-11-10 **Microsoft Internet Explorer IE buffer overflow vulnerability code execution attack Windows XP SP2 update**

DHS IAIP Daily; http://www.uscert.gov/cas/techalerts/TA04−315A.html

November 10, US-CERT — Technical Cyber Security Alert TA04-315A: Buffer Overflow in Microsoft Internet Explorer.

Microsoft Internet Explorer (IE) 6.0 and later contain a buffer overflow vulnerability that could allow a remote attacker to execute arbitrary code with the privileges of the user running IE. A buffer overflow vulnerability exists in the way IE handles the SRC and NAME attributes of various elements, including FRAME, IFRAME, and EMBED. Because IE fails to properly check the size of the NAME and SRC attributes, a specially crafted HTML document can cause a buffer overflow in heap memory. Reports indicate that this vulnerability is being exploited by malicious code propagated via e-mail. IE opens and displays an HTML document that exploits the vulnerability. This malicious code may be referred to as MyDoom or Bofra. Until a complete solution is available from Microsoft, consider the following workarounds: install Windows XP SP2 (SP2 does not appear to be affected by this vulnerability), disable Active scripting, do not follow unsolicited links, read and send e-mail in plain text format, and maintain updated anti-virus software.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-11-11 **phone companies cybersecurity AT&T Sprint network security programs filtering viruses**

NewsScan; http://online.wsj.com/article/0

PHONE COMPANIES TACKLE CYBERSECURITY

As owners of some of the worlds biggest Internet conduits, telephone companies like AT&T and Sprint are in a prime position to monitor Internet activity and stop mischief makers long before they reach the desktops of corporate customers. AT&T recently launched a network security system called Internet Protect and Sprint offers a similar service called IP Defender. Meanwhile, Internet security firm McAfee is marketing a "Clean Pipes" service designed to help carriers purge attacks as they traverse carrier networks. Other big players in the cybersecurity realm include IBM, Symantec and VeriSign, and equipment makers like Cisco and Juniper Networks are embedding security features into their data-routing gear as well. A recent study by Symantec shows a fourfold increase in the number of new viruses attacking Windows computers, to 4,496 in the first half of 2004 -- the largest increase the company has ever documented. Based on numbers like that, Yankee Group predicts that the managed security services market will expand from $1.5 billion in 2002 to $3.7 billion in 2008. (Wall Street Journal 11 Nov 2004)

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-11-14 **Microsoft Internet Explorer Windows XP SP2 vulnerability code execution attack no update issued**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2004/Nov/1012234.html

November 14, SecurityTracker — Microsoft Internet Explorer on XP SP2 remote user vulnerability.

A remote user can bypass the file download security mechanism in Windows XP SP2 and can execute arbitrary scripting code in the local computer zone to take full control of the target user's system. No solution is currently available.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-11-18 **Microsoft Internet Explorer vulnerabilities Windows XP SP2 no update**

DHS IAIP Daily; http://secunia.com/advisories/13203/

November 18, Secunia — Microsoft Internet Explorer vulnerabilities.

Two vulnerabilities have been reported in Internet Explorer, which can be exploited by malicious people to bypass a security feature in Microsoft Windows XP SP2 and trick users into downloading malicious files. 1) Microsoft Windows XP SP2 has a security feature which warns users when opening downloaded files of certain types. The problem is that if the downloaded file was sent with a specially crafted "Content-Location" HTTP header in some situations, then no security warning will be given to the user when the file is opened. 2) An error when saving some documents using the Javascript function "execCommand()", can be exploited to spoof the file extension in the "Save HTML Document" dialog. There is no solution at this time.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-11-20 **Microsoft Internet Explorer IE unauthorized download vulnerability no update issued**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2004/Nov/1012288.html

November 20, SecurityTracker — Microsoft IE Custom 404 error message and execCommand SaveAs permit unauthorized downloads.

A remote user can create HTML that, when loaded by the target user, will prompt the user to download a file but will bypass the XP SP2 executable download warning messages. A remote user can invoke the execCommand 'SaveAs' function via a custom HTTP 404 Not Found error message to download arbitrary files to the target user's system without the XP SP2 warning messages. It is reported that Internet Explorer (IE) does not properly process URLs with certain extraneous characters. A remote user can create a custom HTTP 404 error message and pass this message to the execCommand Method to bypass the 'File Download' and 'File Open' security warnings. There is no solution at this time.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-11-22 **Sun Java JavaScript plugin vulnerability Virtual Machine code execution attack**

DHS IAIP Daily; http://www.idefense.com/application/poi/display?id=158

November 22, iDEFENSE — Sun Java Plug-in Java-to-Javascript bug lets remote applets execute arbitrary code.

Remote exploitation of a design vulnerability in Sun Microsystems Inc.'s Java Plug-in technology allows attackers to bypass the Java sandbox and all security restrictions imposed within Java Applets. The problem specifically exists within the access controls of the Java to Javascript data exchange in Web browsers using Sun's Java Plug-in technology. The vulnerability allows Javascript code to load an unsafe class which should not normally be possible from a Java Applet. Successful exploitation allows remote attackers to execute hostile Applets that can access, download, upload or execute arbitrary files as well as access the network. A target user must be running a browser on top of a vulnerable Java Virtual Machine to be affected. The vendor has issued a fixed version (1.4.2_06), available at: http://java.sun.com/j2se/1.4.2/download.html

---

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-11-29 **vulnerabilities Mozilla Firefox Safari Opera browsers patches**

NewsScan; http://www.internetnews.com/security/article.php/3440971

NEW BROWSER VULNERABILITY TARGETS NON-IE MODELS, TOO

Since its debut, Microsoft's Internet Explorer browser has been plagued by a steady stream of "flaw discovery" announcements followed by the requisite patches. Usually those flaws are exclusive to the Microsoft model, but a new vulnerability also affects the Mozilla Browser, Mozilla Firefox, Opera and Apple Safari browsers. This latest bug, called the Infinite Array Sort Denial of Service Vulnerability, causes the affected browsers to execute an infinite JavaScript array sort, which in turn causes a crash. The flaw was discovered by independent security researcher Berend-Jan Wever, who also uncovered the IFRAME vulnerability that affects banner ads. (InternetNews 29 Nov 2004)

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-11-29 **WS FTP file transfer protocol server buffer overflow vulnerability code execution attack no update issued**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2004/Nov/1012353.html

November 29, SecurityTracker — WS_FTP buffer overflow lets remote users execute arbitrary code. A remote user can execute arbitrary code on the target system. It is reported that a remote authenticated user can trigger a buffer overflow in several FTP commands. The SITE, XMKD, MKD, and RFNR FTP commands are affected. A remote user can cause the FTP service to crash or execute arbitrary code. No solution is available at this time.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-11-30 **CuteFTP file transfer protocol server denial of service DoS vulnerability code execution attack no update issued**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2004/Nov/1012366.html

November 30, SecurityTracker — CuteFTP Professional FTP reply error remote denial of service.

A remote FTP server can cause the target connected FTP client to crash. It is reported that a connected FTP server can send a specially crafted reply code (generally larger than "500") and specially crafted text larger than 65530 bytes to cause the client to crash. Only replies to certain commands are affected. This flaw could possibly be exploited to execute arbitrary code. No solution is available at this time.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-01 **Microsoft security bulletin update Internet Explorer IE vulnerability code execution privilege escalation attack**

DHS IAIP Daily; http://www.microsoft.com/technet/security/bulletin/MS04−
040. mspx

December 01, Microsoft — Microsoft Security Bulletin MS04-040: Cumulative Security Update for Internet Explorer.

A vulnerability exists in Internet Explorer that could allow remote code execution on an affected system. An attacker could exploit the vulnerability by constructing a malicious Web page that could potentially allow remote code execution if a user visited a malicious Website. If a user is logged on with administrative privileges, an attacker who successfully exploited this vulnerability could take complete control of an affected system. Microsoft has assigned a risk rating of "Critical" to this issue and recommends that customers install the update immediately.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-02 **Cisco CNS Network Registrar DNS DHCP server denial of service DoS vulnerability update issued**

DHS IAIP Daily; http://www.cisco.com/warp/public/707/cisco−sa−20041202−
cnr.s html

December 02, Cisco Security Advisory — Cisco CNS Network Registrar denial of service vulnerability.

Cisco CNS Network Registrar Domain Name Service /Dynamic Host Configuration Protocol (DNS/DHCP) server for the Windows Server platforms is vulnerable to a Denial of Service attack when a certain crafted packet sequence is directed to the server. Cisco CNS Network Registrar version 6.0 through 6.1.1.3 are affected by CSCeg27625. However, all versions up to and including version 6.1.1.3 are also affected by CSCeg27614. Cisco has made free software available to address this vulnerability for all affected customers.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-03 **Apple Darwin Streaming Server null byte denial of service DoS attack update issued**

DHS IAIP Daily;
http://www.idefense.com/application/poi/display?id=159&type=
vulnerabilities&flashstatus=true

December 03, iDEFENSE — Apple Darwin Streaming Server DESCRIBE null byte denial of service vulnerability.

Remote exploitation of an input validation vulnerability in Apple Computer Inc.'s Darwin Streaming Server allows attackers to cause a denial of service condition. The vulnerability specifically occurs due to insufficient sanity checking on arguments to DESCRIBE requests. A remote attacker can send a request for a location containing a null byte to cause a denial of service condition, thereby preventing legitimate users from accessing streamed content. Updates are available at: http://www.apple.com/support/downloads//

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-07 **Unicenter Remote Control access management server vulnerability update issued**

DHS IAIP Daily; http://secunia.com/advisories/13311/

December 07, Secunia — Unicenter Remote Control arbitrary URC Management Server access vulnerability.

A vulnerability has been reported in Unicenter Remote Control (URC), which can be exploited by malicious users to access arbitrary URC Management Servers. The vulnerability is caused due to an unspecified error in the URC Management Console allowing users to connect to another URC Management Server and make arbitrary configuration changes on the systems managed by this server. Successful exploitation reportedly requires that a user has been authenticated by the underlying OS. Updates available at: http://supportconnectw.ca.com/public/rco_controlit/infodocs/ securitynotice.asp

---

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-09 **Microsoft Internet Explorer IE 6.0 file transfer protocol FTP command injection vulnerability Windows 2000 2K SP4 XP SP2 no update issued**

DHS IAIP Daily; http://secunia.com/advisories/13404/

December 09, Secunia — Microsoft Internet Explorer FTP command injection vulnerability.

A vulnerability has been reported in Microsoft Internet Explorer, which can be exploited by malicious people to conduct FTP command injection attacks. The vulnerability is caused due to insufficient input validation of FTP URIs. This can be exploited by e.g. a malicious website to inject arbitrary FTP commands in a FTP session using a specially crafted pathname containing "%0A" characters. The vulnerability has been confirmed on a fully patched system with Internet Explorer 6.0 and Microsoft Windows 2000 SP4 / XP SP2. There is no solution at this time.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-10 **MIMEsweeper SMTP PDF denial of service DoS vulnerability**

DHS IAIP Daily; http://secunia.com/advisories/13411/

December 10, Secunia — MIMEsweeper for SMTP PDF file processing denial of service.

A vulnerability has been reported in MIMEsweeper for SMTP, which can be exploited by malicious people to cause a DoS (Denial of Service). The vulnerability is caused due to an error within the Security Service when processing PDF files. This can be exploited to crash the Security Service by sending an e-mail containing a specially crafted PDF file as attachment. Apply MIMEsweeper for SMTP 5.0 Service Pack 1: http://www.clearswift.com/download/info.aspx?ID=562

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-13 **phpBB PHP bulletin board Web software vulnerabilities directory traversal attack update issued**

DHS IAIP Daily; http://secunia.com/advisories/13421/

December 13, Secunia — phpBB Attachment Mod two vulnerabilities.

Two vulnerabilities have been reported in the Attachment Mod module for phpBB, which can be exploited by malicious people to compromise a vulnerable system. An input validation error can be exploited to add, remove, and execute files outside the upload directory via directory traversal attacks. Secondly, an error in the handling of multiple file extensions within "mod_mime" can be exploited to upload malicious script files. The vulnerabilities have been reported in version 2.3.10. Update to version 2.3.11: http://sourceforge.net/project/showfiles.php?group_id=66311

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-14 **phpMyAdmin PHP MySQL Web scripting software update issued**

DHS IAIP Daily; http://secunia.com/advisories/13424/

December 14, Secunia — phpMyAdmin two vulnerabilities.

Two vulnerabilities exist in phpMyAdmin, which can be exploited by malicious people to compromise a vulnerable system and by malicious users to disclose sensitive information. An input validation error in the handling of MySQL data allows injection of arbitrary shell commands. Input passed to "sql_localfile" is not properly sanitized in "read_dump.php" before being used to disclose files. Successful exploitation requires access to the phpMyAdmin interface, and that PHP safe mode is disabled and the UploadDir mechanism to be active. The vulnerabilities have been fixed in version 2.6.1-rc1.

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-14 **zgv xzgv integer overflow vulnerabilities compromise code execution attack update issued**

DHS IAIP Daily; http://secunia.com/advisories/13449/

December 14, Secunia — zgv/xzgv multiple integer overflow vulnerabilities.

Multiple vulnerabilities have been reported in zgv/xzgv, which potentially can be exploited by malicious people to compromise a vulnerable system. The vulnerabilities are caused due to various integer overflows when processing images. These can be exploited to cause buffer overflows via images containing specially crafted headers. Successful exploitation may allow execution of arbitrary code when a malicious image is viewed. Apply patches: http://rus.members.beeb.net/xzgv-0.8-integer-overflow-fix.di ff

---

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-16 **Cisco Unity default usernames passwords Exchange vulnerability update issued**

DHS IAIP Daily; http://secunia.com/advisories/13483/

December 16, Secunia — Cisco Unity default usernames and passwords vulnerability.

A security issue has been reported in Cisco Unity versions 2.x, 3.x, and 4.x (prior to version "4.0(5)") when integrated with Exchange, which can be exploited by malicious people to access administrative functions. The problem is that Cisco Unity creates certain user accounts with default passwords when integrated with Exchange. Successful exploitation provides access to certain administrative functions. A vendor solution is available at: http://www.cisco.com/warp/public/707/cisco-sa-20041215-unity .shtml

---

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-16 **PHP Web scripting language multiple vulnerabilities update issued**

DHS IAIP Daily; http://secunia.com/advisories/13481/

December 16, Secunia — PHP multiple vulnerabilities.

Multiple vulnerabilities have been reported in PHP, which can be exploited to gain escalated privileges, bypass certain security restrictions, gain knowledge of sensitive information, or compromise a vulnerable system. Update to version 4.3.10 or 5.0.3: http://www.php.net/downloads.php

---

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-16 **Samba security integer overflow heap based buffer overflow vulnerability update issued**

DHS IAIP Daily; http://secunia.com/advisories/13453

December 16, Secunia — Samba security descriptor parsing integer overflow vulnerability.

A vulnerability has been reported in Samba versions 2.x and 3.0.x up to and including version 3.0.9, which can be exploited by malicious users to compromise a vulnerable system. The vulnerability is caused due to an integer overflow within smbd when handling security descriptors. This can be exploited to cause a heap-based buffer overflow by requesting an extremely large amount of security descriptors. Successful exploitation allows execution of arbitrary code, but requires that the user has proper credentials to access a share. Apply patch for Samba 3.0.9: http://us1.samba.org/samba/ftp/patches/security/samba-3.0.9-CAN-2004-1154.patch

---

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-17 **Symantec Brightmail software vulnerabilities denial of service DoS update issued**

DHS IAIP Daily; http://secunia.com/advisories/13489/

December 17, Secunia — Symantec Brightmail denial of service vulnerabilities.

Two vulnerabilities have been reported in Symantec Brightmail, which can be exploited by malicious people to cause a DoS (Denial of Service). The Sieve module fails to recognize malformed RFC 822 MIME attachment boundaries and Spamhunter fails to convert certain valid character encoding sets to UTF. Apply patch 134: ftp://ftp.symantec.com/public/english_us_canada/products/sba/sba_60x/updates/Patch134.zip

---

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-21 **US CERT phpBB PHP bulletin board highlight parameter vulnerability Website hacking update issued**

DHS IAIP Daily; http://www.us−cert.gov/cas/techalerts/TA04−356A.html

December 21, US-CERT — Technical Cyber Security Alert TA04-356A: Exploitation of phpBB highlight parameter vulnerability.

The software phpBB, an open-source bulletin board application, contains an input validation problem in how it processes a parameter contained in URLs. An intruder can deface a phpBB Website, execute arbitrary commands, or gain administrative privileges on a compromised bulletin board. According to reports, this vulnerability is being actively exploited by the Santy.A worm. The worm appears to propagate by searching for the keyword "viewtopic.php" in order to find vulnerable sites. The worm writes itself to a file named "m1ho2of" and then overwrites files ending with .htm, .php, .asp. shtm, .jsp, and .phtm replacing them with HTML content that defaces the Web page. Upgrade to phpBB version 2.0.11: http://www.phpbb.com/downloads.php

Category 23.6 *Web-site infrastructure, general Web security issues*

2004-12-30 **colleges recruiting technology admissions tool colleges universities Internet videos Web page Vmags**

EDUPAGE;
http://www.nytimes.com/2004/12/30/technology/circuits/30coll.html

COLLEGES EXPAND RECRUITING TECHNOLOGY

As the effectiveness of e-mail as an admissions tool declines, colleges and universities are beginning to explore alternative recruitment Internet strategies. At the top of the list for many institutions are streaming videos of campus, either on the school's Web page or in the form of video magazines, or Vmags. Saint Mary's College in Notre Dame began testing a Vmag two years ago, sending it to students who had been accepted but had not yet decided to enroll. Saint Mary's Vmag includes four videos, each between one and two minutes, showing various activities on campus. Users who have downloaded the Vmag are prompted when new versions are available. Many believe video is able to persuade in ways that fixed images are not. Westminster College in Salt Lake City has added 136 video clips to its Web site in an effort to appeal to prospective students. Joel Bauman, vice president for enrollment at Westminster, said the videos are fairly inexpensive to produce. Karen Giannino, senior associate dean of admission at Colgate University in Hamilton, N.Y., said the videos added to her institution's Web site help "tell our story in a compelling way" and "differentiate Colgate" from similar schools.

2004-12-30 **Mozilla Internet Web browser buffer overflow vulnerability code execution attack update issued**

DHS IAIP Daily; http://securitytracker.com/alerts/2004/Dec/1012726.html

December 30, SecurityTracker — Mozilla buffer overflow in processing NNTP URLs lets remote users execute arbitrary code.

A heap overflow vulnerability was reported in Mozilla in the processing of NNTP URLs. A remote user can create a specially crafted 'news://' URL that, when loaded by the target user, will trigger a buffer overflow and execute arbitrary code on the target user's system. The code will run with the privileges of the target user. The vendor has issued a fixed version (1.7.5), available at: http://www.mozilla.org/products/mozilla1.x/

Category 23.6 *Web-site infrastructure, general Web security issues*

2005-01-03 **Microsoft Internet Explorer IE vulnerability download directory traversal attack FTP file transfer protocol Windows XP SP2 not vulnerable**

DHS IAIP Daily; http://secunia.com/advisories/13704/

INTERNET EXPLORER FTP DOWNLOAD DIRECTORY TRAVERSAL

It has been reported that a vulnerability exists in Internet Explorer, which can be exploited by malicious people to compromise a user's system. The vulnerability is caused due to an input validation error in the handling of FTP file transfers. This can be exploited by a malicious FTP server to create files in arbitrary locations via directory traversal attacks by tricking a user into downloading malicious files (e.g. by dragging or copying a file or folder). The vulnerability does not affect systems running Windows XP with SP2 installed.

Category 23.6 *Web-site infrastructure, general Web security issues*

2005-01-11 **Squid NTLM memory leak vulnerability segmentation fault update issued**

DHS IAIP Daily; http://securitytracker.com/alerts/2005/Jan/1012818.html

SQUID NTLM FAKEAUTH_AUTH HELPER

A vulnerability known as a memory leak has been reported in Squid in the NTLM fakeauth_auth helper. A remote user can trigger a segmentation fault. Under high load or when running for a long period of time, the application may run out of memory. In addition, a remote user can send a specially crafted NTLM type 3 message to cause a segmentation fault and can cause denial of service conditions. As a solution, apply the following patch: http://www.squid-cache.org/Versions/v2/2.5/bugs/squid-2.5.ST ABLE7-fakeauth_auth.patch

---

Category 23.6 *Web-site infrastructure, general Web security issues*

2005-01-11 **Microsoft Internet Explorer IE vulnerabilities cross site scripting attack Windows XP SP2 vulnerable no update issued**

DHS IAIP Daily; http://secunia.com/advisories/12889/

MICROSOFT INTERNET EXPLORER MULTIPLE VULNERABILITIES

Some vulnerabilities have been discovered in Internet Explorer, which can be exploited by malicious people to compromise a user's system, conduct cross-site/zone scripting and bypass a security feature in Microsoft Windows XP SP2. They do not require user interaction. The vulnerability was originally discussed as the Drag'n'Drop vulnerability back in October 2004. The new development only utilizes flaws in the HTML Help control. This has been confirmed on a fully patched system with Internet Explorer 6.0 and Microsoft Windows XP SP2. There is no solution at this time.

Category 23.6 *Web-site infrastructure, general Web security issues*

2005-01-13 **PHP-Nuke SQL injection vulnerability code execution source code edit**

DHS IAIP Daily; http://secunia.com/advisories/13824/

PHP-NUKE SGALLERY MODULE FILE INCLUSION AND SQL INJECTION

Two vulnerabilities in the Sgallery module for PHP-Nuke can be exploited by malicious people to compromise a vulnerable system and conduct SQL injection attacks. 1) Input passed to the "DOCUMENT_ROOT" parameter in "imageview.php" isn't properly verified, before it is used to include files. This can be exploited to include arbitrary files from external and local resources. 2) Input passed to the "idalbum" and "idimage" parameters in "imageview.php" isn't properly sanitized before being used in a SQL query. This can be exploited to manipulate SQL queries by injecting arbitrary SQL code. The vulnerability has been reported in version 1.01. Other versions may also be affected. Users should edit the source code to ensure that input is properly sanitized.

Category 23.6 *Web-site infrastructure, general Web security issues*

2005-01-14 **ForumKIT input validation vulnerability remote user cross site scripting attack no update issued**

DHS IAIP Daily; http://securitytracker.com/alerts/2005/Jan/1012895.html

FORUMKIT INPUT VALIDATION HOLE LETS REMOTE USERS CONDUCT CROSS-SITE SCRIPTING ATTACKS

A vulnerability has been reported in forumKIT causing the 'f.aspx' script to improperly validate user-supplied input in the 'members' parameter. A remote user can create a specially crafted URL that, when loaded by a target user, will cause arbitrary scripting code to be executed by the target user's browser. The code will originate from the site running the forumKIT software. As a result, the code will be able to access the target user's cookies (including authentication cookies) associated with the site, access data recently submitted by the target user via web form, or take actions on the site acting as the target user. No solution is available at this time.

Category 23.6 *Web-site infrastructure, general Web security issues*

2005-01-20 **JSBoard PHP Web software input validation flaw vulnerability information disclosure update issued**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2005/Jan/1012949.html

JSBOARD 'SESSION.PHP' INPUT VALIDATION FLAW DISCLOSES FILES TO REMOTE USERS

A remote user can view files on the target system with the privileges of the target web service. The 'session.php' script does not properly validate the user-supplied 'table' variable. If magic_quotes_gpc is set to 'off' in the 'php.ini' configuration file, then a remote user can supply a specially crafted URL to view files on the target system with the privileges of the target web service. The vendor has issued a fixed version (2.0.10), available at: http://kldp.net/frs/download.php/1729/jsboard-2.0.10.tar.gz

DHS IAIP Daily; http://securitytracker.com/alerts/2005/Feb/1013098.html

KDE KONQUEROR WEB BROWSER IDN SPOOFING SECURITY ISSUE

A vulnerability was reported in the processing of International Domain Names (IDNs). A remote user can spoof Websites, including secure Websites. The remote user can create a specially crafted URL that, when loaded by the target user, will cause the browser to display a spoofed URL in the status bar but load a Web page from a different Website with an IDN. If the destination site is running SSL and has a valid digital certificate, the browser will authenticate the site but display the spoofed URL as the authenticated URL. No solution is currently available.

2005-02-18 **design flaw automatic redirection denial of service DoS hotel Internet high-speed connection**

RISKS 23 73

RSS READER REDIRECT RISKS

Monty Solomon discovered that RSS feeds are automatically rerouted to an active proxy server if there is a redirection of HTTP requests while the RSS reader is trying to locate its feeds. Unfortunately, this design feature meant that when he logged on in a hotel where there was a _temporary_ redirection to a registration page for the high-speed Internet connection, many of his RSS feeds were permanently redirected to the registration page with no provision for shifting them back. Turns out the switch occurred while the RSS reader was running on the laptop while it was connected to the network but before the user was able to register for normal usage.

Monty's recommendation: "At a minimum, the RSS reader should validate the feed at the redirected URI before blindly switching to it."

2005-02-24 **Mozilla Firefox domain spoofing vulnerability Internationalized Domain Names IDN patch issued**

DHS IAIP Daily; http://news.com.com/Firefox+fix+plugs+security+holes/2100−
10 02_3−5589693.html

MOZILLA FIREFOX VULNERABILITIES PATCHED.

The Mozilla Foundation released on Thursday, February 24, an update to the Firefox Web browser to fix several vulnerabilities, including one that would allow domain spoofing. The open-source project released Firefox 1.0.1 to fix, among other bugs, a vulnerability in the Internationalized Domain Names (IDN), a standard for handling special character sets in domain names that lets companies register domain names that appear to be the same in different languages. The IDN vulnerability allowed an attacker to create a fake Website on a non-Microsoft browser in order to pull off a phishing scam. The update is available for Windows, Mac OS X and Linux at http://www.mozilla.org.

2005-03-11 **man-in-the-middle attack SSL encryption decryption misrepresentation confidentiality data theft risk banking proxy servers vulnerability insider fraud**

RISKS; http://www.shellnofcu.com/site/scams.html 23 79

MAN IN THE MIDDLE ATTACK ON SSL?

Russell Page had an interesting analysis of a technique potentially vulnerable to insider fraud:

Marketscore (www.marketscore.com) offer a free proxy service web users. They offer accelerated downloads and e-mail virus scanning. To use their service users download and install software onto their PCs. Marketscore are quite explicit that they collect a wide range of information about their subscribers, and make information available to web site owners on usage patterns - a sort of "Neilson" for the net.

Unfortunately, they also impersonate SSL sites. If a subscriber attempts to set up an SSL connection to say, her bank, the Marketscore proxy sends back it's certificate, and then establishes an SSL connection to the destination. Clearly for this to work, the servers have to decrypt then re-encrypt all of the traffic. Equally clearly, large numbers of credit card numbers, account names, passwords etc are passing through the Marketscore systems in the clear.

2005-05-06 **Rivest Shamir Adleman RSA Security encryption Authentication Agent heap buffer overflow vulnerability code execution attack**

DHS IAIP Daily; http://www.securityfocus.com/bid/13524/discussion/

RSA AUTHENTICATION AGENT FOR WEB REMOTE HEAP BUFFER OVERFLOW VULNERABILITY.

A remote heap-based buffer overflow vulnerability exists in RSA Authentication Agent for Web. This issue is due to a failure of the application to properly bounds check user-supplied input data prior to copying it into a fixed-sized heap buffer memory region. This vulnerability allows remote attackers to execute arbitrary machine code in the context of the vulnerable server application. This reportedly occurs with 'LocalSystem' privileges, allowing the attacker to gain complete control of the targeted computer. Versions 5.0, 5.2, and 5.3 of RSA Authentication Agent for Web are vulnerable to this issue. Users of affected packages are urged to contact the vendor for further information. Users with valid support contracts with the vendor may be able to locate fixes at: https://knowledge.rsasecurity.com There are currently no vendor-supplied patches for this issue.

Category 23.6 *Web-site infrastructure, general Web security issues*

2005-05-09 **PHP Web scripting programming Advanced Transfer Manager**

DHS IAIP Daily; http://secunia.com/advisories/15279/

PHP ADVANCED TRANSFER MANAGER FILE UPLOAD VULNERABILITY

A vulnerability has been reported in PHP Advanced Transfer Manager, which potentially can be exploited by malicious people to compromise a vulnerable system. A remote user can authenticate to the system, upload a PHP file with the '.ns' extension, and then have the Web server execute the file. The PHP code, including operating system commands, will run with the privileges of the target Web service. There is no solution at this time.

2005-07-19 **IDG fake cards Internet SurfControl PLC phishing personal**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/holes/story/0,10801,103326,00.html

ATTACKERS TURNING TO FAKE ONLINE GREETING CARDS

According to Internet security vendor SurfControl PLC, attackers are increasingly using fake e-mail greeting cards as a way of getting malicious software installed on computers. In fact, the amount of malicious e-mail being disguised as e-mail greeting cards is up about 90% from last year and now makes up more than half of all malicious e-mail being sent, according to Paris Trudeau, a product marketing manager at SurfControl. The number of "phishing" attacks, in which users are tricked into entering personal information on fake Websites, is also on the rise. But increasingly, attackers are looking for ways to trick users into downloading software that can be used to take over a computer, turning it into a so-called zombie machine, she said. Often this can be done by sending an e-mail greeting that entices users to visit a maliciously encoded Web page, Trudeau said. Another trick is to mask an e-mail message so it appears to originate from the user's IT department.

2005-08-23 **safety-critical system architecture software design engineering recommendations article overview**

RISKS; http://www.embedded.com//showArticle.jhtml?articleID=169600396 24 05

ARCHITECTURE OF SAFETY-CRITICAL SYSTEMS

David Kalinsky published an excellent overview of the principles of designing and implementing safety-critical systems for the online journal _Embedded.com_. Here are some highlights:

"Safety-critical systems are embedded systems that could cause injury or loss of human life if they fail or encounter errors. Flight-control systems, automotive drive-by-wire, nuclear reactor management, or operating room heart/lung bypass machines naturally come to mind. But devices as common as the power windows in your car are also safety-critical, once you imagine a small child reaching out of the car window at a fast food drive-through to get another packet of ketchup and accidentally leaning on the control switch making the window shut on the child's arm, or worse.

Small system defects or situations can cascade into life-threatening failures very quickly…."

Key points discussed in the article:

* Safety vs. High availability: Some readers may be thinking "Hey, this is starting to sound an awful lot like high availability." But while there are a number of points of contact between safety-critical system design and high-availability system design, the objectives of the two are quite different and many of the design architectures they use are quite different.

* Step-by-step approach: As with any embedded system, design is preceded by a system requirements definition, covering physical and functional specification. For safety-critical systems, a thorough hazard analysis and risk analysis must also be done. Only then can architectural design get started.

* Detecting sensor errors: Correct sensor data are so crucial to safe operation that many systems use redundancy in their sensor data acquisition. Redundancy doesn't always mean sensor replication as shown in Figure 5 with two identical sensors. It could also mean functional redundancy, or the measurement of the same real-world value in two different ways. For example, patient respiration rate can be measured both by the expansion and contraction of the rib cage, and by measurement of expiratory CO2 concentration.

* Shutdown systems: If a safety-critical system has an immediate safe state, as illustrated on the left side of Figure 2, a shutdown system can be used to terminate a hazardous situation as soon it detects it.

* Single channel with actuation monitoring: The idea of a shutdown system can also be applied on a smaller scale within a primary system itself, as shown in Figure 8. The ellipses represent major system activities, which could be implemented as software tasks or processes, either on separate processors or sharing a single processor, depending on the scale of the system. A basic primary system is structured by the simple design pattern of Input-Process-Output, shown here across the top of the figure as the sequence labeled "Data Acquisition," "Processing/Transformations," "Output/Control." To lower costs, the primary system and the sensor data integrity checking "shutdown" monitoring activity (at the lower left) are shown here as sharing the same input sensor(s).

* Dual-channel architectures: For safety-critical systems without an immediate safe state, dual-channel architectures can be used to allow a system to continue operation even when one of its channels has "fail stopped."

* Monitor-actuator architecture: Many safety-critical systems do not have an immediate safe state, but can't incur the high costs of a full dual-channel or multiple-channel architecture.

* Keeping people safe: The selection of a safety-critical system architecture is driven by a rigorous hazard analysis followed by risk analysis, in addition to conventional system requirements definition. System design may include combinations of redundant sensor configurations, shutdown systems, actuation monitoring, multiple channel architectures, and/or monitor-actuator structuring. These embedded systems architectures are much more valuable than can be measured in dollars and cents. Their true value is in protecting and saving human lives.

2005-09-25 **online scam fraud phishing protection tool GeoTrust TrustWatch Toolbar Website safety SSL**

EDUPAGE; http://news.com.com/2100-1029_3-5879068.html

NEW TOOLS RATE SAFETY OF WEB SITES

Two new tools from GeoTrust offer Internet users another layer of protection against a range of online scams. The TrustWatch Search site and TrustWatch Toolbar both provide indications about the probable reliability of sites users are visiting, in an effort to help consumers avoid being victimized by phishing scams or by other forms of fraudulent Web sites. The tools evaluate sites for security practices such as certain forms of authentication or use of a Secure Sockets Layer certificate. Sites are also screened against a black list of known fraud sites and checked for patterns that would indicate potentially malicious intent. Users are shown a green signal to indicate a verified site, a yellow signal for suspect sites, and a red signal for sites that cannot be verified. The toolbar provides users with a real-time screen for sites they visit; the search site returns search results--powered by Ask Jeeves--with one of the three indicators for each site returned. 2005-12-08 **data corruption WHOIS Internet database Government Accountability Office GAO ICANN FTC Web infrastructure**

EDUPAGE; http://www.internetnews.com/ent-news/article.php/3569521

GAO WARNS OF BAD DATA IN WHOIS

A new report from the U.S. Government Accountability Office (GAO) indicates that as many as 2.3 million Web addresses are owned by individuals or organizations that cannot be identified due to bad data in the WHOIS database for .com, .net, and .org domains. The report said that 5 percent of all addresses have incomplete or inaccurate information about the owner, in effect creating a safe haven for operators of Web-based scams, such as phishing attacks or the distribution of spam and viruses. When authorities try to track down those responsible for such malicious activities, they rely on the WHOIS database to find out who operates suspect domains. When the information in WHOIS is wrong, authorities hit a dead end. The Federal Trade Commission has been urging a clean-up of the database for a long time, but progress has been slow. Data are typically entered into the database through domain registrars, which bear some responsibility for ensuring the integrity of the information, along with the Internet Corporation for Assigned Names and Numbers (ICANN). Despite an ICANN policy requiring registrars to remind domain owners to update their information regularly, a system that tracks reports of complaints, however, indicates that only about 60 percent of problems are resolved. EDUPAGE; http://www.nytimes.com/2006/01/13/technology/13secure.html 23

GOVERNMENT CLOSES WEB SITE DUE TO SECURITY FLAW

A government Web site for contractors has been shut down due to a security flaw that allowed users of the site to see and change data submitted by other vendors. The General Services Administration (GSA) closed eOffer after a consultant reported the problem. Three weeks passed, however, between the reporting of the flaw and the shuttering of the site. The Web site was launched in 2004 as a means for vendors to bid electronically on government contracts for IT products and services. The flaw allowed site users to access and change corporate and financial information, potentially compromising the entire bidding process, according to security experts. The problem could also allow corporate espionage. The GSA said there was no evidence that the site had been abused by either authorized or unauthorized users. The agency said the delay in shutting down the site was caused by the time that was required to process the report. New York Times, 13 January 2006 (registration req'd)

2006-02-20 **Indiana University professor active cookie new technology fight defeat online scams**

EDUPAGE; http://www.pcworld.idg.com.au/index.php/id;215389687;fp;2;fpid;1 23

IU PROFESSOR INTRODUCES ACTIVE COOKIE

A researcher at Indiana University has developed technology he calls "active cookies" that he says will help defeat online scams. Markus Jacobsson, associate professor of informatics and associate director of the Indiana University Center for Applied Cybersecurity Research, has teamed up with Ari Juels, manager and principal research scientist at RSA Laboratories, to form a company called RavenWhite to market the technology. Standard cookies are intended only to identify users to a Web host. According to RavenWhite, active cookies also authenticate users. Pharming scams and other similar malicious activities redirect users from intended Web sites to bogus ones without the user's knowing. Active cookies would reportedly alert users to the redirect and foil the scam. The company said it is working on technology that would extend the protections offered by active cookies to users who use multiple computers or who change browser settings that affect how cookies are handled.

2006-02-23 **Macromedia Shockwave Player installer buffer overflow vulnerability**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2006/0716 23

MACROMEDIA SHOCKWAVE PLAYER INSTALLER BUFFER OVERFLOW VULNERABILITY.

A vulnerability has been identified in Macromedia Shockwave Player, which could be exploited by remote attackers to take complete control of an affected system. Analysis: This issue is due to a stack overflow error in the ActiveX installer that does not properly handle overly large values passed to certain parameters, which could be exploited by attackers to execute arbitrary commands by tricking a user into visiting a malicious Website with Shockwave content that prompts the user to install the player. Affected products: Macromedia Shockwave Player version 10.1.0.11 and prior. Solution: The vendor has fixed the issue in the Shockwave Player ActiveX installer. Note: Since the vulnerability occurs in the installer, no action needs to be taken by users.

Category 23.6 *Web-site infrastructure, general Web security issues*

2006-03-01 **vulnerability update Apache Web server Sun Solaris 8 9 execute arbitrary code workaround**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2006/0789 23

SUN SECURITY UPDATE FIXES MULTIPLE APACHE WEB SERVER VULNERABILITIES.

A vulnerability in the Apache 1.3 Web server bundled with Solaris 8 and 9 may allow a local user who is able to create e SSI documents which are served by Apache to execute arbitrary code with the privileges of the Apache 1.3 process. The Apache HTTP process normally runs as the unprivileged user "nobody" (uid 60001). Analysis: This vulnerability affects the Apache 1.3 Web server bundled with Solaris 10 which may prevent certain configured security features from being applied to specific HTTP transactions when Apache is configured to use SSL. The second vulnerability in the Apache 1.3 Web server may allow local or remote unprivileged users to bypass security protections associated with some network transactions, corrupt information stored in a Web cache, or perform cross site scripting activities when the Apache Web server is configured to run as a proxy. Affected products: Sun Solaris 8, Sun Solaris 9, and Sun Solaris 10. Solution: Until patches are available, upgrade to the latest versions of Apache and mod_ssl as an interim workaround.

Category 23.6 *Web-site infrastructure, general Web security issues*

2006-03-01 **IBM WebSphere Application Service source code disclosure vulnerability**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2006/0788 23

IBM WEBSPHERE APPLICATION SERVER SOURCE CODE DISCLOSURE VULNERABILITY.

A vulnerability has been identified in IBM M WebSphere Application Server, which can be exploited by remote attackers to gain knowledge of sensitive information. Analysis: The flaw is due to an input validation error when processing malformed HTTP requests containing a specially crafted filename extension, which could be exploited by remote attackers to display the source code of arbitrary JavaServer pages (JSP) instead of an expected HTML response. Affected products: IBM WebSphere Application Server version 5.1.1.4 through 5.1.1.9; IBM WebSphere Application Server version 5.0.2.10 through 5.0.2.15. Solution: Upgrade to version 5.0.2.16 or 5.1.1.10 (when available) or apply Interim fixes: http://www-1.ibm.com/support/docview.wss?rs=180&uid=swg27004980

Category 23.6 *Web-site infrastructure, general Web security issues*

2006-03-04 **Microsoft IIS Web server authentication method disclosure vulnerability no patch solution**

DHS IAIP Daily; http://www.securityfocus.com/bid/4235/references 23

MICROSOFT IIS AUTHENTICATION METHOD DISCLOSURE VULNERABILITY.

Microsoft IIS supports Basic and NTLM authentication. Reportedly, the authentication methods supported by a given IIS server can be revealed to an attacker through the inspection of returned error messages, even when anonymous access is also granted. Analysis: When a valid authentication request is submitted for either message with an invalid username and password, an error message will be returned. This happens even if anonymous access to the requested resource is allowed. An attacker may be able to use this information to launch further intelligent attacks against the server, or to launch a brute-force password attack against a known username. For a complete list of vulnerable products: http://www.securityfocus.com/bid/4235/info. Solution: Currently the Security Focus staff is not aware of any vendor-supplied patches for this issue.

Category 23.6 *Web-site infrastructure, general Web security issues*

2006-03-11 **Apple QuickTime iTunes integer heap overflow vulnerabilities Mac OS X Microsoft Windows releases affected no solution**

DHS IAIP Daily; http://www.securityfocus.com/bid/17074 23

APPLE QUICKTIME/ITUNES INTEGER AND HEAP OVERFLOW VULNERABILITIES.

An integer overflow and heap-based buffer overflow vulnerability have been reported in Apple QuickTime and iTunes. These issues affect both Mac OS X and Microsoft Windows releases of the software. Analysis: A successful exploit will result in execution of arbitrary code in the context of the currently logged in user. Vulnerable: Apple QuickTime Player 7.0.4; Apple QuickTime Player 7.0.3; Apple iTunes 6.0.2; Apple iTunes 6.0.1. Solution: Security Focus is currently not aware of any vendor-supplied patches for this issue.

Category 23.6 *Web-site infrastructure, general Web security issues*

2006-03-15 **Adobe Graphics Server interactive login configuration remote arbitrary code execution attack**

DHS IAIP Daily; http://securitytracker.com/alerts/2006/Mar/1015769.html 23

ADOBE GRAPHICS SERVER INTERACTIVE LOGIN CONFIGURATION LETS REMOTE USERS EXECUTE ARBITRARY CODE.

A vulnerability was reported in Adobe Graphics Server. A remote user can cause arbitrary code to be executed on the target system. Analysis: When configured according to vendor recommendations, a remote user may be able to cause arbitrary code to be executed on the target system. The remote user can load arbitrary code onto the server such that it will be executed the next time an interactive user login occurs. The code will run with the privileges of the Adobe Server service account. On some systems, this may be system level privileges. Only Windows based systems are affected. Vulnerable versions: Version(s): 2.0, 2.1. Solution: The vendor recommends following a manual hardening process as well as restricting interactive logins to the service account for the server (adbeserv) by using local security policies. The vendor's advisory describes the service account restriction steps and is available at: http://www.adobe.com/support/techdocs/332989.html

2006-03-27 **Symantec Veritas NetBackup multiple daemons remote buffer overflow vulnerabilities solution update**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2006/1124 23

SYMANTEC VERITAS NETBACKUP MULTIPLE DAEMONS REMOTE BUFFER OVERFLOW VULNERABILITIES.

Multiple vulnerabilities have been identified in Veritas NetBackup Master, Media Servers and clients, which could be exploited by remote attackers to take complete control of an affected system. Analysis: The first issue is due to a buffer overflow error in the volume manager daemon (vmd.exe) that does not properly handle malformed data sent to port 13701/TCP, which could be exploited by remote attackers to execute arbitrary commands. The second flaw is due to a buffer overflow error in the NetBackup Database Manager service (bpdbm.exe) that does not properly handle malformed data sent to port 13721/TCP, which could be exploited by remote attackers to compromise a vulnerable system. The third vulnerability is due to a buffer overflow error in the VERITAS Network Daemon (vnetd) that does not properly handle specially crafted messages sent to port 13724/TCP, which could be exploited by attackers to execute arbitrary commands. See source advisory for a complete list of vulnerable products. Solution: Apply security updates: http://seer.support.veritas.com/docs/281521.htm

Category 23.6 *Web-site infrastructure, general Web security issues*

2006-04-13 **Apache mod_ssl CRL handling off by one buffer overflow vulnerability memory corruption solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/14366/discuss 23

APACHE MOD_SSL CRL HANDLING OFF BY ONE BUFFER OVERFLOW VULNERABILITY.

Apache's mod_ssl is prone to an off by one buffer overflow condition. The vulnerability arising in the mod_ssl CRL verification callback allows for potential memory corruption when a malicious CRL is handled. Analysis: Several vulnerabilities in the Apache 2.0 Web server prior to version 2.0.55 may allow a local or remote unprivileged user to cause a denial-of-service to the Apache 2 HTTP process, or may allow a local user who is able to write to directories served by the Web server to execute arbitrary code with the privileges of the Apache 2 process. The Apache 2 HTTP process normally runs as the unprivileged user "webservd" (uid 80). For a complete list of vulnerable products: http://www.securityfocus.com/bid/14366/info Solution: The vendor has addressed this issue in version 2.0.55 of the 2.0 branch. Users are advised to obtain the available update. Please see the referenced vendor advisories for further information: http://www.securityfocus.com/bid/14366/references

---

Category 23.6 *Web-site infrastructure, general Web security issues*

2006-04-13 **Adobe Document Server multiple remote vulnerabilities solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/17500/discuss 23

ADOBE DOCUMENT SERVER FOR READER EXTENSIONS MULTIPLE REMOTE VULNERABILITIES.

Adobe Document Server for Reader Extensions, included with Graphics Server and Document Server, is prone to multiple vulnerabilities. Analysis: When using Adobe Document Server for Reader Extensions 6.0, a user's session ID is included in the URL ("jsessionid" parameter) and is exposed to other Websites in the "Referer:" header. It is possible that a malicious person might monitor a company's Internet traffic to steal the sessionid directly from the URL. That session ID could be used by the malicious person to gain a copy of the PDF file that a legitimate user is processing with Reader Extensions. Vulnerable products: Adobe Graphics Server 2.1 and Adobe Document Server 6.0. Solution: Adobe has released advisories and updated software to address these issues. Please see the referenced advisories for further information: http://www.securityfocus.com/bid/17500/references

---

Category 23.6 *Web-site infrastructure, general Web security issues*

2006-04-13 **Apache HTTP request smuggling vulnerability solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/14106/discuss 23

APACHE HTTP REQUEST SMUGGLING VULNERABILITY.

Apache is prone to an HTTP request smuggling attack. Analysis: A specially crafted request with a "Transfer Encoding: chunked" header and a "Content Length" header can cause the server to forward a reassembled request with the original "Content Length" header. As a result, the malicious request may piggyback on the valid HTTP request. This attack may result in cache poisoning, cross site scripting, session hijacking, and other attacks. If the described issues have been exploited to cause a denial-of-service condition, the Apache Web Server may be slow to respond to requests or may not respond at all. There are no predictable symptoms that would indicate any of the described issues have been exploited to gain unauthorized access to a host or its data. For a complete list of vulnerable products: http://www.securityfocus.com/bid/14106/info Solution: The vendor has released Apache 2.1.6 to address this issue in the 2.1.x branch. The vendor addressed this issue for earlier versions as well: version 2.0.55 of the 2.0 branch and version 1.3.34 of the 1.3 branch. Please see the referenced vendor advisories for further information: http://www.securityfocus.com/bid/14106/references

2006-05-10 **Microsoft Flash patch glitch user report workaround**

DHS IAIP Daily; http://www.informationweek.com/news/showArticle.jhtml?articleID=187202029&subSection=Breaking+News 23

USERS REPORT GLITCHES WITH MICROSOFT'S FLASH PATCH.

If, as an analyst suggested Tuesday, May 9, Microsoft plans to begin patching more than its own software, its first effort got off to a rocky start. By Wednesday, May 10, Windows users were complaining of glitches in updating Adobe's Flash Player through the Windows Update service. Microsoft took the unusual step Tuesday of feeding an updated edition of Flash Player to Windows XP, Windows 98, and Windows Millennium users. It was the first time the Redmond, WA, developer took an active role in pushing a third-party product update to users. Microsoft is aware of the problem, which it dubbed a "known issue" in a support document posted Wednesday. The document offers a workaround that requires users to delete a pair of Flash-related files, then manually download and install the Player update.

2003-02-24 **Session Initiation Protocol SIP new vulnerabilities exploit software CERT CC advisory**

NIPC/DHS

February 21, CERT/CC — CERT Advisory CA-2003-06: Multiple vulnerabilities in implementations of the Session Initiation Protocol (SIP).

The Session Initiation Protocol (SIP) is a developing and newly deployed text-based protocol that is commonly used in Voice over IP (VoIP), Internet telephony, instant messaging, and various other applications. Numerous vulnerabilities have been reported in multiple vendors' implementations of the SIP. These vulnerabilities may allow an attacker to gain unauthorized privileged access, cause denial-of-service attacks, or cause unstable system behavior. SIP-enabled products from a wide variety of vendors are affected. Other systems making use of SIP may also be vulnerable but were not specifically tested. Not all SIP implementations are affected. Detailed instructions for resolving this issue may be found in this advisory on the CERT/CC Website. To determine if your product is vulnerable please refer to CERT/CC Vulnerability Note VU#528719 at http://www.kb.cert.org/vuls/id/528719

2004-01-14 **VoIP voice over IP flaw weakness hole exploit text messaging Microsoft Cisco crash denial of service DoS**

RISKS; http://news.com.com/2100-1002_3-5140284.html?tag=nefd_lede 23 21

FLAWS THREATEN VoIP NETWORKS

Peter G. Neumann produced this abstract of an article by Robert Lemos in CNET News:

A technical review conducted by the British government has found several security flaws in products that use VoIP and text messaging, including those from Microsoft and Cisco Systems. The flaws affect software and hardware that support the real-time multimedia communications and processing standard, known as the International Telecommunications Union (ITU) H.323 standard.

The security problems can cause a product that supports H.323 to crash. For example, in Cisco telecommunications products running its IOS operating system, the vulnerability could be used to cause the devices to freeze or reboot. However, on Microsoft's Internet Security and Acceleration Server 2000, which is included with Small Business Server 2000 and 2003 editions, the vulnerability could allow an attacker to take control of the system.

2004-01-15 **CERT CC advisorty message vulnerability flaw patch fix**

NIPC/DHS; http://www.cert.org/advisories/CA−2004−01.html

January 13, CERT/CC, NISCC — CERT Advisory CA-2004-01 Multiple H.323 Message Vulnerabilities.

The U.K. National Infrastructure Security Co-ordination Centre has reported multiple vulnerabilities in different vendor implementations of the multimedia telephony protocol H.323. H.323 is an international standard protocol, published by the International Telecommunications Union, used to facilitate communication among telephony and multimedia systems. Examples of such systems include VoIP, video-conferencing equipment, and network devices that manage H.323 traffic. Exploitation of these vulnerabilities may result in the execution of arbitrary code or cause a denial of service, which in some cases may require a system reboot. Systems administrators should apply a patch or upgrade and filter network traffic. Sites should apply network packet filters to block access to the H.323 services at network borders, including 1720/TCP and 1720/UDP. If access cannot be filtered at the network perimeter, the CERT/CC recommends limiting access to only those external hosts that require H.323 for normal operation. Some firewalls process H.323 packets and may themselves be vulnerable to attack. Certain sites may actually want to disable application layer inspection of H.323 network packets. Additional information is available on the Microsoft Website:
http://www.microsoft.com/technet/treeview/default.asp?url=/t echnet/security/bulletin/ms04-001.asp

2004-01-23 **Cisco voice product security flaw vulnerability patch fix**

NIPC/DHS; http://www.cisco.com/warp/public/707/cisco-sa-20040121-voice.shtml

January 22, earthweb.com — Cisco warns of voice product security flaws.

Cisco on Thursday, January 22, warned of a default installation vulnerability in multiple voice products running on the IBM platform that leaves TCP and UDP ports open to malicious attack. Cisco said the security flaw could be exploited to cause denial-of-service attacks and administrative takeover. According to the Cisco advisory, the vulnerable voice products running on IBM servers install the Director Agent insecurely by leaving the service on port 14247 (both TCP and UDP) accessible without requiring user authentication. In addition to leaving the products susceptible to administrative takeover, a malicious attacker could make the IBM Director Agent process consume a server's entire CPU resources by scanning it with a network scanner. This advisory underscores the risks that come with the growing dependence on IP-based networks, especially in the enterprise. Specific information on this advisory can be found at:
http://www.cisco.com/warp/public/707/cisco-sa-20040121-voice.shtml

2004-05-24 **VoIP Voice over IP Internet telephony Juniper Research study**

DHS IAIP Daily; http://www.theregister.co.uk/2004/05/24/voip_market_boom/

May 24, The Register (UK) — VoIP to transform telecoms market.

Internet telephony will make up 12 percent of all telephony revenues in five years time, according to a study by analysts Juniper Research published Friday, May 21. Juniper claims the VoIP (Voice over Internet Protocol) market will contribute $32 billion, out of a total telephony market worth approximately $260 billion, by 2009. Service providers face the challenge of balancing new VoIP revenues against declines in their traditional fixed-line revenues, as flat-rate IP-based voice tariffs replace time and distance related charges. These changes will benefit more nimble service providers. According to Juniper, initial residential use of VoIP will be via a 'PSTN-bypass' through a PSTN interconnect -- this excludes free PC-to-PC or peer-to-peer services that do not offer PSTN interconnect. However in the longer term voice will be offered as part of a service bundle that includes email, Internet access and video telephony. In the enterprise, calls from IP-VPNs (virtual private networks) will also grow quickly as companies take advantage of network convergence to reduce costs. The study is available online: http://www.juniperresearch.com

2004-06-10 **British Telecom circuit-switched network voice over IP VoIP**

NewsScan

BT TO SHUT DOWN 'CIRCUIT-SWITCHED' NETWORK IN FAVOR OF VOIP

U.K. giant British Telecom will gradually shut down its traditional circuit-switched network and migrate over to technologies that route phone calls over the Internet. The change "will deliver our vision of a converged, multimedia world where our customers can access any communications service from any device, anywhere -- at broadband speed," says BT Wholesale CEO Paul Reynolds. The new system will enable each subscriber to have a single phone number for both mobile and fixed-line services, and will make possible such add-on features as family conference calls, video streaming and voice-activated phones. BT estimates that by the 2008-09 fiscal year, the new network could save it about £1 billion annually. (AP 10 June 2004)

2004-06-28 **voice over IP VoIP US consumer use research**

NewsScan

VOIP CATCHING ON

More than 25% of Internet users in the U.S. are aware of VoIP (voice over Internet Protocol) telephony, and 13% of those have considered switching over to Internet telephony for their residential phone service. The new figures from a study conducted by the Pew Internet & American Life
Project and the New Millennium Research Council also show that 11% of Internet users (14 million Americans) have actually made some kind of VoIP phone call. "Anecdotal evidence suggests that the 'pioneering consumer' often faces new technology 'glitches,' but then reaps the benefits and
enjoys being the first on the block with a new gadget," says Pew senior research specialist John Horrigan. The findings suggest that it's not too soon for legislators to begin thinking about the implications of this new technology, says Allen Hepner, NMRC advisory board member: "This
'disruptive technology' is coming to all Americans; it is not a question of 'if,' but 'when.' VoIP also disrupts existing laws and regulations in the telecom arena. Legislators and regulators would be wise to reexamine existing policy sooner rather than later, so as to minimize regulatory uncertainties for business and consumers." (Pew Internet & American Life Project News Release 28 Jun 2004)

2004-07-06 **voice-over-IP VoIP adoption obstacles AT&T**

NewsScan

OBSTACLES TO NET PHONE SERVICE

AT&T says it expects to have 1 million customers for its voice-over-Internet-protocol (VoIP) phone service by the end of next year, and cable-TV company Comcast expects to offer VoIP all its customers by the end of 2006; however, Mark Main of the British consulting firm Ovum warns
that -- although everyone will be using VoIP 10 or 15 years from now -- the road to that point "will be quite varied, quite torturous and not at all clean." Some obstacles in the way: only 27% of U.S. online users have even heard of it; a VoIP subscriber needs a broadband connection, and phone service will be only as good as that broadband connection; prices may go up in the future due to increased regulation and taxes; and VoIP service, which depends on the regular power grid, will fail if grid should fail. (AP/San Jose Mercury News 6 Jul 2004)

Category 23.7 VoIP

2004-08-02 **hackers phone phreaking voice-over-IP VoIP corporate network attack**

DHS IAIP Daily; http://www.nytimes.com/2004/08/02/technology/02virus.html

August 02, New York Times — Hackers are discovering a new frontier:

Internet telephone service. Internet phones break voice conversations into data packets and route them over the Internet, a cheap and more flexible alternative to traditional phone calls that travel over copper wires. But Internet phones and the routers and servers that steer and store the digitized calls are susceptible to bugs, viruses and worms. Already, a few malicious attacks have shut down corporate Internet phone networks, disrupting business at a cost of millions of dollars. With Internet phones, hackers or disgruntled employees with access to a company's phone server can eavesdrop on conversations by surreptitiously installing software that can track voice packets. In theory, hackers can listen in on anyone's conversation, including those of ordinary consumers using a commercial Internet phone service. Hackers, though, are more likely to focus on a business's Internet phone lines to glean information that can be used for profit. Anecdotal evidence and the history of trouble with data networks suggest that it is only a matter time before the number and seriousness of the attacks increases as more companies start digital phone systems and merge them with their data networks.

VOIP -- VOYEURISM OVER INTERNET PROTOCOL?

With businesses and individuals flocking to Internet telephony as a cheap alternative to pricey landline phones, hackers are discovering new opportunities for eavesdropping and making mischief. Tapping phones by hacking into servers and hard drives is much easier than conventional wiretapping and analysts say even though very few incidents have been reported to date, it's just a matter of time. "Once you are running an Internet phone network, all those threats you worry about in the data world will be transferred to the voice world," says one security consultant. "Voice over Internet phones are not in the spotlight of hackers yet, but in this voyeuristic world, if someone can listen in on people's conversations and get a thrill, they will." In addition, voice packets offer new opportunities for disguising and distributing malignant code. "You can spoof a packet and insert myself into a communications flow," says a systems engineer for Mirage Networks. "This kind of threat has been around for a while for data, but now it will move into voice. As you see a broader
acceptance of voice over Internet, you'll see more spoofs." (New York Times 2 Aug 2004)

2004-08-02 **voice-over-IP VoIP outage Vonage**

DHS IAIP Daily; http://zdnet.com.com/2100−1105_2−5293439.html

August 02, CNET News.com — VoIP provider Vonage suffers outage.

Net phone service provider Vonage confirmed that it suffered its first outage in 18 months on Monday, August 2, due to problems at partner Global Crossing. Customers could still receive calls, but a small percentage of Vonage's 200,000 total subscribers couldn't make outbound calls from around 7 a.m. to 8 a.m. PDT, at which time the problem was fixed. Vonage's Website was knocked off the Internet during that time as well, because Global Crossing also hosts the site, according to a Vonage representative. VoIP requires a broadband connection; calls don't dial directly to 911; and if power to a home or office is lost, so is phone service.

2004-10-07 **Skype VoIP voice over IP**

NewsScan; http://www.latimes.com/technology/la-fi-skype7oct07

SKYPE GOES CALLING ON BUSINESSES

Internet telephony service Skype Technologies is turning its attention to small- and medium-size businesses, hoping to duplicate its tremendous success with individual users. "We've been targeting Skype to the individual, not to the residential or business markets. But what we found in a recent survey is that 48% of our customers are people using it for business," says Skype co-founder Niklas Zennstrom. Skype uses filesharing technology to form its network on the fly -- similar to the way that Kazaa filesharing software works. That's no coincidence -- Skype co-founders Zennstrom and Janus Friis are also the original creators of Kazaa. Skype currently counts 12 million users worldwide and last month's introduction of Skype Out -- a service that enables users to make calls to recipients with regular phone service for a minuscule charge -- resulted in an additional 200,000 paying customers. And while up until now, Skype has been offered free, the company's new focus signals a change. "[Zennstrom] is migrating from free services. He's got a revenue plan," says one industry advocate.

FCC TO STATES: LEAVE INTERNET PHONE OVERSIGHT TO US

The Federal Communications Commission is planning to declare Internet phone service off-limits to state regulators. Bruce P. Mehlman of the trade group Internet Innovation Alliance says: "The decision before the FCC is critical, and very serious. The question for regulators is: Do we treat it like telecommunications, taxing it and regulating it heavily, or like information technology, keeping our hands off and letting market-based innovation benefit everyone?" But Mark Cooper of the Consumer Federation of America disagrees, saying: "If you let these people avoid their public responsibilities and not pay their fair share for using the network, the people left behind are going to be harmed by rising prices and declining quality." 2005-01-06 **National Institute of Standards and Technology NIST concern Voice over IP VoIP security vulnerabilities firewalls encryption report**

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2005/0103/web−voip−01−06−05. asp

NATIONAL INSTITUTE OF STANDARDS AND TECHNOLOGY (NIST) RAISES CONCERNS ABOUT VOICE OVER INTERNET PROTOCOL (VOIP).

Government administrators may not understand the complexity of installing security systems for Internet telephony, a new government study suggests. Officials at the National Institute of Standards and Technology (NIST) released a January 5 report that examines security vulnerabilities in Internet-based telephone systems and raises concerns about an emerging technology that otherwise appears to offer many advantages over traditional telephone networks. Security concerns described in the report suggest that the cost and complexity of installing such systems is greater than people realize. The report's authors say that security measures such as firewalls and encryption used in traditional data networks are incompatible with current Internet-based telephone systems and can cause serious deterioration in the voice quality possible on such systems. To compensate for the current security vulnerabilities of Voice over Internet Protocol (VoIP) technology, NIST officials made several recommendations in the report. 2005-02-07 **VoIP security threats companies VoIPSA TippingPoint networks lists white papers research**

EDUPAGE; http://www.internetnews.com/security/article.php/3469251

VOIP PROVIDERS TACKLE SECURITY THREATS UP FRONT

More than 20 companies involved in voice over Internet protocol (VoIP) tools and technology have formed the VoIP Security Alliance (VOIPSA) to try to stay ahead of security threats to the emerging VoIP market. "The same threats on a data network are also inherent in a VoIP deployment," said Laura Craddick, a spokesperson for TippingPoint, one of the founding members of VOIPSA. "Then there are additional risks in VoIP protocols," she added. With VoIP taking hold in some corporate sectors, and with household adoption of VoIP technology expected to rise from 400,000 to 12 million over the next five years, analysts warn of the need to anticipate threats to VoIP networks and prepare for them. VOIPSA will operate discussion lists, publish white papers, and sponsor research. Aside from TippingPoint, VOIPSA members currently include Alcatel, Avaya, Columbia University, and Symantec. Notably absent are Cisco and Nortel, which the group is actively trying to recruit.

2005-02-07 **voice over Internet protocol VoIP security alliance formed VOIPSA Siemens Qwest SANS NIST**

DHS IAIP Daily; http://www.wired.com/news/technology/0,1282,66512,00.html

VOIP SECURITY ALLIANCE FORMED

A new industry group has formed to look at the security threats inherent in voice over Internet protocol (VoIP). The VoIP Security Alliance, or VOIPSA, launched on Monday, February 7. So far, 22 entities, including security experts, researchers, operators and equipment vendors, have signed up. They range from equipment vendor Siemens and phone company Qwest to research organization The SANS Institute. They aim to counteract a range of potential security risks in the practice of sending voice as data packets, as well as educate users as they buy and use VoIP equipment. An e-mail mailing list and working groups will enable discussion and collaboration on VoIP testing tools. Over the past year, experts have repeatedly warned that VoIP abuse is inevitable. The National Institute of Standards and Technology (NIST) put out a report last month urging federal agencies and businesses to consider the complex security issues often overlooked when considering a move to VoIP. NIST is a member of VOIPSA.

2005-02-09 **VoIP voice over IP security alliance**

NewsScan; http://online.wsj.com/article/0

COMPANIES BAND TOGETHER TO PROMOTE VoIP SECURITY

A group of more than 20 companies, including 3Com, Alcatel, Avaya, Siemens, Symantec and Ernst & Young, have formed a VoIP Security Alliance to tackle voiceover- IP security problems and strive toward making VoIP as reliable as traditional telephony. Alliance chairman David Endler warns that as businesses embrace VoIP as a cheap alternative to their current phone system, many network operators are unaware that they need to alter their security strategies when they add the service. For instance, traditional firewalls cannot police VoIP traffic, he notes. "VoIP networks really inherit the same cyber-security threats that data networks are today prone to, but those threats take greater severity in some cases," says Endler. (Wall Street Journal 9 Feb 2005)

EDUPAGE; http://www.wired.com/news/privacy/0,1848,66954,00.html

APPLYING OLD SCAMS TO NEW TECHNOLOGIES

The emergence of voice over Internet protocol (VoIP) phone service has opened a new door for hackers and others to fool users. Using the Internet to transmit phone calls allows callers to spoof Caller ID systems, something that isn't possible with traditional phone service. Although telemarketers are required by the Federal Communications Commission to properly identify themselves, Caller ID spoofing is otherwise not prohibited. As a result, someone can, for example, call Western Union, which requires customers to call from their home phones to initiate money transfers, using a faked source number, and make a fraudulent transfer. In other instances, debt collectors and private investigators use Caller ID spoofing to trick people into answering their phones and possibly divulging information they otherwise would not. Scams similar to e-mail phishing rackets also take advantage of Caller ID spoofing, deceiving people into believing that a caller is at a bank or a financial institution and helping persuade them to reveal personal information to the caller. 2005-04-11 **voice over Internet Protocol VoIP security threats warning emergency services targets fire police**

DHS IAIP Daily; http://www.networkingpipeline.com/showArticle.jhtml?articleID=160700231

VoIP SECURITY CHIEF WARNS OF INCREASED SECURITY THREATS

VoIP Security Alliance Chairman, David Endler, says that threats to VoIP are increasing; and emergency services, fire, and police may be targeted. The Voice Over IP Security Alliance (VOIPSA) is the first industry-wide organization devoted to promoting VoIP security. “As VoIP increases in popularity and number of deployments, so will its attractiveness to potential attackers,” Endler observes. “VoIP networks inherit most of the same security threats that traditional data networks have today,” he notes. "However, by adding new VoIP components to an existing data infrastructure, new security requirements are also added: quality of service, reliability, and privacy. We can expect to see over the next year or two VoIP specific attacks emerge that go beyond today's more prevalent data network vulnerabilities." Our reliance on voice communications for basic needs raises the stakes even higher, when you look at emergency services call centers like 911, police and fire departments, Endler says. One of the problems, he says is that “the threats have not been well identified and laid out yet in a coherent manner. That's one of the things VOIPSA is trying to change with one of our first short-term projects, the VoIP Security Threat Taxonomy.” VOIPSA Website: http://www.voipsa.org/

EDUPAGE; http://chronicle.com/prm/daily/2005/05/2005052701t.htm

UNIVERSITIES UNVEIL 911 VOIP TECHNOLOGY

A group of three universities has announced a project that would allow voice over Internet protocol (VoIP) phone systems to work with 911 calls. Traditional phone networks are connected to 911 networks and, in the event of a 911 call, provide the physical location of the caller. Because VoIP calls are routed over the Internet, which is not connected to 911 networks, making 911 technology work with VoIP has been problematic. The Federal Communications Commission, however, recently issued a ruling that will require VoIP providers to offer 911 service to all customers. The system being developed by Columbia University, Texas A&M University at College Station, and the University of Virginia will provide 911 operators with the caller's location and in some cases would also provide a video image of the caller. Internet2, Cisco Systems, and Nortel are also involved in the project, which is not expected to be complete for another year and a half. Part of the funding for the project came from the National Telecommunications and Information Administration, which is part of the Department of Commerce. 2005-07-11 **VoIP voice over IP fraud international telephone call sell operations**

RISKS; http://www.usenet.org.uk/uk.telecom.voip.html 23 94

VoIP FRAUD COSTING STARTUPS $MILLIONS IN LOSSES

It's one of the best kept secrets in the Voice over IP industry. The biggest problem facing VoIP providers isn't the specter of costly E911 requirements, overzealous regulators, or even competition from a myriad of sources. The biggest issue is fraud, perpetrated by scammers who take advantage of lax international communications standards and regulations, and make thousands of minutes of calls through carriers - many of them fly-by-night operators - in places such as Afghanistan and Lichtenstein, who charge exorbitant rates for call termination, leaving the originating service provider with sky high bills and no one to charge for them.

VoIP scams have already caused start-ups in the fledgling industry millions of dollars in losses and are blamed, in part, for the recent demise of one service provider. "It is the single largest problem facing providers," says Ravi Sakaria, VoicePulse CEO, "because the development cost associated with addressing the issue is significant enough that it could be prohibitive for the smaller players."

2005-07-14 **TechWeb eavesdrop VoIP service alerts Secutity ISS X-Force bugs crash CallManager calls**

DHS IAIP Daily; http://www.techweb.com/wire/security/165702369

ATTACKERS COULD EAVESDROP ON CISCO-ROUTED VOIP CALLS

Flaws in Cisco's Voice-over-Internet Protocol (VoIP) software could allow an attacker to bring down the alternative-to-traditional-telephone service, or access the server that initiates and routes Web-based calls, an Atlanta-based security firm said. According to alerts posted online by Internet Security Systems' (ISS) X-Force research team, Cisco's CallManager sports a pair of bugs that could be "reliably exploited" by hackers. The potential result: at best a denial-of-service style crash, at worst, a situation where the attacker could redirect calls at will or even eavesdrop on conversations. By sending specially crafted packets to Cisco CallManager, an attacker could create a heap overflow and crash the system or gain access. ISS said that an exploit wouldn't need any help from a user, pushing the threat into a more dangerous category. Cisco's own advisory includes details on patched editions of CallManager that are ready to download and install.

EDUPAGE; http://news.com.com/2100-7348_3-5825932.htm

UNIV. RECEIVES FEDERAL SUPPORT FOR VOIP TRACKING TECHNOLOGY

The National Science Foundation has given researchers at George Mason University a grant of more than $300,000 to develop a technology that would allow limited eavesdropping on voice over Internet protocol (VoIP) phone calls. Xinyuan Wang, assistant professor of software engineering at the university and principal investigator, has shown that his method can successfully trace VoIP users without their knowledge. As VoIP service has become more common, law enforcement officials have pointed out that they have no way of tapping such phone calls, potentially resulting in a "haven for criminals, terrorists, and spies," according to the Federal Communications Commission. The technology that Wang and his colleagues are working on does not decrypt conversations. It tracks packets as they move from one user to another, allowing authorities to see who is talking to whom, but not to see what they are saying. Wang conceded that "from a privacy advocate's point of view, this is an attack on privacy," but he also noted that "from a police point of view, this is a way to trace things." CNET, 9 August 2005

DHS IAIP Daily; http://www.networkingpipeline.com/showArticle.jhtml?articleId=170100161

INTERNET PHONE PROVIDERS MAY CUT OFF CUSTOMERS

Providers of Internet-based phone services may be forced next week to cut off tens of thousands of customers who haven't formally acknowledged that they understand the problems they may encounter dialing 911 in an emergency. The Federal Communications Commission (FCC) had set the Monday, August 29, deadline as an interim safeguard while providers of Internet calling, also known as "VoIP" for Voice over Internet Protocol, rush to comply with an FCC order requiring full emergency 911 capabilities by late November. The FCC issued its order in May after a series of highly publicized incidents in which VoIP users were unable to connect with a live emergency dispatch operator when calling 911. Vonage, AT&T, and other carriers have indicated that they plan to comply with the FCC deadline to disconnect customers. But Time Warner Cable, the biggest VoIP provider in the cable TV industry with more than 600,000 users, said in its FCC filing that all customers have already been adequately informed about the risk of losing 911 service in a power outage--the primary issue for cable-based VoIP services--and that all have already acknowledged that risk.

DHS IAIP Daily; http://www.govtech.net/magazine/channel_story.php/96576

NEW YORK CITY HAS AN E911 SOLUTION FOR NOMADIC VOIP TELEPHONE SUBSCRIBERS

New York City is now offering an E911 solution for Voice over IP (VoIP) telephone subscribers. This solution addresses a major emergency dialing problem associated with "nomadic" VoIP services. Nomadic services allow subscribers to move their VoIP phones from one location to another with access to a high-speed Internet connection. DoITT Commissioner Gino Menchini stated "The VoIP/911 solution exemplifies what can be accomplished when government and industry work collaboratively." He went on to say that "The VoIP/911 solution exemplifies what can be accomplished when government and industry work collaboratively," said DoITT Commissioner Gino Menchini. "The City of New York recognizes that VoIP offers great potential for new competitive communications services and we encourage its continued growth. At the same time, however, 911 is at the very heart of government's public safety responsibility. I believe this implementation both strengthens the VoIP industry and upholds government's responsibility to protect human life and property."

2005-10-24 **Security VoIP VoIPSA Threat Taxonomy telephony Internet**

DHS IAIP Daily; http://www.networkingpipeline.com/showArticle.jhtml?articleID=172303368

SECURITY GROUP TAKES FIRST MAJOR STEP AGAINST VOIP DANGERS

The Voice over IP Security Alliance (VoIPSA) has announced its VoIP Security Threat Taxonomy, which is a classification and description of the types of security threats that affect IP telephony. Alliance secretary and taxonomy project head Jonathan Zar says that the taxonomy is the first step in dealing with VoIP security. By defining the kinds and nature of threats, VoIPSA hopes to give the Internet voice industry a common reference point to deal systematically with VoIP security issues. The VoIP Security Threat Taxonomy is organized into four broad categories. Two - denial of service and unlawful signal or traffic modification - deal with the integrity of the network signal and infrastructure. Signal interception and bypass of refused consent categorize threats specific to VoIP and deal specifically with privacy. VoIPSA Website: http://www.voipsa.org/

DHS IAIP Daily;
http://www.boston.com/business/technology/articles/2005/11/08/us_fcc_says_no_cutoff_for_internet_phone_customers/

FEDERAL COMMUNICATIONS COMMISSION SAYS NO CUTOFF FOR INTERNET PHONE CUSTOMERS

According to guidance from the Federal Communications Commission (FCC) released on Monday, November 7, Internet telephone providers will not have to cut off service to U.S. subscribers even if they are not able to receive enhanced 911 (E911) emergency service. Internet telephone providers had worried that the FCC's rules adopted in May would required them to suspend by November 28 service for subscribers who cannot receive E911 service. According to the recently released guidance, existing customers do not have to be disconnected, but Internet telephone providers will have to cease marketing and accepting new customers in areas where they are not connecting 911 calls with the person's location and phone number. The voice-over-Internet-protocol (VOIP) rules adopted in May required 911 calls to be routed to live dispatchers and the caller's location and number be identified. The move followed instances in which customers had trouble reaching help when they dialed 911. The Voice On the Net Coalition, which represents many VOIP providers, said that roughly 750,000 customers could be affected if they had to suspend service to those who did not have enhanced 911 service available. FCC guidance: http://www.fcc.gov/headlines.html

2006-01-23 **Cisco product vulnerabilities alert VoIP security**

DHS IAIP Daily; http://www.informationweek.com/security/showArticle.jhtml?articleID=177102457 23

CISCO SECURITY ALERTS SERVE AS VOIP WAKE-UP CALL.

Cisco Systems' revelation last week of two security alerts and fixes for CallManager, the processing component of its voice-over-IP (VoIP) technology, reminds us that while VoIP offers all sorts of benefits, there's no getting around its vulnerability as a software application. CallManager's vulnerability to denial of service attacks and attacks that would let users increase their access privileges seem mild compared with threats aimed at stealing customer data or blocking Website access. But as more voice communication travels over the Internet, reducing that threat becomes increasingly important. Cisco CallManager extends business telephony functions to IP phones, media-processing devices, VoIP network gateways, and multimedia applications. The denial of service and privilege-escalation vulnerabilities, for which patches are available, affect CallManager 3.2 and earlier, and some versions of CallManager 3.3, 4.0, and 4.1. Like Microsoft in the software market, Cisco is likely to be the main target of VoIP hackers because of its market-share leadership. Another danger lies in IT staff inexperience: VoIP hasn't been much of a target for hackers, and gaining the security know-how to protect those networks may not be top of mind during deployments, says Ofir Arkin, chief technology officer of network-management company Insightix Ltd.

2006-01-25 **Skype Vonage VoIP security warning denial of service DoS**

DHS IAIP Daily; http://news.com.com/Skype+could+provide+botnet+controls/2100 −7349_3−6031306.html?tag=cd.top 23

Skype could provide botnet controls.

Internet phone services such as Skype and Vonage could provide a means for cybercriminals to send spam and launch attacks that cripple Websites, experts have warned. Moreover, because many voice over Internet protocol (VoIP) applications use proprietary technology and encrypted data traffic that can't easily be monitored, the attackers will be able to go undetected. "VoIP applications could provide excellent cover for launching denial of service (DoS) attacks," the Communications Research Network said Wednesday, January 25. The Communications Research Network is a joint venture between Cambridge University and the Massachusetts Institute of Technology. The group urges VoIP providers to publish their routing specifications or switch to open standards. "These measures would…allow legitimate agencies to track criminal misuse of VoIP," Jon Crowcroft, a professor at Cambridge University in the UK, said in a statement. VoIP applications such as eBay's Skype and Vonage could give cybercriminals a better way of controlling their zombies and covering their tracks, the Communications Research Network said. "If the control traffic were to be obfuscated, then catching those responsible for DoS attacks would become much more difficult, perhaps even impossible," the group said in a statement.

2006-03-17 **Skype heap overflow vulnerability abort unpredictable behavior solution update voice over IP VoIP**

DHS IAIP Daily; http://www.securityfocus.com/bid/15192/references 23

SKYPE TECHNOLOGIES SKYPE NETWORKING ROUTINE HEAP OVERFLOW VULNERABILITY.

Skype is prone to a heap overflow vulnerability in its networking routines. Analysis: An attacker who sends a stream of specifically crafted network traffic to a Skype client network can cause the client to overwrite part of the heap, including the heap integrity control data. Since the attacker cannot control the address where the data is written, the most likely effect will be that the Skype will abort execution due to an internal error, although other unpredictable behavior is possible. Such a crash will lead to a loss of availability of the Skype application until it is restarted by the user. A complete list of vulnerable products is available in the source advisory. Solution: A fix for Skype for Pocket PC is not currently available. For further solution details: http://www.securityfocus.com/bid/15192/solution

2006-04-26 **voice over IP VoIP denial-of-service DoS target warning CRN**

DHS IAIP Daily; http://www.cio−today.com/news/Is−VoIP−the−Next−Target−/story .xhtml?story_id=130004HC857W 23

VOIP MAY BE A FUTURE DENIAL OF SERVICE TARGET.

Although there has yet to be a recognized instance of a VoIP-coordinated Denial of Service (DoS) attack, the Communications Research Network (CRN) says it is only a matter of time before the technique becomes mainstream. The CRN working group on Internet security has discovered a security loophole in VoIP applications that could give criminals operating on the Internet a better way of covering their tracks. According to CRN, VoIP tools could offer good cover traffic for DoS attacks because VoIP runs continuous media over IP packets. The ability to dial in and out of VoIP overlays allows for control of an application via a voice network, making tracing the source of an attack almost impossible. In addition, proprietary protocols inhibit the ability of ISPs to track DoS activity. CRN's Jon Crowcroft suggests that the loophole could be resolved if VoIP providers were to publish their routing specifications or switch over to open standards.

2004-08-03 **airport airline security short message service SMS check-in passenger**

NewsScan

SINGAPORE AIRLINES INTRODUCES SMS CHECK-IN

Passengers on Singapore Airlines will now be able to check in for flights by sending a text message on their mobile phones. The short message service (SMS) function is the latest use of technology that Singapore Airlines has introduced to make checking in easier and quicker, adding to Internet, mobile phone and fax facilities. After checking in remotely, passengers need to pick up their boarding passes and check in their luggage on the day of departure from a dedicated counter, rather than wait in regular queues. (The Age 3 Aug 2004) rec'd from John Lamp, Deakin U.

2003-11-14 **BEA Tuxedo Administration vulnerability fix patch Fortune 500 software denial-of-service**

NIPC/DHS

November 10, Information Security — BEA Tuxedo Administration vulnerability requires fix.

Thousands of customers in Fortune 500 enterprises are urged to patch or upgrade to remedy a security issue in BEA Tuxedo Administration Console. A problem with processing input arguments can allow denial of service, disclosure of file system information or cross-site scripting. BEA Tuxedo provides middleware for building scalable enterprise applications in heterogeneous, distributed environments. The BEA Tuxedo administration console is a CGI application for remote administration of Tuxedo functions. Vulnerable versions include BEA Tuxedo 8.1 and prior. A patch is available for Tuxedo 8.1, and previous versions should be upgraded to 8.1:

2005-01-19 **AWStats two vulnerabilities command execution vulnerabilities Perl CGI script**

DHS IAIP Daily; http://secunia.com/advisories/13893/

AWSTATS "CONFIGDIR" PARAMETER ARBITRARY COMMAND EXECUTION

Two vulnerabilities have been reported in AWStats, where one has an unknown impact and the other can be exploited by malicious people to compromise a vulnerable system. Input passed to the "configdir" parameter is not sanitized before being used as an argument to the "open()" Perl routine. This can be exploited to execute arbitrary commands with the privileges of the web server by passing these as input together with certain shell meta-characters. Successful exploitation requires that the application is running as a CGI script. Update to version 6.3: http://awstats.sourceforge.net/#DOWNLOAD

2002-01-19 **operating system push-pop stack buffer overflows design**

RISKS 21 87

Earl Boebert wrote a succinct summary of how easy it would be to prevent buffer overflows if any of several possible well-known designs were used in today's operating systems:
>In my view, attempts to close the buffer overflow vulnerability through software or compiler tricks are doomed to one degree of failure or another because you're trying to program around a stupid processor design. Certain contemporary processors actually host a Pantheon of stupidities, consisting of a Greater Stupidity and two handmaiden Lesser Stupidities.

Greater Stupidity: Read access implying execute access. Any piece of data that the processor can be tricked into loading into the command register immediately becomes code. This is a stupidity of such breadth and depth that it comes with an event horizon.

Lesser Stupidity I: Segmented addressing that isn't. Let's say you have an addressing scheme consisting of segment number plus offset. This raises the question of what to do when, in executing code, block moves, etc., the offset gets counted up to maximum length plus one. Smart answer: take a fault. Dumb answer: set offset to zero and count up one in segment number.

Lesser Stupidity II: Brain-dead stack design. If you enumerate the design space of dynamic storage management, you may realize that one actually has to *work* to produce a stack design so dumb that overflow attacks are possible. Here are four classes of designs that are immune to the vulnerability:

1. Descriptor stacks. The only thing that goes in the stack are addresses, preferably with a bounds value attached. Overflow a buffer and at worst you clobber the heap. Penalty: one level of indirection, which (The Horror! The Horror!) may cause your dancing pigs to dance slower than the other guy's. Possibility: can be fitted transparently to existing processor designs, assuming anybody cared.

2. Stack per protection domain. This assumes you can find the perimeters of your protection domains. Also slows down dancing pig displays because of copying parameters from stack to stack.

3. Separate control and data stacks. CALL/RETURN works the control stack, PUSH/POP works the data stack. Doh.

4. Error-checking stacks. A whole raft of options, including "shadow stacks" with checksums, return addresses protected with trap bits, etc. etc.

So, if it's all so straightforward and well known, why hasn't some vendor or other fixed it? Answer: the dancing pigs have won.<

24.1 Windows 9x/Me

Category 24.1 *Windows 9x/Me*

2000-07-19 **Trojan horse buffer overflow e-mail**

RISKS, Securityfocus http://www.securityfocus.com/news/62 20 97

MS-Outlook and Outlook Express were shown to be susceptible to a buffer overflow through the date field of incoming e-mail. The bug was fixed using the IE SP1 or IE v5.5 on Windows 9x and NT. A service pack was made available for Windows 2000. The buffer overflow would allow execution of arbitrary code upon receipt of e-mail, not through execution of mobile code.

Category 24.1 *Windows 9x/Me*

2001-11-15 **Windows XP vulnerability administrator account root privilege default cost benefit analysis 80/20 rule Pareto principle**

RISKS 21 76

By default, all user accounts created under Windows XP have administrator (root) capability and have no passwords. Mark Wilkins offered an interesting explanation of what might be behind such a decision. Writing in RISKS, he described how he had worked on the design for a TV security system which originally kept all channel lock settings in place, allowing parents to selectively "allow or deny TV viewing according to those settings as they liked." However, the TV manufacturer reversed this policy so that "unlocking the TV caused ALL of the information about which channels or times were or were not permissible to be erased, requiring that they be re-entered next time." Mr Wilkins continued, ". . . . support telephone calls on the issue of parental lock . . . nearly always asked 'My kids have locked me out of the television. What do I do?' Since those calls cost money to support a product for which the company had already been paid, they were to be minimized. The product had to be easy to unlock and hard to lock." He concluded, "I suspect this behavior in Windows XP is a similar matter."

Category 24.1 *Windows 9x/Me*

2002-08-07 **proprietary code open source Windows antitrust settlement court order intellectual property patents**

NewsScan

WINDOWS CODE RELEASED TO DEVELOPERS
Complying with provisions of the proposed antitrust settlement with the Justice Department, Microsoft has begun giving independent software developers technical information about the Windows operating system, which will be used to create alternative Web browsers and other software products to rival ones offered by Microsoft. But the company's critics remain unappeased and vocal. Mike Pettit of ProComp, a trade group backed by Microsoft's competitors, says he has found "several examples where if you unclick a choice indicating you don't want to use Microsoft middleware, it shows up anyway... I find astonishing at this stage of the game that these kinds of things would happen. Either the Justice Department didn't do a very good job of protecting consumers or Microsoft has not done a very good job of compliance." (Los Angeles Times 6 Aug 2002)

Category 24.1 *Windows 9x/Me*

2003-02-27 **Microsoft security bulletin Millenium Edition ME vulnerability**

NIPC/DHS

February 26, Microsoft — Microsoft Security Bulletin MS03-006: Flaw in Windows Me Help and Support Center could enable code execution .

A security vulnerability is present in the Windows Me version of Microsoft's Help and Support Center. Users and programs can execute URL links to Help and Support Center by using the "hcp://" prefix in a URL link instead of "http://". The vulnerability results because the URL Handler for the "hcp://" prefix contains an unchecked buffer. An attacker who successfully exploited this vulnerability could cause code of his or her choice to be executed as though it originated on the local machine. Such code could provide the attacker with the ability to take any desired action on the machine, including adding, deleting or modifying data on the system or running any code of the attacker's choice. Microsoft assigned a risk rating of "Critical" to this vulnerability. A patch is available at the Microsoft website.

2000-02-20 **QA quality assurance operating system bugs**

RISKS 20 80

Jim Allchin, Group Vice President, Platforms Group, Microsoft Corporation, wrote an open letter to MS customers about claims that Windows 2000 had over 63,000 defects. He listed a number of threads of evidence showing that Windows 2000 was the most highly tested and stable products the company had released.

Category 24.2 *Windows NT/2K/XP*

2000-02-21 **QA quality assurance availability operating system**

RISKS 20 81

According to users of a new Windows 2000 system in the Tula County Court Clerk's Office, the new operating system was causing serious downtime: "The new system has been down completely for at least a day twice in the last two weeks and regularly has system errors that hinder access to records for hours at a time."

Category 24.2 *Windows NT/2K/XP*

2000-09-08 **access control vulnerability operating system lock screen saver communications port vulnerability**

RISKS 21 04

Avi Rubin noted in RISKS that despite the "lock" function in Windows 2000 and Windows NT, communications through ports still works. He illustrated the risks by sketching scenarios in which the synchronization function of the Palm Pilot could be used to obtain or damage information on a supposedly locked system. [Readers should note that under Windows 9x, screen savers, even secure ones, do not generally prevent access via the communications ports if appropriate software is running. LapLink, for example, functions perfectly well even if a target computer is in screen-saver mode.]

Category 24.2 *Windows NT/2K/XP*

2001-05-29 **risk management insurance rates operating system stability hacking penetration vulnerabilities**

RISKS 21 44

According to an article in _InternetWeek_, hacking insurance will cost more for clients using Windows NT. Oleg Broytmann contributed this summary:
>"We saw that our NT-based clients were having more downtime" due to hacking, says John Wurzler, founder and CEO of the Michigan company, which has been selling hacker insurance since 1998. Wurzler said the decision to charge higher premiums was not mandated by the syndicates affiliated with Lloyd's of London that underwrite the insurance he sells. Instead, the move was based on findings from 400 security assessments that his firm has done on small and midsize businesses over the past three years. Wurzler found that system administrators working on open-source systems tend to be better trained and stay with their employers longer than those at firms using Windows software, where turnover can exceed 33 percent per year.<

Category 24.2 *Windows NT/2K/XP*

2002-12-13 **critical flaws Windows operating systems alert Java virtual machine HTML**

NewsScan

MICROSOFT WARNS OF 'CRITICAL' SECURITY FLAWS IN WINDOWS
Microsoft revealed "critical" flaws in its Windows operating system that conceivably could allow hackers to alter data stored in computers, load and run malicious programs, or reformat hard drives. Microsoft is urging Windows users to download a new version of Microsoft Virtual Machine, which is the part of Windows that runs Java applications. "An attacker could, in the most serious of these vulnerabilities, gain complete control of a user's system and take any action" he or she chooses, said John Montgomery, head of Microsoft's developer platform and evangelism group. Security features in Outlook Express 6 and Outlook 2002 are safe from the HTML-mail-based attacks by default and Outlook 98 and 2000 users are also protected if users have installed the Microsoft security updates for them. The good news is, a hacker would have to be quite sophisticated to carry out an attack of the kind described, says Gary Bahadur, CIO at Foundstone. "This is not an easy attack at all. You've got to be pretty slick, pretty creative." (Wall Street Journal 13 Dec 2002)

Category 24.2 *Windows NT/2K/XP*

2003-02-06 **Microsoft security bulletin unchecked buffer vulnerability**

NIPC/DHS

February 05, Microsoft — Microsoft Security Bulletin MS03-005: Unchecked buffer in Windows Redirector could allow privilege elevation.

A security vulnerability exists in the implementation of the Windows Redirector on Windows XP because an unchecked buffer is used to receive parameter information. By providing malformed data to the Windows Redirector, an attacker who successfully exploited this vulnerability could cause the system to fail, or could cause code of the attacker's choice to be executed with system privileges. Code running with system privileges could provide the attacker with the ability to take any desired action on the machine, such as adding, deleting, or modifying data on the system, and creating or deleting user accounts. This vulnerability cannot be exploited remotely. Windows XP systems that are not shared between users would not be at risk. The vulnerability could only be exploited by an attacker who had valid credentials to interactively log onto the computer. Microsoft has assigned a severity rating of "Important" to this vulnerability. A patch is available at the Microsoft website.

Category 24.2 *Windows NT/2K/XP*

2003-03-12 **CERT CC advisory Windows Shares Serve Message Block 2000 XP target**

NIPC/DHS

March 11, CERT/CC — CERT Advisory CA-2003-08: Increased Activity Targeting Windows Shares.

Over the past few weeks, the CERT/CC has received an increasing number of reports of intruder activity involving the exploitation of Null (i.e., non-existent) or weak Administrator passwords on Server Message Block file shares used on systems running Windows 2000 or Windows XP. This activity has resulted in the successful compromise of thousands of systems, with home broadband users' systems being a prime target. Recent examples of such activity are the attack tools known as W32/Deloder, GT-bot, sdbot, and W32/Slackor. The presence of any of these tools on a system indicates that the Administrator password has likely been compromised, and the entire system is therefore suspect. With this level of access, intruders may exercise remote control expose confidential data; install other malicious software; change files; delete files; or launch attacks against other sites. Information on how to guard against these attacks may be found on the CERT/CC website.

Category 24.2 *Windows NT/2K/XP*

2003-03-20 **new vulnerability Microsoft security bulletin Windows Script Engine**

NIPC/DHS

March 19, Microsoft — Microsoft Security Bulletin MS03-008: Flaw in Windows Script Engine Could Allow Code Execution.

The Windows Script Engine provides Windows operating systems with the ability to execute script code. A flaw exists in the way by which the Windows Script Engine for JScript processes information. An attacker could exploit the vulnerability by constructing a web page that, when visited by the user, would execute code of the attacker's choice with the user's privileges. The web page could be hosted on a web site, or sent directly to the user in email. Exploiting the vulnerability would allow the attacker only the same privileges as the user. Computers configured to disable active scripting in Internet Explorer are not susceptible to this issue. Users whose accounts are configured to have few privileges on the system would be at less risk than ones who operate with administrative privileges. Automatic exploitation of the vulnerability by an HTML email would be blocked by Outlook Express 6.0 and Outlook 2002 in their default configurations, and by Outlook 98 and 2000 if used in conjunction with the Outlook Email Security Update. Microsoft has assigned a risk rating of "Critical" to this vulnerability. A patch is available at the Microsoft Website. Microsoft has also provided information about preventive measures customers can use to help block the exploitation of this vulnerability while they are assessing the impact and compatibility of the patch.

Category 24.2 *Windows NT/2K/XP*

2003-03-27 **new vulnerability Remote Procedure Call RPC Microsoft denial-of-service advisory**

NIPC/DHS

March 26, Microsoft — Microsoft Security Bulletin MS03-010: Flaw in RPC Endpoint Mapper Could Allow Denial of Service Attacks.

There is a vulnerability in the part of Remote Procedure Call (RPC) that deals with message exchange over TCP/IP due to incorrect handling of malformed messages. This vulnerabilty affects the RPC Endpoint Mapper process, which listens on TCP/IP port 135. To exploit this vulnerability, an attacker would need to establish a TCP/IP connection to the Endpoint Mapper process on a remote machine. Once the connection was established, the attacker would begin the RPC connection negotiation before transmitting a malformed message. At this point, the process on the remote machine would fail. The RPC Endpoint Mapper process is responsible for maintaining the connection information for all of the processes on that machine using RPC. Because the Endpoint Mapper runs within the RPC service itself, exploiting this vulnerability would cause the RPC service to fail, with the attendant loss of any RPC-based services the server offers, as well as potential loss of some COM functions. A patch is available at the Microsoft website for Windows 2000 and Windows XP. However, Microsoft is unable to provide a patch for this vulnerability for Windows NT 4.0 and users are encouraged to employ the workaround posted on the Microsoft website, which is to protect the NT 4.0 system with a firewall that blocks Port 135.

Category 24.2 *Windows NT/2K/XP*

2003-04-10 **new vulnerability Microsoft security bulletin virtual machine flaw patch exploit fix**

NIPC/DHS

April 09, Microsoft — Microsoft Security Bulletin MS03-011: Flaw in Microsoft VM Could Enable System Compromise.

The Microsoft VM is a virtual machine for the Win32 operating environment. The Microsoft VM is shipped in most versions of Windows, as well as in most versions of Internet Explorer. A new security vulnerability affects the ByteCode Verifier component of the Microsoft VM, and results because the ByteCode verifier does not correctly check for the presence of certain malicious code when a Java applet is being loaded. The attack vector for this new security issue would likely involve an attacker creating a malicious Java applet and inserting it into a web page that when opened, would exploit the vulnerability. An attacker could then host this malicious web page on a web site, or could send it to a user in e-mail. Corporate IT administrators could limit the risk posed to their users by using application filters at the firewall to inspect and block mobile code. Microsoft has assigned a risk rating of "Critical" to this vulnerability. A patch is available at the Microsoft website.

Category 24.2 *Windows NT/2K/XP*

2003-04-17 **new vulnerability Microsoft security bulletin buffer overflow kernel message handling**

NIPC/DHS

April 16, Microsoft — Microsoft Security Bulletin MS03-013: Buffer Overrun in Windows Kernel Message Handling could Lead to Elevated Privileges.

The Windows kernel is the core of the operating system. It provides system level services such as device and memory management, allocates processor time to processes and manages error handling. There is a flaw in the way the kernel passes error messages to a debugger. A vulnerability results because an attacker could write a program to exploit this flaw and run code of their choice. An attacker could exploit this vulnerability to take any action on the system including deleting data, adding accounts with administrative access, or reconfiguring the system. For an attack to be successful, an attacker would need to be able to logon interactively to the system, either at the console or through a terminal session. Also, a successful attack would require the introduction of code in order to exploit this vulnerability. Because best practices recommends restricting the ability to logon interactively on servers, this issue most directly affects client systems and terminal servers. Microsoft has assigned a risk rating of "Important" to this vulnerability. A patch is available at the Microsoft website.

Category 24.2 *Windows NT/2K/XP*

2003-04-28 **Cisco Systems Secure Access Control Server Windows vulnerability patch fix**

NIPC/DHS

April 24, CNET News.com — Cisco flaw exposes Windows servers.

A potentially critical vulnerability has been found in Cisco Systems' Secure Access Control Server for Windows servers, which is used to control devices such as routers in large networks. The buffer overflow glitch may allow an attacker to seize control of the Cisco service when it's running on Windows, according to Cisco. The Unix variant is not affected. Exploitation of the flaw could result in a malicious hacker gaining full control of a target company's security infrastructure, leaving it completely exposed. An exploit for the vulnerability is not known to be circulating, and ACS servers are usually deployed on network segments with limited physical access. Administrators of ACS systems block TCP port 2002 until they can deploy Cisco's fix. A patch is available at the Cisco Website:
http://www.cisco.com/warp/public/707/cisco-sa-20030423-ACS.s html.

Category 24.2 *Windows NT/2K/XP*

2003-05-01 **windows flaw patch security microsoft multi-processor machine crash 2000 XP**

NIPC/DHS

May 01, eWEEK — Microsoft updates patch for Windows flaw.

Microsoft Corp. has released an updated patch for a security vulnerability discovered in Windows NT 4.0 in December. The new update fixes a flaw in the original patch that installed the wrong binaries on multi-processor machines, causing them to crash in some situations. The original vulnerability that the patch was meant to fix affected Windows 2000 and XP as well. But the problem that prompted the release of the new patch only occurs in machines running Windows NT 4.0 Terminal Services Edition. The revised bulletin and patch for this flaw are available on the Microsoft Website:
http://www.microsoft.com/technet/treeview/default.asp?url=/t echnet/security/bulletin/MS02-071.asp.

Category 24.2 *Windows NT/2K/XP*

2003-05-07 **MS03-017 Microsoft Windows Media Player 7.1 XP malicious executable HTML e-mail outlook update code execution**

NIPC/DHS

May 07, Microsoft — Microsoft Security Bulletin MS03-017: Flaw in Windows Media Player Skins Downloading could allow Code Execution.

A flaw exists in the way Microsoft's Windows Media Player 7.1 and Windows Media Player for Windows XP handle the download of skin files. An attacker could force a file masquerading as a skin file into a user's machine. This could allow an attacker to place a malicious executable on the system. In order to exploit this flaw, an attacker would have to host a malicious web site and then persuade a user to visit that site. An attacker could also embed the link in an HTML e-mail and send it to the user. If the user was not using Outlook Express 6.0 or Outlook 2002 in their default configurations, or Outlook 98 or 2000 in conjunction with the Outlook Email Security Update, the attacker could cause an attack that could both place, then launch the malicious executable without the user having to click on a URL contained in an e-mail. Microsoft has assigned a risk rating of "Critical" to this vulnerability, and a patch is available at the Microsoft website.

Category 24.2 *Windows NT/2K/XP*

2003-05-28 **MS03-019 microsoft security bulletin ISAPI Extension Windows Media Service Denial Service NT4.0 Server IIS exploit**

NIPC/DHS

May 28, Microsoft — Microsoft Security Bulletin MS03-019: Flaw in ISAPI Extension for Windows Media Services Could Cause Denial of Service.

When Windows Media Services are installed in Windows NT 4.0 Server or added through add/remove programs to Windows 2000, nsiislog.dll is installed to the Internet Information Services (IIS) Scripts directory on the server. A flaw in the way in which nsiislog.dll processes incoming requests could allow and attacker could send specially formed communications to the server that could cause IIS to stop responding to Internet requests. An attacker attempting to exploit this vulnerability would have to be aware which computers on the network had Windows Media Services installed on it and send a specific request to that server. Microsoft has assigned a risk rating of "Moderate" to this vulnerability and a patch is available at the Microsoft website.

Category 24.2 *Windows NT/2K/XP*

2003-07-03 **Windows 2000 ShellExecute API hole buffer overflow vulnerability SecureNet Service MUA**

NIPC/DHS

July 03, eSecurity Planet — Windows 2000 ShellExecute API hole patched.

Microsoft has issued a fix for a buffer overflow vulnerability in the Windows 2000 ShellExecute API after a security researcher warned the flaw could trigger denial-of-service attacks. According to research firm SecureNet Service (SNS), which reported the hole, Microsoft included a fix in Windows 2000 Service Pack 4. It affects Microsoft Windows 2000 Datacenter Server, Windows 2000 Advanced Server, Windows 2000 Server and Windows 2000 Professional. SNS said the problem was triggered when the pointer to an unusually long string was set to the 3rd argument of the Windows 2000 API Shell Execute() API function. SNS said that several applications containing Web browser, MUA and text editor were vulnerable to security hole.

Category 24.2 *Windows NT/2K/XP*

2003-07-09 **MS03-025 windows message handling utility privilege elevation interactive processes**

NIPC/DHS

July 09, Microsoft — Microsoft Security Bulletin MS03-025: Flaw in Windows Message Handling through Utility Manager Could Enable Privilege Elevation.

Microsoft Windows messages provide a way for interactive processes to react to user events and communicate with other interactive processes. A flaw in the way that the Microsoft Accessibility Utility Manager handles Windows messages results in a vulnerability because the control that provides the list of accessibility options to the user does not properly validate Windows messages sent to it. It's possible for one process in the interactive desktop to use a specific Windows message to cause the Utility Manager process to execute a callback function at the address of its choice. Because the Utility Manager process runs at higher privileges than the first process, this would provide the first process with a way of exercising those higher privileges. By default, the Utility Manager contains controls that run in the interactive desktop with Local System privileges. An attacker who had the ability to log on to a system interactively could run a program that could send a Windows message upon the Utility Manager process, causing it to take any action the attacker specified. This would give the attacker complete control over the system. Microsoft has assigned a risk rating of "Important" to this issue and recommends that system administrators install the patch immediately.

Category 24.2 *Windows NT/2K/XP*

2003-07-09 **MS03-024 buffer overrun data corruption Server Message Block SMB port 139 445**

NIPC/DHS

July 09, Microsoft — Microsoft Security Bulletin MS03-024: Buffer Overrun in Windows Could Lead to Data Corruption.

When a client system sends an Server Message Block (SMB) packet to the server system, it includes specific parameters that provide the server with a set of "instructions." The server is not properly validating the buffer length established by the packet. If the client specifies a buffer length that is less than what is needed, it can cause the buffer to be overrun. By sending a specially crafted SMB packet request, an attacker could cause a buffer overrun to occur. If exploited, this could lead to data corruption, system failure, or it could allow an attacker to run the code of their choice. An attacker would need a valid user account and would need to be authenticated by the server to exploit this flaw. By default, it is not possible to exploit this flaw anonymously. The attacker would have to be authenticated by the server prior to attempting to send a SMB packet to it. Blocking port 139/445 at the firewall will prevent the possibility of an attack from the Internet. Microsoft has assigned a risk rating of "Important" to this issue and recommends that system administrators consider installing the patch.

Category 24.2 *Windows NT/2K/XP*

2003-07-16 **MS03-027 buffer windows shell system compromise attacker service pack 1 XP important**

NIPC/DHS

July 16, Microsoft — Microsoft Security Bulletin MS03-027: Unchecked Buffer in Windows Shell Could Enable System Compromise.

An unchecked buffer exists in one of the functions used by the Windows shell to extract custom attribute information from certain folders. An attacker could seek to exploit this vulnerability by creating a Desktop.ini file that contains a corrupt custom attribute, and then host it on a network share. If a user were to browse the shared folder where the file was stored, the vulnerability could then be exploited. A successful attack could have the effect of either causing the Windows shell to fail, or causing an attacker's code to run on the user's computer in the security context of the user. This vulnerability only affects Windows XP Service Pack 1. Microsoft has assigned a risk rating of "Important" to this issue and recommends that system administrators install the patch at the earliest opportunity.

Category 24.2 *Windows NT/2K/XP*

2003-07-17 **flaw Windows Microsoft Server 2003 vulnerability**

NewsScan

MICROSOFT FLAW: A NEW STAGE OF DELIRIUM
Microsoft has acknowledged a critical vulnerability in most versions of its Windows operating system software, including its latest Windows Server 2003 software. The vulnerability (first pointed out by researchers in Poland known as the "Last Stage of Delirium Research Group") could be used by network vandals to seize control of a victim's Windows computer over the Internet, stealing data, deleting files or eavesdropping on e-mail messages. The Server 2003 software was sold under the highly promoted "Trustworthy Computing" initiative launched last year by Microsoft founder Bill Gates. The company urged customers to immediately apply a free software patch available from Microsoft's Web site. Internet Security Systems, an Atlanta-based computer firm, characterized the Windows flaw as "an enormous threat." (AP/San Jose Mercury News 17 Jul 2003)

Category 24.2 *Windows NT/2K/XP*

2003-07-23 **MS03-029 denial service windows nt 4.0 server file management function**

NIPC/DHS

July 23, Microsoft — Microsoft Security Bulletin MS03-029: Flaw in Windows Function Could Allow Denial of Service.

A flaw exists in a Windows NT 4.0 Server file management function that can cause a denial of service vulnerability. The flaw results because the affected function can cause memory that it does not own to be freed when a specially crafted request is passed to it. If the application making the request to the function does not carry out any user input validation and allows the specially crafted request to be passed to the function, the function may free memory that it does not own. As a result, the application passing the request could fail. By default, the affected function is not accessible remotely, however applications installed on the operating system that are available remotely may make use of the affected function. Microsoft has assigned a risk rating of "Moderate" to this issue and recommends that system administrators consider applying the security patch

2003-09-10 **Internet Operations Microsoft Operating Systems Remote procedure Call Server Service RPCSS NCSD DHS IAP DCOM RPC ports exploit vulnerabilities worm virus**

NIPC/DHS

September 10, U.S. Department of Homeland Security — Potential For Significant Impact On Internet Operations Due To Vulnerability In Microsoft Operating Systems' Remote Procedure Call Server Service (RPCSS).

The National Cyber Security Division (NCSD) of the Department of Homeland Security (DHS) / Information Analysis and Infrastructure Protection (IAIP) Directorate is issuing this advisory in consultation with the Microsoft. There are three vulnerabilities in the part of Remote Procedure Call (RPC) that deals with RPC messages for the Distributed Component Object Model (DCOM) activation—two that would allow arbitrary code execution, and one that would result in a denial of service. These particular vulnerabilities affect the DCOM interface within the RPCSS, which listens on RPC enabled ports. An attacker who successfully exploited these vulnerabilities could be able to run code with local system privileges on an affected system, or cause the RPCSS to fail. The attacker could be able to take any action on the system. DHS is concerned that a properly written exploit could rapidly spread on the Internet as a worm or virus in a fashion similar to the Blaster Worm. DHS and Microsoft recommend that system administrators install the patch immediately. Additional information is available on the Microsoft Website:
http://www.microsoft.com/security/security_bulletins/ms03-03 9.asp

2003-09-19 **ATM Windows NT security issues hackers IBM OS/2 open technology hardware support cut-down version**

NewsScan

ATMs TO SWITCH OVER TO WINDOWS
Sixty-five percent of the automated teller machines in the U.S. will be running on a stripped down version of Windows NT within three years, according to a study by market researcher Celent. Currently most ATMs use IBM's OS/2 operating system, but banking industry officials say they now prefer Windows, which is more compatible with their internal corporate networks. "Because we are seeing so many mergers and acquisitions in the last few years, you have large banks running a fleet of ATM hardware," says Celent analyst Gwenn Bezard. "With open technologies [like Windows] it is easier to run different types of hardware on the same software." Banking officials generally dismiss worries over hackers disabling or corrupting ATMs across the country, but some security specialists continue to have doubts: "What Microsoft actually sells to the banks for ATM use is a cut-down version of Windows that doesn't contain things like Web servers. They have tried to cut out the unnecessary rubbish that clutters up the typical PC. How good a job they've done, I just don't know… So we definitely can't rule out the possibility that someone in the future writes a Slammer-style worm that causes thousands of ATMs to start spewing out cash," says British security expert Ross Anderson. (Wired.com 19 Sep 2003)

2003-11-13 **new critical vulnerability Microsoft security bulletin buffer overrun overflow workstation patch fix exploit**

NIPC/DHS

November 11, Microsoft — Microsoft Security Bulletin MS03-049: Buffer Overrun in the Workstation Service Could Allow Code Execution.

A security vulnerability exists in the Workstation service that could allow remote code execution on an affected system. This vulnerability results because of an unchecked buffer in the Workstation service. If exploited, an attacker could gain System privileges on an affected system, or could cause the Workstation service to fail. An attacker could take any action on the system, including installing programs, viewing data, changing data, or deleting data, or creating new accounts with full privileges. If users have blocked inbound UDP ports 138, 139, 445 and TCP ports 138, 139, 445 by using a firewall an attacker would be prevented from sending messages to the Workstation service. Most firewalls, including Internet Connection Firewall in Windows XP, block these ports by default. Disabling the Workstation service will prevent the possibility of attack. Only Windows 2000 and Window XP are vulnerable to this attack. Microsoft has assigned a risk rating of "Critical" to this issue and recommends that system administrators install the patch immediately.

Category 24.2 *Windows NT/2K/XP*

2003-11-17 **Microsoft Windows exploit patch fix release**

NIPC/DHS

November 13, eWEEK — Windows exploits released.

Microsoft Corp. released its monthly passel of patches on Tuesday, November 11, including one for a flaw in the Workstation service in Windows 2000 and XP. A successful exploitation would give the attacker complete control of the compromised PC, Microsoft said. Less than 24 hours after Microsoft issued the fix, two members of the BugTraq security mailing list posted exploit code for the vulnerability. The author of one of the exploits said the code had been tested only on a Windows 2000 machine with Service Pack 4 installed and the FAT32 file system running. The other exploit is designed for machines running Windows XP. However, experts said it would take little effort to adapt the code for other Windows machines. And, more importantly, the Workstation vulnerability appears to be a prime candidate for a worm.

Category 24.2 *Windows NT/2K/XP*

2003-12-11 **security expert warning Microsoft Windows critical vulnerability TCP UDP**

NIPC/DHS

December 10, eWEEK — Security experts warn of new way to attack Windows.

Security experts have found a new way to exploit a critical vulnerability in Windows that evades a workaround. Microsoft Corp. issued a patch for the vulnerability in November, but the security bulletin also listed several workarounds for the flaw, including disabling the Workstation Service and using a firewall to block specific UDP and TCP ports. Researchers at security company Core Security Technologies discovered a new attack vector that uses a different UDP port. This attack still allows the malicious packets to reach the vulnerable Workstation Service. An attacker who successfully exploits the weakness could run any code of choice on the vulnerable machine. An attacker doesn't have to individually address computers on the network, but can broadcast an attack. Such a tactic could actually create a worm that spreads faster than the SQL Slammer worm did last year. Microsoft urged customers to apply the patch. "Applying the patch does correct the problem," said Iain Mulholland, a security program manager for Microsoft.

2004-02-16 **exploit vulnerability Microsoft ASN.1 operating systems Windows NT XP 2000 Trojan Horse**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/24946−1.html

February 16, Government Computer News — Exploit code for Microsoft vulnerability circulating.

Security researchers say code designed to exploit a recently announced critical vulnerability in Microsoft operating systems now is widespread on the Internet. The code crashes targeted computers by exploiting a flaw in Microsoft's Abstract Syntax Notation 1 Library in Windows NT, 2000 and XP. The exploit code was discovered Saturday, February 14, four days after the vulnerability and a patch to correct it was announced by Microsoft. The code is available on several discussion groups and Web sites. Ken Dunham of iDefense Inc. said there have been reports of denial-of-service attacks against specific targets using this exploit, but the attacks are not yet widespread. "It may be a few days before we see anything beyond a DOD attack," he said. " Several attackers are actively working on an ASN.1 exploit to spread Trojans and 'bots. One attacker has expressed an interest in creating a worm that will 'take down the Internet.'" Dunham said the malicious actors are capable of "weaponizing" the exploit, but have so far had little success in their tests. In other malicious-code news, Symantec Corporation has raised the security level for the new Welchia worm because of increasing numbers of infections. Welchia, also known as Nachi, first appeared last August in the wake of the MSBlaster worm. It automatically patched against the vulnerability exploited by Blaster. The new version, Welchia.b, appears to remove the MyDoom a and b worms from infected machines. Once installed on a machine, it tries successively to exploit three vulnerabilities against a random IP address.

2004-03-10 **Microsoft security bulletin vulnerability hole flaw patch fix Windows Media denial-of-service**

DHS IAIP Daily; http://www.microsoft.com/technet/security/bulletin/ms04−
009. mspx

March 09, Microsoft — Microsoft Security Bulletin MS04-008: Vulnerability in Windows Media Services Could Allow a Denial of Service.

A vulnerability exists because of the way that Windows Media Station Service and Windows Media Monitor Service, components of Windows Media Services, handle TCP/IP connections. If a remote user were to send a specially-crafted sequence of TCP/IP packets to the listening port of either of these services, the service could stop responding to requests and no additional connections could be made. The service must be restarted to regain its functionality. Windows Media Unicast Service may also be affected by a successful attack against Windows Media Station Service if Windows Media Unicast Service is sourcing a playlist from Windows Media Station Service. In this case, Windows Media Unicast Service could stop functioning when it encounters the next item in the playlist. Microsoft has assigned a risk rating of "Moderate" to this issue and recommends that system administrators consider installing the security update.

2004-04-26 **Microsoft Windows vulnerability flaw hole exploit worm**

DHS IAIP Daily; http://informationweek.securitypipeline.com/news/19201802;js
essionid=LUENRK1IB4PBYQSNDBGCKHQ

April 26, InformationWeek — Windows vulnerability exploited, worm may be next.

Security experts are monitoring widespread use of exploit code that takes advantage of a recently-disclosed vulnerability in Windows, but a worm, although anticipated, hasn't yet been spotted. The vulnerability stems from a flaw in Windows Protected Communications Technology (PCT) v. 1.0, a packet protocol within Microsoft's SSL library. An April bulletin from Microsoft warned that an attacker could create a buffer overflow condition on vulnerable Windows servers, then follow that by inserting their own code into the system to take control. Windows XP and Windows Server 2003 systems are also vulnerable. The first form of the exploit code was discovered within days of the disclosure of the SSL vulnerability, added Ken Dunham of iDefense. Last week, that code was updated to include a "phone home" feature that allowed hackers using it to be notified when they'd compromised a server. Additional information is available in Microsoft Knowledge Base Article 187498:
http://support.microsoft.com/default.aspx?scid=

2004-04-26 **attack exploit source code Microsoft MS LSASS buffer overflow**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0,10801,92696,00.html

April 26, IDG News Service — Attack code surfaces for recent MS security hole.

Computer code that claims to exploit a recently disclosed hole in Microsoft products has surfaced on a French-language Website. The code can be used by a remote attacker to trigger a buffer overrun vulnerability in the Local Security Authority Subsystem (LSASS). The code was released on Saturday, April 24, according to the Website. It was unclear whether the exploit code works, but notes attached by its author say some modifications may be necessary before the code can be used by a remote attacker to compromise Windows machines. An attacker who could exploit the LSASS vulnerability could remotely attack and take total control of Windows 2000 and Windows XP systems, according to Microsoft. Unlike e-mail worms and viruses, no user interaction would be necessary to trigger the LSASS buffer overflow, according to Johannes Ullrich of the SANS Institute's Internet Storm Center. Microsoft released a patch for the LSASS vulnerability in Microsoft Security Bulletin MS04-011: http://www.microsoft.com/technet/security/bulletin/MS04-011. mspx

2004-04-26 **Windows critical hijack flaw vulnerability**

DHS IAIP Daily; http://www.esecurityplanet.com/alerts/article.php/3345351

April 26, eSecurity Planet — 'Critical' Windows hijack flaw reported.

Security researchers have discovered a serious boundary error vulnerability in multiple versions of Microsoft's Windows platform and warned that attackers could hijack systems via Windows Explorer and Internet Explorer. Rodrigo Gutierrez, a researcher with Trustix AS, notified Microsoft of the flaw with a warning that it could be exploited by malicious attackers to cause a buffer overflow and lead to system takeover. Microsoft confirmed Gutierrez's findings and recommended users install the latest service packs for Windows XP and Windows 2000. Independent security consultants Secunia said the vulnerability "has been confirmed on fully patched systems running Windows XP and Windows 2000." Secunia urged Windows XP and Windows 2000 users to restrict traffic in border routers and firewalls as a temporary workaround. Users could also disable the "Client for Microsoft Networks" for network cards to impact file sharing functionality. The flaw also reportedly affects Windows 95, 98, and Me. 2004-04-29 **Microsoft SSL patch bug confirmation Windows 2K 2000**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1578752,00.asp

April 29, eWEEK — Microsoft confirms bug in SSL patch.

Microsoft Corp. has confirmed in a knowledge base article that its patch for a critical bug can cause some Windows 2000 systems to lock up and fail at boot time. The patch is for a particularly critical vulnerability of which experts have begun to see exploits in the last few days. The knowledge base article goes by the unusually long name: "Your computer stops responding, you cannot log on to Windows, or your CPU usage for the System process approaches 100 percent after you install the security update that is described in Microsoft Security Bulletin MS04-011." The article also gives one specific example, where the Nortel Networks VPN client is installed and the IPSec Policy Agent is set to Manual or Automatic for the startup type. In such cases, the article suggests disabling the IPSec Policy Agent.

2004-05-11 **Microsoft patch vulnerability security bulletin code execution attack**

DHS IAIP Daily; http://www.microsoft.com/security/security_bulletins/200405_windows.asp

May 11, Microsoft — Microsoft Security Bulletin MS04-015: Vulnerability in Help and Support Center Could Allow Remote Code Execution.

A remote code execution vulnerability exists in the Help and Support Center because of the way that it handles HCP URL validation. If a user is logged on with administrative privileges, an attacker who successfully exploited this vulnerability could take complete control of an affected system, including installing programs; viewing, changing, or deleting data; or creating new accounts with full privileges. Users whose accounts are configured to have fewer privileges on the system would be at less risk than users who operate with administrative privileges. Microsoft recommends that customers install the update at the earliest opportunity.

NewsScan

NEW MICROSOFT WINDOWS SECURITY FLAW

Microsoft has identified and released a Windows software patch for a new flaw that could allow hackers to take control of a PC by luring users to a malicious Web site and getting them to take certain actions there. The security flaw affects the latest versions of Windows, including Windows XP, and software for networked computers such as Windows Server 2003. A user would be vulnerable to the security flaw only by visiting the attacker's Web site and performing several actions there. (Reuters/USA Today 12 May 2004)

2004-08-19 **network time synchronization protocol NTP Microsoft operating systems Active Directory vulnerability time spoofing attacks**

DHS IAIP Daily; http://www.securityfocus.com/bid/10980

August 19, SecurityFocus — Microsoft NTP time synchronization spoof weakness.

The NTP implementation in Microsoft operating systems is vulnerable to time spoofing attacks. An attacker may be able to alter the time on the domain controller, causing the entire domain to synchronize with the attacker specified time. This weakness may allow a malicious user to deny service to legitimate users, as correct time is required for many operations, including domain authentication and X.509 certificate expiration times. This weakness is reported to exist in all versions of Microsoft operating systems that include Active Directory support. Microsoft has implemented a default failsafe for time synchronization that prevents an attacker from adjusting the time for more than 12 hours. By setting this to a smaller amount, an attacker would have to spend more time altering the clock by significant amounts.

2004-08-19 **Microsoft Windows XP SP2 bugs vulnerability shell folder**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1637596,00.asp

August 19, eWEEK — Bugs, exploits dog XP SP2.

Microsoft has issued a hotfix for Windows XP Service Pack 2 to solve a problem about which many users have complained: programs that attempt to connect to loopback addresses other than 127.0.0.1 get error messages. However, since it is a hotfix, it is not fully supported. It is expected that Microsoft will issue a more permanent fix in the future. Meanwhile, security researchers are reporting a new vulnerability in SP2 that could allow a malicious Website to deposit an attack program on a user's system. The attack utilizes Internet Explorer's drag-and-drop features and the Windows "shell folders" to copy an executable from a malicious Website to a user's startup folder, from which it would execute the next time the user logged on. Secunia, a security consulting firm, said the attack works on a fully patched Windows XP Service Pack 1 system, and that the drag-and-drop approach could be replaced with a single click. For the attack to succeed, the user would have to visit a Website that hosted it and follow the instructions. Any attack code deposited would be scanned by anti-virus software on the user's computer.

2004-08-30 **Microsoft Windows XP Service Pack 2 SP2 security update**

DHS IAIP Daily; http://www.uscert.gov/cas/alerts/SA04−243A.html

August 30, US-CERT — Cyber Security Alert SA04-243A: Security Improvements in Windows XP Service Pack 2.

Windows XP Service Pack 2 is a major operating system update that contains a number of new security updates and features. Like other Microsoft Service Packs, Windows XP Service Pack 2 also includes previously released security fixes and other operating system updates. To help protect your Windows XP computer from attacks and vulnerabilities, install Service Pack 2 using Windows Update or Automatic Updates. Service Pack 2 makes significant changes to improve the security of Windows XP, and these changes may have negative effects effects on some programs and Windows functionality. Before you install Service Pack 2, back up your important data and consult your computer manufacturer's web site for information about Service Pack 2. Downloads available at: http://www.microsoft.com/windowsxp/sp2/default.mspx

2004-09-17 **Microsoft patch fix early warning systems customers**

NewsScan

PATCH DEALS FAVOR BIG BUSINESS

Microsoft has quietly begun giving some of its largest customers early warning of what types of security patches it will be releasing. Under the free program, some customers are receiving three business days' notice as to how many security fixes Microsoft plans to release in its regular monthly bulletins, and which Microsoft products are affected. Customers also can learn how severe a threat the flaws pose several days before the general public gets that information. Microsoft began testing the program last year, and expanded it in April. It has not been widely publicized, and Microsoft has been offering the service to some customers individually through sales representatives. (The Australian 17 Sep 2004) Rec'd from John Lamp, Deakin U.

2004-11-27 **Microsoft WINS packet memory overwrite vulnerability code execution attack**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2004/Nov/1012341.html

November 27, SecurityTracker — Microsoft WINS Memory overwrite lets remote users execute arbitrary code.

It is reported that a remote user can send a specially crafted WINS packet to the target server on TCP port 42 to modify a memory pointer and write arbitrary contents to arbitrary memory locations. This could permit a remote user to execute arbitrary code on the target system. There is no solution at this time.

Category 24.2 *Windows NT/2K/XP*

2004-12-07 **Microsoft Windows 2000 2K XP Resource Kit buffer overflow vulnerability no update issued**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2004/Dec/1012435.html

December 07, SecurityTracker — Microsoft Windows Resource Kit buffer overflow and input validation holes.

Several vulnerabilities were reported in the 'w3who.dll' Microsoft ISAPI extension in the Windows 2000/XP Resource Kit. A remote user can execute arbitrary code on the target system because the software does not properly validate user-supplied input before displaying HTTP headers or error messages. A remote user can create a specially crafted URL that, when loaded by a target user, will cause arbitrary scripting code to be executed by the target user's browser. No solution is available at this time.

2004-12-22 **EU Microsoft antitrust media player**

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A18543-2004Dec22.html

EU COURT RULES AGAINST MICROSOFT

A European Union judge today ruled that Microsoft must immediately submit to sanctions imposed by EC regulators after they found that Microsoft broke antitrust laws by integrating its Windows Media Player into Windows, thus putting rival media software companies at a disadvantage. Microsoft had appealed the initial decision, arguing that pulling Media Player out of Windows would degrade its performance, but in today's ruling, Chief Judge Bo Vesterdorf of the Court of First Instance found that postponing sanctions would give Microsoft time to strengthen its grip on the market for media playing applications. Microsoft must now create two versions of Windows for European distribution -- one that contains Media Player and one without. Microsoft announced it would comply while contemplating its next legal move. (Washington Post 22 Dec 2004)

2004-12-24 **Microsoft Windows unpatched holes warning Symantec heap overflow vulnerability no update issued**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/holes/s
tory/0,10801,98532,00.html

December 24, IDG News Service — Researchers warn of multiple unpatched Windows holes.

The antivirus company Symantec Corp. warned its customers about a number of critical holes in Microsoft Corp.'s Windows operating system that surfaced late Thursday, December 23, that could make Windows systems vulnerable to compromise by remote attackers. Symantec acted after security researchers published the details of the heap overflow vulnerabilities in messages posted to online security news groups, including the Bugtraq mailing list and on xfocus.net. The flaws affect most supported versions of Windows, but Microsoft has not yet issued a patch for the newly disclosed holes. Windows users are vulnerable to Internet based attacks until patches are issued, Symantec said. Symantec recommended that Windows users exercise caution when receiving and opening files from unknown sources.

2004-12-28 **Microsoft Windows kernel file parsing denial of service DoS vulnerability XP SP2 not vulnerable**

DHS IAIP Daily; http://security−
protocols.com/modules.php?name=News&file=art icle&sid=2357

December 28, Security Protocols — Microsoft Windows Kernel ANI file parsing crash and denial of service.

Parsing a specially crafted ANI file causes the Windows kernel to crash or stop to work properly. An attacker can crash or freeze a target system if he sends a specially crafted ANI file within an HTML page or within an e-mail. Two vulnerabilities exist in the Windows kernel when it parses ANI files. These vulnerabilities are due to improper input validation of the frame number set and the rate number set in the ANI file header. Windows XP SP2 is not vulnerable.

2005-01-11 **Microsoft Windows Security Bulletin cursor icon format handling vulnerability code execution full rights attacker critical rating update issued**

DHS IAIP Daily; http://www.microsoft.com/technet/Security/bulletin/ms05−
002. mspx

VULNERABILITY IN CURSOR AND ICON FORMAT HANDLING COULD ALLOW REMOTE CODE EXECUTION

This update resolves several newly-discovered, privately reported and public vulnerabilities. An attacker who successfully exploited the most severe of these vulnerabilities could take complete control of an affected system, install programs; view, change, or delete data; or create new accounts that have full privileges. Microsoft has assigned a risk rating of "Critical" to these issues and recommends that customers apply the update immediately.

Category 24.2 *Windows NT/2K/XP*

2005-01-11 **Microsoft Windows Security Bulletin indexing service format handling vulnerability code execution full rights attacker important rating update issued**

DHS IAIP Daily; http://www.microsoft.com/technet/security/bulletin/MS05−
003. mspx

VULNERABILITY IN THE INDEXING SERVICE COULD ALLOW REMOTE CODE EXECUTION

A remote code execution vulnerability exists in the Indexing Service because of the way that it handles query validation. An attacker could exploit the vulnerability by constructing a malicious query that could potentially allow remote code execution on an affected system. An attacker who successfully exploited this vulnerability could take complete control of an affected system. While remote code execution is possible, an attack would most likely result in a denial of service condition. Microsoft has assigned a risk rating of "Important" to this issue and recommends that system administrators consider applying the security update.

Category 24.2 *Windows NT/2K/XP*

2005-01-11 **Microsoft Windows Security Bulletin HTML Help vulnerability code execution full rights attacker critical rating update issued**

DHS IAIP Daily; http://www.microsoft.com/technet/security/Bulletin/MS05−001. mspx

MS05-001: VULNERABILITY IN HTML HELP COULD ALLOW CODE EXECUTION

A vulnerability exists in the HTML Help ActiveX control in Windows that could allow information disclosure or remote code execution on an affected system. If a user is logged on with administrative privileges, an attacker who successfully exploited this vulnerability could take complete control of an affected system. An attacker could then install programs; view, change, or delete data; or create new accounts with full privileges. Users whose accounts are configured to have fewer privileges on the system could be less impacted than users who operate with administrative privileges. Microsoft has assigned a risk rating of "Critical" to this issue and recommends that customers install the update immediately.

Category 24.2 *Windows NT/2K/XP*

2005-01-12 **Microsoft Windows multiple vulnerabilities denial of service privilege escalation code execution update issued**

DHS IAIP Daily; http://www.us−cert.gov/cas/techalerts/TA05−012A.html

MULTIPLE VULNERABILITIES IN MICROSOFT WINDOWS ICON AND CURSOR PROCESSING

Microsoft Windows contains multiple vulnerabilities in the way that it handles cursor and icon files. A remote attacker could execute arbitrary code or cause a denial-of-service condition. If a remote attacker can persuade a user to access a specially crafted bitmap image, icon, or cursor file, the attacker may be able to execute arbitrary code on that user's system, with their privileges. Potentially, any operation that displays an image could trigger exploitation, for instance, browsing the file system, reading HTML e-mail, or browsing Websites. A solution is to install the update as described in Microsoft Security Bulletin MS05-002: http://www.microsoft.com/technet/security/bulletin/ms05-002. mspx

2005-02-02 **Microsoft software international government threat early warning attack prevention mitigation national security public safety**

DHS IAIP Daily; http://www.nytimes.com/aponline/technology/AP−Microsoft−Secu rity.html

MICROSOFT OFFERING GOVERNMENTS EARLY WARNINGS

Microsoft offered Wednesday, February 2, to begin alerting the world's governments early to cyberthreats and security flaws in its attack-prone software. Microsoft also wants to work with governments to help prevent and mitigate the damage from hacker attacks, said Giorgio Vanzini, the director of Microsoft's government engagement team. Microsoft already provides the U.S. government with early warnings. Vanzini said extending the program aims to protect critical infrastructure given that major Internet attacks can affect national security, economic stability and public safety. The new program intends to complement Microsoft's existing Government Security Program, in which governments and agencies may review Microsoft's proprietary source code for Windows operating systems and Office business software and evaluate for themselves the software's security and ability to withstand attacks. So far three countries, Canada, Chile and Norway, as well as the U.S. state of Delaware, have been engaged in the new project, Vanzini said. Governments currently under a trade embargo with the United States are not eligible to sign up to the program, which is provided free of charge.

2005-08-26 **Microsoft Windows 2000 2K XP design flaw hackers hide malicious code anti-virus scanner registry**

DHS IAIP Daily;
http://www.techweb.com/showArticle.jhtml?articleID=170100835

WINDOWS FLAW MAY LET HACKERS HIDE CODE FROM ANTI-VIRUS SCANNERS

A flaw in how Windows handles entries in the all-important registry can be used by hackers to hide evidence of malicious code from a wide swath of commercial anti-virus and anti-spyware scanners, the SANS Internet Storm Center reported Friday, August 26. Extra-long key entries (those greater than 254 characters) are mishandled by the Windows registry editor, and essentially "disappear" from view, as do others added to the key after that because the editor stops at that too-long key, thinking it is the last in the section. Worse, many malicious code scanners have a similar blind spot, and also stop processing the registry for anomalous entries when they come to a too-long key. The technique would let attackers add their malicious software to the "Run" registry key which lists the programs or components that automatically launch at Windows' boot. The weakness, said Secunia, affects Windows 2000 and XP, including fully patched XP SP2 systems.

Category 24.2 *Windows NT/2K/XP*

2005-10-03 **error-handling code systems engineering software design quality assurance QA operating system file system inconsistency**

RISKS 24 06

INCONSISTENT ERROR-HANDLING CODE IN WINDOWS

In the Windows XP command interpreter CMD.EXE (the default command line shell) one can specify multiple arguments to the DEL(ete) command, in order to delete multiple files. If at least one of the files can be deleted, the command will not complain about any nonexistent files specified as arguments. For example:

```
C:\> echo.>foo
C:\> del nonexistent foo
C:\> del nonexistent
Could Not Find C:\nonexistent
```

This behavior is non-orthogonal and risky. If one mistypes the name of one of several files that are to be deleted, that file will silently continue to exist. The same will happen if one of the files has the hidden attribute set: DEL will silently ignore it, rather than issue an error message. Although one should not depend on a delete command to reliably obliterate data, the current behavior can lead to difficult-to-locate bugs, especially in scripts.

Further examination of the command reveals other instances of non-orthogonal behavior. When specifying multiple non-existent files as arguments, DEL will complain only about the first one, but when specifying multiple files with the read-only attribute set, DEL will complain about each one. Also DEL, never sets the ERRORLEVEL environment variable to indicate an error, although other commands, like DIR, set it correctly.

The logic behind a correctly-operating implementation of DEL is trivial.

```
Errorlevel = 0
foreach filename
    if not delete(filename) then
        display_error_message(filename)
        errorlevel = 1
    end if
end foreach
exit(errorlevel)
```

If a central and critical piece of the Windows operating system, such as the command shell, can't get the above logic right, what are the chances of having in the system a secure TCP/IP stack, web browser, or firewall?

2006-01-02 **Microsoft WMF flaw exploit unofficial patch SANS ISC**

DHS IAIP Daily; 23
http://www.techworld.com/security/news/index.cfm?NewsID=5070 &inkc=0

SANS: DON'T WAIT FOR MICROSOFT TO FIX WMF FLAW

Windows users should install an unofficial security patch now, without waiting for Microsoft to make its move, advised security researchers at the SANS Institute's Internet Storm Center (ISC). Their recommendation follows a new wave of attacks on a flaw in the way versions of Windows from 98 through XP handle malicious files in the WMF (Windows Metafile) format. One such attack arrives in an e-mail message entitled "happy new year," bearing a malicious file attachment called "HappyNewYear.jpg" that is really a disguised WMF file, security research companies, including iDefense and F-Secure, said Sunday, January 1. Even though the file is labeled as a JPEG, Windows recognizes the content as a WMF and attempts to execute the code it contains. Staff at the ISC worked over the weekend to validate and improve an unofficial patch developed by Ilfak Guilfanov to fix the WMF problem, according to an entry in the Handler's Diary, a running commentary on major IT security problems on the ISC Website. Updated version of Guilfanov's patch: http://isc.sans.org/diary.php?storyid=999

2006-01-03 **Microsoft Windows WMF vulnerability third-party patch warning**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1907562,00.asp 23

MICROSOFT: BEWARE OF THIRD-PARTY WMF PATCH

Microsoft Corp. has slapped a "buyer beware" tag on a third-party patch for the zero-day Windows Metafile (WMF) flaw and promised that its own properly tested update will almost certainly ship Tuesday, January 10. The company's latest guidance comes days after an unofficial hotfix from reverse-engineering guru Ilfak Guilfanov got rare blessings from experts at the SANS ISC (Internet Storm Center) and anti-virus vendor F-Secure Corp. Guilfanov, author of the IDA (Interactive Disassembler Pro), released an executable that revokes the "SETABORT" escape sequence that is the crux of the problem. The hotfix was tested and approved for use by many security experts, but Microsoft says it cannot vouch for the quality of the fix. Microsoft said its own patch has already been developed and is going through a rigid round of quality assurance testing. Last-minute glitches in the patch testing process could still delay the update. As a general rule, the company never recommends third-party updates. Ever since attackers started exploiting the bug to push malware on vulnerable Windows systems (XP SP2 included), the company has thrown all its security resources into the investigation and patch-creation process, making it virtually impossible to validate the third-party code.

2006-01-03 **WMF vulnerability zero-day Microsoft Windows patch release plan**

DHS IAIP Daily; 23
http://www.securitypipeline.com/news/175800841;jsessionid=HCQOZBHQGSYK0QSNDBCSKHSCJUMEKJVN

MICROSOFT PLANS TO PATCH ZERO-DAY WINDOWS BUG

Microsoft plans to patch an increasingly-dangerous zero-day vulnerability in Windows next week as part of its monthly security update, the Redmond, WA,-based developer said Tuesday, January 3. "Microsoft has completed development of the security update for the vulnerability," a company spokesperson stated. "The security update is now being localized and tested to ensure quality and application compatibility." The move is just the latest in the week-long story of a new vulnerability uncovered in Windows' rendering of WMF (Windows Metafile) images, and an increasingly long list of both exploits and Websites using these exploits to hack into PCs. As far as some researchers are concerned, Microsoft's promise is overdue.

2006-01-04 **Microsoft Windows WMF vulnerability users await patch**

EDUPAGE; http://news.zdnet.com/2100-1009_22-6016747.html 23

USERS SWEAT BULLETS WAITING FOR WMF PATCH

Security experts are warning about the danger of a currently unpatched vulnerability in all current versions of the Windows operating system, but Microsoft has said the patch won't be released until January 10, its next scheduled patch release date. Sam Curry of Computer Associates International said, "This vulnerability is rising in popularity among hackers, and it is simple to exploit." Others estimate that more than one million computers have already been infected worldwide, noting that attacks have taken the form of malicious Web sites, Trojan horses, and instant messaging worms. The flaw, which affects how Windows handles Windows Meta File (WMF) images, is especially dangerous because users need only view an image designed to take advantage of the vulnerability to have their computers infected. Despite the calls for an immediate patch, Microsoft, which adopted a schedule of monthly patch updates, has said the fix for the current bug will not be released until the next scheduled group of patches. In the meantime, Microsoft is warning users to be careful about what sites they visit. Most Internet users, however, do not have a level of awareness of such security concerns to protect themselves, according to Stacey Quandt, an analyst with the Aberdeen Group.

2006-01-05 **Microsoft Windows WMF vulnerability patch release**

DHS IAIP Daily; 23
http://www.cnn.com/2006/TECH/internet/01/05/wmfflaw/index.html

MICROSOFT RELEASES PATCH FOR WMF FLAW

Microsoft has released a patch for a vulnerability in some Windows graphics files. For more than a week, criminal hackers have been exploiting the flaw in Windows Meta File, or WMF. About 90 percent of computer users worldwide use some form of the Windows operating system. The company became aware of the malicious attacks Tuesday, December 27. What's especially dangerous about the attacks: Your computer could be infected with viruses, spyware or other malicious programs just by viewing a Webpage, an e-mail message, or an Instant Message that contains one of the contaminated images. Computer security experts have been dealing with scores of variations on the attack since it was discovered. "Nobody knew it was coming," security expert Rick Howard of Counterpane Internet Security said. "There was no security intervention or mitigation for it." Unlike infamous computer worms and viruses like Blaster, Code Red or I Love You, the WMF attack is not spreading like wildfire across the Internet. Most of the malicious efforts fit the patterns of recent attacks. They are not designed to earn bragging rights for a brash programmer, but instead are likely tied to theft, fraud and organized crime. US-CERT Technical Cyber Security Alert TA06-005A: Update for Microsoft WMF vulnerability: http://www.uscert.gov/cas/techalerts/TA06-005A.html Microsoft Security Bulletin MS06-001: http://www.microsoft.com/technet/security/Bulletin/MS06-001. mspx

2006-01-05 **Microsoft Windows WMF vulnerability patch early release**

EDUPAGE; http://news.zdnet.com/2100-1009_22-6020070.html 23

MICROSOFT RELEASES WMF PATCH EARLY

Responding to concerns that the recently disclosed Windows Meta File (WMF) vulnerability presented serious risk, Microsoft has released a patch ahead of the company's monthly patch release date. Microsoft said that testing of the patch was completed early and that there was "strong customer sentiment that the release should be made available as soon as possible." Some security experts, warning of the threat posed by the flaw, had even encouraged users to install a third-party patch developed by a European programmer. The patch is for Windows 2000, Windows XP, and Windows Server 2003; although Microsoft had earlier said the vulnerability also affected Windows 98 and Windows ME, the company now says those operating systems are not affected by the flaw. With the release, Microsoft acknowledged that the risk to unpatched systems is critical, though it said data indicated that the infection rate from attacks that exploit the weakness was low to moderate so far. Some security experts offered a different characterization of the situation, saying they have identified thousands of Web sites that exploit the flaw.

2006-01-06 **Microsoft Windows WMF vulnerability critical patch release**

DHS IAIP Daily; 23
http://www.techweb.com/showArticle.jhtml?articleID=175802037

MICROSOFT PLANS TWO MORE CRITICAL PATCHES THIS WEEK [6 JAN 2006]

Microsoft may have released the Windows Metafile hot fix, but it has other patches still to come Tuesday, January 10, the Redmond, WA-based developer said late Thursday, January 5. In the monthly pre-patch notification it puts out five days prior to releasing fixes, Microsoft warned users that two security bulletins, both tagged as "Critical," will be issued Tuesday. In Microsoft's terminology, Critical means that a vulnerability can be remotely exploited. One of the two bulletins will involve Windows, and the other will affect Microsoft Office and Microsoft Exchange, the company's business suite and e-mail server software, respectively. Multiple non-security, high-priority updates will also be released Tuesday, as will an updated Windows Malicious Software Removal Tool. Microsoft will host a follow-up Webcast Wednesday, January 11, to answer questions about the fixes. More details can be found in the advance notice posted on Microsoft's Website: http://www.microsoft.com/technet/security/bulletin/advance.mspx

2006-01-09 **Microsoft Windows WMF new vulnerability denial of service DoS arbitrary code execution**

DHS IAIP Daily; http://www.securitypipeline.com/news/175802826 23

MORE UNPATCHED BUGS LOOSE IN MICROSOFT WINDOWS METAFILE

Just days after Microsoft rushed out a patch for a bug in Windows Metafile (WMF) image processing, a security company has warned customers that multiple memory corruption vulnerabilities in the same rendering engine could leave users open to attack. "An attacker may leverage these issues to carry out a denial of service attack or execute arbitrary code," Symantec said in a vulnerability alert issued through its DeepSight Management System. The bugs may be associated with the one patched Thursday, January 5, by Microsoft, but they involve different functions of the Windows WMF rendering engine, added Symantec, which highlighted the various values and structures within the engine which could be exploited. "Reports indicate that these issues lead to a denial of service condition, however, it is conjectured that arbitrary code execution is possible as well," the Symantec alert went on. If true, the dangers of these new vulnerabilities are identical to the flaw that Microsoft fixed last week. Like that bug, these newly-discovered vulnerabilities can be exploited with a maliciously-crafted WMF file that's posted on a Website, opened from an e-mail attachment, or launched with Microsoft or third-party image applications.

http://news.com.com/Microsoft+to+hunt+for+new+species+of+Win
dows+bug/2100−1002_3−6024778.html?tag=cd.lede

MICROSOFT TO HUNT FOR NEW SPECIES OF WINDOWS BUG

Microsoft plans to scour its code to look for flaws similar to a recent serious Windows bug and to update its development practices to prevent similar problems in future products. The critical flaw, in the way Windows Meta File (WMF) images are handled, is different than any security vulnerability the software maker has dealt with in the past, said Kevin Kean and Debby Fry Wilson, directors in Microsoft's Security Response Center. Typical flaws are unforeseen gaps in programs that hackers can take advantage of and run code. By contrast, the WMF problem lies in a software feature being used in an unintended way. In response to the new threat, the software company is pledging to take a look at its programs, old and new, to avoid similar side effects. Microsoft has been working for years to improve its security posture, beginning with its Trustworthy Computing Initiative, launched in early 2002. The WMF problem is not a good advertisement for Microsoft's security efforts, one analyst said, as the legacy issue seemingly went undetected. "This should have been caught and eliminated years ago," said Gartner analyst Neil MacDonald.

2006-01-11 **Microsoft Outlook Exchange vulnerability danger WMF exploit e-mail**

DHS IAIP Daily; 23
http://www.techweb.com/wire/security/175803652;jsessionid=KS
BY2QFNY1BIQQSNDBOCKHSCJUMEKJVN

MICROSOFT'S NEWEST BUG COULD BE SERIOUS, RESEARCHER SAYS

The Outlook and Exchange vulnerability disclosed by Microsoft Tuesday, January 10, has the potential to become a much more virulent problem than the long-hyped Windows Metafile (WMF) bug patched last week, said one of the e-mail flaw's discoverers Wednesday, January 11. The TNEF (Transport Neutral Encapsulation Format) vulnerability, which Microsoft spelled out in the MS06-003 security bulletin, is a flaw in how Microsoft's Outlook client and older versions of its Exchange server software decode the TNEF MIME attachment. TNEF is used by Exchange and Outlook when sending and processing messages formatted as Rich Text Format (RTF), one of the formatting choices available to Outlook users. "All that's required to exploit this is an e-mail message," said Mark Litchfield, director of NGS Software. "If you did it right, you could own every Outlook user in the world within a week," he said.

2006-01-18 **Windows XP patch update delay Vista release Palladium**

DHS IAIP Daily; http://www.securityfocus.com/brief/107 23

WINDOW XP UPDATE DELAYED UNTIL AFTER VISTA

Microsoft will not release Windows XP Service Pack 3 until the second half of 2007, after the company's planned shipment date for its next-generation operating system Vista, the software giant said on Wednesday, January 18. Vista will add some long-overdue security features, including limiting the privileges of the everyday user account similar to Unix-based systems, such as Linux and the Mac OS X. Another security feature that Microsoft touted -- the next-generation secure computing base (NGSCB), formally known as "Palladium" -- will only be partially incorporated in Vista, and it's uncertain whether it will follow the industry-created standard. The last major update for Windows XP, known as Service Pack 2, was released in August 2004 and added a host of new security features and bug fixes to Microsoft's flagship desktop operating system. Vista's focus on security will not eradicate security flaws -- just this week the software giant released an update for the beta version of the operating system to fix the recent vulnerability in the Windows Meta File (WMF) format.

2006-04-26 **Microsoft Windows Shell COM object remote code execution vulnerability solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/17464/solution 23

MICROSOFT WINDOWS SHELL COM OBJECT REMOTE CODE EXECUTION VULNERABILITY.

Microsoft Windows Shell is prone to a remote code execution vulnerability. This issue is due to a flaw in its handling of remote COM objects. Analysis: If a user is logged on with administrative user rights, an attacker who successfully exploited this vulnerability could take complete control of an affected system. An attacker could then install programs; view, change, or delete data; or create new accounts with full user rights. Users whose accounts are configured to have fewer user rights on the system could be less impacted than users who operate with administrative user rights. For a detailed list of vulnerable products: http://www.securityfocus.com/bid/17464/info Solution: Microsoft has released an advisory along with fixes to address this issue. Microsoft has updated this security bulletin (MS06-015) to release new fixes due to problems with the fixes originally released with this bulletin. Customers who did not experience problems with Windows shell or Windows Explorer after installing the original fixes do not need to update their fixes. Microsoft Security Bulletin MS06-015: http://www.microsoft.com/technet/security/Bulletin/MS06-015. mspx

2002-01-20 **vulnerability flaw quality assurance QA penetration weakness operating system OS UNIX TCP/IP malformed packet patches**

Security Wire Digest 4 5

CERT ISSUES NEW WARNING FOR OLD FLAW
Attackers are now actively exploiting a 2-month-old CDE vulnerability in Sun Microsystems' Solaris and other Unix OSes to break into servers on the Internet, say researchers at the Honeynet Project. According to published reports, researchers believe the vulnerability was first exploited in the wild last week. The buffer-overflow flaw, which affects Solaris, IBM's AIX, HP-UX and other Unix OSes, allows a specially crafted packet of Internet data to give an attacker full system access. Details of the vulnerability were published in a November CERT advisory. Security experts recommend administrators install corresponding patches, and limit or disable access to the vulnerable service.

2002-05-05 **operating systems command interpreters standards assumptions differences dialects user interface UNIX LINUX GNU**

RISKS 22 05ff

Theo Markettos provided an interesting warning about assuming anything about command structures in different dialects of UNIX:

***

Both Linux and HPUX provide a 'killall' command. Under Linux 'killall <process name>' is used to kill all processes with the given name -- for example, as root one might kill all instantiations of httpd.

Under HPUX, killall kills _every_ process, except those required for shutdown. It takes an optional signal argument, but ignores this if it doesn't recognise it as a valid signal name. Hence 'killall httpd' kills everything except a handful of processes required for shutdown. If not running as root, it kills all processes owned by the current user.

The RISK? Don't assume something that is safe on one OS is on another, and don't assume that running a command without arguments to get help will do the right thing.

***

Markettos' short comment provoked a flurry of rants and counter-rants in subsequent issues of RISKS; one quibble was that Linux is not UNIX (Richard Stallman once suggested it be spelled "LiGNUx"). Another comment I liked was that a well-designed command interpreter should question the presence of parameters following a command when it doesn't expect them, just as it would question the absence of required parameters.

OPEN-SOURCE ACTIVISTS SAY: GIVE US LIBERTY FROM MICROSOFT
A group of just 30 of the 15,000 Linux World conference attendees in San Francisco staged a rally outside City Hall to urge politicians to adopt the Digital Software Security Act, which would require California state agencies to use open-source software such as Linux as an alternative to Microsoft Windows. A leader of the group proclaimed, "Government and monopolists want to take away our right to write software and use computers as we want to use them. Open source is the true spirit of democracy, and we must preserve it." The Computing Technology Industry Association, a Washington, D.C.-based industry trade group, charged that the proposed Digital Software Security Act -- which is supported by an array of hackers, civil libertarians, and critics of Microsoft -- would stifle innovation in corporate America and have unintended adverse consequences. SUN OFFERS SCHOOLS STAROFFICE SOFTWARE FOR FREE
Sun Microsystems took aim at Microsoft's dominant position as a supplier of office software for schools and is sponsoring a giveaway of its rival StarOffice product to ministries of education in Europe and South Africa. Sun hopes its donation, estimated to be worth $650 million, will put StarOffice into schools serving some 26 million elementary, secondary and college students in those areas. The donation comes as something of a departure for Sun, which up until now has focused more on supplying relatively obscure software development tools to universities. The company's goal, says CEO Scott McNealy, is to destabilize Microsoft Office's dominance on the PC desktop and to erode billions of dollars of profit earned from sales of the software. The prevalence of Office in schools means that by the time children graduate, "they're going to be kind of hooked for life," says McNealy, who noted his initiative would also free up funding for other instructional expenses and student/teacher ratio reductions. 2002-11-18 **Linux Windows personal computers PCs consumer sales**

NewsScan

WAL-MART SELLS WINDOW-LESS COMPUTERS
Wal-Mart's online shopping site has started selling inexpensive computers, priced in the $299 to $599 range, that feature the Linux-based LindowsOS operating system. Lindows' Web site says "LindowsOS computers come with software to view, print and copy MS Word files, MS PowerPoint files and MS Excel files," but they lack the software necessary to run those programs. Instead, the LindowsOS computers support alternatives such as the free OpenOffice software suite. Wal-Mart said its move comes in response to customers asking for machines loaded with Linux, but it has no plans to sell them in its stores. (AP 16 Jul 2002)
http://apnews.excite.com/article/20020716/D7KQADA80.htm

LINUX, IN DAVID VS. GOLIATH BATTLES, CONTINUES TO MAKE HEADWAY
Little Linux, the home-grown, fast-growing, open-source operating system that invites code-enhancements from programmers all over the world, continues to make headway in the so-called real world: Wall Street, Hollywood, and government. Industry analyst Bill Claybrook of the Aberdeen Group says the operating systems wars will come down to two players, with Sun's Unix offering eventually falling in battle: "The real horse race, long-term, is going to be between Linux and Windows." [Yes, we've mixed some metaphors here. Be quiet.] Microsoft, unsurprisingly, thinks that victory is theirs, but Linux supporters believe that the bigger they are the harder they'll fall. Surprisingly, money may be the ultimate deciding factor, and one information services executive who just opted for Linux in his company explains: "We wanted to run it on Linux because it was quick and easy to launch. Plus, it was a fraction of the cost of a Microsoft license." (USA Today 5 Aug 2002)

SUN'S NEW LINUX STRAGEGY
Sun Microsystems is introducing its first line of computers using the Linux operating system, created and distributed as "open source code" by the Finnish programmer Linus Torvalds, and then further developed by volunteer programmers throughout the world. The pricing of Sun's LX50 server will begin at $2,795, making it very competitive with Dell's system running the red Hat version of Linux and costing about $3,700 for a similarly configured system. Sun seems to be shifting away from its "thin client" strategy, which uses inexpensive terminals that rely on powerful centralized computing, and instead embracing the Linux operating sytems and its low-cost StarOffice software suite for word processing, spreadsheet, and other business applications. Sun is hoping to persuade large corporations to abandon Microsoft software applications: "Our target is the telephone-call center that wants to put software on 10,000 desktops," says Sun executive Jonathan Schwartz. (New York Times 12 Aug 2002)

THE LINUX ASSAULT ON MICROSOFT
Although Linux has proven quite successful in the server market, it has had trouble penetrating the desktop market because Microsoft's Windows software comes bundled with most new PCs. The new hope of Linux enthusiasts is that the release of LindowsOS 2.0 as a $129 standalone product will create new momentum in the war against Microsoft domination. The new Lindows product will support dozens of Linux applications (including ones that mimic Windows applications), will include Sun's StarOffice 6.0 word processing software, and will support more than 800 printers. The software will also be available on an inexpensive tablet computer scheduled for release in early 2003. (ZDNet 18 Nov 2002)

2003-01-16 **Linux operating system data centers corporations study prediction open source**

NewsScan

LINUX: THE RISE OF THE PENGUIN
Linux will emerge as the dominant operating system in corporate data centers, according to a new study by Goldman Sachs, which says the ascendance of the open source software will enable IT managers to take advantage of lower-cost, higher-performance Intel-based servers, and to avoid "premium-priced proprietary systems." The report, titled "Fear the Penguin," predicts that eventually, Linux-based systems will displace those running on Unix and RISC processors: "Many observers confine Linux's enterprise opportunity to the market for low-end 'edge' servers such as file, print, Web and e-mail servers. But we are confident that the technical developments and market forces are in place for it also to become the dominant OS on the higher-end servers of the enterprise data center." The winners in this scenario will be "independent PC semiconductor companies (Intel and AMD) and Intel-based server businesses (Dell)." The emergence of Linux is also expected to buoy the fortunes of "open" infrastructure software vendors, such as BEA Systems, BMC Software, Oracle and Veritas. However, with regard to archrival Microsoft, Linux will "hamper the movement of Windows into the enterprise data center, an area that Microsoft has only recently begun to target for growth," by providing an easier migration path from current Unix-based systems. "This shift will limit Windows' market opportunity in the data center for both its OS and its applications that run on that platform," concludes the study. (NewsFactor Network 15 Jan 2003)

2003-01-21 **Linux operating system sales**

NewsScan

LINUX ACCOUNTS FOR $2 BILLION OF HP's SALES
Carly Fiorina, the chief executive of Hewlett-Packard, the world's top seller of personal computers, says that the Linux operating system now accounts for fully $2 billion of HP sales. That $2 billion figure contrasts with virtually no sales at all a mere five years ago. Of course, the increasing importance of Linux goes beyond HP, and market research groups such as IDC say that Linux installations grew 35% last year, in spite of the fact that corporate information technology budgets were in most cases flat or declining. 2003-03-19 **Linux vulnerability open source Samba file server**

NIPC/DHS

March 17, CNET News.com — Linux firms urge users to plug Samba hole.

The open-source community is urging customers to patch their systems to close a hole in a software component that allows Windows programs to store and retrieve files on Linux and Unix servers. Known as Samba, the software can be found on many workstations and servers running any one of the variety of flavors of Linux and Unix, including systems running Apple OS X. The flaw occurs in the code that reassembles data that the software receives from the Internet, according to the advisory. By sending the server a specially crafted data packet, an attacker could overload the memory used by the Samba software and cause the application to run code of the intruder's choice. Members of the Samba team planned to announce the vulnerability on Tuesday, but they released information over the weekend because some believed a Web site break-in in Germany may have been attributed to the software. Several Linux editions—including Debian, Gentoo, and SuSE—released patches for the problem. Apple Computer noted in an advisory that Samba is not enabled by default with Mac OS X and Mac OS X Server, but the company plans to issue a patch for version 10.2.4. Red Hat hasn't yet released a patch but will do so soon, the company said in a statement.

2003-04-08 **US military hacking fund open source software DARPA secure**

NIPC/DHS

April 06, The Globe and Mail (Canada) — U.S. Military funds Calgary hacker.

Theo de Raadt, a hacker from Calgary, Canada, has received a $2-million grant from the U.S. Defense Advanced Research Projects Agency (DARPA), the R&D arm of the U.S. military. For this grant, DARPA is interested in testing the security of commercial software systems against the security of open source software projects. de Raadt leads development of OpenBSD, an open-source computer operating system. OpenBSD, a derivative of the Unix operating system, is widely considered by computer experts to be the most resistant to unauthorized use. "We were convinced OpenBSD was the best platform to use as a basis for further securing open source," said Jonathan Smith, a professor of computer and information science at the University of Pennsylvania. Because DARPA does not directly fund projects outside the United States, it is Smith's computer science department that received the grant, although most of the money flows through to de Raadt's project. Although Microsoft Corp., whose Windows products are the world's dominant operating system products, and many other commercial software vendors are paying new attention to the security of their products, that renewed interest has done little to improve their products so far, de Raadt said.

2003-04-09 **vulnerability Samba file server Windows Linux Unix patch fix FreeBSD Sun Solaris**

NIPC/DHS

April 07, CNET News.com — Samba flaw threatens Linux file servers.

The Samba Team released a patch on Monday for the second major security flaw found in the past few weeks in the open-source group's widely used program for sharing Windows files between Unix and Linux systems. The security problem could easily let an attacker compromise any Samba server connected to the Internet. The vulnerability is already being used by online attackers to compromise vulnerable servers, the company warned in an advisory. The Samba software that runs on major Linux distributions as well as FreeBSD and Sun Microsystems' Solaris operating system were affected. Security firm Digital Defense found the vulnerability. However, in an added twist to the situation that could make the threat more serious, while Digital Defense noted that some hackers obviously knew of the method by which the vulnerability could be exploited, it also mistakenly posted its own exploit onto its Web site. A patch is available on the Samba Website: http://us1.samba.org/samba/samba.html.

2003-04-10 **Linux operating system cheap changing business operation**

NewsScan

RISE OF LINUX IS CHANGING THE LANDSCAPE
The growing appeal of Linux as an alternative to rival operating systems such as Microsoft's Windows and Sun Microsystems' Solaris is changing the dynamics of the computer software business. Although currently relegated to "back-office" operations that handle e-mail, Web pages, file-sharing and printing, Linux is primed to begin making inroads into the higher echelons of business computing, such as telecom billing and airline reservation systems. A recent Garner report says that "businesses are coming to regard Linux as a worthy alternative to Unix and Windows." That trend has proven a boon for IBM, which embraced Linux in 1999 and now offers it across its entire product range, from lowly PCs to mighty mainframes. Also benefiting are Hewlett-Packard and Dell, both of which have been successful selling Linux servers. But the blossoming of Linux could prove toxic to Sun, which has seen some of its high-end Solaris server customers migrate to inexpensive Linux-run machines. Sun has compensated by offering its own cheap boxes running Linux alongside its more powerful Solaris-based ones, but many in the industry predict the dual strategy is "doomed." 2003-06-04 **Novell Unix patent copyright operating system SCO SEC**

NewsScan

NOVELL CLAIMS UNIX PATENTS, COPYRIGHTS NEVER TRANSFERRED
Conflicting claims of Unix intellectual property ownership have come to light, with Novell saying it sold SCO Group broad rights to the Unix operating system but retained the copyrights and patents. According to a 1995 contract, Novell sold "all rights and ownership of Unix and UnixWare" to SCO's predecessor, the Santa Cruz Operation. But the asset purchase agreement filed with the SEC specifically excludes "all copyrights" and "all patents" from the purchase. "This agreement is kind of murky. You end up with a lot of questions, to put it mildly," says one intellectual property lawyer. The question of Unix patent and copyright ownership is central to SCO's attempt to force companies using Linux software to pay royalties for Unix software code that SCO says was illegally incorporated into Linux. On May 14, SCO sent letters to 1,500 of the world's largest corporations warning them that using Linux could open them up to legal liability for infringement. SCO CEO Darl McBride acknowledged last week that the contract contained "conflicting statements," but added: "It doesn't make sense. How would you transfer the product but not have the copyright attached? That would be like transferring a book but only getting the cover." Novell CEO Jack Messerman, meanwhile, said his company is basing future operating system products on Linux: "Novell is an ardent supporter of Linux and the open-source development community." 2003-11-12 **attack hack Linux kernel operating system Trojan horse development code**

NIPC/DHS

November 06, CNET News.com — Attempted attack on Linux kernel foiled.

An unknown intruder attempted to insert a Trojan horse program into the code of the next version of the Linux kernel, stored at a publicly accessible database. The public database was used only to provide the latest beta, or test version, of the Linux kernel to users of the Concurrent Versions System (CVS), a program designed to manage source code. The changes, which would have introduced a security flaw to the kernel, never became a part of the Linux code and were never a threat, said Larry McVoy, founder of software company BitMover and primary architect of the source code database BitKeeper, Thursday, November 6. An intruder apparently compromised one server earlier, and the attacker used his access to make a small change to one of the source code files, McVoy said. The change created a flaw that could have elevated a person's privileges on any Linux machine that runs a kernel compiled with the modified source code. The recent incident raises questions about the security of open-source development methods, particularly how well a development team can guarantee that any changes are not introducing intentional security flaws. While Microsoft code has had similar problems, closed development is widely considered to be harder to exploit in that way.

2003-12-03 **Linux security new critical vulnerability kernel operating system**

NIPC/DHS

December 01, eWEEK — Researchers find serious vulnerability in Linux kernel.

Security professionals took note of a critical new vulnerability in the Linux kernel that could enable an attacker to gain root access to a vulnerable machine and take complete control of it. An unknown hacker recently used this weakness to compromise several of the Debian Project's servers, which led to the discovery of the new vulnerability. This discovery has broad implications for the Linux community. Because the flaw is in the Linux kernel itself, the problem affects virtually every distribution of the operating system and several vendors have confirmed that their products are vulnerable. The vulnerability is in all releases of the kernel from Version 2.4.0 through 2.5.69, but has been fixed in Releases 2.4.23-pre7 and 2.6.0-test6. RedHat Inc. and the Debian Project have both released advisories warning customers of the issue and providing information on fixes. Products from other vendors, including, MandrakeSoft S.A., SuSE Linux AG and Caldera International Inc., are also vulnerable.

2003-12-08 **vulnerability fix flaw patch Gentoo operating system Linux**

NIPC/DHS

December 05, ZDNet UK — Patch fixes flaw behind Gentoo attack.

The team responsible for Rsync, an open-source file-transfer program, has released a fix for a security flaw used in the recent compromise of a Gentoo Linux project server. The attacker used a flaw in Rsync along with a recently-announced bug in the Linux kernel to penetrate the security of the Gentoo machine, which was subsequently taken offline for analysis. The attack and compromise of Gentoo's server came after several machines belonging to the Debian Linux project were breached by attackers last month. Gentoo and Debian are both distributions of the open-source operating system based on the Linux kernel. The flaw in Rsync versions 2.5.6 and earlier cannot be used on its own to remotely gain administrator, or root, access to a Rsync server, but could be used with the kernel flaw for a full remote compromise—as was apparently the case with Gentoo's Rsync server. The exploit does not work unless Rsync is being used as a server. Users are recommended to immediately upgrade to Rsync version 2.5.7, a version of the Linux kernel later than 2.4.23, and turn off the "use chroot = no" option in Rsync. Additional information available here:
http://rsync.samba.org/

2004-01-07 **Linux security flaw critical vulnerability warning virtual memory**

NIPC/DHS; http://www.pcworld.com/resource/printable/article/0,aid,114088,00.asp

January 05, PC World — Security group warns of Linux flaw.

There is a critical vulnerability in the code used to manage virtual memory on Linux systems. The vulnerability affects versions of the Linux kernel up to and including version 2.6 and would give low-level Linux users total control over a Linux system. ISEC Security Research said Monday, January 5, that the problem is in kernel code for a component called "mremap," the core of the Linux operating system that provides basic services for all other parts of the operating system such as allocating processor time for the programs running on the computer and managing the system's memory or storage. Attackers could use the vulnerability to create an invalid virtual memory area, which could destabilize the Linux operating system or allow a malicious user to run attack code on the system. Attackers would need local user access to the vulnerable machine, but would not need any special privileges on the Linux system to exploit the hole, ISEC said. ISEC said they have developed test code to exploit the mremap vulnerability. Users should fix vulnerable systems as soon as software patches became available from their vendor. The original advisory is available here:

2004-01-20 **HP Tru64 UNIX operating system vulnerability flaw patch fix**

NIPC/DHS;
http://news.zdnet.co.uk/software/linuxunix/0,39020390,39119149,00.htm

January 16, ZDNet — HP patches critical security holes in Tru64 Unix.

Critical security vulnerabilities in HP's Tru64 Unix operating system were patched on Friday, January 16, after it was discovered that implementations of IPsec and SSH programs, which carry VPN and secure system command traffic, were vulnerable to attackers. The vulnerabilities both were found in vital components of the operating system and both could enable malicious users to either take control of a machine or launch a denial of service attack. SSH, a secure Telnet program, is used to securely send commands to a server, while IPSec is used to create virtual private networks to carry encrypted information over the Internet between two computers. HP has issued patches that will fix any known problems. Only HP's Tru64 UNIX 5.1B is affected and fixes for both the IPsec software and SSH software can be found on HP's Web site:
http://us-support3.external.hp.com/common/bin/doc.pl/sid=485 45bf71719ae72bf

2004-02-18 **Sun Cobalt server security holes vulnerability update issued**

DHS IAIP Daily;
http://searchsecurity.techtarget.com/originalContent/0,289142,sid14_gci950995,00.html?track=NL−358

February 18, SearchSecurity.com — Sun combats security holes in cancelled Cobalt line.

Sun Microsystems continues to battle operating system vulnerabilities in its doomed line of Cobalt appliance servers. Administrators should upgrade to prevent remote exploits that could include cracking private keys, exposing confidential data, spoofing identities, escalating privileges, executing arbitrary code and denial of service. Perhaps the most serious vulnerability is a heap-based buffer overflow in rsync. Remote attackers can use this to gain access to a system or execute arbitrary code. Sun has fixes for RaQ 550, Qube 3 and RaQ 4. A defect in gnupg incorrectly creates El Gamal sign and encrypt keys using the same key component. This could allow an attacker to get the private key from a signature, which could be used to spoof identities and decrypt confidential data. Fixes are available for Qube 3, RaQ 550 and RaQ XTR. An integer overflow in the ls program in the fileutils or coreutils packages can render applications that use ls, including wu-ftpd, vulnerable to remote exploitation. Attackers could cause a denial of service on the server. There are fixes for RaQ XTR, RaQ 550, Qube 3 and RaQ 4. Finally, an update is available for an unspecified vulnerability in IPtables on RaQ 550.

2004-02-19 **Linux kernel 2.4 server flaws vulnerabilities update issued**

DHS IAIP Daily; http://news.com.com/2100−1002_3−5162055.html?tag=nefd_top

February 19, CNET News.com — Linux servers at risk from trifecta of flaws.

Three separate security flaws could be used by an ordinary user to gain total control of a Linux server or workstation, security researchers have warned. Two of the vulnerabilities lie in the way the Linux kernel--the core of the open-source operating system--manages memory. They affect all current versions of Linux, according to advisories released on Wednesday by iSEC Security Research, a Polish security company. The third flaw affects the module for the kernel that supports ATI Technologies' Rage 128-bit video card. Because Linux is frequently used on shared servers, security holes that allow a user to expand their access rights on a computer are serious, said Alfred Huger of Symantec. However, they are not as critical as flaws that allow an outsider to compromise the computer, he said. The Linux Kernel Project released a new version of the 2.4 series kernel--version 2.4.25--to fix the vulnerability. Linux companies and projects that package their own version of Linux have rushed to deliver updates. Red Hat, Novell's SuSE Linux, Debian and other Linux distributions had released fixes by Thursday, February 19.

2004-03-10 **security vulnerability flaw hole patch fix Linux privilege escalation denial-of-service Gentoo**

NIPC/DHS

March 09, eSecurity Planet — Linux privilege escalation hole detected.

According to an advisory from computer security consultants iSEC Security Research, a flaw was found in the Linux kernel memory management code and is completely unrelated to a similar vulnerability reported in February. The flaw carries a "critical" rating and affects Linux versions 2.2 up to and including 2.2.25; it also impacts versions 2.4 up to and including 2.4.24 as well as versions 2.6 up to and including 2.6.2. "Proper exploitation of this vulnerability leads to local privilege escalation giving an attacker full super-user privileges. The vulnerability may also lead to a denial-of-service attack on the available system memory," iSEC warned. Linux distributor Gentoo confirmed its implementation of the open source operating system was susceptible to the flaw and strongly urged uses to upgrade to newer, more secure versions. The flaw was discovered in the memory subsystem which allows for shrinking, growing, and moving of chunks of memory along any of the allocated memory areas which the kernel possesses. iSEC Security Research found that the code doesn't check the return value of the memory function.

2004-04-16 **Linux open-source operating system kernel flaws**

DHS IAIP Daily; http://www.esecurityplanet.com/trends/article.php/3341341

April 16, eSecurity Planet — Multiple Linux flaws reported.

Security researchers are warning of a buffer overflow security flaw in the Linux kernel that can be exploited to lead to privilege escalation attacks. According to an advisory issued by iDEFENSE, the vulnerabilities affect Linux Kernel 2.6.x; Linux Kernel 2.5.x and Linux Kernel 2.4.x. The company found that affected versions of Linux kernel performed no length checking on symbolic links stored on an ISO9660 file system, a problem that allows a malformed CD to perform an arbitrary length overflow in kernel memory. "Symbolic links on ISO9660 file systems are supported by the 'Rock Ridge' extension to the standard format. The vulnerability can be triggered by performing a directory listing on a maliciously constructed ISO file system, or attempting to access a file via a malformed symlink on such a file system. Many distributions allow local users to mount CDs, which makes them potentially vulnerable to local elevation attacks," according to the security alert. Updated Linux kernel versions are available at kernel.org. Separately, security firm Secunia warned of an information leak and denial-of-service holes in Linux Kernel 2.4.x and 2.6.x. The information leak problem was discovered with the ext3, XFS, and JFS file system code and can lead to the exposure of data like cryptographic keys to malicious attackers. Another error was found within the OSS code for SoundBlaster 16 devices that could be used to trigger denial-of-service attacks with odd numbers of output bytes are submitted.

2004-05-03 **Linux operating systems vulnerabilities security**

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2004/0503/feat-linux3-05-03-04.asp

May 03, Federal Computer Week — Linux has its own security holes.

There may be fewer viruses designed to attack the Linux operating system, but experts warn that Linux is no more bulletproof than any other system. Agencies that adopt Linux should be aware of its vulnerabilities, according to Travis Witteveen, of security firm F-Secure Corp. "Computing systems are very similar, whether they're called Linux, Windows, Unix, MacIntosh, or even PocketPC," he said. Vius writers will target Linux when the system gains a high enough profile, Witteveen said. But even now, there are some Linux viruses out in cyberspace. The most damaging Linux virus so far, the Slapper worm, infected 20,000 systems in 100 countries in late 2002, said Laura DiDio, senior analyst of application infrastructure and software platforms for the Yankee Group. "That pales in comparison to the most damaging Windows virus, MyDoom and its variants, which infected several million computers in three weeks," she said. Linux is "on everyone's radar screen," and creators of malicious code are increasingly taking notice, she said. Many Linux viruses don't require user interaction, unlike most Windows attacks that depend on the user to run an attached file in order to infect the computer.

2004-06-28 **Project Looking Glass Sun Microsystems 3-D interface software**

NewsScan

SUN 3-D INTERFACE OFFERED TO OPEN-SOURCE COMMUNITY

Sun Microsystems has designed 3-D interface software to compete with the PC desktop metaphor of desktops and file folders. The new technology will be offered to the open source community, and a Sun executive says, "What we want to do is leverage the community of open-source developers to do things we might not have thought of." Produced through a company effort dubbed Project Looking Glass, the 3D interface allows windows containing documents or images to be turned sideways (like books on a shelf) and spun around so that notations can be made on the reverse side. It may eventually be used on Windows machines, but Sun is initially planning to use the
technology on desktop machines running Linux or Sun's own Solaris operating system. Sun president and COO Jonathan Schwartz says that Project Looking Glass reflects a swing in software development back toward desktop machines or other client devices, instead of running programs on centralized servers. (Wall Street Journal 28 Jun 2004)

2004-07-29 **Gentoo Linux Samba vulnerability fix patch update SWAT buffer overflow**

DHS IAIP Daily; http://searchsecurity.techtarget.com/originalContent/0,289142,sid14_gci996615,00.html

July 29, SearchSecurity.com — Gentoo fixes Samba vulnerabilities.

Gentoo Linux has fixed buffer overflow vulnerabilities in Samba. The buffer overflow found in SWAT is located in the base64 data decoder used to handle http basic authentication. The same flaw is present in the code used to handle the sambaMungedDial attribute value when using the ldapsam passdb backend. Another buffer overflow was found in the code used to support the 'mangling method = hash' smb.conf option. The SWAT authentication overflow could be exploited to execute arbitrary code with the rights of the Samba daemon process. The overflow in the sambaMungedDial handling code is not thought to be exploitable. The buffer overflow in 'mangling method = hash' code could also be used to execute arbitrary code on vulnerable configurations. For a workaround, the Gentoo advisory suggests users disable SWAT, not use ldapsam passdb backends and avoid the 'mangling method = hash' option. All Samba users should upgrade to the latest version, Gentoo said: http://www.gentoo.org/security/en/glsa/glsa-200407-21.xml

2004-08-04 **Linux vulnerability pointer handling kernel memory disclosure**

DHS IAIP Daily; http://secunia.com/advisories/12210/

August 04, Secunia — Linux kernel file offset pointer handling memory disclosure vulnerability.

A vulnerability in the Linux kernel can be exploited by malicious, local users to disclose sensitive information in kernel memory. The vulnerability is caused due to race conditions and conversion errors when handling 64-bit file offset pointers. Successful exploitation may disclose large portions of kernel memory. The vulnerability has been reported in version 2.4.26 and prior and in version 2.6.7 and prior. Users should grant only trusted users access to affected systems.

2004-08-11 **Sun Solaris X Display Manager XDMCP request vulnerability remote protocol**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/139504

August 11, US-CERT — Vulnerability Note VU#139504: Sun Solaris X Display Manager does not properly handle invalid XDMCP requests.

The X Display Manager (xdm(1)) is responsible for managing collections of X displays from local or remote servers using the X Display Manager Control Protocol (XDMCP). The Sun Solaris X Display Manager contains a denial-of-service vulnerability that could be triggered by an invalid XDMCP packet. A remote attacker with the ability to send XDMCP packets to a vulnerable system could cause the X Display Manager to crash. For more information on patches available for your system, please refer to Sun Security Alert 57619: http://sunsolve.sun.com/pub-cgi/retrieve.pl?doc=fsalert/5761 9

Category 24.3 *UNIX flavors*

2004-08-16 **SuSE Linux operating system rsync program vulnerability Red Hat Package Manager rpm update issued**

DHS IAIP Daily; http://www.suse.com/de/security/2004_26_rsync.html

August 16, SUSE, Inc. — SUSE Linux rsync vulnerability.

If rsync is running in daemon-mode and without a chroot environment it is possible for a remote attacker to trick rsyncd into creating an absolute pathname while sanitizing it. As a result it is possible to read/write from/to files outside the rsync directory. SUSE Linux 8.1, 8.2, 9.0, and 9.1 are vulnerable. Please download the update package for your distribution and verify its integrity by the methods listed in section three of this announcement. Then, install the package using the command "rpm -Fhv file.rpm" to apply the update. Our maintenance customers are being notified individually. The packages are being offered to install from the maintenance web.

Category 24.3 *UNIX flavors*

2004-08-25 **OpenBSD kernal panic attack ICMP request system reboot**

DHS IAIP Daily; http://www.zone−h.org/advisories/read/id=5413

August 25, zone-h.org — OpenBSD kernel panic.

A vulnerability exists in OpenBSD 3.4 and 3.5 configured to act as a gateway. This vulnerabilty may cause the kernel to crash. An OpenBSD 3.5 machine, configured as a gateway, with active bridging, and the link2 option given (for IPSec processing), is vulnerable to a crash when to a single ICMP echo request sent from a machine on interface A's network is sent to a machine on interface B's network. No core file is generated. If the DDB_PANIC option is set, the machine reboots upon receipt of the ICMP echo request. Patches are available at: ftp://ftp.openbsd.org/pub/OpenBSD/patches

2004-12-13 **Linux flaws Microsoft security research reliability security open-source**

NewsScan;
http://news.com.com/Security+research+suggests+Linux+has+fewer+flaws/2100
-1002_3-5489804.html

REPORT CONCLUDES LINUX HAS FEWER FLAWS

A four-year research effort by code-analysis firm Coverity has concluded that Linux has significantly fewer software bugs in it than most commercial counterparts. Coverity uncovered 985 flaws in the 5.7 million lines of code that make up the Linux core operating system, compared with the more than 5,000 defects typically found in commercial software of similar size. "Linux is a very good system in terms of bug density," says Coverity CEO Seth Hallem. Though Coverity's report doesn't contain any specific data about the frequency of glitches in Microsoft's Windows operating system, it's likely to add fuel to the debate over which system -- Linux, Mac OS or Windows -- is most secure. One recent report found that Red Hat Linux contained fewer critical flaws than Microsoft Windows, while a Forrester Research study (sponsored by Microsoft) unsurprisingly favored Microsoft. (CNet News.com 13 Dec 2004)

2005-01-12 **Linux kernel multiprocessor page fault privilege escalation vulnerability no update issued**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2005/Jan/1012862.html

LINUX KERNEL MULTIPROCESSOR PAGE FAULT HANDLER RACE CONDITION LETS LOCAL USERS GAIN ELEVATED PRIVILEGES

A vulnerability was reported in the Linux kernel in the page fault handler code for multiprocessor systems. A local user can obtain root privileges. If two concurrent threads share the same virtual memory space and request stack expansion at the same time, a race condition can be exploited on multiprocessor systems. A local user can cause arbitrary memory contents to be injected into memory locations used by a set user id (setuid) application to execute arbitrary code with elevated privileges. The flaw resides in the down_read() function in 'arch/i386/mm/fault.c'. No upstream solution is currently available.

Category 24.3 *UNIX flavors*

2005-01-13 **SGI IRIX operating system design error vulnerability code execution attack no update issued**

DHS IAIP Daily; http://idefense.com/application/poi/display?id=182&type=vuln erabilities&flashstatus=true

SGI IRIX INPVIEW DESIGN ERROR VULNERABILITY.

Local exploitation of a design error vulnerability in the inpview command included in multiple versions of Silicon Graphics Inc.'s IRIX could allow for arbitrary code execution as the root user. All that is required to exploit this vulnerability is a local account and an open X display, which could be the attacker's home machine or another compromised system. Exploitation does not require any knowledge of application internals, making privilege escalation trivial, even for unskilled attackers. Support for the InPerson product did not extend beyond 02/2002 as noted in the following publication: techpubs.sgi.com/library/manuals/4000/007-4526-001/pdf/007-4526-001.pdf. As a result, no patch will be issued for this vulnerability. A workaround is available on the iDefense Website.

Category 24.3 *UNIX flavors*

2005-01-28 **HP-UX TGA daemon vulnerability denial of service DoS attack**

DHS IAIP Daily; http://www.k−otik.com/english/advisories/2005/0076

HP-UX TGA DAEMON REMOTE DENIAL OF SERVICE VULNERABILITY

A new security vulnerability has been identified in HP-UX, which may be exploited by remote attackers to conduct denial of service attacks. The problem is caused due to an an unspecified error in the TGA daemon when handling certain network traffic, which may be exploited to cause a vulnerble system to stop responding. Original advisory and solution available at: http://www5.itrc.hp.com/service/cki/docDisplay.do?admit=5522 67591+1106928673434+28353475&docId=HPSBUX01111

2005-05-17 **Linux kernel locally exploitable flaws no update issued**

DHS IAIP Daily; http://www.securiteam.com/unixfocus/5GP0F20FQI.html

LINUX KERNEL PKTCDVD AND RAWDEVICE IOCTL RACE CONDITION

Two locally exploitable flaws have been found in the Linux rawdevice and pktcdvd block device ioctl handler that allows local users to gain root privileges and also execute arbitrary code at kernel privilege level. The Linux kernel contains pktcdvd and rawdevice block device components. Due to the missing checks in pktcdvd and rawdevice ioctl handler parameter, the process can break user space limit and execute arbitrary code at kernel privilege level. There is no solution at this time.

Category 24.3 *UNIX flavors*

2005-06-15 **vulnerability hole remote buffer overflow ViRobot Linux server no solution**

DHS IAIP Daily; http://www.securityfocus.com/bid/13964/exploit

VIROBOT LINUX SERVER REMOTE BUFFER OVERFLOW VULNERABILITY

ViRobot Linux Server is prone to a remote buffer overflow vulnerability affecting the Web based management interface. This issue presents itself because the application fails to perform boundary checks prior to copying user supplied data into sensitive process buffers. An attacker can gain unauthorized access to a vulnerable computer by supplying malformed values through cookies. There is no solution at this time.

Category 24.3 *UNIX flavors*

2005-11-01 **vulnerability hole Linux kernel buffer overflow fixed update**

DHS IAIP Daily; http://secunia.com/advisories/17384/

LINUX KERNEL POTENTIAL BUFFER OVERFLOW VULNERABILITIES

Two vulnerabilities have been reported in the Linux Kernel. Currently they have an unknown impact. The first includes a boundary error due to missing parameter validation in the "map_to_seg7()" function in "drivers/usb/input/map_to_7segment.h" of the Yealink driver may cause out-of-bound memory references. The second vulnerability is a boundary error in "/drivers/i2c/i2c-core.c" when handling SMBus Block Write transactions may cause a buffer overflow. According to Secunia the vulnerabilities have been fixed in version 2.6.14-git4.

Category 24.3 *UNIX flavors*

2005-11-02 **vulnerability multiple NetBSD fix patch update**

DHS IAIP Daily; http://secunia.com/advisories/17389/

NETBSD UPDATE FIXES MULTIPLE VULNERABILITIES

There have been vulnerabilities reported in NetBSD. These vulnerabilities could be exploited by malicious, local users to gain escalated privileges, or by malicious users to cause a Denial of Service and compromise a vulnerable system, or by attacker's attempting to bypass security restrictions and compromise a user's system. According to Seunica, the vulnerabilities have been fixed NetBSD-current (October 31, 2005) and NetBSD-1.6 branch (November 1, 2005).

Category 24.3 *UNIX flavors*

2005-12-22 **Linux kernel socket buffer memory exhaustion denial of service vulnerability check memory resource**

DHS IAIP Daily; http://www.securityfocus.com/bid/16041/references

Linux kernel local socket buffer memory exhaustion denial of service vulnerability.

Linux kernel is susceptible to a local denial of service vulnerability. The issue is due to a failure of the kernel to properly check and enforce memory resource constraints. This is triggered by consuming excessive kernel memory by creating multiple sockets with large kernel buffers; this allows local attackers to consume excessive kernel memory, eventually leading to an out of memory condition, and a denial of service for legitimate users.

Category 24.3 *UNIX flavors*

2005-12-22 **Linux kernel remote denial of service vulnerability memory crash user address issue Ubuntu**

DHS IAIP Daily; http://www.securityfocus.com/bid/16044/references

Linux kernel ICMP_Push_Reply remote denial of service vulnerability.

Linux kernel is prone to a remote denial of service vulnerability. Remote attackers can exploit this to leak kernel memory. Successful exploitation will result in a crash of the kernel, effectively denying service to legitimate users. Solution: Linux kernel version 2.6.12.6 has been released to address this issue. Ubuntu Linux has released advisory USN-231-1, along with fixes to address various kernel issues. For further solution detail refer to: http://www.securityfocus.com/bid/16044/solution

2006-01-04 **denial of service privilege escalation vulnerability Linux kernel update**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2006/0035 23

LINUX KERNEL MULTIPLE DENIAL OF SERVICE AND PRIVILEGE ESCALATION ISSUES

Multiple vulnerabilities were identified in Linux Kernel, which could be exploited by malicious users to cause a denial of service and potentially obtain elevated privileges. The first issue is due to an error in "mm/mempolicy.c" when handling policy system calls, which could be exploited by local attackers to cause a denial of service via a "set_mempolicy" call with a 0 bitmask. The second flaw is due to a one-byte buffer overrun error in "kernel/sysctl.c" when processing an overly long user-supplied string, which could be exploited by local attackers to potentially execute arbitrary commands. The third vulnerability is due to an error in "net/ipv4/fib_frontend.c" when processing malformed "fib_lookup" netlink messages, which could cause illegal memory references. The fourth issue is due to a buffer overflow error in the CA-driver for TwinHan DST Frontend/Card [drivers/media/dvb/bt8xx/dst_ca.c], which could be exploited by malicious users to cause a denial of service or potentially execute arbitrary commands. Solution: Upgrade to Linux Kernel version 2.6.15: http://www.kernel.org/.

2006-01-16 **Linux kernel remote denial of service DoS vulnerability upgrade**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2006/0220 23

LINUX KERNEL MULTIPLE REMOTE AND LOCAL DENIAL OF SERVICE VULNERABILITIES

Multiple vulnerabilities were identified in Linux Kernel, which could be exploited by remote or local attackers to cause a denial of service. The first issue is due to an infinite loop in the "netlink_rcv_skb" [af_netlink.c] function when handling a specially crafted "nlmsg_len" value, which could be exploited by local attackers to cause a denial of service. The second flaw is due to an error in the PPTP NAT helper that does not properly calculate the offset when handling an inbound "PPTP_IN_CALL_REQUEST" packet, which could be exploited by attackers to crash a vulnerable system. The third vulnerability is due to an error in the PPTP NAT helper that does not properly calculate the offset based on the difference between two pointers to the header, which could be exploited by attackers to cause a kernel crash. Solution: Upgrade to Linux Kernel 2.6.15.1: http://www.kernel.org/

2006-01-31 **HP Tru64 UNIX BIND user privileged access DNS BIND**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2006/Jan/1015551.html 23

HP TRU64 UNIX BIND FLAW MAY LET REMOTE USERS GAIN PRIVILEGED ACCESS.

A vulnerability was reported in BIND on HP Tru64 UNIX. A remote user may be able to gain access on the target system. An unspecified vulnerability exists in the HP Tru64 UNIX operating system when running DNS BIND and configured as a DNS BIND name server. A remote user can gain privileged access. Solution: HP has issued Early Release Patch kits (ERPs). See source Website for more details.

2006-03-14 **Linux XFS file system local information disclosure vulnerability solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/16921/references 23

LINUX KERNEL XFS FILE SYSTEM LOCAL INFORMATION DISCLOSURE VULNERABILITY.

The Linux kernel's XFS file system is susceptible to a local information disclosure vulnerability. Analysis: The flaw in the file system that may result in previously written data being returned to local users. A flaw was found in the module reference counting for loadable protocol modules of netfilter. By performing particular socket operations, a local attacker could exploit this to crash the kernel. A complete list of vulnerable products is given on the source advisory. Solution: The vendor has released version 2.6.15.5 to address this, and other issues. For more details: http://www.securityfocus.com/bid/16921/solution

2006-03-16 **Linux kernel buffer overflow vulnerability race condition solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/14205/references 23

LINUX KERNEL IA32 EXECVE LOCAL BUFFER OVERFLOW VULNERABILITY.

The Linux kernel is susceptible to a local buffer overflow vulnerability. Analysis: This issue is due to a race condition in an IA32 emulation system call that leads to a memory copy operation that overflows a previously allocated memory buffer. During the time between two function calls to obtain buffer sizes, there exists a window of opportunity for attackers to alter memory contents. This race condition allows local attackers to overwrite critical kernel memory, facilitating kernel level machine code execution and privilege escalation. On multiprocessor computers, attackers can directly alter the memory contents to exploit this race condition. On uniprocessor computers, a blocking function call allows attackers to exploit the race condition. A complete list of vulnerable products is available in the source advisory. Solution: Version 2.4.32-pre1 or later of the 2.4 series, and 2.6.7 or later of the 2.6 series of the Linux kernel include a fix for this issue. It should be noted that the 2.4.32-pre1 version is not considered a stable, production quality kernel. Users of kernel series 2.4 may have to wait until proper vendor fixes, or a stable version of the kernel is released. For further solution details: http://www.securityfocus.com/bid/14205/solution

2006-03-22 **Linux kernel buffer overflow vulnerabilities arbitrary command execution denial-of-service DoS**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2006/1046 23

LINUX KERNEL "DO_REPLACE" AND "NDIS" RESPONSE BUFFER OVERFLOW VULNERABILITIES.

Two vulnerabilities have been identified in Linux kernel, which could be exploited by attackers to execute arbitrary commands or cause a denial-of-service. Analysis: The first issue is due to a buffer overflow error in the do_replace() function [Netfilter module], which could be exploited by attackers to cause a kernel memory corruption and possibly execute arbitrary commands with elevated privileges. The second flaw is due to a buffer overflow error in drivers/usb/gadget/rndis.c when processing NDIS responses to OID_GEN_SUPPORTED_LIST, which could be exploited by attackers to cause a memory corruption and possibly execute arbitrary commands with elevated privileges. Affected products: Kernel versions prior to 2.6.16. Solution: Upgrade to kernel version 2.6.16: http://www.kernel.org/

2006-03-28 **Sun Solaris process environment disclosure vulnerability solution update**

DHS IAIP Daily; http://www.hackerscenter.com/archive/view.asp?id=23886 23

SUN SOLARIS PROCESS ENVIRONMENT DISCLOSURE SECURITY ISSUE.

A security issue has been reported in Sun Solaris, which can be exploited by malicious, local users to gain knowledge of potentially sensitive information. Analysis: The security issue is caused due to the "/usr/ucb/ps" command revealing the environment variables and values of all processes to an unprivileged user when run with the "-e" option. This can potentially reveal certain information of processes that belong to the root user. Affected: Sun Solaris 8 and Sun Solaris 9. Solution: Apply patches. See source advisory for further solution details.

Category 24.3 *UNIX flavors*

2006-03-28 **Linux kernel IP ID value increment vulnerability information disclosure solution update**

DHS IAIP Daily; http://www.hackerscenter.com/archive/view.asp?id=23887 23

LINUX KERNEL IP ID VALUE INCREMENT WEAKNESS.

A weakness in the Linux kernel, which can be exploited to disclose certain system information and potentially to bypass certain security restrictions. Analysis: The weakness is caused due to an error within the "ip_push_pending_frames()" function when creating a packet in reply to a received SYN/ACK packet. This causes RST packets to be sent with a IP ID value that is incremented per packet. This can potentially be exploited to conduct idle scan attacks. Affected products: Linux Kernel 2.4.x; Linux Kernel 2.6.x. Solution: Update to version 2.6.16.1: http://www.kernel.org/ Secunia is currently not aware of any official patches for the 2.4 kernel.

Category 24.3 *UNIX flavors*

2006-04-04 **Linux kernel IP ID information disclosure vulnerability solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/17109/references 23

LINUX KERNEL IP ID INFORMATION DISCLOSURE WEAKNESS.

The Linux kernel is susceptible to a remote information disclosure weakness. This issue is due to an implementation flaw of a zero 'ip_id' information disclosure countermeasure. This issue allows remote attackers to use affected computers in stealth network port and trust scans. The replies to TCP SYN packets contain a correct IP ID value of zero, but replies to TCP SYNACK packets have an incremental IP ID field instead. This means a remote attacker can abuse this behavior for malicious purposes to perform an idle scan with nmap. For a complete list of vulnerable products: http://www.securityfocus.com/bid/17109/info Solution: Various Linux kernel versions, such as some in the 2.4 series, are not affected by this issue. The vendor has released version 2.6.16.1 of the Linux kernel to address this issue. For further solution details: http://www.securityfocus.com/bid/17109/solution

2006-04-11 **Linux ioctl() denial-of-service DoS vulnerability no solution**

DHS IAIP Daily; http://www.securityfocus.com/bid/14902/discuss 23

LINUX KERNEL 64-BIT SYMMETRIC MULTI-PROCESSOR ROUTING_IOCTL() LOCAL DENIAL-OF-SERVICE VULNERABILITY.

A local denial-of-service vulnerability affects the Linux kernel on 64-bit Symmetric Multi-Processor platforms. Analysis: Specifically, the vulnerability presents itself due to an omitted call to the 'sockfd_put()' function in the 32 bit compatible 'routing_ioctl()' function. That insufficient input validation in the zisofs driver for compressed ISO file systems allows a denial-of-service attack through maliciously crafted ISO images. Multiple overflows exist in the io_edgeport driver which might be usable as a denial-of-service attack vector. A race condition in the /proc handling of network devices. A (local) attacker could exploit the stale reference after interface shutdown to cause a denial-of-service or possibly execute code in kernel mode. For a complete list of vulnerable products: http://www.securityfocus.com/bid/14902/info Solution: Linux kernel 2.6.13.2 is not vulnerable to this issue. For solution details: http://www.securityfocus.com/bid/14902/references

2006-04-18 **Linux kernel child auto reap denial-of-service DoS vulnerability local remote solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/15625/discuss 23

LINUX KERNEL PTRACED CHILD AUTO REAP LOCAL DENIAL-OF-SERVICE VULNERABILITY.

Several local and remote vulnerabilities have been discovered in the Linux kernel that may lead to a denial-of-service or the execution of arbitrary code. Analysis: The kernel improperly auto reaps processes when they are being ptraced, leading to an invalid pointer. Further operations on this pointer result in a kernel crash. This issue allows local users to crash the kernel, denying service to legitimate users. For a complete list of vulnerable products: http://www.securityfocus.com/bid/15625/info Solution: Please see the referenced vendor advisories for further information on obtaining and applying the appropriate updates: http://www.securityfocus.com/bid/15625/references Linux kernel versions 2.6.15-rc3 and 2.6.14.3 have been released to address this issue.

Category 24.3 *UNIX flavors*

2006-04-29 **Linux kernel CIFS/SMB CHRoot security restriction bypass vulnerability no solution**

DHS IAIP Daily; http://www.securityfocus.com/bid/17742/references 23

LINUX KERNEL CIFS/SMB CHROOT SECURITY RESTRICTION BYPASS VULNERABILITY.

The Linux kernel is prone to a vulnerability that allows attackers to bypass a security restriction. Analysis: This issue is due to a failure in the kernel to properly sanitize user-supplied data. The problem affects chroot inside of an SMB-mounted filesystem ('cifs' or 'smbfs'). A local attacker who is bounded by the chroot can exploit this issue to bypass the chroot restriction and gain unauthorized access to the filesystem. For a complete list of vulnerable products: http://www.securityfocus.com/bid/17742/info Solution: Currently, Security Focus is not aware of any vendor-supplied patches for this issue.

Category 24.3 *UNIX flavors*

2006-04-29 **Linux kernel USB denial-of-service vulnerability solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/14955/discuss 23

LINUX KERNEL USB SUBSYSTEM LOCAL DENIAL-OF-SERVICE VULNERABILITY.

A local denial-of-service vulnerability affects the Linux kernel's USB subsystem. Analysis: This issue is due to the kernel's failure to properly handle unexpected conditions when trying to handle USB Request Blocks. Local attackers may exploit this to trigger a kernel 'oops' on computers where the vulnerable USB subsystem is enabled. This would deny service to legitimate users. For a complete list of vulnerable products: http://www.securityfocus.com/bid/14955/info Solution: Please see the referenced vendor advisories for further information on obtaining and applying the appropriate updates: http://www.securityfocus.com/bid/14955/references

2006-05-02 **Department of Homeland Security code audit critical Linux bugs**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1956652,00.asp 23

DEPARTMENT OF HOMELAND SECURITY AUDIT FLAGS 'CRITICAL' LINUX BUG.

An open-source security audit program funded by the U.S. Department of Homeland Security has flagged a critical vulnerability in the X Window System which is used in Unix and Linux systems. Coverity, the San Francisco-based company managing the project under a $1.25 million grant, described the flaw as the "biggest security vulnerability" found in the X Window System code since 2000. Coverity Chief Technical Officer Ben Chelf said the flaw resulted from a missing parenthesis on a small piece of the program that checked the ID of the user. It could be exploited to allow local users to execute code with root privileges, giving them the ability to overwrite system files or initiate denial-of-service attacks.

Category 24.3 *UNIX flavors*

2006-05-02 **vulnerabilities Linux Cisco products software CLI application arbitrary code execution**

DHS IAIP Daily; http://www.securiteam.com/unixfocus/5LP050KIKW.html 23

MULTIPLE VULNERABILITIES IN LINUX-BASED CISCO PRODUCTS.

A vulnerability in the CiscoWorks WLSE "show" CLI application allows execution of arbitrary code as the root user. Analysis: The Cisco shell presents the administrator with a restricted set of commands which includes a "show" application. The "show" application has several vulnerabilities which allow an attacker to "break out" of the shell and execute commands (including /bin/sh) as the root user. A cross site scripting flaw exists in: /wlse/configure/archive/archiveApplyDisplay.jsp with the "displayMsg" parameter. This can be used to steal the JSP session cookie, therefore giving a targeted attacker admin level access to the system. Once the attacker has admin Web GUI access to the system via the XSS, they can then change the admin password or create a new admin user (without requiring the admin password). Affected software: Cisco Wireless Lan Solution Engine (WLSE); Cisco Hosting Solution Engine (HSE); Cisco Ethernet Subscriber Solution Engine (ESSE); Cisco User Registration Tool (URT); CiscoWorks2000 Service Management Solution (SMS); Cisco Vlan Policy Server (VPS); Cisco Management Engine (ME1100 Series); CiscoWorks Service Level Manager (SLM). Solution: Cisco has released patches for the vulnerabilities. Cisco Security Advisory: http://www.cisco.com/warp/public/707/cisco-sa-20060419-wlse. shtml Cisco Security Response: http://www.cisco.com/warp/public/707/cisco-sr-20060419-priv. shtml

1998-12-23 **TCP/IP vulnerability hole weakness advisory threat denial**

CNET news.com http://www.news.com/News/Item/Textonly/0,25,30250,00.html

CERT-CC announced that another vulnerability to IP spoofing in the TCP/IP that underlies the Internet would allow denial-of-service attacks by criminal hackers. Using forged source address in packet headers, the attackers could crash vulnerable systems. CERT-CC posted solutions to the exploit on its site, recommending that vulnerable Web sites reconfigure their routers or firewalls and install filtering on the routers to prevent IP spoofing attacks.

Category 24.4 TCP/IP & HTTP

2000-09-25 **availability single point of failure dynamic addressing**

RISKS 21 07

William P. N. Smith reported in RISKS on an interesting failure of his cable-modem service on the 24th September due to failure of the DHCP (Dynamic Host Configuration Protocol) servers that temporarily assign ("lease") IP addresses to users on TCP/IP networks: "Turns out the DHCP server for the entire northeast went down, and as people's leases on their IP addresses expired, they were dropped off the network. I asked about the secondary or backup DHCP servers, but apparently there was so much demand due to expired leases that the backup server couldn't respond quickly enough, and was getting overloaded with requests."
[A personal note from your editor: I have a secondary ISP with which I contract for only 5 hours a month at a very low cost. Although I use it rarely, it has prevented me from snarling in frustration on the odd occasion when my primary ISP has rejected connections.]

Smith drew two particularly interesting conclusions from this case:
* "Even single users ought to have a backup Internet connection" such as a dialup ISP;
* "Your backups might have to be more powerful than your primary servers. . . ."

Category 24.4 TCP/IP & HTTP

2000-12-16 **Web site redirection spoof HTTP syntax misleading trickery hoax joke**

RISKS 21 16

A hoax taking advantage of a little-used and practically unknown feature of HTTP syntax for URLs convinced many victims that the CNN.com site had been hacked. Rob Warnock explained what happened in a report for the RISKS Forum: "An MIT student named Eric Varady took a parody news article from The Onion <URL:http://www.theonion.com/onion3637/bush_horrified.html>, edited the layout to resemble CNN's format, and copied it to his own site <URL:http://salticus-peckhamae.mit.edu/evarady/www/top_story.htm>." He then circulated a false story about a hack of the CNN site and pointed people to < URL:http://www.cnn.com&story=breaking_news@18.69.0.44/evarady/www/top_story.htm>. It turns out that although this URL follows the correct syntax, anyone assuming that the Web page resides on "www.cnn.com" is being misled. The section between the "//" delimiter and the "@" sign is actually interpreted as a _user_ field and then discarded. The actual URL is therefore the part following the "@" sign and is therefore equivalent to < http://18.69.0.44/evarady/www/top_story.htm >. The numerical IP address is "salticus-peckhamae.mit.edu." Moral: any URL containing the "@" sign should be parsed carefully to find out where it is _really_ pointing. Warnock concluded, "The RISK is that users are being bombarded with these monstrosities so often that they've grown used to it, and that they'll fail to recognize when they're being sent someplace they might not really want to go!! (Perhaps when it's not a joke, such as being sent to a porn site while working at a company with a "no tolerance" policy.)"

2001-05-01 **vulnerability sequence number datagrams packets alert CERT/CC**

NIPC Daily Report

On 1 May, CERT/CC released Advisory CA-2001-09, Statistical Weaknesses in TCP/IP Initial Sequence regarding a new vulnerability (CERT VU#498440, CVE CAN-2001-0328) which is present when using random increments to constantly increase TCP ISN values over time. Attacks against TCP initial sequence number (ISN) generation have been discussed for some time now. The reality of such attacks led to the widespread use of pseudo-random number generators (PRNGs) to introduce some randomness when producing ISNs used in TCP connections. Previous implementation defects in PRNGs led to predictable ISNs despite some efforts to obscure them. The defects were fixed and thought sufficient to limit a remote attacker's ability to attempt ISN guessing. It has long been recognized that the ability to know or predict ISNs can lead to manipulation or spoofing of TCP connections. What was not previously illustrated was just how predictable one commonly used method of partially randomizing new connection ISNs is in some modernTCP/IP implementations. Additional information regarding this advisory can be found at
http://www.cert.org/advisories/CA-2001-09.html. (Source: CERT/CC, 1 May)

2003-01-16 **buffer overflow vulnerabilities Internet Software Consortium ISC BIND**

NIPC/DHS

January 16, CERT/CC — VU#284857: Buffer overflows in ISC DHCPD minires library.

During an internal source code audit, developers from the Internet Software Consortium (ISC) discovered several vulnerabilities in the error handling routines of the minires library, which is used by NSUPDATE to resolve hostnames. These vulnerabilities are stack-based buffer overflows that may be exploitable by sending a DHCP message containing a large hostname value. Note: Although the minires library is derived from the BIND 8 resolver library, these vulnerabilities do not affect any current versions of BIND. At this time, CERT is not aware of any exploits. The ISC has addressed these vulnerabilities in versions 3.0pl2 and 3.0.1RC11 of ISC DHCPD. More information may be found on the ISC Website:
http://www.isc.org/

Category 24.4 *TCP/IP & HTTP*

2003-07-16 **MS03-026 buffer overrun RPC remote procedure call interface code execution DCOM 135 changing viewing deleting data installing programs unauthorized**

NIPC/DHS

July 16, Microsoft — Microsoft Security Bulletin MS03-026: Buffer Overrun In RPC Interface Could Allow Code Execution.

Remote Procedure Call (RPC) is a protocol used by the Windows operating system which provides an inter-process communication mechanism that allows a program running on one computer to seamlessly execute code on a remote system. There is a vulnerability in the part of RPC that deals with message exchange over TCP/IP which results because of incorrect handling of malformed messages. This vulnerability affects a Distributed Component Object Model (DCOM) interface with RPC, which listens on TCP/IP port 135. This interface handles DCOM object activation requests that are sent by client machines to the server. To exploit this vulnerability, an attacker would need to send a specially formed request to the remote computer on port 135. If successful, an attacker could then run code with Local System privileges on an affected system and then be able to take any action on the system, including installing programs, viewing changing or deleting data, or creating new accounts with full privileges. Microsoft has assigned a risk rating of "Critical" to this issue and recommends that system administrators install the patch immediately.

2003-07-17 **flaw vulnerability Windows Cisco Microsoft routers**

NewsScan

YESTERDAY A MICROSOFT FLAW, TODAY A CISCO FLAW
Cisco, which makes communications routers and switches, has found a flaw in its software that could be used by network vandals to cause widespread outages; the company has released a free patch to fix the flaw in its Internetworking Operating System. No vandals have exploited the vulnerability up to this point, and Cisco says: "We literally have people working around the clock right now to get this situation taken care of." According to the company, the vulnerability could only be exploited by sending a "rare sequence" of data packets to a device running IOS, the equivalent of Windows for routers and switches. (AP/San Jose Mercury News 17 Jul 2003)

Category 24.4 *TCP/IP & HTTP*

2003-09-03 **MS03-034 NetBIOS information Disclosure BNBS NetBT Name Service UDP port 137 Internet Browser query**

NIPC/DHS

September 03, Microsoft — Microsoft Security Bulletin MS03-034: Flaw in NetBIOS Could Lead to Information Disclosure.

Under certain conditions, the response to a NetBT Name Service (NBNS) query may, in addition to the typical reply, contain random data from the target system's memory. This data could, for example, be a segment of HTML if the user on the target system was using an Internet browser, or it could contain other types of data that exist in memory at the time that the target system responds to the NBNS query. An attacker could seek to exploit this vulnerability by sending a NBNS query to the target system and then examine the response to see if it included any random data from that system's memory. If best security practices have been followed and port 137 UDP has been blocked at the firewall, Internet based attacks would not be possible. Microsoft has assigned a risk rating of "Low" to this vulnerability and a patch is available on the Microsoft website.

2003-12-11 **Moonv6 Internet Protocol IPv6 security testing network**

NIPC/DHS

December 09, Government Computer News — Moonv6 testing to continue.

Initial ten-day testing in October on the nation's largest native IPv6 network by the Department of Defense (DoD) and the University of New Hampshire demonstrated IPv6 linkage of academic and military sites from New Hampshire to San Diego. Time was short, and there was a dearth of applications written for the new Internet Protocol. "We had a limited number of vendor implementations to work with," said Ben Schultz, managing engineer of the University of New Hampshire's interoperability laboratory. Opportunities to test security also were limited, he said Tuesday, December 9, at the U.S. IPv6 Summit in Arlington, VA. Under those constraints, the File Transfer Protocol, Hypertext Transfer Protocol, Secure HTTP, Telnet and Domain Name System applications worked, Schultz said. The Moonv6 test bed is a collaboration by JITC, the university lab and the North American IPv6 Task Force. The second phase of testing, scheduled to run from February 2 to April 14, will dig deeper into security, mobility and routing protocol testing, as well as network stability and management, JITC's Major Roswell Dixon said.

Category 24.4 *TCP/IP & HTTP*

2003-12-11 **Internet Protocol IPv6 security implementation IPSec**

NIPC/DHS

December 10, Government Computer News — IPv6 will need security, too, experts warn.

Security has been one of the selling points for the new Internet protocol, but IPv6 is not inherently secure, say those planning its implementation. The Internet Engineering Task Force is still working on IPv6 security elements and "many of them need to be tested in the real world," security consultant Richard Graveman said Wednesday, December 10, at the U.S. IPv6 Summit in Arlington, VA. One of the key security elements in IPv6 is IPSec encryption, which is mandatory in the new protocol. But security is more than IPSec, Graveman said. "Downloading an encrypted virus and installing it is just as bad as downloading an unencrypted virus," he said. Good encryption will not stop hackers either, he said. "You don't break good crypto, you go around it," he said, so proper implementation of IPv6 and a secure platform still are key to securing networks. Latief Ladid, president of the IPv6 Forum, said warned that hackers already are studying the new protocols and are uncovering security flaws.

2004-01-14 **Microsoft security bulletin patch flaw vulnerability fix Exchange Server http**

DHS/IAIP Update

MICROSOFT SECURITY BULLETIN MS04-002: VULNERABILITY IN EXCHANGE SERVER 2003 COULD LEAD TO PRIVILEGE ESCALATION.

A vulnerability exists in the way that Hypertext Transfer Protocol (HTTP) connections are reused when NTLM authentication is used between front-end Exchange 2003 servers providing Outlook Web Access (OWA) and, OWA on Windows 2000 and Windows Server 2003, and when using back-end Exchange 2003 servers that are running Windows Server 2003. Users who access their mailboxes through an Exchange 2003 front-end server and OWA might get connected to another user's mailbox if that other mailbox is (1) hosted on the same back-end mailbox server and (2) if that mailbox has been recently accessed by its owner. Attackers seeking to exploit this vulnerability could not predict which mailbox they might become connected to. The vulnerability causes random and unreliable access to mailboxes and is specifically limited to mailboxes that have recently been accessed through OWA. This vulnerability is exposed if the Website that is running the Exchange Server 2003 programs on the Exchange back-end server has been configured not to negotiate Kerberos authentication, causing OWA to fall back to using NTLM authentication. The only known way that this vulnerability can be exposed is by a change in the default configuration of Internet Information Services 6.0 on the Exchange back-end server. Microsoft has assigned a severity rating of "Moderate" to this issue.

2004-03-22 **security vulnerability flaw hole patch fix exploit open source Apache Web server HTTP**

DHS IAIP Daily;

March 19, eWEEK — Security holes uncovered in Apache.

Security researchers on Friday, March 19, uncovered a vulnerability in the open-source Apache Web server software that could easily enable a denial of services attack. The Apache problem is one of several reported in Version 2.0.48, and lets an attacker open a short-lived connection on a particular, rarely accessed listening socket. The software will block out all other connections until another connection comes in on the same socket. The Apache Software Foundation released update to its HTTP Server software that fixed the problem as well as several others:
http://www.apacheweek.com/redirect.cgi?link=http://www.apache.org/

2004-04-20 **TCP Transmission Control Protocol design flaw disrupt Internet router**

NewsScan

SERIOUS FLAW IN TCP FOUND

Computer security experts in the U.S. and Britain have identified an inherent design flaw in the transmission control protocol (TCP) that could make it easy for hackers to disrupt Internet activities worldwide. Paul Watson, the security researcher who sounded the alarm over the flaw, warns it could be used to disable Internet routers -- the complex machines that direct most Internet traffic -- by tricking them into resetting themselves. Apparently, security experts have known for years about the basic vulnerability, but discounted its threat because attackers would have to successfully guess several specific sets of information in order to exploit it -- something that many thought would take several years using powerful computers. Watson appears to have discovered a shortcut that makes it possible to complete that task in just a few minutes. U.S. Homeland Security cybersecurity director Amit Yoran says despite the seriousness of the problem, most of the world's major Internet service providers have already quietly taken steps to protect themselves: "It's important to note that this is a significant discovery, but it's also important to provide a fair degree of assurance that the sky is not falling." (Washington Post 20 Apr 2004)

2004-04-20 **Internet security flaw fix experters disrupt communications routers TCP/IP protocol**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A27890−2004Apr 20.html

April 20, Washington Post — Experts race to fix serious Internet flaw.

Computer security experts in the U.S. and UK confirmed Tuesday, April 20, that a new method has been identified that could make it easy for hackers to disrupt Internet communications worldwide. The exploit, identified by Milwaukee security researcher Paul Watson, could give hackers the ability to crash Internet routers--the complex machines that direct most of the world's Web traffic. Watson's method takes advantage of an inherent design flaw in transmission control protocol (TCP)--the language that all computers use to communicate on the Internet--that could place ordinary computers at greater risk of attack. Watson is slated to present his findings at a security conference in Canada later this week. Amit Yoran, director of the cybersecurity division for the Department of Homeland Security, said most of the world's major Internet service providers had already taken steps to prevent the attack. Additional information is availabe in "Technical Cyber Security Alert TA04-111A: Vulnerabilities in TCP," available on the U.S. Computer Emergency Readiness Team Website: http://www.us-cert.gov/cas/techalerts/TA04-111A.html. The UK's National Infrastructure Security and Coordination Center has posted a vulnerability notice here: http://www.uniras.gov.uk/vuls/2004/236929/index.htm

2004-04-21 **TCP injection vulnerability Border Gateway Protocol Initial Sequence Number DoS routers**

http://searchsecurity.techtarget.com/originalContent/0,289142,sid14_gci960715,00.html?track=NL-102&ad=480263

In April 2004, the technical press responded strongly to notices of some fundamental flaws in the TCP/IP suite.
* The "TCP Injection Vulnerability" could work with a problem in the Border Gateway Protocol to allow remote termination of network sessions, potentially leading to denial of service.

* The "TCP/IP Initial Sequence Number Vulnerability" could permit data corruption, session hijacking and denial of service.<

Internet Security Systems (ISS) stated that "network infrastructure providers and enterprises' internal networks …[are] the most vulnerable to potential denial-of-service/distributed denial-of-service attacks that can cause significant outages and downtime to users and customers."

Shawna McAlearney, writing for SearchSecurity.com, summarized recommendations as follows: "Experts recommend immediately applying patches issued by affected vendors. Workarounds include: ingress and egress filtering; prohibiting externally initiated inbound connections to non-authorized services and preventing machines providing public services from initiating outbound connections to the Internet; deploying and using cryptographically secure protocols, such as IPSec; and network isolation."

2004-07-31 **domain name service DNS vulnerability Defcon 12 presentation intellectual property theft**

DHS IAIP Daily; http://news.com.com/Internet%27s+%27white+pages%27+allow+data+attacks/2100−1002_3−5291874.html?tag=nefd.hed

July 31, CNET News.com — Internet's 'white pages' allow data attacks.

The same technology that allows Web surfers to locate and connect to computers on the Internet can be used to create covert communications channels, bypass security measures and store distributed content, a security researcher said at the Defcon hacking conference in Las Vegas, NV, Saturday, July 31. The security hack essentially uses data transferred by domain name service (DNS) servers to hide additional information in the network communications. DNS servers act as the white pages of the Internet, invisibly transforming easy-to-remember domain names into the numerical network addresses used by computers. Moreover, corporate security measures, such as firewalls, tend to ignore DNS data because they assume it's harmless, said Dan Kaminsky, a security researcher for telecommunications firm Avaya said. That flaw in most companies' network security leaves a vulnerability that can be used by hackers to sneak intellectual property outside a company, communicate with a compromised server inside the company, or gain free access to many wireless and Internet services found in coffee houses and hotels, he said.

2004-08-11 **IBM Tivola vulnerability http response splitting input validation patch issued**

DHS IAIP Daily; http://www.zone−h.org/advisories/read/id=5254

August 11, zone-h — IBM Tivoli Access Manager HTTP response splitting vulnerability.

A vulnerability has been discovered in IBM Tivoli Access Manager for e-business, which can be exploited by malicious people to conduct cross-site scripting attacks. The vulnerability is caused due to insufficient input validation and can be exploited to inject malicious characters into HTTP headers. This may allow execution of arbitrary HTML and script code in a user's browser session associated with an affected site. According to the vendor, successful exploitation may allow people to gain access and control over an affected system. A patch is available from the vendor.

2004-10-07 **Internet Protocol IP v6 security protocol adoption interest Internet**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/27552−1.html

October 07, Government Computer News — Market for IPv6 security is starting to grow.

Internet Protocol Version 6 (IPv6) is still in the early adoption phase, but commercial demand for tools to secure IPv6 networks is beginning to grow, according to one vendor. The Defense Department, which has committed to moving its networks to IPv6 by fiscal 2008, is the largest government customer for the security products. IPv6 provides improved security, increased IP address space and greater authentication capabilities to the Internet. Jim Bound, chairman of the North American IPv6 Task Force, said Japan now is the only country with a production IPv6 Internet backbone. Other networks, such as the Moonv6 test bed in the United States, are in pilot phases.

2005-04-13 **Internet Protocol IP Control Message Protocol ICMP flaw attack router Internet software UK short term denial of service DoS**

DHS IAIP Daily;
http://www.infoworld.com/article/05/04/13/HNipflaw_1.html?SE CURITY

IP FLAW COULD ALLOW ATTACKS ON ROUTERS AND INTERNET SOFTWARE

The UK's National Infrastructure Co-Ordination Center (NISCC) has warned of a flaw in Internet Protocol (IP) that could allow significant attacks on a wide range of products, including routers and Internet software from Microsoft, Cisco Systems, IBM, Juniper Networks, and others. While the flaw in ICMP, IP's control protocol, will be only moderately critical for some vendors' products, in others it could allow a denial-of-service attack with medium-term effects, effectively putting the system out of commission for a significant period of time while it is reset, the NISCC said in an advisory. In other products, attacks could merely slow down traffic or result in short-term denial-of-service. "Most vendors include support for this protocol in their products and may be impacted to varying degrees," the agency said in its advisory. NISCC Advisory:
http://www.niscc.gov.uk/niscc/docs/al-20050412-00308.html?la ng=en

2005-04-14 **Transmission Control Protocol TCP sequence number approximation vulnerability reset session update issued**

DHS IAIP Daily; http://www.securityfocus.com/bid/10183/info/

MULTIPLE VENDOR TCP SEQUENCE NUMBER APPROXIMATION VULNERABILITY

A vulnerability in TCP implementations has been reported that may permit unauthorized remote users to reset TCP sessions. This issue affects products released by multiple vendors. This issue may permit TCP sequence numbers to be more easily approximated by remote attackers. Vendor advisories and solutions through Source link.

Category 24.4 *TCP/IP & HTTP*

2005-05-09 **Internet Protocol Security IPSec information disclosure vulnerability**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/0507

IPSEC ESP CONFIGURATIONS INFORMATION DISCLOSURE VULNERABILITY

Three vulnerabilities were identified in certain configurations of IPSec, which may be exploited by attackers to disclose sensitive information. These attacks are possible when IPSec uses Encapsulating Security Payload (ESP) in tunnel mode with confidentiality only, or with integrity protection being provided by AH or a higher layer protocol. A remote attacker that is able to intercept and modify IPSec and ICMP communications between security gateways, could exploit this vulnerability and perform "Destination Address Rewriting", "IP Options modification", and "Protocol Field modification" attacks, which will cause the plaintext version of the IPsec communications between the protocols to be disclosed. See Source link for suggested workarounds.

Category 24.4 *TCP/IP & HTTP*

2005-05-17 **Internet Protocol IPv6 TCP IP LAN denial of service DoS Microsoft vulnerability**

DHS IAIP Daily; http://www.securityfocus.com/bid/13658/info/

MICROSOFT IPV6 TCPIP LOOPBACK LAND DENIAL OF SERVICE VULNERABILITY

The Microsoft Windows IPV6 TCP/IP stack is prone to a "loopback" condition initiated by sending a TCP packet with the "SYN" flag set and the source address and port spoofed to equal the destination source and port. When a packet of this type is handled, an infinite loop is initiated and the affected system halts. A remote attacker may exploit this issue to deny service for legitimate users. There is no solution at this time.

Category 24.4 *TCP/IP & HTTP*

2005-07-27 **IPSec Incorrection networking AES XCBC MAC algorithm encryption forge packets disclosure privilege**

DHS IAIP Daily; http://www.zone−h.org/advisories/read/id=7851

IPSEC INCORRECT KEY USAGE IN AES-XCBC-MAC

IPsec is a security protocol for the Internet Protocol networking layer. It provides a combination of encryption and authentication of system, using several possible cryptography algorithms. A programming error in the implementation of the AES-XCBC-MAC algorithm for authentication resulted in a constant key being used instead of the key specified by the system administrator. If the 10 AES-XCBC-MAC algorithm is used for authentication in the absence of any encryption, then an attacker may be able to forge packets which appear to originate from a different system and thereby succeed in establishing an IPsec session. If access to sensitive information or systems is controlled based on the identity of the source system, this may result in information disclosure or privilege escalation.

2005-08-03 **domain name system DNS services WWW Internet vulnerable cache poisoning**

EDUPAGE; http://news.com.com/2100-7349_3-5816061.html

RESEARCHER SAYS DNS SERVERS VULNERABLE

In a presentation at the Black Hat conference last week, security researcher Dan Kaminsky argued that domain name system (DNS) servers represent a broad vulnerability in the Internet. Kaminsky said that of 2.5 million DNS servers he tested, nearly 10 percent could be susceptible to so-called DNS cache poisoning. In total, about 9 million DNS servers are operating globally. DNS servers translate typed URLs into numbers necessary to locate Web sites. In cache poisoning, legitimate numeric Web addresses are replaced, causing users to be redirected to sites of the hacker's choosing. Often, users are sent to Web sites that install malware or that deceive users into disclosing personal information, which can then be used in identity theft. Incidents of cache poisoning have disrupted Internet service in the past, including this March, when users trying to access CNN.com and MSN.com were sent to sites that installed spyware. Security experts advise operators of DNS servers to audit their machines and make sure they configure them in the safest manner possible.

2006-01-02 **cross-site scripting command execution vulnerability Nortel SSL VPN**

DHS IAIP Daily; 23
http://www.securiteam.com/windowsntfocus/5GP060KHFE.html

NORTEL SSL VPN CROSS-SITE SCRIPTING AND COMMAND EXECUTION

The Nortel SSL VPN is a remote access security solution. By using secure sockets layer (SSL) as the underlying security protocol, Nortel SSL VPN allows for using the Internet for remote connectivity and the ubiquitous Web browser as the primary client interface. Due to insufficient input validation within the Web interface of Nortel's SSL VPN appliance, it is possible to hide commands in links to certain pages of the Web interface. As the Java Applet which is called from those Web pages is cryptographically signed, it may execute operating system commands with the privileges of the user sitting in front of the browser. An attacker can thus supply a victim with malicious link where remote commands are hidden. If the victim clicks on the link and logs onto the SSL VPN Web interface (where it is automatically taken), arbitrary commands are executed locally on the client of the victim.

2006-01-09 **Internet Protocol IPv6 technology upgrade US government DoD OMB**

DHS IAIP Daily; 23
http://www.compliancepipeline.com/news/175803121;jsessionid=
AYA3DIDAR5V2OQSNDBECKHSCJUMEKJVN

IPV6: WORLD'S LARGEST TECHNOLOGY UPGRADE ON DECK

Bugs, spam, viruses, software security issues, quality of service and more have spurred experts to push for commercial deployment and government reform on Internet Protocol version 6 (IPv6). A panel battled the topic of when companies should deploy IPv6 and where the technology will make the greatest impact. The discussion took place at the 2006 International Consumer Electronics show in Las Vegas, NV, last week. In the end, the four panelists agreed to disagree. IPv6, the latest version of Internet Protocol, provides more IP addresses than today's version 4. It supports auto-configuration to help correct most shortcomings in the current version, and has security, quality of service, digital rights management and mobile communications features. The debate has heated up in the U.S. now that Asian countries are mandating adoption where IP addresses are in short supply. The U.S. government and the Department of Defense, two of IPv6's strongest proponents, are estimated to spend billions to make the transition happen. The White House Office of Management and Budget has directed U.S. federal agencies to develop IPv6 transition plans by February and requires that agencies comply with the mandate by June 2008.

Category 24.4 *TCP/IP & HTTP*

2006-04-06 **Cisco Optical Networking System multiple vulnerabilities denial-of-service DoS**

DHS IAIP Daily; http://secunia.com/advisories/19553/ 23

CISCO OPTICAL NETWORKING SYSTEM 15000 SERIES MULTIPLE VULNERABILITIES.

Some vulnerabilities have been reported in Cisco Optical Networking System 15000 Series, which can be exploited by malicious people to cause a denial-of-service (DoS) or compromise a vulnerable management system. Multiple services are vulnerable to ACK DoS attacks where an invalid response is sent instead of the final ACK packet during the 3-way handshake. This can be exploited to cause the control cards to exhaust memory resources, not respond to further connections, or reset by establishing multiple of these connections. Successful exploitation requires that IP is configured on the LAN interface (enabled by default). For more information please see source advisory. Solution: Updated versions are available -- see patch matrix in vendor advisory: http://www.cisco.com/warp/public/707/cisco-sa-20060405-ons.s html Also update to Cisco Transport Controller version 4.1.0 or later.

2006-05-09 **Sun Solaris IPSec IKE processing bug remote denial-of-service DoS vulnerability solution update**

DHS IAIP Daily; http://securitytracker.com/alerts/2006/May/1016043.html 23

SUN SOLARIS LIBIKE IPSEC IKE PROCESSING BUG LETS REMOTE USERS DENY SERVICE.

A vulnerability was reported in the 'in.iked' daemon on Sun Solaris. A remote user can cause denial-of-service conditions. Analysis: The 'libike' library does not properly process certain Internet Key Exchange (IKE) packets. A remote user can send specially crafted packets to the target system to cause the in.iked(1M) daemon to crash or to potentially send invalid data to a peer system, which may in turn cause the peer system's in.iked daemon to crash. Solution: Sun has issued the following fixes: SPARC Platform: Solaris 9 with patch 113451-11 or later; Solaris 10 with patch 118371-07 or later. x86 Platform: Solaris 9 with patch 114435-10 or later; Solaris 10 with patch 118372-07 or later. Sun advisory: http://sunsolve.sun.com/search/document.do?assetkey=1-26-102 246-1

2001-10-15 **wireless networks wired LANs cache poisoning vulnerability penetration hacker**

RISKS 21 69

Gary McGraw summarized a new class of wireless attacks in RISKS:

Bob Fleck, a security consultant at Cigital, working with Jordan Dimov, has discovered new class of wireless attacks that can be used to gain unauthorized access to normally-protected machines on a standard wire-based internal network. Wireless networks involve installation of a wireless Access Point on a normal internal network. This Access Point is usually connected to the wired network through a switch or a hub. The attacks discovered by Cigital are based on an adaptation of a well understood network attack from the non-wireless world known as ARP cache poisoning. This emphasizes the importance of re-considering old risks in light of new technologies, something that is especially important in software-based systems!

The new class of attacks encompasses: 1) the ability to monitor and manipulate traffic between two wired hosts behind a firewall 2) the ability to monitor and manipulate traffic between a wired host and a wireless host 3) the ability to compromise roaming wireless clients attached to different Access Points 4) the ability to monitor and manipulate traffic between two wireless clients

Previous wireless attacks have demonstrated that wireless traffic on an 802.11b network is vulnerable to monitoring and manipulation, even when it is "protected" with WEP encryption. This new class of attacks discovered by Cigital is based on abusing the Address Resolution Protocol (ARP) which binds internal IP addresses to ethernet addresses.

Mitigating the risks of these attacks is possible. The best fix involves placing a technical barrier between the wireless network and the normal wired network. This provides only a partial solution that leaves the wireless network in a compromised state, though it protects against the worst of the attack class Cigital discovered. Further risks can be mitigated through advanced design of any and all software applications that make use of the wireless network.

For more, see:
http://www.cigital.com/news/wireless-sec.html
http://www.cigital.com/news/wireless/faq.html

Category 24.5 *LAN OS*

2003-01-09 **protocol vulnerability note CERT IEE 802.3 Ethernet information leakage**

NIPC/DHS

January 06, CERT/CC — CERT Vulnerability Note VU#412115: "Network device drivers reuse old frame buffer data to pad packets".

The Ethernet standard (IEEE 802.3) specifies a minimum data field size of 46 bytes. If a higher layer protocol such as IP provides packet data that is smaller than 46 bytes, the device driver must fill the remainder of the data field with a "pad". For IP datagrams, RFC1042 specifies that "the data field should be padded (with octets of zero) to meet the IEEE 802 minimum frame size requirements." Researchers from @stake Inc., a digital security company in Cambridge, Mass, have discovered that, contrary to the recommendations of RFC1042, many Ethernet device drivers fail to pad frames with null bytes. Instead, these device drivers reuse previously transmitted frame data to pad frames smaller than 46 bytes. This constitutes an information leakage vulnerability that may allow remote attackers to harvest potentially sensitive information. Depending upon the implementation of an affected device driver, the leaked information may originate from dynamic kernel memory, from static system memory allocated to the device driver, or from a hardware buffer located on the network interface card.

Category 24.5 *LAN OS*

2003-06-13 **windows 2003 server third-party device drivers TCP transmissions Chris Taget NGS data leakage**

NIPC/DHS

June 13, vnunet — Flaws expose Win Server 2003.

Several third-party device drivers that ship with Windows Server 2003 contain a vulnerability that causes them to leak potentially sensitive data during TCP transmissions. Security experts have criticized many of the vendors for failing to act quickly enough to guide users to fixes, and warned that the flaw could lead to attacks through local area networks (LANS). The so-called Etherleak flaw, first identified in January, occurs when messages transmitted between two machines are padded with arbitrary data in order to bring their byte size in line with the accepted standard. Chris Taget of security consultancy NGS Software warned that the vulnerability could be extremely serious and suggested that "IT directors should find out whether their vendors have updated the driver to resolve the issue."

2004-08-09 **RSA Cfengine daemon vulnerability network administration tool fix patch issued**

DHS IAIP Daily;
http://www.coresecurity.com/common/showdoc.php?idx=387&idxse ccion=10

August 09, Core Security Technologies — Cfengine RSA authentication heap corruption.

Cfengine, the configuration engine, is a very high level language for simplifying the task of administrating and configuring large numbers of workstations. Two vulnerabilities were found in cfservd, a daemon which acts as both a file server and a remote cfagent executor. This daemon authenticates requests from the network and processes them. If exploited, the first vulnerability allows an attacker to execute arbitrary code with those privileges of root. The second vulnerability allows an attacker to crash the server, denying service to further requests. Cfservd uses an IP based access control (AllowConnectionsFrom) which must be passed before the vulnerabilities can be exploited. The level of risk thus depends on how this access control is configured. These vulnerabilities are present in versions 2.0.0 to 2.1.7p1 of cfservd. Release 2.1.8 which fixes these vulnerabilities is available from http://www.cfengine.org.

2004-12-06 **Novell NetMail network messaging application protocol NMAP authentication failure**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2004/Dec/1012429.html

December 06, SecurityTracker — Novell NetMail default authentication credentials lets remote user access the mail store.

Novell reported that if the default Network Messaging Application Protocol (NMAP) authentication credentials have not been changed after installation, a remote user can connect to port 689 to gain access to the mail store. A remote user can also send unauthorized messages to other local or remote users. The default NMAP authentication credential is set automatically during installation but should be changed after installation using the nmapcred utility. As a solution, Novell indicates that you should use the NMAP Server Credential Generator (nmapcred) to set a unique NMAP authentication credential. Category 24.5 *LAN OS*

2005-01-26 **Cisco Internetwork Operating System IOS reload vulnerability denial of service DoS update issued**

DHS IAIP Daily; http://www.us−cert.gov/cas/techalerts/TA05−026A.html

MULTIPLE DENIAL-OF-SERVICE VULNERABILITIES IN CISCO IOS

Several denial-of-service vulnerabilities have been discovered in Cisco's Internet Operating System (IOS). A remote attacker may be able to cause an affected device to reload the operating system. Although the underlying causes of these three vulnerabilities is different, in each case a remote attacker could cause an affected device to reload the operating system. This creates a denial-of-service condition since packets are not forwarded through the affected device while it is reloading. Repeated exploitation of these vulnerabilites would result in a sustained denial-of-service condition. Since devices running IOS may transit traffic for a number of other networks, the secondary impacts of a denial of service may be severe. Cisco has updated versions of its IOS software to address these vulnerabilities. Additional information is available on the US-CERT Website.

2001-04-03 **802.11 wireless local area networks bug flaw vulnerability eavesdropping spoofing man-in-the-middle attack**

NewsScan

FLAW IN STANDARD FOR LOCAL WIRELESS NETWORKS
Computer science researchers at the University of Maryland have found new security flaws in the 802.11 wireless standard used in many local area wireless networks deployed in corporations and in public areas such as airports and cafes. Researchers from Intel and the University of California at Berkeley had previously found weaknesses in the standard. William A. Arbaugh, in the Maryland group, said: "We're seeing a great proliferation of wireless activity now in products, and people have not paid close enough attention to security issues. When we began looking at this I was flabbergasted by what I found." The newly discovered flaw might be used by someone physically close to private wireless computer network to masquerade as a legitimate user. (New York Times 3 Apr 2001)

Category 24.6 *WAP, WEP, Wi-Fi, Bluetooth, 802.11, WiMax*

2001-05-03 **wireless network interception intrusion spam penetration e-mail**

RISKS 21 39

Thor Lancelot Simon commented on a bad implementation of wireless network access in a report in RISKS:

>A local university has deployed a large 802.11 wireless network without WEP or any other security measure. Given the complexity of distributing WEP keys to huge numbers of students, faculty, and staff, not to mention the need for periodic changes, and the notorious insecurity of WEP itself, this might seem to be a reasonable choice. They have decided to provide public access to their IP connectivity for those within radio range of their campus rather than tackle the very significant issues associated with restricting access.

The RISK? Their campus mail-handling machines will relay mail to any inside or outside destination if it's received from an address "inside" their campus network. The network architecture they've chosen for their wireless deployment dictates that anyone can walk onto their (large, urban) campus, or even just park his car outside, and spam away freely with hundreds of megabits per second of bandwidth to most points on the Internet.

Basically, their entire campus just became a "safe harbor" for anyone owning a laptop and wireless card to do nefarious things to outside hosts with, essentially, perfect, impenetrable anonymity. There's not even a billing record for a throwaway dialup account to trace back; just a MAC address that can be trivially changed and the knowledge that it was used *somewhere* on their campus to do Bad Things at some point in the past.<

In a followup posting to RISKS, Danny Burstein confirmed by direct experimentation that fears of abuse were perfectly justified. Burstein wrote, "Furthermore, any mail coming through them will have an envelope indicating it came from a well known and trusted source. Meaning not only would people be more likely to let it through their filters (whether computerized or the Mark One Eyeball method of glancing at the 'from' and 'subject' line), but they're also far more likely to open it."

In addition, wrote Burstein, "Getting back to spamming: this system doesn't block outgoing 'port 25' access, meaning a spammer could set up their own mail server and pseudo-anonymously engage in all sorts of socially deviant activities."

WIRELESS INTERNET SPARKS SECURITY CONCERNS
Business travelers plugging into wireless Wi-Fi networks now found in airports and coffee shops should beware -- those networks can easily be intercepted, according to security experts. "When you sit in an airport and use your laptop you might as well be broadcasting to anyone within listening distance," says a digital forensics specialist with Predictive Systems. No special software is required to intercept data off a Wi-Fi network, and eavesdropping on other's e-mail exchanges is easy to do, says one security expert. "Everyone who is touching the Internet should know that it is wide open to everyone," says MobileStar chief technology officer Ali Tabassi. "People should think of it as a pay phone or a cell phone, in a public place." (AP 12 Aug 2001)

DRIVE-BY HACKING
An experiment conducted by BBC Online found that the "wifi" (wireless) computer networks in London's financial center have serious security gaps that would allow network vandals to drive, pedal a bike, or walk through the streets and pick up information from the networks almost at will. The problem will only be solved when companies take security seriously and protect wireless networks behind a firewall that allows only encrypted, authenticated traffic to pass from a wifi network to a wider corporate network. RISKS, http://www.pcworld.com/news/article/0,aid,84424,00.asp 21 92

Prof. William Arbaugh and graduate student Arunesh Mishra of the University of Maryland published a paper entitled, "An Initial Security Analysis of the IEEE 802.1X Standard" in which they demonstrated specific methods of session hijacking in the Wi-Fi protocol. Hijacking involves monitoring the authentication process and then sending a forged "disassociate" message apparently from the access point. The attacker then continues using the established session while the original user simply assumes there's been a communications error and establishes a new connection.

2002-04-01 **satellite radio wireless communications interference jamming Wi-Fi frequencies**

NewsScan

SATELLITE RADIO OPERATORS COMPLAIN ABOUT WI-FI INTERFERENCE
XM Satellite Radio and Sirius Satellite Radio have petitioned the FCC to regulate Wi-Fi technology more closely, threatening to stymie innovation in the nascent wireless technology market. The satellite radio broadcasters say that even though Wi-Fi operates on a different frequency, the frequencies are so close that it's possible for energy to leak over from Wi-Fi devices and interfere with their services. They're asking the FCC to set limits on the services, although they say they're not trying to shut them down. "I think wireless devices are going to blossom," says Sirius co-founder Robert Briskman, who says Wi-Fi device manufacturers could alleviate the problem by installing filters and making other changes to wireless transmitters. Wi-Fi advocates say their systems comply with current FCC rules and that if the satellite radio folks are worried about interference, they should tinker with their own systems. Meanwhile, FCC Chairman Michael Powell is keeping mum on the satellite proposals, but has cautioned that heavy usage of Wi-Fi and other devices that use unlicensed frequencies could eventually cause a "meltdown." (Wall Street Journal 1 Apr 2002)

EARTHLINK TO OFFER WI-FI SERVICE
EarthLink is marketing its "EarthLink Wireless High Speed" service to customers eager to take advantage of about 650 Wi-Fi networks in coffee shops, hotels, airports and other public spaces throughout the country. The deal makes EarthLink among the first traditional ISPs to sell services based on the Wi-Fi wireless networking standard. Analysts say many ISPs are interested in selling Wi-Fi services, but have been waiting on the sidelines for heavyweights, like EarthLink or AOL, to make the first move. "This is what people have been waiting for: stronger backing by service providers," says an analyst with Synergy Research Group. EarthLink's service is offered in conjunction with Wi-Fi networking firm Boingo Wireless, a startup headed by EarthLink founder Sky Dayton. EarthLink customers will use Boingo's networks, and have the option of buying access in 24-hour chunks, during which they can log on and off as many times as they choose. A single "day pass" costs $8, or customers may purchase a package of 10 "day connects" for $25. (CNet News.com 11 Jun 2002)

IS WI-FI THE FUTURE OF TELECOM?
Working with Athens, Georgia, to develop a wireless communications "cloud" over the city's downtown, Scott Shamp, the director of the University of Georgia's New Media Institute, says: "We're designing a sandbox. We want a place where people can experiment... This feels like the Internet from 1994." Will Wireless Fidelity (or WiFi) networks, based on the technical standard 802.11b, provide competition for the large telecom companies? Not just yet, but experts such as MIT Media Laboratory director Nicholas Negroponte recently told a Congressional committee that the telecom industry may not recover its former market value, because in the future "we're going to use telecommunications very differently." Wireless clouds can support a new generation of technology, including always-on portable digital devices and environmental sensors. The hope of WiFi enthusiasts is that the low-cost, grass-roots technology will grow "organically" into a nationwide communications system. (AP/San Jose Mercury News 12 Aug 2002)

WI-FI FANS WANT TO ROAM
The popularity of Wi-Fi — the wireless networking technology that broadcasts an Internet connection over a radius of 300 feet — is spawning efforts to expand the service so that customers of one wireless provider could use the network of another. The barrier lies not in the technology, but in the billing technicalities. "The bits, the bytes and the hardware exist for roaming. We just need someone to start pulling it all together," says Barry Davis, Intel's director of platform architecture. And while a technical standard isn't required to create roaming capability, there is industry pressure on the IEEE (Institute of Electrical and Electronic Engineers) and the ETSI (European Telephone Standards Institute) to agree one, because it would cut costs and help jumpstart the development of future Wi-Fi technology. Meanwhile, some Wi-Fi carriers are teaming up on their own: Boingo Wireless, the second-largest U.S. carrier, has already established roaming agreements with two other wireless providers and is looking for more. In Europe, a number of companies, including Swiss carrier Monzune, are testing Wi-Fi roaming, and in Japan, Multimedia Mobile Access Communication Systems has created its own wireless roaming standard. "The Asian market is getting faster adoption, and the Europeans are next in line," says John Baker, CEO of Transat, which makes software that enables Wi-Fi roaming. (CNet News.com 10 Sep 2002)

WIRELESS BROADBAND MAKES SPLASH
A new wireless Internet service provider is offering its customers speeds up to 20 times faster than typical dialup services using the CDMA20001xEV-DO standard. By November, Monet Mobile Networks plans to offer its Monet Broadband service in cities in North Dakota, South Dakota and Wisconsin. EV-DO, as it's nicknamed, offers downloads at speeds up to 2.4Mbps, and leading wireless carriers Verizon Wireless and Sprint PCS may be considering building EV-DO networks by 2005. Both companies now use the CDMA standard, which is adaptable to the faster version. Verizon says it is already testing EV-DO networks in San Diego and Washington, DC. Meanwhile, Monet plans to focus its business strategy on bringing broadband Internet access to rural areas, which typically are underserved. "We've received tremendous welcome by these communities which have been overlooked by most of the technology sector," says a Monet spokesman. For $40 a month, Monet subscribers get unlimited Web access, three e-mail addresses and 5MB of data storage. An alternative plan offers five accounts and 25MB of storage for $60 a month. THE FUTURE OF COMPUTING WILL BE INVISIBLE
Computing power will be easier to harness as it pervades every corner of our lives, and at the same time will be increasingly transparent, according to an annual technology forecast from PriceWaterhouseCoopers. The proliferation of printable, low-power, short-range radio ID tags will imbue many formerly dumb household appliances with "smart" computing power. Alongside these developments will go efforts to hide the difficulties of tying these devices together and managing large numbers of networked computers, phones or gadgets. "Users do not want to see that complexity," says PWC analyst Kevin Findlay. Meanwhile, businesses will discover the power of in-house grid computing, which from time to time could give a pharmaceutical firm, for instance, the processing power of a supercomputer, just by linking their own idle desktop machines. Findlay also noted that companies likely will move toward renting data storage as they need it, rather than buying it and having it sit idle. (BBC News 13 Nov 2002)

2003-01-09 **wireless Internet LAN networking WiFi Denver airport tested secured**

NIPC/DHS

January 06, Computerworld — American Airlines secures wireless LANs in Denver.

Last January it was discovered that the wireless local area networks (LANs) American Airlines Inc. had been operating at their Denver International Airport (DIA) terminal were highly vulnerable to hackers. White Hat Technologies Inc., a Colorado-based security firm, found they had been operating without any encryption and had even pasted the IP addresses of curbside terminals on the monitors. A test at DIA on December 20 by White Hat was unable to detect a single airline wireless network operating without encryption protection, said Thubten Comerford, CEO of White Hat. In addition, American had not only removed the IP addresses from its OneStop self-service kiosks, but it had also added Cisco Systems Inc.'s Lightweight Extensible Authentication Protocol (LEAP) authentication technology on top of the standard 40-bit Wired Equivalent Privacy (WEP) encryption. LEAP is an authentication algorithm that leverages the 802.1x framework and provides dynamic, per-user WEP keys to protect data in transit. On the downside, Comerford said the recent test of the DIA facility still managed to pick up a suspected rogue access point (AP), as well as a significant number of vulnerable wireless transmissions emanating from public traveler lounges and frequent-flier clubs throughout the airport. "The biggest danger at DIA is the sniffing of sensitive information being transmitted by travelers. Few, if any, airports have addressed this security vulnerability, [and] few airports or airlines warn travelers of the danger of using the wireless networks," Comerford said.

2003-01-15 **wireless WiFi technology security implications concerns**

NIPC/DHS

January 14, Government Computer News — Spread of handheld devices raises security questions.

Wireless security is a major concern for agencies that deal with ever-more tech-savvy employees bringing to work handheld devices that don't mesh with federal security guidelines, said CDW Government Inc. president James R. Shanks. As agencies are working to bolster network security, the proliferation of wireless devices is raising new security challenges, said Shanks. The potential mobilization of military troops for a war with Iraq is "adding fuel to the fire," Shanks said. Meanwhile, agencies also are working to merge a vast range of applications for use on wireless devices and figure out how to manage the applications from central servers. Some companies that develop wireless software have met with standards writers to better align their products to meet federal and commercial security needs, said Larry S. Kirsch, senior vice president of CDWG. And a few companies have begun to pitch products that inventory and update network administrators when any user taps into the server via a wireless device.

HYPERTAG SYSTEM LINKS CELL PHONES TO BILLBOARD ADS
Hypertag, based in Cambridge, England, has developed cheap, smart tags that can beam Web site links to mobile phones, giving passersby additional information about the poster, billboard or shop to which the tag is attached — for instance, links could lead to descriptions of historic monuments or exhibits in a museum, or contact information for products advertised on an outdoor kiosk. Hypertag CEO Jonathan Morgan says 40% of modern cell phones can already accept information sent via infrared technology, and added that his company was also working on a Bluetooth version , which would transfer data via short-range radio link. Many wireless firms see location-based information services as a potentially lucrative revenue stream, but the technological limitations of such systems are still being overcome. "The granularity of GPS and cell-ID is rather large," says Morgan, "and you have to have a lot of infrastructure behind it to make it work." By contrast, the Hypertag system is cheap to use ("It is just like using a remote control on the TV," says Morgan) and the tags can be attached to ads adjacent to each other without muddling the data streams. 2003-03-03 **Department Homeland Security DHS wireless security ISAC analysis**

NIPC/DHS

February 28, Government Computer News — Wireless security on DHS agenda.

Four groups in the Information Sharing and Analysis Center (ISAC) for the information and communications sectors, a public-private security forum, are meeting to evaluate commercial wireless security. The Cellular Telecommunications Industry Association (CTIA), Telecommunications Industry Association, Information Technology Association of America, and United States Telecom Association, have begun meeting with the National Infrastructure Simulation and Analysis Center and other Energy organizations, said Kathryn Condello, vice president of operations for CTIA. The ISAC currently has no industrywide way to review security gaps in the networks and services of wireless carriers. But that's just what the Department of Homeland Security will likely need to know to toughen security as more government employees adopt mobile devices and agencies integrate wireless platforms into their programs. Individual companies "know what their problems are," said Condello, who spoke yesterday on a panel about asset security at the Armed Forces Communications and Electronics Association's homeland security conference. But expanding individual assessments to a competitive telecom market with a half-dozen major carriers, each operating its own distinct network elements, is "really tough," Condello said. "That's a lot of data points."

MCDONALD'S JUMPS ON WI-FI BANDWAGON
McDonald's announced ten stores in Manhattan will begin offering one hour of Wi-Fi high-speed Internet access to anyone who buys a combination meal, and plans to extend the program to 300 McDonald's restaurants in New York, Chicago and a yet-unannounced California town. "You can come in and have an extra value meal and send some e-mail," says a McDonald's spokeswoman. McDonald's joins more than 400 Borders bookstores, hundreds of hotels and a couple of U.S. airports where Wi-Fi access will be available by summer. (AP 11 Mar 2003)

PAYPHONES SEEK NEW LIFE AS INTERNET TERMINALS
Bell Canada is in the midst of a pilot program that offers customers in Toronto, Montreal and Kingston free Wi-Fi Internet access through hotspots originating in 16 former payphone booths located in airports, hotels, libraries, train stations and other public transit locales. As with regular Wi-Fi access, customers must be within 100 feet of the booth to use the signal. Bell Canada spokesman Don Blair says the company has received positive feedback so far: "We've received phone calls and e-mails from people using the service. The are very positive responses from users, as well as a lot of calls from location providers — people wanting to offer (wireless Internet) hotspots to their customers." Meanwhile, in Singapore, InfiniTech has a different idea for resuscitating the payphone booth. The company is looking for U.S. partners to help roll out booths where people could recharge their cell phones when their batteries run down. Users would deposit coins and then recharge their phones. 2003-03-27 **wireless Wi-Fi network communication infrastructure unguarded protection**

NIPC/DHS

March 26, Government Computer News — Wireless infrastructure goes unguarded.

The national wireless infrastructure "is one of the most important and least protected parts" of U.S. communications capability, a technology strategist said today. David Porte, an executive with technology incubator Astrolabe Innovations of Cambridge, Mass., said the World Trade Center attacks on September 11, 2001, were a case in point. Porte spoke at a Newport, R.I., conference sponsored by the National High-Performance Computing and Communications Council. The trade center towers housed hubs for multiple types of communications, he said: broadcast, land-line telecommunications and cellular phones. Yet when the towers fell, "cell phones became the primary means of national security communications," Porte said. The result was widespread congestion with a ripple effect that ended in loss of many communications spokes, he said. Lack of wireless interoperability also interfered with government communication in that crisis. The wireline infrastructure, although the first to go down on September 11, "was the first to recover because of built-in redundancy," he said. Porte encouraged greater density of cells and wireless hubs, saying, "Government and industry need to get wireless ready for emergencies."

2003-04-09 **802.16 Wi-Fi wireless technology vendor support**

NewsScan

NEW WIRELESS STANDARD BUILDS SUPPORT
A new wireless standard — 802.16 — is gaining support, with Intel, Proxim and Fujitsu announcing yesterday they'd joined an industry group called WiMax, which is charged with helping to certify equipment based on the new standard. Unlike the increasingly popular WiFi standard, which is generally limited to a 300-foot radius from the base station antenna, 802.16 technology has a range of more than 31 miles. That means it can be used to extend broadband access to rural and remote locations that currently aren't served. "We believe it's the next big thing in the wireless broadband arena," says Margaret LaBrecque, president of WiMax and an Intel manager. WiMax says its goal is to ensure that 802.16 equipment from different companies will be able to communicate with each other. Analysts expect products using 802.16 to be available during the second half of 2004 and carriers may introduce high-speed Internet service based on the standard in 2005. UPS DEVICE CONNECTS SIX WAYS
United Parcel Service is giving its drivers new handheld devices that connect to six different wireless networks. The Delivery Information Acquisition Device (DIAD) connects via infrared, WiFi, Bluetooth, GPS, and two cell networks: CDMA1x and GSM/GPRS. "It reminded me of 'shock and awe,'" says telecom analyst Jeff Kagan. "There are just so many different kinds of weapons, tools and technologies." A UPS manager says the handheld's battery, which is about the same size as a typical laptop battery, has enough power to last through normal workday because a driver likely would use only two connections at a time — for instance, using Bluetooth to read a packing slip and then connecting to a cell phone network to send information back to UPS headquarters. 2003-04-28 **WiFi technology compete cellular wireless phone**

NewsScan

WHY WIFI WON'T COMPETE WITH CELLULAR ANYTIME SOON
Business Week columnist Andy Reinhardt says despite the recent buzz over WiFi technology, there are fundamental limitations that will restrict its ability to break into the voice communications market. "Just look at roaming. In the mobile world, a fantastically complex system of databases and electronic billing is completely hidden from consumers, whose handsets magically switch from one network to another as they move around. Not so for WiFi, where going online from an unfamiliar hot spot is no easy feat. WiFi will definitely siphon off some of the revenues the Bell-heads [traditional phone companies] want to score from mobile data. But as long as users have to fiddle with Internet protocol settings and quirky, unpredictable connections, WiFi will remain a niche occupied by the technoscenti." (Business Week Online 28 Apr 2003)

2003-05-08 **Wi-Fi security violators LAN hacker virus attacks Delaware Department Technology sniffer software**

NIPC/DHS

May 08, Washington Technology — State CIO hunts for Wi-Fi security violators.

The new Delaware Department of Technology and Information has employed sniffer software to see whether state agencies have deployed wireless fidelity, or Wi-Fi, networks that meet state standards for such networks. Each month the department checks a different location for non-standard, or "illegal," use of a Wi-Fi local area network. During the course of one such check, the department discovered a serious violation, Delaware Chief Information Officer Tom Jarrett Jarrett said "I told the agency to cease and desist or in two days I would take them off the network." Because the agency was "running wide open" with Wi-Fi, they were putting the entire network community at risk from hacker and virus attacks, he said.

2003-05-20 **GPS data stop wireless attacs Yi-Chi Hu Adrian Perrig Carnegie Mellon wormhole Ad-Hoc networks**

NIPC/DHS

May 20, New Scientist — GPS data could stop wireless network attacks.

U.S. computer researchers Yi-Chin Hu and Adrian Perrig of Carnegie Mellon University, PA, and David Johnson at Rice University, TX have revealed that a "wormhole attack" could be used to knock a vulnerable network out of action or defeat a wireless authentication system. "Ad-hoc" wireless computer networks, which are used to extend the range of wireless LAN networks, and are used by the military and emergency services, could be severely disrupted using the technique. But the same researchers have also devised a radical scheme designed to counter it. The researchers propose defending networks against the attack by attaching identifying tags to each packet. They suggest tagging packets with GPS information or a timestamp based on a synchronized network clock. Both could be used to verify that a packet genuinely comes from another nearby node and not one intercepted much further away. The threat and countermeasure are outlined in the paper "Packet Leashes: A Defense Against Wormhole Attacks in Wireless Networks" presented at the Twelfth World Wide Web conference in Bucharest, Romania.

NewsScan

PDAs IN THE CORPORATE SCHEME OF THINGS
Handheld computers are in evidence everywhere in corporate America — yet they typically belong to individual employees rather than to the corporations that employ them. (Gartner Research analyst Todd Kort says that only 28% of all PDA's worldwide were purchased by businesses.) Microsoft is hoping that its new Windows Mobile software for the Pocket PC handheld operating system will bring that percentage up to a much higher level. Gartner's Kort says, "Most of the cool stuff is under the hood. The average end user isn't going to be immediately aware that any kind of major changes have taken place. What they're doing is a lot of things to satisfy IT managers." IT departments "don't want those support calls," so Microsoft has created a new configuration manager for automatically detecting and connecting to Wi-Fi and Bluetooth networks and allowing users to connect wirelessly without having to deal with any complicated configurations or setups — and without having to ask for help. (Information Week 26 Jun 2003)

2003-07-03 **Wi-Fi encryption eavesdropping AirDefense POP e-mail passwords**

NIPC/DHS

July 03, SecurityFocus — Study: Wi-Fi users still don't encrypt.

Two days of electronic eavesdropping at the 802.11 Planet Expo in Boston last week sniffed out more evidence that most Wi-Fi users still aren't getting the message. Security vendor AirDefense set up two of its commercial "AirDefense Guard" sensors at opposite corners of the exhibit hall at the Boston World Trade Center, the site of the conference. The company provided attendees with ample notice of the study. "There were huge signs throughout the place saying AirDefense is monitoring all conference traffic." They found that users checking their e-mail through unencrypted POP connections vastly outnumbered those using a VPN or another encrypted tunnel. Only three percent of e-mail downloads were encrypted on the first day of the conference, 12 percent on the second day. That means the other 88% could easily be intercepted by eavesdroppers using commonly-available tools, compromising both the e-mail and the user's passwords.

NewsScan

SHIP-TO-SHORE WI-FI
For years, mariners have been reliant on pricey maritime radio and satellite services for connectivity afloat, but Wheat Wireless Services of Reston, Virginia is now selling a tweaked version of Wi-Fi Internet access that is functional up to 30 miles offshore. The boat receiver is a 4-foot antenna, and the Wi-Fi service piggybacks off T1 lines in data centers along the coast beamed from radio towers up to 300 feet tall perched atop coastal structures. The service isn't cheap — it costs $7,500 for installation and another $500 a month for unlimited Internet access — but that's pocket change for wealthy yacht owners and cruise lines, says In-Stat/MDR analyst Daryl Schooler. "Basically, they're delivering more than a T1 worth of bandwidth to people. Satellite is slower than that and could be tens of thousands of dollars a month." Two casino ships have signed up for Wheat's service, but not to provide their passengers with Internet access. "They want people to gamble," says Wheat CEO Forrest Wheat. "They don't want them to surf the Internet. (The Internet service) is for the crew." (Wired.com 29 Aug 2003)

2003-11-07 **wireless Wi-Fi security protocol vulnerability**

NIPC/DHS

November 06, InternetNews.com — Weakness found in Wi-Fi security protocol.

Wireless security expert Robert Moskowitz has detected a glaring weakness in the interface design of a Wi-Fi Protected Access (WPA) protocol deployed in numerous Wireless LAN products. According to a research paper written by Moskowitz, the weakness could allow intruders to crack poorly chosen passphrases via offline dictionary attacks. The paper means that Wi-Fi hardware products that ship with WPA might be less secure than the older Wireless Encryption Protocol (WEP), which it replaced in 2002. The WPA standard was designed to improve upon the security features in wireless networks. The weakness only takes effect when short, text-based keys are used and does not reflect a fault in the WPA protocol. The weakness can be avoided if WLAN hardware manufacturers build units with the ability to generate random keys that can be copied and pasted across systems. Manufacturers can also restrict the ability to enter weak keys by requiring passphrases with numerous characters instead of words that can be found in the dictionary. Moskowitz warned that dictionary based programs used to crack passwords are heavily used by criminal hackers. The paper is available online: http://wifinetnews.com/archives/002452.html

2003-12-05 **Cisco Systems wirelss LAN security alert Wi-Fi SNMP vulnerability**

NIPC/DHS

December 04, VNUNet (UK) — Cisco issues wireless Lan security alert.

Cisco has warned firms using its Aironet access points running Cisco IOS operating software of a security flaw that allows hackers to gain full access to wireless networks. The vulnerability allows hackers to steal Wired Equivalent Privacy (Wep) encryption keys. The issue arises if the wireless Lan device's 'SNMP-server enable traps wlan-wep' command is enabled. "Under these circumstances, an adversary will be able to intercept all static Wep keys," Cisco said in a statement. If the command is switched on, which Cisco stressed is disabled by default, the access point will broadcast any network static Wep keys in cleartext to the SNMP server every time a key is changed or access points rebooted. Affected hardware models are the Cisco Aironet 1100, 1200 and 1400 series. Cisco has posted a workaround advising companies with deployments of these devices to disable this command, adding that any dynamically set Wep key will not be disclosed. The problem only applies to wireless Lan kit running its IOS software, so Aironet access point models running VxWorks are not affected. Customers are advised to upgrade their IOS version to a patched system. Cisco's advisory and workaround are available here: http://www.cisco.com/warp/public/707/cisco-sa-20031202-SNMP- trap.shtml

2003-12-19 **wireless Internet test Rutgers WINLAB NSF**

NIPC/DHS

December 17, Rutgers University — Rutgers area to become test track for wireless Internet. The Wireless Information Network Laboratory (WINLAB) at Rutgers, The State University of New Jersey, has won a $5.45 million, four-year grant from the National Science Foundation (NSF) to construct and operate a facility for researchers around the nation to test the next generation of wireless and mobile networks. This wireless networking test bed will include both a large-scale "radio grid emulator" laboratory and a "field trial" system in and around the Rutgers campus and nearby Central New Jersey communities. The project is called the Open Access Research Testbed for Next-Generation Wireless Networks. Rutgers is managing the project in collaboration with Columbia University, Princeton University, Lucent Bell Labs, IBM Research, and Thomson Inc. The two-tiered project will include a new wireless system emulation laboratory to be headquartered at the Technology Centre of New Jersey. An indoor radio grid of about 625 stationary and mobile nodes will give researchers throughout the country remote access for testing of future network concepts under a variety of computer-generated topologies and radio conditions. The field test network will include about 50 nodes running a configurable mix of third generation high-speed cellular, along with wi-fi wireless access.

MOTOROLA LICENSES WOZNIAK'S WIRELESS TRACKING TECHNOLOGY

Motorola is licensing technology developed by Apple co-founder Steve Wozniak's new venture, Wheels of Zeus. The wireless tracking system, dubbed "wOzNet," uses a wireless tag that links to GPS satellites and transmits location information via low-power radio signal. "Let's say you're a parent, you have four kids, and as soon as they hit the amusement park they run in four directions," says Motorola Broadband business development director Vince Izzo. "You could set the thing to let you know if any of them is more than 50 feet away from you." The technology could also enable a parent to monitor a child in the park without going along — the signal could be picked up by a cell phone company or local park operators and transmitted via the Internet to a base station in the parent's home. 2004-01-26 **wireless risks Wi-Fi security threat shared sensitive information**

RISKS 23 16

ANOTHER WIRELESS RISK

Contributor Chris Meadows writes about an experience of his with wireless networking. When at Kinko's, needing print a credit card invoice urgently, Meadows scanned for an available printer on a wireless network. He found an open router called "linksys" which had a Lexmark printer connected to it. Meadows printed his CC invoice on this linksys printer. When he asked the Kinko's clerk where this printer was, the clerk responded, "[B]ut we don't have a wireless network…and we don't have any Lexmark printers either." Meadows had printed his invoice to a "stranger's printer." But Meadows assures us that the invoice contained no really sensitive information, and was closing that account anyway. Commenting on his experience, he says the risk with wireless networking, instead of "you never know who might be using your network," is, "you never know whose network you might be using."

2004-02-03 **NTIA Wi-Fi wireless broadband applications license**

DHS IAIP Daily;
http://www.govtech.net/news/news.php?id=87078&e=1&u=/nm/20040203/tc_nm/tech_microsoft_dc

February 03, Government Technology — NTIA seeks to expand spectrum available for high-speed Internet.

Last week, the National Telecommunications and Information Administration (NTIA) announced it was considering an expansion of the 3650-3700 MHz band to unlicensed devices for wireless broadband applications such as Wi-Fi while protecting federal operations in those bands from interference or other adverse effects. NTIA has invited interested parties to file comments on technical requirements and interference-mitigation techniques necessary for compatible unlicensed device usage in those bands. "We want to make more spectrum available so that people who live in rural areas can have access to wireless broadband," said Acting Assistant Secretary of Commerce Michael D. Gallagher. "This continues our progress in facilitating the sharing of spectrum among government and commercial users." The filing says it appears that "very significant benefits" to the economy, businesses, consumers, and government agencies can be gained by allowing unlicensed devices to operate in other certain bands at higher power levels than currently permitted.

FOUR NEW WIRELESS TECHNOLOGIES

Four new wireless technologies are now in the pipeline, and are expected to be ready for use by early 2005. The first is WiMax, which will have a reach up to 30 miles away and be competitive with cable and DSL for use by Internet service providers. The second is the 802.16e standard, an extension to WiMax that will allow connection to the Internet while a user is in a moving vehicle. The third is 802.11n, a high-bandwidth extension to the current Wi-Fi standard that would increase the speed of Wi-Fi connections by 10 to 20 times. And the fourth is Ultrawideband, which could be used for transmitting large amounts of data short distances. Jeff Harris of General Atomics explains Ultrawideband by offering this example: "We want to eliminate that cable that goes between devices. If you go and drop a few thousand dollars on a flat-panel television, we want you to be able to put it on the best wall in your house — not just the wall that's closest to the cable outlet."(USA Today 28 Mar 2004)

2004-03-31 **Department of Defense DoD WiFi issue policy IEEE 802.11b**

NIPC/DHS

March 31, Government Computer News — DOD set to issue policy on WiFi use.

The Department of Defense (DoD) will soon issue a policy to guide the use of WiFi equipment, said Ronald Jost, director of wireless technology for the DoD. Jost spoke Wednesday, March 31, in Washington, D.C. at the National High Performance Computing Conference. The new policy will mandate that no information—either classified or unclassified—will be allowed to travel unencrypted across a wireless network. But DoD will encourage use of wireless networks, as they reduce the amount of time it takes to set up and tear down LANs. DoD currently has top-secret, local IEEE 802.11b networks running, Jost said. Offices can now procure military-grade secure equipment, so the remaining hurdles involve establishing policy, Jost said. The policy, DOD 8100.bb, is finished and awaiting sign-off, Jost said. DoD also will establish Websites instructing offices how to set up wireless networks for both classified and unclassified use. DoD is also developing a policy for the use of cellular phones. Jost said the department will establish relationships with selected commercial providers who will be able to provide military personnel with cellular voice and data connections. The process will involve companies certifying their equipment as secure. " All [cellular] data traffic will go through virtual private networks," Jost said.

2004-05-03 **wireless airlines air travel snail mail**

DHS IAIP Daily; http://www.dmnews.com/cgi−bin/artprevbot.cgi?article_id=2734 5

May 03, DM News — Airlines use wireless tracking to comply with USPS contracts.

At least two airlines are working with a wireless company based in Redmond, WA, to track mail as it moves through their systems as part of their contracts with the U.S. Postal Service (USPS). The data is used by the postal service to verify whether an airline is adhering to on-time performance standards. Depending on the results, a carrier could lose, maintain, or gain postal business. As part of contracts awarded last year, carriers are required by the USPS to scan mail at the time it is received, when the carrier loads the mail onto a flight, during transfers to connecting flights, and upon delivery to the postal service. The change to the contract process came about in part from Federal Aviation Administration security restrictions put in place after September 11. Air Transport Association statistics indicate that carriers last year flew 1.3 billion mail revenue ton miles, which is one ton of mail payload transported one mile.

2004-05-05 **Wi-Fi Wireless security WPA WEP 802.11i**

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,115999,00.asp

May 05, IDG News Service — Wi-Fi security improves.

Two key improvements for the security and performance quality of Wi-Fi devices are scheduled to reach wireless network users this year as businesses and consumers continue to adopt wireless technology in greater numbers. The Wi-Fi Alliance will certify products for the new 802.11i and 802.11e standards by September, says Frank Hanzlik, managing director of the Wi-Fi Alliance. The 802.11i standard is the complete version of the preliminary security standard WPA (Wi-Fi Protected Access) introduced last year, while 802.11e is a new standard that will improve the quality of wireless networks that transmit voice and video. Security has been one of the biggest obstacles to the growth of wireless networking. Last year, WPA replaced the flawed Wired Equivalent Privacy (WEP) protocol to shore up wireless security before the full 802.11i standard could be ratified. WPA uses a dynamic encryption key as opposed to the static key used by WEP, and it also improves the user authentication process. The 802.11i standard adds Advanced Encryption Standard (AES) technology, a stronger level of security than used in WPA.

2004-05-10 **wireless Wi-Fi security Trusted Computing Group TSG**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1590243,00.asp

May 10, eWEEK — Spec in works to secure wireless networks.

The Trusted Computing Group (TSG) said Monday, May 10, that it is working on a specification to ensure that wireless clients connecting to a network won't serve as a back door to worms and crackers. The specification will be finalized later this year. Although a client or customer connecting to an enterprise network may not overtly be seeking to do harm, the laptop may in fact hide an unpatched system that could serve as an unexpected back door into an otherwise secure system. Likewise, a network administrator cannot be sure whether a laptop hides a worm that might otherwise have been blocked by a wired firewall. When completed, the specification will serve as a means by which network security and network infrastructure vendors can ensure a level of compliance with the best practices of network security, executives said. The specification will specify a level of trust for network endpoints, characterized by the version number of specific applications; whether those applications have been patched; and whether those OSes and applications are free from viruses, as defined by the revision numbers of the signature libraries used within antivirus applications. If a client fails to meet those specifications, the Trusted Network Connect specification will define a process by which the client is quarantined until the appropriate patches and anti-virus tools have been applied.

2004-05-11 **Bluetooth wireless security bluesnarfing**

DHS IAIP Daily;
http://www.computerworld.com/printthis/2004/0,4814,93066,00.html

May 11, Computerworld — Bluetooth group downplays security risks.

The Bluetooth Special Interest Group (SIG) is dismissing security fears about the technology. Mike McCamon of Bluetooth SIG said Monday, May 10, that Bluetooth device shipments have now hit one million per week and that any security problems with the wireless technology security problems are limited to a handful of phones manufactured by Nokia Corp. and Sony Ericsson Mobile Communications AB. Those phones, which include Sony Ericsson's R520m and T68i phones and Nokia's 6310, 6310i, 8910 and 8910i phones, are susceptible to a hacking technique known as "bluesnarfing," according to Nick Hunn, a Bluetooth security expert in London. Flaws in these phones can allow hackers to access data such as information stored in address books or calendars, he said. Both Nokia and Sony Ericsson are developing patches for the older phones, while newer models won't be vulnerable to a bluesnarfing attack, Hunn said. Nokia said that it views any security threat from bluesnarfing as minimal and that the technique can be easily prevented by setting Bluetooth on the phones to a "hidden" mode. That makes intrusion more difficult, "since the hacker will have to know or guess the Bluetooth address before establishing a connection," said Nokia.

2004-05-13 **CERT AusCERT vulnerability wireless 802.11**

DHS IAIP Daily; http://www.auscert.org.au/render.html?it=4091 Source:
http://www.kb.cert.org/vuls/id/106678

May 13, US-CERT — Vulnerability Note VU#106678: IEEE 802.11 wireless network protocol DSSS CCA algorithm vulnerable to denial of service.

The Clear Channel Assessment (CCA) algorithm used in conjunction with Direct Sequence Spread Spectrum (DSSS) transmission is vulnerable to an attack in which a specially crafted RF signal will cause the algorithm to conclude that the channel is busy, so that no device in range of the signal will transmit data. The attacker must be actively transmitting a signal and within range to affect wireless devices. AusCERT notes that devices that use 802.11 and DSSS transmission encoding are affected. An unauthenticated, remote attacker can cause any vulnerable device within range to stop transmitting, causing a denial of service. A complete solution is not available for 802.11 DSSS devices. This vulnerability and potential workarounds are available in AusCERT Advisory AA-2004.02: http://www.auscert.org.au/render.html?it=4091

2004-05-16 **w-fi flaw Queensland University Australia 802.11 exploit**

NewsScan

RESEARCHERS FIND WIFI FLAW

Researchers at Queensland University of Technology in Australia have discovered an easily-exploited vulnerability that can be used to take down most 802.11 wireless networks. The flaw operates at lower network layers than most previously-discovered security flaws in 802.11 networking, and affects any network operating at the 2.4GHz frequency — which is the sole frequency used by the most popular wireless protocol, 802.11b. (The Australian 13 May 2004) rec'd from John Lamp, Deakin U.

2004-05-17 **Wi-Fi transportation airlines broadband**

DHS IAIP Daily; http://www.newscientist.com/news/news.jsp?id=ns99995001

May 17, New Scientist — Hi-flying Wi-Fi debuts on transatlantic flight.

Passengers flying on a Lufthansa flight from Munich to Los Angeles on Monday, May 17, became the first to experience in-flight Wi-Fi -- a broadband wireless internet connection. The satellite-based system enables passengers to surf the web and send emails from their own Wi-Fi-enabled laptop or handheld computers instead of using the more limited services some airlines offer through their seatback displays. The system, called FlyNet, has already been installed on five of Lufthansa's fleet, with plans to extend this to all 80 of the German airline's long-haul planes by the end of 2006. The cost to passengers is $10 for half an hour, or a flat rate of $30 for the entire flight. This is far cheaper that the $16 per email charged by some companies via seatback equipment. Internet traffic to and from the aircraft is handled via geostationary communications satellites orbiting the Earth at 36,000 kilometres.

2004-05-25 **Wireless Wi-Fi WLAN flaw vulnerability defense**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/holes/story/0,10801,93343,00.html?SKC=security−93343

May 25, ComputerWorld — IT managers ready defenses against flaw in wireless LANs.

Information technology managers last week said a denial-of-service vulnerability that affects some Wi-Fi wireless LANs (WLANs) could force companies to develop new skills and rethink the way their networks are set up. But, they added, it should be relatively easy to defend WLANs against attacks seeking to exploit the flaw. Companies that operate multiple access points on their WLANs could also switch network traffic to other access points if one or more were attacked, although doing so would require radio frequency management skills and tools. The flaw was discovered by a team of graduate students at Queensland University of Technology in Brisbane, Australia. Mark Looi, a professor there, suggested that one defense against attacks would be to replace all 802.11b access points with 802.11a technology, which uses a different form of modulation than DSSS.

2004-06-09 **Wi-Fi spread NBA stadium access**

NewsScan

WI-FI EVERYWHERE?

The head of arena operations for the Charlotte Bobcats, an NBA expansion team, is including Wi-Fi wireless communications in the design of the team's new $265 million arena. He says, "Some people will think this is the geeky thing, the nerdy thing. But they were probably saying that 10 years ago when other people were going to Web sites and using e-mail." Other professional sports teams are making the same moves, and Giants chief information officer Bill Schlough says: "It's like walking into Starbucks. Except our Wi-Fi is free." Using Wi-Fi, fans will be able to access content
such as historical videos, trivia games and real-time statistics from the Internet or through customized material available only in the stadium. Schlough says: "There's a lot of purist fans who scoff at anybody bringing laptops to games. I've been heckled when I go in the stands. But then
they'll end up wanting to look over your shoulder." His only fear: "The real problem is business people coming and doing their office e-mails at the game." (USA Today 9 Jun 2004)

2004-06-11 **broadband WiFi spectrum reconfiguration Federal Communications Commission FCC**

NewsScan

FCC PAVES THE WAY FOR SPECTRUM RECONFIGURATION

The Federal Communications Commission approved a plan to reconfigure a chunk of valuable airwave spectrum in an effort to boost wireless broadband use. The current configuration places spectrum intended for educational-video use adjacent to spectrum earmarked for commercial uses -- a situation that requires the agency to impose rigid rules on commercial users to avoid interference. The FCC also decided to maintain its policy of allowing educators to lease spectrum to companies such as Nextel and Sprint, but ruled against allowing the widespread sale of educational licenses. Currently, schools can license 120 megahertz of the 194 MHz band, and educators are permitted to lease as much as 95% of their airwaves to commercial users and spend the proceeds for educational purposes. Critics had charged that some educators had not made good use of their licenses, but most educators opposed outright sale of the licenses, comparing the idea to the sale of national parks. 2004-08-06 **computer science research team Wi-Fi security study weakness RSA RPI**

DHS IAIP Daily; http://www.stevensnewsservice.com/pr/pr460.htm

August 06, Stevens News Service — CompSci team spots weaknesses in Wi-Fi security.

A research team led by Dr. Susanne Wetzel, an Assistant Professor of Computer Science at Stevens Institute of Technology, has produced a study of the weaknesses of Wi-Fi networks. Wetzel's team has discovered "stealth attack" methods of disrupting and draining power from individual nodes within an "ad hoc" wireless network--i.e., a network that one "connects to" as a visitor as one moves physically with one's mobile computer from location to location, without a dedicated access point. While still rare, ad hoc modes are the underpinning for many of the advanced data networking schemes now being proposed. "Most of today's communication infrastructure is based on trustworthy collaboration among information routers," says Wetzel. " However, given the increased economic reliance on a working communication infrastructure, this has become a potential target for terrorists and other criminals." Wetzel worked with researchers from Rensselaer Polytechnic Institute and RSA Labs, as well as Stevens' own Wireless Network Security Center (WiNSeC).

2004-08-12 **Widcomm Bluetooth virus vulnerability PDA PC**

DHS IAIP Daily; http://www.esecurityplanet.com/alerts/article.php/3394181

August 12, eSecurity Planet — Widcomm Bluetooth a virus risk.

A security research firm has discovered a serious vulnerability in Widcomm's widely deployed Bluetooth Connectivity Software that could lead to wireless delivery of malicious worms and viruses. According to an advisory from British security firm Pentest, an unauthenticated remote attacker could exploit the flaw to submit malformed service requests via Bluetooth, which would trigger a buffer overflow. Buffer overflows are commonly used by malicious hackers to execute arbitrary code on vulnerable systems. In theory, security experts say this could pave the way for the creation of a wireless worm that spreads between PCs or PDAs using Bluetooth over the air. "Worms like this could spread very fast, especially in an environment like a seminar or a conference," said Jarno Niemela, a virus tracker at F-Secure.

SOFTWARE AND THE CITY

Philadelphia officials are considering a plan to turn the whole city into the world's largest wireless Internet hot spot, placing thousands of small Wi-Fi transmitters around the city. Philadelphia chief information officer Dianah Neff says, "If you're out on your front porch with a laptop, you could dial in, register at no charge, and be able to access a high speed connection. It's a technology whose time is here." The Philadelphia service wouldn't be the first city to do this, only the largest so far. The Minneapolis suburb of Chaska began offering citywide wireless Internet access this year for $16 a month (to an area of about 13 square miles), and Cleveland has positioned 4,000 wireless transmitters in several areas, offering free Wi-Fi Internet access for anyone who passes through those areas. Neff estimates it would cost Philadelphia $1.5 million a year to maintain the system it's considering. (AP 2 Sep 2004)

2004-09-02 **New York City NYC Republican National Convention RNC 2004 elections wireless security challenge Wi-Fi war driving unencrypted hot spots access points discovery**

DHS IAIP Daily;
http://www.computerworld.com/mobiletopics/mobile/story/0,10801,95641,00.html

September 02, Computerworld — Manhattan presents wireless security challenge for RNC.

IT security researchers have uncovered a significant number of unencrypted wireless devices in close proximity to the Republican National Convention (RNC) at New York's Madison Square Garden. During a two-hour "war drive" around the site of the RNC as well as Manhattan's financial district, security researchers from Newbury Networks Inc. discovered more than 7,000 wireless devices, 1,123 of which were located within blocks of the convention. More important, 67% of those devices were access points that did not have encryption protection. The findings underscore that the huge numbers of open, unsecured wireless networks represent a serious threat to the city's hard-wired infrastructure, said Newbury CEO Michael Maggio. "A wireless-enabled notebook computer powered up inside Madison Square Garden by a conventioneer or media representative could automatically associate with wireless networks outside of the building," said Maggio, noting that such a security gap could allow an attacker to "hop onto" the wired network inside the facility.

2004-11-23 **municipal WiFi MAN Verizon Pennsylvania legislation**

NewsScan; http://online.wsj.com/article/0

TELCOS THREATENED BY MUNICIPAL WIFI

Dozens of municipalities around the country are installing WiFi networks in order to provide citizens with low- or no-cost wireless Internet access -- a phenomenon that has raised the ire of large telephone and cable companies, who see their lucrative broadband businesses eroding. In response, telcos and cable companies are pushing states to pass legislation that could make such municipal networks illegal. Last week, after intensive lobbying by Verizon, the Pennsylvania General Assembly passed a bill with a deeply buried provision that would make it illegal for any "political subdivision" to provide to the public "for any compensation any telecommunications services, including advanced and broadband services within the service territory of a local exchange telecommunications company operating under a network-modernization plan." Verizon is the local exchange operator for most of Pennsylvania and is planning a major fiber-optic cable rollout. Similar bills have passed in Utah, Louisiana and Florida. Critics say the telco giants' clout is stifling broadband expansion in the U.S., but the telcos argue it's unfair for them to have to compete against local governments, which have easy access to capital and pay no taxes. 2004-11-29 **WiMax 802.16 TowerStream New York**

NewsScan; http://www.nytimes.com/2004/11/29/technology/29max.html

WIMAX PROSPECTS LOOKING UP

Upstart TowerStream is offering a new take on wireless broadband, delivering highspeed connections to business customers through antennas perched atop highrises in urban areas. The service, dubbed WiMax (worldwide interoperability for microwave access), uses fixed antennas to send and receive signals across entire metropolitan areas. The radio signals and antennas are unaffected by bad weather and provide a cheaper alternative to data cables buried below streets that are vulnerable to accidental severing by construction crews. Although other companies are getting into the WiMax business, TowerStream is currently the market leader, with a lock on prime locations like the top of the Empire State Building and the MetLife Building in New York City. "The real estate is the hard part of the business," says TowerStream COO Jeff Thompson. "When you tell people you can reach 10,000 clients, they don't believe you." It took him more than two years to negotiate those leases, but Thompson's optimism is warranted, say many analysts. The high-speed wireless Internet market is worth about $400 million globally and could quadruple in the next few years, according to the WiMax Forum, a group of WiMax equipment makers and providers. FAKE WIRELESS ACCESS POINTS OR "EVIL TWINS" WARNED FOR WIRELESS INTERNET

People using wireless high-speed Internet (Wi-Fi) are being warned about fake hotspots, or access points. The latest threat, nicknamed evil twins, pose as real hotspots but are actually unauthorized base stations, say experts at Cranfield University in the U.K. Once logged onto an Evil Twin, sensitive data can be intercepted. "Users can also protect themselves by ensuring that their Wi-Fi device has its security measures activated," said Professor Brian Collins, head of information systems at Cranfield University. In most cases, base stations straight out of the box from the manufacturers are automatically set up with the least secure mode possible. Cybercriminals who try to glean personal information using the scam, jam connections to a legitimate base station by sending a stronger signal near to the wireless client.

2005-01-20 **researchers bogus Wi-Fi access points wireless devices personal information cybercrime technology**

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4190607.stm

RESEARCHERS WARN OF BOGUS WI-FI ACCESS POINTS

Researchers at Britain's Cranfield University are warning users of wireless computing devices about bogus Wi-Fi access points that can steal personal information. The so-called evil twin hotspots are set up near existing access points, where they can hijack signals sent between wireless devices and legitimate access points. Dr. Phil Nobles, a expert on cybercrime and wireless technology at Cranfield, said, "Because wireless networks are based on radio signals, they can be easily detected by unauthorized users tuning into the same frequency." Security experts said that setting up adequate protections for access points, as well as installing personal firewalls on wireless devices, can prevent users from being victimized by the unauthorized hotspots.

2005-01-28 **social engineering shoulder surfing confidential data theft threat greater Wi-Fi evil twin malicious hot spot**

DHS IAIP Daily; http://www.techweb.com/wire/mobile/57704010

LOW-TECH WAYS TO STEAL CONFIDENTIAL DATA WORSE THAN "EVIL TWIN" THREAT

You're more likely to have secrets stolen at a coffee shop from someone snooping over your shoulder or using wireless sniffing software than from sophisticated hackers deploying a so-called "Evil Twin" access point, said Jay Heiser, a U.K.-based research director with Gartner. "Unless the Wi-Fi session is encrypted in some way, which by default it's not, then all of the traffic is available for perusal by anyone with a wireless-enabled laptop and the right software." Heiser was reacting to an announcement last week by academic researchers in Britain who warned that rogue wireless access points -- dubbed "Evil Twin" -- posed a security risk to users in public places like coffee shops and airports where wireless Internet service is available. The lowest-tech way to lose confidential data while at a public hotspot -- which by definition are not encrypted -- is to be a victim of "shoulder surfing," where someone simply peeks over the shoulder of the user to watch for passwords and login names.

2005-02-21 **mobile phone virus Cabir US UK China Bluetooth Philippines standards international widespread infection**

NewsScan; http://www.nytimes.com/reuters/technology/tech-tech-security.html

MOBILE PHONE VIRUS INFILTRATES U.S.

The world's first mobile phone virus "in the wild," dubbed Cabir, has migrated to the U. S. from its point of origin in the Philippines eight months ago, infecting phones in a dozen countries along the way. Experts say the mobile-phone virus threat will increase as virus-writers become more sophisticated and phones standardize technologies that will make it easier to for viruses to spread not just across devices, but the whole industry. Up until now, disparate technical standards have worked against fast-moving virus infiltration, but Cabir has now been found in countries ranging from the China to the U.K., spread via Bluetooth wireless technology. The biggest impact of the relatively innocuous virus is that it's designed to drain mobile phone batteries, says Finnish computer security expert Mikko Hypponnen. Last November, another virus known as "Skulls" was distributed to security firms as a so-called "proof-of-concept alert, but was not targeted at consumers. (Reuters/New York Times 21 Feb 2005)

RADIO-CONTROLLED LAND MINES POSE SECURITY RISKS

Rob Slade pointed out that the new radio-controlled land mines pose significant security risks. "There are very few details provided in regard to the new mines. There appear to be different types. They have some kind of wireless capability. They have remote detonation capability."

He added,

"Based upon what is said, we can determine some additional aspects of the technology, as well as surmise more. They likely communicate via radio frequencies. They will have some kind of (likely minimal) software for reception of signal, authentication, and activation. (Deactivation is likely accomplished by activating the mine when [hopefully] nobody is around.) The mines are probably individually addressable: blowing an entire minefield for a single intrusion would not seem to be an effective use of resources. Radio communication would imply that either the mines are battery powered, or that they contain an antenna and transponder. Given the purpose and use of mines, it is likely that there is an alternate and more standard triggering mechanism such as pressure plates or tripwires that does not require wireless activation."

. . . .

"The potential risks are numerous. With radio communications mines that are buried, or placed under or behind metal or water, may fail to detonate when needed, or deactivate. Any kind of software is, of course subject to failures (which, in this case, could be literally catastrophic). Authentication would be a fairly major issue: sniffing of radio traffic could easily determine commands, replay attacks, static passwords, or number sequences. (Note that the mines require "minimal training" for use.) Failure of authentication could, again, result in failure of either detonation or deactivation. Battery failure would be an issue and therefore transponders are more likely, but transponders would be more difficult to troubleshoot. (Should the transponders retransmit? That would assist with finding and disarming mines, but broadcasting a signal with known improper authentication would result in a means of determining the location of mines.)"

HACKERS ATTACK IT CONFERENCE IN LONDON

Hackers infiltrated an IT exhibition last week and attacked delegates' computers with a new type of wireless attack. Security experts attending the Wireless LAN Event in London last Wednesday, April 20, found that anonymous hackers in the crowd had created a Website that looked like a genuine login page for a Wi-Fi network, but which actually sent 45 random viruses to computers that accessed it. Spencer Parker, a director of technical solutions at AirDefense, said that the hackers walked around the exhibition carrying a Linux-based laptop running software that turned it into a wireless access point. The technique has evolved from an "evil twin" attack, where hackers host fake log-in Websites at commercial Wi-Fi hotspots. This was originally used to lure people into typing in credit card details onto the Web page, so the hacker could steal them.

WIRELESS LEADERS FORM ALLIANCE TO ADDRESS SECURITY

BT, Cisco and Intel announced a formal alliance at InfoSec Europe to promote better security for users of wireless networks. The trio are concerned that fears about security will harm the rollout of wide-scale wireless networks, and have produced advice sheets for businesses, homes and public Wi-Fi access points. BT, Cisco and Intel also agreed to standardize on the Wireless Encryption Protocol, and to implement stronger encryption and identity systems as soon as they are finalized.

2005-05-17 **US Government Accounting Office report wireless network security concern**

DHS IAIP Daily; http://www.gao.gov/cgi−bin/getrpt?GAO−05−383

INFORMATION SECURITY: FEDERAL AGENCIES NEED TO IMPROVE CONTROLS OVER WIRELESS NETWORKS (REPORT)

The Government Accountability Office (GAO) was asked to study the security of wireless networks operating within federal facilities. GAO found that federal agencies have not fully implemented key controls such as policies, practices, and tools that would enable them to operate wireless networks securely. Further, tests of the security of wireless networks at six federal agencies revealed unauthorized wireless activity and "signal leakage"—wireless signals broadcasting beyond the perimeter of the building and thereby increasing the networks' susceptibility to attack. Without implementing key controls, agencies cannot adequately secure federal wireless networks and, as a result, their information may be at increased risk of unauthorized disclosure, modification, or destruction. GAO recommends that the Director of the Office of Management and Budget (OMB) instruct the agencies to ensure that wireless network security is incorporated into their agencywide information security programs in accordance with the Federal Information Security Management Act. OMB generally agreed with the contents of this report. Highlights: http://www.gao.gov/highlights/d05383high.pdf

2005-05-17 **GAO report Wi-Fi security criticism government agencies unauthorized access NIST OMB**

EDUPAGE; http://www.reuters.com/newsArticle.jhtml?storyID=8521359

GAO WARNS OF INSECURE WI-FI

A report released this week by the Government Accountability Office (GAO) strongly criticizes the Wi-Fi security of federal agencies. Wireless networks with no security or with poorly configured security pose significant risks of unauthorized access. Hackers within range of the network could access the network and potentially other computers on the network. Despite guidelines issued by the National Institute for Standards and Technology stating that government agencies should forgo wireless networks unless their security can be ensured, 13 of 24 major agencies do not require security for wireless networks, and 9 agencies do not have wireless-security plans. Investigators from the GAO monitored six agencies and detected Wi-Fi signals outside all of them. The GAO report recommends that the Office of Management and Budget require all federal agencies to use a variety of security measures, including encryption and virtual private networks. 2005-06-04 **Bluetooth wireless networking security breach weakness vulnerability exploit demonstration**

RISKS; http://www.newscientist.com/article.ns?id=dn7461 23 89

METHOD DISCOVERED OF CRACKING BLUETOOTH SECURITY

Avishai Wool and Yaniv Shaked of Tel Aviv University in Israel have demonstrated a method of cracking Bluetooth security. Every Bluetooth device broadcasts its ID code to everything in the vicinity. The method is to pick up an ID code, then send a message to another device, spoofing the ID code, and telling it that the 'link key' used for encrypting communication has been 'forgotten'. This forces the two devices to go through a 'pairing' exercise to establish another link key. (Normally this is done only on the first occasion on which two devices communicate with each other.) The attacker can then eavesdrop on the messages exchanged in the pairing session, and analyse these using software which implements the Bluetooth algorithm. The four-digit PIN (set on each device by the legitimate user) can be cracked by 'brute force'. The link key can then be derived, and the attacker can then communicate with either device by pretending to be the other.

2005-07-12 **wireless attack threat "phlooding" overloading AirMagnet dictionary attacks flood operations VPN firewall businesses**

DHS IAIP Daily; http://www.ebcvg.com/articles.php?id=802

NEW WIRELESS ATTACK DISCOVERED

The security threat of wireless networks to the enterprise keeps growing, this time with the discovery of a new wireless attack. Dubbed “phlooding,” this new exploit targets businesses central authentication server with the goal of overloading it and cause a denial-of-service attack. The “phlooding” attack, discovered by AirMagnet, describes a group of simultaneous but geographically distributed attacks that targets wireless access points with login requests using multiple password combination in what are known as dictionary attacks. The multiple requests create a flood of authentication requests to the company’s authentication server, which could slow down logins and potentially interfere with broader network operations, since many different users and applications often validate themselves against the same identity management system. Phlooding could effectively block broadband VPN or firewall connections that use a common authentication server to verify an incoming user's identity, making it temporarily impossible for employees to access their corporate network. Businesses with multiple office locations served by a single identity management server could be particularly vulnerable to phlooding attacks.

2005-10-10 **wireless networks Wi-Fi consortium standards speed range**

EDUPAGE; http://www.usatoday.com/tech/wireless/2005-10-10-wi-fi-standards_x.htm

WIRELESS COMPANIES FORM NEW GROUP

A new alliance among 27 technology companies intends to accelerate the development of the 802.11n standard for wireless transmission. Members of the Enhanced Wireless Consortium include Broadcom, Intel, Cisco, Lenovo, Sony, and Toshiba. The standard promises speeds of between two and ten times faster than current wireless technologies, as well as increased range, while being compatible with products based on the 802.11a, 802.11b, and 802.11g standards. With the new standard, less capacity is used to verify that transmissions are accurate, leaving room for the speed and distance improvements. Members of the consortium said they expect to have drafts of the standard available by early 2006 and the standard ratified by late 2006, well ahead of the timeline if it followed traditional procedures. Organizers said they hope makers of consumer electronics will take advantage of the early release of drafts of the 802.11n standard to develop products that can be available to consumers before ratification. HURRICANE-RAVAGED NEW ORLEANS GETS WI-FI

Hurricane-stricken New Orleans is largely destroyed and abandoned, but city officials said on Tuesday, November 29, it will soon have universal wireless Internet service. A free, municipally run Wi-Fi system has begun operation in the French Quarter and central business district and should cover the entire city within a year, Mayor Ray Nagin said. "We are among the first cities to feature a citywide wireless network and that's especially important to the recovery of our community," he said. Much of the equipment for the system has been donated by private companies.

U.S.-CANADA TECHNOLOGY EXPERIMENT ASSESSES SECURE WIRELESS DATA COMMUNICATION ENHANCEMENTS

SRI International Monday, December 5, announced the completion of tests that aim to improve the security of wireless data communications among domestic public safety, emergency preparedness, and law enforcement agencies, as well as for use in cross-border situations. The test exercise was commissioned by the U.S. Department of Homeland Security Science and Technology Directorate and its Cyber Security Research and Development Center. The test was conducted in late October in partnership with Defense Research and Development Canada (an agency of the Canadian Department of National Defense). The trial assessed various technologies developed by Voltage Security, CipherTrust, and Research in Motion/RIM. The technologies were evaluated under operationally relevant conditions, using repeatable procedures, automated tools, and infrastructure and instrumentation that could be refined and re-used to support future, related activities. "Recent natural disasters emphasize a critical need for secure mobile data communications in cross-agency and cross-border environments. This exercise proves that commercially available, secure mobile communications are available to government agencies," said Douglas Maughan, program manager of the DHS Cyber Security R&D Center. Exercise participants discussed the trial, its results, and the benefits of deploying a secure wireless solution for data communications at the InfoSecurity New York conference Wednesday, December 7.

2005-12-06 **Network Chemistry wireless threat database resource**

DHS IAIP Daily;
http://www.newsfactor.com/story.xhtml?story_id=01300000B4F7

WIRELESS THREAT DATABASE DEBUTED

Wireless security vendor Network Chemistry has announced the creation of an online Wireless Vulnerabilities and Exploits database intended to be a universal collection point for credible information about security threats affecting multiple wireless technologies, including 802.11 Wi-Fi, CDMA 1X EV-DO, EDGE, Bluetooth, and RFID, as well as emerging protocols like HSDPA and 802.16 WiMAX. The database is co-sponsored by Network Chemistry, wireless LAN training and certification firm CWNP, and the Center for Advanced Defense Studies, a non-profit, non-governmental institute. Brian de Haaff, vice president of product management and marketing at Network Chemistry, said of the database, "We hope it grows into an industry initiative. We've been talking quite a bit to other network security people and carrier people about it. No one has ever tried before to collect this kind of information in one place." Wireless Vulnerabilities and Exploits database: http://www.wirelessve.org/

DHS IAIP Daily; http://www.vnunet.com/vnunet/news/2148609/microsoft−wi− 23
flaw−found

WINDOWS 2000/XP FALL THROUGH WI-FI FLAW

Hackers have exposed details of a previously undocumented flaw in Microsoft's handling of Wi-Fi which affects users of Windows 2000 and XP. The vulnerability was detailed at the Shmoocon hackers conference in Washington, DC, by self-confessed hacker Mark Loveless, (a.k.a. Simple Nomad), a senior security researcher for Vernier Threat Labs. Loveless explained that the issue centers on the way in which the operating systems look for wireless networks during start-up. When a Wi-Fi equipped laptop starts up using Windows 2000 or XP it immediately starts scanning for wireless networks. If none is found it sets up an ad hoc link using the name of the last wireless network accessed. If a hacker was aware of the last used network ID, for example knowing the name of a corporate Wi-Fi network address, it could be used to establish a direct local link with the Windows PC offering access to all local drives. However, the problem only arises if the target machine is not running a firewall. One of the changes in Windows XP SP2 turns the built-in firewall on by default.

2006-02-22 **London Wi-Fi network McAfee concern security**

DHS IAIP Daily; http://news.zdnet.co.uk/internet/security/0,39020375,3925373 23
0,00.htm

SECURITY FEARS OVER LONDON'S BLANKET WI-FI.

Security company McAfee on Tuesday, February 21, raised security concerns over the London's plan to install a Wi-Fi network throughout the Square Mile. The system will be constructed by The Cloud, and should give most of the city's workers wireless access within six months. However, McAfee has raised concerns about the security implications of the project. "Our big concern is that most people care more about connectivity than security. Always-on broadband makes it easier for hackers to find and target people. There is also a knowledge gap -- most people aren't that savvy when it comes to this technology," said Sal Viveros, security expert at McAfee. McAfee recommended that companies prepare themselves for always-on wireless access by learning about the techniques that hackers are using to target susceptible mobile employees, as London is a tempting target for hackers.
